shall be in addition to the three way gauge cock provided along with the pressure/D.P gauges.

Table 9.2
Specification for Seamless SS Pipe

S.N	Property	Requirement
1	Reference	ASTM A-312 TP-316
2	Material Grade	TP-316
3	Type	Seamless/Plain end
4	Size	½ " NB
5	Schedule	40/60/80
6	Standard Length	5 metre

Table 9.3
Specification for Seamless SS Pipe Fittings

S.N	Property	Requirement
1	Reference	ASTM A-182 F-316
2	End Connection	Socket welded
3	Type	Forged conforming to ANSI B16.11
4	Size	½ " NB
5	Rating	3000/6000/9000 lbs
6	Type of Fittings	Reducing coupling, Male-Female reducer, Straight coupling, Equal Tee, Three Piece Union, Elbow, Cap etc.

Table 9.4A
Specification for Seamless SS Tube (1/2")

S.N	Property	Requirement
1	Reference	ASTM A-213 TP-316
2	Material Grade	TP-316
3	Type	Cold Drawn annealed, pickled, passivated, descaled, hydraulically cleaned seamless tube.
4	Size	½ " OD X 2.1 mm thick
5	Properties	Tube shall be free from scratches & suitable for bending & capable of being flared by hardened & tapered steel pin. The expanded tube shall show no crack or rupture. Hardness shall be RB 80
6	Test Pressure	400 Kg/Sq mm minimum
7	Tolerance	+/- 0.13 mm for outside dia. +/- 15% for wall thickness

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[79]	25.09.2014

S.N	Property	Requirement
8	Test	Flare, Hardness, Ball & Bubble test
9	Standard Length	5 metre

Table 9.4B
Specification for Seamless SS Tube (1/4")

S.N	Property	Requirement
1	Reference	ASTM A-269 TP-316
2	Material Grade	TP-316
3	Type	Cold Drawn annealed, pickled, passivated, descaled, hydraulically cleaned seamless tube.
4	Size	1/4" OD X 1.2 mm thick
5	Properties	Tube shall be free from scratches & suitable for bending & capable of being flared by hardened & tapered steel pin. The expanded tube shall show no crack or rupture. Hardness shall be RB 80
6	Test Pressure	400 Kg/Sq mm minimum
7	Tolerance	+/- 0.13 mm for outside dia. +/- 15% for wall thickness
8	Test	Flare, Hardness, Ball & Bubble test
9	Standard Length	5 metre

Table 9.5
Specification for Seamless SS Tube Fittings

S.N	Property	Requirement
1	Reference	ASTM A-182
2	Material Grade	SS 316 forged
3	Type	Double ferrule double compression
4	Ferrule	SS 316
5	Size	To suit SS tubing & NPT end connection
6	Type of fittings	Male/Female connectors, elbow, Equal & Unequal Tee, Cross, Straight connector, bulk head unions, etc. as required to suit the installation.

Table 9.6
Specification for Instrument Valve Manifolds

S.N	Property	Requirement
1	Type	Two valve manifold/Three Valve Manifold

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[80]	25.09.2014

S.N	Property	Requirement
		Five valve manifold
2	Mounting	Remote 2" pipe mounting
3	Construction	Single Block (Bar Stock)
4	Material	Forged body & bonnet AISI 316 SS
5	Ports	½ " NPT
6	Rating	420 Kg/ cm2 at ambient
7	Packing	PTFE Wafer
8	Seat & Stem	AISI 316 SS
9	Plug	AISI 316 SS free to turn on stem/ 17-4 PH
10	Handle	AISI 316 SS
11	Connection	Straight
12	Accessories	Plug for all ports Mounting Bracket, nut, bolts etc.

Table 9.7
Specification for Seamless Copper Tube

	Property	Requirement
1	Reference	ASTM B-68/1975
2	Material	The copper tube shall be of following chemical compositions - copper content 99.90% (minimum) phosphorus content 0.04% (maximum).
3	Type	Cold drawn soft annealed PVC coated 1mm thick
4	Size	6 mm OD /4 mm ID
5	Properties	The tube shall be suitable for bending and capable of being flared by hardened and tapered steel pin. The expanded tube shall show no cracking or rupture.
6	Test Pressure	Burst pressure 100 Kg/Sq. Cm
7	Tolerance	± 0.5 mm for outside diameter ± 0.1 mm for wall thickness
8	Test	Ball and Bubble Test

Table 9.8
Specification for Seamless Copper Tube Fittings

	Property	Requirement
1	Material	Leaded brass (58% Cu, 2% Pb) forging, Nickel plated.
2	Type	Double ferrule double compression
3	Ferrule	Brass, Nickel plated

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[81]	25.09.2014

	Property	Requirement
4	Pressure Rating	40 Kg/Sq. cm
5	Temperature Rating	-100 to +200 Deg C
6	Size	To suit copper tubing and end connection
7	Type of fittings	Male/Female connectors, elbow, Equal & Unequal Tee, Cross, Straight connector, bulk head unions, etc. as required to suit the installation.

9.2 Air Supply Piping

1. All pneumatic piping, fittings, valves, air filter cum regulator and other accessories required for instrument air for the various pneumatic devices/ instruments shall be used.
2. This shall include as a minimum air supply to pneumatically operated control valves, actuators, instruments, continuous and intermittent purging requirements of Local Instrument Enclosures (LIE) etc.
3. For individual supply line and control signal line to control valve, 1/4 inch size light drawn tempered copper tubing conforming to ASTM B75 shall be used. The thickness of copper tubing shall not be less than 0.065 inch and shall be PVC coated. The fittings to be used with copper tubes shall be of cast brass, screwed type.
4. All other air supply lines of 1/2 inch to 2 inch shall be of carbon steel hot dipped galvanized inside and outside as per IS-1239, heavy duty with threaded ends. The threads shall be as per ASA B.2.1. Fittings material shall be of forged carbon steel A234 Gr. WPB galvanized inside and outside, screwed as per ASA B2.1. Dimensions of fittings shall be as per ASA B16.11 of rating 3000 lbs.
5. Instrument air filter cum regulator set with mounting accessories shall be used for each pneumatic device requiring air supply. The filter regulators shall be suitable for 10 kg/ sq.cm max. inlet pressure. The filter shall be of size 5 microns and of material sintered bronze. The air set shall have 2 inch size pressure gauge and built in filter housing blow down valve. The end connection shall be as per the requirement to be finalised during detailed engineering.
6. All the isolation valves in the air supply line shall be gate valves as per ASTM B62 inside screw rising stem, screwed female ends as per ASA B2.1. Valve bonnet shall be union type & trim material shall be stainless steel, body rating 150 pounds ASA. The valve sizes shall be 1/2 inch to 2 inch.

10 INSTRUMENTATION CABLES & ACCESSORIES

10.1 Specifications of Instrumentation Cables

a) Common Requirements

Table 10.1
Specification of Instrumentation Cables- Common Requirement

S.N	Property	Requirement
1	Voltage grade	600 V (Peak Value)
2	Codes and Standard	All instrumentation cables shall comply with VDE 0815, VDE 0207, Part 4, Part 5, Part 6 , VDE 0816, VDE 0472, SEN 4241475, ANSI MC 96.1, IS-8784, IS-10810 (latest editions) and their amendments read along with this specification
3	Continuous operation suitability	At 70 deg. C for all types of cables, while 205 deg C for Type-C cables
4	Progressive automatic on-line sequential marking of length in meters.	To be provided at every one meter on outer sheath.
5	Marking to read 'FRLS'	To be provided at every 5 meters on outer sheath except for type-C cable.
6	Allowable Tolerance on overall diameter	+/- 2 mm (maximum) over the declared value in data sheet.
7	Variation in diameter	Not more than 1.0 mm throughout the length of cable.
8	Ovality at any cross-section	Not more than 1.0 mm
9	Others	<p>a) Durable marking at intervals not exceeding 625 mm shall include manufacturer's name , insulation material, conductor's size, number of pairs, voltage rating, type of cable, year of manufacture to be provided.</p> <p>Cables shall be suitable for laying in conduits, duct, trenches, racks and underground-buried installation</p> <p>Repaired cables shall not be</p>

S.N	Property	Requirement
		b) acceptable

b) Specific Requirements

Table 10.2
Specification of Instrumentation Cables- Specific Requirement

S.N	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
A.	Conductors				
i.	Cross section area				
ii.	Conductor material	ANSI type KX	ANSI type SX	High conductivity annealed tin coated copper	ANSI type KX
iii.	Colour code	Yellow-red	Black-Red	As per VDE-0815	Yellow-red
iv.	Conductor Grade	As per ANSI MC 96.1		Electrolytic	As per ANSI MC 96.1
v.	No. & dia. of strands	n (nom)			
vi.	No. of Pairs	2, 6	2	4, 8, 12, 16, 24, 48,	2
vii.	Max. conductor resistance per Km (in ohm) at 20 deg. C	As per ANSI MC 96.1		73.4 (loop)	As per ANSI MC 96.1
viii.	Reference Standard	As per ANSI MC 96.1		VDE 0815	As per ANSI MC 96.1
B.	Insulation				
i.	Material	PVC type YI 3 with FRLS properties			Teflon (i.e. extruded FEP)
ii.	Thickness in mm (Min/Nom/Max)	0.25 / 0.3 / 0.35			0.4 / 0.50
iii.	Volume Receptivity (Min) in ohm-cm	1x10 ¹⁴ at 20 deg. C & 1x 10 ¹¹ at 70 deg.			---
iv.	Voltage rating	600 V peak operating voltage			
v.	Reference Standard	VDE 0207 Part 4			VDE 0207 part 6 & ASTM D 2116.
vi.	Core diameter above insulation	Suitable for cage clamp connector			

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[85]	25.09.2014

S.N	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
C.	Pairing & Twisting				
i.	Max. lay of pairs (mm)	50			
ii.	Single layer of numbered binder tape on each pair provided	Yes			
iii.	Unit formation of four pairs with printing of no. of Unit provided	NA		Yes	NA
iv.	Conductor / pair identification as per VDE0815	NA		To be provided	NA
D.	Shielding				
i.	Type of shielding	Al-Mylar tape			
ii.	Individual pair shielding	No		To be provided for Type-F cable	No
iii.	Minimum thickness of individual pair shielding	No		28 micron	No
iv.	Overall cable assembly shielding	To be provided			
v.	Minimum thickness of overall cable assembly shielding	55 micron			
vi.	Shielding coverage	100% with at least 20% overlap			
vii.	Drain wire provided for individual shield	NA		Yes (for F-type) 7 -strand 20 AWG (0.51 mm2) annealed Tin coated copper	NA
viii.	Drain wire provided for overall shield	Yes (for F-type) 7 -strand 20 AWG (0.51 mm2) annealed Tin coated copper			
E.	Fillers				
i.	Non-hygroscopic, flame retardant	To be provided			
F.	Outer Sheath				
i.	Material	Extruded PVC compound YM1 with FRLS properties			Teflon (i.e. extruded FRP)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[86]	25.09.2014

S.N	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
ii.	Minimum thickness at any point	1.8mm			0.4 mm
iii.	Nominal Thickness at any point	> 1.8mm			0.5mm
iv.	Color	Blue			
v.	Resistant to water, fungus, termite & rodent attack	Required			
vi.	Oxygen index as per ASTM D-2863	Not less than 29%			NA
vii.	Temperature index as per ASTM D-2863	Not less than 250 deg. C			NA
viii.	Acid gas generation by weight as per IEC-60754-1	Maximum 20 %			NA
ix.	Smoke Density rating as per ASTM D-2843	Maximum 60% (defined as the average area under the curve when the results of smoke density test plotted on a curve indicating light absorption vs. time as ASTM D-2843)			NA
x.	Reference Standard	VDE 207 part 5			VDE 207 Part 6 & ASTM D 2116
xi	Armour	Galvanised steel wire armoured type conforming to IS-3975			
G.	Electrical Parameters				
i.	Mutual capacitance between Conductors. At 0.8KHz (Max.)	200 nF / Km		120 nF / Km for F type 1000 nF / Km for G-type	200 nF / Km
ii.	Insulation resistance (Min.)	100 M ohm / Km			
iii.	Cross talk Figure (min.) at 0.8 KHz	60 dB		60 dB	NA
iv.	Characteristics impedance (Max) At 1 KHz	NA		320 ohm for F type 340 ohm for G type	NA
v.	Attenuation Figure at 1 KHz	NA		1.2 dB / Km	NA

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[87]	25.09.2014

S.N	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
H.	Complete Cable				
i.	Complete Cable assembly	Shall pass Swedish chimney test as per SEN-SS 4241475 class F3.			NA
ii.	Flammability	Shall pass flammability test as per IEEE-383 read in conjunction to this specification			NA
I.	Accessories				
i.	Cable accessories of flame retardant quality	Yes. (Accessories such as harnessing components, markers, bedding, cable jointer, binding tape etc.)			
J.	Cable Drum				
i.	Type	Non-returnable wooden drum (wooden drum to be constructed from seasoned wood free from defects with wood preservative applied to the entire drum) or steel drum.			
ii.	Outermost layer covered with waterproof paper	Yes			
iii.	Painting	Entire surface to be painted			
iv.	Length	1000m + 5% for up to & including 12 pairs 500m + 5% for above 12 pairs			

c) Type Test

Table 10.3
Type Test Requirement for Cables

S.N	Item	Test Requirement	Standard
1	Conductor	Resistance Test Diameter test Tin coating test (drain wire)	VDE – 0815 IS – 10801
2	Insulation	Loss of mass Ageing in air ovens Tensile strength & elongation test before & after ageing Heat shock Hot deformation Shrinkage Bleeding & Blooming	VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 IS – 5831
3	Inner sheath	Loss of mass	VDE – 0472

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[88]	25.09.2014

S.N	Item	Test Requirement	Standard
		Heat shock Hot deformation Shrinkage Cold bend / Cold impact test	VDE – 0472 VDE – 0472 VDE – 0472 IS – 5831
4	Outer sheath	Loss of mass Ageing in air ovens Tensile strength & elongation test before & after ageing Heat shock Hot deformation Shrinkage Bleeding & Blooming Colour fastness to water Cold bend / Cold impact test Oxygen Index test Smoke Density test Acid gas generation test	VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 IS – 5831 IS – 5831 IS – 5831 ASTM D – 2863 ASTM D – 2843 IEC – 754 – I
5	Filters	Oxygen Index test Smoke Density test Acid gas generation test	ASTM D – 2863 ASTM D – 2843 IEC – 754 – 1
6	AL-MYLAR Shield	Continuity test Shield thickness Overlap test Noise interference	
7	Overall cable	Flammability	IEEE 383 & IEC – 332
8		Noise interference Dimensional checks Cross talk Mutual capacitance HV test Drain wire continuity	IS – 10810 VDE – 0472 VDE – 0472

d) Routine Test

To be carried out by supplier during various stages of manufacture.

1. Insulation & jackets: All tests as per IS – 5831 except insulation resistance, voltage & spark test shall be as per BS – 5308, Part II (1986)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[89]	25.09.2014

2. Armor test as per IS – 3975
3. Conductor resistance
4. Cable capacitance and L/R ratio.

e) Acceptance Test

These following tests shall be carried out as acceptance test:

1. Continuity test
2. Voltage test as per BS – 5308 Part II (1986)
3. Conductor resistance and drain wire resistance
4. Cable capacitance and L/R ratio test.
5. Tests for uniformity of galvanization of armor as per IS – 2633
6. Oxygen and temperature index test as per ASTM D – 2863
7. Dimensional checks for overall diameter and under armour / over armour diameter.
8. Checking of drum length & overall length tolerances.

Immediately after completion of electrical tests, the ends of the cable shall be sealed to prevent ingress of moisture with suitable PVC / Rubber caps

10.2 Specifications of Optical Fibre Cables (OFC)

1. OFC shall be installed on cable tray, duct bank, cable trench installation as necessary. For outdoor applications the cable shall be armoured with Poly Ethylene sheathing. In all cases cable shall be routed through suitable grade HDPE permanently lubricated protection pipe as per IS-4984, IS-12235 & TEC.G/CDS-08/01 of suitable size @ 53% fill factor.
2. The optical fibre core shall be of ultrapure fused silica glass coated with UV cured acrylate suitable to withstand temperature of about 80 deg. Centigrade continuously.
3. OFC shall be 4 / 8 / 12 core, galvanized corrugated steel taped armored, fully water blocked with dielectric central member for outdoor / indoor application so as to prevent any physical damage. The cable shall have multiple single-mode or multi-mode fibres on as required basis so as to avoid the usage of any repeaters. The outer sheath shall have Flame Retardant, UV resistant properties & to be identified with the manufacturer's name, year of manufacture, progressive automatic sequential on-line marking of length in meters at every meter on outer sheath.
4. The cable core shall have suitable characteristics and strengthening for prevention of damage during pulling viz. steel central member, Loose buffer tube design, 4 fibres per buffer tube (minimum), Interstices and buffer tubes duly filled with Thixotropic jelly or better material etc. The cable shall be suitable for maximum tensile force of 2000 N during installation, and once

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[90]	25.09.2014

installed, a tensile 1000 N minimum. The compressive strength of cable shall be 3000N minimum & crush resistance 4000 N minimum. The operating temperature shall be -20 DegC to 70 DegC.

5. The splicing loss of any two fibres in any case shall not exceed 0.10 db/splice.
6. The total additional attenuation above the nominal attenuation due to regular splices, repair splices, connectors, temperature variation, ageing etc. shall be indicated.
7. Fibre coloring shall conform to EIA/TIA-598. The color-coding shall be permanent thus withstanding normal handling; e.g., during termination, testing, or cable relocation. Refer to EIA – 359 for color identification and coding.
8. Cables shall be designed & tested in accordance with ISO 11801, TIA-568 & ICEA 596 and Performance specifications shall be measured in accordance with the Fibre Optic test procedures(EIA/TIA -455 documents) test procedures of IEC-60793 & IEC-60794
9. The OFC shall generally conform to the following specifications

Table 10.4A
Specifications for Single Mode Optical Fibre

S.N	Feature		Minimum Requirement
1	Maximum Uncabled Attenuation Coefficient	@1310 nm	0.4 dB/km
		@1550 nm	0.3 dB/km
2	Mode field Diameter	@1310 nm	9.2 ± 0.4 µm
		@1550 nm	10.4 ± 0.8 µm
3	Maximum Cable Cut-off Wavelength		1260 nm
4	Maximum Zero Dispersion Wavelength		1321.5 nm
5	Minimum Zero Dispersion Wavelength		1301.5 nm
6	Maximum Zero Dispersion Slope		0.092 ps/nm ² ·km
7	Maximum Polarization Mode Dispersion		0.2 ps/√km
8	Gigabit Ethernet Length 1000BASE-LX		2-5000 mtrs.
9	Ten Gigabit Ethernet Length	10GBASE-LX	2-10000 mtrs.
		10GBASE-LX4	2-10000 mtrs.
10	Maximum Core/cladding Concentricity Error		0.5 µm
11	Cladding Diameter		125.0 ± 1.0 µm
12	Cladding Non-circularity		1 %

Document Number	Rev No.	Description	Page No.	Date of Issue

10.3

Instrumentation Cable Interconnection & Termination Philosophy

The cable interconnection philosophy to be adopted shall be such that expensive grouping of signals by large scale use of field mounted Group Junction Boxes (JBs) at strategic locations. (Where large concentrations of signals are available, e.g. valves limit and torque switches, switchgear) is done and consequently cable with higher number of pairs are extensively used. The details of termination to be followed are mentioned in the following Table:

Table 10.5
Instrumentation Cable Interconnection & Termination Philosophy

S.N	Application		Type of Termination		Type of Cables
	From (A)	To (B)	End A	End B	
1.	Limit, Torque switches of valves / dampers / drives (integral junction box)	Marshalling cubicle / Marshalling cum Termination Cubicle / Local group JB	Plug-in connector	Posts mount cage clamp type	G
2.	Transmitters, E/P converters, process actuated switches mounted in LIE / LIR	Integral junction box of LIE / LIR	Plug-in connector	Cage clamp (rail mount)	F, G
3.	RTD heads	Local junction Box	Plug-in connector	Cage clamp (Rail mount) type	F
4.	Other Field Mounted Instrument	Local JB / Group JB	Plug in connector	Screwed, Cage clamp (Rail mount) type	F (For analog signals) G (For Binary Signals)
5.	Local junction box, Instrument Junction box of LIE / LIR / Group JB / MCC / SWGR	Group JB	Cage clamp (Rail mount) type	Cage clamp (Rail mount) type	F, G
6.	Local junction box, Instrument Junction box of LIE / LIR / Group JB / MCC / SWGR	Marshalling Cubical / Marshalling cum termination Cabinet	Cage clamp (Rail mount) type	Posts mount cage clamp type	F, G
7.	Marshalling	Electronic	Cage clamp post	Plug-in connector / Other System	Internal

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[94]	25.09.2014

S.N	Application		Type of Termination		Type of Cables
	From (A)	To (B)	End A	End B	
	Cubical / Termination Cabinet	system cabinet	mounted type	as per manufacturer's Standard	Wiring

Notes:

1. Normally 10% spare cores shall be used when the numbers of pairs of cables are more than four pairs.
2. For analog signals, individual pair shielding & overall shielding & for binary signals only overall shielding of instrumentation cables shall be used.
3. * For high temperature applications only.
4. Instrument Cabling for instruments / equipment of specialized / proprietary Control System shall be as per manufacturer's standard.

10.4

Terminal Blocks

1. All terminal blocks shall be rail mounted/post mounted, cage clamp type with high quality non-flammable insulating material of melamine suitable for working temperature of 105 deg. C. The terminal blocks in field mounted junction boxes, temperature transmitters, instrument enclosures/racks, etc. shall be suitable for cage clamp connections. The terminal blocks in Control Equipment Room logic / termination / marshalling cubicles shall be suitable for the post mounted cage clamp connection at the field input end. The terminal blocks for Ash Handling control system Input/ Output connections from/to SWGR/MCC, shall be used with built in test and disconnect facilities complete with plug, slide clamp, test socket etc.
2. All the terminal blocks shall be used complete with all required accessories including assembly rail, locking pin and section, end brackets, partitions, small partitions, test plug bolts and test plug (as specified above for SWGR connections), transparent covers, support brackets, distance sleeves, warning label, marking , etc.
3. The marking on terminal strips shall correspond to the terminal numbering on wiring diagrams. At least 20% spare unused terminals shall be used everywhere including local junction boxes, instrument racks/enclosures, termination/marshalling cabinets, etc. All terminal blocks shall be numbered for identification and grouped according to the function. Engraved labels shall be used on the terminal blocks.
4. The terminal blocks shall be arranged with at least 100 mm clearance between two sets of terminal blocks and between terminal blocks and junction box walls.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[95]	25.09.2014

5. Internal wiring in factory pre-wired electronic equipment cabinets may be installed according to the applicable standards as to wire size and method of termination or internal equipment. Terminal blocks for connection of external circuits into factory pre-wired electronic equipment cabinets shall meet all the requirements as specified above.

10.5 Internal Panels, Cabinets, System Cabinet Wiring Philosophy

1. Internal panel/cabinet wiring shall be of multi-stranded copper conductor with FRLS PVC insulation without shield and outer sheath meeting the requirements of VDE 0815.
2. Wiring to door mounted devices shall be done by 19 strand copper wire provided with adequate loop lengths of hinge wire so that multiple door opening shall not cause fatigue breaking of the conductor.
3. All internal wires shall be used with Tag identification of printed type (partex labels) at both ends. All wire directly connected to trip devices shall be distinguished by one additional red color.
4. All external connection shall be made with one wire per termination point. Wires shall not be tapped or spliced between terminal points.
5. All floor slots of desk/Panels/cabinets used for cable entrance shall be used with removable gasketed gland plates and sealing material. Split type grommets shall be used for prefabricated cables.
6. All the special tools as may be required for solder less connection.
7. Tag identification for internal wires shall be printed (partex labels)
8. Wire sizes to be utilized for internal wiring shall be as per following table.

Table 10.6
Wire Size for Internal Wiring

S.N	Application	Wire Size
1	Current (4-20mA), low voltage signals (48 V)	0.5 Sq. mm
2	Ammeter/ Voltmeter circuit, control switches etc. for electrical system.	1.5 Sq. mm
3	Power supply and internal illumination.	2.5 Sq. mm minimum (shall be as per load requirement)

10.6 Cable Installation & Routing

1. All cable assigned to a particular duct/conduit shall be grouped and pulled in simultaneously using cable grips and suitable lubricants. Cables removed from one duct/conduit shall not be reused.
2. Cables shall be segregated as per IEEE Std. 422. In vertically stacked trays, the higher voltage cable shall not be in higher position and instrumentation

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[96]	25.09.2014

cable shall be in bottom tier of the tray stack. The distance between instrumentation cables and those of other system shall be as follows:

- From 11KV/6.6KV/3.3KV tray system - 900 mm
 - From 415KV tray system - 600 mm
 - From control cable tray system - 300 mm
3. Cables shall terminate in the enclosures through cables glands. All cable glands shall be properly gasketed. Fire proof sealing (to prevent ingress of dust entry and propagation of fire) shall be used for all floor slots used for cable entrance. Compression cable glands (double for armored and single for other cables) shall be used.
 4. All cables shall be identified by Tag. Nos. provided in approved format at both the ends as well as at an interval of 5 meters.
 5. Line voltage drop due to high resistance splices, terminal contacts, insulation resistance at terminal block, very long transmission line etc. shall be reduced as far as practicable.
 6. The cables emanating from redundant equipment/devices shall be routed through different paths. The above segregation of cables & wiring for redundant equipment / devices shall be in accordance with IEEE-Std-422

10.7 Cable Laying

1. Cable shall be laid strictly in line with cable schedule. In general, the cable routing from the local instrument to JB shall be such that the cable go away from the hot zone.
2. Identification tags for cables.
Indelible tags to be provided at all terminations, on both sides of wall or floor crossing, on each conduit/duct/pipe entry/exit, and every 20 m in cable trench / tray.
3. Cable tray numbering and marking.
To be provided at every 10m and at each end of cables way & branch connection.
4. Joints for less than 250 Meters runs of cable shall not be permitted.
5. Buried cable protection
With concrete slabs; Route markers at every 20 meters along the route & at every bend.
6. Road Crossings
Cables to pass through buried high density PE pipes encased in PCC. At least 300 mm clearance shall be used between.
 - HT power & LT power cables,
 - LT power & LT control cables,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[97]	25.09.2014

- LT control & instrumentation cables,
Spacing between cables of same voltage grade shall be in accordance with the derating criteria adopted for cable sizing.
7. Segregation (physical isolation to prevent fire jumping)
 - a) All cable associated with the unit shall be segregated from cables of other Units.
 - b) Interplant cables of station auxiliaries and unit critical drives shall be segregated in such a way that not more than half of the drives are lost in case of single incident of fire.
 8. Cable clamping
All cables laid on trays shall be neatly dressed up & suitably clamped/tied to the tray. For cables in trefoil formation, trefoil clamps shall be used.
 9. Optical fibre cables inside conduits shall be laid on cable trays wherever available and feasible. In areas where the same are required to be buried, the same shall be buried in separate trench approx. 1.6 meter depth, to be laid in 2" GI/rodent proof HDPE conduits covered with sand, brick and soil along the pipe line route.
 10. While crossing roads- to be laid in GI/rodent proof HDPE conduits with sand filling at bottom and sand, soil filling at top with cement concrete;
While crossing canals/river- to be laid in GI/rodent proof HDPE conduits within Hume pipe.

10.8

Cable Accessories

1. Cables, which terminate in cabinets or draw out sections, shall have sufficient cable coils in the bottom of the cabinet to permit full withdrawal of draw out sections without disconnecting the cables. When prefabricated cables with factory connectors on both ends are longer than required, the excess cable shall be coiled in the bottom of one or both termination cabinets.
2. No splices shall be made in conductors for instrument and control circuits except where required at connections to devices equipped with factory installed pigtails. Such splices shall be made only in approved splicing boxes of fitting with removable cover. The splices shall be made with sufficient slack left in the wire to permit withdrawal of the splice from the splicing boxes for ease of future disconnection of the splices. All exposed conductor or connector surfaces shall be covered with a minimum of three half-lapped layers of all weather vinyl plastic electrical tape. Taping shall extend a minimum of two cable diameters over the cable jacket and a similar distance over the other insulation or connections requiring insulation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[98]	25.09.2014

3. Proper grounding of all equipments shall be done. Further, proper termination of cable shield shall be verified and the grounding of the same shall be coordinated so as to achieve grounding of all instrumentation cable shields at same potential. This shall be completed prior to system tests.
4. Take full care while laying/installing cables as recommended by cable manufacturers regarding pulling tensions and cable bends.

10.9 Cable Conduits

1. Conduits shall be generally used for interconnecting cables from field instruments to Local JB's. All unarmoured cables shall be installed in conduit. All rigid conduits, couplings and elbows shall be hot dipped galvanized rigid mild steel in accordance with IS: 9537 Part-I (1980) and Part-II (1981). The conduit interior and exterior surfaces shall have continuous zinc coating with an overcoat of transparent enamel lacquer or zinc chromate. Flexible metal conduit shall be heat resistant lead coated steel, water leak, fire and rust proof. The temperature rating of flexible conduit shall be suitable for actual applications. The flexible metal conduit shall be constructed with interlocked corrosion resistant steel & manufactured in accordance with UL1 & NEC Article 348.
2. All grounding bushings within all enclosures shall be wired together and connected internally to the enclosure grounding lug or grounding bus with 8 AWG bare copper conductors. Conduit runs to individually mounted equipment shall be grounded to the cable tray grounding conductor with 12 AWG bare copper conductors.
3. All rigid conduit fittings shall conform to the requirements of IS: 2667, 1976. Galvanized steel fitting shall be used with steel conduit. All flexible conduit fittings shall be liquid tight, galvanized steel. The end fittings shall be compatible with the flexible conduit supplied.
4. All individually mounted equipment and devices shall be connected to the supply conduit, using not more than one meter of flexible conduit adjacent to the equipment or device. Flexible conduit shall be installed in all conduit runs, which are supported by both building steel and structures subject to vibration or thermal expansion.
5. Special areas, such as Control Rooms in which external noise is to be minimized, shall have flexible conduit in conduit runs where the runs cross from the main building framing to the Control Room framing.
6. Conduit supports shall be furnished and installed in accordance with these specifications. Support material shall comply with the requirements.
 - a) Hanger rods shall be 12 mm diameter galvanized threaded steel rods.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[99]	25.09.2014

- b) Single conduit support shall be one-hole cast straps and clamp backs. Multiple conduit bank supports shall be constructed of special galvanized support channels with associated conduit clips.
7. Conduit sealing, explosion proof, dust proof and other types of special fittings shall be used as required by these specifications and shall be consistent with the area and equipment with which they are installed. Fittings installed outdoors and in damp locations shall be sealed and gasketed. Hazardous area fittings and conduits sealing shall conform to NEC requirements for the area classification.
8. Double locknuts on all conduit terminations shall be used. Water tight conduit unions and rain tight conduit hubs shall be utilized for all the application which shall be exposed to weather. Moistures pockets shall be eliminated from conduits.
9. Conduits shall be securely fastened to all boxes and cabinets.

10.10 Cable Sub Trays & Support

1. The cable sub-trays and the supporting system, to be generally used between Local/Group JB's and the main cable trays. It is the assembly of section and associated fitting forming a rigid structural system used to support the cable from the equipment or instruction enclosure up to the main cable trays (trunk route). The material of cable tray shall be GI.
2. The covers on the cable sub-trays shall be used for protection of cables in areas where damage may occur from falling objects, welding spark, corrosive environment, etc. & shall be electrically continuous and solidly grounded. The cable trays shall not have sharp edges, burrs or projections injurious to the insulation or outer sheath of the cables.
3. The supporting arrangement of cable tray system shall be able to withstand the weight of the cable and cable tray system. The supporting interval shall not be more than the recommended span for the above loading for the type of cable tray selected. The tray shall not overhang by more than one meter from the support at the dead end. As far as practicable the cable sub-tray system shall be supported from one side only, in order to facilitate installation and maintenance of cables.
4. Install the estimated quantities and size of sub trays / troughs including all required fittings and adaptors on as required basis

Table 10.7
Specifications for Cable Tray

S.N	Feature	Minimum Requirement

4	Length	2.5 Mtr. +/- 10 mm
5	Width	W +/- 3mm
6	Inward Bend	25 mm
7	Coupler Plate	Thickness 2 mm, length 100 mm, Width 50 mm
8	Coupler plate material	MS with Hot dip galvanised
9	Nuts, Bolts, washer etc.	As required/ Hot dip galvanised
10	Cover	Dome Fixed type, Thickness 1.2 mm (Minimum)
11	Cover Material	Hot dip galvanised MS sheet

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[101]	25.09.2014

11 SYSTEM CABINETS, PANELS & JUNCTION BOX

11.1 General Requirements

1. All control panels, system cabinets, local panels and local instrument enclosures, racks shall be furnished fully wired with necessary provision for convenience outlets, internal lighting, grounding, ventilation, space heating, anti-vibration pads and accessories as per IS:5039-1969 as required for completeness of the system.
2. All panels & cabinets shall be free standing type and have bottom entry for cables unless otherwise specified. The bottom of panels, cabinets, enclosures shall be sealed with bottom plate, compression cable glands and fire proof sealing material to prevent ingress of dust and propagation of fire. The Cabinets shall be designed for front & back access to components, terminals and wiring.
3. The cabinets shall be used with bottom glanding plate which shall be removable from inside and shall be used with sufficient no. of knockouts. The details of knockouts shall be used during detail engineering. All knockouts shall be used with pluggable grommets.
4. The cabinets shall be of max. 2200mm height including base channel. The base channel shall be of 100 ISMC. All cabinets shall be of same height. Construction shall be modular.
5. System & non-system cabinets shall have "look alike" appearance.
6. All electronic system cabinets shall be designed for 50 deg C operating under maximum ambient temperature without air conditioning system in service. Further cabinets, panels shall be so designed that temperature rise due to heat load does not exceed 10 deg. C above ambient temperature under all operating conditions. Necessary louvers, fans, limited packing density, adequate spacing between instruments, devices etc. shall be used to maintain temperature rise within permissible limits.
7. Panels, cabinets enclosures wiring shall be arranged to enable the removal of modules/instruments and devices without unduly disturbing them.
8. All panels, cabinets, enclosures interiors shall be illuminated with rapid start fluorescent strip fixtures with door actuated switches. Door switch terminals shall be shrouded. All illuminated lights shall be used with isolation switch in addition to door switch for maintenance & switching off when not required. Illumination light shall be used on both front & back sides if both sides are provided with equipments/instruments/terminal blocks requiring maintenance.
9. Sufficient number of power receptacles with disconnect switches shall be installed within panels, enclosure and racks.
10. The local instrument enclosures/racks shall be used locally for mounting of electronic transmitters and switches, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[102]	25.09.2014

11. Exterior steel surface shall be sand blasted, ground smooth, filed, primed, sanded and smooth enamel painted to give a good finish subject to minimum paint thickness of 65-75 microns for sheet thickness of 3 mm and 50 microns for sheet thickness of 2mm. Minimum 2 coats of primer and two sprays of final finish colour shall be applied to all surfaces.
12. The colour of the panel's interior shall be brilliant white. External colour of the panels shall be as RAL 7032 for LIE/ LIR and RAL 7035 for control room system cabinets.
13. All panels, enclosures, system cabinets, marshalling cabinets shall be used with a minimum of 20% spare terminations and system cabinets shall be used with spare space for 20% additional modules fully wired with connectors etc. in excess of the total requirement of the system design when the cabinets are delivered. The spare space capacity shall be distributed evenly throughout the cabinets.

11.2

System Cabinets

Table 11.1
Specifications for System Cabinets

S.N	Features	Minimum Requirements
1	Application	For housing Signal conditioning cards, input/output cards, processor cards, power supply units etc.
2	Location	Indoor
3	Type	Free standing Vertical type
4	Protection class	IP-44
5	Material & Thickness	CRCA steel/ min. 2mm for panel sides & 3mm for gland plates
6	Doors	Double door with neoprene gasket, Lockable,
7	Cable entry	Bottom with fire proof compound thickness 50 mm for sealing
8	Anti vibration pad	Required, 15mm
9	Painting	Interior- Brilliant White Exterior- RAL 7035
10	Cabinet Dimension	To be decided during detail engineering
11	Grounding	M6 earthing stud shall be used
12	Ventilation	Fans & louvers with brass mesh required
13	Lighting	rapid start fluorescent strip fixtures with door actuated switches required
14	Lifting arrangement	Removable lifting eyebolts shall be used

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[103]	25.09.2014

1. Beacon Lamps shall be used in each cabinet to indicate panel having fault condition.
2. The racks in system cabinets shall have provision along with plug in sockets/back plane to house accommodate the spare slots/modules as specified elsewhere.
3. The system cabinets, racks in system cabinets, slots in the racks & the terminals shall have identification numbers. A stainless steel metal tag (plate) shall be fixed to the inside of the door & the layout of the racks, slots & details of the card type/service shall be inscribed on this metal tag.
4. Each cabinet shall be used with one each 3 pin receptacles for 230 V, 1P, 50 Hz and receptacles for 24V DC.
5. One of the doors shall be used with folder to keep the relevant engineering document of the cabinet.
6. All cabinets shall have common key for locks.
7. Door shall have concealed type of hinges with 120 degree swing.
8. Door latches shall be of the three-point type to ensure tight closing.
9. Separate Power & shield earthing bus shall be used at the front & rear side of the cabinets. The earthing bus shall be isolated from panel body by suitable insulation material.

11.3 Marshalling Cabinets

Table 11.2
Specifications for Marshalling Cabinets

S.N	Features	Minimum Requirements
1	Application	For termination of all cables originating from field.
2	Location	Indoor
3	Type	Free standing Vertical type
4	Protection class	IP-44
5	Material & Thickness	CRCA steel/ min. 2mm for panel sides & 3mm for gland plates
6	Doors	Double door with neoprene gasket, Lockable,
7	Cable entry	Bottom with fire proof compound thickness 50 mm for sealing
8	Terminal Blocks	Rail mounted cage-clamp suitable for conductor size up to 2.5 mm ² & fused type with LED indication for power supply (24 VDC, 230 V AC, 110 V AC etc.) for instruments & equipments.
9	Anti vibration pad	Required, 15mm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[104]	25.09.2014

S.N	Features	Minimum Requirements
10	Painting	Interior- Brilliant White Exterior- RAL 7035
11	Cabinet Dimension	To be decided during detail engineering
12	Grounding	M6 earthing stud shall be used
13	Ventilation	Fans & louvers with brass mesh required
14	Lighting	rapid start fluorescent strip fixtures with door actuated switches required
15	Lifting arrangement	Removable lifting eyebolts shall be used

1. Separate Marshalling cabinets for the system shall be supplied for terminating all cables originating from the field and for distributing the signals to different functional panels and cubicles.
2. The terminal blocks shall be cage clamp type. Fused terminal blocks hinged at one end to facilitate easy isolation shall be used wherever necessary. All cabinets shall be used with spare terminals for the spare inputs/outputs as specified elsewhere in the specification. The type of terminals for terminations from cabinets/panels shall match with the pre fabricated cables and pins supplied.
3. The terminals for field cables shall be arranged in a logical order of equipment/system wise.
4. The marshalling cabinets, the terminal blocks, the terminals and the electronic hardware if any, shall have identification numbers.
5. Each cabinet shall be used with one each 3 pin receptacles for 230 V, 1P, 50 Hz and receptacles for 24V DC.
6. One of the doors shall be used with folder to keep the relevant engineering document of the cabinet.
7. All cabinets shall have common key for locks.
8. Door shall have concealed type of hinges with 120 degree swing.
9. Door latches shall be of the three-point type to ensure tight closing.
10. Separate Power & shield earthing bus shall be used at the front & rear side of the cabinets. The earthing bus shall be isolated from panel body by suitable insulation material

11.4 Local Instrument Enclosure & Racks

1. Transmitters and switches, devices, etc. mounted in the field shall be suitably grouped together and mounted in local instruments enclosures in case of open areas of the plant and in local instrument racks in case of covered areas. These local instrument enclosures and racks shall be furnished as per the project requirements.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[105]	25.09.2014

2. The local instrument enclosures shall be constructed of 2 mm sheet plate and shall be of modular construction with one or more modules and two end assemblies bolted together to form an enclosure. Vibration dampeners shall be installed for supporting each enclosure. The internal layout shall be such that the impulse piping/ blow down lines are accessible from back doors of the enclosure and the transmitters etc. are accessible from front side for easy maintenance. Gaskets shall be used between all mating sections to achieve protection class of IP-65.
3. The local instrument racks shall be free standing type constructed of suitable 3 mm thick channel frame of steel and shall be used with a canopy to protect the equipment mounted in racks from falling objects, water etc. The canopy shall not be less than 3 mm thick steel, and extended beyond the ends of the rack. Bulk heads, especially designed to provide isolation from process line vibration shall be used. Exact fabrication details shall be as finalized during detailed engineering stage. The junction box for racks also shall conform to IP 65 protection class.
4. The junction box of Local Instrument Enclosure & Racks shall be used with hinged type door, latch for locking & gland plates for cable entry. All terminals in junction box shall be of rail mounted cage clamp type suitable for conductor size up to 2.5 Sq. mm.

11.5

Local Junction Box

Table 11.3
Specifications for Junction Box

S.N	Features	Minimum Requirements
1	No. of Ways	32 (2X16) with 20% spares terminals
2	Material & Thickness	3 mm thick Stainless steel
3	Protection class	IP-65 for outdoor/ IP 55 for Indoor
4	Cable entry	Bottom
5	Mounting	Suitable for Wall/column/structures mounting
6	Terminal Blocks	Rail mounted cage-clamp type suitable for conductor size up to 2.5 mm ²
7	Grounding	M6 earthing stud shall be used
8	Gland plate	Removable type
9	Door	Single Lockable door with gasket, able to open sideways, turnable hinge based, latch type lock without handle with common key.
10	Accessories	Tag plate, clamps, fixtures, bolts (SS), nuts (SS), Gasket (Neoprene), cable glands (SS), Lugs (Brass), Fire proof compound for sealing.

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[106]	25.09.2014

1. All JB's for outdoor application shall be used with individual canopies to prevent ingress of water.
2. All JB' shall have provision to add 10% additional TB's.
3. The marking on terminal strips shall correspond to the terminal numbering on wiring diagrams.
4. Separate Terminal blocks shall be used for Analog & Digital Signals & also for signals with different voltage levels.
5. The terminal blocks shall be arranged with at least 100 mm clearance between two sets of terminal blocks and between terminal blocks and junction box walls.
6. Separate shield bus shall be used with screw connection for terminating cable shields.
7. All spare cable entries shall be used with plugs.
8. All wires in JB shall be neatly dressed & ferruled.
9. Double deck type terminal block shall not be used.

Table 11.4
Specifications for Cable Glands

S.N	Features	Minimum Requirements
1	Type	Double compression
2	Entry Thread	½ " NPT
3	Material	Brass
4	Finish	Cadmium Plated
5	Protection	IP-54 or better
6	Accessories	Neoprene gasket, Locknut, Reducer etc.

1. CIVIL, STRUCTURAL & ARCHITECTURAL WORKS- DESIGN & EXECUTION CRITERIA

1.1 Introduction

This specification covers the design, preparation of general arrangement, construction as well as fabrication drawings, supply of all labour as well as materials and construction of all civil, structural as well as architectural work on EPC basis for Renovation and Modernisation of Ash Handling system and associated structures. Description of various items of work under this specification and nature of work in detail are given hereinafter. The complete work under this scope shall be as per Volume-II, Section-I, CIVIL SCOPE OF WORK.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[1]	25.09.2014

2. *[BUILDINGS & STRUCTURES]*

Design and construction of new buildings, structures, foundations etc. as well as repairing / retrofitting of existing buildings, structures, foundations shall take into account requirement for operation and maintenance of all equipments and its users. The buildings will have good architectural features. The surrounding areas shall be properly micro levelled and graded. The architectural design concept of buildings structure shall be evolved considering the functional, technological and other requirements for efficient operation ensuring comfortable working environment for personnel, satisfying the aesthetic requirements. Special care shall be taken to provide elegance and aesthetics, with effective use of appropriate treatment, materials fittings and finishes.

- *Due consideration shall be given for adequate natural lighting and ventilation for both plant and non-plant buildings.*
- *Retrofitting / repair works / new constructions shall not cause damage to the existing structures. The temporary supports shall not be allowed on the existing structures for any of these works unless the loads are minor and may not cause any damage to any existing structure. However in such a case Bidder shall take approval from the Owner/Consultant prior to initiating the work.*
- *Internal finishes shall be provided with latest available materials approved by Owner/Consultant with due consideration of the functional aspect of the area.*
- *External finishes shall be provided with latest materials approved by Owner/Consultant for improving the aesthetics.*
- *The orientation of the important buildings shall be in line with the existing site condition and function as such.*
- *Each building shall have its own identity. However, a total homogeneity shall be maintained in the design of all buildings.*
- *Adequate frontage shall be provided to all important buildings to create a better visual impact.*
- *All other civil and structural buildings shall be developed in conjunction with the above aspects.*

All Civil, Structural and Architectural works of the following systems shall be covered under this package.

- a) *Vacuum Pump House including Switchgear Room*
- b) *Ash water pump house including ash water tank, with switchgear and Control room*
- c) *Ash slurry pump house including make-up water sump, ash slurry sump, switch gear and control room*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[2]	25.09.2014

- d) Bottom Ash Disposal System Structures including Storage hopper*
- e) Fly Ash Disposal System Structures including intermediate surge hoppers*
- f) Fly ash equipment building*
- g) Fly ash silos*
- h) Silo utility building*
- i) Pipe racks & Cable racks*
- j) Pedestal for lean slurry disposal system*
- k) Ash Pond*
- l) AHP Clarifier, Clear Water Tank, Recirculation Pump House and Chemical House for Ash WTP*
- m) Any building inadvertently left out in the above list, however required for proper functioning of the power plant as per system requirement stipulated under Mechanical & Electrical section of this specification shall also be included.]*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[3]	25.09.2014

3. DESIGN REQUIREMENTS

3.1 Location

Geographical location of the plant site is approximately between [...]°[...]′[...]″ N] to [...]°[...]′[...]″ N], Latitude and [...]°[...]′[...]″ E] to [...]°[...]′[...]″ E], Longitude.

3.2 Ground Condition

Subsurface condition: The natural ground surface level approximately varies from [...] m to [...] m] from MSL.

[The soil profile in the plant area can be broadly classified into 3 layers namely laterite, cemented sand and cemented silt in general as per detail soil investigation report. Top soil upto a depth ranging from 0.4 m to 0.75 m is entirely non-uniform. The underlying layer is laterite whose depth varies from 4.0 m to 5.5 m followed by deep layers of cemented silt and cemented sand].

The ground water table (GWT) at finished ground level shall be considered for foundation design purposes.

The detailed soil investigation report conducted for plant shall be made available to Bidder for required replacement / refurbishment / retrofitting of Foundations, if any.

Bidder is advised to carefully study the content of detailed Soil investigation report for the existing type of foundations and design of new ones.

The type, size, depth of the foundation shall be based on the detail soil investigation report provided by OWNER.

3.3 Climatic Condition

a) Temperature

Maximum : [...] °C

Minimum : [...] °C

For design purpose, maximum temperature to be considered: [...] °C

minimum temperature to be considered: [...] °C.

b) Rain fall

Minimum : [...] mm in May]

Maximum : [...] mm in October]

Peak hourly rain fall: [...]mm] (corresponding to 50 years return period)

[Note: Maximum per day rainfall as per weather report has been considered conservatively as peak hourly rain fall which will be used for drainage system design etc.]

Annual average: [...] mm to [...] mm & average [...] mm]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[4]	25.09.2014

3.4 Seismic Zone

The site is located in [Zone III] as per IS: 1893-2002. Zone factor shall be [0.10]. Importance factor shall be considered as [1.75].

3.5 Wind Zone

The site is located in wind speed zone [...] m/s] as per IS: 875 (Part 3)-1987.

3.6 Loads and Load Combinations

All new structures shall be designed and old structures requiring modification shall be checked for the most critical combinations of dead loads, imposed loads, equipment loads, wind loads, seismic loads, temperature loads, forces developed due to differential settlement and any other loading conditions which can occur during the design life of the facility.

(a) Dead Loads

Dead loads consist of the weights of the complete structure with finishes, fixtures, partitions, wall panels and all existing / modified / replaced equipments of semi-permanent nature including storage structures (Tanks, bins, silo etc) partitions, roofing, piping, cable trays, bus ducts etc. The content of storage structures etc. shall be measured at full capacity for this purpose.

The piping loads (for empty, operating and test conditions), cable tray loads and the contents of the storage structures shall be listed separately so that they can be excluded from dead load when dead loads are acting as stabilizing load for uplift.

The following unit weight of material shall be considered for computation of loads. Loads given in IS: 875 (part-I) shall be made use of for material not listed below.

Table 2.1
Weights of Material

Material	Unit weight (kN/m ³)
Plain cement concrete	24.0
Reinforced cement concrete	25.0
Structural steel	78.5
Brick work	19.0
Cement plaster	21.0
Floor Finish	24.0
[Coal]	11

(b) Superimposed Live Load (SILL)

Listed below is the minimum SILL for the areas involved. Floors and supporting members subjected to heavy equipment live loads shall be designed on the basis

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[5]	25.09.2014

of the equipment loads specified by vendor or specifically defined SILL whichever is greater.

The specific minimum floor SILL is listed below:

**Table 2.2
Superimposed Live Load (SILL).**

S.No	Description	SILL Value
a)	Roof	
	Flat accessible roof	1.5 kN/m ²
	Flat accessible roof with HVAC equipments, etc.	5 kN/m ²
	Flat inaccessible roof	0.75 kN/m ²
	Sloped Roof	As per code IS: 875 (Part-2)
b)	All building floors & Stairs	5 kN/m ²
c)	Walkways of Conveyor Galleries	5 kN/m ² or Concentrated Load of 3 kN at centre which ever is critical
d)	M.C.C. Floor	10 kN/m ²
e)	Equipment Load	As applicable
f)	Culverts & its allied structures including Concrete pipes	Class "A" / Class "70R" as per IRC standard whichever is higher / load due to bull dozers
g)	Underground basement,	Surcharge of 10 kN/m ²
h)	Vehicular traffic	Surcharge of 20 kN/m ²
i)	Covers for Channels	Surcharge of 10 kN/m ²
j)	Pump Houses	
	Operating Floor Slab	15 kN/sqm or as required by equipment supplier whichever higher
	Workshop	10 kN/m ²
k)	Other areas:	
	• RCC floors (Offices, laboratories, conference rooms and general floors)	5 kN/m ²
	• Balconies	5 kN/m ²
	• Chequered plate / gratings	5 kN/m ²
	• Walkways	3 kN/m ²
	• Toilets	2 kN/m ²

- In addition to LL, Hung loads for electrical, ventilation & air conditioning minimum of 0.5 kN/m² shall be considered.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[6]	25.09.2014

- Load of 1 kN/m² shall be considered as hung load for piping unless otherwise mentioned. However, the actual loads will be as furnished by the supplier. The stringent most will be followed.
- For other areas LL shall be considered as per IS: 875 (Part-2).

(c) Seismic Load

The proposed plant is located in Seismic *[Zone-I]* as per IS: 1893, Seismic force on the structures will be considered accordingly.

(d) Wind Load

The proposed plant is located in Wind Speed Zone of *[...m/s]* as per IS: 875 (Part 3). The wind force on the structures will be considered as follows:

**Table 2.3
Wind Speeds**

Description	Wind Speed
Basic Wind Speed V _b (at 10m above mean ground level)	<i>[50 m/sec]</i>
Risk coefficient K ₁ (for 100 years)	<i>[1.07]</i>
Category of terrain	<i>[Category 1]</i>
Factor K ₂	As per IS: 875
Topography factor K ₃	As per IS: 875

For the design of structures, wind force on Equipment, supported on frame including all fixtures, piping, staircase, ladder, etc, shall be considered.

Design of structures shall be checked for the condition of wind load with gust factor.

(e) Earth Pressure Loads

For earth pressure the worst condition with dry / submerged and active, passive or at rest shall be considered. The pressure coefficient shall be adopted as recommended in Soil Report or for the backfill material used.

(f) Temperature Loads

The total temperature variation shall be considered as 2/3rd of the average maximum annual variation in temperature. The average maximum annual variation in temperature for this purpose shall be taken as the average between the mean of the daily minimum ambient temperature during the coldest month of the year and mean of daily maximum ambient temperature during the hottest month of the year. The structure shall be designed to withstand stresses due to 50 % of the total considered temperature variation with temperature load applied with positive and negative sense.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[7]	25.09.2014

For design purpose average maximum annual variation shall be taken as *[+50°C]* to +5°C.

Coefficient of thermal expansion of steel shall be taken as per IS: 800 where the value is given as $12 \times 10^{-6}/^{\circ}\text{C}$. Coefficient for thermal expansion for concrete shall be taken as per IS: 456.

(g) Thermal Loads (during operating condition)

When thermal loads (such as produced by temperature changes in piping, equipment and structures) results in friction between equipment and supports (exchangers) or piping and supports, the friction force will be taken as the operating load on the support multiplied by the applicable friction coefficient given below:

**Table 2.4
Thermal Loads**

Description	Value
Surfaces	Friction coefficient
Rolling supports	0.05
Steel to steel	0.30 (longitudinal) and 0.10 (lateral)
Concrete to steel	0.30

(h) Equipment Loads

Static and dynamic loads of major existing / modified / replaced equipments shall be based on the manufacturer's data of the specified equipments and shall be considered in design in addition to the live load.

Equipments to be tested for hydraulic test, tanks and piping design loading shall include hydraulic test loading. Weight of equipments, ducts, tanks, pipes, conduits, etc. supported by structure shall include maximum possible loading conditions i.e. flooded conditions and associated impacts, test loading, anchorages and constraint effects.

Air and gas duct loads shall include weight of insulation, duct attachments, dust accumulation loads, seismic, wind and other loads applicable.

(i) Cranes, Hoists, Monorail and Elevator loads

All lifting beams and monorails shall have their design loads increased for impact factor. Loads for overhead cranes, hoists, monorails and elevators shall be taken as per IS: 875.

100 % of the lifted load including elevator live load plus the cab weight shall be considered for the elevator support beam design. Pedestals in elevator pits shall be designed assuming impact factor as per IS codes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[8]	25.09.2014

(j) Vibration and Noise

The design shall ensure that vibrations from any moving machinery transmitted from its immediate foundations to adjacent buildings or areas of the same building shall be suppressed in accordance with the recommendations of relevant codes of practice.

(k) Other Loads

- Stresses imparted to structures due to differential settlements, variation of water table, erection and maintenance loads, creep and shrinkage shall also be considered in design of all structures.

- Dust loads

All buildings / structures shall be designed for a dust load of 1 kN/m² for flat roof and 0.5 kN/m² for sloped roof.

- Construction /Erection/Maintenance Loads

The integrity of the structures shall be maintained without use of temporary framing struts or ties and cable bracing as far as possible. However, construction or access considerations may dictate the use of temporary structural systems. Special studies shall be made and documented to ensure the stability and integrity of the structures during any periods involving use of temporary bracing systems.

- Future Loads

Loads from future expansion shall be considered when so directed by the Owner/Consultant. Future loads may include any of the loads listed above.

- Surge Loads

Surge loads may occur in some vessels or equipment. In such cases, the magnitude and direction of the load shall be given by the equipment supplier.

(l) Basic Load Cases

Following basic loads shall be considered for analysis and design:

Dead load	:	DL
Superimposed dead load	:	SIDL
Self weight of permanent equipment	:	EL
Steam piping (Static & Dynamic) & other piping loads	:	PL
Cable loads	:	CL
Live load on floor / walkway	:	LL
Superimposed live load	:	SILL
Live load on roof	:	LLR

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[9]	25.09.2014

Seismic load	:	SL
Wind load	:	WL
Load due to soil pressure	:	SP
Load due to surcharge	:	SCL
Load due to hydrostatic pressure	:	HP
Load due to temperature	:	TL
Hoist, monorail loads	:	MR1
Crane Load	:	CRL
Special loads	:	SPL

(m) Load Combinations

The individual members of the frame shall be designed for worst combination of forces such as bending moment, axial force, shear force and torsion. Permissible stresses for different load combinations shall be taken as per IS: 456, IS: 800 & IS: 875 (all parts) and other relevant IS codes.

Wind and seismic forces shall not be considered to act simultaneously.

Criticality of erection / maintenance loads shall also be checked separately in combination with other simultaneously occurring loads for possible design loading.

(n) Load Combinations for underground structures

- For the design of sub structure only liquid pressure from inside and no earth pressure and ground water Pressure and surcharge pressure from outside (applicable only to the Structures which are liable to be filled with water or any other liquid) shall be checked.
- For the design of sub structure combination of earth pressure, surcharge pressure and ground water pressure from outside and no water pressure from inside shall be applied.

(o) Ash Silos

The following densities of ash shall be considered for the design or renovation & modernisation of concrete ash silos:

For volume calculation of bottom ash silo	:	6.5 KN/cum
For volume calculation of fly ash silo	:	7.5 KN/cum
For load calculation of both types of silos	:	16 KN/cum

The concrete ash silo shall be designed generally as per the criteria laid down in IS: 4995 (Part I & II). The static pressure calculated at rest shall be multiplied by an over pressure factor of 1.35 for the top 1/3 rd portion and by a factor of 1.75 for the bottom 2/3rd portion. Special attention shall be given in assessing

Document Number	Rev No.	Description	Page No.	Date of Issue

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[11]	25.09.2014

4. EARTHWORK AND ROCKWORK

4.1 General

This section applies to all earth and rockwork required for the replacement / refurbishment / retrofitting of existing foundations or construction of new buildings foundations (if any), any types of structure and burying service lines in the ground.

The Bidder shall satisfy himself as to the ground conditions on the site including the nature of the strata to be excavated, obstructions, possibilities of flooding and such like and shall allow for all provisions necessary to carry out the work in the most suitable manner when submitting his tender.

Generally, all buildings and structures must be founded on bearing strata which means that all excavation work for foundations shall meet the requirements of structural analysis based on the results obtained from the detailed soil investigation and of the available information and instruction given in writing by the Owner/Consultant.

Excavation shall be done to the required dimensions and shall be finished according to the specified lines and slopes, in a way acceptable to the Owner/Consultant. All necessary precautions shall be taken to cause the minimum possible alteration or disturbance to the other existing foundations, material lying under and adjacent to the excavation final lines.

4.2 Fill Materials

The fill materials used and source are to be examined and approved. Excavation materials can be used if they fulfil the requirements.

a) Select fill shall have the following properties:

Well graded (uniformity index not less than 5), non-cohesive and nearly silt free (silt content not greater than 5%; up to 10% tolerated, except below footings of structures), salt free (content less than 3%), soils free of organic matter (limit 2%). Decomposing or compressible materials shall not be used.

All materials shall be of such nature and character that it can be compacted to the specified densities in a reasonable length of time. It shall be free of highly plastic clays, of all materials subject to decay, decomposition or dissolution, and of cinders or other materials, which will corrode piping or other metal.

The intention is to use select fill below plinth, floors, roads, parking areas etc.

b) Ordinary fill shall have the following properties:

- Natural inorganic soils: salt content not greater than 5%, organic matter less than 3%. For other properties see under 'Select fill'.
- The intention is to use ordinary fill for non-built areas.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[12]	25.09.2014

c) Special fill:

- Special fill material shall be gravel or crushed rock (for other properties see under 'Select fill'). The intention is to use special fill e.g. as sub-base material for tanks.

4.3 Excavation

The works shall be excavated either by hand or by use of excavating plant and tools acceptable to the Owner/Consultant. Last 300 mm shall be excavated by hand tools only to ensure that natural conditions of soil at foundation level should not be disturbed. In case if over excavation has been done, the depth of soil over excavated shall be filled with M10 Grade concrete and no earth filling shall be allowed to fill over excavated earth.

Also excavation by hand may be required close to existing installations, existing foundations and/or underground services, but subject to special instruction of the Owner/Consultant.

The Bidder shall carry out all kind of earth and rockwork for the following particular works as defined hereafter (where applicable):-

- i) Clearing and grubbing
- ii) Excavation of topsoil
- iii) Open cut excavation
- iv) Backfilling
- v) Safety precaution during earthwork
- vi) Mining or underground excavation (if required)
- vii) Grading
- viii) Replacement of material
- ix) Trench excavation for service lines
- x) Embankments
- xi) Archaeological findings

4.4 Safety Precautions

The Bidder shall be responsible for all necessary safety measures.

Proper strutting, sheeting and bracing, including re-arrangement of the installations when necessary, stabilization and protection of slopes, methods of excavation to reduce risks of slides etc shall be to the Bidder's debit. The additional moving of soil resulting from such damages will not be paid for.

4.5 Over Excavation

Bidder shall ensure that no excavation work is carried out beyond the founding level of existing nearby building/equipment. Any damage to adjoining structure/ foundation shall be rectified by the Bidder without any extra cost to Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[13]	25.09.2014

4.6 Stockpiles and Disposal

Excavated material from the works selected by the Owner/Consultant for re-use shall be placed immediately in its final position, if possible, or otherwise may be stockpiled or deposited on site as directed by the Owner/Consultant

The Bidder shall not have the right either to additional payment or to claim because of work involved in stockpiling materials, re-use of for carting to the waste disposal areas. Soil unfit for re-use shall be removed to sites approved by the Owner and shall not be permanently deposited elsewhere. The Bidder shall trim and form the edges of spoil to profiles and levels as directed by the Owner/Consultant. . Distance of stockpiling of excavated material from the pit edge shall be minimum 1.5 meters or half of the depth of the pit whichever is higher.

The placing of materials within the waste disposal areas shall be made in layers not exceeding 0.50 m in thickness in order to obtain an appreciable degree of compaction by means of transportation equipment and/or if required by appropriate compaction equipment.

All traffic to or from the waste disposal areas shall run over the surface of such areas in order to achieve compaction.

4.7 Preparation of Foundation

All earth surfaces against which concrete is to be poured, shall be clean and free of any detrimental impurities, organic matter or unsuitable material. Immediately after excavation, all such surfaces shall be moistened and treated as directed by the Owner/Consultant and then protected by means of a lean concrete layer, 7.5 cm or PCC thickness as shown in the design drawings, whichever is greater. No concrete is to be poured until formation is inspected and approved by the Owner/Consultant. No structural concrete shall be poured against earth surface. Shuttering shall be used at sides and PCC shall be provided below foundations.

4.8 Backfilling

Foundations and structures shall be backfilled with approved material compacted in layers not exceeding 150 mm by suitable equipment upto the required designed levels. Compacting shall be carried out with special care by means of pneumatic or mechanical rollers or other compactors of a type previously approved by the Owner/Consultant.

Density requirements as per standard Proctor Test shall be in accordance with relevant parts of IS: 2720 and all tests shall be made by/on under the supervision of Owner/Consultant at Bidder's own expenses, at optimum moisture content:

- a) Backfilling of foundations and under grade slabs - 98%
- b) Under roadways and parking areas - 98%
- c) Embankment - 95%

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[14]	25.09.2014

The thickness of fill layers, number of passes and type of equipment to be used shall be proposed to the Owner/Consultant after compaction tests have been made.

Surfaces receiving fill layers shall, if smooth, be previously scarified to obtain a good key between the new fill layer and the sub-grade.

Backfilling of foundation work with approved materials shall be carried out only after foundations have been inspected by the Owner/Consultant.

4.9 Soil Replacement

The material to be used for replacement of soil shall not contain soluble or swelling components such as clays, or organic matters. Sand gravel mixtures of favourable grain size distribution shall be used in exchange. The suitability of soil for its use for filling shall be as per provisions of Indian Standards.

Prior to the commencement of work, three samples shall be taken from the anticipated borrow area and tested in respect of IS: 2720 or Proctor density, optimum moisture content, grain size distribution and content of soluble matters.

These three samples shall cover the approximate variation of materials to be expected within the borrow area.

The fill material shall be placed in horizontal layers of not more than 15 cm in compacted thickness. The fill moisture content shall be controlled and adjusted in order to achieve a maximum of compaction. Fresh water shall be used for watering of soils.

The fill material shall be compacted by vibratory roller (min. weight 20T.). However for small compaction works such as small patches etc., comparatively low weight compactors or other compaction methods may be used after taking approval from Owner / Consultant. The minimum required degree of compaction should be as defined under "Tests and Properties". One Proctor and three density tests shall be made at every fourth fill layer prior to continuation of filling work. The testing location will be indicated by the Owner/Consultant. Bidder shall make suitable arrangements for carrying out all the necessary quality tests or he shall co-operate with an experienced soil testing laboratory, subject to the approval of the Owner/Consultant

Filling work may be continued in case all tests performed show satisfactory results.

4.10 Pipe Bed Preparation

Pipe beds shall be constructed to guarantee the uniform transmission of loads. The bearing section for supported profiles shall cover at least an arc of 90°.

Pipes shall be bedded in an earth foundation of uniform density and carefully shaped by means of a template supported at the desired grade, to fit the lower part of the pipe exterior.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[15]	25.09.2014

Where rock in either ledge or boulder formation is encountered, it shall be removed below grade and replaced with suitable materials in such a manner as to provide a compacted earth cushion having a thickness under the pipe of not less than one quarter of outside pipe diameter with a minimum allowable thickness of 20 cm if not otherwise specified.

Where a firm foundation is not possible at the grade established due to soft, spongy or other unstable soil, all such unstable soil under the pipe and for a width of at least one diameter on each side of the pipe shall be removed and replaced with suitable selected materials as approved by the Owner/Consultant, properly compacted to provide adequate support for the pipe.

4.11 Protection of Existing Utilities and Services

During modification/rehabilitation of existing structures or construction of new structures, the Bidder shall provide all protection for existing utilities and services as may be required by his modification and construction operations. Permanent protection of certain items shall be as included under other sections or as instructed by the Owner/Consultant.

In addition to the requirements as specified, herein the Bidder shall comply with the following requirements:

- a) Use all necessary precautionary and protective measures required to maintain existing structures, utilities, services and appurtenances that must be kept in operation. In particular, the Bidder shall take adequate measures to prevent undermining of existing structures and utilities/services presently in service.
- b) Protect existing or new utilities and services where required by the Bidder's operations and/or as directed by the Owner/Consultant. The Bidder shall be responsible for bracing and supporting existing structures, utilities and services to prevent settlement, displacement or damage.

4.12 Dust Control

The Bidder shall use all means necessary to control dust on roads, dismantling/demolition and modification areas, construction areas and borrow pits.

Surfaces shall be regularly watered to prevent dust becoming a nuisance for the public and interfering with the proper execution of the works.

4.13 Dewatering during Construction

This division applies to the methods and techniques of ground water control. Prior to the decision for the method and technique to be applied, a comprehensive knowledge of the soil and ground water conditions have to be obtained from the results of the detail soil investigation and/or information given in writing by the Owner/Consultant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[16]	25.09.2014

Ground water control for keeping the construction pits dry shall be included in the Bidder's scope of work.

The method and technique shall be based on the IS: 3764.

The scope of supply includes removal of all equipment, plants, pipes, machinery, etc for modification /rehabilitation of existing foundations and re-installation of all equipment, plants, pipes, machinery, etc and its removal after completion including operation & maintenance of the equipment during the construction period.

Where necessary, cofferdams, sheet piles, pump sumps, equipment and channels, troughs, inlet gutters, pipes and any other works required for the water control and discharge shall be part of the scope of supply. The dewatering system shall be designed and installed in such a way that alterations and extensions can be made at any time throughout the operating time, if necessary. Reserve units shall be kept ready for service when failure of any of the installed units occurs.

The Bidder has to consider the possibility of a temporary failure of any pump, diesel engine and/or the electric power service and shall install emergency power units with sufficient capacity to feed the necessary power to the installed unit at the moment of failure. The Bidder shall submit to the Owner/Consultant, the detailed method of the envisaged pumping system for dewatering, the pump capacity and the standby reserve units. The Bidder shall adjust the system if required by the Owner/Consultant.

The Bidder must ensure that any dewatering works will not cause any interference to his own work and to those of other Bidders working elsewhere on site. Any damage occurring during the above mentioned period should then be made good by the Bidder at his own expense.

During the foundation works, the excavated areas, foundation levels, and pits are to be kept free of water down to at least *[0.50]* m below the foundation level.

4.14 Equipments

All equipments, instruments, machineries, tools, pipelines, etc required for execution of the water control shall be kept in good working condition throughout the operation period.

4.15 Execution

The Bidder shall keep records of all data of importance occurring during operation of the water control system. The records shall be submitted to the Owner/Consultant for information and checking every working day. For that purpose, the lowering of the water table shall be controlled by piezometers. The numbers and position of them shall be submitted to the Owner/Consultant's approval. The Bidder shall provide and maintain these piezometers at his own

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[17]	25.09.2014

expenses during the dewatering works or as long as the Owner/Consultant requires it.

Pump operations shall not be stopped nor pipes, channels and equipment for dewatering and water control removed or altered in any way, except with the express permission of the Owner/Consultant. The Owner/Consultant will stipulate the time of removal. Until then, the pumps and water drainage facilities shall be kept in proper working order without extra payment being granted.

Pump sumps and channels:

Provision of pump sumps and channels of the dimensions required for each particular case shall include all necessary excavation of any kind of soil above and under water, backfill and consolidation, sheeting, bracing, stiffening, sealing, scaffolding accesses, as well as the disposal of water and all auxiliary works.

Routing of channels or pipes for discharge water shall be such as not to impede or obstruct any of the other works and/or operations.

The same shall be applicable for pump sumps. Prior to the determination of any arrangement of pump sumps, the Owner/Consultant's approval shall be obtained.

Routing and location of water discharge lines shall be submitted to the relevant authorities and to the Owner/Consultant's approval.

Difficulties during dewatering:

The Bidder shall consider all difficulties and additional work due to the presence of unexpected ground water during subsequent construction work. Where it is possible to keep off or divert such water without special dewatering arrangements or where work can be carried out normally under or in water, such a method may only be applied after approval from Owner/Consultant has been obtained.

Ready for service condition:

The Bidder shall maintain ready for service and regularly clean all dewatering equipment and accessories and shall keep all access clear so that they can safely be used without risk of accident. Any recommendations made by the Owner/Consultant in this matter shall be carried out immediately.

Leakage:

Blockouts and pipe connections through structures and their closure, proper grouting of joints, etc or repairs in the event of leakage shall be the responsibility of the Bidder.

Piezometers:

The ground water lowering effect is to be checked by piezometers in unfavourable positions (e.g. in the middle of the building pit) before starting the excavation. The piezometers are to be installed at unfavourable positions or in

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[18]	25.09.2014

more permeable layers (in stratified sub-soil) below the bottom of the excavation. They serve to check whether or not the water pressure (head) has been sufficiently reduced in those layers below the bottom of the excavation, which are more permeable. Security against hydrostatic uplift is to be demonstrated by calculation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[19]	25.09.2014

5. REINFORCED CONCRETE STRUCTURES AND FOUNDATIONS

5.1 General

All structures, building foundations, machines / equipment foundation, water retaining structures, trenches, pits, etc. shall be checked / designed as per latest relevant IS codes in general. Construction in general shall follow provisions of IS: 456 and IS: 3370 for normal and water retaining structures respectively.

5.2 Design Methodology

a) General

All designs of RCC structures shall be carried out by limit state method as per IS: 456 unless use of working stress method is specifically mentioned. Design strength of materials and design loads shall be calculated using appropriate partial safety factors over characteristic strength and characteristic loads as per IS: 456.

IS: 11384 shall be followed for design of steel concrete composite beam.

For reinforcement detailing IS: 5525 and SP: 34 shall be followed.

The walls shall be provided with reinforcement on both faces for sections 150 mm or more, even if not required from design consideration.

b) Foundation and Underground Structures

Type of foundation system, i.e. isolated, strip, raft shall be decided based on the loading arrangement, load intensity and soil strata. Design of foundations at various levels shall be dependent upon the soil bearing capacity at that level.

Foundation system adopted shall ensure that settlement / relative settlement is as per provision of IS: 1904 and other Indian Standards. However, the settlement shall be restricted to a lower value, if necessary as per the system requirement.

All foundation including machine / equipment foundations shall be of RCC construction. All foundations shall be designed in accordance with relevant parts of the latest revisions of Indian standards IS: 2974 and IS: 456. Raft foundations shall be designed as per IS: 2950.

All foundations shall be treated as per the guidelines prescribed in IS 456: 2000 against sulphate/other aggressive chemicals if found present in soil or as per the requirements of detail Geotechnical Investigation Report.

For design of underground structures, subsoil water level shall be assumed at Finished Ground level. All underground pits, tunnels, basements, cable and pipe trenches, etc. shall be designed as leak proof RCC structure, where depth of ground water table so warrants. In case of leakage in the above structures injection grouting method shall be applied to repair the structure according to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[20]	25.09.2014

the requirement of IS: 6494. Effects of uplift and reduction in bearing capacity due to underground water table shall also be considered.

For Subsoil conditions, Average ground water table, Foundation system, Earth Pressure Coefficient, refer to detail geo-technical investigation report of the site.

The soil conditions met during the foundation works especially in the foundation level are to be checked by the Bidder's soil Engineer, recorded and compared with previous known or investigated results. If essential differences occur, which could be detrimental to the structures, the Bidder has to inform the Owner/Consultant and to propose further measures. Foundation works in such areas are to be continued only after approval of such measures by the Owner/Consultant

If there is any doubt about the soil quality or if discrepancies appear with regard to the previous decisions or investigations stated by the Owner/Consultant, then additional measures are to be taken after consulting the Owner/Consultant (e.g. additional excavation and lean concrete fill)

Allowable settlements, elastic plus consolidation, shall be limited as follows: -

- i) Total settlement : 38 mm
- ii) Differential settlement : 6 mm

Foundations for equipment shall be designed to meet the total and differential settlement established by the equipment manufacturer if they are more stringent than the allowable settlements listed above. Foundations for buildings shall be designed to meet the total and differential settlement as required for the building function if they are more stringent than the allowable settlements listed above.

c) Movement and Expansion Joints

Joints are to be arranged in such a way that stresses and strains caused by settlements, temperature, differential settlement, etc do not adversely affect the structures. This primarily applies to differently loaded areas and structures having different foundations or foundations of different depths. The settlement joints shall run through the complete structure down to foundation level, the expansion joints however shall stop on the top level of foundations.

The joint width is to be at least 2 cm is to be planned considering all relevant factors (settlements, tilting, movements, aspects etc.).

Settlements of all relevant structures shall be measured, recorded and shown in diagrams according to IS: 8009 – "Code of Practice for calculation of settlement of foundation".

d) Foundations at Different Depths

Foundations at different levels should be based beyond a load-spread angle of 30° (against the horizontal). Otherwise, the load influence (e.g. earth pressure) of the higher-level structures on the lower ones must be taken into consideration.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[21]	25.09.2014

e) Replacement

If unsuitable soils are encountered below the grade slabs or basement floor, they are to be replaced by suitable layer wise compacted material down to the good bearing soil.

Materials and compaction method as well as quality control are described in clause 'Earth and Rockworks' of this section. Selected fill is to be employed below all grade paving and basement floors.

f) Liquid Retaining Structures

RCC water retaining structure like storage tanks shall be leak proof and designed as un-cracked section in accordance with IS: 3370 (Part 1 to IV) by working stress method. However the parts of such structures not coming in contact with liquid may be designed according to IS: 456.

Water channels and substructure of pump houses shall be designed as cracked section with steel stresses as per IS: 3370 (Part 1 to IV) by working stress method and limiting crack width to 0.2 mm.

All water retaining / storage structures shall be designed assuming liquid upto the height of wall irrespective of provision of any over flow arrangement. No pressure relieving devices shall be permitted in underground structures.

In all liquid retaining structures, PVC water bar shall be provided at each construction / expansion joint. The sequence of construction shall also be specified on drawings showing construction joints.

The walls shall be designed for a surcharge load of 2000 Kg/m² or actual whichever is higher.

Liquid Retaining Structure shall be checked for two loading conditions. With water inside up to operating level and no earth fill outside or water in one compartment and no water in the other compartment (where two compartments are provided).

Base slab / raft of all liquid retaining structure shall be designed to withstand the uplift pressure.

g) Modification of the existing foundation (as required) for the new equipment supplied

The new equipment shall be supported on an RCC deck which in turn shall be supported over steel helical springs and viscous dampers. The steel helical springs and viscous dampers shall be supported over structural steel beams which in turn shall rest over columns. The columns shall be supported over foundation. The modification of existing foundation may involve partial to full dismantling and reconstruction of new foundation as per design & constraints of space.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[22]	25.09.2014

Precautions shall be taken not to disturb the basic building structure & other foundation and it shall be ensured that no excavation work is carried out beyond the founding level of existing nearby building/equipment. Any damage to adjoining structure/ foundation shall be rectified by the Bidder without any extra cost to Owner.

The contractor shall be responsible for maintaining all safety norms including the stability of existing structures. Any propping, shoring and under pinning required to this effect shall be put in place before the dismantling work is undertaken.

Wherever any existing concrete member is required to be partially dismantled, a coat of epoxy paint shall be applied to the exposed reinforcement and the cut surface of concrete shall be built up by providing 40 mm thick concrete with wire mesh.

h) Machine Foundations

General

Design of equipment foundation for block type machine foundation (if any) shall be done for the actual equipment loading data. The foundation arrangement shall be decided keeping in mind the existing structural arrangement and space limitation.

The design of machine / equipment foundation shall be as per IS: 456 and IS: 2974. The provisions of DIN 4024 shall also be followed for machine foundations. All machine / equipment foundations and structures subject to vibrations shall be suitably proportioned so that amplitude and frequency of the foundation / structures are within permissible limits.

Dynamic analysis shall be carried out to calculate natural frequencies in all modes including coupled modes and to calculate vibration amplitudes. Frequency and amplitude criteria as laid down by the relevant codes or machine manufacturers shall be satisfied. Minimum reinforcement shall be governed by IS: 2974 and IS: 456.

For the foundations supporting minor equipment weighing less than one ton or if the mass of the rotating parts is less than one hundredth of the mass of the foundation, no dynamic analysis is necessary. However, if such minor equipment is to be supported on building structures, floors, etc. suitable vibration isolation shall be provided by means of springs, neoprene pads, etc. and such vibration isolation system shall be designed suitably. All such foundation shall be separated from adjoining part of building and other foundations. Joints at floor/ slab shall be suitably sealed. All appendages to such foundations shall be reinforced suitable to ensure integral action.

The extent of foundation shall be based on the general arrangement of the equipment and the design requirement. However minimum width of any foundation shall not be less than one meter. Water table has to be considered at finished ground level for design of all foundations.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[23]	25.09.2014

Suitable arrangement shall be made for prevention of transmission of vibration from the proposed foundation to the nearby structure/ foundation/ paving slab.

All design calculations and drawings shall be submitted to Owner for approval.

In case any modification to any existing nearby structural steel bracing/support system/ concrete work is required, the contractor shall check the adequacy of the design of the existing structures for the new loads. Suitable modification to the existing structure as required shall be carried out by the contractor.

Loose pockets if any found below the foundation shall be removed and filled up with PCC of grade M10.

Loads

All static and dynamic forces / loads which equipment supplier considers applicable shall be considered for analysis and design of machine foundations.

Foundation Sizing

The outline plan dimensions of foundations as given by the machine supplier will be adopted. The height of foundation will be selected after taking into consideration soil strata and operating level of the machine. The eccentricity of common CG of machine and foundation with respect to the centroid of base area should not exceed 5 % of the corresponding base dimensions of foundation. Partial contact between the foundation and soil strata shall be considered wherever applicable. The footing will be checked for minimum contact area of 80 % and maximum bearing pressure will be calculated for the actual contact area only.

Analysis and Design

The minimum grade of reinforced cement concrete shall be M25, unless specified otherwise.

The analysis and design of machine foundations will be carried out to ensure the following:

- Compliance with the manufacturer's requirements and relevant standards
- No resonance phenomenon of a disturbing nature to machine operation should exist at the normal running speed
- Calculations to be performed for dynamic as well as static cases for reinforced concrete block type pedestal
- Soil bearing capacities
- Deep foundation capacities
- Lateral earth pressures
- Allowable settlements
- Structure, equipment and environmental loadings
- Equipment performance criteria
- Access and maintenance requirements

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[24]	25.09.2014

- Temporary construction loadings

The foundation will be designed for the most critical combinations of forces and moments, resulting from all possible combinations of the various loading from the equipment system. The foundation sections will be sized and reinforced adequately for bending moments and shear stresses and uplift.

The foundation shall be checked for overturning, sliding and uplift as per relevant IS Codes. The foundation will be checked for overturning with minimum and maximum vertical loads.

For analysis of machine foundation following data will be furnished by the equipment manufacturer:

- Loading diagram showing static and dynamic loads and points of application of loads
- Operating speed of machine
- Weight of rotating parts, maximum eccentricity of rotating mass from the geometric axis of rotation
- Location of C.G. of machines in all three axis
- Mass moment of inertia
- Allowable amplitude / velocity of vibration at machine bearing points
- Temperatures at various areas during operation

While designing following aspects shall also be taken care of:

- All dynamic foundations shall be isolated from building foundations. The isolation gap shall be of minimum 25 mm.
- Natural frequencies of structures and components shall be away from running speed of equipment by at least 20 % generally but for important ones it shall be away by at least 30 %.
- For design of foundation of large fans etc., provision shall be kept in the foundation for addition of mass / area for retaining of the foundations if required at a later date

However following minimum factor of safety shall be followed:

- Factor of safety against overturning due to wind, seismic or other lateral loads shall be 1.5
- Factor of safety against sliding shall be 1.5
- Factor of safety against uplift due to hydrostatic forces shall be 1.2 and due to any other loads shall be 1.5. Uplift check shall be carried out during construction stage also.

For miscellaneous machines, most suitable type of foundation shall be provided. Foundation for pumps, and minor rotating equipment etc., are usually in the form of solid block foundations, resting on the ground or on a floor of the building. At such machine supports, floor may be thickened and extra reinforcement may be provided. Also the machines, which are almost vibration free, light to moderately heavy, may be supported in the above manner. Rubber

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[25]	25.09.2014

or neoprene pads under some of these machines to reduce transmission of vibrations to the supporting floor will be provided if required.

All block foundations resting on soil shall be designed using the elastic half space theory. The mass of the RCC block shall not be less than three times mass of the machine. Dynamic analysis shall be carried out to calculate natural frequencies in all modes including coupled modes and to calculate vibration amplitudes. Frequency and amplitude criteria as laid down by the relevant codes or machine manufacturers shall be satisfied. Minimum reinforcement shall be governed by IS: 2974 and IS: 456. Suitable vibration isolation shall be provided by means of springs, neoprene pads, etc. and such vibration isolation system shall be designed suitably. All such foundation shall be separated from adjoining foundations.

Temperature Control of Concrete

The temperature of fresh concrete shall not exceed 25°C when placed. For maintaining the temperature of 25°C in the top decks of machine foundations, crushed ice shall be used in mixing water.

Non-Shrink Grout for Equipment Foundations

Special non-shrinking grout of approved make shall be provided in strict accordance with the manufacturer's instructions / specifications. Ready mix non-shrink grout of GP2 brand or equivalent, of approved make shall be used for base grouting of major rotating equipments.

i) Increase in Stresses

Where stresses due to wind (or seismic) and temperature are combined with those due to other loads, the allowable stresses in concrete and reinforcement steel shall be increased by 33.33% in case of working stress design.

Bearing capacity of the soil shall be allowed to be increased by 25 % under seismic/ wind load condition.

j) Elevated Foundations

Design of all equipment foundations shall be done for the actual equipment loading data. The foundation arrangement shall be decided keeping in view the existing structural arrangement and space limitation. Adequacy of the design of the existing structures, for the new loads shall be, checked by the contractor. Suitable modification as required shall be carried out by the Contractor and complete design for the same shall be furnished to owner for approval. Where ever new columns/foundation is required the same shall be designed and constructed by the contractor as per relevant Indian Standard Code.

For the foundations of the all equipments details static and dynamic analysis shall be done. The static analysis shall include all operating condition, load cases and abnormal loads like short circuit, loss of blades & unbalance and seismic forces as per 18:1893. The dynamic analysis shall consist of free vibration

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[26]	25.09.2014

analysis and forced vibration analysis. Design of RCC foundations/as well as structures, checking of design of existing structure shall be carried out by working stress method. A fatigue factor of 2.0 shall be considered for dynamic forces.

The foundation general arrangement shall be such that the spring units are placed over the structural steel beams. The isolation efficiency for steel helical springs and viscous dampers shall be at least 90%. The vibration amplitudes at the bearing locations shall not exceed the limits as per VDI 2060 or limits specified by the machine supplier whichever is more stringent. The ratio of actual spring supported weight to the nominal spring capacity shall not exceed 0.80. At least 3% to 5% of critical damping shall be provided in the form of viscous dampers.

The grade of concrete for the top deck shall be M35.

k) Steel Helical Springs and Viscous Dampers

The supporting structural beam and columns shall be designed for the loads transferred through springs and all other loads such as piping loads, seismic loads as per IS:1893. The stiffness of the beams supporting the springs shall be at least 10 times the stiffness of the springs supported over it along both vertical and horizontal direction.

The scope of work shall be deemed to include all activities which may not have been explicitly mentioned but are reasonably implied for the successful completion of the work for which these specifications are intended.

Scope of work of the bidder shall include manufacturing, testing, supply, transport to site, pre-stressing, erection, supervision of erection, release of pre-stress, alignment, commissioning etc of Steel helical springs and viscous dampers:

- Steel helical spring units and viscous dampers along with viscous liquid including associated auxiliaries for installation of the spring units and dampers like steel shims, adhesive pads, etc.
- Frames for pre-stressing of spring elements.
- Suitable hydraulic jack system including electric pumps, high- pressure tubes etc. required for the installation, alignment etc, of the spring units. One set of extra hydraulic jacks, and hand operated pumps shall also be provided.
- Any other items which may be required for the complete installation and satisfactory commissioning of the spring system.

Supervision of complete erection and commissioning of the steel helical springs and viscous dampers including pre-stressing of elements, placing of elements in position, checking clearances on the shuttering of the RCC top deck, releasing of pre-stress in spring elements and making final adjustments and alignments after machine installation etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[27]	25.09.2014

The steel helical springs and viscous dampers supplied should be of proven make. The bidder or his sub-contractor should have designed spring supported machine foundations, manufactured, supplied and installed steel helical springs and viscous dampers (conforming to DIN 2096 & DIN2089) and viscous dampers (providing damping resistance in all three planes) for not less than 2 (two) machine foundations of heavy rotating machine systems.

The damper units or spring-cum-damper units should be of viscous type offering velocity proportional damping. The damper units should be suitable for temperatures ranging from 0 to 50°C. The damping resistance of individual damper units should be such that the designed damping can be provided using reasonable number of units.

All design calculations and drawings shall be submitted to Owner for approval.

5.3 Stability of Structures

Design shall be checked against buoyancy due to the ground water during construction and maintenance stages for structures like underground storage tanks, pits, trenches, basements, etc. Minimum factor of safety of 1.2 against buoyancy shall be ensured considering empty condition inside and ignoring the superimposed loading. For the purpose of calculating downward load due to any overburden, only the mass located vertically above the projected area of the base slab shall be taken in to consideration.

All building sub-structures including pump houses shall be checked for sliding and overturning stability during both construction and operating conditions for various combination of loads. Factor of safety for these cases shall be taken as mentioned in IS: 456 and other latest relevant IS codes. However following minimum factor of safety shall be followed:

- Factor of safety against overturning due to wind, seismic or other lateral load shall be 1.5 minimum
- Factor of safety against sliding shall be 1.5 minimum
- Factor of safety against uplift due to hydrostatic forces shall be 1.2 and due to any other loads shall be 1.5

Stability of the structure shall also be investigated for loading conditions during construction, repair or other temporary measures. Lower factor of safety may be used for such loading conditions as per relevant IS codes.

In cases where dead load provides the restoring force, only 0.90 times characteristic dead load shall be considered. Imposed loads shall not be considered as restoring force.

5.4 Minimum Thickness of Concrete Structural Elements

The following minimum thickness shall be followed:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[28]	25.09.2014

Table 2.5
Minimum Thickness of Concrete

S.No	Description	Thickness, mm
a)	Suspended floor / slab / walkways /canopy slabs, etc.	125
b)	Ground floor slab (non-suspended)	150
c)	Water Retaining slabs / walls	200
d)	Cable/pipe trenches/underground pits/Laundry walls and base slab	125
e)	All footings (including raft foundations)	300
f)	Parapets	125
g)	Sunshades	75 at edge
h)	Precast louvers / fins	50
i)	Precast trench cover slabs / floor slabs / louvers	75
j)	Paving	100
k)	Basement walls and base slab	200
l)	Bin Walls	150
m)	Underground tank:	
	Below ground water table	200
	Above ground water table	150

From fire resistance point of view minimum cover to reinforced concrete members shall be as per Table 16A of IS: 456.

5.5 Minimum Heights for Pedestal of Steel Columns

Pedestals to Steel Columns for building structures:

Top of RCC foundations (pedestals) shall normally be kept at a minimum [250 mm] above finished floor level (FFL) unless specified otherwise. Foundation levels for columns shall be decided to accommodate underground services, pits, trenches, etc.

Stair and ladder pedestal shall be kept [200 mm] above the finished floor level.

Pedestals to Steel Columns for Equipment structures:

- a) Equipment in open area : as required [(300 mm min)]
- b) Equipment in covered area : as required [(150 mm min)]
- c) Structures and equipment
Supplied by vendor : as per vendor's data subject to minimum as specified above.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[29]	25.09.2014

5.6 Minimum heights for encasement of steel columns

In case the top of pedestal is kept at a lower level so that the column base plate together with gussets and stiffeners remain below finished floor level (FFL) the column bases as well as the column sections shall be encased in concrete above FFL as per following:

- a) Open area : [300 mm] above paved level
- b) Covered area : [150 mm] above FFL

5.7 Concrete Works

i) General Description, Proportions and Mixing

Mix Design

At the commencement of the contract the Bidder shall make preliminary tests to determine the proportions by weight of cement, fine aggregates, coarse aggregates and water necessary to produce required grades of concrete. The mix proportions shall be selected to ensure that workability of the fresh concrete is suitable for the conditions of handling and placing and when concrete hardens, it shall have the required strength, durability and surface finish. The Bidder shall get approval of Owner/Consultant to such proportions before he starts concreting. However, such approval shall not relieve the Bidder of his responsibility to produce concrete having compressive strengths as laid down in the foregoing Table.

No departure from the approved proportions will be permitted during the works unless and until the Owner/Consultant gives written authorisation for any change in proportion. The Owner/Consultant shall have authority at any time to check whether the mixing of concrete is being carried out according to the approved proportions.

For the all major and important R.C. works and for all special works, the design of mixes shall be made by the Bidder at his own cost, for each grade of concrete as well as for various workability. The design of mixes shall be made according to I.S. 10262 or any other approved standard methods.

The concrete made by designing the mix is termed hereinafter as "Design Mix Concrete".

The cement content for various grades of concrete shall be based on design mix. However, irrespective of requirement of cement found out from design mix, cement content of concrete shall not be reduced below the quantities specified as under.

Grade of concrete	Minimum cement content per Cu.m finished concrete
M-15	290 kg
M-20	320 kg

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[30]	25.09.2014

M-25	380 kg
M-30	not less than 400 kg
M-35	not less than 400 kg

Water Cement Ratio

Where a particular water cement ratio is stipulated in the design or drawing along with the characteristic grade of concrete the design of mix shall be carried out by adjusting the other variable factors to obtain the characteristic strength of concrete with stipulated water cement ratio.

In the structures where the impermeability and shrinkage of concrete have an important bearing on the durability and serviceability of the structures, such as water retaining structures, basements, underground premises, tunnels, pump houses, pre-stressed structure, thin precast members etc. the water cement ratio shall be kept low and preferably not exceeding 0.45.

The water cement ratio, as achieved in the Mix Design, or as specified in the drawings shall be adhered to strictly and shall not be varied without the permission of the Owner/Consultant.

Workability

The workability of fresh concrete shall be such that the concrete is just suitable for the conditions of handling & placing so that after compaction it becomes completely consistent and homogeneously surrounds all the reinforcement and completely fills the formwork.

The workability of fresh concrete at the place of batching/mixing shall be measured by compacting factor test and at the place of disposition by means of slump test. During the finalisation of Trial Mixes, the relationship between compacting factor and slump test shall be established for each grade of concrete as well as for various levels of workability. The workability tests shall be carried out in accordance with IS:1199.

Normally, in the condition of low water cement ratio as well as for medium/high workability, the workability shall be achieved by increasing the cement content, in consistent with added water.

In cases where the cement content is to be limited to reduce the heat of hydration, and the water/cement ratio is also to be kept low to reduce the permeability or due to other requirements the desired workability may be achieved with use of limited doses of plasticiser or air entraining agent. In such cases the method of mixing and dosage of the plasticiser/air entraining agent shall be according to the manufacturer's specification and with the approval of the Owner/Consultant.

The usual limits of consistency for various types of structures are given below:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[31]	25.09.2014

Limits of consistency

Degree of Workability	Slump in mm with Standard - Cone		Use for which concrete is suitable as per IS : 1199
	Minimum	Maximum	
Very low	0.0	25.0	Large mass concrete structure with heavy compaction equipment, roads and the like.
Low	25.0	50.0	Uncongested wide and shallow R.C.C structures
Medium	25.0	75.0	Deep but wide R.C.C structures with congestion of reinforcement and inserts
High	75.0	125.0	Very narrow and deep R.C.C structures with congestion due to reinforcement and Inserts

Durability

The durability of concrete, depending on the exposure condition, is to be taken into account while designing the mix. For given aggregates, the cement content should be sufficient to make sufficiently low water cement ratio and Appendix A of IS: 456 shall be taken as guideline for durability considerations.

Minimum fire rating of 2 hours shall be considered where fire hazard is expected and accordingly minimum cover shall be taken as per Table 16 A of IS: 456. For structures below ground level which are exposed to sulphate attack, requirement of cement shall be as per Table 5 of IS: 456. Intermixing of different grades of concrete in the same structure shall not be allowed in a particular element.

Mix design concrete shall be used for all areas other than plain concrete work used for lean concrete, screeds and backfill.

The following minimum grades of concrete as per IS: 456 shall generally be used for the type of structures noted against each grade.

Table 2.6
Grades of Concrete

Concrete mix/Grade	Type of structure
1:5:10	Fill concrete
1:4:8	Blinding layer below foundations, trenches and underground structures, foundation below brick wall, etc. Minimum thickness of layer shall be 75 mm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[32]	25.09.2014

Concrete mix/Grade	Type of structure
M15	Plinth protection work around buildings
M25	Base plate encasement, encasement of structural steel work, all RCC paving work, ground floor slabs, cable and pipe trenches, precast concrete work etc.
M30	All RCC structures and equipment foundations, super structure, grade beams, columns, roof slabs and all underground RCC structures, cable and pipe rack foundation, pedestals etc.

Inter mixing of different grade of concrete in the same structure shall not be allowed normally.

ii) Trial Mixes

- Before concreting commences, the Bidder shall, at his own expense, make trial mixes to determine the mix proportions required to produce the strengths specified for each class of concrete and for each degree of workability required to allow placing, transporting and compacting of the concrete with the equipment he proposes to use in any particular situation. Only materials which the Bidder intends to use for concreting (including all admixtures) shall be used in the trial mixes.
- Test cubes from trial mixes shall be made and tested in accordance with IS: 516.
- As per IS: 456 and IS: 516, three separate batches of concrete should be made, workability of each batch determined and three test cubes shall be made from each batch for each age (e.g. for 7 and 28 days) at which tests are required. The strength shall conform to target mean strength as per IS: 456 – Requirements for design mixes.
- The appropriate strength requirements may be considered to be satisfied if none of the strengths of the cubes is below the required characteristic strength and if the average strength of the nine cubes is not less than recommended by IS: 456 and IS: 516, trial mixes.

iii) Quality and Testing

Not more than 5% of the test results may fall below the 28 days specified strength. Making and curing of test specimens shall be in accordance with relevant IS: 456, IS: 516 and IS: 1199.

All mixes can only be placed following approval by the Owner/Consultant. The mean strength shall exceed the characteristic strength by a margin of 1.65 times the standards deviation expected from the batching plant. However, no standard deviation less than 3.5 N/mm² shall be used as a basis for designing a mix.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[33]	25.09.2014

iv) Trial Mixes and Field Tests

Sufficient laboratory trial mixes shall be prepared to show that concrete complies fully with the specified performance criteria. The following tests are to be included:

- Air content < 1%
- Slump: Piles 170 + 25 mm, regular work 80 + 20 mm as per IS: 1199
- Fresh and hardened concrete densities
- Field trial mixes shall be carried out under full-scale site conditions as per IS: 4925 (for structural concrete only).
- Where directed by the Owner/Consultant, concrete incorporating reinforcement details shall be cored to assess stratification of mixes. Cores of 150 x 200 mm (diameter and length) shall be used.
- Each trial mix shall have 9 x (150 x 150 x 150 mm) cubes taken to measure 24 hours/7 days and 28 day compressive strengths. These trials shall be run for three consecutive days (for structural concrete only).
- At least 3 x sets of field trials shall be tested according to the provisions laid down in laboratory testing.
- The average 28 day characteristic strength for trial mixes shall be as per IS: 456. Failure to comply shall result in the mix having to be re-designed.
- All test results shall have to be complied before approval can be given.

v) Consistency of Concrete

The amount of water used in the concrete shall be adjusted as required to ensure such a consistency that it can be readily transported, placed and compacted without segregation of the materials or bleeding of free water at the surface. Addition of water to compensate for stiffening of the concrete before placing shall not be permitted. Consistency of the concrete shall be checked by slump tests measured in accordance with IS: 1199 and shall not exceed the values given in clause 7.1 of IS: 456-2000.

vi) Mixing of Concrete

- The cement and aggregate shall be thoroughly mixed in a batch-type pull mill mixer. The capacity of the mixer shall not be less than 1 (one) cubic meter and the total capacity of the batching mixing plant shall be such to accommodate the various concrete quantities to be cast in a continuous way and shall comply with the requirements of IS: 456, IS: 1791 and IS: 12119.
- The water shall not be added until all the aggregate and cement are in the drum. Mixing shall continue until the concrete is uniform in colour and for not less than 2 (two) minutes after all the materials and water are in the drum.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[34]	25.09.2014

- Partly set or excessively wet concrete shall not be used. No concrete shall be mixed by hand.

Bidder shall make suitable arrangements for carrying out all the necessary quality tests and ensure that testing work shall be carried out in compliance with the standards..

5.8 Strength of Concrete

i) Testing of fresh concrete by means of test cubes

- All test cubes shall be made and tested for compressive strength in accordance with IS: 456, IS: 516 and IS: 1199.
- The minimum required strength for different classes of concrete shall be as shown in clause "General description and proportions and mixing" here above.
- The grade of concrete required will depend partly on the particular use and the characteristic strength needed to provide the structure with adequate ultimate strength and partly on the exposure conditions and the cover provided to any reinforcement.
- A minimum of four test samples (of six test cubes each) shall be taken on each concreting day (from the same mix) and for at least each 40 m3 of concrete mixed. At least one sample shall be taken for each shift.
- For columns, beams and cantilevers seven (7) cubes for every 15 m3 of concrete poured shall be taken. The concrete for test samples shall be taken directly from the concrete mixer and shall be handled (vibrated etc) under similar conditions to those prevailing during the construction. The moulds for the test cubes shall be made of steel. Tests shall be carried out in an approved laboratory.
- The strength level of each type and each strength concrete will be evaluated separately and the concrete strength will be considered satisfactory if:
 - Compressive strength: The concrete shall be deemed to comply with the strength requirements when both the following conditions are met:-
 - The mean strength determined from any group of four consecutive test results complies with the appropriate limits in column 2 of table 11 of IS: 456.
 - Any individual test result complies with the appropriate limits in column 3 of table 11 of IS: 456.
 - Flexural strength: When both the following conditions are met, the concrete complies with the specified flexural strength:-
 - The mean strength determined from any group of four consecutive test results exceeds the specified characteristic strength by at least 0.3 N/mm².
 - The strength determined from any test result is not less than the specified characteristic strength less 0.3 N/mm²..

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[35]	25.09.2014

- g) If the results are less than those specified, the Owner must suspend all concreting work and order further tests. Any concrete found not to comply with the specification shall be broken out and replaced to the satisfaction of the owner.
- h) The Bidder shall pay all costs incurred in making, curing, delivering and testing of concrete cubes.

ii) Testing of concrete in structures

- a) The types of tests described hereinafter are applicable to the finished parts of the structures. They may be used in routine inspection and for quality control.
- b) Type of tests:
- Cutting cores: The procedure used shall comply with the requirements of IS: 516 or an approved equivalent standard.
 - Gamma radiography: The testing shall be carried out in accordance with the requirement of IS: 13311, part 1 or equivalent.
 - Ultrasonic test: Such tests may be used to obtain approximate indications of the strength of the concrete in the structures (IS: 13311, part 1).
 - Electromagnetic cover measuring devices: Such tests may be used to verify the position of the reinforcement and shall be in accordance with the requirements of design (IS: 13311, part 1).
 - Rebound hammer test: Such tests may be used to obtain approximate indications of the strength of the concrete (Ref. IS: 13311, part 2).
 - Load tests of structures or parts of structures: If the results of the above mentioned check tests show that the quality of the materials is inadequate or if other defects are revealed, the owner may require a loading test to be made.
- c) For the purpose of testing floors, roofs and similar structures and their supports, the test load shall be equivalent to the sum of the characteristic dead load and one-and-a quarter times (1.25 times) the characteristic imposed load for a period of 24 hours which the works or part thereof to be tested have been designed.
- d) Wherever certain procedures for testing of parts in structures are required by standards or codes of practice, these are to be followed. All tests must be conducted in the presence of the Owner/Consultant.
- e) If within 24 hours of removal of the imposed load, the structure does not recover at least 75% of the deflection under superimposed load, the test may be repeated after a lapse of 72 hours. If the recovery is less than 80%, the structure shall be deemed to be unacceptable.
- f) If the result of the test is not satisfactory, the Owner/Consultant shall instruct that the part of the works concerned be taken down or cut and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[36]	25.09.2014

reconstructed to comply with this specification. The Bidder shall at his own cost take down or cut out and reconstruct the defective work.

- g) The Owner/Consultant may require other tests to be made. Number of samples, tests and types will be as per Owner requirements.
- h) All the costs for the above mentioned tests shall be borne by the Bidder.

5.9 Materials

a) Storage of materials

All materials shall be stored and handled in a manner that will prevent contamination and/or deterioration. Storage of materials shall conform to IS-4082 "Recommendation on stacking and storage of construction materials and components at site". Deteriorated and/or contaminated material shall not be used for the concrete and shall be removed from the site at the expense of the Bidder.

b) Cement

OPC/PPC Cement of reputed make conforming to relevant codes, shall be used for all Concreting works and the certificate of manufacturer shall be furnished with each batch. Cement used shall be ordinary Portland cement unless the chemical nature of the soil warrants special cement for structures below ground level.

Sampling and Testing of Cement

- All deliveries of cement to the concrete supplier shall be accompanied by a certified mill test report and shall include all of the physical and chemical properties as required by relevant IS: 8112 for grade 43 and IS-12330 for sulphate resistant cement.
- The manufacturer's test certificate will normally be accepted as proof of compliance with the specification, but the Owner may order further tests of a character specified in the appropriate Indian standards. The confirmatory tests are to be conducted by a recognized quality control organization. The Bidder shall bear all expenses required for the preparation, dispatch, and tests of the samples. In case the results of such tests show any sample to be inferior to specifications, the whole consignment from which the sample was taken shall not be used and shall be immediately removed from the site.

Delivery and Storage of Cement

- The following information shall be provided for all cement shipments (either whole or part) which are intended for delivery to site: date of manufacture, date of original loading, destinations en-route, date of unloading, intended date of delivery to site.
- The Bidder shall obtain and provide to the owner the manufacturer's average test certificate for each consignment of cement to the works.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[37]	25.09.2014

- The certificates shall be provided before the consignments are required for use and shall show the chemical composition and physical properties determined in accordance with the relevant standard.
- Samples shall be taken from each consignment of cement and tested as directed by the owner in an approved independent laboratory.
- Consignments shall be used in the order in which they were delivered.
- Bagged cement shall be stored in a weatherproof building having dense impervious bituminous or concrete floors which shall be kept swept clean at all times. The storage arrangements shall be fully completed and approved by the owner before any cement is delivered to site.
- Each consignment of cement shall be separately stored for ease of access, identification, inspection and sampling. Sufficient stocks shall be maintained on site to ensure the proper progress of the works and the stock holdings shall be to the approval of the owner.
- No cement from any consignment shall be used in permanent works without the approval of the owner.
- Cement which contains air-set or hardened lumps, re-powdered air-set material, foreign matter or which has been contaminated or is otherwise unsatisfactory in the opinion of the Owner/Consultant will be rejected and shall be removed from site without delay.
- The Bidder shall be responsible for satisfying himself that the performance characteristics of cement are not such as to necessitate excessive cement content or be likely to cause or accentuate any undesirable properties in the fresh or hardened concrete notwithstanding apparent compliance with this specification.

c) Reinforcing steel

General

Reinforcing steel used in reinforced concrete shall comply with the following standards:-

Deformed bars shall be of grade Fe500 and conform to IS: 1786.

Mild steel shall conform to IS: 432.

Mesh reinforcement shall conform to IS: 1566.

Binding wire

Binding wire for general use shall be annealed wire 16/18/20 BWG conforming to IS 280. The number of strands shall be as per IS specification.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[38]	25.09.2014

Reinforcement supports

- Reinforcement supports shall include all spacers, chairs, ties, slab bolster, clips, chair bars, and other devices for properly assembling, placing, spacing; supporting, and fastening the reinforcement.
- Spacers shall be cast from concrete of the same quality as that in which they will be embedded.
- Concrete block spacers shall be cast in metal moulds with an approved means of separating blocks and of ensuring that the blocks are of the proper size.
- Binding wire shall be incorporated into the blocks to enable them to be securely attached to vertical or horizontal bars and the Bidder shall demonstrate both that the blocks are of the requisite strength and that the means of attachment to the reinforcement are adequate.

Certificates

Each consignment of steel reinforcement shall be accompanied by a test certificate from the manufacturer showing that the steel has been tested and analyzed and the date of such tests and analyses and that such tests and analyses comply in all respects with the standards. The following tests shall be carried out on reinforcement:-

- Cast analysis
- Carbon equivalent value
- Tensile strength, yield stress, elongation
- Bend test
- Bond classification
- Chemical analysis

Stock of reinforcing steel

In order to ensure due progress of the works, the Bidder shall at all times maintain on the site a stock of reinforcing steel sufficient for the following month's work. No reinforcing steel shall be used upon the works until it has been accepted as satisfactory by the Owner/Consultant.

Rejection

The owner at his discretion may order random testing of the reinforcement steel and in the event of any failed test reject the entire lot notwithstanding the manufacturer's or coating applicator's certificates.

The Bidder shall remove all rejected reinforcing steel from the site without delay at his own expense.

Storage

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[39]	25.09.2014

All bars for reinforcement and steel fabric reinforcement shall be stored on the site under cover on timber or concrete supports suitably spaced and of sufficient height to keep the steel not less than 150 mm clear of the ground.

Bar-bending Schedules

The Bidder shall prepare bar bending schedules based on the detailed reinforcement drawings. These shall be presented to the Owner/Consultant for review. The Bidder is fully responsible for their completeness and correctness in every way nor shall any claim for extra cost or time be allowed on the grounds of errors or discrepancies which may arise between drawings and schedules.

d) Water

Water used for mixing and curing shall be clean and free from injurious amounts of oils, acids, alkalis, salts, sugar, organic materials or other substances that may be deleterious to concrete or steel. pH value of water shall not be less than 6.

Only potable water shall be used. Tests and quality of water shall be in accordance with IS: 456 or equivalent.

e) Aggregates

General

The aggregates for concrete shall be crushed natural rock subject to Owner's approval.

The aggregate to be used in the work shall be supplied from an established pit or quarry.

The concrete supplier shall obtain from the aggregate producer, or otherwise provide current test, examination, and inspection reports performed and certified by an approved laboratory for submittal to the Owner/Consultant.

As a minimum, this information shall include the following items:-

- **Item 1**

A comprehensive description, with current photographs of the pit or quarry, including but not limited to, identification by name and location, type of deposit, age, potential reserves, primary products by size including average gradation based on previous six (6) months production and the range for each sieve size; mining methods, process equipment, quality control organization and laboratory; the primary and alternate means of product transportation; listing of primary and secondary users of the product.

- **Item 2**

Petrographic examination in accordance with IS: 2386 (Part-8) and ASTM C-295 performed by a qualified concrete aggregate petrographer. This

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[40]	25.09.2014

report shall be based on material produced and examined within the previous six (6) months and must be representative of the current production.

- **Item 3**

Coarse aggregate shall be sampled from current production in accordance with IS: 2386 (Part 1 to 8). Three [20 mm, 10 mm & 5 mm] nominal maximum size (NMS) aggregates shall be sampled and tested as follows:

IS 2386(Part 1):	Methods of test for aggregates for cement: Part 1 Particle size and shape (Amendments 3)
IS 2386(Part 2):	Methods of test for aggregates for concrete: Part 2 Estimation of deleterious materials and organic impurities (Amendment 1)
IS 2386(Part 3):	Methods of test for aggregates for concrete: Part 3 Specific gravity, density, voids, absorption and bulking
IS 2386(Part 4):	Methods of test for aggregates for concrete: Part 4 Mechanical properties (Amendments 3)
IS 2386(Part 5):	Methods of test for aggregates for concrete: Part 5 Soundness
IS 2386(Part 6):	Methods of test for aggregates for concrete: Part 6 Measuring mortar making properties of fine aggregates (Amendments 2)
IS 2386(Part 7):	Methods of test for aggregates for concrete: Part 7 Alkali aggregate reactivity
IS 2386(Part 8):	Methods of test for aggregates for concrete: Part 8 Petrographic examination
ASTM C-295	Standard guide for petrographic examination of aggregates for concrete

Aggregates when subjected to the tests defined in items above, unless otherwise approved by the Owner/Consultant shall meet the requirements of IS: 383 and IS: 456.

Testing is to be carried out at the following intervals:

Table 2.7
Grades of Concrete

Type	Coarse Agg.	Fine Agg.
Grading	Daily	Daily
Specific Gravity	7 days	7 days
Magn Sulphate soundness	30 days	-

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[41]	25.09.2014

Type	Coarse Agg.	Fine Agg.
Clay, Silt and dust content	Daily	Daily
Shape (elongation and flakiness)	3.5 days	-
Los Angeles Abrasion	Initial stage only	Initial stage only
Moisture content	2 days	Daily
Drying shrinkage	Initial only	Initial only
Organic impurities	30 days	30 days
10% fines value for concrete	7 days	-

Combined grading shall also be done on a daily basis.

Storage and handling of aggregates

- Aggregate stockpiles shall be arranged and used in a manner to avoid segregation and to prevent contamination with other materials or with other sizes of like aggregates. Aggregate delivery trucks shall be covered to prevent wind blown contamination. Aggregate stockpiles shall be located relative to prevailing winds to mitigate the accumulation of wind-borne dust.
- Adequate storage shall be provided for each aggregate. The aggregate storage area shall be on concrete pavement sloped to drain excessive moisture. The aggregate storage area shall provide bulkheads to separate piles and protect against wind blown contaminants. Provision shall be made to shade and sprinkle the aggregates with potable water.
- Aggregate stockpiles shall be built in successive horizontal layers not exceeding 1 m in thickness, with each layer being completed before the next is started. No vehicles shall be allowed to operate on top of the stockpiles.
- Rescreening Coarse Aggregate: Rescreening and washing of coarse aggregates is required, if necessary, to reduce total chloride and/or sulphate contents to a level less than the maximum allowed by the specifications. If rescreening is required, the screening and washing shall be just prior to transferring aggregate to batch plant bins. Aggregates shall be dewatered over a screen to remove excess water before being stored in the batch plant bins.
- Natural or manufactured sand shall be allowed to drain until it has reached somewhat uniform moisture content before it is used.

Fine Aggregate

Fine aggregate source shall be manufactured crushed stone or river sand, excluding fines, which are by products/rejects of coarse aggregate production. The crushed stone sand shall be graded from fine to coarse with the coarse sizes predominating to give maximum density.

The amount of fine particles as ascertained by the laboratory sedimentation method shall not exceed 10% for crushed stone nor 4% for natural sand.

The amount of material passing a 75 micron sieve (IS test sieve) shall not exceed the following limits:-

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[42]	25.09.2014

Crushed Stone Sand

- i) Concrete subject to abrasion 1 % by weight
- ii) All other concrete 3% by weight

There shall be no clay or fine silt present.

The amount of hollow shells like to form voids or remain partially unfilled and present in material retained on an IS 2.36 mm sieve, determined by direct visual separation, shall not exceed 3% by weight of the entire sample.

Tests are to be executed in accordance with IS: 2386. The grading of fine aggregate for concrete work shall comply with the requirements of IS: 383.

The grading of the aggregates should be such as to produce a concrete of the specified proportions, which will work readily into position without segregation and without the use of excessive water content. The grading should be controlled throughout the work so that it conforms closely to that used for the preliminary tests.

A check on the moisture content of sand should be made at least once a day before concreting. The amount of water to be added to the concrete mix should be adjusted accordingly. Any washing, screening, classifying and other operations on the fine aggregate required to meet this specification shall be done by the Bidder. Washing is required if the content of silt adhering to the aggregate is found to be unacceptably high.

Coarse Aggregate

Coarse aggregate shall be crushed rock and shall be free from decomposed stone, clay, earth or other deleterious substances. The unit weight of the coarse aggregate shall not be less than 2.5 t/m³. Aggregate of crushed natural stone is deemed adequate if the stone reveals a crushing strength of 1000 kg/cm² when tested. Friable, flaky and laminated pieces, mica and shale shall only be present in such quantities as not to affect the strength and durability of the concrete.

The grading of coarse aggregate for concrete shall comply with the requirements of IS: 383.

Samples of aggregates shall be submitted to the Owner/Consultant, together with sieve analysis showing the proportion by weight passing sieves. When aggregates which are satisfactory to the Owner/Consultant have been selected, the Bidder shall secure his entire supply of each material from the same source so as to maintain the same quality and grading throughout the work. Should it become necessary to change the source or characteristics of the material supplied this shall only be done after additional tests.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[43]	25.09.2014

f) Concrete additives

Use of Concrete Additives

Concrete additives approved by the Owner/Consultant shall be used to improve consistency, workability, quality and strength of the concrete.

Chemical admixtures manufacturer shall provide certified test reports from qualified independent laboratories showing actual test results indicating material that complies in all respects with the applicable specification.

Admixtures used in concrete shall conform to the appropriate specification and requirements as indicated below:-

- Air entraining admixtures shall conform to IS: 9103.
- Water reducing and retarding admixtures shall conform to IS: 9103. Accelerating admixtures shall not be used.
- High range water reducers shall be naphthalene-sulfonated polymer based material. No admixtures containing chlorides shall be used.
- Chemical admixture suppliers shall provide certified test reports with each shipment indicating compliance with the appropriate specification. The test reports shall include the chloride content of the admixture, specific gravity and solids content.
- Fibers: Polypropylene fibers shall be collated, fibrillated polypropylene fiber of approved manufacture.
- Admixtures used in production of concrete shall be the same as used in establishing the required concrete mix and shall be used in accordance with the manufacturer's directions.
- Liquid admixtures shall be stored in such a manner to avoid contamination, evaporation and segregation in accordance with the manufacturers' recommendations

Accelerating and Retarding Additives

Such additives shall only be used in case of necessity and after obtaining the written approval of the Owner/Consultant.

Plasticizers and Air entraining Additives

Plasticizers and air entrainers are intended to reduce bleeding of free water at the surface. It shall only be used after the written approval of the Owner/Consultant and in accordance with the manufacturer's instructions.

5.10 Dismantling/Demolishing and Modification in PCC&RCC

- The dismantling implies, carefully taking up or down and removing without damage. This shall consist of dismantling one or more parts of a structure. This includes chipping work, cutting of reinforcement, making holes/opening

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[44]	25.09.2014

etc. in concrete members, according to the required shape, size and profile at all elevations.

- The term demolition implies, taking up or down or breaking up of a structure/member, in part or full, as specified or shown in the drawings or as directed by Engineer.
- In a structural member, both dismantling and demolishing work may be involved. In such case, the portion of work treated as demolishing shall be as shown on the drawing or as directed by the Engineer.
- All material obtained from the demolition/dismantling work shall be property of the Owner, unless otherwise specified.
- All serviceable materials obtained, shall be separated out and stacked properly upto a lead of *[500 meter]* or shall be returned to OWNER's stores and all unserviceable materials, rubbish etc., shall be disposed off as directed by the Engineer, upto a lead of *[2kms]*.
- The dismantling / demolishing operations shall be carried out in proper sequence so that the serviceable material can be salvaged, without being damaged during the process or work.
- Necessary propping, shoring and under pinning shall be provided for safety of adjoining work or property which is to be left intact, before dismantling/demolishing work.
- All demolition work shall be carried out in conformity with the local safety regulations, extreme caution being exercised to avoid damage to the work and the equipment, which are to be left intact. Necessary precautions shall be taken to keep the dust nuisance down. Safety requirements stipulated in IS: 4130 shall also be followed.
- As and where necessary, the dismantled/demolished materials shall be lowered to the ground and not thrown and then properly stacked as directed by the Engineer. Wherever required, temporary enclosures shall be erected to minimize the dust or moisture infiltration.
- Wherever fresh concrete is laid over old concrete, to ensure proper bond between old concrete and fresh concrete, the surface of old concrete shall be thoroughly cleared by removing all loose particles and coat of epoxy paint shall be applied.

5.11 Minimum Cover to Foundation Bolts

Minimum distance from the centre line of foundation / anchor bolt to edge of pedestal shall be the maximum of the following:

Clear distance from the edge of base plate / base frames to the outer edge of the pedestal shall be minimum 50 mm

Clear distance from the face of pocket to the outer edge of pedestal shall be 75 mm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[45]	25.09.2014

Clear distance from the edge of sleeve or anchor plate to the edge of pedestal shall be 75 mm

5.12 Miscellaneous Requirements

Fillets at the junction of roof and vertical walls shall be provided with cast in-situ cement concrete 1:2:4 (nominal mix) followed by 12 mm thick 1:4 cement mortar.

A screed layer not less than 100 mm thick of cast in-situ concrete of nominal mix 1:3:6 shall be provided below all water retaining structures. A sliding layer of craft paper or bitumen paper shall be provided over the screed layer to destroy the bond between screed and base slab.

Plywood formwork shall be used for all water retaining / conveying structures and for all over ground concrete works. For other areas steel/ plywood formwork shall be used.

Unless specified 20 mm and down graded aggregates shall be used for all structural concrete works. However 40 mm and down graded aggregates may also be used under special conditions for foundation.

Tolerance for formed and concrete dimension shall be as per IS: 456.

5.13 Major Equipment Foundation

Special requirements for concreting of major equipment foundations shall be as given below:

Coarse Aggregates

Sound and durable crushed stone aggregates shall be used. All aggregates shall be tested for alkali aggregate reaction. Materials, which contain high percentage of reactive silica, shall not be used. In exceptional cases of high percentage of reactive silica content, aggregate may be allowed where low alkali cement shall be used. Lime stone aggregate shall not generally be used for foundations, which are subjected to high temperature and repeated temperature cycles (like in the case of all machine foundations).

Temperature Control of Concrete

The temperature of fresh concrete shall not exceed 25° C when placed. For maintaining the temperature of 25° C in the top deck of machine foundations, crushed ice shall be used in mixing water.

Admixture

Plasticizer cum retarder/accelerating type admixture shall generally be added to the concrete for promoting workability in addition to retarding / accelerating setting time for mass concreting work. The Bidder shall submit the mixing proportion/report after conducting the design mix as per the relevant codes and standards. The slump of concrete shall generally be in the range given below:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[46]	25.09.2014

Block foundation : 100mm to 150mm
Column : 100mm to 150mm

Formwork

Plywood formwork shall be used for the top deck of all machine foundations. Any other type of formwork required to be used may be permitted subject to prior approval of the OWNER/CONSULTANT after submission of the required data.

Scheme for Concreting

Batching plants shall be mobilized for all RCC works. Concrete pump shall be mobilized for foundations. Arrangements for stand-by Plant and Equipments shall also be made.

Placing of Concrete

Base mat as well as top deck of machine Foundations shall be cast in a single pour. However the BIDDER shall submit method statements for various structures and shall get the prior approval from the OWNER/CONSULTANT before placing the concrete.

Ultrasonic Testing

Ultrasonic pulse velocity test shall be carried out for the top deck of all machine foundations to ascertain the homogeneity and integrity of concrete. In addition, additional cubes (at the rate of one cube per 150 cum of concrete subject to a minimum of six cubes) shall be taken to carry out Ultrasonic Pulse velocity (UPV) testing on the cubes to serve as reference UPV values. Testing shall be done as per IS: 13311 (Part-1). In case of any defects, the BIDDER shall rectify the defects suitably using cement / epoxy grout etc.

5.14 Transport of Concrete

Immediately after mixing, the concrete shall be conveyed to the place of use as rapidly as possible using methods, which will prevent the segregation, loss or contamination of materials. The concrete shall be placed and compacted within 90 minutes of the addition of water to the mix. Any concrete left unplaced after this time shall be rejected and removed from the site.

The Concrete shall be transported by transit mixers of adequate capacity. Before using concrete pumps, placer pipelines, chutes or spouts it is necessary to have the written approval of the Owner/Consultant.

The Bidder shall obtain permission well in advance of any concrete pour.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[47]	25.09.2014

5.15 Concreting Operations

Inspection prior to Concreting

All concreting methods shall be subject to the approval of the Owner/Consultant.

Concrete placing shall not be started until the Owner/Consultant has approved all preparation of forms, reinforcement, joints and all mixing, conveying, spreading, curing, finishing and protection equipment.

Placing of Concrete

Concrete shall be placed in the forms as close as possible to its final position in a single operation to the full thickness of slabs and beams and shall be placed in horizontal layers, not exceeding 2.5 m height in a single pour in walls, columns and similar members.

The Bidder shall organize the pouring of concrete in such a manner that once concreting of a section has started the operation shall be continuous and each operation shall be completed prior to a stoppage.

The temperature of concrete shall not exceed 40°C measured at discharge into the works.

The maximum allowable temperature of any point within any cast element is 60°C. The maximum allowable differential temperature between any two points in the same element is 15°C. Additional temperature control measures during construction (such as the use of insulated formwork) will be required. Bidder to prepare a process control chart and method statement verifying measures to achieve these requirements.

Temperature monitoring of concrete work is required where:

The minimum dimension of any casting is 0.8 metres or more, or otherwise instructed by the Owner/Consultant.

Where specified on the drawings, construction, expansion or contraction joints shall be provided and the concrete shall be poured continuously between two adjacent joints. No other joints than shown on the drawings shall be permitted. Stoppage (cold) joints formed between two concreting operations separated by more than 6 hours time shall be subject to the same treatment as the construction joints.

Concrete shall not be dropped into place from a height exceeding 1.5 metres. Trunking and chutes to Owner/Consultant's approval shall be used for any concrete to be deposited from a height exceeding 1.5 m.

Concrete which has partially hardened shall not be exposed to injurious vibration or shock, except for controlled re-vibration where specified. When concreting of a certain large structural element is specified strictly as to be poured

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[48]	25.09.2014

continuously, then the concreting operations shall be organized for day and night working, in long shifts, as necessary.

5.16 Compaction and mechanical vibration of concrete

As concrete is being placed it shall be compacted by mechanical vibrators complying with IS: 2505, IS: 2506, IS: 2514 & IS: 4656, to obtain a dense material free from honeycombing, free from water and air holes.

The Bidder shall ensure that the vibrators are used in such a manner that the reinforcement is not displaced, the formwork not damaged and no segregation/bleeding caused, but complete compaction of the concrete is achieved.

5.17 Finish of concrete

The concrete face shall have the finishes indicated on the drawings or in the present specification. The finished surface of the concrete shall be sound, solid and free from honeycombing, protuberances, air holes or exposed aggregate. No plastering, cement wash, mortar or paint shall be applied to cover defective concrete surfaces.

5.18 Construction, expansion and contraction joints

Construction joints

The number of construction joints should be kept as low as possible consistent with reasonable precautions against shrinkage. Concreting should be carried out continuously up to construction joints.

Where it is necessary to introduce construction joints, careful consideration should be given to their exact location, which should be indicated on the drawings. Alternatively, the location of joints should be subject to agreement between the Owner/Consultant and the Bidder before any work commences. Construction joints should be at right angles to the general direction of the member and should take due account of shear and other stresses.

Concrete should not be allowed to run to a featheredge and vertical joints should be formed against a stop board.

The top surface of a layer of concrete should be level and reasonably flat unless design considerations make this undesirable. Joint lines should be so arranged that they coincide with features of the finished work.

If a kicker (i.e. a starter stub) is used it should be at least 70 mm high and carefully constructed. The kicker must be incorporated with the previous concrete. Where possible, the formwork should be designed to facilitate the preparation of the joint surface, as the optimum time for treatment is usually two to four hours after placing.

The maximum horizontal length of wall to be poured in one operation in any one direction is 7.5 metres. A period of 7 days to be allowed between adjacent

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[49]	25.09.2014

pours except where water stops are provided when this can be reduced with Owner/Consultant's approval. Alternatively a gap of 600 mm width shall be left between adjacent pours and filled after 7 days from the date of formation subject to Owner/Consultant's approval.

Immediately prior to recommencement of concreting on a joint, the surface of the concrete against which new concrete will be cast should be free from laitance and should be roughened to the extent that the largest aggregate is exposed but not disturbed. Care should be taken that the joint surface is clean immediately before the fresh concrete is placed against it.

Particular care should be taken in the placing of the new concrete close to the joint. This concrete should be particularly well compacted and if possible a vibrator should be used.

Where the Owner/Consultant considers that special preparation is necessary, i.e. for an in-situ structural connection, preparation should be carried out preferably when the concrete has set but not hardened, by spraying with a fine spray of water or brushing with a stiff brush, which is sufficient to remove the outer mortar skin and expose the larger aggregate. Where this treatment is impracticable, sand blasting or a needle gun should be used to remove the surface skin and laitance. Hacking of hardened surfaces should be avoided.

A record shall be kept on site of the time and date of placing the concrete in each section of the work.

Expansion and contraction joints

The expansion joints, contraction joints and other permanent structure joints shall be provided in positions as shown in the drawings.

Joints shall be straight and vertical, except where otherwise specified, and concrete surfaces on both sides of the joint shall be flush. Where necessary, water stoppers of a type approved by the Owner/Consultant shall be embedded in the concrete. The water stopper should be made of high quality material, which must obtain its resilience through the service life of the structure for the double function of movement and sealing. The surface of water stoppers should be carefully rounded to ensure tightness of the joint even under heavy water pressure. To ensure a good tightness with or without movement of the joints the water stopper should be provided with anchor parts. The cross-section of the water stoppers should be determined in accordance with the presumed maximum water pressure and joint movements. The complete works of fixed and welded connections must be carried out strictly in accordance with the manufacturer's instructions.

All joints between structural steel and concrete parts shall be sealed by a suitable permanent flexible compound.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[50]	25.09.2014

5.19 Concreting at night

When approval is given to carry out concreting operations (under control of the Owner/Consultant) at night or in places where daylight is excluded, the Bidder has to provide adequate lighting at all points of mixing, transportation and placing of concrete.

5.20 Protective measures for concrete

In general, the cover of rebars shall be as per IS: 456 taking into account the site conditions. However, the minimum concrete cover shall not be less than:

Concrete parts above ground (external surface)	: 40 mm
Concrete exposed to underground & groundwater	: 50 mm
Isolated footings	: 50 mm
Raft	: 75 mm
Slabs	: 25 mm
Beams	: 25 mm
Columns	: 40 mm

Immediately after the compaction of the concrete has been finished, the Bidder shall ensure adequate protection from the weather. Excessive drying can lead to crack formation as a result of plastic contraction. The concrete surface shall be covered with a layer of sacking, canvas, straw mats or similar absorbent material, special protection sprays kept constant moist for at least 7 days.

Curing compounds or other methods of preventing evaporation may be used if approved by the Owner/Consultant. Where formwork cannot be removed within 24 hours after placing the concrete, the formwork shall be kept shaded from the direct rays of the sun and shall be sprayed with water.

Owner/Consultant's approval to the use of a particular curing compound and to the method of application will only be given after the Bidder has completed satisfactory site trials and a sample panel has stood for at least 28 days.

Where large sections of concrete are poured, special precautions to the approval of the Owner/Consultant shall be taken to reduce and dissipate the heat generated by the setting and hardening of the concrete.

The minimum amount of reinforcement shall be present to prevent shrinking cracks.

No load of any kind, however light, shall be allowed on concrete which has not properly set and the Bidder shall prevent any load to be imposed on the concrete structures until it has been declared by the Owner/Consultant to be ready to carry loads.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[51]	25.09.2014

5.21 Concrete with Special Properties

General requirements

The pre-condition for obtaining concrete with special properties is that it should be made with the appropriate composition, that it is placed in such a way that segregation does not occur and further that it is fully compacted and given appropriate curing.

Waterproof concrete

This concrete must meet the provisions of IS: 3370. Waterproof concrete must be sufficiently dense (impermeable).

Waterproofing and protection of underground concrete structures

Water aggressive to concrete should be kept away from the fresh concrete.

Concrete, which is exposed for a prolonged period to “very severe” chemical attack, must be protected against direct access of the aggressive substances.

The protection, which is to be laid as protection to all concrete surfaces in contact with the ground, shall consist of an approved waterproofing membrane. The membrane shall adhere to all concrete surfaces, including undersides of structures and other surfaces where concrete is cast in contact with the membrane.

Such membranes shall be PVC sheets of minimum 0.35 mm thickness with knobs of Maxlock.

The waterproof membranes shall be installed in strict accordance with manufacturer’s instructions.

The membranes shall extend 15 cm above ground level.

When setting forms and reinforcing steel caution shall be exercised to avoid damage to the impervious membrane. The surface of the impervious membrane extending outside the forms shall be protected during subsequent operations.

Any puncture or damaged areas shall be cleaned and patched according to manufacturer’s instructions.

Concrete with high wearing resistance

Concrete which is exposed to severe mechanical action, e.g., due to intensive traffic, sliding of bulk materials, frequent impact blows or movements of heavy objects, or due to fast-flowing water carrying solids, or other causes, should possess high wearing resistance and correspond at least to grade M30.

The aggregate upto 4 mm size should consist predominantly of quartz or materials of at least equal hardness; the coarser particles should consist of stone or artificial materials possessing high abrasion resistance. In the case of particularly severe mechanical action, it will be necessary to use special hard

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[52]	25.09.2014

materials. The particles of all types of aggregate should have a moderately rough surface and be of compact shape. The combined aggregate should be as coarsely graded as possible.

Furthermore, the concrete should be as stiff as possible, in order that there will be no concentration of cement slurry or water in the top layer. The concrete should be kept moist for at least 7 days after placing.

Finishing of formed surfaces

Fins and other surface projections shall be removed from all formed surfaces except exterior surfaces that shall be covered with earth backfill. Exterior surfaces that shall be exposed above grade and all interior surfaces, except those not usually exposed to view shall be cleaned and rubbed. Rubbing shall produce a smooth, uniform surface free of marks, voids, surface glaze, and discolorations.

Rubbing shall be done by hand with a carborundum stone using only the mortar produced by the rubbing action and the application of water.

Projecting ends of all form ties shall be removed. The resulting recesses shall be cleaned, wetted, and filled with patching mortar. Patches on rubbed surfaces shall match the texture of the adjacent concrete.

Finishing of unformed surfaces

No surface treatment shall be required for buried or permanently submerged concrete. As a minimum, unformed surfaces shall be finished by screeding and floating. Surfaces requiring a trowelled finish shall be finished by screeding, floating, and trowelling.

Float finished and screeded surfaces shall be finished to provide a flat profile within a 6 mm deviation as measured from a 3 m straightedge. Trowel finished surfaces shall be finished to form a flat plane. The surface profile shall not deviate more than 3 mm when measured from a 3 m straightedge.

Screeding

Screeding shall provide a concrete surface conforming to the designated elevations and contours with all aggregates completely embedded in adjacent mortar. Surface irregularities in screeded surfaces shall be limited to the tolerances specified.

Floating

The surfaces shall be screeded and given an initial float finish as soon as the concrete has stiffened sufficiently to work. Coarse aggregate disturbed by the float or causing a surface irregularity shall be removed and replaced with mortar. Initial floating shall produce a surface of uniform texture and appearance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[53]	25.09.2014

Initial floating shall be followed by a second floating at the time of initial set. The second floating shall produce a smooth float finish of uniform texture and colour.

Floating shall be performed with hand floats or suitable mechanical compactor floats.

Trowelling

The exposed portions of the tops of equipment bases, tops of interior curbs, and the surfaces of interior slabs not receiving a separate finish shall receive a steel trowel finish. Trowelling shall be performed after the second floating when the surface has hardened sufficiently to prevent excess cement from being drawn to the surface. Trowelling shall produce a dense, smooth, uniform surface free from blemishes and trowel marks.

Surfaces to be covered with neoprene-hypalon coatings shall be lightly trowelled but not burnished.

Brooming

Brooming shall follow the float finish for exterior surfaces where a nonslip surface is required. Brooming shall be done with an acceptable steel or fiber broom not less than 450 mm wide. Brooming ridges shall be transverse to the normal traffic direction and shall be between 1.5 mm and 3 mm deep. Adjacent strokes of the broom shall overlap slightly. Broomed surfaces shall be free of porous spots, irregularities, depressions, and small pockets or rough spots.

Aggregate Exposure

Surface mortar shall be removed and the aggregate exposed from surfaces that shall be covered with mortar, concrete, or grout at a later time.

Edging

Unless specified otherwise, exposed edges of floated or troweled surfaces shall be edged with a tool having a 6 mm corner radius.

Finishing mortar

Finishing mortar shall be added if there is not sufficient mortar available from the concrete mix. The proportions for this finishing mortar shall be 102 kilograms of concrete sand to one sack of Portland cement, mixed with enough water for proper application. Slump for finishing mortar shall not exceed 50 mm.

Separate finishes

Certain slabs surfaces shall be finished with a separate concrete finish or floor covering.

Base slab surfaces shall be ground or filled until each surface is within the specified tolerances. Low areas shall be filled. High spots shall be ground

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[54]	25.09.2014

slightly lower than required and then filled and smoothed to the proper elevation and surface.

Surfaces that receive epoxy set quarry tile and resilient tile shall be flat with a profile that shall not deviate more than 3 mm from a 3 m straightedge placed on any part of the surface. These surfaces shall be either trowel finished concrete at the elevation indicated on the drawings or a float finished surface set 3 mm low and levelled with trowel finished fill material.

Surfaces that receive a mortar set quarry tile, ceramic tile, or vitrified finish shall be given a smooth, tight, and uniform float finish with a profile tolerance of 6 mm as measured from a 3 m straightedge.

5.22 Formwork

Design and construction

For stability and type of formwork and support framing used, IS: 14687 is to be observed.

The formwork and the supporting structure are to be so dimensioned as to be able to withstand all vertical and horizontal forces safely.

Supporting structures shall be sufficiently rigid to maintain the forms in their correct position and to be true to shape and dimensions so that the final concrete is within the limits of the dimensional tolerances specified in section) "Dimensional Tolerances".

The Bidder shall submit in sufficient time in advance for the approval of the Owner/Consultant the calculations, designs and details of the methods adopted and materials proposed for the formwork.

Particular attention must be paid to the formwork supports and braces to avoid any slip when the concrete is poured.

Materials for formwork

Forms shall be constructed from steel or from sound timber well seasoned and free from shakes. Plywood lining for forms shall be of timber, which is resin-bonded and water repellent.

Formwork surfaces in contact with concrete shall be free from adhering grout, projecting nails, splits or other defects.

Joints shall be sufficiently tight to prevent the leakage of cement grout. Connections shall be constructed to permit easy removal of the shuttering and shall be either nailed, screwed, bolted, or otherwise secured so as to be strong enough to retain the correct shape during consolidation of the concrete. Where a slope exceeds 1 V: 2 ½ H, formwork shall be provided for the top of the concrete faces and anchored to prevent flotation.

The details of fair-faced concrete facades have to be to the satisfaction of the Owner/Consultant. The concrete surface for facades has to be absolutely

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[55]	25.09.2014

stainless and all efforts have to be taken to achieve this. All the proposed formwork shall be properly designed before its usage.

Grading of formwork and of finished concrete surfaces

Quality of formwork, materials to be used and treatments of surface are graded according to the finish of the concrete surface as given in IS: 14687.

The type and treatment of the formwork lining (plywood, metal, plastics, etc) should be appropriate to the grade of concrete finish required.

Preparation and inspection of formwork

Before concrete is placed, all formwork shall be inspected to see if it is built according to the approved plans and to see if it has been cleaned and is free from sawdust, shavings, dust, mud, earth or other contamination and properly oiled. Contact surfaces of panels shall be treated with a suitable release agent (e.g. non-staining mineral oil) where applicable. Surfaces, which are not oiled, shall be wetted thoroughly to prevent warping.

Erection and placing of formwork

All formwork shall be erected and placed in accordance with the construction drawings approved by the Owner/Consultant. Shuttering shall be true to line and braced and strutted to prevent deformation under weight and pressure of the wet concrete, live loads, wind and other forces. The deflections shall not exceed 3 mm.

The formwork for beams and slabs shall be erected so that the form on the sides of the beams and of the soffits of slabs can be removed without disturbing the beam soffit.

If the formwork for columns is erected to the full height of the columns, one side shall be provided with openings for concreting in order to guarantee a proper compaction of the poured concrete.

Formwork for walls and elsewhere shall be arranged for a maximum concreting height of 2.5 m in a single pour. Wherever necessary, panel openings are to be provided in the forms for cleaning, inspection, access of vibrators, etc.

Before placing of concrete, bolts, ties and fixings shall be positioned and all devices used for forming openings, holes, pockets, chases, recesses, etc shall be fixed to the formwork carefully.

Panels shall be put together to ensure a perfect fit at the joint and fixed in both directions.

Where concrete surfaces will be exposed to view (permanently exposed surfaces) the formwork shall be such as to produce a completely true, smooth surface, free from perceptible irregularities or to show clearly the desired texture. Such formwork shall be marked on the drawings as "Fair-faced Formwork".

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[56]	25.09.2014

Where concrete surfaces are covered (non-exposed surfaces), the formwork shall be referred to and marked as "Sawn Formwork".

Internal spacers and ties, if any, shall be so arranged that after removing of the forms no holes shall extend through the concrete, in the case of watertight concrete or to be closed by plastic plugs and epoxy mortar in all other cases.

All formwork will be inspected and approved by the Owner/Consultant before concrete placing commences but this shall not relieve the Bidder of any of his responsibilities under the contract.

Striking of formwork

Formwork shall not be removed until the concrete has sufficient strength to carry its own weight plus any constructional or designed loads likely to be applied with a normal factor of safety. It shall be removed in such a manner that no shock or injury shall result to the concrete.

Before removal of the formwork, the concrete shall be examined and removal shall proceed only on the instructions and under the supervision of a competent person.

In accordance with IS: 456 clause 11.3.1, the striking period for cast in-situ concrete under certain conditions may be taken as follows: -

Table 2.8
Formwork

Type of Formwork	Minimum period before striking formwork
Vertical formwork to columns, walls, beams	16 to 24 hours
Soffit formwork to slabs (props to be refixed immediately after removal of formwork)	3 days
Soffit formwork to beams (props to be refixed immediately after removal of formwork)	7 days
Props to slabs:	
1) Spanning upto 4.5 m	7 days
2) Spanning over 4.5 m	14 days
Props to beams and arches:	
1) Spanning upto 6 m	14 days
2) Spanning over 6 m	21 days

Special care is necessary in the case of components, which have to carry nearly the full-calculated load as soon as the formwork is struck.

Columns, piers and walls are to be struck before the beams and slabs supported by them. Scaffolds, formwork supports and self-supporting floor formwork are to be carefully lowered by releasing the devices.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[57]	25.09.2014

Extreme care shall be taken to avoid chipping of corners during removal of formwork.

To keep deflections through creep and shrinkage to a small amount, auxiliary supports should be left in place or immediately repositioned after striking.

5.23 Water stoppers

Water stoppers shall be of PVC or equivalent and shall be eye-letted with a minimum 25 cm width. Type and manufacturer shall be submitted to the Owner/Consultant's approval.

All intersection pieces shall be prefabricated by the manufacturer and only welding of butt-joints in running lengths will be allowed to be carried out on the site.

The site welding of butt-joints shall be executed by using the manufacturer's purpose-made electrically heated jig and work shall be done by competent and trained personnel only. The manufacturer's instructions shall be carefully observed.

The wings of the water stoppers shall be formed with corrugations or bulbs to achieve a good bond. Moreover, the water stoppers shall conform to the following requirements:-

- The tensile strength not less than 10 N/sq.mm when tested.
- The ultimate elongation shall not be less than 22% when tested.
- The tear resistance shall not be less than 2 N/sq.mm when tested.
- The material shall not crack when tested.
- Under accelerated elongation, the tensile strength shall not be less than 8 N/sq.mm and the ultimate elongation shall not be less than 200%.

The water stoppers shall be installed so that they are securely held in position during the placing of concrete, which shall be fully and properly compacted around the water stoppers to prevent voids or porous areas. Adequate clearance between the reinforcement and all the water stoppers shall be kept to permit proper compaction of concrete.

No holes or nailing shall be made through any water stopper for fixing purposes. Jointing by lapping two pieces of water stoppers shall not be permitted.

The free edges of water stoppers shall at all times be protected from direct sunlight.

5.24 Curing

Concrete shall be protected from loss of moisture for not less than 7 days after the concrete is placed and if required the concrete may be protected for few more days as per the design mix / approved methodology.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[58]	25.09.2014

Trowelled surfaces except those that receive a separate finish or coating, shall be cured with a membrane curing compound. Float finished surfaces, except those that receive a separate finish, may be cured with either a membrane-curing compound or with water. Only water curing shall be used if the surface receives a separate finish.

Water curing

Water saturation of concrete surfaces shall begin as quickly as possible after initial set of the concrete. Water curing shall begin within 12 hours in dry weather and within 24 hours in damp weather. The rate of water application shall be regulated to provide complete surface coverage with a minimum of runoff. The application of water may be interrupted for surface rubbing. The concrete surface shall not be permitted to dry.

After the rubbing has been completed, rubbed surfaces shall be covered with burlap and kept saturated for the remainder of the curing period.

Membrane curing

Membrane curing compound shall be applied within 30 minutes after final finishing of the surface or as soon as possible after finishing without causing damage to the surface. Membrane curing compound shall be spray applied at coverage of not more than 7.4 sqm/litre. Membrane curing shall not be used on surfaces that shall be covered at a later date with mortar, concrete, damp proofing, tile, or any coating. Membrane curing shall not be used on cast-in-place concrete bases for field-erected tanks. Membrane curing will be permitted only after prior approval of the OWNER/CONSULTANT.

Floor sealer

All concrete floors shall be given two coats of clear floor sealer in addition to that applied as membrane curing compound. The first coat shall be applied at the end of the curing period before any traffic is permitted on the floor. The second coat shall be applied after the floor has been cleaned in preparation for the final inspection. Floor sealer shall be applied in strict accordance with the manufacturer's recommendations.

5.25 Waterproofing/Damp proofing

A waterproofing seal shall be provided for all below grade structures where applicable by external tanking with PVC sheets of 1.0 mm thickness with knobs for membrane type waterproofing. In addition, joints in deep underground structures shall be provided with structural waterproofing.

Damp-proof course 40 mm thick, consisting of cement concrete 1:2:4, with admixture of approved water-proofing compound shall be laid at plinth level for walls of all buildings for protection of super-structure against moisture and dampness.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[59]	25.09.2014

5.26 Repair of damaged and defective concrete

Concrete after its final setting shall be inspected by the Owner/Consultant and any cracks, honeycomb areas, segregations, etc shall be marked. No repairs shall be carried out until directed by the Owner/Consultant.

Surface defects in formed concrete shall be repaired to the satisfaction of the Construction Manager within 24 hours. Concrete that is porous, honeycombed, or otherwise defective to a depth in excess of 25 mm shall be cut out and removed to sound concrete. Edges shall be square cut to avoid feathering. Cut surfaces shall be coated with epoxy bonding compound before the concrete is placed.

Defective concrete shall be replaced within 48 hours after the forms have been removed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[60]	25.09.2014

6. PRESSURE GROUTING

The work shall consist of drilling grout holes, exploratory holes and check holes, pressure testing, pressure washing, and injecting suspension grout under pressure, and shall include furnishing of all materials, labor, and equipment as described and specified.

6.1 Materials

a) Cement

Portland cement shall be containing less than 0.6 percent alkali.

b) Aggregate

Aggregate shall be non reactive and shall be washed before use. When sources of aggregate are changed, test reports shall be provided for the material from the new source prior to commencing grout work. Fine aggregate shall be sand or crushed stone.

c) Admixtures

Admixtures shall be compatible with the grout and shall comply with the manufacturer's recommendations. Admixtures shall be added to the grout mix separately.

Water Reducing Retarder: Water reducing retarder shall comply with relevant Indian standard or as approved by Owner.

Lubricant: Lubricant additive for cement pressure grouting shall be Intrusion Prepakt Intrusion Aid, Sika Intraplast N, or as approved by Owner.

d) Water

Water for washing aggregate, for mixing and for curing shall be potable, shall not contain more than 1000 mg/l of chlorides as Cl, nor more than 1300 mg/l of sulfates as SO₄, and shall not contain impurities which may change the setting time by more than 25 percent or a reduction of more than 5 percent of the compressive strength of the grout at 14 days when compared to the results for grout made with distilled water.

e) Grout

Drypack Grout

Drypack grout shall be a mixture of approximately one part cement, 1.5 parts sand, water reducing retarder and sufficient water to make a stiff workable mix, branded Dry Pack or approved equal.

Cement Grout

Cement grout shall be a mixture of one part cement, two parts sand proportioned by volume admixtures for pressure grouting and sufficient water to form a workable mix.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[61]	25.09.2014

Nonshrink Grout:

- Non-shrink expansive flowable grout shall be used for under pinning work below base plate of columns. Non-shrink cum plasticiser admixture shall be added in the grout. For grouting of base of machine foundation high strength ready mixed non-shrink flowable grout shall be used.
- Type and grade of grouting for structural columns and equipment bases shall be as indicated. Crushing strength of the grout shall generally be one grade higher than the base concrete. Minimum grade of grout shall be M 30.
- Nominal thickness of grouting shall be at least 50 mm for building columns and pedestals of major equipment. For secondary posts, stair and ladder base, etc. grouting shall not be less than 25 mm thick.

Special grout, where specified on the drawings, shall be provided in strict accordance with the manufacturer's instructions/specifications. Pre-mixed Grout Conbextra GP-2 of 'FOSROC' make or equivalent of crushing strength 650 kg/cm² for major equipment foundations and Conbextra GP-1 or equivalent having crushing strength of 450 kg/cm² for other foundations where concrete grade M30 or higher is provided

- Forms and shims used to obtain adequate clearance shall not be removed and the anchor bolts shall not be tightened for at least three days after placing the grout. After the removal of forms and shims, area occupied by shims shall be filled and the area between the base and edge of the foundation shall be finished smooth to allow drainage away from the base. Attachment of interconnecting piping of machinery and complete load transfer of machinery shall not be done before the bolts are tightened. During this period, grouting work shall be properly cured using rags/gunny bags.

In view of extremely small proportion (about 0.01% by weight of cement) of the aluminium powder required, it is necessary to take all precautions to ensure thorough mixing. It is advisable to mix the blend of aluminium powder thoroughly with sand and cement before water is added because aluminium powder has a tendency to float on water.

- Proprietary material of approved manufacture used as an admixture to obtain non-shrinking grout shall be mixed in the proportion of 1:1:1 (1 cement: 1 admixture: 1 sand), or as per manufacturer's instructions.

Pre-mixed non-shrinking grout shall be used as per manufacturer's instructions and without any additional materials/admixtures such as cement, sand and aggregates etc.

Epoxy Grout for Crack Repair and Dowel Anchorage

Except for applications involving pressure grouting or crack injection, epoxy shall be a high modulus, moisture insensitive, two components, 100 percent solids,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[62]	25.09.2014

thermosetting modified polyamid epoxy compound. The material shall equal which is capable of not sagging in horizontal or overhead anchoring applications.

Epoxy for applications involving pressure grouting or crack injection, shall be a high modulus, moisture insensitive, two components, injection grade, 100 percent solids blend of epoxy resin compounds. The material shall equal which is capable of achieving complete penetration of hairline and larger cracks.

Polymer Concrete for Resurfacing and Patching

Polymer concrete shall consist of a liquid binder and dry aggregate mixed together to make a flowable mortar. The liquid binder shall be a chemical and oil resistant, stress relieved, low modulus, moisture insensitive, two component epoxy resin compound. The binder material shall equal with a consistency similar to light weight oil for proper mixing with the aggregate. The aggregate shall be oven dry, kept in sealed packages until the time of mixing and be of size and consistency compatible with recommendations of the manufacturer of the liquid binder for the intended application.

Adhesive Resin for Dowel Anchorage:

Pneumatically operated caulk gun and automatically mixed at nozzle. Subject to compliance with one of the following: HIT RE500-SD Adhesive Anchoring System, Hilti, Inc. (ICC ESR-2322), HIT-HY 150 MAX-SD Adhesive Anchoring System, Hilti, Inc. (ICC ESR-3013), SET-XP Adhesive Anchoring Systems, Simpson Strong-Tie Co. (ICC ESR-2508).

6.2 Pressure Grouting Equipment

Pressure grouting equipment shall include a mixer and holdover agitator tanks designed to place grout at pressures up to 0.345N/mm² (50 psi). Gauges indicating grouting pressure shall be provided and the mixer shall be equipped with a meter capable of indicating to within 0.003 m³ the volume of grout placed.

6.3 Execution

Bonding compounds for use with grout is to be provided and installed per the manufacturer's recommendations.

a) Drypack Grout

Drypack grout is to be used for built-up surfaces, setting miscellaneous metal items and minor repairs.

Surfaces required to be built-up with drypack grout are to be roughened by brushing, cleaned and coated with the bonding compound before application of grout. The grout is to be applied to the required thickness.

b) Cement Grout

Cement grout is to be used for filling nonbearing portions of equipment pads and pressure grouting.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[63]	25.09.2014

Except for the specialized requirements for pressure grouting, grout is to be mixed and placed in the same manner as cast-in-place concrete. Grout is to be mixed for at least one minute and diluted grout is to agitated until placed.

c) Non-shrink Grout

Nonshrink, nonmetallic aggregate grout is to be used under equipment, bearing plates and column base plates. Nonshrink, metallic aggregate grout is to be used under rotating equipment where high strength and fatigue are of concern, to grout anchor bolts and to grout reinforcing steel. Grout is to be placed and cured in accordance with the manufacturer's recommendations.

Holes required for grouting shall be blown clean with compressed air and are to be free of dust or standing water. Horizontal holes for grouting are to be drilled at a slight downward angle and with the inserted dowel or bolt bent to match.

d) Epoxy Grout

Epoxy grout shall be used for repairing cracks by pressure grouting or gravity, repairing structural concrete and may be used for setting dowels or bolts in holes. Concrete is to be primed in accordance with the grout manufacturer's recommendations.

The use of epoxy grout must comply with the following restrictions:

- Limited to areas where exposure, on an intermittent or continuous basis, to acid, chlorine gas or to machine or diesel oils, is extremely unlikely.
- Limited to applications where exposure to fire or to concrete temperatures above the product heat deflection temperature or 120 deg F (40 deg C)(whichever is less) is extremely unlikely. Overhead applications are not allowed.
- Holes for the anchors shall be drilled (not cored), shall be blown clean with compressed air and shall be free of dust or standing water.
- The anchor type, size and embedment depth shall be as shown on the drawings and the anchor must be installed in accordance with the manufacturer's recommendations.
- The anchor must not be loaded until after the full curing period has elapsed.

e) Pressure Grouting

Prior to grouting, cracks and holes to be grouted shall be washed clean. Washing is not required for grouting soil voids. Once started, grouting shall be continuous until completed. In case of a mechanical failure or other stoppage of the work, the grout equipment shall be washed out sufficiently to ensure that fresh only grout is pumped when the work is restarted.

After grouting is completed, the Contractor shall remove the grouting plant and all related parts, equipment, and supplies from the site, including unused materials and waste.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[64]	25.09.2014

6.4 Field Quality Control

- Bidder shall make suitable arrangements for carrying out all the necessary quality tests and ensure that testing work shall be carried out in compliance with the standards.
- Testing of grout mixes for conformance to manufacturer's specified strength: The independent testing laboratory shall take four test samples of each day's grout mix and test grout mix samples at 7 and 28 days. Test reports shall be submitted to the Owner for review.
- Test 25 % of reinforcing steel dowels installed with adhesive resin on a given day in tension using pullout procedure. Test to 80% of specified yield strength of the dowel with special inspection. Dowels specifically noted on the drawings as "No test required" do not require tension testing.
- If the failure rate of dowels exceeds 10 percent, testing will be increased to 100 percent of that day's installation of similar anchors or dowels. Testing will be reduced to 25 % of that day's installation when the failure rate is reduced to 10 percent or less. Failed dowels will be replaced at no additional cost to the Owner. The Contractor will produce daily reports of all testing activities; copies of daily reports will be submitted to the Owner in a timely manner.

6.5 Submittal

- Manufacturer's data shall be provided for bonding compounds, dry pack, non-shrink, pressure grout, retardants, epoxy grout, polymer concrete.
- Test reports, accompanied by a manufacturer's statement that previously tested material is of similar type, quality, and manufacture as that which is proposed for use on this projects, shall be submitted for Cement, Aggregates, Retardants, Bonding compounds and Epoxy resin
- The Contractor's testing laboratory shall provide evidence of correction of deficiencies noted in the inspection report before materials specified in this section are delivered to the job site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[65]	25.09.2014

7. RETROFITTING WORKS

7.1 General

- a) The Work shall, in general, conform to other works/items specified in this Specification.
 - If the specifications for any item are not available in in this Specification cited above, relevant BIS Specifications should be followed.
 - In case BIS Specifications are also not available, the decision of Engineer-in-Charge given in writing based on acceptable sound engineering practice and local usage shall be final and binding on the contractor.
- b) The work will be carried out in accordance with the architectural and structural drawings to be approved by Owner. The structural and architectural drawings shall have to be properly correlated before executing the work.
- c) For items where so desired, samples shall be prepared before starting the particular items of work for prior approval of the Owner and nothing extra shall be payable on this account.
- d) Materials brought at site of work shall not be used in the work before getting satisfactory Mandatory test results.
 - Equivalents for the various materials and the materials of approved make shall be got approved from the Owner in writing before using them on the work.
- e) The contractor shall submit the required documents regarding the genuineness of materials used such as manufacturer's certification that the firm has manufactured the supplied materials.
- f) The contractor shall get approved from the Owner the storage space for epoxy/polymer/patented/other manufacture of materials to ensure that the storage temperature is maintained between 5° C and 38° C unless recommended otherwise by the manufacturer.
- g) Contractor shall comply with manufacturer recommendations so as to comply with environmental conditions under which the repair materials may be applied.
- h) The contractor shall employ Principal Technical Representative & skilled site workers who shall have adequate qualifications and experience for the proper execution of such works and already performed works of this kind with success.
- i) Contractor shall advise all workers working with epoxies to avoid contact with eyes and skin, inhalation of vapours, and ingestion. Necessary protective and safety equipments in the form of hand gloves, welders' goggles, shall be provided by the contractor and used on site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[66]	25.09.2014

- j) Care shall be taken to ensure that vibrations are well within acceptable limits for structural safety and users of the building.
- k) For the execution of protection and repair works, properly maintained plant and equipment permitting adequate treatment of the concrete substrate, proper execution of the work and determination of the required properties of the construction materials and construction measures must be present on the construction site.
- l) To ensure efficient and effective functioning, all plant and equipment must be checked on-site and at field material testing laboratory prior to first use and at appropriate intervals thereafter.

7.2 Chipping of Unsound/Weak Concrete Material

a) Purpose

To remove weak, loose or carbonated concrete over an area from its surface with pneumatically operated or power driven tools by chiselling, chipping etc.

b) Materials and Tools & Plants (T&P)

Power or pneumatically driven chisel, chipping tools complete with accessories, hand-tools like chisels, hammer, pH indicator (0.2% phenolphthalein solution) with pH range at least up to 10.5 and clinical injection syringe.

c) Safety

Safety shall be ensured in accordance with contract conditions and specifications.

Procedure

Step-1: Prop and support to relieve the structural member of stress and strains.

Step-2: Scaffolding, if necessary for the exterior members, shall be done for working upon the area.

Step-3: Working Platforms for interior members, if necessary, shall be erected suitably or provided as mobile.

Step-4: Provide Protective Screen, if necessary.

Step-5: Mark off the area to be repaired using straight lines between corners. The marked area shall have 90° corners with the sides parallel or normal to the direction of the reinforcement. The marked boundaries for the repair area should be a minimum of 50 mm outside the perimeter of the spall. For a single spall, the repair area should have a minimum width of 100mm in any direction. If a number of spalls are closely located to each other, these spalls should be included in a single area marked for repair.

Step-6: Cut shall be made along the marked boundary, normal-to-the surface. It should be made with a diamond cutter blade. However, when diamond cutting is not practical, the normal cut can be made with a power driven chisel. Minimum depth of cut shall be 10 mm. In situations where the diamond saw could cut

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[67]	25.09.2014

into the reinforcing steel due to inadequate concrete cover, the boundary edge should be formed manually by means of chisel and impact hammers. A cover meter could be used to estimate the depth of cover.

Step-7: Chipping to remove all the unsound and weak concrete material shall be done carefully from the damaged portions of structural members by adopting mechanical or manual means up to the required depth to produce sound concrete surface to a near uniform depth for the repair area.

d) Tolerance

The chipping tolerances shall be $\pm 5\text{mm}$.

e) Chiselling

Hand Tools are typically applicable for concrete removal for smaller, moderate and areas of limited access. Removal should begin at the interior of the repair area and progress toward the boundaries, using suitable hammer. Power Driven Chisels/Hammers are normally applicable for chiselling smaller thicknesses up to about 50 mm. Pneumatic Hammers are normally applicable for chiselling larger thicknesses in excess of 50 mm Mechanical Milling (single drum, rotary cutter head with Tungsten-carbide bits) is applicable for large areas where the concrete cover is to be removed. Care must be taken to avoid contact with the reinforcing steel as both the reinforcement and the cutter drum could be damaged. Rounded And Feathered Edges should be hand cut to form normal-to-the-surface boundaries. All the edges and cavities shall be square shouldered.

Step-8: Test for carbonation shall be carried out at embedded or exposed reinforcement locations, by spraying phenolphthalein indicator on concrete in contact and in the immediate vicinity of reinforcement soon after its chipping. As otherwise, chipped concrete surface in contact with air is likely to get carbonated soon after its coming in contact with atmospheric carbon dioxide.

Step-9: A full-depth chiselling and removal of concrete all round reinforcement shall be carried out, in case the concrete in contact and in immediate vicinity of the reinforcement is carbonated.

Step-10: Inspection and soundness testing, after concrete removal & cleaning, for weaknesses and delamination of exposed surfaces shall be visually carried out. If required, additional removal will be done.

Step-11: Cleaning of debris and dust shall be carried out from within the chiselled/ chipped area and its disposal as per direction of the Engineer-in-Charge.

7.3 Removing concrete all around reinforcement including from its behind

a) Purpose

To create an average clear air gap equal to nominal size of coarse aggregate plus 5 mm all around embedded reinforcement, in contact with carbonated concrete for rust removal & passivating its surface with fresh alkaline passivating coat and concrete/ mortar.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[68]	25.09.2014

b) Materials and T&P

Power or pneumatically driven chiselling, abrading, chipping tools complete with accessories, hand-tools like chisels, hammer, pH indicator i.e. 0.2% solution of phenolphthalein indicator for pH range preferably up to 11.5 or at least up to 10.5, clinical injection syringe.

c) Safety

Safety shall be ensured in accordance with contract conditions and specifications.

d) Procedure

Step-1: Prop and support, if not done already, to relieve the structural member of stress and strains.

Step-2: Scaffolding & working platforms for the exterior members, if not already done and if necessary, shall be erected for working upon the area.

Step-3: Working Platforms for interior members, if not already done and if necessary, shall be erected suitably or provided as mobile.

Step-4: Provide Protective Screen, if not already done and if necessary.

Step-5: Test for carbonation shall be carried out at embedded or exposed reinforcement locations, by spraying phenolphthalein indicator on freshly chipped concrete in contact and in the immediate vicinity of reinforcement.

Step-6: A full-depth chiselling and removal of concrete all round reinforcement shall be carried out, if the concrete in contact and in immediate vicinity of the reinforcement is carbonated. The concrete around reinforcement shall be removed so as to have a near uniform air gap of about 5 mm plus the nominal size of coarse aggregate to be used in repair concrete/mortar. However, the air gap shall not be less than 15 mm in any case. Power/pneumatic driven tools/chisels shall be used for such portions of carbonated concrete around reinforcement, which could not be removed manually, to achieve a near uniform required air gap all around including behind the reinforcement. Power Driven Chisels/Hammers are normally applicable for chiselling smaller depths up to about 50 mm. Pneumatic Hammers are normally applicable for chiselling larger depth in excess of 50 mm.

Step-7: Cleaning of debris and dust shall be carried out from within the chiselled /chipped area and its disposal as per direction of the Engineer-in-Charge.

7.4 Rust Cleaning from reinforcement steel

a) Materials and T&P

Chiselling, abrading, chipping, hammering, wire brushes, paint brush, abrading cloth, etc hand tools complete with accessories, tested and approved chemical rust remover.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[69]	25.09.2014

b) Safety

Safety shall be ensured in accordance with contract conditions and specifications.

c) Procedure

Step-1: Cleaning by manual method-

Remove the rust manually from all round the surface along the length of reinforcement, using hand tools like chisels, hammers, wire brushes, abrading cloth/paper, etc. This shall be continued manually along the length of the rusted reinforcement till such time that the steel surface is cleared of all rust that could be removed manually.

Step-2: Cleaning by chemicals –

Remove the Rust by using tested chemicals, if directed by Engineer-in-Charge, due to unsatisfactory results of manual rust removal. Chemical rust remover shall be brush applied over the reinforcement surface thoroughly all around the circumference and along the full length of rusted reinforcement. After 24 hours (or as prescribed by manufacturer) of its application, the surface shall be cleaned with wire brush and all loose particles removed. It shall be washed with water thoroughly and allowed to dry.

7.5 Cleaning Reinforcement and exposed concrete surface of loose and foreign material by means of sand blasting

a) Purpose

Clean the prepared concrete surface of all-loose, lightly sticking materials including the foreign materials, loose concrete, aggregates etc to provide a good bond with the applied repair material and clean the reinforcement surface of any minor rust remaining after manual and chemical cleaning to achieve shining bright metal.

b) Materials and T&P

Coarse sand conforming to Zone I or II as per IS: 383, Air compressor of a minimum 35 Kilowatt capacity, spray gun for sand, all related accessories for sand blasting, hand tools like wire brushes, chisels, etc

c) Testing of Materials and T&P

The sand shall be tested to conform to the specification.

The air compressor shall be tested to perform to the required standards as laid down in specifications of shotcreting.

d) Safety

Safety shall be ensured in accordance with contract conditions and specifications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[70]	25.09.2014

e) Procedure

Step-1: Specified tested coarse sand shall be collected at site in required quantity for sand blasting.

Step-2: Make available mechanical power driven air compressor in working condition at site with all required accessories for carrying out sand blasting as well as air blasting operations.

Step-3: Coarse sand shall be sprayed under pressure over the exposed surface so as remove all loose and foreign material and to cause an intense abrading of the reinforcement and removal of rust from entire surface of reinforcement to achieve shining bright surface. The sand blasted surface shall be subsequently cleaned with oil free air blast.

7.6 Providing drilling and inserting nipples along crack lines

a) Purpose

To fix injection nipples and seal the remaining portion of honey combed or cracked concrete /masonry for grout injection.

b) Materials and T&P

12 mm diameter approved PVC/aluminium /Galvanised Iron nipples, Chisel, hammer, power driven tool for chase cutting & drilling, hand operated blow out pump, sealing putty of polyester/epoxy/polymer modified mortar etc. and all related accessories and materials.

c) Testing

The sealing putty and the nipples shall be tested to conform to the manufacturers specifications. The power driven tools shall be test driven and their drill/cutting bits shall be tested for effectiveness before taking up the repair operation.

d) Procedure

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Personnel, Supervision, Product delivery, Storage and Handling etc.

Step-2: Identify the Cracks and mark the area for injection grouting.

Step-3: Prop & support the structural member, if required, to relieve it of stress and strains.

Step-4: Open up cracked surface by making 'V' notch or groove of size 12 mm x 12mm.

Step-5: Remove plaster, if required, to identify and mark the honey combed area.

Step-6: Drill holes at least 25 mm diameter and 40mm deep along crack lines at spacing of 300 mm or thickness of the structural member, whichever is less. In

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[71]	25.09.2014

honey combed area @ 9 nos per sqm. as directed by Engineer-in-Charge and up to 30 mm to 40 mm depth.

Step-7: Remove coarse debris and dust in opened up cracks and drilled holes by blowing oil free compressed air, if available with air compressor, otherwise with hand operated blow out pump. Concrete surfaces required to be grouted shall be free from all loose and unsound materials by means of mechanical abrasion using stiff wire brushes, after removing all loose areas with chisel and hammer. Area shall be made free from any deleterious materials, such as oil dust dirt etc. by means of oil free jet of compressed air. All prepared concrete surfaces shall be thoroughly inspected and got approved by the contractor.

Step-8: Insert 12mm dia specified injection nipples in holes drilled along crack lines and fix them by sealing only its sides with epoxy or polymer modified mortar.

Step-9: Seal the crack or the honey combed surface between the nipples by polymer modified mortar as may be approved by Engineer-in charge. The polymer used shall be of approved grade and applied as per specifications mentioned separately elsewhere. The polymer-modified mortar shall be moist cured for 1-3 days and allowed to gain strength before actual grouting commences.

7.7 Sealing of cracks by injection of advance grout

a) Purpose

To inject the specified grout into honeycombed or cracked concrete/ masonry

b) Materials and T&P:

Cement, sand. Water and admixture for cementitious grout shall be as per clause 5 of this specification.

Polymer: It shall be as specified and shall conform to ASTM-C-1059.

Hand/power operated grouting pressure pump/gun with pressure gauge. The grouting equipment shall be capable of supplying, mixing, stirring and pumping grout to the satisfaction of the Owner. The equipment shall have the capacity to inject grout at a pressure upto 7 kg per square centimeter measured at the grout connections. It shall be capable of mixing and pumping of cement sand grout 1:2 with water cement ratio ranging from 0.5 to 1.

Air compressor with all related accessories for carrying compressed air to the required location. Hand operated blow out pump may be allowed by Owner for small crack depths/areas.

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions), Mechanical blender for mixing, Spray equipment/brush for application of polymer modified/ bonding cement slurry

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[72]	25.09.2014

c) Execution:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured material (e.g. specified resin, hardener, polymer, cement, etc as may be required) shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the storage period shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3: If directed by Owner, collect random samples of materials for test and send to approved laboratories so as to ensure that they satisfy the physical and mechanical properties. The grout pump and the pressure gauge shall be tested before taking up the repair operation.

Step-4: Identify the Cracks and mark the area for injection grouting.

Step-5: Surface Preparation: The appropriate propping/supporting, surface preparation and crack sealing as per site requirements shall be completed, which may sequentially cover one or more of the following items of work:

- Prop & support the structural member to relieve it of stress and strains.
- Provide grouting nipples.

Step-6: Blow the compressed air followed by washing with water through nipples located at the highest level and downwards to ensure removal of even fine dust particles from the cracked surface, which could obstruct the free flow of grout material and impede its bonding with cracked surface (and drying with air blast wherever epoxy injection grout is to be used).

Step-7: Saturate the cracked surface in the vicinity of crack/honeycombed concrete/ masonry with water (but without excess water), only if the cementitious grout is to be injected. Otherwise, this step may be skipped.

Step-8: Prepare the injection grout as specified under clause 5 of this specification.

Step-9: Inject the approved & specified grout into the cracks by means of suitable gun or pump at a pressure of 1- 2 kg./cm² for epoxy grout and 4-7 kg./cm² for cementitious grout. In case of vertical cracks injection shall be started at the lowest nipple and continued until the injected grout begins to flow out at the next higher nipple. Whereas in other cases of horizontal locations, the injection shall be started from one nipple and continued until the injected grout begins to flow out at the other nipple.

The first nipple shall then be closed off and injection continued at the second until the grout flows out at the third. The process shall be repeated until the whole of the crack has been sealed. As soon as the system is cured, the nipples shall be cut.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[73]	25.09.2014

In case of Honeycombed Area, each grout hole shall be grouted individually. Grouting pressures to be used in the work will vary with the conditions encountered and different areas and the pressure used shall be between 1 to 4 kg/cm². The sequence of injection shall be as per the direction of Engineer-in-Charge.

7.8 Providing and inserting shear key bars

a) Purpose

Shear key bars are used for providing a structural connection of the applied repair material with the substrate/parent surface for transfer of forces occurring at the interface.

b) Materials and T&P:

Epoxy cartridges and specified lengths and diameter of steel reinforcement.

Standard Power driven drilling/hammering equipment, Hand operated blow out pump, brushes, epoxy dispenser, epoxy cartridge holder, disposable PVC mixing nozzle for epoxy, and any other incidental accessories and T&P items.

c) Procedure

Step 1: Mark the locations of shear keys and get the same approved for structural connection from the Owner.

Step 2: Drill holes to specified depth and diameter in concrete at marked locations for the specified dia of shear key bars.

Step 3: The drilled hole in dry state shall be cleaned with round brushes and by blowing air through a tube inserted in the hole and connected to hand operated blow out pump.

Step 4: Inject epoxy from the foil pack with the help of epoxy dispenser, epoxy cartridge holder and disposable PVC mixing nozzle inserted inside the drilled hole to fill it from bottom of the hole and upwards.

Step 5: Insert the reinforcing bar and allow the epoxy adhesive to cure.

7.9 Reinforcement for RCC works etc.

a) Purpose

To provide reinforcement in repair concrete for structural purposes, controlling effects of thermal variation or holding shotcrete/gunite material in position. The reinforcement material may comprise specified grade and quality with or without zinc coating.

b) Material & T&P:

Specified reinforcing material, necessary hand or power driven tools for cutting, bending, binding, transportation, handling and placement etc. Reinforcement bars if used shall conform to I.S. 432 (Part-I) or I.S. 1786. Welded wire fabric where used shall conform to I.S. 1566.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[74]	25.09.2014

c) Procedure

The general requirements, placing in position, measurement etc. shall be generally followed as in clause 4 of this specifications excepting those specifications provided in the following clauses.

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Testing of Material: The requisite number of test specimens of specified reinforcing material shall be collected from each batch of manufacture or supply received (whichever is less) for these to be tested for conformance to the specified requirements before use on the work.

Step-3: Execution:

The required reinforcement as per approved detailed drawings in the form of round bars or welded wire fabric in such a way so as to cause the least interference with placement of repair material.

d) Overlaps:

Lapped reinforcing bars shall not be tied together. They shall be separated by at least 50 mm wherever possible. Wire mesh shall be lapped by 1-1/2 squares in all direction. Minimum requirement of lap length of bars shall be as specified in I.S. 456.

e) Clearance around reinforcement:

Sufficient clearance shall be provided around the existing exposed and additional reinforcement to permit complete encasement with sound repair material.

f) Cover:

Minimum cover to reinforcement shall be as specified under clause 4 or as per I.S. 456. As far as possible the bars shall be arranged so as to permit shooting from opposite side.

g) Fixing:

Reinforcement shall be fixed to existing shear key bars and depth gauges driven into the concrete with wires and secured rigidly so that the vibration resulting from the deposition of repair material shall not impair or displace them.

h) Where Guniting /shotcrete to be done in more than one layer

In such cases, the additional reinforcement should be so fixed that it is encased in succeeding layer. No additional reinforcement is required to be fixed in first layer of guniting.

Mesh reinforcement shall be fixed in the manner so that it is firmly held at least 12 mm away from the parent concrete surface as well as from the final finished surface. It shall be ensured that it is stiffened enough and cannot belly out during the guniting / jacketing / concrete overlays with consequent lack of cover. It shall be done by tying with parent concrete surface through shear key

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[75]	25.09.2014

bars or depth gauges. GI-wire mesh fabric will add sacrificial "Zinc" coating & shall reduce corrosion process in the reinforcement. The wire mesh spacing shall be as specified in the drawings.

7.10 Alkaline Passivating bond coat over Reinforcement

a) Purpose

To protect steel reinforcement with a passivating alkaline layer provided all around its circumference along the length with strong adhesive to bond with applied repair concrete or mortar.

b) Materials and T&P:

Specified alkaline passivating & bonding materials e.g. CPCC material, epoxy, epoxy phenolic IPN-RB or specified polymer and cement, mixing water, necessary T&P for mixing and applying bond coat e.g. brush, mechanical mixer, mechanical stirrer, etc.

Epoxy Adhesives shall conform to ASTM C-882.

Polymer Latex shall conform to ASTM C-1059.

Cement shall be ordinary Portland cement conforming to IS: 269.

Patented materials e.g. CPCC or epoxy-phenolic IPN-RB as per licensee's specifications

c) Execution:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured repair materials shall be received at site in factory sealed containers with labels legible and intact, if the shelf life so permits. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3: Prepare the surface for treatment.

Step-4: Thoroughly inspect all the concrete surfaces prior to applications of passivating/ bond coat and get approved from the Engineer-in-Charge.

Step-5: Test the materials by taking random samples and testing in approved laboratories so as to check whether they satisfy the physical and mechanical properties.

Step-6: Make available at site all necessary mechanical equipment as under:

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions),

Mechanical blender for mixing

Brush for application of specified and approved passivating/bond coat.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[76]	25.09.2014

Step-7: Material Mixing: Components of the passivating/ bond coat mix shall be weigh batched and mixed in specified proportions in a clear container free from harmful residue or foreign particles. The components shall be thoroughly blended with a mechanical mixer to a uniform and homogeneous mixture. Small batches (upto 1 litre) may however be allowed by manual mixing using spatulas, palette, knives etc.

Step-8: Material Application: The alkaline passivating & bonding material shall be applied to prepared reinforcement substrate after tying in new reinforcement wherever specified in the form of bars or welded wire fabric. It shall be applied to reinforcement surfaces by stiff nylon bristle brush. The coating material shall be worked well all round the periphery and along its exposed length using a stiff brush ensuring that no pinholes are remaining. The second coat, if required, the same shall be applied as per manufacturer's recommendation after the first coat is touch dry.

7.11 Bonding coat for hardened concrete with repair concrete/shotcrete/cement mortar

a) Purpose

To provide adequately strong adhesion of parent concrete with applied repair concrete or mortar.

b) Materials and T&P

Specified bonding materials e.g. epoxy or polymer and cement, mixing water, necessary T&P for mixing and applying bond coat e.g. brush, spray gun, mixer, mechanical stirrer, etc.

Epoxy Adhesives shall conform to ASTM C-882

Polymer Latex shall conform to ASTM C-1059.

Cement shall be ordinary Portland cement conforming to IS: 269.

c) Execution

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured repair materials shall be received at site in factory sealed containers with labels legible and intact, if the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer- in-Charge Full quantity shall be worked out as theoretically required for consumption in the whole work

Step-3: Prepare the surface for treatment.

Step-4: Saturate the surface with water but shall be free of excess surface water, debris and dust, where cementitious bond coat is to be applied. Otherwise, surface to remain dry and clean of debris and dust.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[77]	25.09.2014

Step-5: Thoroughly inspect all the concrete surfaces prior to applications of adhesive and get approved from the Engineer-in-Charge.

Step-6: Test the materials by taking random samples and testing in approved laboratories so as to check whether they satisfy the physical and mechanical properties.

Step-7: Make available at site all necessary mechanical equipment as under:

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions), Mechanical blender for mixing Spray equipment, brush for application of epoxy, polymer modified, bonding cement slurry.

Step-8 Bond Coat Mixing: Components of the bonding coat mix shall be weigh batched and mixed in specified proportions in a clear container free from harmful residue or foreign particles. The components shall be thoroughly blended with a mechanical mixer to a uniform and homogeneous mixture. Small batches (upto 1 litre) may however be allowed by manual mixing using spatulas, palette, knives etc.

Step-9 Bond coat application for jacket concrete/ shotcrete/ Mortar placement: The specified adhesive shall be applied to concrete surface at atmospheric temperatures below 40°C for epoxy adhesive and below 30°C for polymer modified cement or cement-sand slurry adhesive. Bonding coat shall be applied by spray equipment or stiff nylon bristle brush as approved by Engineer-in-Charge. The bonding material shall be worked well into the surface of the parent body ensuring that no pinholes are visible.

Polymer modified bonding cement slurry shall be applied to a thickness not in excess of 2 mm.

If necessary, a second coat shall be applied at right angles to the first to ensure complete coverage and absence of pin holes.

All concrete surface shall be well protected beyond limits of surface receiving adhesive against spillage.

Step-10 Repair Material Application: Fresh plastic concrete/ shotcrete/ mortar shall be applied while adhesive is still tacky and well within the pot-life/ setting period. If adhesive cures to the extent of losing its tack or has set before plastic concrete/shotcrete/mortar is placed, the same shall be removed or slightly abraded and second coat of adhesive applied. Freshly placed plastic concrete shall be thoroughly consolidated to ensure full bonding of new concrete with the substrate.

d) Bond of repair with parent concrete:

Evaluate bonding of fresh concrete/ shotcrete/ mortar to existing concrete after the fresh material has cured for not less than 7 days by sounding and tapping fresh concrete with a blunt metal instrument to the satisfaction of Engineer-in-charge. Suspect inadequate bonding, if a hollow sound is detected in any area.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[78]	25.09.2014

In case of conflicted location contractor shall extract one core from the repaired surface area at the end of 28 days.

Conduct one core test at random for checking the bond, for every 100 square metre or part thereof. The contractor shall core each area after 28 days of application of concreting/ shotcreting/ repair mortar application for determination of bonding adequacy.

Core drilling shall be done through applied repair material and into the existing concrete. Core diameter shall be not less than three times the nominal size of the coarse aggregate used in repair material or as required by the Engineer-in-Charge. Length of cylindrical cores shall preferably be twice the core diameter or twice the thickness of applied repair material or as instructed by Engineer-in-Charge but in any case not less than the dia of the core.

Cores shall be visually inspected by Engineer-in-Charge for evidence of poor workmanship.

Cores shall be tested in tension to evaluate the quality of bond between new concrete/shotcrete/mortar and the parent concrete. If the failure is in the parent concrete the bond of new repair material shall be deemed to be satisfactory.

Failure at the bond line or in the repair material shall be concluded as lack of proper bond or inadequate strength of repair mortar

Dismantle such areas of work failed in bond or repair material and re-prepare the surface after chipping off new concrete/mortar work and abrading the epoxy/polymer/cement slurry interface. Nothing for testing concrete for bond between old and new concrete shall be paid separately.

7.12 Curing of RCC Surfaces etc

a) Purpose

To ensure satisfactory hydration of cement by retaining or replenishing the mixing water lost due to natural drying and evaporation process for a specified period through exposed cementitious surfaces of the freshly placed cement mortar/ concrete.

b) General

Importance of wet curing to all items of work involving use of cement can not be over emphasised. Any surface experiencing discontinuity of dampness of surface with any patch having dried out during the specified period of curing, it shall be prominently marked with lime or other suitable prominent colour.

c) Materials and T&P:

Curing compound, brush or hand operated spraying gun and all other related accessories for application on Concrete/Plastered Surface.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[79]	25.09.2014

d) Procedure:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of specified manufactured material shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out theoretically for consumption in the whole work.

Step-3

- **Moist Curing:**

Cover all exposed surface of concrete, when the concrete begins to harden i.e. two to three hours after compaction with moist gunny bags or any other material approved by the Owner.

Keep the exposed surfaces continuously damp after its final setting (i.e. after a maximum of 8 hours of concreting) by ponding with a sheet of water or by covering with a layer of sacks, canvass, hessian or similar water absorbent materials constantly kept wet by water sprinkling for at least 7 days, where ordinary portland cement is used and 10 days, where portland pozzolana cement is used from the date of placing of concrete. For concrete work with other types of cement, curing period shall be as per manufacturer's recommendations or as directed by the Owner.

- **Using Curing compound:**

Testing of Materials:

It must be ensured that curing compound should neither affect the strength nor the surface of concrete. It shall not leave any undesirable stains on surface to affect the bond of plaster or other finishes to be applied later. It should be soluble in water, so that it can be removed by splashing or washing with water without scrubbing the surface.

Test for Efficacy:

The testing of curing compounds shall be done from each lot of curing compound received at site by casting two sets of 15 cm cubes with each set having 6 cubes. One set shall be moist cured by covering with damp gunny bags and subsequently by immersing under water and the other set by applying curing compound on top after 2 to 3 hours of casting and subsequently on de-moulding apply on the remaining faces all around. The cubes shall be kept in an environment similar to which the actual structure is exposed for a period of 7 days after its casting. Three concrete cubes each from both sets shall be tested after 7 days for their crushing strength as per standard test procedure. The average crushing strength of cubes cured with curing compound shall be not less than 95% of the crushing strength of cubes cured under damp or immersion curing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[80]	25.09.2014

Test for Staining:

The set of three sample cubes applied with curing compound, remaining after 7-day cube crushing strength test, shall be washed with water with soft brush scrubbing with nylon bristles and allowed to dry for a period of seven days in an atmosphere with relative humidity not exceeding 40% at ambient temperature. The other set of three cubes cured for seven days under damp or immersion conditions shall also be kept for another seven days under identical humidity and temperature conditions. The surface of the two sets of such cubes shall be compared by closely observing for any visible stain and texture that may detrimentally affect its bond with subsequently applied plain plaster or aesthetic appearance. Such observations shall be recorded in three categories as no effect, slight effect and moderate effect. The curing compound shall be considered as acceptable in the 'no effect' category and unacceptable in the 'moderate' category. The decision of Engineer-in-Charge, which shall be final and binding, based on the likely use of finished surface of concrete/plaster shall determine the acceptability of the 'slight effect' category.

Concrete curing compounds, after testing satisfactorily for efficacy, may be used in lieu of moist curing with the permission of the Engineer-in-Charge. Such compounds shall be applied to all exposed surfaces of the concrete by spraying or brushing within two to three hours of casting and well within an hour of removal of formwork.

7.13 Engineered Steel Tubular double Scaffolding System

a) Purpose

To provide a scaffolding system with adjustable working platforms on the exterior of the building for the workmen to work upon any part of the area to be accessed safely and with ease for surface preparation, application of repairs and construction activity.

b) Materials

The standard proprietary tubular double scaffolding system of repute with all accessories, working platforms etc.

c) Design

It shall be designed for all the incidental dead, live and wind loads as per IS: 875 in steel tubular sections as per general design considerations governed by IS:800. The design of the scaffolding system shall cater to the safety features for the workmen.

d) Fabrication and Erection

Fabrication and erection shall be done as per the design brief and installation instructions of the proprietary firm. It shall be maintained in functional condition for the work duration.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[81]	25.09.2014

7.14 Temporary barricading using angle iron verticals and sheet panels

a) Purpose

To provide a barricading on ground to physically define the boundaries of the site of construction/repair activity for restricted entry of only those involved with the construction work.

b) Materials

Available Corrugated G.I. Sheet minimum 24 G thick; Framing structural material at least MS Angle iron of size [40x40x5mm] or equivalent.

c) Fabrication & Erection

Size of framing panel shall be decided depending upon site conditions and these could be approximately 2.0 metres long with height as 1.8 metre.

It shall be made up at least of two verticals, each with additional length of about 600 mm for fixing in to ground firmly and two horizontals equal to the length of panel.

It shall be made up by cutting the structural sections to size, shear punching holes in verticals and horizontals for nuts and bolts or making other suitable provision for receiving CGI sheet or other specified panelling material and connection of panel with adjoining panels.

Fabrication of frame of an individual panel shall be by welding at corners, welding MS plate at base of verticals or any other acceptable practice approved by Engineer-in-charge.

G. I sheet or other specified panelling material shall be suitably fixed. It shall preferably be done by means of nuts and bolts at its ends spaced at about 300 mm c/c transversely and at about 600 c/c longitudinally along corrugations. The corrugations of CGI sheet shall run along the shorter span of the panel.

In case of newly fabricated panels, these shall be painted with red oxide zinc chromate primer on steel work and approved primer on other material and at least one coat of paint of approved shade. In case of used panels, one coat of paint of approved shade shall be applied over the existing paint. The portion of verticals to be embedded in ground shall be suitably protected against rusting by painting it with bitumen or other suitable paint.

The fabricated panels shall be suitably fixed vertically and firmly in to the ground to the satisfaction of Engineer-in charge by maintaining a uniform height of about 1.8 metres above GL and connecting each panel with the adjoining panels with nut and bolts or other suitable means.

Suitable provision of frame/posts in the openings provided in barricading shall be made for receiving door shutter at locations as approved by Engineer-in-Charge.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[82]	25.09.2014

7.15 Temporary protective fabric screens

a) **Purpose**

To protect passersby from falling debris and also to protect the workmen and structure being repaired against direct exposure to sun.

b) **Materials:**

For screening purpose jute cloth, woven PVC cloth, geo-textile or wire-mesh as specified and approved by Engineer-in-Charge shall be used, which shall conform to their relevant BIS Code. Screen materials shall be fixed by suitable means comprising of M.S.Flats/ J-bolts /nails/clamps, etc with washer or any other suitable means on frames of existing scaffolding etc.

c) **Procedure**

Scaffolding, if required, comprising of verticals, horizontals and diagonal bracings of steel tubes shall be fixed over ground which is payable separately.

One end of the screening material, brought to site in looms/rolls, shall be properly fixed over top horizontal member with suitable means and suspended so as to cover the required area.

The vertical fall of screen shall be suitably fixed/firmed up at intermediate levels so as to keep it in position during the work duration.

Next strip of the screening material shall be fixed with its sides stitched or suitably jointed or lapped with the previous ones as approved by Engineer-in-charge.

Spacing of frame member of scaffolding shall be so selected that the sagging of screen shall not hinder the repair process.

The contractor shall maintain the protective screens in acceptable conditions for the entire work duration as required by the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[83]	25.09.2014

8. CONCRETE RETROFITTING METHODS

In selecting the retrofitting method, the current status of the existing concrete structure as determined through inspection, the performance of the structure, the performance required of the structure after retrofitting, the conditions for retrofitting construction work, the ease of maintenance, economy and other factors shall be considered.

At the stage of selecting the retrofitting method, the current status of the existing structure and its performance shall be obtained, and the performance required for the structure after retrofitting and the conditions for retrofitting work shall be determined. Factors that should be considered in selecting the method include the effectiveness of the various retrofitting methods with respect to the required performance improvements, the viability of execution of the retrofitting work, the impact of the retrofitting work on the surrounding environment, the ease of maintenance after retrofitting, economy and other factors.

Various retrofitting methods listed below shall be used for retrofitting objective:

8.1 Retrofitting of concrete members

a) **Continuous fiber reinforced plate bonding construction method:**

Bonding continuous fiber reinforced plates to the surface of the existing structure to restore or improve load-carrying capacity

b) **Continuous fiber reinforced plate jacketing construction method:**

Jacketing with continuous fiber reinforced plates around the periphery of the existing structure to restore or improve load-carrying capacity and deformation characteristics

c) **Prestressed concrete jacketing construction method:**

Placing pre-stressing wires and pre-stressing stranded steel wires in place of lateral ties around the periphery of existing member sections and using mortar and concrete to bond them in order to reinforce the structure. To increase the restraining effect of the inner concrete, the pre-stressing steel is generally stressed during placement.

d) **Pre-stressing introduction (internal cable) construction method:**

Using internal cables for the existing concrete members to provide pre-stressing and restore or improve the load-carrying capacity of the members.

e) **Repaving method:**

Replacing some or all of the existing concrete members with new members through the use of precast members or concreting on site to restore or improve load-carrying capacity.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[84]	25.09.2014

8.2 Retrofitting as a structural body

a) Beam (girder) addition method:

Adding beams between the main girders of the existing reinforced concrete deck to reduce the deck span and restore or improve the load-carrying capacity of the reinforced concrete deck.

b) Seismic wall addition method:

Placing new reinforced concrete walls between existing reinforced concrete rigid-frame bridge piers and bonding them to form a continuous unit in order to restore or improve the load-carrying capacity as a structural body.

c) Support point addition method:

Supporting the intermediate sections of the beams and other existing concrete members with new members to reduce the span of the members in order to restore or improve the load-carrying capacity as a structure.

d) Seismic isolation method:

Using seismic isolation bearings and the like to reduce the seismic energy applied to the structure in order to improve its various performance values during an earthquake.

8.3 Foundation retrofitting

a) Underground wall (beam) addition method:

Connecting the foundations with cast-in-site diaphragm walls and underground connecting beams to distribute stress and ensure the stability of the entire system.

b) Pile/footing addition construction method:

When pile foundations are damaged or there is residual displacement, adding piles or footings to increase the load-carrying capacity of the foundation.

c) Foundation improvement method:

Improving the ground around the foundation with cement improvement materials to improve the ground bearing capacity and horizontal foundation resistance. Also prevents excessive pore water pressure and liquefaction.

d) Steel sheet-pile coffering construction method:

Placing sheet-piles around the periphery of the footings and bonding them to the footings to improve bearing capacity and horizontal resistance.

e) Foundation compacting method:

When insufficient foundation bearing capacity is a concern due to scouring or the like, using concrete or the like to compact the ground around the foundation in order to restore bearing capacity.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[85]	25.09.2014

8.4 Repair of cracks and missing sections

a) **Cracks fill method:**

Forcing low viscosity resin and ultra-fine cement into the cracks in existing concrete members to seal the cracks.

b) **Fill method:**

Filling cracks, rock pockets, cavities, peeling and other small-scale missing sections in existing concrete members with resin and mortar to repair sections.

c) **Section repair method:**

Removing deteriorated or damaged portions of existing concrete members and then restoring these members to their original sectional status using materials with excellent bonding to existing concrete.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[86]	25.09.2014

9. SHORING AND UNDERPINNING

9.1 Material and Equipment

- a) The contractor shall furnish all materials, tools, equipment, facilities and services as required for providing the necessary shoring and underpinning work and facilities. Jack and jacking equipment shall be more than adequate for the imposed loads and shall be provided with calibrated gauges.
- b) Shoring and bracing materials
Provide heavy timber posts, beams, planks, boards, pipe struts, pin piles, and accessories as required.
- c) Lagging and sheeting material
Provide heavy timber boards, planking or sheeting as required. Lagging board shall be secured in place by steel H-piles, with boards inserted between the H-flanges.
- d) Underpinning Pier
An excavation pit, provided generally by manual excavation, which is carried to a pre-selected bearing surface and then filled with concrete to provide supplementary foundation support for the underpinning structure.
- e) Concrete
Refer clause 4 of this specification for concrete requirements.
- f) Grout
Refer to Clause 5 of this specification for Non-Shrink Grout requirements.
- g) Structural Steel
Refer to Clause 9 of this specification for Structural steel requirements

9.2 Execution

- a) Detection of Movement
 - For each existing structure that may be affected by the work, install settlement markers on each footing, building corners, wall or surrounding improvements to be monitored. Settlement markers shall be capable of being read to an accuracy of 1.52mm.
 - Take and record readings not less than once per week during performance of the work until the permanent structures is complete to the ground level.
 - Stop work; notify the Engineer, and take immediate remedial action if movement of the existing structure occurs during performance of the work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[87]	25.09.2014

- Upon completion of the work, take weekly readings of the measurement points for a period of 4 weeks or longer if movement persists, and report the results to the Engineer.
- The detection of movement shall be performed by a qualified licensed land surveyor or civil engineer.

9.3 Shoring and Underpinning

- Existing footings, foundations, pile caps, grade beams, retaining walls, or pavement which may be affected by excavation operations shall be shored or underpinned adequately or otherwise protected against settlement and shall be protected against lateral movement.
- Provide soldier piling, lagging and sheeting, tie-backs, slurry diaphragm wall, and cementitious grouting, as required, to hold back earth at excavations and as required to prevent cave-ins and earth sloughs.
- Footings, foundations, pile caps, grade beams, retaining walls, or pavements which have been undermined by earthwork and pile-driving operations shall be filled and supported with concrete extended to undisturbed bearing earth or bedrock.
- Concrete may be placed as a stiff mix of minimum slump (dry pack), or concrete may be pneumatically placed (shotcrete), or concrete may be placed by conventional methods with concrete formed to hold it in proper position.

9.4 Concrete Piers, Walls and Pile caps

- Install concrete underpinning piers, walls, and pile caps as indicated, with the bottom at the indicated or bearing elevation and the top approximately three inches below the structure to be underpinned. Dry pack the space within three days after concrete placement is completed.
- Where earth forms are indicated, install waterproof building paper or board between the earth and concrete to prevent water loss from the fresh concrete.
- Do not remove support of existing structure until concrete piers, walls, or pile caps have attained design strength.

9.5 Piles and Caissons

- Install pipe pile shells or drilled shafts at locations indicated, and extend from underside of existing footings to indicated elevations, plus additional penetration if required to develop the design working load of the pile or caisson.
- Distribute jacking reactions over the existing structure in a manner that will not overstress or deflect the existing structure.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[88]	25.09.2014

- Weld splices where indicated. Provide watertight welds capable of developing the full strength of the pile or caisson. Align splices to ensure the straightness of the pile from top to tip. Use outside sleeves and backup rings as necessary.
- Where the pile tip is below the ground-water table, maintain the elevation of the water inside the shell at approximately the elevation of the ground-water table during installation of the shell.
- After installation of the shell, apply the full design-working load to the empty pile shell and maintain until there is no measurable settlement over a one hour period.
- Maintain the excavation within the pile shell approximately 12 inches above the tip during driving, and dewater pile shells prior to filling with concrete in a manner which will prevent loss of earth or soil at the tip. An earth plug may be left in the pile tip or a concrete plug may be placed and cured prior to dewatering pile shells.
- After load testing to the design load, dewatering, and inspection of the shell by the Engineer, fill accepted pile shells with concrete in the presence of the Engineer. Keep an accurate record of the volume of concrete deposited in each pile. Deficiencies revealed by comparing the volume of the inside of the pile with the volume of placed concrete will be cause for rejection of the pile or correction of the deficiency.
- Securely wedge in place with steel wedges those piles that have satisfied the load-testing requirements. Weld and encase in concrete all wedges, plates, wedging struts and piles, as indicated or required.
- Following completion of load transfer of underpinned structures, fill the underpinning pits with concrete as indicated. Provide reinforcement, shear keys, dowels, and water stops as indicated or required. Place concrete to within 3 inches of the underside of the existing foundation. After three days, dry pack the space between the foundation and concrete.

9.6 Load testing of piles and acceptance criteria

- After the concrete within the pile or shaft has set for at least 24 hours, test each pile or pier by jacking to a load equal to 150 percent of the design-working load of the pile. Maintain the load until there is no measurable settlement of the pile over a one-hour period.
- Load-test piles in sequences and groupings that will minimize or eliminate eccentric loadings on the existing foundation and piles.
- Piles will be rejected and shall be retested if, in the opinion of the Engineer, there is a danger of unequal loading.
- Should the existing structure fail to furnish sufficient reaction to installed underpinning piles to the test loads specified, provide additional reaction to prevent damage to, and movement of, the structure during installation of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[89]	25.09.2014

piles, and to obtain specified underpinning test loads. The additional reaction shall not detrimentally affect the structure.

- Maximum out-of-plumb tolerance for installed piles: two percent.
- Maximum offset of top of pile from the design center: 3 inches.

9.7 Fill and backfill

Provide engineered fill and backfill in accordance with Clause 3 of this specification, after acceptance of the underpinning by the Owner.

9.8 Temporary Supports

Install temporary supports where necessary to support structures to be underpinned and those that will be affected by underpinning and restoration work.

9.9 Restoration

Restore existing structures to conditions equivalent to those existing prior to the start of shoring and underpinning work, including repair of any settlement-related damage.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[90]	25.09.2014

10. STRUCTURAL STEEL WORK

Design of structural steel work shall include generally but not be limited to the steel constructions listed below:

- Steel building structure and open structures including beams, columns, bracings, supporting structures for floors, roof slabs, cladding etc.
- Hoist & monorail supporting beams etc.
- Platforms and walkways
- Ladders, staircases, handrails, etc.

10.1 Design

(a) General

Concrete floors shall be considered to provide continuous lateral support to the top (compression) flange of the support beams. However where large cut outs are to be provided in the floor slabs horizontal floor bracing shall be provided. Grating / Chequered plate floor shall neither be considered to provide lateral support to the top flange of supporting beams nor to provide a shear diaphragm. Adequate lateral support and horizontal bracing shall be provided as required in such cases.

Floors for vibrating machines of all kind together with supporting framework shall be adequately braced in both horizontal and vertical planes. Floors or structure supporting mechanical equipment shall be designed to minimize vibration, avoid resonance and maintain alignment and level.

(b) Design of structure

The Design of steel structures shall be done by Working stress or Limit state method, in accordance with the provisions of IS: 800 and other relevant IS codes as applicable to specific structures. Basic consideration for structural framing shall be stability, rigidity, building usage, ease of fabrication / erection and overall economy. Additional bracings / moment connections shall be used to assure stability of structures. Structure shall be designed such that the surfaces of all parts shall be accessible for inspection, cleaning, painting and maintenance. Most of steel superstructure shall be designed as simple space frame structures. Simple space frame design utilizes single-span beam systems, vertical diagonal bracing at main column lines and horizontal bracing at the roof and major floor levels.

Large span built-up girders shall be single web plate girders of welded construction with bearing and intermediate stiffeners. For lifting / monorails beams ISMB sections shall be preferred and the bottom flange of all beams shall be checked separately for distortion and reinforced suitably if required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[91]	25.09.2014

Columns shall be designed to support the load combination which results in maximum interaction ratio. Exterior columns shall be designed to resist moments due to wind & seismic. Columns shall also be designed to resist moments caused by discontinuous vertical bracing or non-concentric bracing work points. Column base can be fixed or pinned. Lateral forces shall be resisted by rigid jointed moment connections in rigid frame design. For design which requires the use of the minimum column load (such as, uplift on anchor bolts, column axial tension, etc.) use 90 % of the column dead load and no live load. Uplift forces from vertical bracing and Wind uplift on the roof shall be included where applicable.

Permissible stresses for different members shall not be allowed to exceed by 33.33 % under wind and seismic conditions. However, members who shall be designed primarily to resist wind load such as bracing members, no increase in permissible stresses will be permitted. However, permissible stresses in bolts and welds shall be allowed to exceed up to 25 % only.

Base plates shall be placed on foundation pedestal with grouting. For large base plates necessary grout holes shall be provided. All anchor bolts for fastening steel columns on foundation shall be embedded in foundation during concreting itself. No anchor pockets in foundation shall be allowed. Design of base plates shall be based on design pressure on foundation which shall not exceed the following:

Pedestal in concrete grade M30 7.50 N/mm²

The total horizontal shear force at the base of column is transferred to the column pedestals through friction between the base plate and the grout. A coefficient of friction of 0.30 shall be used in conjunction with the minimum column load. If the horizontal shear force exceeds the frictional resistance force or if the column is subjected to a net uplift load, the total force shall then be transmitted through shear bars / shear keys welded to the base plate. Anchor bolts are not assumed to resist any horizontal shear force. Necessary recesses shall be kept in the foundation concrete for shear lugs.

Static analysis of overhead conveyor galleries upto a span of 24 m is allowed. However dynamic analysis shall be carried out for overhead conveyor galleries exceeding 24 m span.

For equipments, the bolt shall be either embedded or placed inside the pedestal and grouted with non-shrink grout.

The following criteria shall be followed for posting loads on the design drawings. For vertical beam reactions, the load shall be posted whenever the value exceeds the maximum allowable uniform distributed load. For axial loads in floor beams, the actual horizontal load which the beam end connection must resist shall be posted for each end of the beam. Note that this value may be different for opposite end of the same beam. For truss members, only one member force shall be noted for each member.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[92]	25.09.2014

(c) Permissible deflections

The permissible deflections of various steel members under normal loading conditions shall be as specified below. For calculation of deflections in structures and individual members dynamic effects shall not be considered, unless specified otherwise. Also, no increase in deflection limits shall be allowed when wind or seismic loads are acting concurrent with normal loading conditions.

• **Vertical deflection**

a) For beams supporting dynamic equipment	Span / 500
b) For beams supporting floors / masonry	Span / 325
c) For beams supporting pipes (pipe racks)	Span / 400
d) For roofing and cladding components	Span / 250
e) For gratings and chequered plates	Span / 200 subject to a maximum of 6 mm

For crane gantries or any member subjected to working loads, the maximum deflection under dead load and live load excluding impact shall not exceed the following values:

For manually operated cranes and monorails : Span / 500

For electric overhead cranes

i) Up to 50 t capacity : Span / 750

ii) Over 50 t capacity : Span / 1000

• **Horizontal deflections**

The permissible horizontal deflections shall be as per following unless specified otherwise:

a)	Single storey building (without crane load)	Height / 325
b)	Multistoried building (without crane load)	Height / 500
c)	Pipe rack columns	Height / 200
d)	Open Structures	Height / 200
e)	Crane gantry girder due to surge	Span / 2000 limited to maximum of 15 mm
f)	Building main columns at crane rail due to action of crane surge load only	Height / 2500 limited to level maximum of 10 mm
g)	Open gantry columns at crane rail level due to action of crane surge load only	Height / 4000 limited to maximum of 10 mm

Provisions of IS: 800 and relevant latest IS Codes shall be followed for limiting deflections of structural elements not listed above.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[93]	25.09.2014

(d) Minimum thickness and size of steel elements

• **Minimum Thickness**

The minimum thickness of various components of a structure and hot rolled sections shall be as follows. The minimum thickness of rolled shapes shall mean flange thickness regardless of web thickness. Structural steel members exposed to significantly corrosive environment shall be increased suitably in thickness or suitably protected otherwise as per good practice and sound engineering judgement in each instance.

Trusses, purlins, girts and bracing	6 mm
Columns and beams	8 mm
Gussets	8 mm
Stiffeners	8 mm
Base plate	10 mm
Chequered plates	6 mm o/p
Grating flats	5 mm

Minimum thickness of structural members other than gratings and chequered plate directly exposed to weather and inaccessible for painting and maintenance shall be 8 mm.

Chequered plate shall conform to IS: 3502 (latest) and minimum thickness of chequered plate for floorings, covers etc shall be 6 mm.

• **Minimum Sizes**

The flange width of purlins supporting light weight concrete slab shall not be less than 65 mm and for those supporting roof sheeting and wall cladding it shall not be less than 50 mm. Width of steel rolled section connected to other member shall be at least 50 mm. The depth of beams for platform of all structures shall not be less than 125 mm.

(e) Slenderness and depth ratios

The slenderness ratio of main members in tension, compression or bending shall be in accordance with IS: 800.

The following limiting ratios of depth to span shall be considered as a general guide.

Truss	1 / 10
Rolled beams and girders for Ordinary floors and rafters	1 / 24
Supporting floor beams for vibrating Machines / equipments	1 / 15
Roof purlins and girts	1 / 45
Gable columns	1 / 30

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[94]	25.09.2014

(f) Design of Connections

Welding will be done in accordance with the recommendations of IS: 816 and IS: 9595.

Shear connections will be designed for 75 % of section strength for rolled sections and 80 % of section strength for built up section or rolled section with cover plates. Designed shear force shall be more than actual shear. Moment connections between beam and column will be designed for 100 % of moment capacity of the beam section.

All butt welds will be full penetration butt welds.

Size of fillet weld for flange to web connection for built up section will be as follows:

- i) Able to take full shear capacity or actual shear whichever is more for box section
- ii) Able to take 80 % of full shear capacity or actual shear (if indicated in drawings) or shall be 0.5 times of the web thickness whichever is more. For I-section Weld will be double fillet
- iii) All welds will be continuous. The minimum size of the fillet weld will be 6 mm as per relevant IS code

Connection of vertical bracings with connecting members will be designed for full tensile capacity of the bracings. The connection between top flange & web of built-up girder will be full penetration butt weld & for bottom flange, connection may be fillet weld.

Connection of base plate & gusset members with the columns will be done considering that total load gets transferred through weld.

Splicing

All splicing work will be full strength. Field splicing will be done with web / flange cover plates. For, exceptional cases the field splicing will be designed for 50 % of load carried by the cover plates and remaining 50 % load through full penetration butt weld. Shop splicing for all sections other than rolled will be carried out by full penetration butt welds with no cover plates. Splicing for all rolled sections will be carried out using web and flange cover plate. For design efficiency of site weld shall be considered as 80 %.

Insert plates

Insert plates shall be designed / checked for shear and bending moment. All lugs shall be checked for tension. Bond strength of concrete shall also be checked. Lugs using steel bars shall preferably be fillet welded to the plate to transfer full strength of the lug.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[95]	25.09.2014

10.2 Fabrication

(a) General

Fabrication drawings shall be prepared according to the provision of IS: 800, IS: 813, IS: 816, IS: 9595, IS: 1367 and IS: 9178.

The work to be provided by the Bidder, unless otherwise specified elsewhere in the contract, shall include, but not be limited to the following:

- i) Preparation of complete detailed fabrication drawings and erection marking drawings required for all the structures covered under the scope of the contract based on design drawings submitted by the Bidder and approved by the Owner/Consultant.
- ii) To submit revised design with calculations and detailed fabrication (drawings in case any substitution of the designed sections are to be made.
- iii) To submit design calculations for joints and connections developed by the Bidder along with detailed fabrication drawings.
- iv) Furnish all materials, labour, tools and plant and all consumables required for fabrication and supply, all necessary bolts, nuts, washers, tie rods and welding \ electrodes for field connections. The field connection materials supplied by the Bidder shall be to the extent of actual requirement plus 10 % (ten percent).
- v) Furnish shop painting of all fabricated steelwork as per requirements of this Specification.
- vi) Suitably mark, bundle and pack for transport all fabricated materials.
- vii) Prepare and furnish detailed Bill of Materials, Drawing Office Dispatch lists, Bolt List and any other list of bought out items required in connection with the fabrication and erection of the structural steelwork.

(b) Conformity with Design

Except where the standard connection details are furnished, the Bidder shall design all connections, supply and fabricate all steelwork and furnish all connection materials, Shear connectors / shear lugs on the beams in accordance with the approved drawings and / or as instructed by the Owner/Consultant Keeping in view the maximum utilization of the available sizes and sections of steel materials. The methods of painting, marking, packing and delivery of all fabricated materials shall be in accordance with the provisions of the contract and / or as approved by the Owner/Consultant. Provision of all relevant Indian Standard Specifications and Codes of Practice shall be followed unless otherwise specified in the contract.

(c) Quality control

The Bidder shall establish and maintain quality control procedures for different items of work and materials to the extent he deems necessary to ensure that all work shall be performed in accordance with this specification. In addition to the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[96]	25.09.2014

Bidder's quality control procedures, materials and workmanship at all times shall be subjected to inspection by the Owner/Consultant. As far as possible, all inspection by the Owner/Consultant shall be made at the Bidder's fabrication shop whether located at Site or elsewhere. The Bidder shall co-operate with the Owner/Consultant in permitting access for inspection to all places where work shall be done and in providing free of cost all necessary help in respect of tools and plants, instrument, labour and materials required to carry out the inspection. The inspection shall be so scheduled as to provide the minimum interruption to the work of the Bidder.

Materials or workmanship not in reasonable conformance with the provisions of this Specification may be rejected at any time during the progress of the work.

The quality control procedure shall cover but not be limited to the following items of work

- a) Steel Quality, manufacturer's test certificates, test reports of representative samples of materials from unidentified stocks if permitted to be used.
- b) Bolts, Nuts Manufacturer's certificate, dimension & Washers checks, material testing.
- c) Electrodes Manufacturer's certificate, thickness and quality of flux coating.
- d) Welders .Qualifying Tests
- e) Welding sets Performance Tests
- f) Welds Inspection, X-ray, Ultrasonic tests
- g) Paints Manufacturer's certificate, physical Inspection reports
- h) Galvanizing Tests in accordance with IS: 2633 and IS: 4759.

(d) Materials

If desired by the Owner/Consultant, Test Certificates of materials supplied by the Bidder in respect of each consignment shall be submitted in triplicate. Whenever the materials are required to be used from unidentified stocks, if permitted by the Owner/Consultant, a random sample shall be tested at an approved laboratory from each lot of 50 tonnes or less of any particular section.

Materials for main and secondary members shall be selected in line with good engineering practice and shall be arranged within any structure with due regard for maintenance of the structure and Plant and Equipment supported or sheltered by the Structure and also with regard to corrosion.

All steel materials shall be free from all imperfections, mill scales, slag intrusions, laminations, pitting, rusts, etc. that may impair their strength, durability and appearance.

All rolled steel shall conform to the requirements of the Indian Standards.

- i) Structural Steel will conform to IS: 2062 Grade-A for rolled steel members or plates up to 20 mm thickness.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[97]	25.09.2014

- ii) For plates above 20 mm thickness and welded construction, steel conforming to IS: 2062 Grade-B will be used.

(e) Workmanship

All workmanship shall be equal to the best practice in modern structural shops, and shall conform to the provisions of IS: 800 and other relevant Indian Standards or equivalent.

Straightening Material

Rolled materials before being laid off or worked, must be clean, free from sharp kinks, bends or twists and straight within the tolerances allowed as per IS:1852. If straightening is necessary, it may be done by mechanical means or by the application of a limited amount of localized heat. The temperature of heated areas, as measured by approved methods, shall not exceed 600°C.

Cutting

Cutting shall be affected by shearing, cropping or sawing. Use of a mechanically controlled gas cutting torch may be permitted for mild steel only. Gas cutting of high tensile steel may also be permitted provided special care is taken to leave sufficient metal to be removed by machining, so that all metal that has been hardened by flame is removed. Gas cutting without a mechanically controlled torch may be permitted if special care is taken and done under expert hand, subject to the approval of the Owner/Consultant.

To determine the effective size of members cut by gas, 3 mm shall be deducted from each cut edge. Gas cut edges, which will be subjected to substantial stress or which are to have weld metal deposited on them, shall be reasonably free from gouges. Occasional notches or gauges not more than 4 mm deep will be permitted. Gouges greater than 4 mm that remain from cutting shall be removed by grinding. All re-entrant corners shall be shaped notch-free to a radius of at least 12 mm. Shearing, cropping and gas cutting shall be clean, reasonably square and free from any distortion.

Planning of Edges

Planning or finishing of sheared or cropped edges of plates or shapes or of edges gas-cut with a mechanically controlled torch shall not be required, unless specifically required by design and called for on the drawings, included in a stipulation for edge preparation for welding or as may be required after the inspection of the cut surface. Surface cut with hand-flame shall generally be ground, unless specifically instructed otherwise by the Owner/Consultant.

Clearances

The erection clearance for cleated ends of members connecting steel to steel shall preferably be not greater than 2 mm at each end. The erection clearance at ends of beams without web cleats shall be not more than 3 mm at each end,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[98]	25.09.2014

but where, for practical reasons, greater clearance is necessary, suitably designed cleatings shall be provided.

Bolted construction

All bolts and nuts shall conform to the requirements of IS: 1367.

Field connections shall preferably be bolted connections unless specified otherwise. Weld connections at site shall be avoided.

High strength friction grip bolts shall be of property class 8.8 and shall conform to IS: 3757 and shall not be less than 20 mm in diameter unless designated otherwise. High strength bolts shall be installed as bearing type joint except where loads are reversible. Bearing Type connection (H.T. bolts Grade 8.8) shall be used for all removable type connections. Bolts will be tightened to develop the required pre-tension during their installation.

All erection bolts shall be of minimum 16 mm diameter of property class 4.6 conforming to IS: 1367 unless specified otherwise.

Holes for bolts shall not be more than 1.5 mm for bolt of diameter equal or lesser than 25 mm and shall not be more than 2 mm for bolt of diameter greater than 25 mm.

Holes through more than one thickness of material for members, such as compound stanchions and girder flanges, shall be drilled after the members are assembled and tightly clamped or bolted together. Punching may be permitted before assembly, if the thickness of the material is not greater than the nominal diameter of bolt plus 3 mm subject to a maximum thickness of 16 mm provided that the holes are punched 3 mm less in diameter than the required size and reamed after assembly to the full diameter.

Holes for turned and fitted bolts shall be drilled to a diameter equal to the nominal diameter of the shank or barrel subject to a tolerance grade of H8 as specified in IS: 919. Parts to be connected shall be firmly held together by tacking welds or clamps and the holes drilled through all the thicknesses in one operation and subsequently reamed to size. Holes not drilled through all thickness in one operation shall be drilled to a smaller size and reamed out after assembly.

Holes for bolts shall not be formed by gas cutting process.

Assembly

Drifting to enlarge un-matching holes shall not generally be permitted. In case drifting is permitted to a slight extent during assembly, it shall not distort the metal or enlarge the holes. Holes that must be enlarged to admit the bolts shall be reamed. Poor matching of holes shall be cause for rejection. The component parts shall be so assembled that they are neither twisted nor damaged and shall be so prepared that the specified cambers, if any, are maintained.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[99]	25.09.2014

Bolted construction shall be permitted only in case of field connections if called for on the Drawings and is subjected to the limitation of particular connections as may be specified. In special cases, however, shop bolt connections may be allowed if directed by the Owner/Consultant.

Washers shall be tapered or otherwise suitably shaped, where necessary, to give the heads and nuts of bolts a satisfactory bearing. The threaded portion of each bolt shall project out through the nut at least one thread. In all cases the bolt shall be provided with a washer of sufficient thickness under the nut to avoid any threaded portion of the bolt being within the thickness of the parts bolted together. In addition to the normal washer, one spring washer or locknut shall be provided for each bolt for connections subjected to vibrating forces or otherwise as may be specified on the Drawings.

Welded Construction

Welding shall be in accordance with relevant Indian Standards. Welding shall be done by experienced and good welders who have been qualified by tests in accordance with IS: 817. All shop connections shall be welded type.

Preparation of Material

Surface to be welded shall be free from loose scale, slag, rust, grease, paint and any other foreign material except that mill scale which withstands vigorous wire brushing may remain. Joint surfaces shall be free from fins and tears, Preparation of edges by gas-cutting shall, wherever practicable, be done by a mechanically guided torch.

Parts to be fillet welded shall be brought in as close contact as practicable and in no event shall be separated by more than 4 mm. If the separation is 1.5 mm or greater, the size of the fillet welds shall be increased by the amount of the separation. The fit of joints at contact surfaces which are not completely sealed by welds, shall be close enough to exclude water after painting. Abutting parts to be butt-welded shall be carefully aligned. Misalignments greater than 3 mm shall be corrected and in making the correction the parts shall not be drawn into a sharper slope than 20C.

The work shall be positioned for flat welding whenever practicable.

In assembling and joining parts of a structure or of built-up members, the procedure and sequence of welding shall be such as will avoid needless distortion and minimize shrinkage stresses. Where it is impossible to avoid high residual stresses in the closing welds of a rigid assembly, such closing welds shall be made in compression elements.

In the fabrication of cover-plated beams and built-up members, all shop splices in each component part shall be made before such component part is welded to other parts of the member. Long girders or girder sections may be made by shop splicing not more than three sub-sections, each made in accordance with this paragraph.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[100]	25.09.2014

When required by the Owner/Consultant, welded assemblies shall be stress relieved by heat treating in accordance with the provisions of the relevant Indian Standard or any other Standard approved by the Owner/Consultant.

All complete penetration groove welds made by manual welding, except when produced with the aid of backing material not more than 8 mm thick with root opening not less than one-half the thickness of the thinner part joined, shall have the root of the initial layer gouged out on the back side before welding shall be started from that side, and shall be so welded as to secure sound metal and complete fusion throughout the entire cross-section. Groove welds made with the use of the backing of the same material as the base metal shall have the weld metal thoroughly fused with the backing material. Backing strips need not be removed. If required, they may be removed by gouging or gas cutting after welding is completed, provided no injury is done to the base metal and weld metal and the weld metal surface is left flush or slightly convex with full throat thickness.

Groove welds shall be terminated at the ends of a joint in a manner that will ensure their soundness. Where possible, this should be done by use of extension bars or run-off plates. Extension bars or run-off plates need not be removed upon completion of the weld unless otherwise specified elsewhere in the Contract.

To get the best and consistent quality of welding, automatic submerged arc process shall be preferred. The technique of welding employed, the appearance and quality of welds made, and the methods of correcting defective work shall all conform to the relevant Indian Standards.

No welding shall normally be done on parent material at a temperature below (-) 50C. However, if welding is to be undertaken at low temperature, adequate precautions as recommended in relevant Indian Standard shall be taken. When the parent material is less than 40 mm thick and the temperature is between (-) 50C and 00C, the surface around the joint to a distance of 100 mm or 4 times the thickness of the material, whichever is greater, shall be preheated till it is hand warm. When the parent material is more than 40 mm thick, the temperature of the area mentioned above shall be in no case be less than 200C. All requirements regarding preheating of the parent material shall be in accordance with the relevant Indian Standard.

Submerged arc welding process shall be used for welding longitudinal fillet welds (connecting flanges with web) and longitudinal / transverse butt joints for fabrication of columns, framing beams and all other built up members unless manual arc welding is specifically required. All electrodes, flux, bare wire etc will be procured from approved manufacturers. All butt welds in beams, girders & columns will be of full penetration. All butt welds will be radio-graphically or ultrasonically tested as per relevant IS codes and standard practice. The base wire electrodes for submerged arc welding will conform to IS: 7280. The combination of wire and flux will satisfy requirements of IS: 3613.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[101]	25.09.2014

Peening

Where required, intermediate layers of multiple-layer welds may be peened with light blows from a power hammer, using a round-nose tool. Peening shall be done after the weld has cooled to a temperature warm to the hand. Care shall be exercised to prevent scaling or flaking of weld and base metal from over peening.

Equipment

These shall be capable of producing proper current so that the operator may produce satisfactory welds. The welding machine shall be of a type and capacity as recommended by the manufacturers of electrodes or as may be approved by the Owner/Consultant.

Finish

Column splices and butt joints of compression members depending on contact for stress transmission shall be accurately machined and close-buttressed over the whole section with a clearance not exceeding 0.2 mm locally at any place. In column caps and bases, the ends of shafts together with the attached gussets, angles, channels etc., after welding together, should be accurately machined so that the parts connected butt over the entire surfaces of contact. Care should be taken that those connecting angles or channels are fixed with such accuracy that they are not reduced in thickness by machining by more than 2 mm.

Slab bases and caps

Bases and caps fabricated out of steel slabs, except when cut from material with true surface, shall be accurately machined over the bearing surface and shall be in effective contact with the end of the stanchion. A bearing face which is to be grouted direct to a foundation need not be machined if such face is true and parallel to the upper face.

Miscellaneous

- Lacing bars

The ends of lacing bars shall be neat and free from burrs.

- Separators

Rolled section or built-up steel separators or diaphragms shall be required for all double beams except where encased in concrete, in which case, pipe separators shall be used.

- Bearing Plates

Provision shall be made for all necessary steel bearing plates to take up reaction of beams and columns and the required stiffeners and gussets whether or not specified in Drawings.

- Architectural Clearances

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[102]	25.09.2014

Bearing plates and stiffener connections shall not be permitted to encroach on the designed architectural clearances.

- Shop Connections
 - i) All shop connections shall be welded as specified on the Drawings.
 - ii) Certain connections, specified to be shop connections, may be changed to field connections if desired by the Owner/Consultant for convenience of erection and the Bidder will have to make the desired changes at no extra cost to the Owner.
- Shop Erection

The steelwork shall be temporarily shop-erected complete or as directed by the Owner/Consultant so that accuracy of fit may be checked before despatch. The parts shall be shop-erected with a sufficient number of parallel drifts to bring and keep the parts in place. In case of parts drilled or punched using steel jigs to make all similar parts interchangeable, the steelwork shall be shop erected in such a way as will facilitate the check of interchange ability.

(f) Shop Painting

All fabricated steel material, except those galvanized or to be embedded in concrete, shall receive paint coatings as specified below. All paints shall be of approved brand and shade as per the Owner's requirement.

Steel surface, which is to paint, shall thoroughly be cleaned of all loose mill scale, rust, grease, dirt and other foreign matter by wire brush & if required by sand blasting prior to actual surface preparation. The surface shall be cleaned to grade ST-2.5 as per SIS05-5900 or as per IS: 1477 (Part -I).

All steel structures shall receive two primer coats and two finish coats of painting. After fabrication the first coat of primer shall be immediately given over the prepared steel surface. The second coat of primer shall be applied over the dried first primer coat. Two finish coats shall be applied over the primer coats before dispatch of structure at site.

Primer paint shall be red oxide zinc chromate conforming to IS: 2074. Dry film thickness of each coat shall be 50 microns. Adequate care should be taken such that the surface does not possess a slick finish to which paint may not adhere properly. Top coat shall consist of two coats of HB Synthetic enamel of approved shade and colour with glossy finish and DFT as 75 microns (total). Thus the total DFT of painting including that of primer coats shall not be less than 175 microns.

Following care shall be taken while painting:

- i) Joints to be site welded shall have no paint applied within 100 mm of welding zone. Similarly where friction grip fasteners are to be used no painting shall be provided. On completion of the joint the surfaces shall receive the paint as specified.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[103]	25.09.2014

- ii) Surfaces inaccessible after assembly shall receive two coats of primer prior to assembling.
- iii) Surfaces inaccessible after erection, including top surfaces of floor beams supporting gratings or chequered plate, shall receive one additional coat of finish paint over and above number of coats specified above before erection.
- iv) Portion of steel member embedded / to be encased in concrete shall not be painted.
- v) Areas / Surfaces subjected to chemical attacks shall be painted with acid resistant paint.
- vi) Machine finished surfaces shall be protected against corrosion by a rust inhibiting coating that can be easily removed prior to erection or which has characteristics that make removal unnecessary prior to erection.

(g) Inspection, testing and acceptance criteria

Unless specified otherwise, inspection to all work shall be made by the Owner/Consultant at the place of manufacture prior to delivery. The Owner / Consultant shall have free access at all reasonable times to those parts of the manufacturer's works which are concerned with the fabrication of the steelwork under this Contract and he shall be afforded all reasonable facilities for satisfying himself that the fabrication is being done in accordance with the provisions of this Specification. The Bidder shall provide free of charge, such labour, materials, electricity, fuel, water, stores, tools and plant, apparatus and instruments as may be required by the Owner/Consultant to carry out inspection and / or tests in accordance with the Contract.

The Bidder shall guarantee compliance with the provisions of this Specification.

The Bidder shall carry out sampling and testing in accordance with the relevant Indian Standards and as supplemented herein for the following items at his own cost, unless otherwise specified in the Contract. The Bidder shall get the specimens tested in a laboratory approved by the Owner/Consultant and submit to the Owner/Consultant the test results in triplicate within 3 (three) days after completion of the test.

Steel

All steel supplied by the Bidder shall conform to the relevant Indian Standards, except otherwise mentioned in the Contract, only tested quality steel having mill test reports shall be used. In case unidentified steel materials are permitted to be used by the Owner/Consultant, random samples of materials will be taken from each unidentified lot of 50 ton or less of any particular section for tests to conform to relevant Indian Standards. Cost of all tests shall be borne by the Bidder.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[104]	25.09.2014

All material shall be free from all imperfections like mill scales, slag intrusions, laminations, pittings, rusts etc. that may impair their strength, durability and appearance.

All raw steel plate of thickness more than 20 mm supplied by the Bidder shall be checked against lamination before procurement & prior to commencement of fabrication work in the following ways as directed by the Owner/Consultant:

- i) Ultrasonic testing along the edge of specified points of the plates shall be carried out to delete lamination in the plates, if any.
- ii) If the results of the tests in (i) are not satisfactory, the whole area of the plates shall be checked by ultrasonic testing at specified nodal points formed at equidistant grid locations. The spacing of the grids shall be determined from tests in (i) or as directed by the Owner/Consultant.

If the results of the above tests are not satisfactory, the plates shall not be taken up for fabrication work. Even after fabrication at shop, if the Owner/Consultant requires any ultrasonic testing to detect lamination of plates, the same shall be carried out by the Bidder. If the plates in the fabricated item are found to be laminated, the component will be rejected.

Welding

All electrodes shall be procured from reliable manufacturers with test certificates. The correct grade and size of electrode which has not deteriorated in storage shall be used. The inspection and testing of welding shall be performed in accordance with the provisions of the relevant Indian Standards or other equivalents. For every 50 tonnes of welded fabrication, the Owner may ask for at least one test-destructive or non-destructive including X-ray, ultrasonic test or similar, the cost of which shall be borne by the Bidder. In the event of further tests as may be desired by the Owner. The cost of such test shall be borne by the Bidder if the results are found to be unsatisfactory; and if the test shows no defect, the cost shall be borne by the Owner. In cases of the test results showing deficiency, the Owner / Consultant shall have option to reject or instruct any remedial measures to be taken free of charge to the Owner.

Bolts, nuts and washers

All bolts, nuts and washers shall be procured from reputed manufacturer approved by the Owner/Consultant and shall conform to the relevant Indian Standards. If desired by the Owner/Consultant, representative samples of these materials may have

- i) Name of the Bidder
- ii) Number and date of the Contract
- iii) Name of the office placing the contract

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[105]	25.09.2014

- iv) Nomenclature of stores
- v) A schedule of parts or pieces, giving the parts or piece number with
- vi) Tolerance

The tolerance on the dimension of the individual rolled steel components shall be as specified in IS: 1852. The tolerances on straightness, length etc. of various fabricated components (such as beams, girders, columns, etc) of the steel structures (other than steel railway and road bridges structure) subjected to dynamic loading (like wind, seismic etc.) and thin walled constructions (like box girders) shall be as specified in IS: 7215.

10.3 Erection

(a) General

The work to be provided for by the Bidder, unless otherwise specified in the Bid, shall include but not be limited to the following:

- i) The Bidder shall provide all transport equipment, lifting equipment, tools, tackle, consumables, materials, labour and supervision required for the erection of the structural steelwork.
- ii) Receiving, unloading, checking and moving to storage yard at Site including prompt attendance to all insurance matters as necessary for all fabricated steel materials arriving at Site. The Bidder shall pay all demurrage and / or wharfage charges etc. on account of default on his part.
- iii) Transportation of all fabricated structural steel materials from Site storage yard, handling, rigging, assembling, bolting, welding and satisfactory installation of all fabricated structural steel materials in proper location according to approved erection drawings and / or as directed by the Owner/Consultant. If necessary, suitable temporary approach roads to be built for transportation of fabricated steel structures.
- iv) Checking centre lines, levels of all foundation blocks including checking line, level, position and plumb of all bolts and pockets. Any defect observed in the foundation shall be brought to the notice of the Owner/Consultant. The Bidder shall fully satisfy himself regarding the correctness of the foundations before installing the fabricated steel structures on the foundation blocks.
- v) Aligning, plumbing, levelling, bolting, welding and securely fixing the fabricated steel structures in accordance with the Drawings or as directed by the Owner/Consultant.
- vi) Touch up paintings, making good any damaged shop painting and completing any unfinished portion of the shop coat shall be carried out by the Bidder free of cost to the Owner.
- vii) All minor modifications of the fabricated steel structures as directed by the Owner/Consultant including but not limited to the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[106]	25.09.2014

- Removal of bends, kinks, twists etc. for parts damaged during transport and handling.
- Cutting, chipping, filling, grinding etc. if required for preparation and finishing of site connections.
- Reaming of holes for use of higher size bolt if required.
- Welding of connections in place of bolting for which holes are either not drilled at all or wrongly drilled during fabrication. Welding in place of bolting will be permitted only at the discretion of the Owner/Consultant.
- Re-fabrication of parts damaged beyond repair during transport and handling or re-fabrication of parts which are incorrectly fabricated.
- Fabrication of parts omitted during fabrication by error, or subsequently found necessary.
- Drilling of holes which are either not drilled at all or are drilled in incorrect location during fabrication.
- Carry out tests in accordance with this Specification if directed.

(b) Conformity with design

The Bidder will erect the entire fabricated steel structure, align all the members, complete all field connections and grout the foundations all as per the provisions of this specification and the design criteria detailed in the approved erection drawings and / or other stated document. All work shall conform to the provisions of the relevant Indian Standard Specifications and / or the instructions of the Owner/Consultant. The testing and acceptance of the erected structures shall be in accordance with the provisions of this Specification and / or the instructions of the Owner/Consultant.

(c) Storage of materials

All material shall be so stored as to prevent deterioration and to ensure the preservation of their quality and fitness for use in the works. Any material which has been deteriorated or damaged beyond repairs and has become unfit for use shall be removed immediately from the site.

(d) Yard

The Bidder will have to establish a suitable yard in an approved location at site for storing the fabricated steel structures and other materials which will be delivered to him by the Owner according to the Contract. The yard shall have proper facilities like, drainage, lighting, suitable access, trailers and other heavy equipments. The yard shall be fenced all round with security / arrangement and shall be of sufficiently large area to permit systematic storage of the fabricated steel structures without overcrowding and with suitable access, trailers and other equipment for use in erection work in proper sequence in accordance with the approved programme of work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[107]	25.09.2014

The Bidder should visit the site prior to submission of his Tender to acquaint himself with the availability of land and the development necessary by way of filling, drainage, access roads, fences, sheds etc. All of which shall be carried out by the Bidder at his own cost as directed by the Owner.

(e) Covered Store

All field connection materials, paints, etc. shall be stored on well designed racks and platforms off the ground in a properly covered store building to be built at the cost of the Bidder.

(f) Workmanship

Erection Plant and equipment

The suitability and adequacy of all erection tools and plant and equipment proposed to be used shall be efficient, dependable, in good working condition and shall have the approval of the Owner/Consultant.

Method and sequence of erection

The method and sequence of erection shall have the prior approval of the Owner/Consultant. The Erection shall arrange for most economical method and sequence available to him consistent with the Drawings and Specifications and such information as may be furnished to him prior to the execution of the Contract.

Temporary bracing

Unless adequate bracing is included as a part of the permanent framing, the erector during erection shall install, free of cost to the Owner, temporary guys and bracings where needed to secure the framing against loads such as wind or seismic forces comparable in intensity to that for which the structure has been designed, acting upon exposed framing as well as loads due to erection equipment and erection operations.

If additional temporary guys are required to resist wind or seismic forces acting upon components of the finished structure Installed by others during the course of the erection of the steel framing, arrangement for their installation by the erector shall be made free of cost to the Owner.

The responsibility of the Bidder in respect of temporary bracings and guys shall cease when the structural steel is once located plumbed levelled, aligned and grouted within the tolerances permitted under the specification and guyed and braced to the satisfaction of the Owner/Consultant.

The temporary guys, braces, false work and cribbing shall be removed immediately upon completion of the steel erection and shall return to the Owner's store in good condition if the materials are supplied by the Owner otherwise permission shall be given to Bidder to take out the materials from 'the project site. The Owner may remove and return the materials in good condition to the Bidder without any charge if they have been left in place under other agreed arrangement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[108]	25.09.2014

Temporary floors for buildings

It shall be the responsibility of the Bidder to provide free of cost planking and to cover such floors during the work in progress as may be required by any Act of Parliament and / or by-laws of state, Municipal or other local authorities.

Setting out

Positioning and levelling of all steelwork, plumbing of stanchions and placing of every part of the structure with accuracy shall be in accordance with the approved Drawings and to the satisfaction of the Owner/Consultant. Concrete foundations, where required, shall be made by other agencies. Anchor bolts and other anchor steel shall be embedded by other agencies. The Bidder shall check the positions and levels of the anchor bolts, etc. before concreting and get them properly secured against disturbance during pouring operations.

He shall remain responsible for correct positioning. For heavy columns, etc. the Bidder shall set proper screed bars if desired by the Owner/Consultant, to maintain proper level. No extra payment shall be made for this.

Each tier of column shall be plumbed and maintained in a true vertical position subject to the limits of tolerance allowable under this Specification.

No permanent field connections by bolting or welding shall be carried out until proper alignment and plumbing has been attained.

Field bolting

All relevant portions in respect of bolted construction of the Specification for Fabrication of Structural Steelwork applicable to the Project shall also be applicable for field bolting in addition to the following:

Bolts shall be inserted in such a way so that they may remain in position under gravity even before fixing the nut. Bolted parts shall fit solidly together when assembled and shall not be separated by gaskets or any other interposed compressible materials. When assembled, all joint surfaces, including those adjacent to the washers shall be free of scales except tight mill scales. They shall be free of dirt, loose scales, burns, and other defects that would prevent solid seating of the parts. Contact surfaces within friction-type joints shall be free of oil, paint, lacquer, or galvanizing.

Drifting

Correction of minor misfits of bolts will be considered as permissible. For this, light drifting may be used to draw holes together and drills shall be used to enlarge holes as necessary to make connections. Reaming, that weakens the member or makes it impossible to fill the holes properly or to adjust accurately after reaming shall not be allowed.

(g) Testing and Acceptance Criteria

General

Loading tests shall be carried out on erected structures, if required by the Owner/Consultant, to check adequacy of fabrication and / or erection. Any

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[109]	25.09.2014

structure or a part thereof found to be unsuitable for acceptance as a result of the test shall have to be dismantled and replaced with suitable member as per the Contract of either fabrication or erection of steelwork whoever is responsible for it and no payment towards the cost of the dismantled portion and any connected work shall be made to the Bidder, unless it is proved that the deficiency is due to reasons beyond the Bidder's scope. If any damage is done to any other parts of the structure or to any fixtures, the same shall be made good free of cost by the Bidder responsible, to the satisfaction of the Owner/Consultant. The cost of the tests specified hereinafter shall be borne by the Owner. Any extra claim due to loss of time, idle labour, etc. arising out of these testing operations shall not be entertained, however, only reasonable and appropriate time extensions will be allowed. The structure or structural member under consideration shall be loaded with its actual dead load for as long a time as possible before testing and the tests shall be conducted as indicated below. The method of testing and application of loading shall be as approved by the Owner/Consultant.

Stiffness Test

In this test, the structure or member shall be subjected, in addition to its actual dead load, to a test load equal to 1.5 times the specified superimposed load, and this loading shall be maintained for 24 hours. The maximum deflection attained during the test shall be within the permissible limit. If, after removal of the test load, the member or structure does not show a recovery of at least 80 % of the maximum strain or deflection shown during 24 hours under load, the test shall be repeated. The structure or member shall be considered to have sufficient stiffness, provided that the recovery after this second test is not less than 90 % of the maximum increase in strain or deflection recorded during the second test.

Strength Test

The structure or structural member under consideration shall be subjected, in addition to its actual dead load, to a test load equal to the sum of the dead load and twice the specified superimposed load, and this load shall be maintained for 24 hours. In the case of wind load, a load corresponding to twice the specified wind load shall be applied and maintained for 24 hours, either with or without the vertical test load for more severe condition in the member under consideration or the structure as a whole. Complete tests under both conditions may be necessary to verify the strength of the structure. The structure shall be deemed to have adequate strength if, during the test, no part fails and if on removal of the test load, the structure shows a recovery of at least 20 per cent of the maximum deflection or strain recorded during the 24 hours under load.

Structure of same design

Where several structures are built to the same design and it is considered unnecessary to test all of them, one structure, as a prototype, shall be fully tested, as described in previous sub-clauses, but in addition, during the first application of the test load, particular note shall be taken of the strain or

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[110]	25.09.2014

deflection when the test load 1.5 times the specified superimposed load has been maintained for 24 hours. This information is required as a basis of comparison in any check test carried out on samples of the structure when a structure of the same type is selected for a check test, it shall be subjected, in addition to its actual dead load, to a superimposed test load, equal to 1.5 time the specified live load, in a manner and to an extent prescribed by the Owner/Consultant. This load shall be maintained for 24 hours, during which time, the maximum deflection shall be recorded. The check test shall be considered satisfactory, provided that the maximum strain or deflection recorded in the check test does not exceed by more than 20 % of the maximum strain or deflection recorded at similar load in the test on the prototype.

Repair after inspection tests

An actual structure which has passed the "Strength Test" as specified above herein before and is subsequently to be erected for use, shall be considered satisfactory for use after it has been strengthened by replacing any distorted members and has subsequently satisfied the 'Stiffness Test' above.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[111]	25.09.2014

11. ARCHITECTURAL WORKS

The architectural design concept of buildings shall be evolved considering the functional, technical and other requirements for efficient operation, ensuring comfortable working environment for personnel, satisfying the aesthetic requirements. Special care shall be taken to provide elegance and aesthetics, with effective use of appropriate treatment, materials, fittings and finishes. To achieve above objective Bidder shall employ a qualified architect / architectural firm to carry out all designs and hold all other architectural responsibilities for the project.

The Bidder shall obtain and be conversant with all laws, by-laws and regulations of local and Statutory Bodies as applicable to the project. The architectural concept evolved should also take care of these requirements. The Bidder shall provide the drawings and documents for such statutory approvals.

11.1 General

The architectural services shall cover finishing work of new buildings and modernised existing buildings/structures, included under the specification starting from masonry work, partition walls, cladding walls, roof protection, finishing of walls, floors and ceilings, false ceiling as required potable water system, sanitation etc.

During execution of the contract, the Bidder shall take approval from the Owner, for all building materials and finish items (e.g. floor tiles, doors, and windows, paints etc.) to be used for the contract by submitting samples and/or product literature as appropriate.

Finishing works including material used for renovation/modernisation work shall be matched with the finishing of existing structures to make similarity in architectural view of new and existing structures.

11.2 Finishes

All exposed surfaces shall be clean and smooth and members shall be sized to give a pleasing appearance. The Finishes for all Structures and Buildings shall meet the functional requirements and shall be as per the approved Finishing Schedule. However, the finishing schedule shall be pre-approved by the Owner/Consultant.

11.3 Design Requirements

(a) Architectural Concepts

- All buildings and structures shall be architecturally treated in such a way so as to be in complete harmony with the surrounding structures and environment. Local architectural characters may be judiciously imbibed. The building shall be designed initiating an architectural control common to all

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[112]	25.09.2014

buildings. The architectural control shall be clearly spelt out in terms of scale, man & form.

- Overall colour scheme of the plant and other buildings shall be designed judiciously and in a comprehensive manner taking into account the mass and void of buildings, its facade, equipments, exposed structural elements, piping, trestles, bus ducts and other service elements.
- Overall emphasis shall be on developing an eco-friendly architecture, merging with the nature with its own sustainable energy management systems.
- The scheme shall be conceptually finalized in totality including that of equipments so that the proper co-ordination with other agencies can be taken up at appropriate time.

(b) Architectural Design

- Natural light shall be used to the maximum extent. For adequate light and ventilation, National Building Code recommendation shall be followed.
- Entrance canopies, chajjas (projections, recesses) over openable windows and door openings on exterior facades shall be provided.
- All the buildings shall be architecturally designed to meet the National Building Code.
- Architectural design and detailing aspects of all the buildings shall be rendered through professional services of an Architect Statutory requirement and any clearances from local authority may be required to be met with, wherever essential. The Architect Consultant shall be of national - International repute having experience in similar kind of works. The consultant shall evolve the design philosophy and shall present it in the form of presentation drawings, prospective views, 3-D Models & detail drawings.
- A comprehensive interior design scheme shall be conceived with the intention of projecting a definite theme and aesthetic appearance to inside working environment. It shall take into account the multidisciplinary engineering activities involving plant technology and architectural & civil engineering for a smooth control hierarchy and man machine interface.

The Bidder shall develop the architectural layout of all the buildings listed in this document as per the final approved equipment disposition and other layout considerations indicated elsewhere in this specification. These drawings shall need the approval of the Owner/Consultant before construction. The Bidder shall also have to submit perspective views if so desired by the Owner/Consultant at no expenditure to the Owner. Approval from statutory authorities, e.g. Factories Inspector, Explosives Inspector, Loss Prevention Association of India / Tariff

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[113]	25.09.2014

Advisory Committee etc. shall be the responsibility of the Bidder without any obligation of the Owner.

The entire complex shall have an architectural character and style of its own and shall be visually and functionally integrated with the existing landscape. The Bidder must visit the site and have a feel of the overall environment, so that a harmonious as well as integrated architectural concept of the proposed phase of development is achieved. Special care must be taken to enhance the visual and technological quality of development by adopting updated technology, materials, finish etc.

11.4 Guideline for Architectural Works

11.4.1 Roof Insulation and Ventilation

Wherever required the roof of buildings shall be insulated with foam concrete. For ventilation requirements relevant section of the specification shall be referred.

11.4.2 Roof Waterproofing

All roofs of buildings shall be provided with 3 layers, first being elastomeric membrane water proofing treatment, secondly screed concrete shall be laid and finally the wearing course. Elastomeric membrane shall be laid as per manufacturer's specifications which shall adhere to specifications as given in IS 2645. Run off gradient shall be given a minimum of 1 in 100. Gradient shall comprise screed concrete 1:2:4 using 12.5 mm or below coarse aggregate. Over the screed concrete waterproofing treatment shall be provided as below:

A wearing course shall consist of pressed clay tiles of size 230x230x18 mm laid in water proofing compound mixed cement mortar (1:3) and sealing of joints using sealing compound.

11.4.3 Brick/stone masonry and parapet wall

All masonry works shall be designed in accordance with IS: 1597, IS: 1905, IS: 2212, IS: 4326 and other relevant IS codes as applicable. Structural design of load bearing and non-load bearing walls constructed with solid or perforated burnt clay bricks or concrete blocks shall be in accordance with criteria specified by National Building Code of India.

All walls shall be non-load bearing infill panel walls. External walls of all buildings shall be at least one brick thick. All internal walls shall be at least one brick thick except for internal partition walls for office area, canteen, change rooms, first aid rooms and toilets, which may be half brick thick.

Minimum 50 kg/sq.cm compressive strength brick shall be used for non-load bearing super structure brickwork. Cement sand mortar 1:6 for one brick thick wall and 1:4 for half brick thick wall shall be used. For half brick walls, RCC transoms and mullions shall be provided to reinforce the wall where required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[114]	25.09.2014

All brickwork shall be plastered as per specification.

Even where metal cladding is specified, for initial *[3 m]* height from the ground level, minimum one brick thick masonry wall shall be provided.

All up stands and parapet walls on roof shall be of RCC construction, minimum height of parapet walls shall be *[1050 mm]* and a minimum thickness of *[125 mm]*.

11.4.4 Cement based polymer modified mortar

a) Purpose

To carry out structural repairs to prepared patches of spalled concrete with an alkaline impervious repair material comprised of polymer admixed cement-sand mortar.

b) Materials and T&P

Polymers in emulsion or powder forms as may be specified conforming to ASTM C1059, Ordinary Portland Cement of 43 grade conforming to relevant BIS code, Sand conforming to Zone-II or Zone-III grade of IS: 383, Mixing water conforming to IS: 456-2000, mortar mixer with mechanical water dozer, spatulas, trowels, etc.

c) Procedure:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of specified polymers shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3 Testing of Material: The requisite number of test specimens of mortar shall be cast from each batch of manufactured or supplied materials received (whichever is less). These are to be tested for conformance to the specified requirements before use on the work. Polymer modified cement mortar with cement: sand proportion by weight as (1:3) shall have the following properties

Minimum compressive strength -20N/sq.mm after 28 days at 27oC

Step-4: Identify and mark the area for Polymer modified mortar repair.

Step-5 Surface Preparation: The appropriate propping/supporting, surface preparation and crack sealing as per site requirements shall be completed, which may sequentially cover one or more of the following items of work:

Prop & support the structural member to relieve it of stress and strains.

Removal of existing surface plaster/treatment shall be done.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[115]	25.09.2014

Chipping unsound/weak concrete material shall be done.

Removing concrete all around embedded rusted reinforcement shall be done.

Removing and cleaning reinforcement of rust from its surface to give it a shining bright metal shall be done.

Sealing the cracked or honeycombed concrete with injection grouting shall be done.

Providing and inserting mild steel shear key bars shall be done with minimum 3 nos per square meter of surface area of substrate, which may also be used as depth measuring gauge.

Additional fresh reinforcement, if required, shall be tied with required overlaps or welded.

The rust, if any, persisting over the existing exposed reinforcement or the new reinforcement shall be removed mechanically or chemically.

Cleaning of lightly sticking materials and foreign matter from the exposed concrete surface and steel reinforcement by suitable means shall be done.

Step-6: Clean the dust and saturate the prepared surface of concrete and reinforcement with a clean oil free air blast and water fit for construction.

Step-7: Inspection of concrete surface prior to adhesive application shall be thoroughly inspected and got approved by the Engineer-in-Charge. Surfaces shall be ensured to be free from any deleterious materials such as oil, dust, dirt etc. using oil free air blast.

Step-8: Alignment & thickness Control- Ground wires shall be fixed at reference points to measure and control the thickness of overlay. Shear keys fixed earlier could also function as depth gauges. Adequate ground wires shall be installed to establish thickness and surface planes of the overlay build up. Ground wires shall be tight and true to line and placed in such a manner that they may be further tightened.

Step-9: Apply Passivating & bonding coat over the cleaned existing and new reinforcement.

Step-10: Apply bond coat on the cleaned concrete substrate.

Step-11: Mix and Prepare Polymer Modified Mortar to have a uniform consistency and texture by adding cement sand and polymer as weigh batched ingredients of the design mix, a specified proportion of water through water dozer.

Use of prepacked ready to use components supplied by manufacturers in containers may be allowed subject to approval of Owner. In case where prepacked ready to use materials are to be used, the contractor shall submit the manufacturer's certificate verifying conformance to material specification as specified, manufacturer's mixing and application procedure for approval by Engineer-in-charge.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[116]	25.09.2014

Plastering with cement based polymer modified mortar shall be done immediately after applying the bonding slurry to the prepared surfaces, preferably in coats of approximately 10mm thickness as greater thickness may lead to delamination/collapse. However, coats shall be applied in fairly rapid successions within 15 to 30 minutes. After applications of mortar the surface shall be finished using a wooden float.

Step-12: Moist cure the polymer modified mortar surface for 1-3 days followed by air curing at ambient temperature or as per manufacturer's specification, if specified otherwise. Use of flowing water or ponding of water shall not be done for curing. Steam curing shall not be permitted.

Step-13: Test the Surface of 7-day cured concrete overlay for soundness by tapping or sounding with hard blunt surface.

d) Inspection & Quality control

The mortar application work shall be continuously inspected by a qualified supervisor who shall check materials, application of mortar, curing stoppage of work during low temperatures (minimum working temperature being 8°C in most of the polymer modified mortar or as per manufacturer direction) and high winds etc. Each completed work of mortar shall be systematically sounded with a hammer to check for drummy areas after hardening.

In suspect areas or whenever directed by Engineer-in-Charge, the contractor shall drill the cores from the finished work and in to the host concrete after 28 days of mortar application. The cores shall be examined for evidence of poor workmanship by the Owner, and if he is satisfied that either the bonding work or the subsequent layer of mortar are not of the required workmanship, the contractor at the instruction of Engineer-in-Charge shall dismantle such areas of work as required by the Owner and re-do the same after re-preparing the surface by chipping off mortar work and abrading the bonding slurry interface.

11.4.5 Partition Wall

All intermediate walls shall be full brick thick wall in 1:6 cement sand mortar. Half brick thick wall in 1:4 cement: sand mortar with [2 nos. 6 mm] diameter rod in every fourth layer shall be provided. For long walls intermediate RCC pillars and RCC horizontal tie shall be provided. Full glazed partition in anodized aluminium frame shall be provided for operator's cubicles for clear view of the operating equipment and in Control room area.

11.4.6 Metal cladding

a) Permanent colour coated sandwiched insulated metal cladding system

Trough zinc-aluminium alloy coated (both sides) M.S. sheet having 0.6 mm minimum thickness (or high tensile steel sheet of 0.5 mm minimum thickness) shall be used on external face (outer face) of cladding system. Weight of coating shall not be less than 180 gm / sq.m. The outer side (exposed face) shall be permanently colour coated with Polyfluro Vinyl Coating (PVF2) of Dry Film

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[117]	25.09.2014

Thickness (DFT) 20 microns (minimum) over primer. Inner side of external sheet shall be provided with suitable pre-coating of minimum 7 microns.

Galvanised M.S. sheets of minimum 0.6 mm thickness shall be used as inner liner (internal face) of cladding system. The exposed face shall be permanently colour coated with silicon modified polyester paint of DFT 20 microns (minimum) over primer. Inner face of external sheet shall be provided with suitable pre-coating of minimum 7 microns. The rate of galvanising shall not be less than 180 gm / sq. m.

The permanent colour coated sheet shall meet the general requirements of IS: 14246 and shall conform to class 3 for the durability.

Inner sheet shall fixed directly to side runners and Z spacers made of at least 2 mm thick galvanised steel sheet of grade 375 as per IS: 277. Inner sheet shall be fixed at the rate not more than 0.75 m centre to centre to hold the insulation and external sheeting.

The insulation shall be of bonded mineral wool of minimum thickness 50 mm conforming to IS: 8183, having a density of 32 kg / cu. m for glass wool & 48 kg / cu. m for rock wool.

b) Permanent colour coated (non-insulated) metal cladding system

Trough zinc-aluminium alloy coated not less than 180 gm/sq.m M.S. sheets having 0.6 mm minimum thickness (or High tensile steel sheet of 0.5 mm minimum thickness) shall be used for the cladding system. The outer side (exposed face) shall be permanently colour coated with PVF2 paint of minimum DFT 20 microns over primer and the inner side (internal face) shall be coated with same paint of minimum DFT 12 microns over primer. These shall be fixed directly to runners. The sheets shall meet the general requirement of IS: 14246 and shall conform to class 3 for the durability.

c) Flashings, Cap, Trim Closures etc.

All flashings, trim closures, caps etc. required for the metal cladding system shall be made out of plain sheets having same material and coating specification as mentioned above for the outer face of the sandwiched metal cladding.

11.4.7 Plastering

On the exterior wall & rough side of interior brick wall *[18 mm]* thick minimum with cement-sand mortar in two layers shall be applied. Where external finish will require rich plastering for special finish plaster shall be of 1:4/1:3.

Interior wall: *[12 mm]* thick with 1:4 cement-sand mortars

Ceiling: *[6 mm]* thick with 1:3 cement-sand mortar shall be provided to all exposed ceilings.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[118]	25.09.2014

11.4.8 Removal of plaster manually from masonry or concrete surface using chisel and hammer and disposal of debris etc

a) Purpose

For removal of all type of loose /delaminated /damaged/weak cement plaster from surface of masonry or concrete.

b) Procedure

Step-1: Safety shall be ensured in accordance with contract conditions and specifications.

Step-2: Provide double scaffolding, protective screens etc.

Step-3: Existing plaster to be identified for removal by tapping all areas and its boundary shall be marked with a colour marking (in an optimal rectangular shape), which shall be approved by Engineer-in-Charge.

Step-4: Make a cut normal to the surface all along the boundaries with power driven cutters. The depth of cut shall not exceed the thickness of plaster.

Step-5: Remove the plaster manually with the help of chisel and hammers to completely expose the parent masonry or concrete surface, so as not to have any traces of such plaster left behind.

11.4.9 False ceiling and under deck insulation

All air conditioned areas shall be provided with the suspended false ceiling system. Under deck insulation system shall be provided on the under side of the roof / floor slab of the air-conditioned areas based on the functional requirement. Aluminium false ceiling system shall comprise of [84 mm] wide [12.5 mm] deep closed type plain panels of approved colour, roll formed out of [0.5 mm] thick corrosion resistant aluminium alloy AA 5050 fixed on roll formed carriers. Additional hangers and height adjustment clips shall be provided for return air grills, supply air diffusers, light fixtures, AC ducts etc. Suitable M.S channel (minimum ISMC100) grid shall be provided above false ceiling for movement of personnel to facilitate maintenance of lighting fixtures, AC ducts etc.

Bidder shall prepare a layout of the false ceiling system incorporating light fixtures, supply air diffuser, return air grills, fire detectors, fire protection sprinklers etc. such that the ceiling looks aesthetically pleasing. Work shall commence only after the Owner approves the layout. Under deck insulation shall comprise of [50 mm] thick resin bonded mineral wool insulation mat conforming to IS:8183. This mat shall be backed with [0.05 mm] thick aluminium foil and [24 Gx25 mm] wire mesh netting. These shall be fixed to ceiling or wall as the case may be with [100x50x6 mm] slotted mild steel plate welded to M.S. plate inserts embedded at the soffit of the slab at [600 mm c/c and 14 G] steel wire drawn through slots and fixed to wire netting.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[119]	25.09.2014

11.4.10 Doors

- Generally hollow metal (steel) flush doors with pressed steel frame shall be provided for plant and utility areas.
- Solid core factory made wooden flush doors in hard wood frame shall be used in interior office areas. Aluminium doors shall be provided in at entrances and important areas.
- Special areas like control rooms and other special area shall be provided with minimum 15 micron pre-coated Le. colour anodised aluminium glazed partitions with air lock facilities having two sets of doors.
- Fire rated doors with panic bar shall be provided in cable spreader rooms and other areas having fire hazard and also to all fire exists as per TAC requirement.
- Doors shall be provided at appropriate location to prevent dust ingress from outside.
- FRP Doors with FRP Frames shall be provided for all the toilet doors.
- Weather stripping shall be provided to all outside doors as well as air-conditioned areas and all other doors where dust-free environment is required.

11.4.11 Rolling shutters

Rolling steel shutters conforming to IS: 6248 will be used for large openings where frequent use is not envisaged. Unless noted otherwise, main entry doors of width and height to suit the requirements. Rolling shutters with area up to 8 m² shall be pull and push type hand operated, while above 8 m² shall be pull and push type with ball bearings (Electrically operated) as per IS specification.

11.4.12 Windows & Ventilators

In all buildings, full glazed windows and ventilators in minimum *[15 micron]* colour anodized aluminium window frame shall be provided with *[4 to 6 mm]* thick (depending on the size of panel) clear float glass and *[6 mm]* thick clear wired/laminated glass where required from safety point of view. Structural glazing may be considered as an important facade element.

The window area shall be so decided as to allow adequate natural ventilation and light.

Note: Glass thickness and member sizes of Aluminium Glazed doors and windows shall be designed by the manufacturer and to be submitted for approval by the Bidder before execution.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[120]	25.09.2014

11.4.13 Plywood Covering Panels to Cover Windows etc. During repairs

a) Purpose

To protect the finished items against their spoiling/damage to finishes during the process of carrying out repairs in a building. The items could include finished windows, doors, glass curtain wall or other such items.

b) Materials:

Wooden Battens of size 50mm X 50mm (approximately) or as approved by Engineer-in-charge, free from warping, cracks etc. made from locally available timber.

Plywood of suitable thickness, preferably 6 mm thick, as approved by Engineer-in-Charge.

Nails, screws etc. as per requirement.

c) Fabrication:

Size of covering panels shall be more than the size of windows etc. to be shielded/ protected, enough to be fixed to the walls without damaging the windows etc.

Wooden battens shall be cut approximately to the size of panels of windows etc. to be protected. The joints of the wooden framework shall be lap joint or as approved by Engineer-in-Charge.

Where the panel size is more than 2 square metres or as specified by the Engineer-in-Charge, the stiffening shall be done with batten backing to impart stiffness enough to provide rigidity against undue deflection due to impact of falling debris, self load, etc.

Plywood shall be fixed with nails/screws over the batten frames. The spacing of nails/screws shall be about 300mm c/c or as may be required at site.

d) Fixing:

The plywood covering panel shall be suitably fixed without damaging the windows etc. being protected by such panels with nails/screws fixed in walls strong enough to resist the forces likely to be imparted during repair work. It shall be done in such a manner that it can be removed with ease without damaging the covered windows etc. after completion of repairs.

e) Removal:

After completion of work, the covering panels shall be removed carefully, so as not to cause any damage to windows etc. covered. The damages, if any, shall be made good.

11.4.14 Facilities in Buildings

Adequate toilet and drinking water facilities shall be provided for personnel working in each building. Each building shall have toilet facilities both for Gents

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[121]	25.09.2014

and Ladies. Number of toilet fixtures shall be adequate for the occupancy as per National Building Code.

However minimum 1 Water Closet, 1 washbasin, 1 urinal shall be provided in each toilet.

Each floor shall have drinking water facility connected through water purification system like Aquaguard or similar approved make.

11.4.15 Glazing & Glazed Partition

- Glazing in Control room between AC. and non-AC. areas shall be insulating glass consisting of *[two 6 mm]* thick toughened float glass sheet hermetically sealed and separated by *[12 mm]* gap for thermal insulation. Clear glass shall be provided where clear view is required. In other areas tinted glass may be provided.
- *[4 mm]* thick ground glass shall be provided for toilets.
- Glazing between two AC. areas shall be with 6 mm thick clear float glass.
- All glazing shall be in aluminium frame.
- *[6mm]* thick Wired / laminated glass shall be used for windows / ventilators at higher level for safety.
- *[24mm]* thick insulated double glazing having 6mm thick tinted heat-reflecting type float glass on outer side and 6mm thick clear float glass on inner side with *[12mm]* air gap & hermetically sealed shall be mounted on *[15 micron]* coloured anodised aluminium frame suitable for structural glazing system.

11.4.16 Sealant

Silicon sealant or polyurethane sealant shall be used in all expansion joints exposed to weather. All joints around exterior doors, windows, and expansion joints, etc. shall be sealed for proper water-lightness.

11.4.17 Damp Proof Course

[40 mm thick 1:1.5:3] concrete with waterproofing admixture. Water proofing compound shall be of Zydex, SIKA, or similar approved.

11.4.18 Plinth Protection

Minimum *[1000 mm]* wide and minimum *[100 mm]* thick M 15-grade concrete plinth protection along building periphery shall be provided with surface drain of required size and slope, to suit storm water quantity, shall be provided. The plinth protection shall be laid over prepared sub-grade and base formed with locally available broken laterite stone to thickness of *[150 mm]*.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[122]	25.09.2014

11.4.19 Painting

- Exterior Masonry Surface : Buildings shall be finished with [Acrylic Emulsion pain] as per IS specification with approved colour and scheme.
- Exterior Steel Work : Anti-corrosive synthetic enamel paint over [anti corrosive primer].
- All Woodwork: [Synthetic paint over a coat of primer].
- All Internal Steel Work : [Synthetic enamel over a coat of primer].
- Interior Office Spaces Rooms, All AC Areas : Acrylic emulsion paint over [2 mm] control thick plaster of paris punning.
- Balance areas: As indicated in finish schedule in this document.
- Fire Door: Post Office red shade shall be provided.

11.4.20 Flooring

Unless and otherwise specified, the nominal total thickness of floor finish shall be [50 mm] including under bed and topping. The flooring shall be laid on already matured concrete base. The under bed for floors shall consist of minimum grade of M 15 with stone chips [12.5 mm] downgraded as coarse aggregates. The under bed shall be provided appropriate slope towards catch pit for floor drainage.

- **False Flooring System**

Removable type false flooring system shall be provided wherever required (computer rooms etc.). RCC floor slab will be sunk to a depth [800 mm], which shall be height of the false floor system. The flooring shall consist of fire resistant phenol formaldehyde bonded particle board panels [600x600x35 mm] size, mounted on steel pedestals of adjustable height and supporting steel grid system to provide under floor space. [2 mm] thick flexible anti-static PVC topping on top and PVC strip edging on sides of each panel shall be provided.

- **PVC Floor Finish**

Two mm thick PVC as per IS: 3462 and laid as per IS: 5318 over concrete under bed of [48 mm] shall be provided in electronic cubicle rooms, conference room, etc. PVC tiles shall ensure anti static surface.

- **Vitrified ceramic Tiles**

Heavy duty vitrified ceramic tiles of appropriate thickness and of minimum size [600 mm x 600 mm] of approved shade & colour shall be provided for control room as per relevant code and manufacturer's specification over concrete bedding to result in an overall thickness of [50 mm].

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[123]	25.09.2014

- **IPS Flooring**

IPS (cement concrete flooring) with metallic floor hardener topping [12 mm] thick with a total thickness of [50 mm] shall be provided in maintenance and unloading area, ground floors, floor of pump house, permanent stores and other plant building areas where heavy duty flooring is required.

IPS flooring with non-metallic floor hardener shall be provided in all MCC and switchgear rooms, which are not air-conditioned.

IPS flooring shall also be provided in areas, which are not provided with any special finish. Areas which are likely to be subjected to oil spillage shall be provided with two coats of oil resistant painting over IPS floor finish. If required, Bidder has to use floor hardeners at appropriate locations.

- **Heavy Duty Ceramic Tiles**

Heavy duty vitrified ceramic tiles with suitable finish shall be used in toilets, pantry, dining hall of canteen, locker rooms etc. The tiles shall be minimum of [300 x 300 x 7 mm] of approved shade, brand and colour.

- **Acid / Alkali Resisting Tiles**

Battery rooms and other areas coming into contact with acid / alkali vapours or fumes shall be given acid / alkali resistant tiles [25 mm] thick, jointed with acid / alkali resistant cement slurry. Bedding shall comprise of potassium silicate mortar conforming to IS: 4832 (Part-I) and resin based mortar like epoxy for jointing. Total thickness of flooring shall be [50 mm]. Ceramic unglazed vitreous tiles conforming to IS: 4457 with minimum thickness of 20 mm may also be used as acid / alkali resistant tile.

- **Integral Floor Finish**

For cable vaults floor finish integral to the concrete base shall be provided as per IS: 2571.

- **Cast-in-situ Terrazzo**

Risers and treads of staircases shall be provided with cast in-situ terrazzo. This shall be laid as per IS: 2114, using white cement or cement with colouring pigment. Chequered finish shall be provided for treads. Total thickness of the finish shall be 25 mm.

11.4.21 Miscellaneous

PVC nosing shall be provided for edge protection of R.C.C. stair treads.

Angles [50x50x6 mm] (minimum) with lugs shall be provided for edge protection of cutouts / openings in floor slabs, edge of drains covering gratings, edge of R.C.C cable / pipe trenches of any other place where breakage of edges / corners is expected.

Floors of switchgear rooms shall have embedded steel channel suitable for easy movement of breaker panel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[124]	25.09.2014

11.4.22 Skirting/DADO

- [150 mm] skirting matching with floor finish shall be provided in all areas unless specified otherwise elsewhere.
- Toilets and locker rooms shall be provided with dado of [2100 mm] high with glazed tiles of minimum 5 mm thickness generally as per IS: 777.
- For battery room and other areas coming in contact with acid / alkali spillage / fume, dado of acid / alkali resistant tiling as per IS: 4457 shall be provided to a height of [2100 mm] set in potassium silicate mortar and joints pointed with resin bonded mortar
- Staircase wall shall be given dado of vitrified tiles of approved colour and shade to a height of [2100 mm] or as per approved drawings.

11.4.23 Roof access

All roofs shall be provided with access thorough a staircase / cage ladder. Minimum [1000 mm] wide access path shall be provided with suitable tiles to approach equipment on roof.

11.4.24 Roof Drains

Roof drains design criteria

Minimum diameter of the pipe shall be [150 mm]. The roof drains shall be sized for the roof area runoff for a maximum rainfall per hour at site.

Detailed specification is mentioned elsewhere in this specification.

Roof Drainage and Water Proofing

All roofs of buildings shall be provided with 3 layers, first being elastomeric membrane water proofing treatment, secondly screed concrete shall be laid and finally the wearing course. Elastomeric membrane shall be laid as per manufacturer's specifications which shall adhere to specifications as given in IS 2645. Run off gradient shall be given a minimum of 1 in 100. Gradient shall comprise screed concrete 1:2:4 using 12.5 mm or below coarse aggregate. Over the screed concrete waterproofing treatment shall be provided as below:

A wearing course shall consist of pressed clay tiles of size [230x230x18 mm] laid in water proofing compound mixed cement mortar (1:3) and sealing of joints using sealing compound.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[125]	25.09.2014

12. GENERAL REQUIREMENTS

12.1 Roof

All the buildings having R.C.C slabs over structural steel framing are provided with troughed metal sheet decking which acts as permanent shuttering. These sheets shall meet the general requirements of IS: 14246 and shall conform to class 3 for durability. The sheeting shall be permanently colour coated galvanised M.S. troughed metal sheet decking of approved profile with minimum base metal thickness of 0.8 mm and minimum trough depth of 38 mm. Silicon modified polyester painting shall be used for permanent coating over galvanised surface with minimum rate of galvanising of 180 gm of zinc per sq. m. Dry film thickness of colour coating shall be at least 20 micron.

Roof of all buildings having R.C.C. framework shall have cast in-situ R.C.C. slab with conventional shuttering.

Structural steel roofing wherever required shall be of permanently colour coated galvanised M.S troughed metal sheet of approved profile. Minimum base metal thickness shall be 0.8 mm. The rate of zinc consumption for galvanising shall be 275 gm/sq. m. The external face shall have permanent colour coating of PVF 2 paint of minimum DFT of 20 microns and inner surface shall be coated with silicon modified polyester paint with DFT of 20 microns.

12.2 Platforms and walkways

Platforms shall be provided to all major equipment, not directly accessible from the floors, for maintenance. Platforms and connecting walkways shall have a minimum width of 750 mm. Platforms in front of the entry shall be at least 900 mm wide. Platforms located close to each other shall be connected with walkways.

All steel platforms above grade level shall be constructed with kick plates at edge of the platform to prevent tools or materials from falling off. It shall consist of 8 mm thick steel plate projecting 100 mm above the platform surface. Kick plate shall be painted with the same type of coating as the material to which it is attached. Approach to EOT crane shall be ensured by Cage ladder or staircase.

12.3 Stairs and ladders

Steel Stairs

All steel staircases shall normally have minimum clear width (back to back of stringer) of 1000 mm and maximum inclination with horizontal of 35.75°. However, in case of space restriction, minimum clear width up to 750 mm and slope up to 45° may be provided. The vertical height between successive landings shall not exceed 5 m. Channels (minimum MC 200) shall be provided as stair stringers. Treads shall be minimum 250 mm wide of chequered

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[126]	25.09.2014

plate/grating, with suitable nosing, and spaced equally so as to restrict the rise to maximum 180 mm (200 mm in exceptional cases).

Steel Ladders

Ladders shall be provided to platforms, walkways, instruments and equipments, which do not require frequent access. Ladders shall preferably be vertical and its angle with vertical shall not exceed 50. Ladders shall be of minimum 450 mm clear width with 20 mm diameter MS rungs spaced at 300 mm (maximum).

Ladders shall be provided with a safety cage of minimum 750 mm diameter clear when the top of ladder is more than 4.5 m above the landing level. However safety cages shall start at 2.5 m above the lower landing level.

RCC Stairs

All stairs shall have maximum riser of 180 mm and a minimum tread of 250 mm. However, for public buildings riser shall be limited to 150 mm and tread width of 300 mm. Minimum width of stairs shall be 1200 mm generally. All stairs normally shall not have more than 15 risers in one flight. Aluminium angle nosing with minimum 50X25X3 angle or PVC nosing shall be provided for edge protection of RCC stairs.

12.4 Handrails

Handrails shall be provided at appropriate places to ensure safety e.g. around all floors/roof openings, projections / balconies, walkways, platforms, steel stairs etc.

All handrails shall be of 32 mm nominal bore MS pipes (medium class) as per IS: 1161 galvanised using 900 gm/sq. m of zinc. Handrails for platforms, walkways and projections shall be a two-rail system with the top rail 1000 mm above the walkway surface and the intermediate rail 450 mm below the top rail. Handrail post spacing shall be limited to 1500 mm as far as possible but can be proportioned to the length of the protected horizontal opening. In such a case spacing shall not exceed 1850 mm centre to centre of posts. Handrails shall be shop fabricated for specific locations and field welded or bolted to the erected structural steel. For platforms at elevation more than 30 m, three rail system with top rail at 1500 mm shall be adopted.

For RCC stairs, handrails with 20 mm square MS bar balustrade with suitable MS flat & aluminium / Teakwood handrail shall be provided, unless specifically mentioned otherwise. All hand rails except stairways shall be provided with toe guard plate of 100x8mm thick.

12.5 Edge protection

Wherever possible around floor openings an RCC kerb of 100 mm wide 150 mm high shall be provided. All concrete edges, where breakage of concrete corner is expected, shall be provided with angles at least L 50x50x6 with lugs for edge protection e.g. all round the cut-outs/openings in floor slab, edges of drains supporting grating covers, edges of RCC cable/pipe trenches supporting covers,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[127]	25.09.2014

edges of manholes supporting covers and supporting edges of precast covers etc.

12.6 Vertical Headroom

All accessible areas shall be provided with minimum clear headroom as follows, unless otherwise specified:

Table 2.9

Headroom

Description	Headroom, mm
Finished floors to ceiling (buildings)	3000
Doors, Walkways, Platforms, Stairs etc.	2100
False ceiling of office areas	3000
False ceiling walkway	1000
Safety cage for ladders	2500
Access for forklift trucks	2800
Main roads/Railway crossings & crane access	7000
Other plant roads and truck access	5000
Cable & Pipe rack (except road/rail crossings)	3000

12.7 Waterproofing of underground structures

All underground structures like basements, pump houses, water retaining structures etc. shall have plasticiser cum waterproofing cement additives conforming to IS: 9103. In addition, limits on permeability as given in IS: 6494 shall also be met with. The concrete surface of these structures in contact with soil shall be provided with minimum two coats of bituminous painting of grade 85/25 conforming to IS: 702 @ 1.7 kg/sq.m (minimum) for water/ damp proofing. Also provision shall be made on the inner surface of walls and base slab, so that waterproofing grouting can be injected later in case of leakage.

12.8 Anti-termite treatment/Anti-weed treatment

Pre-constructional anti termite treatment shall be given to all buildings as per IS: 6313 and other relevant Indian Standards.

Reservoirs shall be given an anti-weed treatment of approved quality and quantity as per the manufacturer's specification. Anti weed treatment shall be carried out before carrying out the lining work.

12.9 Plinth Level

The finished floor levels shall be 800 mm higher than the external finished ground level. Finished ground floor level (plinth level) of all buildings and pump houses shall be minimum 500 mm above the formation level/grade level.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[128]	25.09.2014

All cable vaults shall be located above ground level i.e. cable vaults shall not be provided as basements in the buildings.

12.10 Statutory Requirements

All the applicable statutory rules pertaining to Indian Factories act, Factory rules of state government, Fire safety rules of Tariff Advisory Committee, Water act of Pollution Control Boards, Explosives act etc. and stipulations of other relevant statutory authorities shall be taken into consideration at the time of design.

Provisions of safety, health and welfare according to Factories act shall be complied with design stage. These shall include provision of continuous walkway (minimum 500 mm wide) along crane-girder at crane girder level on both sides of the building, comfortable approach to EOT crane cabin, railings, fire escape, locker room for workmen, pantry, toilets, rest room etc.

Adequate number of fire escapes shall be provided in a building. Fireproof doors, number of staircases, fire separation walls, lath plastering on structural steel member (in fire prone areas) shall be made according to the recommendation of TAC. For fire safety requirements of buildings IS: 1641 and IS: 1642 shall be followed in addition to TAC requirements. All masonry firewalls shall be minimum 345 mm thick and RCC firewall shall be minimum 200 mm thick.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[129]	25.09.2014

13. GENERAL CIVIL WORKS AND CONSTRUCTION TOLERANCES

13.1 Basic requirements for all civil works

Design requirements

The design of all structures under this contract shall be such that differential and total settlements or other movements shall not exceed acceptable limits and full provision shall be made for all expansion and other joints. The design shall be to the approval of the Owner/Consultant.

- Structural members subjected to flexure shall be designed to have adequate stiffness to limit deflections or any deformations that affect strength or serviceability of a structure adversely. The maximum allowable deflections of structural members shall be in accordance with the relevant design standards and/or the limits prescribed by the machinery manufacturers (whichever is less).
- The superstructures and foundations subjected to vibrations (the primary source of these vibrations being the unbalanced forces generated by rotating or reciprocating equipment) shall be designed such that vibrations will be neither intolerable nor troublesome to personnel and will not cause damage to the machine or structure.
- The natural frequency of the whole of the superstructures and foundations or parts thereof and all structures adjacent thereto shall not coincide with the operating frequency of the vibrating plant.
- The differences between frequencies and the dynamic analysis of the superstructures and foundations shall be in accordance with the relevant design standard.
- The dimensions of all the buildings shall be such as to provide adequate space for the safe installation and proper operation, maintenance and repair of all plant and equipment.
- Throughout the works all floor slabs above rooms containing electrical equipment shall be watertight. No drainpipes or water pipes are permitted to pass through these rooms.
- All materials used in the works shall be of the best quality of their respective kinds as specified herein, obtained from sources and suppliers approved by the Owner/Consultant and shall comply strictly with the tests prescribed hereinafter or, where tests are not laid down in this specification, with the requirements of the latest issue of the relevant Indian, American, British, German Standards or other Standards approved by the Owner/Consultant.
- Samples of all materials proposed to be used in the works may be called for at any time by the Owner/Consultant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[130]	25.09.2014

- The work shall be carried out by competent personnel skilled in their various trades.
- Before commencing the works, the Bidder shall ascertain the locations and nature of all existing underground services and shall take every possible precaution against any damage occurring to them or interference therewith, during the execution of the works.
- Suitable access to the roofs of the buildings by means of steel stairs shall be provided for maintenance and repair of any installation.
- All rooms with fire hazard shall be provided with suitable emergency exists.
- Proper access roads with footpaths shall be provided to bring in all the equipment and to take it out in case of maintenance. These access roads shall be suitable for the vehicles, which will be used (cars, forklifts, trucks/trailers etc) to reach up to the point of unloading of the equipment.
- Safe, convenient and straight forward accesses and means are to be provided to take equipment in and out of all rooms, at all levels using suitable stair wells and suitable electric hoists. The dimensions of rooms, stairwells, doors, etc shall be designed to suit the a.m. transport concept.
- Before starting of design works, the Bidder shall submit to the Owner/Consultant for approval the project design manual containing the design data and the detailed design criteria for all civil works. Design works shall commence only after approval of the project design manual by the Owner/Consultant.

13.2 Basic requirements during construction

Basic Cleaning

Basic cleaning includes all floors, walls, ceilings, built-in fittings and equipment, including the furnishings. The basic cleaning operation must result in a degree of cleanness, which permits the fully equipped buildings and rooms and associated outdoor installations and secured surfaces to be taken over without complaint.

Advertising boards and stickers, temporary protective coatings and claddings, remains and splashes of paint, must be removed with water or suitable solvents. Dust and other dirt must be completely removed from all wall and floor surfaces, as well as from all furniture.

Windows and mirrors must be cleaned so that they are completely clear and without streaks.

Perlator gauges, showerheads, odour traps and floor drains of the sanitary installations must be cleaned and the fittings and bright pipe work must be spotlessly polished.

Petrol and oil separators must be emptied, cleaned and refilled if necessary during basic cleaning.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[131]	25.09.2014

Lamps, including dishes, lighting units and tubes, switches and sockets as well as bases and skirting boards, doors with frames and glazing, windows, window seats and other furniture and fittings must be included in the basic cleaning operation.

Initial Equipment

The specification is drawn up on the assumption that the scope of the initial equipment and consumption materials is to be provided complete in every respect; everything required for the use and care of the installations must be supplied, even if this is not expressly specified in the documentation.

Bidder shall ensure that during excavation ground water level shall be lowered by at least 0.50 m below the founding level adopting appropriate method of dewatering. Lean concrete below foundation shall be laid soon after excavation with minimum loss of time.

13.3 Ash Pond

General

The Ash Bund shall be designed to be suitable under all conditions to which they may be subjected to, including self weight, vertical loads, lateral loads, water pressure, seepage and draw down, seismic effects etc. for the ultimate stage of raising of the bund. Raising of the bunds of the settling ponds shall be by upstream method of construction. The bunds shall be of homogenous earthen construction. Earth used shall conform to classification GC, CL or CI. Earth may be from inside of the pond or from approved borrow pits. It is the responsibility of the Contractor to identify suitable source of earth in adequate quantities. The source and type of earth shall be same for the full length and height of starter bund. The design of the bund shall in generally follow the provision of IS: 8826. Stability analysis shall in general follow IS: 7894.

Construction of the bund shall generally commence about 750 mm below the general ground level after the ground is clear of all roots, stumps, organic and vegetable matter. Loose pocket if any shall be removed and rectified to ensure fairly uniform bearing capacity. The bunds shall have a minimum top width of 6000 mm. Slope on the downstream side shall be a minimum 1 vertical to 2.5 horizontal. Slope on the upstream side shall be minimum 1 vertical to 2.5 Horizontal. Free board above full reservoir level shall be calculated as per IS:10635. However minimum free board shall be 1500 mm. The design of bund shall ensure that the phreatic line shall not meet downstream face of the embankment. To ensure this adequate internal drainage arrangement shall be provided as described below:

- i) Sand chimney a minimum of 500 mm thickness upto 1 m below the top of bund.
- ii) Continuous Sand blanket of a minimum 500 mm thick at ground level connecting chimney to rock toe.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[132]	25.09.2014

iii) Rock toe to a minimum height of 1000 above the outside ground level with a top width of 1 meter and side slope of 1 vertical to 1.5 horizontal. The rock toe shall extend to the full depth of bund below ground level

iv) 150 mm thick coarse sand filter and 150 mm thick fine sand filter between sand blanket and rock toe.

The embankment shall be safe against failure due to “piping”. The design shall ensure that the exit gradient is less than 1 m. The gradient shall be calculated by drawing flow net.

Downstream face shall be protected by turfing with turf. A peripheral drain of minimum internal width of 450 mm and minimum depth of 300 mm shall be provided at the side of the rock toe along the periphery of the bund to drain the seepage from rock toe and rain water from the surface drains. The toe drain shall be of brick in CM 1:4 with cement plaster 15 mm thick on the outside and inside. Base of the drain shall be 150 mm thick PCC of grade M15. The drain shall be constructed in a minimum slope of 1 in 750 and shall lead the water to the nearest water course. To lead out the rain water on the downstream side surface drains formed out of brick paving 75 mm thick minimum 600 mm wide and 150 mm deep shall be provided at about 100 Meters c/c along the length of the bund. The brick shall be pointed using cement mortar 1:3. The surface drain shall be connected to the toe drain through the filter and rock toe. The upstream slope for the bottom ash slurry side will be protected by providing LDPE Liner. The LDPE Liner shall be 200 micron thick and of black colour. The lining shall have a 150 mm sand cushion at the bottom. The liner shall be as per IS:2508. The liner shall be protected by providing one layer of brick 75 mm thick over a cement mortar layer of minimum 15 mm thick or 75 mm thick M10 PCC layer over a (1:4) cement mortar layer of minimum 15 mm thick spread over the LDPE Liner. The joints between the brick shall be filled with CM 1:4 after curing the brick paving for 3 days. The LDPE Liner shall be properly anchored at the top of the bund, at the berms and at the bottom of the bund with appropriate embedment with PCC in continuous trench. The bottom ash pond floor shall also be lined to prevent seepage of ash into ground water as per the requirements of environmental authority. The floor shall be based with LDPE Liner of 150 microns thickness as per IS:2508, black in colour with a bottom sand cushions of 150 mm and top earth cover of 300 mm. IS:8237 shall also be followed for guidance while designing slope protection. The subgrade for LDPE film shall be prepared from natural river sand / manufactured crusher sand as per IS codes / fly ash.

Water Escape Structure (Discharge Shaft):

The decanted water collected in stilling ponds shall be discharged through water escape structure, to the forebay of the pump house of the Ash water recovery system. Discharge shaft shall be circular in shape of suitable diameter with an internal diameter of a minimum of 4000 mm. On the two opposite sides of the shaft vents will be provided at different levels to drain out the decanted water as the level of ash in the ponds increase. Size of the vents shall be fixed in such a way that the inflow into the ponds equals the out flow. These vents will be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[133]	25.09.2014

blocked progressively as the ash level in the pond rises. The discharge shaft shall be sized to handle full out flow from the pond. The shaft will be designed as water retaining structure limiting crack width to 0.1 mm. Minimum grade of concrete shall be M25 for the shaft and foundation. The structure and foundation shall be designed to support the load of the ultimate height of the shaft. The contractor shall conduct necessary geotechnical investigation at the location of the water escape structure to decide on the type of foundation considering the ultimate load on the structure. From the discharge shaft water will be led out through a pipe with R.C.C encasement all round to protect the pipe from the super imposed earth load. The invert level of the pipe shall be kept 250 mm above the bottom of the shaft and will be given adequate slope to ensure discharge matching the inflow into the shaft. The shaft shall be provided with G.I rungs of 25 mm dia at 300 mm c/c for access during maintenance. Stop Log arrangement to block the vents during maintenance shall be designed and provided. At the top of the shaft removable platform with G.I gratings will be provided for operation and maintenance. The bunds shall be designed in spans not exceeding 20 m with R.C.C piers to support intermediate spans. Bridges shall be of structural steel with precast R.C.C deck slab for ease in dismantling and re erection. As the height of the bund is increased, these bridges will also be dismantled and re-erected.

The location of the discharge shaft shall be such that the edge of the foundation shall be 5000 mm clear of the upstream toe of ultimate stage of the bund.

Energy Dissipating Structures:

Along the upstream slope of the stilling ponds the ash slurry will be discharged through pipes at intervals. The pumped slurry will erode the lining and the bund proper if proper energy dissipating steps are not provided. The energy dissipating structure shall confine the flow from the pipe to an R.C.C. trough about 1500 mm wide projecting about 600 mm from the slope surface with R.C.C steps extending from the top of the bund to the toe where a water cushioning sump 1000 deep and 1500 x 1500 in plan will be provided for water overflow. Grade of concrete shall be a min of M25.

Weir with energy dissipating arrangement in all ash lagoons of dyke body at suitable points shall be provided to drain off the surface rain off.

Road way on top of bund:

4000 mm wide carriage way with WBM finish with 200 mm thick granular sub base and 200 mm thick WBM layer shall be provided at the top of the bund.

The carriage way shall be sloped in one direction toward downstream side where surface drains are provided. Guard stones shall be provided at 3000 mm c/c on either side of the bund.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[134]	25.09.2014

14. Standards, Codes and References

14.1 General

The Design of the Steel Structural Works shall be prepared and presented in accordance with IS codes. In absence of guidelines of specific items in the IS codes, International codes viz., American, BS, DIN or Australian code shall be used. All the Indian Standards referred to shall be the latest revision (including all amendments issued thereto) on the date of opening of the price bid. The Standards adopted shall be clearly stated in the calculations.

The Design shall comply with the current Local Authority Building Regulations (National Building Code) where appropriate. Subject to the agreement of the Owner, other International / Foreign National Standards, and, International / Foreign National Standard Codes of Practice, may be used.

To the extent that the Design shall include materials, methods or workmanship to be incorporated into the works, they shall be selected and incorporated into the design in accordance with the recommendations and requirements of the following (as appropriate in order of precedence but not mutually exclusive):

Statutory requirements

The Contract provisions

Bureau of Indian Standard Codes of Practice

International / Foreign National Standards

Agreement Certification for Materials

Manufacturer's recommendations for materials

Competent Trade Association recommendation

Engineering judgment

In case of any deviation / conflict between provisions of IS codes and the design criteria, the provisions that are more stringent shall be followed unless specifically directed otherwise.

Reference to only some of the codes in this document and various clauses of design criteria shall not limit or restrict the scope or applicability of other relevant codes. It shall be ensured that all other codes relevant to a specific job, in addition to those already mentioned, are followed wherever applicable.

Where British / American / DIN or other codes and standards are referred to in this document, equivalent Indian Standards may be substituted if available.

Materials supplied from India shall follow the Indian Standard Specifications.

Field and laboratory testing procedures for materials follow Indian Standard Specifications.

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-D	[135]	25.09.2014

14.2 Codes for Loads

- IS: 875 : Code of Practice for design loads (other than earthquake) for Buildings and structures (All parts)
- IS: 1911 : Schedule of unit weights of building materials
- IS: 1893 (Part 1) : Criteria for earthquake resistant design of structure – General provisions and buildings
- IS: 1893 (Part 4) : Criteria for earthquake resistant design of structure – Industrial structures including stack-like structures

14.3 Codes for RCC

- IS: 456 : Plain and reinforced concrete - Code of Practice
- IS: 2974 : Code of Practice for design and construction of machine foundations
- IS: 2911 : Code of Practice for design and construction of pile foundation
- IS: 4326 : Code of Practice for earthquake resistant design and construction of buildings
- IS: 4995 : Criteria for design of reinforced concrete bins for storage of granular (all parts) and powdery materials
- IS: 5525 : Recommendation for detailing of reinforced concrete works
- IS: 1786 : Specification for high strength deformed steel bars and wires for concrete reinforcement
- IS: 11384 : Code of Practice for composite construction in structural steel and concrete
- IS: 13920 : Code of Practice for ductile detailing of reinforced concrete structures subjected to seismic forces

14.4 Codes for Structural Steel

- IS: 800 : Code of Practice for general construction in steel
- IS: 801 : Code of practice for use of cold-formed light gauge steel structural members in general building construction
- IS: 806 : Code of Practice for use of steel tubes in general building construction
- IS: 808 : Dimensions for hot rolled steel beam, column channel and angle section
- IS: 812 : Glossary of terms relating to welding & cutting of metals
- IS: 813 : Scheme of symbols for welding
- IS: 814 : Covered electrodes for manual metal arc welding of carbon and carbon manganese steel - Specification
- IS: 815 : Classification coding of covered electrodes for metal arc

VOLUME-II: TECHNICAL SPECIFICATIONS

SECTION-I: PROJECT TECHNICAL SPECIFICATION

1. Intent of Specification
2. Site & Project Specific Information
3. Existing Plant Details
4. Scope of Supply & Services
5. Terminal Points & Exclusions
6. General Technical Requirements
7. Layout Consideration
8. Performance Guarantees
9. Spare Parts
10. Annexure

SECTION-II:DETAILED TECHNICAL SPECIFICATION

1. Detailed Technical Specification-Mechanical
2. Detailed Technical Specification-Electrical
3. Detailed Technical Specification-I&C
4. Detailed Technical Specification-Civil

TECHNICAL DATASHEETS – ASH HANDLING PLANT

1	ASH HANDLING PLANT		
1.1	Design Basis		
			<i>Design Coal Worst Coal</i>
	Maximum Coal consumption	: (TPH)	[...]
	Ash content	: (%)	[...]
	Ash generated		[...]
	a) Bottom ash generated	: (TPH)	[...]
	b) Coarse ash generated	: (TPH)	[...]
	c) Fly ash generated	: (TPH)	[...]
	Bottom ash removal time	:(minutes)	[...]
	Coarse ash & fly ash removal time	:(minutes)	[...]
	Guaranteed Capacity of Ash Handling System	:	[...]
	Bottom Ash System	:	
	Fly Ash System	:	
1.2	Bottom Ash (BA) System		
	BA Hopper – Type; Capacity; Material	:	
	a) Storage capacity of ash hopper 300 mm below operating water level	:	[...]
	b) Hours of storage of Boiler BA corresponding to maximum specified ash collection rate		
	c) Hopper material and Thickness	:	[...]
	d) Hydraulic Gate		[...]
	Material	:	
	Type	:	
	No.s per Hopper	:	
	Method of operation	:

1.0 MOTOR

SL. NO.	DESCRIPTION	UNIT	DATA
1.	Manufacturer		
2.	Type and frame size		
3.	Nos. required		
4.	Application		
5.	Specification & Codes		
6.	Capacity for specified climatic conditions [50°C]		
7.	Location for installation		
8.	Type of enclosure & ventilation		
9.	Degree of protection		
10.	Type of duty		
11.	No. of phases, frequency & voltage		
12.	Permissible variations in		
a)	Voltage		
b)	Frequency		
c)	Combined		
13.	At rated voltage & frequency		
a)	Full load current		
b)	Full load speed		
c)	No load current		
14.	Minimum permissible voltage during starting :		
15.	Maximum permissible time at minimum permissible voltage during running at full load.		
16.	Maximum permissible time at 75% of rated voltage during running at full load.		
17.	Whether motor stalls at 70% of rated voltage Efficiency & power factor.		
18.	Stator winding		
	Type & nos. of terminals Brought out		
	Resistance between terminals at 20°C		
	Resistance per phase at 20°C		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-III, Part-B	[2]	25.09.2014

Technical Specification For R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

SL. NO.	DESCRIPTION	UNIT	DATA
	Inductance per phase		
	Capacitance per phase		
	Starting current as % of full load current		
19.	Torque at full load in Kgm.		
a)	Break away torque in % of full load torque		
b)	Pull up torque in % of full load torque		
c)	Pull out torque in % of full load torque		
20.	Starting time in sec.		
a)	Without mechanism coupled		
b)	Mechanism coupled through hydraulic coupling when it may be presumed that load is transferred to motor shaft only after attaining almost full speed.		
	i. with rated voltage		
	ii. with 80% of rated voltage		
	iii. with 110% of rated voltage		
21.	Starting time in sec. With mechanism coupled through flexible coupling		
a)	with rated voltage		
b)	with 80% of rated voltage		
c)	with 110% of rated voltage		
22.	Safe stall time (hot motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
23.	Safe stall time (Cold motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
24.	Limiting motor temperature to determine safe stall time		
25.	Permissible maximum accelerating time (hot motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-III, Part-B	[3]	25.09.2014

Technical Specification For R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

SL. NO.	DESCRIPTION	UNIT	DATA
26.	Permissible maximum accelerating time (cold motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
27.	Class of Insulation And Material		
28.	Whether insulation is suitable for 415 V, 6.6kV system		
29.	Temperature rise under normal conditions over 50°C ambient temperature		
30.	By resistance method --- °C over cooling water temp. for CACW motors.		
31.	Degree centigrade over cooling air temp. for CACA motor.		
32.	By Thermometer method ---- Degree centigrade over cooling water temp. for CACW motor.		
33.	Degree centigrade over cooling air temp. for CACA motor.		
34.	Method of starting :		
35.	Permissible starting duty cycles :		
36.	Stator thermal time constant :		
37.	Method of cooling (If applicable)		
	Details of water cooling system		
a)	No. of cooler		
b)	Water requirement per cooler		
c)	Losses removed by cooler		
d)	Max. permissible temperature of cooling water at inlet		
e)	Max. permissible temperature of cooling water at outlet		
f)	Maximum permissible pressure at water outlet		
g)	Water pressure drop through the cooler		
h)	Temp. of cold air coming out & entering the machine For permissible cooling water temperature of [31°C]		
i)	Temp. rise of air passing through machine at full load.		
j)	Air pressure drop through The cooler		
k)	Temp. rise of water through cooler		
l)	Protection against leakage of water :		

Document Number	Rev No.	Description	Page No.	Date of Issue

SL. NO.	DESCRIPTION	UNIT	DATA
m)	Arrangement to ensure the water flow		
38.	Bearings		
a)	Number :		
b)	Type :		
c)	Lubrication system :		
d)	Quantity of lubricant reqd. For both the bearings. Life in hours at rated speed :		
e)	Recommended lubricant :		
f)	Bearing end play :		
g)	Inlet oil pressure :		
h)	Temp. rise of oil :		
i)	Max. permissible temp. of bearing :		
j)	Max. Permissible temp. of Oil		
k)	Permissible running time without forced oil at full load & full speed :		
39.	Whether bearings are provided with 4 wire, platinum RTD having 100-ohm resistance at 0°C for remote temp. Indication.		
a)	Whether bearings are provided with local temperature indicator having two adjustable contacts rated for 5A at 240V AC or 0.5A at 220V DC. : Yes/No		
b)	If forced lube oil system provided :Yes / No		
c)	Qty of lubricant required for initial filling.		
d)	Recommended period after which lubricant should be replaced		
e)	Bearing cooling water requirement		
f)	Max. Permissible bearing cooling water inlet temp. (permissible)		
g)	Max. Permissible bearing cooling water outlet temp.		
h)	Terminal designation corresponds to direction of rotation (Facing driving end).		
i)	Terminal boxes with accessories separate terminal boxes provided.		
40.	Winding temp. detectors		
41.	Bearing temp. detectors

42.	Moisture detectors		
43.	Neutral terminals		
44.	Main terminal box details		
a)	Type & Nos.		
b)	Fault level permissible for 0.25 sec.		
c)	Location		
d)	Cable gland size & no.		
e)	Direction of cable entry.		
45.	Space Heater		
a)	Number		
b)	Location		
c)	Capacity of each		
d)	Total power requirement		
e)	Voltage.		
46.	Details of 4 wire platinum RTD having 100 ohm resistance at 0°C for winding temp. detector.		
a)	Nos. provided		
b)	Location		
47.	Whether CTs for differential protection are provided : Yes / No		
a)	If Yes, no. of CTs supplied along with motors C.T. details		
	i. C.T. ratio		
	ii. Knee point voltage		
b)	S.C. withstand capacity		
c)	Type of mounting		
48.	Shaft orientation		
49.	Shaft extension		
50.	Grounding pads size nos. & location		
51.	Method of coupling to driven mechanism		
52.	Motor GD ² :		
53.	Lifting device		
54.	Weight

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-III, Part-B	[13]	25.09.2014

Technical Specification For R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

30.	Max. Noise level		
31.	Auxiliary supply		
32.	LV neutral side current transformer for standby earth fault protection		
33.	Guaranteed no load loss (kW)		
34.	Guaranteed load loss (kW)		
35.	Efficiency		
a	At full load		
b	At 75% load		
c	At 50% load		
36.	Accessories		
	Each transformer furnished With fittings and accessories as per specification.		
37.	Approximate overall dimensions		
a	Length		
b	Breadth		
c	Height		
38.	Crane lift for un taking core and coil assembly Approximate Weights		
a	Core and coil		
b	Enclosure and fittings		
c	Oil		
d	Total weight		
39.	Shipping Details:		
a	Weight of the heaviest package		
b	Dimension of the largest package : (LxBxH)		
40.	Tests		
	Routine test as per IS and other tests as per specification

1 PROGRAMMABLE LOGIC CONTROLLER (PLC)

Table 1.1
Data Sheet for PLC

S.N	Feature	To be Filled by Bidder
1	Type of the system offered and Model No.	
2	Make	
3	Year of launching of the system	
4	Is the system offered, the latest system available/ being marketed in the international market by the vendor	
5	Place of Manufacturing	
6	Is the offered system confirms to the Specification provided in the tender document with regard to Spare Capacity, Expandability, Redundancy,	
7	Is the System offered is with open system architecture to enable integration of third party hardware/ software applications	
8	Support direct connectivity to Ethernet based LAN	
9	Deterministic and secure architecture	
10	On-line removal/replacement of I/O modules/ drive control modules possible without switching off power supply to the corresponding rack & without affecting controller operation	
11	Total I/O handling capacity of Controller	
12	No. of Tags handling capacity of Controller	
13	Total Power requirement for the offered system	
14	Total Heat Load of all cabinets	
15	Scanning rate for	
a	Analog Signal	
b	T/C Signal	
c	RTD Signal	
d	Binary Signal	
16	Loop Execution Time for	
a	Interlocks	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-III, Part-C	[1]	25.09.2014

b	Close loops	
17	Auto switchover to backup redundancy Level	
a	Controller Level	
b	Power supply Level	
c	Communication Level	
18	Output Status on Controller Failure	
19	Battery back-up duration for control processor	
20	Non-volatile memory capacity to store programs, standard software to perform control, DAS & Diagnostic functions	
21	Maximum no. of Channels for	
a	Analog Input module	
b	T/C Input module	
c	RTD Input module	
d	Analog Output module	
e	Binary Input Module	
f	Binary Output module	
22	Optical Isolation for Binary Input/Output provided.	
23	Galvanic isolation for Analog Input/Output provided	
24	Can the analog and binary controls be implemented at different execution speeds, in the multi-function controllers.	
25	Simulation of Analog/Digital Input/Output possible.	
26	Data Transmission speed for	
a	Ethernet LAN	
b	Data Highway	
c	I/O Bus	

Table 1.2
Data Sheet for High Level Analog Input Module

S.N	Feature	To be Filled by Bidder
1	No. of Inputs/Module	
2	Types of Input (Linear)	
3	Accuracy

Table 4.3
Data Sheet for Fibre Optic Cable (Single Mode)

S.N	Feature	To be Filled by Bidder
1	Maximum Uncabled Attenuation Coefficient	@1310 nm
		@1550 nm
2	Mode field Diameter	@1310 nm
		@1550 nm
3	Maximum Cable Cut-off Wavelength	
4	Maximum Zero Dispersion Wavelength	
5	Minimum Zero Dispersion Wavelength	
6	Maximum Zero Dispersion Slope	
7	Maximum Polarization Mode Dispersion	
8	Gigabit Ethernet Length 1000BASE-LX	
9	Ten Gigabit Ethernet Length	10GBASE-LX
		10GBASE-LX4
10	Maximum Core/cladding Concentricity Error	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-III, Part-C	[25]	25.09.2014

S.N	Feature	To be Filled by Bidder
11	Cladding Diameter	
12	Cladding Non-circularity	
13	Coating Diameter	
14	Maximum Coating Concentricity Error	
15	Temperature Dependence (-60 to + 85C)	
16	Temperature & Humidity Cycling (-10 to + 85C, 4 to 90% RH)	
17	Minimum Proof Test	
18	Bending Induced Attenuation (100 turns, 75mm diameter)	

Table 4.4
Data Sheet for Fibre Optic Cable (Multi Mode)

S.N	Feature	To be Filled by Bidder
1	Maximum Uncabled Attenuation Coefficient	@850 nm
		@1300 nm
2	Overfilled Launch Bandwidth	@850 nm
		@1300 nm
3	Gigabit Ethernet Length	1000BASE-SX
		1000BASE-LX
4	Ten Gigabit Ethernet Length	10GBASE-SR
		10GBASE-LX4
5	Numerical Aperture	
6	Core Diameter	
7	Maximum Core Non-circularity	
8	Maximum Core/cladding Concentricity Error	
9	Cladding Diameter	
10	Cladding Non-circularity	
11	Coating Diameter	
12	Maximum Coating Concentricity Error	
13	Temperature Dependence (-60 to + 85C)	
14	Temperature & Humidity Cycling (-10 to + 85C, 4 to 90% RH)

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

1.0 INVITATION FOR BID

Tender No : [-----]

1.1 Introduction

[Give brief introduction about the name, ownership, business & Power Projects of the utility inviting tender for R & M work]

[XXX is undertaking Renovation & Modernization of XXX MW Unit no.-XX ----- of the Power Plant]

1.2 Invitation

[Name of The Utility], hereinafter referred to as “Employer / Owner / Purchaser”, invites sealed Tenders in English language from Prequalified Bidders for the Renovation & Modernization of Electrical Balance of Plant (eBOP) package of Unit No.*[XXX]* of the *[XXX]* Power Plant on International Competitive Bidding (ICB) basis as per the scope of work given in Technical Specification Volume-II.

1.3 Brief Scope of Work

The scope of work under this R&M package involves disassembly of existing equipment / systems, replacement of specified equipments / systems by supplying new equipments/ systems including supply of assembly materials, inspection & testing at suppliers works, supply of mandatory spares, packing and forwarding, transportation & insurance, receipt at site, unloading, handling & storage at site, pre-assembly, fabrication, repair, servicing/ overhauling, erection, all associated civil works including supply of cement, steel etc., testing & commissioning, successful completion of trial operation and guarantee tests for *[Electrical Balance of Plant (eBOP)]* package of Unit no. *[XXX] of [XXX]* Power Plant. The detailed scope of work is given in Technical Specification Vol. II.

The brief scope of work is given below: -

[-----]
[-----]
[-----]
[-----]
[-----]

For detailed Scope of Work & Services, refer Section-I of Volume-II of this Specification.

1.4 Tender Details

(a)	Cost of Tender Documents	:	INR <i>[---]</i> / USD <i>[---]</i> / EUR <i>[---]</i>
(b)	Bid Guarantee Amount	:	INR <i>[-----]</i> / USD <i>[-----]</i> / Euro <i>[-----]</i>
(c)	Date of issuance of Tender Document	:	<i>[-----]</i>
(d)	Date & Time of pre-Bid Conference	:	<i>[-----]</i>

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 1-	25.09.2014

(e)	Last Date & Time of Receipt of Bid (Both Part I & Part II)	:	[-----]
(f)	Date & Time of Opening of Unpriced Techno-Commercial Bid (Part-I)	:	[-----]

1.5 Time Schedule

The time schedule for completion of facilities and performance guarantee test shall be as per SCC.

1.6 Bid Submission

- (a) The Tender Documents are issued to bidders already qualified in a pre-qualification process. The Tender documents are not transferable.
- (b) The Bid proposals are to be submitted in two parts in separate sealed covers as follows:

Part I : Bid Guarantee and Technical & Commercial Proposal without prices

Part II : Price Schedule and Schedule of Functional Guarantee parameters with values.
- (c) All other terms and conditions along with the Technical Specifications, General Conditions of Contract, Special Conditions of Contract, Time Schedule, Bid Guarantee details, Validity of Bid and Instructions to Bidders, etc. are contained in the Tender Documents.
- (d) Bidder shall submit the bid on or before the scheduled date and time as specified. Any offer received after the expiry of the time specified for receiving the completed bids are liable for rejection. The bid shall be submitted to:
[Designation, Address and Contact details.....]
.....]
- (e) Issuance of Tender Documents to a Bidder shall not be construed to mean that such Bidder would be automatically considered.
- (f) The Bid may be made in Indian Rupees as well as in Foreign Currencies (maximum three foreign currencies) and all payments for the entire scope will be made in Indian Rupees as well as in the respective quoted Foreign Currencies.
- (g) Bids submitted by E-mail, Fax, E-tender etc. will not be accepted.
- (h) The Tender Documents are meant for the exclusive purpose of bidding against the subject package and shall not be transferred, reproduced or otherwise used for purposes other than for which these are specifically issued.

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 2-	25.09.2014

2 INSTRUCTIONS TO BIDDERS

2.1 Introduction

[Name of Utility], the Owner, intends to carry out the Renovation & Modernization of [Unit no.-XX ----- of the XXXX Power Plant].

Under the subject Tender, [Utility] invites bid for Renovation & Modernization of Electrical Balance of Plant (eBOP) package of the said Renovation & Modernization work to be carried out as per the accompanying Technical Specifications. The Bidder shall submit the offer for complete scope of work indicated in the Technical Specification.

2.2 Address and Contact Details of Owner

[Designation, Address and Contact details

-----]

2.3 General Project Information

General information about the plant and R&M project is indicated in section 3.0 on General Project Information.

2.4 Owner's Consultant

[-----], hereinafter referred to as "Consultant" is the Consulting Engineer for the project, appointed by the Owner, [-----], to provide project consultancy services.

2.5 Sources of Fund

[Utility] intends to finance the subject Package of the said renovation & modernization work, through Internal and other sources & External/ Domestic Commercial/ Borrowing from international development funding agencies. [Utility] has tied up the required fund for this package.

2.6 Cost of Bidding

The Bidder shall bear all costs associated with the preparation and submission of its bid, and the Owner will in no case be responsible or liable for these costs, regardless of the conduct or outcome of the bidding process.

2.7 Non-Transferability of Bid document

Transfer of Bid documents issued to one intending bidder to another is not permissible.

2.8 Scope of Work & Single Bidder Responsibility

The scope of the work shall be on the basis of single Bidder responsibility, covering the complete scope of work specified under these specifications and documents. It shall include the following:

- (a) Disassembly of existing equipment/ systems as required.
- (b) Detailed design of the systems/equipment covering all Mechanical, Electrical, Control & Instrumentation, Civil and Structural works.
- (c) Complete manufacture, including shop inspection and testing.
- (d) Providing engineering drawings, data, operational & maintenance manuals, etc., for the Owner's review/ approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 3-	25.09.2014

- (e) Packing, forwarding and transportation including insurance from the manufacturer's works to plant site and transportation from storage yard to erection site.
- (f) Receipt, storage, preservation and conservation of system/equipment at site including construction of storage facility viz. covered, semi-covered, air-conditioned, open yard at the space allocated at site by Owner including storage-cum-erection and all other specified & statutorily required insurance.
- (g) Pre-assembly, if any, erection, testing, commissioning, completion of plant and equipment/ system, conducting trial operation, performance guarantee test and handing over of all the plant and equipment/ system covered under this specification.
- (h) Carrying out all related civil and structural works at site including construction of foundations, buildings, structures etc. Including supply of cement and steel and all other required materials.
- (i) Supply of mandatory spares and tools & tackles.
- (j) Training of Owner's personnel.

Detailed scope is provided in Volume-II of the Technical Specifications.

Bids not covering the entire scope mentioned hereinabove may be treated as incomplete and hence are liable for rejection.

2.9 Time Schedule

The completion Time Schedule for Completion of R&M work and Performance Guarantee Tests shall be as given in the SCC.

2.10 Tender Documents

The scope of contract, technical specification, bidding procedures and contract terms are prescribed in the Tender Documents. The Tender Documents comprise, inter alia, the following volumes:

Volume – I	:	Commercial
Volume – I, Chapter-1	:	Invitation for Bid
Volume – I, Chapter-2	:	Instructions To Bidders
Volume – I, Chapter-3	:	General Project Information
Volume – I, Chapter-4	:	General Condition of Contract (GCC)
Volume – I, Chapter-5	:	Special Condition of Contract (SCC)
Volume – I, Chapter-6	:	Forms & Schedules
Volume – II	:	Technical Specifications
Volume – II , Section-I	:	Project Technical Specification
Volume – II, Section-II, Part-A	:	Not Applicable
Volume – II, Section-II, Part-B	:	Detailed Technical Specification-Electrical
Volume – II, Section-II, Part-C	:	Not Applicable
Volume – II, Section-II, Part-D	:	Detailed Technical Specification-Civil

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 4-	25.09.2014

Volume – III	:	Technical Schedules
Volume – III, Part-A	:	Not Applicable
Volume – III, Part-B	:	Technical Schedule-Electrical
Volume – III, Part-C	:	Not Applicable

The Bidder is expected to examine all instructions, forms, terms and specifications in the Tender Documents including clarifications/corrigendum/amendments for completeness and obtain clarifications, if any, from the Owner.

The Bidder is expected to examine all instructions, forms, terms, conditions, specifications and other information in the bidding documents. Failure to furnish all information required as per the bidding documents or submission of a bid not substantially responsive to the bidding documents in every respect will be at the Bidder's risk and may result in rejection of its bid.

A prospective Bidder requiring any clarification to the Tender Documents may notify the Owner in writing by post or by e-mail followed by postal confirmation at the Owner's address indicated in ITB. The Owner will respond in writing by post or by e-mail followed by post confirmation to any request for clarification or modification of the bidding documents that it receives not later than twenty-one (21) days prior to the deadline for submission of bids prescribed by the Owner. Owner's response will be sent to all prospective Bidders that have been issued the Bidding Documents.

The Bidder is advised to visit the plant and obtain on its own responsibility all information that may be necessary for preparing the bid. The Owner will facilitate the bidder to collect such information about the plant in the manner that does not interface with plant operation and does not in any way adversely impact the interest of the Owner. The costs of visiting the site including engaging any third party consultant by Bidder, if required as per the assessment of Bidder, shall be borne by the bidder fully.

The Bidder, its personnel and agents will release and indemnify the Owner and its personnel and agents from and against all liability during such information collection and will be responsible for death or personal injury, loss of or damage to property and any other loss, damage, costs and expenses incurred as a result of the inspection.

At any time prior to the deadline for submission of bids, the Owner may, for any reason, whether at its own initiative, or in response to a clarification requested by a prospective Bidder, amend the bidding documents.

The amendment will be notified in writing by post or by e-mail followed by post confirmation to all prospective Bidders that have received the bidding documents and will be binding on them.

At any time prior to the deadline for submission of bids, the Owner, at its discretion may extend the deadline for submission of the bids.

2.11 Preparation of Bids

2.11.1 Language of Bid

The bid prepared by the Bidder and all correspondence and documents related to the bid shall be in English language, provided that any printed literature furnished by the Bidder may be written in another language, as long as such literature is accompanied by a translation of its pertinent passages in English language in which case, for purposes of interpretation of the bid, the translation shall govern.

2.11.2 Bidding Procedure

Single Stage Two Part Bidding Procedure will be followed for this package.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 5-	25.09.2014

The bidders are required to submit, the bids for the Renovation and Modernization work in two parts. Both the parts are to be submitted together before the indicated Bid submission Time & Dates.

The Part-I Bid comprises the techno-commercial bid without prices. The main components of the Techno-Commercial Bid are Bid Guarantee, Scope of Work & Terminal Points, Technical descriptions/details, Technical Data Sheets, List of Tools & Tackles, Deviations to Technical and Commercial Specifications/Conditions, Overall Completion Time Period & L-1 Network Schedule, Resource Deployment Schedule, Detail of Sub-Contractors/Sub-Suppliers/Sub-Vendors, Spares list, Quality Assurance Programme, Details of the present commitments & details of contracts in hand, Indices and Coefficients for Price Variation etc. Part-II Bid will comprise Quoted Price and Quoted Performance Guarantee Parameters. Initially, only the Part-I Bid will be opened and Part-II Bid will be kept in safe custody.

After evaluation of the Techno-Commercial (Part-I) Bids, each Bidder who has submitted a broadly responsive Part-I Bid, will be invited for Techno-Commercial Discussion, during which, all the required amendments, additions, deletions and other adjustments are noted and recorded in a memorandum. Part-II Bid (Price Bid) of only those Bidders will be opened, whose Part-I Bid is found to be responsive to Tender Specifications and Conditions. The date & time for opening of Price Bid will be intimated separately.

Techno-Commercial Bid should not contain any price data.

Price Bid should not contain any matter in respect of Technical and / or Commercial aspects other than the details specifically sought by the Owner.

2.11.3 Bid Submission

- (1). Bid proposals shall be accepted from only those eligible bidders who are found qualified during the pre-qualification process & are issued Tender Documents. Unsolicited bids shall not be taken into cognizance.
- (2). All Bid proposals shall be prepared and submitted in two parts, part-wise in separate sealed covers, with all pages serially numbered. All bids shall be prepared in the English language only, by typing or printing.
- (3). **[One original and 9 (nine) identical]** copies of the original with all enclosures shall be submitted by each Bidder for Part-I and Part-II, clearly indicating the original and the number of the copy (i.e., "Original", "Copy No. 1", "Copy No. 2" etc.).
- (4). All these covers shall be individually sealed and put in an outer cover which also shall be sealed and super scribed as in other covers.
- (5). The covers should be pasted properly before applying the wax seal. Failure to do so may result in rejection of such bids.
- (6). The Bidder's Bid and the documents attached thereto shall be considered as forming part of the Contract documents.
- (7). In the event of discrepancy between "Original" and any copy of the bids, the hard copy of Original shall prevail.
- (8). The Bid shall be submitted to [-----]. Bid submitted to any other office of Owner is liable for rejection. Bids submitted by Telefax or e-mail will be rejected
- (9). Owner will receive Bids in respect of all the equipment/systems and scope of work as set forth in the accompanying Technical Specifications. All bids shall be prepared and submitted in accordance with the Tender Documents.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 6-	25.09.2014

- (10). Failure to furnish all information required in the Tender Documents or submission of a Bid not substantially responsive to the Tender Conditions and Technical Specifications in every respect or bids received in incomplete shape shall be liable for rejection. A bid shall be determined as substantially responsive in every respect, if it conforms to all the terms, conditions and specifications specified in Tender Documents without material deviations, objections, conditionality or reservations.
- (11). A material deviation, objection, conditionality or reservation is one:
 - (i). That affects in any substantial way the scope, quality or performance of the contract;
 - (ii). That limits in any substantial way, inconsistent with the Tender Documents, the Owner's rights or the successful Bidder's obligations under the contract.
- (12). Deviation(s) to vital clauses listed under the Tender Documents shall be considered to be material deviation(s).
- (13). Notwithstanding any information and data, which may be contained in these Tender Documents, the Bidder has to make independent inquiries and generally obtain his own information on all matters that may in any way affect prices, risks and obligations of the Contractor under the Contract.
- (14). Either the Indian agent or the foreign Principal directly could bid in a tender, but not both. The same applies to an Indian agent/dealer representing any Indian manufacturer. In case both submit the tenders, the tender of the manufacture will alone be considered.
- (15). An agent representing one manufacturer in a tender will not be allowed to quote on behalf of another manufacturer along with previous manufacturer in a subsequent / parallel tender for the same item.

2.11.4 Bid Guarantee

- (1). The Bid shall be accompanied by Bid Guarantee either in the form of Bank Guarantee valid for [---] days from the scheduled date of opening of the Bids (Part-I) or Demand Draft of equivalent amount drawn in favour of "[-----]" payable at "[-----]".
- (2). The Bank Guarantee shall be from any scheduled commercial Bank in India authorized by Reserve Bank of India,, to issue such Bank Guarantee on a non-judicial stamp paper of value not less than Rs. [---]/-.The stamp paper shall be purchased in the name of the Bank. Foreign Bidders may submit the Bank Guarantee from any bank in India as above or from any foreign bank which is in the approved list of RBI.
- (3). Unless otherwise expressly stated,
 - a) The Bid Guarantee shall be executed only on behalf of the Bidder in whose name the Tender Documents have been issued.
 - b) The Bid and other documents shall be submitted only by the Bidder in whose name the Tender Documents have been issued.
 - c) The Bid Guarantee shall be executed only as per the format prescribed by Owner at ([-----]). In the event of any deviation in this regard, the decision of Owner as to whether the same could be accepted or not, will be final and binding on the Bidder.
 - d) In case of foreign Bidder, the Bid Guarantee amount shall be in US Dollar / Euro/ Indian Rupee.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 7-	25.09.2014

- (4). The Bidder shall arrange for extension of validity of Bid and that of the Bid Guarantee upon request from the Owner.
- (5). No interest shall be paid on Bid Guarantee amount. The offer without Bid Guarantee or with short Bid Guarantee or Bid Guarantee in the form other than that specified herein above or from banks not specified hereinabove will be liable for rejection.
- (6). Any Bid not accompanied by the Bid Guarantee shall be rejected and the Bidder shall not be permitted to participate in the tender.
- (7). The Bid Guarantee shall be forfeited if the Bidder withdraws / modifies / changes / impairs / derogates the bid proposal on its own after the Bids are opened or submits forged/bogus certificates or fails to accept the Letter of Award issued by Owner or fails to submit Contract Performance Guarantee.
- (8). The Bid Guarantee of all unsuccessful Bidders shall be returned after price cover opening and price evaluation. The Bid Guarantee of the successful Bidder shall be returned after furnishing of the Contract Performance Bank Guarantee to the Owner and acceptance thereof.

2.11.5 Bid Opening

1. This is a single stage two part tender. On the specified date and time of opening, Part– I Bid containing Bid Guarantee and Technical and Commercial Proposal without Prices will be opened. At the time of opening of Part–I of the bids, the names of the bidders who submitted their bids shall be read out and other such details as Owner, at its discretion, may consider appropriate, shall be read out. The Part – II (Price Bid) will be lodged and opening date of the same will be intimated separately to those Bidders whose Part-I Bid will be determined to be substantially responsive to Tender Conditions and Technical specifications in all respects.
2. If the Bidder desires to be present at the time of opening of Part-I of bids, it shall depute its representatives (not more than two persons) in time with due authorization for participating in the Bid opening.
3. Owner takes no responsibility for delays, loss or non-receipt of Bid documents or any letters sent by post/courier either way and also reserve the right to reject any Bid in part or full without assigning any reasons thereof.

2.12 Composition of Techno Commercial Bid (Part-I Bid)

This part shall, inter alia, include the following in the same order as listed below. One original and 9 (nine) identical copies shall be submitted.

- (i). Duly filled in "Form of Bid" (As per Annexure-B of this Volume).
- (ii). Power of Attorney/Authorization with the seal of the company in favour of the person signing the Bid.
- (iii). Deleted.
- (iv). Letter of Unequivocal Consent to be furnished by the Bidder and Assignee as per Annexure-E of this Volume
- (v). Bid Guarantee- as per Annexure A.
- (vi). Schedule of Prices as per Schedule – F1 (Table 1 to Table-7) with the word "Quoted" in lieu of Price data and all other details except price data.
- (vii). Mandatory spares as per Technical Specifications (with the word "Quoted" in lieu of Price data)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 8-	25.09.2014

- (viii). Recommended spares (with the word “Quoted” in lieu of Price data)
- (ix). Tools & Tackles as per Technical Specifications (with the word “Quoted” in lieu of Price data)
- (x). Schedule of Performance Guarantees- as per Schedule – F1 (Table-8) with the word “Quoted” in lieu of Performance Guarantee parameters
- (xi). Signed copy of all the corrigendum’s/amendments/clarifications, if any issued for the tender
- (xii). Overall Time Schedule as per Schedule – F2 and Bar chart/PERT Network schedule to achieve the time schedule
- (xiii). Deviations to the Commercial specification, if any, as per Schedule – F3.
- (xiv). Deviations to Technical Specifications, if any, as per Schedule – F4.
- (xv). Requirements of the Contractor at site, as per Schedule – F5.
- (xvi). Resource deployment schedule as per Schedule – F6
- (xvii). Details of the present commitments of the Bidder, details of contracts in hand
- (xviii). Details of Sub-Contractors/Sub-Suppliers/Sub-Vendors, if any
- (xix). Quality Assurance Programme
- (xx). Technical Details to be furnished with the Bid as called for in the Technical Specification Volume-II and Technical Bid Data Sheet Volume-III.
- (xxi). Schedule of weights and dimensions
- (xxii). Coefficients and indices for price variation formula

The Part-I Bid shall not contain any Price data.

2.13 Composition of Price Bid (Part-II Bid)

The Bidders are requested to quote the Prices and the Performance Guarantee parameters only in the specified format. Price given in Part-II should cover the entire scope of work as given in Part-I of the offer including list of mandatory spares and Tools & tackles with itemized price and should be as per Schedule of Price enclosed. *[One original and 9 (Nine) identical]* copies shall be submitted.

1. **The Price Bid shall contain the following :**
 - (i). Duly filled in Form of bid as per Annexure-C
 - (ii). Completely filled in Schedule of Prices Schedule – F1 (Table 1 to Table-7)
 - (iii). Completely filled in Schedule of Performance Guarantees Schedule – F1 (Table-8).
2. The Bidder shall quote his price against each item of the schedules as indicated in the enclosed formats. The Bidder shall quote the prices only once after considering all the pros and cons, risks and contingencies. Rebate percentage etc., if any, should be spelt out by the Bidder in the first Bid itself.
3. The amount shall be quoted both in figures and words clearly and legibly. No overwriting is allowed. All scoring and cancellations should be countersigned by the Bidder. In case of illegibility, the interpretation of the Owner shall be final. All entries shall be in English language only.
4. The Bid may be made in Indian Rupees as well as in Foreign Currencies (maximum three foreign currencies) and all payments for the entire scope will be made in Indian Rupees as well as in the quoted Foreign Currencies.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 9-	25.09.2014

5. Prices in Indian supply shall be quoted on Ex-works supply of plant & equipment basis including Packing & forwarding. Inland transportation, Insurance charges, etc. shall be indicated separately.
6. Prices of imported supply of plant & equipment directly consigned to site shall be quoted on CIF Indian port of entry basis. The bidder shall also quote separately for FOB port of shipment price for ocean freight for Marine insurance, all port charges including customs clearance and inland transport charges from port of destination to Owner's site.
7. Custom Duty, Excise Duty, Central sales tax (CST), service tax, Value Added Tax (VAT), VAT on Works Contract, other applicable taxes, duties and Cess shall be clearly indicated by the bidder in the price schedules and these taxes shall be considered for bid evaluation.

2.14 Bid Prices

Bidders shall quote for the entire scope of work on single responsibility basis & the total bid price covers all the Contractor's obligations mentioned in tender document specification or to be reasonably inferred from the tender documents/ specification in respect of the disassembly/ dismantling of existing equipment facility as specified, design, manufacture, including procurement and subcontracting (if any), delivery, construction, installation, commissioning, completion of the facilities and conductance of Performance Guarantee tests for the facilities including supply of mandatory spares, recommended spare & tools/ tackles (if any). This includes all requirements under the Contractor's responsibilities for testing, pre-commissioning and commissioning of the facilities, conducting Guarantee tests and, where so required by the tender documents, the acquisition of all permits, approvals and licenses, etc.; the operation, maintenance and training services and such other items and services as may be specified in the tender documents, all in accordance with the requirements of the Conditions of Contract and Technical Specifications.

Bidders are required to quote the price for the commercial, contractual and technical obligations outlined in the tender documents.

Prices quoted by the Bidder shall be subject to adjustment during performance of the Contract to reflect changes in the cost of labour, material, etc. A bid submitted with a fixed price quotation will not be rejected, but the price adjustment will be treated as zero. The price adjustment provision will not be taken into consideration in bid evaluation.

2.15 Signature of Bids

Each page of the Bid must be signed and stamped by the Bidder with his usual signature. The names of all persons signing should also be typed or printed below the signature. Satisfactory evidences of authority of a person signing on behalf of the Bidder shall be furnished with the Bid. Erasures or corrections in the Bid documents if any shall be signed by the person signing the Bid. Printed literature, if enclosed need not be signed. Bids not conforming to the above requirements are liable to be treated as non-responsive.

2.16 Clarifications/Corrigendum/ Amendment of Tender Specifications

1. At any time prior to the deadline for submission of Bids, the Owner may, for any reason, whether at his own initiative or in response to clarification(s) requested by a prospective Bidder, modify the Tender Specifications by amendment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 10-	25.09.2014

2. Clarifications/Corrigendum/Amendment shall be construed to be an integral part of the Tender Specifications, which will be notified. Amendments will be hosted in Owner's website. Bidders are requested to visit Owner's website and note amendments, if any, before submission of bid. Owner shall not be responsible if any bidder fails to notice any amendment.
3. Amendment shall be numbered serially. Signed copies of amendments & clarifications shall be enclosed in Part-I of bid by bidder.

2.17 Modification of Bids

The Bidder is not permitted to modify his Bid suo-moto after the Bid submission.

2.18 Information to be Furnished with the Bid

1. The Bid (Part-I) must clearly indicate the name of the manufacturer, the type or model of each principal item of equipment proposed to be supplied and erected. The Bid should also contain drawings and descriptive materials indicating general dimensions, material from which the parts are manufactured, principles of operation and the extent of pre-assembly involved, major erection equipment required to be deployed, method of erection and the proposed erection Organization structure.
2. The above information shall be provided by the Bidder in the form of separate sheets, drawings, catalogues, etc.
3. Any Bid not containing sufficient descriptive material to describe accurately the system / equipment proposed may be treated as incomplete and hence rejected. Such descriptive materials and drawings submitted by the Bidder will be retained by the Owner. Any major departure from these 'drawings and descriptive material submitted will not be permitted during the execution of the Contract' without specific written permission of the Owner.
4. Oral statements made by the Bidder at any time regarding quality, quantity or arrangement of the equipment or any other matter will not be considered.
5. Standard catalogue pages and other documents of the Bidder may be used in the Bid to provide additional information and data as deemed necessary by the Bidder.
6. In addition to the hard copy of Part-I Bid, the Bidder shall submit soft copy of all data sheets, Schedule, List of Mandatory spares, tools & tackles and Bar Chart/PERT as well as deviation tables in a compact disk (CD). However, hard copy alone will be considered as authentic for evaluation. Bidder shall submit all the filled in datasheet also in soft copy. Bidder shall also furnish soft copies and hard copies of Data Sheet with filled in details wherever details are required to be indicated by the Bidder.

2.19 Policy of Bids under Consideration

Bids shall be deemed to be under consideration immediately after they are opened. While the Bids are under consideration, Bidder's and/or their representatives or other interested parties are advised to refrain from contacting by any means, the Owner and/or his employees/ representatives on matters related to the Bids under consideration. The Owner, if necessary will obtain clarifications on the Bids by requesting for such information from any or all the Bidders, in writing as may be necessary.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 11-	25.09.2014

2.20 Validity of Bid

1. The Bid shall be kept valid for acceptance for **[180 days]** from the schedule date of opening of the Part-I Bid.
2. The Bidder will not be permitted to change the substance of the Bid suo-moto, after Bid has been opened.
3. Unilateral revision or withdrawal of offer by the Bidder within the subsistence of the validity period of offer shall not be permitted. Violation of this condition shall result in rejection of the Bid without notice, besides forfeiture of Bid Guarantee. The Bidder shall also be debarred either permanently or for a fixed period, at the discretion of Owner from participating in any of the Owner's tenders.

2.21 Understanding & Clarification on Documents & Specifications

1. The Bidder is required to carefully examine the specifications and documents and fully inform himself as to all the conditions and matters which may in any way affect the 'Renovation and Modernization work to be carried out or the cost thereof. Bidders are required to visit the plant to get familiarized with local conditions. However, the Bidders' visit to site shall be at their cost and risk, without any liability on part of the Owner.
2. Bidders may seek clarifications to the prescribed clauses and / or different part of the Tender Specifications. Such a request for clarifications, if any, should reach the Owner at least **[7 (seven) days]** before the date stipulated for pre-bid meeting. The Owner then will issue interpretations and clarifications as it may think fit in during the pre-bid meeting. After pre-Bid meeting, Bidder may seek further clarification till **[21 days]** prior to schedule opening date of Part-I Bid. After receipt of such clarifications, the Bidder may submit its Bid but within the time and date as specified in the Invitation for Bid or as amended by the Owner. All such clarifications and the relevant exchange of correspondence between the parties shall be construed to form part of the tender specifications.
3. Pre-Bid Conference will be organized and outcome of the pre-bid conference is binding on all the Bidders. Outcome of the Pre-Bid Conference will be intimated by the Owner to all the Bidders.
4. A copy of such clarifications duly signed and stamped shall be enclosed with the Bid (Part-I). In case any queries remain un-replied, it shall be construed that in respect of those queries, the respective stipulations of the Tender Specifications/Conditions shall continue to apply and/or no new stipulations are made with respect to those queries.
5. No extension of time for submission of Bid will be granted on account of Bidders' request for interpretation/clarifications.

2.22 Latest Hour for Receipt of Bids

Bids must reach the designated Office of Owner not later than **[-----]** Hrs, Indian Standard Time (IST) on the date fixed for receipt of the Bid as indicated in the Invitation for Bid. Bids delivered / received after the time and date fixed for the receipt of the bids shall be liable for rejection.

2.23 Single Bidder Responsibility

1. The scope of supply and services shall be under single Bidder responsibility.
2. The successful Bidder should not sub contract the entire work on back to back basis or otherwise.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 12-	25.09.2014

2.24 No Claim for Compensation for Submission of Bid

1. The submission of any Bid connected with these documents and specifications shall constitute an agreement that the Bidder shall have no cause of action or claim against the Owner for rejection of his Bid.
2. Regardless of the conduct or outcome of the bidding process, Bidder shall not be entitled to claim any costs, charges and expenses incidental to or incurred by him through or in connection with his submission of Bid or its consideration by the Owner, even though the Owner may elect to modify/withdraw the Invitation for Bid or does not accept the Bid(s).

2.25 Deputation of Representatives for Discussion

After opening of the Bid, if the Owner desires to have techno-commercial discussion on the Bid, the Bidder shall be in a position to depute his competent representatives of various disciplines at short notice with full authority for finalising technical parameters as well as Commercial Terms and Conditions of the Tender.

2.26 Evaluation of Bid

1. For evaluation and comparison of price bid, the prices indicated at [-----] summary of Prices as per Schedule [-----] will be considered. The Bids received will be evaluated by the Owner to ascertain the lowest evaluated substantially responsive Bid vis-à-vis the Tender Specifications. The Bidder has to satisfy himself that full information is furnished as required in the specifications. Lack of particulars or incomplete information furnished will run the risk of rejection of the bid. The following major procedures would be followed for evaluation of bids.
2. All the Bidders would be brought on par with reference to Technical Specification, Commercial Condition, Instructions to Bidders and subsequent techno-commercial discussions/ clarifications.
3. After the evaluation of Part-I bids (techno-commercial bids) and before opening of Part-II bids (Price Bids), in case the bidders are asked to make changes to their techno commercial offer that may have price implications, Owner may give the bidders opportunity to submit addendum to price bid covering the price implication only against such changes before the opening of Part-II bids (Price Bids). All the bidders will be notified, at least 15 days before the Price Bid opening date, about such changes against which they can submit addendum to Price Bid.
4. Commercial loading would be done for non-compliance of commercial terms and conditions of the Tender Specifications other than the vital clauses, as the case may be.
5. To facilitate evaluation and comparison, the Owner will convert all bid prices expressed in foreign currencies into Indian Rupee at State Bank of India Bills Selling exchange rates prevailing on the date of opening of the price bid.
6. The Bidder is eligible for a price variation as per Tender Condition. However Price variation shall not be considered for Bid evaluation.
7. Technical loading will be done for omission of price data in respect of equipment/facilities, spares, tools & tackles, etc. The highest quoted corresponding price will be loaded against such omission. If no quoted price is available, the loading will be done as per the corresponding price as estimated by the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 13-	25.09.2014

8. The Bidder has to meet the minimum functional performance levels indicated in Volume-II Technical Specification for all categories of Guarantees. If one or more of Functional Performance Parameters offered by the Bidder is inferior to the minimum functional performance level (i.e. higher or lower than maximum or minimum value specified in Technical Specification), then such bid will be considered non-responsive and rejected.
9. The quoted values for Performance Guaranteed Parameters given in Table below would be evaluated using evaluation factors specified. The evaluation factors shall be applicable to the differential values calculated from among the Bidders of corresponding item with appropriate highest or lowest value (i.e., the best quoted value) as the base. The evaluation will be based on the guarantee parameters inclusive of all tolerance furnished at the Guaranteed Condition. Bidders to note that the values indicated in the Schedule of Performance Guarantees shall be inclusive of all tolerances including measurement uncertainty.

Table-Bid Evaluation Factors

Sl. No.	Functional Performance Parameter	Evaluation Factor Rate
1.	Copper Losses	[-----] INR per kW
2.	Iron Losses	[-----] INR per kW
3.	Auxiliary Power	[-----]INR per kW

The basis on which the Functional Performance Parameters are to be quoted shall be as per Volume-II Technical specification.

The evaluation factors rate shall be prorated for any fractions of the specified value.

- (1). Arithmetical errors will be rectified on the following basis:
 - If there is any discrepancy between the unit price and the total price that is obtained by multiplying the unit price and the quantity, the unit price shall prevail and the total price will be corrected.
 - If there is a discrepancy between the total Bid Price and the sum of total prices, the sum of the total prices shall prevail and the total Bid Price will be corrected.
 - If there is discrepancy between the rates in figures and in words, the rates expressed in words shall only prevail and shall be adopted.
- (2). All the Sl. Nos. and columns in the 'Schedules of Prices' shall be quoted. If no prices are envisaged for any of the entries, 'Nil' shall be mentioned. In this context "Nil" mentioned against any item shall construe that the Bidder shall not charge any amount separately for that item from the Owner. If the terms, such as 'not applicable' "-----" or blank are mentioned against any Sl. Nos./columns, the highest amount quoted for the concerned entry among all Bidders will be loaded for purposes of evaluating the Price Bids.

2.27 Local Conditions

1. The Bidder shall inspect the site and shall satisfy himself of the site conditions and shall apprise himself of the procedure for engagement of agencies/labour

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 14-	25.09.2014

and shall collect any other information, which may be required before submitting the Bid.

2. Wages not less than Minimum wages for Contract labour shall be paid as applicable in this region from time to time. Claims and objections due to ignorance of site conditions will not be considered after submission of Bid.
 - (i). The Bidder is required to carefully examine the Technical & General Specification, commercial Terms and Conditions, drawings and other details relating to work given in the Tender Specification and get fully acquainted as to all conditions and matters which may in any way affect the work or the cost thereof.
 - (ii). The Bidder shall be deemed to have exhaustively examined the Tender Specifications including the Form of Contract, to have obtained all information and clarifications on all matters whatsoever that might affect the carrying out of the work and to have satisfied himself as to the adequacy of his Bid. He is deemed to have known the scope, nature and magnitude of the work and the requirements of materials and labour involved etc. and as to all work he has to complete in accordance with the Contract for the adequacy of his Bid.
 - (iii). The Bidder shall be deemed to have visited and carefully examined the plant/ site and surroundings, to have satisfied himself about the nature and details of all existing structures, if any, and also as to the nature and conditions of the railways, roads, bridges and culverts, means of transport and communications, whether by land, water or air and as to possible interruptions thereto and the access to and from the site, to have made independent enquiries, examined and satisfied himself as to the sources for obtaining earth, gravel, sand, stones, bricks and all other construction materials, the site for disposal of surplus earth and debris, the available accommodation, underground existing services, sub-soil water conditions, storms, prevailing winds, climatic conditions and all other similar matters which may affect the work.
 - (iv). The Bidder shall be deemed to have acquainted himself with the Indian Income tax Act, 1961, Indian Companies Act, 1956, Indian Customs Act, 1962, Indian Central Excise Act, Value Added Tax, Indian Sales Tax Act, Indian Electricity Act, Central Electricity Authority Regulations, Indian Boiler Regulations, Factories Act, Pollution Control Regulations and other related Acts & Laws prevalent in the State of [-----] and in India and as amended from time to time. The Owner shall not entertain any request for clarifications from the Bidders regarding such local conditions.
 - (v). Any neglect or omission or failure on the part of the bidder in obtaining necessary and reliable information as stated above or on any other matter affecting the Bidder shall not relieve him from any risk or liabilities or the entire responsibility for completion of the work in accordance with the Tender Specifications.

2.28 Deviations

1. Normally, deviations are not permitted in commercial terms & conditions and technical specification. Nevertheless, if the Bidder takes any deviation, it shall be clearly indicated in the deviation schedule (Schedule – [-----] and Schedule- [-----] with a soft copy in MS-Word format in compact disc, with “Original” of Part-I of the Bid). Deviation listed elsewhere in the Bid shall be summarily rejected and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 15-	25.09.2014

ignored. Separate printed standard terms and conditions of the Bidder shall not be taken into cognizance and shall be totally rejected.

2. No alterations or disfigurement, other than filling in particulars wherever called for in the formats of the Tender Specifications shall be made in the Bid. Any changes/modifications made by the Bidder in Bid documents itself shall not be taken into consideration.
3. If at any later date, it is found that documents, information, averments and data submitted by the bidder in the Bid, based on which the Bidder has been considered eligible or successful or has been awarded the Contract is incorrect or false to the extent that had the correct or true information been made available to the Owner at time of tender evaluation, the Bid would have been declared ineligible or unsuccessful, the Bidder shall be forthwith disqualified or, as the case may be, the Contract awarded based on such incorrect or false information shall be cancelled and the Bid Guarantee / contract performance Guarantees deposited shall be appropriated by the Owner towards Owner's cost, loss and damage to Owner.

2.29 Blacklisting/Debarring

In case, certificates submitted by the Bidders are found to be a forged/untrue, the Bidder will not only be disqualified for this tender but also would be black listed/debarred by the Owner.

2.30 Award of Contract

1. Award Criteria

- The Owner will award the contract to the successful Bidder whose Techno-commercial bid has been determined to be substantially responsive and Price Bid to be the lowest evaluated bid, provided that the Bidder is determined to be qualified to perform the contract satisfactorily.
- The Owner reserves the right to vary the quantity of any of the Items / Spares and / or delete any Item / Spares altogether at the time of Award of Contract.

2. Owner's Right to Accept Any Bid and to Reject Any or All Bids

The Owner reserves the right to accept or reject any bid, for any reasons including National defense and security consideration and to annul the bidding process and to reject all bids at any time prior to award of contract, without thereby incurring any liability to the affected Bidder or bidders or any obligation to inform the affected Bidder or bidders of the grounds for the Owner's action.

3. Notification of Award

Prior to the expiration of the period of bid validity, the Owner will notify the successful Bidder in writing by registered letter (Letter of Award or LOA) or by email to be confirmed in writing by registered letter, that its bid has been accepted. The notification of award will constitute the formation of the contract.

Upon the successful Bidder's furnishing of the performance securities the Owner will promptly notify each unsuccessful Bidder and will discharge its bid security.

4. Signing the Contract Agreement

At the same time as the Owner notifies the successful Bidder that its bid has been accepted, the Owner will send to the Bidder the Contract Agreement provided in the bidding documents, incorporating all agreements between the parties.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 16-	25.09.2014

Within *[twenty-eight (28)]* days of receipt of the Contract Agreement, the successful Bidder / assignee of foreign bidder (if applicable) shall sign and date the Contract Agreement and return it to the Owner.

5. Corrupt or Fraudulent Practices

The Owner requires that Bidders, Contractors and Suppliers observe the highest standard of ethics during the procurement and execution of the contracts. In pursuance of this policy, *[Name of Utility]* requires that Bidders, Contractors and Suppliers observe the highest standard of ethics during the procurement and execution of the contracts. The Employer may reject a Bid Proposal of a successful Bidder if it emerges that the Bidder recommended for award has engaged in Corrupt or Fraudulent practices in competing for the subject contract. The Employer may declare a Bidding firm ineligible for participation in future tenders of the Employer, either indefinitely or for a stated period of time, if it at any time it emerges that the firm has engaged in Corrupt or Fraudulent practices in competing for or in executing a contract of the Owner. Corrupt Practice means the offering, giving, receiving or soliciting of anything of value to influence the procurement process or contract execution. Fraudulent practice means a misrepresentation of facts in order to influence a procurement process or the execution of a contract to the detriment of the Employer and includes collusive practice among Bidders designed to establish bid prices at artificial non-competitive levels and to deprive the Employer of the benefits of free and open competition.

2.31 Agency Commission

No Agency commission shall be payable under the Contract.

2.32 Contract Performance Bank Guarantee (CPBG)

As a Contract security, the successful Bidder, to whom the work is awarded, shall be required to furnish a Contract Performance Bank Guarantee (CPBG) in the Format attached as Annexure- G, in favour of the Owner within 30 days from the date of issue of Letter of Award (LOA). The guarantee amount shall be equal to ten percent (10%) of the 'Contract Price' and it shall guarantee the faithful performance of the 'Contract' in accordance with the terms and conditions specified in these documents and specifications. The CPG shall be valid till the end of 'Warranty Period' plus Ninety (90) days grace period. If the contract price is in more than one currency, CPBG shall be 10% of respective currency.

In case of a successful foreign bidder, if the Owner accepts to enter into the Second Contract and / or Third Contract with the assignee, then, within Thirty (30) days after receipt of Letter of Award, the assignee shall furnish an additional Contract Performance Bank Guarantee for five percent (5%) of the value of the Contract entered into with the assignee (i.e. for five percent of aggregate value of component Contract(s) entered into with the assignee).

2.33 Contract Quality Assurance

1. The Bidder shall include in his Bid a detailed Quality Assurance Programme containing the overall quality, management and procedures which he proposes to follow in the performance of the 'Works' during various phases.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 17-	25.09.2014

2. After Letter of Award (LOA), the detailed Quality Assurance Programme to be followed for the execution of the 'Contract' will be mutually discussed and agreed to and such agreed Programme shall form a part of the 'Contract'.

2.34 Codes & Standards

Specifications give reference to Indian or internationally accepted Standards. However, equipment or materials meeting other recognized National or International Standards, which ensure an equal or superior quality than Standards specified, will also be accepted. For details of codes and standards refer Technical specification, Volume-II.

2.35 Vital Clauses

The following clauses in the Tender Specification & Draft Contract are vital. Bidder is advised not to take deviations to these clauses. If deviations are taken from the stipulations of these clauses, such Bids would be liable for rejection:

- Scope of Work
- Time Schedule
- Price Basis
- Contract Performance Guarantee
- Warranty
- Liquidated Damages
- Force Majeure
- Arbitration
- Taxes & Duties
- Bid Guarantee
- Patents, Indemnity
- Validity of Bids

4 GENERAL CONDITIONS OF CONTRACT (GCC)

4.1 Definitions

- i. **"Applicable Laws"** means the laws of any national, state, local or municipal legislature in India, or of any other Competent Authority, including all laws, acts, judgments, statutes, rules, regulations, ordinances, orders, decrees, injunctions, governmental authorizations, requirements of Applicable Permits and any agreements, decisions, acts, instructions, requirements, directions and notifications of any competent or other Competent Authority or court or tribunal or arbitrator having jurisdiction over the matter in question, including those related to taxes, assessments, expropriation and duties, or authoritative interpretation, as amended, modified, enacted, reinterpreted or revised from time to time hereafter.
- ii. **"Applicable Permits"** means all permits, licenses, authorizations, consents, decrees, waivers, privileges, acknowledgements, concessions, approvals, rulings, decisions and visas from, filings with or applications submitted to, any Competent Authority or court or tribunal of competent jurisdiction necessary from time to time for or in relation to the performance of the Works, including as detailed in this GCC.
- iii. **"Agreement"** means the Contract Agreement (entitled "Contract Agreement") executed by the parties to which these Conditions are annexed and also includes supplements & amendments to the Contract.
- iv. **"Contract"** means the Agreement entered into between Owner and Contractor as per the 'Contract Agreement' signed by the parties, including contract documents, all attachments and appendices thereto and all documents incorporated by reference therein.
- v. **"Contract Documents"** means the complete documents, which are the basis of finalization of the contract, including correspondence exchanged from issue of tender till date of signing the contract. All such documents shall be listed in the Contract Agreement.
- vi. **"Contractor's Equipment"** means all plant, facilities, equipment, machinery, tools, apparatus, appliances or things of every kind required in or for installation, completion and maintenance of Facilities that are to be provided by the Contractor, but does not include Plant and Equipment, or other things intended to form or forming part of the Facilities.
- vii. **"Contractor"** means the person(s), Firm or a Company whose bid to perform the Contract has been accepted by the Owner and shall be named as such in the Contract Agreement, and includes the legal successors or permitted assigns of the Contractor.
- viii. **"Contract Price"** means any sum or sums finally accepted by the Owner for the execution of this contract, subject to such additions and adjustments thereto or deductions there from, as may be made pursuant to the Contract.
- ix. **"Contractor's Representative"** means any person nominated by the Contractor & approved by the Owner hereof to perform the duties delegated by the Contractor.
- x. **"Consulting Engineer"** means Owner's Engineer appointed by the Owner. Also refers to any other firm(s) or person(s) as may be appointed by the Owner from time to time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 20-	25.09.2014

- xi. **“Commissioning”** means the construction of plant and equipment for operation of the Facility at rated capacity are complete and the plant and equipment achieves the designated full load/full capacity, at designated fuel/input.
- xii. **“Completion”** means that the Facilities (or a specific part thereof where specific parts are agreed) have been completed operationally and structurally and put in a tight and clean condition, and that all work in respect of pre-commissioning of the Facilities or such specific part thereof has been completed and commissioning has been attained as per Technical Specifications.
- xiii. **“Competent Authority”** means any agency, authority, department, inspectorate, ministry or statutory person (whether autonomous or not) of GOI, [Name of the State], Ministry of Environment and Forests (MoEF) any other State of the Republic of India or any local authority.
- xiv. **“Day”** means calendar day of the Gregorian calendar.
- xv. **“Defect Liability Period”** means the period of validity of the warranties given by the Contractor, commencing at completion of the Facilities or a part thereof, during which the Contractor is responsible for defects with respect to the Facilities.
- xvi. **“Effective Date”** means the date from which the Time for Completion of the facilities and other milestones for execution of the Renovation & Modernization work as per the scope of work under this tender by the Contractor shall be determined.
- xvii. **“Erection Services”** means those entire services ancillary to the supply of the plant and equipment for the Facilities, to be provided by the Contractor under the Contract. e.g. transportation and provision of marine or other similar insurance, inspection, expediting, site preparation works (including the provision and use of Contractor's Equipment and the supply of all construction materials required), installation, testing, Pre-commissioning, commissioning, operations, maintenance, the provision of operations and maintenance manuals, training of Employer's Personnel etc.
- xviii. **“Facilities”** means the plant and equipment to be supplied and installed, as well as all the Erection Services to be carried out by the Contractor under the Contract.
- xix. **“Force Majeure”** means mean any event beyond the reasonable control of the Owner or of the Contractor, as the case may be, and which is unavoidable notwithstanding the reasonable care of the party affected.
- xx. **“GCC”** means the General Conditions of Contract hereof.
- xxi. **“Good Industry Practice”** means the exercise of that degree of skill, diligence and prudence which would reasonably and ordinarily be expected from a skilled and experienced Contractor, equipment manufacturer or operator applying the standards generally adopted by global Contractors, global equipment manufacturers and operators in the construction or operation of power generation facilities or the manufacture of equipment therefore, except in so far as inconsistent with any applicable Indian law or directive.
- xxii. **“Guarantee Test(s)”** means the test(s) specified in the Technical Specifications to be carried out to ascertain whether the Facilities or a

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 21-	25.09.2014

specified part thereof is able to attain the Functional/Performance Guarantees specified in the Technical Specification.

- xxiii. **"Incoterms"** means International rules for interpreting trade terms published by the International Chamber of Commerce (latest edition), Paris (France). Unless inconsistent with any provisions of the contract, the meaning of any trade term and the rights and obligations of the parties there under shall be as prescribed by Incoterms.
- xxiv. **"Inspector/Inspecting Engineer"** means the Owner or any person nominated by the Owner from time to time, to inspect the equipment of works under the contract and/or the duly authorized representative of the Owner.
- xxv. **"Latent Defect"** means the defects inherent in the material or arising out of design deficiency which does not manifest itself during the Warranty Period/Defect Liability Period, as described in this GCC.
- xxvi. **"Letter of Intent (LOI)/Letter of Award (LOA)"** means the official letter issued by the Owner notifying the Contractor that its Bid Proposal has been accepted.
- xxvii. **"Month"** means calendar month of the Gregorian calendar.
- xxviii. **"Manufacturer's Works" or "Contractor's Works"** means the place used by the Contractor, its manufacturer, supplier, collaborators or sub-contractors/vendors/sub-vendors for the performance of the works.
- xxix. **"Operational Acceptance"** means the acceptance by the Owner of the Facilities (or any part of the Facilities where the Contract provides for acceptance of the Facilities in parts), which certifies the Contractor's fulfillment of the Contract in respect of performance guarantees of the Facilities.
- xxx. **"Owner" or "Purchaser"** shall means the [Name of the Utility], and includes its legal successors or permitted assignees.
- xxxi. **"Person"** means any natural person, firm, corporation, company, voluntary association, partnership, joint venture, trust, and incorporated organization, unincorporated organization, Competent Authority or other entity.
- xxxii. **"Pre-commissioning"** means the testing, checking and other requirements specified in the Technical specifications that are to be carried out by the Contractor in preparation for commissioning.
- xxxiii. **"Project"** means the Owner's [-----] in respect of which the Contract has been signed.
- xxxiv. **"Project Consultant" or "Owner's Consultant"** means the engineering firm or person(s) appointed by the Owner to render engineering project consultancy services for the project.
- xxxv. **"Project Manager"** means the person appointed by the Owner thereof and named as such, to perform the duties delegated by the Owner.
- xxxvi. **"Plant and Equipment"** means permanent plant, equipment, systems, machinery, apparatus, articles and things of all kinds to be provided and incorporated in the Facilities by the Contractor under the Contract (including the spare parts to be supplied by the Contractor under the Contract Agreement), but does not include Contractor's Equipment.
- xxxvii. **"SCC"** means the Special Conditions of Contract hereof.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 22-	25.09.2014

- xxxviii. **“Site”** means the land and other places upon which the Facilities are to be installed, and such other lands or places as may be specified in the Contract as forming part of the Site.
- xxxix. **“Sub Contractor”, including “Vendors/Sub-Vendors”**, means any firm or person to whom execution of any part of the Facilities, including preparation of any design or supply of any plant and equipment is subcontracted directly or indirectly by the Contractor, and includes its legal successors or permitted assignees.
- xl. **“Technical Specification / “Tender Documents”** means the document, setting out a description and specification of the Works and statement of the technical and other standards to which the Works are to be performed including any modifications thereto made in accordance with the Conditions. This includes the technical & commercial specifications and other Tender Documents forming a part of the Contract and such other Schedules and drawings as may be mutually agreed upon.
- xli. **“Tenderer”/“Bidder”** means the Person(s), Firm/Company who has submitted its Bid Proposal in response to the bid invitation by the Owner, for the Project.
- xl. **“Time for Completion”** means the time within which completion of the Facilities as a whole (or of a part of the Facilities where a separate time for completion of such part has been specified) is to be attained in accordance with the stipulations and provisions of the Contract.
- xl. **“Warranty Period” or “Defect Liability Period”** means the period during which the Contractor shall remain liable for repair or replacement of any defective part of the works performed under the contract, free of cost.
- xl. **“Work(s)”** means and includes the tasks of furnishing of equipment, labour & services, transport, handling, unloading and storage at site, civil construction and complete erection, testing, commissioning putting into satisfactory operation and completion of successful performance tests, reliability tests and any other guaranteed parameters as defined in the Contract, replacement, modification, repair of defective parts or equipment during warranty period and rectification of latent defects during latent defect period.
- xl. **“Writing” or “Written”** shall include any manuscript, type-written or printed statement, under or over signature and/or seal as the case may be.

When the words "Approved", "Subject to Approval", "Satisfactory", "Equal to", "Proper", "Requested", "As Directed", "Where Directed", "When Directed", "Determined by", "Accepted", "Permitted", or words and phrases of similar importance are used, the approval, judgment, direction, etc., is understood to be a function of the Owner. Words implying persons or the gender neutral pronoun 'it', shall include firms, companies, corporation, associations or body of individuals whether incorporated or not. Words implying masculine gender or singular number shall also include the feminine gender and plural number and vice-versa where the context so requires or permits.

Terms and expressions not herein defined shall have the same meaning as are assigned to them in the Indian Sale of Goods Act (1930), failing that in the Indian Contract Act (1872) and failing that in the General Clauses Act (1897) including amendments thereof, if any.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 23-	25.09.2014

4.2 Contract Documents

- a) All documents forming part of the Contract (and all parts thereof) are intended to be correlative, complementary and mutually explanatory. The Contract shall be read as a whole.
- b) The Contract will be signed in three originals and the Contractor shall be provided with one signed original and the rest will be retained by the Owner.

4.3 Order of Precedence of Contract Documents

In case there is any ambiguity of conflict between different contract documents, the order of precedence shall be as follows:-

- i. The signed Contract Agreement & the annexure/ appendices thereto (highest precedence)
- ii. Notification of award.
- iii. Special Condition of Contract
- iv. General Condition of Contract
- v. Technical specification & Tender Drawing submitted by the contractor.
- vi. The bid & schedules/ attachment.

4.4 Interpretation

All Contract Documents, all correspondence and communications to be given, and all other documentation to be prepared and supplied under the Contract shall be written in English, and the Contract shall be construed and interpreted in accordance with English language.

The singular shall include the plural and the plural the singular, except where the context requires otherwise.

Unless inconsistent with any provision of the Contract, the meaning of any trade term and the rights and obligations of parties there under shall be as prescribed by Incoterms. Incoterms means latest edition of International Rules for Interpreting Trade Terms published by the International Chamber of Commerce Paris, France.

4.5 Construction of the Contract

The Contracts to be entered between the Owner and the Contractor shall be as under:

- 'First Contract' for CIF/CIP (Indian Port of Entry) Supply of all Offshore Plant & Equipment including Mandatory Spares and technological and miscellaneous structures with all accessories to be supplied from abroad.
- 'Second Contract' for Ex-Works Supply of all indigenous Plant & Equipment including Mandatory Spares of Indian origin and technological and miscellaneous structures with all accessories.
- 'Third Contract' for providing all services i.e. Port Handling, Port Clearance and Port Charges for the imported goods, further Loading and Inland Transportation for Delivery at Site, Unloading, Storage, Handling at Site, Erection, Insurance Covers other than inland transit insurance, Testing, Commissioning and Conducting Guarantee Tests in respect of all the Equipment supplied under the First Contract & the Second Contract, Civil works including supplies such as cement & reinforcement steel and all other services specified in the Tender Documents.

All the above Contracts will contain a cross-fall breach clause specifying that breach of one Contract will constitute breach of the other Contracts which will confer a right on

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 24-	25.09.2014

the Owner to terminate the other Contracts also at the risk and the cost of the Contractor.

The foreign bidder, however, has the option, to be exercised as a part of its bid proposal, to propose an Assignee in its bid to execute the Second Contract and/or the Third Contract. Such foreign bidder shall furnish a written unequivocal consent (with Part-I Bid) of the proposed Assignee to work as independent Contractor on the terms and conditions offered by the bidder For the scope of work envisaged by the foreign bidder, in its bid, to be executed by Assignee, the Assignee should have relevant/required capacity and experience of executing similar job. The bidder shall substantiate with relevant/required documents in the bid to establish capacity and experience of the Assignee.

If the foreign bidder has proposed an Assignee in its bid to execute the Second Contract and/or the Third Contract and has also furnished written unequivocal consent of the proposed Assignee to work as an independent Contractor on the terms and conditions offered by the bidder and if the Owner is satisfied with the capacity and experience of the Assignee proposed in the bid, the Owner will enter into the "Second Contract" and/or the "Third Contract" with the Assignee. However, if the Owner in its judgment does not find acceptable the Assignee proposed in the bid as its Contractor, then on the request of the Owner, the Bidder shall have option to propose an alternate Assignee on the same terms and conditions and cost as offered in its bid. In case the Assignee option is not exercised by the Bidder or if the Assignee fails to enter into Contract(s) with the Owner or if the Owner in its judgment does not find acceptance of the Assignee as its Contractor, then the foreign bidder shall be obliged to enter into and execute all the contracts envisaged to be entered upon this Tender with the Owner covering the entire scope of work envisaged in the Tender Documents on the same terms and conditions and cost as offered in its Bid.

If any foreign bidder has proposed an Assignee in his bid to execute the Second Contract and/or the Third Contract and has also furnished written unequivocal consent of the proposed Assignee to work as independent Contractor on the terms and conditions offered by the bidder and if the Owner is satisfied with capacity and experience of the Assignee, the Owner will enter into the 'Second Contract' and/or 'Third Contract' with the said Assignee. In case no Assignee has been proposed by the foreign bidder in his bid or if the Assignee fails to enter into the Second Contract and/or Third Contract with the Owner or if the Owner in its judgment does not find acceptance of the proposed Assignee as its Contractor, then the foreign bidder shall be obliged to enter into and execute all the three Contracts with the Owner.

If the Owner accepts to enter into Second Contract and/or Third Contract with the Assignee of foreign bidder, the said Assignee, in addition to the Contract Performance Securities to be provided by the foreign Contractor shall provide within *[twenty eight (28)]* days of Notification of Award, separate Contract Performance Bank Guarantee equivalent to five percent (5%) of the value of the Contract(s) entered into with the Assignee for the due performance of the Contract, with an initial validity up to *[ninety (90) days]* beyond the scheduled Defects Liability Period.

The award of the separate Contracts shall not in any way dilute the responsibility of the Contractor for the successful completion of the Facilities as per Contract Documents and a breach in one Contract shall automatically be construed as a breach of the other Contract(s) which will confer a right on the Owner to terminate the other Contract(s) also at the risk and the cost of the Contractor.

Document Number	Rev No.	Description	Page No.	Date of Issue

4.6 Independent Contractor

The Contractor shall be an independent contractor performing the Contract. The Contract does not create any agency, partnership, joint venture or other joint relationship between the parties hereto.

Subject to the provisions of the Contract, the Contractor shall be solely responsible for the manner in which the Contract is performed. All employees, representatives or Subcontractors engaged by the Contractor in connection with the performance of the Contract shall be under the complete control of the Contractor and shall not be deemed to be employees of the Owner, and nothing contained in the Contract or in any subcontract awarded by the Contractor shall be construed to create any contractual relationship between any such employees, representatives or Subcontractors and the Owner.

4.7 Joint Venture or Consortium

Not Used.

4.8 Non-Waiver

No relaxation, forbearance, delay or indulgence by either party in enforcing any of the terms and conditions of the Contract or the granting of time by either party to the other shall prejudice, affect or restrict the rights of that party under the Contract, nor shall any waiver by either party of any breach of Contract operate as waiver of any subsequent or continuing breach of Contract. Any waiver of a party's rights, powers or remedies under the Contract must be in writing, must be dated and signed by an authorized representative of the party granting such waiver, and must specify the right and the extent to which it is being waived.

4.9 Severability

If any provision or condition of the Contract is prohibited or rendered invalid or unenforceable, such prohibition, invalidity or unenforceability shall not affect the validity or enforceability of any other provisions and conditions of the Contract.

4.10 Origin

"Origin" means the place where the materials, equipments and other supplies for the Facilities are mined, grown, produced or manufactured, and from which the services are provided.

4.11 Notices

All notices to be given under the Contract shall be in writing, and shall be sent by personal delivery, or post, or special courier, or telefax, or E-mail to the address of the relevant party indicated in the Contract.

Either party may change its postal address, telefax number, or addressee-mail for receipt of such notices by ten (10) days' notice to the other party in writing

Notices shall be deemed to include any approvals, consents, instructions, orders and certificates to be given under the Contract.

4.12 Governing Laws

The Contract shall be governed by and interpreted in accordance with laws in force in India. The Courts of [.....] shall have exclusive jurisdiction in all matters arising under the Contract.

Document Number	Rev No.	Description	Page No.	Date of Issue

4.13 Settlement of Disputes

a) Mutual Consultation

If any differences/ dispute arises between the Owner and the Contractor in connection with or arising out of the Contract, before or after the termination, abandonment or breach of the Contract—the Owner & Contractor shall seek to resolve any such dispute or difference by mutual consultation. If the parties fail to resolve such a dispute or difference by mutual consultation, then the dispute shall be referred in writing by either party to the Arbitrator, with a copy to the other party.

b) Arbitration

Either Owner or the Contractor may, of its intention to commence arbitration, as to the matter in dispute, and no arbitration may be commenced unless such notice is given.

Any dispute, in respect of which a notice of intention to commence arbitration has been given, as above shall be finally settled by arbitration. Arbitration may be commenced prior to or after completion of the Facilities

Any dispute submitted by a party to arbitration shall be heard by an arbitration panel composed of three arbitrators, in accordance with the provisions set forth below.

The Owner and the Contractor shall each appoint one arbitrator, and these two arbitrators shall jointly appoint a third arbitrator, who shall chair the arbitration panel. If the two arbitrators do not succeed in appointing a third arbitrator within *[twenty eight (28)]* days after the latter of the two arbitrators has been appointed, the third arbitrator shall, at the request of either party, be appointed by the Appointing Authority for arbitrator is given below.

Appointing Authority for Arbitrator:

- President, Institution of Engineers in case of an Indian Contractor.
- President, International Chambers of Commerce, Paris in case of a Foreign Contractor.

If one party fails to appoint its arbitrator within *[forty-two (42)]* days after the other party has named its arbitrator, the party which has named an arbitrator may request the Appointing Authority to appoint the second arbitrator.

If for any reason an arbitrator is unable to perform its function, the mandate of the Arbitrator shall terminate in accordance with the provisions of applicable laws and a substitute shall be appointed in the same manner as the original arbitrator.

Arbitration proceedings as follows:-

- In case of a foreign contractor the arbitration proceeding shall be conducted in accordance with the United Nations Commission on International Trade Law (UNCITRAL) Arbitration Rules of 1976.
- In case of an Indian Contractor Adjudication/Arbitration proceedings shall be conducted in accordance with Indian Arbitration and Conciliation Act 1996.
- In case of a foreign associate of the contractor, the arbitration proceedings shall be conducted in accordance with the United Nation Commission on International Trade Law (UNCITRAL) Arbitration Rules of 1976.

The Place for Arbitration shall be: *[New Delhi]*, India.

The language of arbitration shall be English.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 27 -	25.09.2014

The decision of a majority of the arbitrators (or of the third arbitrator chairing the arbitration, if there is no such majority) shall be final and binding and shall be enforceable in any court of competent jurisdiction as decree of the court. The parties thereby waive any objections to or claims of immunity from such enforcement.

Notwithstanding any reference to the arbitration,

- the parties shall continue to perform their respective obligations under the Contract unless they otherwise agree
- The Owner shall pay the Contractor consideration due to the Contractor.

4.14 Scope of Facilities

- a) Unless otherwise expressly limited in the Technical Specifications, Facilities the Contractor's obligations cover the provision of all Plant and Equipments including spares and the performance of all Services required for design, manufacture (including procurement, quality assurance, construction, installation, associated civil works, Structural and others construction works, precommissioning and delivery) of the Plant and Equipment and the installation, commissioning, completion of facilities and performance testing of the Facilities in accordance with the plans, procedures, specifications, drawings, codes and any other documents as specified in the Technical Specifications. Such specifications include, but are not limited to, the provision of supervision and engineering services; the supply of labour, materials, equipment, spare parts and accessories; Contractor's Equipments; construction utilities and supplies; temporary materials, structures and facilities; transportation loading & unloading.
- b) The Contractor shall, unless specifically excluded in the Contract, perform all such work and/or supply all such items and materials not specifically mentioned in the Contract but that can be reasonably inferred from the Contract as being required for attaining Completion of the Facilities.

4.15 Time for Commencement and Completion

- a) The Contractor shall commence work on the scope of work under this Tender from the date of Letter of Award. Contractor shall thereafter proceed with the Facilities in accordance with the time schedule specified in SCC & detailed network schedule agreed & appended to the contract.
- b) The Contractor shall attain Completion of the Facilities (or of a part where a separate time for Completion of such part is specified in the Contract) within the time stated in the SCC subject to time extensions, the contractor is entitled under the contract conditions or time extension expressly grouted by the Owner.

4.16 Spare Parts

In addition to the supply of Mandatory Spare Parts included in the Contract, the Contractor agrees to supply other spare parts (recommended spares) required for the operation and maintenance of the Facilities for 3 years. However, the identity, specifications and quantities of such spare parts and the terms and conditions relating to the supply thereof are to be agreed between the Owner and the Contractor, and the price of such spare parts shall be that given in Price Schedule for recommended spares. The price of such spare parts shall include the purchase price thereof and other costs and expenses (including the Contractor's fees) relating to the supply of spare parts. The prices of recommended spares covered in price schedule shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 28-	25.09.2014

valid for a period of six months after the date of Notification of Award of Main Equipment and Mandatory Spares.

- The Contractor shall supply the recommended spares at the same terms and conditions as are otherwise applicable to this Contract.
- All the spares for the equipment under the Contract will strictly conform to the Specification and other relevant documents and will be identical to the corresponding main equipment/components supplied under the Contract and shall be fully interchangeable.
- All the Mandatory Spares covered under the Contract shall be manufactured along with the main equipments as a continuous operation and the delivery of the spares will be affected along with the main equipments in a phased manner and the delivery would be completed by the respective dates for the various categories of equipment as per the agreed schedule. If order for the Recommended Spares has been placed with the Contractor prior to commencement of manufacture of the main equipment this shall be applicable for manufacturer of recommended spares as well.
- The Contractor will provide the Owner with the manufacturing drawings, catalogues, assembly drawings and any other document required by the for the recommended spares. Such details will be furnished to the Owner as soon as they are prepared but in any case not later than six months prior to commencement of manufacture of the corresponding main equipment.
- In addition to the spares recommended by the Contractor, if the Owner further identifies certain particular items of spares, the Contractor will submit the prices and delivery quotation for such spares within [30] days of receipt of such request with a validity period of 6 months for consideration by the Owner and placement of order for additional spares, if the Owner so desires.
- The quality plan and the inspection requirement finalised for the main equipment will also be applicable to the corresponding spares.
- The Contractor will provide the Owner with all the addresses and particulars of his sub-suppliers while placing the order on vendors for items/components/equipment covered under the Contract and will further ensure with his vendors that the Owner, if so desires, will have the right to place order for spares directly on them on mutually agreed terms based on offers of such vendors.
- The Contractor shall guarantee the long term availability of spares to the Owner for the full life of the equipment covered under the Contract. The same provision will also be applicable to spares supplied by Sub-contractors.
- For the first 6 years from the schedule date of completion of facilities the prices will be derived from the corresponding Ex-Works Price at which the order for such spares have been placed by Owner as a part of Mandatory Spares or Recommended Spares, or from the rates of Mandatory Spares or Recommended Spares as quoted by/negotiated with the Contractor. Ex-Works order price of future spares shall be computed in accordance with the price adjustment provisions covered under the main Contract excepting that the base indices will be counted from the scheduled date of Commissioning of the last equipment under the main project. The Contractor will indicate in advance the delivery period of the items of spares, which the Owner may procure in accordance with this clause. In case of emergent requirements of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 29-	25.09.2014

spares, the Contractor would make every effort to expedite the manufacture and delivery of such spares on the basis of mutually agreed time schedule.

- In case the Contractor fails to supply the mandatory or recommended spares in the terms stipulated above, the Owner shall be entitled to purchase the same from the alternate sources at the risk and the cost of the Contractor and recover from the Contractor, the excess amount paid by the Owner over the rates worked on the above basis. In the event of such risk purchase by the Owner, the purchases will be as per the Works and Procurement Policy of the Owner prevalent at the time of such purchases and the Owner at his option may include a representative from the Contractor in finalising the purchases.
- It is expressly understood that the final settlement between the parties in terms of relevant clauses of the Contract Documents shall not relieve the Contractor of any of his obligations under the provision of long term availability of spares and such provisions shall continue to be enforced till the expiry of 6 years period reckoned from the scheduled date of Commissioning of the Plant and Equipment unless otherwise discharged expressly in writing by the Owner.
- The Contractor shall warrant that all spares supplied will be new and in accordance with the Contract Documents and will be free from defects in design, material and workmanship. The defects liability period for spares shall be 12 months from the date it is put to use. In case of failure of any spare part due to fault in design material or workmanship the same part will be replaced by the contractor without any extra cost of the Owner.

In case of any failure in the original component/equipments due to faulty designs, materials and workmanship, the corresponding spare parts, if any, supplied will be replaced without any extra cost to the Owner unless a joint examination and analysis by the Owner and the Contractor of such spare parts prove that the defect found in the original part that failed, can safely be assumed not to be present in spare parts. Any replaced spare parts will have the Defects Liability period of 12 months from the date it is put in use. The discarded spare parts will become the property of the Contractor as soon as they have been replaced by the Contractor. In any case the defect liability of spares will expire at the end of 48 months from the date of their receipt at site

The Defects Liability of spares that are not used within 18 months from the respective date of the delivery at Site will, be subject to condition that all such spares are stored in accordance with Contractor's standard recommended practice, if any, and the same has been furnished to the Owner.

4.17 Contractor's Responsibilities

- a) The Contractor shall design, manufacture (including associated purchases and/or subcontracting), disassemble/dismantle wherever required, install, commission and complete the Facilities and carryout the Guarantee tests with due care and diligence in accordance with the Contract.
- b) Before entering into this contract the Contractor is responsible to have examined the data relating to the Facilities provided by the Owner, and on the basis of information that the Contractor could have obtained from a visual inspection of the Site and of other data readily available to it relating to the Facilities as at one month days prior to bid submission. Any failure to acquaint itself with all such data and information shall not relieve contractor of its responsibility for properly estimating the difficulty or cost of successfully performing its scope of work under this contract.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 30-	25.09.2014

- c) The Contractor shall acquire in its name all permits, approvals and/or licenses from all local, state or national government authorities or public service undertakings in the country where the Site is located that are necessary for the performance of the Contract, including, without limitation, visas for the Contractor's and Subcontractor's personnel and entry permits for all imported Contractor's Equipment.
- d) The Contractor shall comply with all laws in force in India and the place where the facility is located out. The laws will include all national, provincial, municipal or other laws that affect the performance of the Contract and bind upon the Contractor. The Contractor shall indemnify and hold harmless the Owner from and against any and all liabilities, damages, claims, fines, penalties and expenses of whatever nature arising or resulting from the violation of such laws by the Contractor.

4.18 Owner's Responsibilities

- a) The Owner shall be responsible for acquiring and providing legal and physical possession of the Site and access thereto, and for providing possession of and access to all other areas reasonably required for the proper execution of the Contract, including all requisite rights of way.
- b) The Owner shall acquire and pay for all permits, approvals and/or licenses from all local, state or national government authorities or public service undertakings, which such authorities or undertakings require the Owner to obtain them in the Owner's name, are necessary for the execution of the Contract.
- c) If requested by the Contractor, the Owner shall use its best endeavours to assist the Contractor in obtaining in a timely and expeditious manner all permits, approvals and/or licenses necessary for the execution of the Contract from all local, state or national government authorities or public service undertakings that such authorities or undertakings require the Contractor or Subcontractors or the personnel of the Contractor or Subcontractors, as the case may be, to obtain.
- d) The Owner shall be responsible for the continued operation of the Facilities after Completion.

4.19 Taxes & Duties

- a) Custom Duty, Excise Duty, Central sales tax (CST), service tax, Value Added Tax (VAT), VAT on Works Contract, other applicable taxes, duties and Cess shall be clearly indicated by the bidder in the price schedules and these taxes shall be considered for bid evaluation. The reimbursement of these taxes shall be on actual subject to the quoted value of these taxes as ceiling corresponding to the base price. Additional liability of taxes and duties arising out of price variation shall be reimbursed against documentary evidence over and above the ceiling (quoted value). Statutory variation in Indian taxes and duties will be dealt with as per the relevant stipulations of the specification.
- b) Except as otherwise specifically provided in the Contract, the Contractor shall bear and pay all Taxes, Duties, Levies and Charges including Entry Tax, Service Tax, if applicable in connection with the Facilities in India and outside India. All taxes, duties & levies on works contract, if any, shall be to the Contractor's account and no separate claim in this regard will be entertained by the Owner.
- c) All taxes, duties and levies including entry tax/octroi (if any) in respect of all components, equipments and material to be dispatched directly from the sub-vendor's works to site shall be to the Contractor's account and no separate claim in this regard will be entertained by the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 31-	25.09.2014

- d) In case there is introduction of GST or any other tax in lieu of existing Excise Duty/Service Tax and VAT/ Sales Tax, the contract price will be adjusted for the impact of any differential tax liability subject to documentary evidence. This will be restricted to direct transaction between the owner and contractor, and bought out items directly dispatched from sub-vendor's works to project site.
- e) Further all taxes, duties and levies including sales tax on works contract, Entry Tax, if any, in respect of civil construction works, erection & commissioning if any and custom duty/sales tax as applicable on the materials used for such construction works shall be to the contractor's account and no separate claim in this regard will be entertained by the Owner. Incidence of Service Tax & cess on any component of the Bid Price shall be to the Contractor's account and bidders shall include Service Tax as applicable at the date seven (7) days prior to the date of bid submission in the bid price. The Contract Price will be adjusted for impact of any change in the rate of service tax or cess on service tax subsequent to this date for direct transactions between the Owner and the Contractor.
- f) If any tax exemptions, reductions, allowances or privileges may be available to the Contractor, the Owner shall use its best endeavours to enable the Contractor to benefit from any such tax savings to the maximum allowable extent.

4.20 Intellectual Property

The copyright in all drawings, documents and other materials containing data and information furnished to the Owner by the Contractor herein shall remain vested in the Contractor or, if they are furnished to the Owner directly or through the Contractor by any third party, including suppliers of materials, the copyright in such materials shall remain vested in such third party. The Owner shall however be free to reproduce all drawings, documents and other material furnished to the Owner for the purpose of the contract including, if required, for operation and maintenance.

4.21 Confidential Information

- a) The Owner and the Contractor shall keep confidential and shall not, without the written consent of the other party hereto, divulge to any third party any documents, data or other information furnished directly or indirectly by the other party hereto in connection with the Contract, whether such information has been furnished prior to, during or following termination of the Contract. Notwithstanding the above, the Contractor may furnish to its Subcontractor(s) such documents, data and other information it receives from the Owner to the extent required for the Subcontractor(s) to perform its work under the Contract, in which event the Contractor shall obtain from such Subcontractor(s) an undertaking of confidentiality similar to that imposed on the Contractor.
- b) The Owner shall not use such documents, data and other information received from the Contractor for any purpose other than the operation and maintenance of the Facilities. Similarly, the Contractor shall not use such documents, data and other information received from the Owner for any purpose other than the design, procurement of Plant and Equipments, construction or such other work and services as are required for the performance of the Contract.
- c) The obligation of a party, shall not apply to that information which
 - now or hereafter enters the public domain through no fault of that party
 - can be proven to have been possessed by that party at the time of disclosure and which was not previously obtained, directly or indirectly, from the other party hereto

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 32-	25.09.2014

- Otherwise lawfully becomes available to that party from a third party that has no obligation of confidentiality.

4.22 Representatives

a) Project Manager

If the Project Manager is not named in the Contract, then within fourteen (14) days of the Effective Date, the Owner shall appoint and notify the Contractor in writing of the name of the Project Manager. The Owner may from time to time appoint some other person as the Project Manager in place of the person previously so appointed, and shall give a notice of the name of such other person to the Contractor without delay. The Owner shall take reasonable care to see that no such appointment is made at such a time or in such a manner as to impede the progress of work on the Facilities. The Project Manager shall represent and act for the Owner at all times during the currency of the Contract. All notices, instructions, orders, certificates, approvals and all other communications under the Contract shall be given by the Project Manager, except as herein otherwise provided.

All notices, instructions, information and other communications given by the Contractor to the Owner under the Contract shall be given to the Project Manager, except as herein otherwise provided.

b) Contractor's Representative & Construction Manager

- If the Contractor's Representative is not named in the Contract, then within *[fourteen (14) days]* of the Effective Date, the Contractor shall appoint the Contractor's Representative and shall request the Owner in writing to approve the person so appointed. If the Owner makes no objection to the appointment within *[fourteen (14)]* days, the Contractor's Representative shall be deemed to have been approved. If the Owner objects to the appointment within *[fourteen (14)]* days giving the reason there for, then the Contractor shall appoint a replacement within *[fourteen (14) days]* of such objection.
- The Contractor's Representative shall represent and act for the Contractor at all times during the currency of the Contract and shall give to the Project Manager all the Contractor's notices, instructions, information and all other communications under the Contract. All notices, instructions, information and all other communications given by the Owner or the Project Manager to the Contractor under the Contract shall be given to the Contractor's Representative or, in its absence, its deputy, except as herein otherwise provided. The Contractor shall not revoke the appointment of the Contractor's Representative without the Owner's prior written consent, which shall not be unreasonably withheld. If the Owner consents thereto, the Contractor shall appoint some other person as the Contractor's Representative.
- The Contractor's Representative may, subject to the approval of the Owner (which shall not be unreasonably withheld), at any time delegate to any person any of the powers, functions and authorities vested in him or her. Any such delegation may be revoked at any time. Any such delegation or revocation shall be subject to a prior notice signed by the Contractor's Representative, and shall specify the powers, functions and authorities thereby delegated or revoked. No such delegation or revocation shall take effect unless and until a copy thereof has been delivered to the Owner and the Project Manager.
- From the commencement of installation of the Facilities at the Site until Operational Acceptance, the Contractor's Representative shall appoint a

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 33-	25.09.2014

suitable person as the construction manager (hereinafter referred to as “the Construction Manager”). The Construction Manager shall supervise all work done at the Site by the Contractor and shall be present at the Site throughout normal working hours except when on leave, sick or absent for reasons connected with the proper performance of the Contract. Whenever the Construction Manager is absent from the Site, a suitable person shall be appointed to act as his or her deputy.

- The Owner may by notice to the Contractor object to any representative or person employed by the Contractor in the execution of the Contract who, in the reasonable opinion of the Owner, may behave inappropriately, may be incompetent or negligent, or may commit a serious breach of the Site regulations.
- If any representative or person employed by the Contractor is removed.

4.23 Work Program

a) Contractor’s Organization

The Contractor shall supply to the Owner and the Project Manager a chart showing the proposed organization to be established by the Contractor for carrying out work on the Facilities. The chart shall include the identities of the key personnel together with the curricula vitae of such key personnel to be employed within *[twenty one (21)]* days of the Effective Date. The Contractor shall promptly inform the Owner and the Project Manager in writing of any revision or alteration of such an organization chart.

b) Program of Performance

Within *[twenty-eight (28)]* days after the date of Notification of Award of Contract, the Contractor shall prepare and submit to the Project Manager a detailed Program of Performance of the Contract, made in the form specified in the SCC and showing the sequence in which it proposes to design, supply, transport, assemble, install and precommissioning the Facilities, as well as the date by which the Contractor reasonably requires that the Owner shall have fulfilled its obligations under the Contract so as to enable the Contractor to execute the Contract in accordance with the program and to achieve Completion and Acceptance of the Facilities in accordance with the Contract. The program so submitted by the Contractor shall accord with the Time Schedule included in Appendix 4 (Time Schedule) to the Form of Contract Agreement and any other dates and periods specified in the Contract. The Contractor shall update and revise the program as and when appropriate or when required by the Project Manager, but without modification in the Times for Completion.

c) Progress Report

The Progress Report shall be in a form acceptable to the Project Manager and shall indicate: (a) percentage completion achieved compared with the planned percentage completion for each activity; and (b) where any activity is behind the program, giving comments and likely consequences and stating the corrective action being taken.

d) Progress of Performance

If at any time the Contractor’s actual progress falls behind the program, or it becomes apparent that it will so fall behind, the Contractor shall, at the request of the Owner or the Project Manager, prepare and submit to the Project Manager a revised program, taking into account the prevailing circumstances, and shall notify the Project Manager of the steps being taken to expedite progress so as to attain Completion of the Facilities within the Time for Completion.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 34-	25.09.2014

e) Work Procedures

The Contract shall be executed in accordance with the Contract Documents and the procedures given in the section on Forms and Procedures of the Contract Documents.

If agreed between the Owner and the Contractor, the Contractor may execute the Contract in accordance with its own standard project execution plans and procedures to the extent that they do not conflict with the provisions contained in the Contract.

4.24 Subcontractors and Subvendors

- a) The Contract Agreement specifies major items of supply or services and a list of approved Subcontractors against each item, including vendors. Insofar as no Subcontractors are listed against any such item, the Contractor shall prepare a list of Subcontractors for such item for inclusion in such list. The Contractor may from time to time propose any addition to or deletion from any such list. The Contractor shall submit any such list or any modification thereto to the Owner for its approval in sufficient time so as not to impede the progress of work on the Facilities. Such approval by the Owner for any of the Subcontractors shall not relieve the Contractor from any of its obligations, duties or responsibilities under the Contract.
- b) The Contractor shall select and employ its Subcontractors/Subvendors for such major items from those listed.

4.25 Design and Engineering

a) Specifications and Drawings

The Contractor shall execute the basic and detailed design and the engineering work in compliance with the provisions of the Contract, or where not so specified, in accordance with good engineering practice. The Contractor shall be responsible for any discrepancies, errors or omissions in the specifications, drawings and other technical documents that it has prepared, whether such specifications, drawings and other documents have been approved by the Project Manager or not, provided that such discrepancies, errors or omissions are not because of inaccurate information furnished in writing to the Contractor by or on behalf of the Owner.

b) Codes and Standards

Wherever references are made in the Contract to codes and standards in accordance with which the Contract shall be executed, the edition or the revised version of such codes and standards current at the date *[twenty eight (28)]* days prior to date of bid submission shall apply unless otherwise specified. During Contract execution, any changes in such codes and standards shall be applied after approval by the Owner.

c) Approval/Review of Technical Documents by Project Manager

The Contractor shall prepare (or cause its Subcontractors to prepare) and furnish to the Project Manager the documents for its approval Any part of the Facilities covered by or related to the documents to be approved by the Project Manager shall be executed only after the Project Manager's approval thereof.

Project Manager shall either return one copy thereof to the Contractor with its approval endorsed thereon or shall notify the Contractor in writing of its disapproval thereof and the reasons there for and the modifications that the Project Manager proposes. The Project Manager shall not disapprove any document, except on the grounds that the document does not comply with some specified provision of the Contract or that it is contrary to good engineering practice. The procedure for

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 35-	25.09.2014

submission of the documents by the Contractor and their approval by the Project Manager shall be discussed and finalised with the Contractor.

If any dispute or difference occurs between the Owner and the Contractor in connection with or arising out of the disapproval by the Project Manager of any document and/or any modification(s) thereto that cannot be settled between the parties within a reasonable period, then such dispute or difference may be referred to an Adjudicator. If such dispute or difference is referred to an Adjudicator, the Project Manager shall give instructions as to whether and if so, how, performance of the Contract is to proceed. The Contractor shall proceed with the Contract in accordance with the Project Manager's instructions, provided that if the Adjudicator upholds the Contractor's view on the dispute, then the Contractor shall be reimbursed by the Owner for any additional costs incurred by reason of such instructions and shall be relieved of such responsibility or liability in connection with the dispute and the execution of the instructions as the Adjudicator shall decide, and the Time for Completion shall be extended accordingly.

The Project Manager's approval, with or without modification of the document furnished by the Contractor, shall not relieve the Contractor of any responsibility or liability imposed upon it by any provisions of the Contract except to the extent that any subsequent failure results from modifications required by the Project Manager.

4.26 Procurement

a) Plant and Equipment

The Contractor shall manufacture or procure and transport all the Plant and Equipments in an expeditious and orderly manner to the Site.

b) Transportation

The Contractor shall at its own risk and expense transport all the Plant and Equipments and the Contractor's Equipments to the Site by the mode of transport that the Contractor judges most suitable under all the circumstances. Unless otherwise provided in the Contract, the Contractor shall be entitled to select any safe mode of transport operated by any person to carry the Plant and Equipments and the Contractor's Equipment. Upon dispatch of each shipment of the Plant and Equipments and the Contractor's Equipments, the Contractor shall notify the Owner by telex, cable, telefax, facsimile or Electronic Data Interchange (EDI) of the description of the Plant and Equipments and of the Contractor's Equipments, the point and means of dispatch, and the estimated time and point of arrival in the country where the Site is located, if applicable, and at the Site. The Contractor shall furnish the Owner with relevant shipping documents to be agreed upon between the parties.

The Contractor shall be responsible for obtaining, if necessary, approvals from the authorities for transportation of the Plant and Equipments and the Contractor's Equipments to the Site. The Owner shall use its best endeavours in a timely and expeditious manner to assist the Contractor in obtaining such approvals, if requested by the Contractor. The Contractor shall indemnify and hold harmless the Owner from and against any claim for damage to roads, bridges or any other traffic facilities that may be caused by the transport of the Plant and Equipments and the Contractor's Equipments to the Site.

c) The Contractor shall, at its own expense, handle all imported Plant and Equipments and spares and Contractor's Equipments at the point(s) of import and shall handle any formalities for customs clearance.

Document Number	Rev No.	Description	Page No.	Date of Issue

4.27 Installation

a) Setting Out/Supervision/Labour

Bench Mark: The Contractor shall be responsible for the true and proper setting-out of the Facilities in relation to bench marks, reference marks and lines provided to it in writing by or on behalf of the Owner.

If, at any time during the progress of installation of the Facilities, any error shall appear in the position, level or alignment of the Facilities, the Contractor shall forthwith notify the Project Manager of such error and, at its own expense, immediately rectify such error to the reasonable satisfaction of the Project Manager. If such error is based on incorrect data provided in writing by or on behalf of the Owner, the expense of rectifying the same shall be borne by the Owner.

Contractor's Supervision: The Contractor shall give or provide all necessary superintendence during the installation of the Facilities, and the Construction Manager or its deputy shall be constantly on the Site to provide full time superintendence of the installation. The Contractor shall provide and employ only technical personnel who are skilled and experienced in their respective callings and supervisory staff who are competent to adequately supervise the work at hand.

The Contractor shall provide and employ on the Site in the installation of the Facilities such skilled, semi-skilled and unskilled labour as is necessary for the proper and timely execution of the Contract. The Contractor is encouraged to use local labour that has the necessary skills. Unless otherwise provided in the Contract, the Contractor shall be responsible for the recruitment, transportation, accommodation and catering of all labour, local or expatriate, required for the execution of the Contract and for all payments in connection therewith.

The Contractor shall at its own expense provide the means of repatriation to all of its and its Subcontractor's personnel employed on the Contract at the Site to their various home countries. It shall also provide suitable temporary maintenance of all such persons from the cessation of their employment on the Contract to the date programmed for their departure. In the event that the Contractor defaults in providing such means of transportation and temporary maintenance, the Owner may provide the same to such personnel and recover the cost of doing so from the Contractor.

The Contractor shall, in all dealings with its labour and the labour of its Subcontractors currently employed on or connected with the Contract, pay due regard to all recognized festivals, official holidays, religious or other customs and all local laws and regulations pertaining to the employment of labour.

b) Contractor's Equipments

All Contractors' Equipments brought by the Contractor onto the Site shall be deemed to be intended to be used exclusively for the execution of the Contract. The Contractor shall not remove the same from the Site without the Project Manager's consent that such Contractor's Equipments are no longer required for the execution of the Contract. Unless otherwise specified in the Contract, upon completion of the Facilities, the Contractor shall remove from the Site all Equipments brought by the Contractor onto the Site and any surplus materials remaining thereon.

The Owner will, if requested, use its best endeavours to assist the Contractor in obtaining any local, state or national government permission required by the Contractor for the export of the Contractor's Equipments imported by the Contractor for use in the execution of the Contract that is no longer required for the execution of the Contract.

c) Site Regulations and Safety

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 37-	25.09.2014

The Owner and the Contractor shall establish Site regulations setting out the rules to be observed in the execution of the Contract at the Site and shall comply therewith. The Contractor shall prepare and submit to the Owner, with a copy to the Project Manager, proposed Site regulations for the Owner's approval, which approval shall not be unreasonably withheld.

Such Site regulations shall include, but shall not be limited to, rules in respect of security, safety of the Facilities, gate control, sanitation, medical care, and fire prevention.

d) Opportunities for Other Contractors

The Contractor shall, upon written request from the Owner or the Project Manager, give all reasonable opportunities for carrying out the work to any other contractors employed by the Owner on or near the Site. If the Contractor, upon written request from the Owner or the Project Manager, makes available to other contractors any roads or ways the maintenance for which the Contractor is responsible, permits the use by such other contractors of the Contractor's Equipments, or provides any other service of whatsoever nature for such other contractors, the Owner shall fully compensate the Contractor for any loss or damage caused or occasioned by such other contractors in respect of any such use or service, and shall pay to the Contractor reasonable remuneration for the use of such equipments or the provision of such services.

The Contractor shall also so arrange to perform its work as to minimize, to the extent possible, interference with the work of other contractors. The Project Manager shall determine the resolution of any difference or conflict that may arise between the Contractor and other contractors and the workers of the Owner in regard to their work.

The Contractor shall notify the Project Manager promptly of any defects in the other Contractors' work that come to its notice, and that could affect the Contractor's work. The Project Manager shall determine the corrective measures, if any, required to rectify the situation after inspection of the Facilities. Decisions made by the Project Manager shall be binding on the Contractor.

e) Emergency Work

If, by reason of an emergency arising in connection with and during the execution of the Contract, any protective or remedial work is necessary as a matter of urgency to prevent damage to the Facilities, the Contractor shall immediately carry out such work.

If the Contractor is unable or unwilling to do such work immediately, the Owner may do or cause such work to be done as the Owner may determine is necessary in order to prevent damage to the Facilities. In such event the Owner shall, as soon as practicable after the occurrence of any such emergency, notify the Contractor in writing of such emergency, the work done and the reasons there for. If the work done or caused to be done by the Owner is work that the Contractor was liable to do at its own expense under the Contract, the reasonable costs incurred by the Owner in connection therewith shall be paid by the Contractor to the Owner. Otherwise, the cost of such remedial work shall be borne by the Owner.

f) Site Clearance

Site Clearance in Course of Performance: In the course of carrying out the Contract, the Contractor shall keep the Site reasonably free from all unnecessary obstruction, store or remove any surplus materials, clear away any wreckage, rubbish or temporary works from the Site, and remove any Contractor's Equipments no longer

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 38-	25.09.2014

required for execution of the Contract. Clearance of Site after Completion: After Completion of all parts of the Facilities, the Contractor shall clear away and remove all wreckage, rubbish and debris of any kind from the Site, and shall leave the Site and Facilities clean and safe.

g) **Watching and Lighting**

The Contractor shall provide and maintain at its own expense all lighting, fencing, and watching when and where necessary for the proper execution and the protection of the Facilities, or for the safety of the owners and occupiers of adjacent property and for the safety of the public as per specification.

4.28 Testing & Inspections

- a) The Contractor shall at its own expense carry out at the place of manufacture and/or on the Site all such tests and/or inspections of the Plant and Equipments and any part of the Facilities as are specified in the Contract.
- b) The Owner and the Project Manager or their designated representatives shall be entitled to attend the aforesaid test and/ or inspection, provided that the Owner shall bear all costs and expenses incurred in connection with such attendance including, but not limited to, all travelling and board and lodging expenses.
- c) Whenever the Contractor is ready to carry out any such test and/or inspection, the Contractor shall give a reasonable advance notice of such test and/or inspection and of the place and time thereof to the Project Manager. The Contractor shall obtain from any relevant third party or manufacturer any necessary permission or consent to enable the Owner and the Project Manager (or their designated representatives) to attend the test and/or inspection.
- d) The Contractor shall provide the Project Manager with a certified report of the results of any such test and/or inspection. If the Owner or Project Manager (or their designated representatives) fails to attend the test and/or inspection, or if it is agreed between the parties that such persons shall not do so, then the Contractor may proceed with the test and/or inspection in the absence of such persons, and may provide the Project Manager with a certified report of the results thereof.
- e) The Project Manager may require the Contractor to carry out any test and/or inspection not required by the Contract, provided that the Contractor's reasonable costs and expenses incurred in the carrying out of such test and/or inspection shall be added to the Contract Price. Further, if such test and/or inspection impede the progress of work on the Facilities and/or the Contractor's performance of its other obligations under the Contract, due allowance will be made in respect of the Time for Completion and the other obligations so affected.
- f) If any Plant and Equipment or any part of the Facilities fails to pass any test and/or inspection, the Contractor shall either rectify or replace such Plant and Equipment or part of the Facilities and shall repeat the test and/or inspection upon giving a notice.
- g) If any dispute or difference of opinion shall arise between the parties in connection with or arising out of the test and/or inspection of the Plant and Equipments or part of the Facilities that cannot be settled between the parties within a reasonable period of time, it may be referred to the Adjudicator.
- h) The Contractor shall afford the Owner and the Project Manager, at the Owner's expense, access at any reasonable time to any place where the Plant and Equipments are being manufactured or the Facilities are being installed, in order to inspect the progress and the manner of manufacture or installation, provided that the Project Manager shall give the Contractor a reasonable prior notice.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 39-	25.09.2014

- i) The Contractor agrees that neither the execution of a test and/ or inspection of Plant and Equipments or any part of the Facilities, nor the witnessing of any test by the Owner, nor the issuance of any test certificate shall relieve the Contractor of any obligation under this Contract.
- j) No part of the Facilities or foundations shall be covered up on the Site without the Contractor carrying out any test and/or inspection required under the Contract. The Contractor shall give a reasonable notice to the Project Manager whenever any such part of the Facilities or foundations is ready or about to be ready for test and/or inspection; such test and/or inspection and notice thereof shall be subject to the requirements of the Contract.
- k) The Contractor shall uncover any part of the Facilities or foundations, or shall make openings in or through the same as the Project Manager may from time to time require at the Site, and shall reinstate and make good such part or parts.

4.29 Completion of the Facilities

- a) As soon as the Facilities or any part thereof has, in the opinion of the Contractor, been completed operationally and structurally and put in a tight and clean condition as specified in the Technical Specifications, excluding minor items not materially affecting the operation or safety of the Facilities, the Contractor shall so notify the Owner in writing.
- b) The Owner shall supply the operating and maintenance personnel specified in to the Form of Contract Agreement for Precomissioning of the Facilities or any part thereof.
- c) As soon as all works in respect of Precomissioning are completed and, in the opinion of the Contractor, the Facilities or any part thereof is ready for Commissioning, the Contractor shall commence Commissioning as per procedures stipulated in Technical Specifications, and as soon as Commissioning is satisfactorily completed, the Contractor shall so notify the Project Manager in writing.
- d) If the Project Manager notifies the Contractor of any defects and/ or deficiencies, the Contractor shall then correct such defects and/or deficiencies.
If the Project Manager is satisfied that the Facilities or that part thereof have reached Completion, the Project Manager shall, within **[seven (7)]** days after receipt of the Contractor's notice, issue a Completion Certificate stating that the Facilities or that part thereof have reached Completion as at the date of the Contractor's notice.
If the Project Manager is not so satisfied, then it shall notify the Contractor in writing of any defects and/or deficiencies within **[seven (7)]** days after receipt of the Contractor's repeated notice, and the above procedure shall be repeated.
- e) If the Project Manager fails to issue the Completion Certificate and fails to inform the Contractor of any defects and/or deficiencies within **[seven (7)]** days after receipt of the Contractor's notice, or if the Owner makes use of the Facilities or part thereof, then the Facilities or that part thereof shall be deemed to have reached Completion as of the date of the Contractor's notice, or as of the Owner's use of the Facilities, as the case may be.
- f) As soon as possible after Completion, the Contractor shall complete all outstanding minor items so that the Facilities are fully in accordance with the requirements of the Contract, failing which the Owner will undertake such completion and deduct the costs thereof from any monies owing to the Contractor.
- g) Upon Completion, the Owner shall be responsible for the care and custody of the Facilities or the relevant part thereof, together with the risk of loss or damage thereto, and shall thereafter take over the Facilities or the relevant part thereof.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 40-	25.09.2014

4.30 Commissioning & Operation Acceptance

a) Commissioning

Commissioning of the Facilities or any part thereof Acceptance shall be completed by the Contractor as per procedures detailed in the Technical Specifications. The Contractor shall, unless otherwise specified in Contract/ Tender Specifications, supply the and all raw materials, utilities, lubricants, chemicals, catalysts, facilities, services and other matters required for Commissioning.

b) Guarantee Test

The Guarantee Tests (and repeats thereof) shall be conducted by the Contractor after Commissioning of the Facilities or the relevant part thereof to ascertain whether the Facilities or the relevant part can attain the Functional Guarantees specified in the Contract Documents. The Contractor's and Project Manager's advisory personnel shall attend the Guarantee Test. The Owner shall promptly provide the Contractor with such information as the Contractor may reasonably require in relation to the conduct and results of the Guarantee Tests (and any repeats thereof). If for reasons not attributable to the Contractor, the Guarantee Tests of the Facilities or the relevant part thereof cannot be successfully completed within the period from the date of Completion, specified in the SCC or any other period agreed upon by the Owner and the Contractor, the Contractor shall be deemed to have fulfilled its obligations with respect to the Functional Guarantees.

c) Operational Acceptance

Operational Acceptance shall occur in respect of the Facilities or any part thereof when

- the Guarantee Tests have been successfully completed and the Functional Guarantees are met; or
- The Guarantee Tests have not been successfully completed or has not been carried out for reasons not attributable to the Contractor within the period from the date of Completion specified in the SCC or any other agreed upon period as specified in GCC.
- The Contractor may give a notice to the Project Manager requesting the issue of an Operational Acceptance Certificate in respect of the Facilities or the part thereof specified in such notice as at the date of such notice.
- The Project Manager shall, after consultation with the Owner, and within forty five (45) days after receipt of the Contractor's notice, issue an Operational Acceptance Certificate. If within *[forty five (45)]* days after receipt of the Contractor's notice, the Project Manager fails to issue the Operational Acceptance Certificate or fails to inform the Contractor in writing of the justifiable reasons why the Project Manager has not issued the Operational Acceptance Certificate, the Facilities or the relevant part thereof shall be deemed to have been accepted as at the date of the Contractor's said notice.

d) Partial Acceptance

If the Contract specifies that Completion, Commissioning and Guarantee Tests shall be carried out in respect of parts of the Facilities, the provisions relating to Completion and Commissioning including the Guarantee Tests shall apply to each such part of the Facilities individually, and the Operational Acceptance Certificate shall be issued accordingly for each such part of the Facilities. If a part

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 41-	25.09.2014

of the Facilities comprises facilities such as buildings, for which no Commissioning or Guarantee Tests are required, then the Project Manager shall issue the Operational Acceptance Certificate for such facility when it attains Completion, provided that the Contractor shall thereafter complete any outstanding minor items that are listed in the Operational Acceptance Certificate.

4.31 Completion Time and Liquidated Damage

a) **Completion Time Period**

The Contractor guarantees that it shall attain Completion of the Facilities (or a part for which a separate time for completion is specified in the SCC) within the Time for Completion specified in the SCC.

b) If the Contractor fails to attain Completion of the Facilities or any part thereof within the Time for Completion, the Contractor shall pay to the Owner liquidated damages in the amount computed at the rates specified in the SCC. The aggregate amount of such liquidated damages shall in no event exceed the amount specified as "Maximum" in the SCC.

However, the payment of liquidated damages shall not in any way relieve the Contractor from any of its obligations to complete the Facilities or from any other obligations and liabilities of the Contractor under the Contract.

c) No bonus will be given for earlier completion of the facilities or part thereof.

4.32 Defects Liability

a) The Contractor warrants that the Facilities or any part thereof shall be free from defects in the design, engineering, materials and workmanship of the Plant and Equipments supplied and of the work executed.

b) The Defects Liability Period shall be [eighteen (18)] months from the date of Completion of the Facilities (or any part thereof) or [twelve (12)] months from the date of Operational Acceptance of the Facilities (or any part thereof).

If during the Defects Liability Period any defect should be found in the design, engineering, materials and workmanship of the Plant and Equipments supplied or of the work executed by the Contractor, the Contractor shall promptly, in consultation and agreement with the Owner regarding appropriate remedying of the defects, and at its cost, repair, replace or otherwise make good (as the Contractor shall, at its discretion, determine) such defect as well as any damage to the Facilities caused by such defect. The Contractor shall not be responsible for the repair, replacement or making good of any defect or of any damage to the Facilities arising out of or resulting from any of the following causes:

- improper operation or maintenance of the Facilities by the Owner
- operation of the Facilities outside specifications provided in the Contract
- Normal wear and tear.

c) The Owner shall give the Contractor a notice stating the nature of any such defect together with all available evidence thereof, promptly following the discovery thereof. The Owner shall afford all reasonable opportunity for the Contractor to inspect any such defect.

d) The Owner shall afford the Contractor all necessary access to the Facilities and the Site to enable the Contractor to perform its obligations.

e) If the repair, replacement or making good is of such a character that it may affect the efficiency of the Facilities or any part thereof, the Owner may give to the Contractor a notice requiring that tests of the defective part of the Facilities shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 42-	25.09.2014

made by the Contractor immediately upon completion of such remedial work, whereupon the Contractor shall carry out such tests.

- f) If the Contractor fails to commence the work necessary to remedy such defect or any damage to the Facilities caused by such defect within a reasonable time (which shall in no event be considered to be less than fifteen (15) days), the Owner may, following notice to the Contractor, proceed to do such work, and the reasonable costs incurred by the Owner in connection therewith shall be paid to the Owner by the Contractor or may be deducted by the Owner from any monies due to the Contractor or claimed under the Performance Security.

If the Facilities or any part thereof cannot be used by reason of such defect and/or making good of such defect, the Defects Liability Period of the Facilities or such part, as the case may be, shall be extended by a period equal to the period during which the Facilities or such part cannot be used by the Owner because of any of the aforesaid reasons. Upon correction of the defects in the Facilities or any part thereof by repair/replacement, such repair/replacement shall have the Defects Liability Period extended by a period of *[twelve (12) month]* from the time such replacement/repair of the Facilities or any part thereof.

4.33 Functional Guarantees

The Contractor guarantees that during the Guarantee Tests, the Facilities and all parts thereof shall attain the Functional Guarantees as per the Contract. If, for reasons attributable to the Contractor, Functional Guarantees are not met either in whole or in part, the Contractor shall, within a mutually agreed time, at its cost and expense make such changes, modifications and/or additions to the Plant or any part thereof as may be necessary to meet such Guarantees. The Contractor shall notify the Owner upon completion of the necessary changes, modifications and/or additions, and shall seek the Owner's consent to repeat the Guarantee Test. If the specified Functional Guarantees are not established even during the repeat of the Guarantee Tests, the Owner may at its option, either reject the plant and equipment and recover from the Contractor payments already made or Accept the equipment/system/plant after levying Liquidated Damages as specified.

4.34 Patents Indemnity

The Contractor shall indemnify and hold harmless the Owner and its employees and officers from and against any and all suits, actions or administrative proceedings, claims, demands, losses, damages, costs, and expenses of whatsoever nature, including attorney's fees and expenses, which the Owner may suffer as a result of any infringement or alleged infringement of any patent, utility model, registered design, trademark, copyright or other intellectual property right registered or otherwise existing at the date of the Contract by reason of: (a) the installation of the Facilities by the Contractor or the use of the such Facilities.

4.35 Limitation of liability

Except in cases of criminal negligence or wilful misconduct by the Contractor, the aggregate liability of the Contractor to the Owner, whether under the Contract, in tort or otherwise, shall not exceed the total Contract Price, provided that this limitation shall not apply to any obligation of the Contractor to indemnify the Owner with respect to patent infringement.

Except in cases of criminal negligence or wilful misconduct by the Contractor, the Contractor shall not be liable to the Owner, whether in contract, tort, or otherwise, for any indirect or consequential loss or damage, loss of use, loss of production, or

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 43-	25.09.2014

loss of profits or interest costs, provided that this exclusion shall not apply to any obligation of the Contractor to pay liquidated damages to the Owner.

4.36 Transfer of Ownership

Ownership of the Plant and Equipments (including spare parts) to be imported into India shall be transferred to the Owner upon loading on to the mode of transport to be used to convey the Plant and Equipments from the country of origin to that country.

Ownership of the Plant and Equipments (including spare parts) procured from within India shall be transferred to the Owner when the Plant and Equipments including spares are loaded on to the mode of transport to be used to convey the Plant and Equipments including spares from the works to the site and upon endorsement of the despatch documents in favour of the Owner. Ownership of the Contractor's Equipments used by the Contractor and its Subcontractors in connection with the Contract shall remain with the Contractor or its Subcontractors. Ownership of any Plant and Equipments in excess of the requirements for the Facilities shall revert to the Contractor upon Completion of the Facilities or at such earlier time when the Owner and the Contractor agree that the Plant and Equipments in question are no longer required for the Facilities, provided quantity of any Plant and Equipments specifically stipulated in the Contract shall be the property of the Owner whether or not incorporated in the Facilities. Notwithstanding the transfer of ownership of the Plant and Equipments, the responsibility for care and custody thereof together with the risk of loss or damage shall remain with the Contractor until Completion of the Facilities.

4.37 Care of Facilities

The Contractor shall be responsible for the care and custody of the Facilities or any part thereof until the date of Completion of the Facilities, where the Contract provides for Completion of the Facilities in parts, until the date of Completion of the relevant part, and shall make good at its own cost any loss or damage that may occur to the Facilities or the relevant part thereof from any cause whatsoever during such period. The Contractor shall also be responsible for any loss or damage to the Facilities caused by the Contractor or its Subcontractors in the course of any work carried out.

4.38 Loss of or Damage to Property; Accident or Injury; Indemnification

The Contractor shall indemnify and hold harmless the Owner and its employees and officers from and against any and all suits, actions or administrative proceedings, claims, demands, losses, damages, costs, and expenses of whatsoever nature, including attorney's fees and expenses, in respect of the death or injury of any person or loss of or damage to any property (other than the Facilities whether accepted or not), arising in connection with the supply and installation of the Facilities and by reason of the negligence of the Contractor or its Subcontractors, or their employees, officers or agents, except any injury, death or property damage caused by the negligence of the Owner, its contractors, employees, officers or agents.

4.39 Insurance

- a) The Contractor shall at its expense take out and maintain in effect, or cause to be taken out and maintained in effect, during the performance of the Contract, the insurances set forth below in the sums and with the deductibles and other conditions as specified. The identity of the insurers and the form of the policies shall be subject to the approval of the Owner, who should not unreasonably withhold such approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 44-	25.09.2014

- Cargo Insurance during Transport:-Covering loss or damage occurring while in transit from the Contractor's or Subcontractor's works or stores until arrival at the Site, to the Plant and Equipments (including spare parts thereof) and to the Contractor's Equipments.
 - Installation All Risks Insurance:-Covering physical loss or damage to the Facilities at the Site, occurring prior to Completion of the Facilities, with an extended maintenance coverage for the Contractor's liability in respect of any loss or damage occurring during the Defects Liability Period while the Contractor is on the Site for the purpose of performing its obligations during the Defects Liability Period.
 - Third Party Liability Insurance: - Covering bodily injury or death suffered by third parties (including the Owner's personnel) and loss of or damage to property occurring in connection with the supply and installation of the Facilities.
 - Automobile Liability Insurance:-Covering use of all vehicles used by the Contractor or its Subcontractors (whether or not owned by them) in connection with the execution of the Contract.
 - Workers' Compensation:-In accordance with the statutory requirements applicable in any country where the Contract or any part thereof is executed.
 - Owner's Liability: - In accordance with the statutory requirements applicable in any country where the Contract or any part thereof is executed.
 - Other Insurances Such other insurances as may be specifically agreed upon by the parties.
- b) The Owner shall be named as co-insured under all insurance policies taken out by the Contractor pursuant except for the Third Party Liability, Workers' Compensation and Owner's Liability Insurances, and the Contractor's Subcontractors shall be named as co-insured's under all insurance policies taken out by the Contractor except for the Cargo Insurance During Transport, Workers' Compensation and Owner's Liability Insurances. All insurers' rights of subrogation against such co-insured's for losses or claims arising out of the performance of the Contract shall be waived under such policies.
- c) The Form of Contract Agreement, deliver to the Owner certificates of insurance (or copies of the insurance policies) as evidence that the required policies are in full force and effect. The certificates shall provide that no less than twenty one (21) days' notice shall be given to the Owner by insurers prior to cancellation or material modification of a policy.
- d) The Contractor shall ensure that, where applicable, its Subcontractor(s) shall take out and maintain in effect adequate insurance policies for their personnel and vehicles and for work executed by them under the Contract, unless such Subcontractors are covered by the policies taken out by the Contractor.
- e) The Owner shall at its expense take out and maintain in effect during the performance of the Contract those insurances specified.
- f) the Owner may take out and maintain in effect any such insurances and may from time to time deduct from any amount due the Contractor under the Contract any premium that the Owner shall have paid to the insurer, or may otherwise recover such amount as a debt due from the Contractor. If the Owner fails to take out and/or maintain in effect the insurances the Contractor may take out and maintain in effect any such insurances and may from time to time deduct from any amount due the Owner under the Contract any premium that the Contractor shall have paid to the insurer, or may otherwise recover such amount as a debt due from the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 45-	25.09.2014

Owner. If the Contractor fails to or is unable to take out and maintain in effect any such insurances, the Contractor shall nevertheless have no liability or responsibility towards the Owner, and the Contractor shall have full recourse against the Owner for any and all liabilities of the Owner herein.

- g) The Owner shall give to the Contractor all such reasonable assistance as may be required by the Contractor. With respect to insurance claims in which the Owner's interest is involved, the Contractor shall not give any release or make any compromise with the insurer without the prior written consent of the Owner. With respect to insurance claims in which the Contractor's interest is involved, the Owner shall not give any release or make any compromise with the insurer without the prior written consent of the Contractor.
- h) Wherever total damages/loss of equipments/materials, would occur, the Contractor will be entitled to payment of all payments received from the underwriters except the following amounts:
 - The amount paid to the Contractor under the Contract in respect of equipments/materials damaged/lost (excluding the pro-rata initial advance) but including the entire amount of escalation, if any, already paid to the Contractor.
 - Custom Duties and taxes which have already been paid by the Owner.
 - In case of damage to any equipments/materials during any stage, the Contractor upon rectification of the damaged equipment to the satisfaction of the Owner shall be paid to the extent of full claims settled by the underwriters.
- i) All the Plants & Equipment being supplied by the Owner free of cost for installation of the equipment, cabling, earthing and lightning protection etc. by the Contractor, covered by this specification shall be kept insured by the Contractor against loss, damage, theft, pilferage, fire etc. from the point of unloading at Site up to the time of taking over by the Owner including handling, in plant transportation, storage, installation, testing and commissioning, etc. and the Contractor shall be fully responsible for making good of any loss or damage at his own cost within a reasonable time as mutually agreed upon by the Owner and the Contractor. Any loss/damage shall be brought to the Owner's notice immediately. The premium paid by the Contractor to the Insurance Company for such insurance shall be reimbursed by the Owner to the Contractor at actual against documentary proof to be furnished by the Contractor. The Contractor shall obtain competitive quotation for such insurance and shall take prior approval from the Owner before taking the insurance. The insurable value of the equipment being procured by the Owner will be intimated to the Contractor for the purpose of insurance.
 - It will be the responsibility of the Contractor to lodge, pursue and settle all claims with the Insurance Company in case of any damage, loss, theft, pilferage, fire, etc. and the Owner shall be kept informed about it. The losses, if any, will have to be borne by the Contractor, if the claims are not lodged and pursued properly or in the time or if the same are not settled by the Insurance Company.

4.40 Change in Laws & Regulation

- a) If, after the date [seven (7)] days prior to the date of Bid submission, in India, any law, regulation, ordinance, order or by-law having the force of law is enacted, promulgated, abrogated or changed (which shall be deemed to include any change in interpretation or application by the competent authorities) that subsequently affects the costs and expenses of the Contractor and/or the Time

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 46-	25.09.2014

for Completion, the Contract Price shall be correspondingly increased or decreased, and/or the Time for Completion shall be reasonably adjusted to the extent that the Contractor has thereby been affected in the performance of any of its obligations under the Contract. However, these adjustments would be restricted to direct transactions between the Owner and the Contractor and not on procurement of raw materials, intermediary components etc. by the Contractor. Notwithstanding the foregoing, such additional or reduced costs shall not be separately paid or credited if the same has already been accounted for in the price adjustment provisions wherever applicable.

4.41 Force Majeure

- (a) Force Majeure" shall mean any event beyond the reasonable control of the Owner or of the Contractor, as the case may be, and which is unavoidable notwithstanding the reasonable care of the party affected. Force Majeure events include Acts of God, Acts of Government, war, sabotage, riots, civil commotion, revolution, flood, earthquake, cyclone, fire, epidemic etc.
- (b) If either party is prevented, hindered or delayed from or in performing any of its obligations under the Contract by an event of Force Majeure, then it shall notify the other in writing of the occurrence of such event and the circumstances thereof within *[fourteen (14)]* days after the occurrence of such event.
- (c) The party who has given such notice shall be excused from the performance or punctual performance of its obligations under the Contract for so long as the relevant event of Force Majeure continues and to the extent that such party's performance is prevented, hindered or delayed.
- (d) The party or parties affected by the event of Force Majeure shall use reasonable efforts to mitigate the effect thereof upon its or their performance of the Contract and to fulfil its or their obligations under the Contract, but without prejudice to either party's right.
- (e) No delay or non-performance by either party hereto caused by the occurrence of any event of Force Majeure shall
 - constitute a default or breach of the Contract
 - to any claim for damages or additional cost or expense occasioned thereby
 if and to the extent that such delay or non-performance is caused by the occurrence of an event of Force Majeure.
- (f) If the performance of the Contract is substantially prevented, hindered or delayed for a single period of more than *[sixty (60)]* days or an aggregate period of more than one hundred and *[twenty (120)]* days on account of one or more events of Force Majeure during the currency of the Contract, the parties will attempt to develop a mutually satisfactory solution.
- (g) Force Majeure shall not apply to any obligation of the Owner to make payments to the Contractor herein.

4.42 Change in the Facilities

(a) Introducing a Change

- The Owner shall have the right to propose, and subsequently require, the Contractor during the performance of the Contract to make any change, modification, addition or deletion to, in or from the Facilities (hereinafter called "Change"), provided that such Change falls within the general scope of the Facilities and does not constitute unrelated work and that it is technically practicable, taking into account both the state of advancement of the Facilities

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 47-	25.09.2014

and the technical compatibility of the Change envisaged with the nature of the Facilities as specified in the Contract.

- The Contractor may from time to time during its performance of the Contract propose to the Owner (with a copy to the Project Manager) any Change that the Contractor considers necessary or desirable to improve the quality, efficiency or safety of the Facilities. This includes any additional scope of work that the contractor thinks is essential for achieving the minimum performance level specified in the SCC or the Contract. The Owner may at its discretion approve or reject any Change proposed by the Contractor.
- No change made necessary because of any default of the Contractor in the performance of its obligations under the Contract shall be deemed to be a Change, and such change shall not result in any adjustment of the Contract Price or the Time for Completion.

(b) Changes Originating from Owner

- If the Owner proposes a Change, it shall send to the Contractor a "Request for Change Proposal," requiring the Contractor to prepare and furnish to the Project Manager as soon as reasonably practicable a "Change Proposal," which shall include the following:
 - ✓ brief description of the Change
 - ✓ effect on the Time for Completion
 - ✓ estimated Cost of the Change
 - ✓ effect on Functional Guarantees (if any)
 - ✓ effect on any other provisions of the Contract.
- The pricing of any Change shall, as far as practicable, be calculated in accordance with the rates and prices included in the Contract. If the rates and prices of any change are not available in the Contract, the parties thereto shall agree on specific rates for the valuation of the Change.
- If before or during the preparation of the Change Proposal it becomes apparent that the aggregate effect of compliance therewith and with all other Change Orders that have already become binding upon the Contractor to increase or decrease the Contract Price as originally set forth in the Contract Agreement by more than fifteen (15) percent, the Contractor may give a written notice of objection thereto prior to furnishing the Change Proposal as aforesaid. If the Owner accepts the Contractor's objection, the Owner and the Contractor shall agree on specific rates for valuation of the change.
- Upon receipt of the Change Proposal, the Owner and the Contractor shall mutually agree upon all matters therein contained including agreement on rates if such rates are not available in the Contract or if the limit of 15% set forth has been exceeded. Within *fourteen (14)* days after such agreement, the Owner shall, if it intends to proceed with the Change, issue the Contractor with a Change Order.
- If the Owner is unable to reach a decision within *fourteen (14)* days, it shall notify the Contractor with details of when the Contractor can expect a decision.
- If the Owner decides not to proceed with the Change for whatever reason, it shall, within the said period of *fourteen (14)* days, notify the Contractor accordingly.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 48-	25.09.2014

- If the Owner and the Contractor cannot reach agreement on the price for the Change, an equitable adjustment to the Time for Completion, or any other matters identified in the Change Proposal, the Owner may nevertheless instruct the Contractor to proceed with the Change by issue of a "Pending Agreement Change Order."

Upon receipt of a Pending Agreement Change Order, the Contractor shall immediately proceed with effecting the Changes covered by such Order. The parties shall thereafter attempt to reach agreement on the outstanding issues under the Change Proposal.

(c) Changes Originating from Contractor

- The Contractor shall submit to the Project Manager a written "Application for Change Proposal," giving reasons for the proposed Change and including the information. Upon receipt of the Application for Change Proposal, the parties shall follow the procedures indicated above for "Request for Change Proposal."

4.43 Extension of Time for Completion

- (a) The Time(s) for Completion specified in the SCC shall be extended if the Contractor is delayed or impeded in the performance of any of its obligations under the Contract by reason of any of the following:
- Any Change in the Facilities or
 - any occurrence of Force Majeure or
 - any suspension order given by the Owner or reduction in the rate of progress or
 - any changes in laws and regulations or
 - any default or breach of the Contract by the Owner, or any activity, act or omission of any other contractors employed by the Owner or
 - any other matter specifically mentioned in the Contract;
- By such period as shall be fair and reasonable in all the circumstances and as shall fairly reflect the delay or impediment sustained by the Contractor.
- (b) Except where otherwise specifically provided in the Contract, the Contractor shall submit to the Project Manager a notice of a claim for an extension of the Time for Completion, together with particulars of the event or circumstance justifying such extension as soon as reasonably practicable after the commencement of such event or circumstance. As soon as reasonably practicable after receipt of such notice and supporting particulars of the claim, the Owner and the Contractor shall agree upon the period of such extension.
- (c) The Contractor shall at all times use its reasonable efforts to minimize any delay in the performance of its obligations under the Contract.

4.44 Suspension

- (a) The Owner/ Project Manager may, by notice to the Contractor, order the Contractor to suspend performance of any or all of its obligations under the Contract. Such notice shall specify the obligation of which performance is to be suspended, the effective date of the suspension and the reasons thereof. The Contractor shall thereupon suspend performance of such obligation (except those obligations necessary for the care or preservation of the Facilities) until ordered in writing to resume such performance by the Project Manager/ Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 49-	25.09.2014

If, by virtue of a suspension order given by the Project Manager/ Owner, other than by reason of the Contractor's default or breach of the Contract, the Contractor's performance of any of its obligations is suspended for an aggregate period of more than *[ninety (90)]* days, then at any time thereafter and provided that at that time such performance is still suspended, the Contractor may give a notice to the Project Manager requiring that the Owner shall, within *[twenty eight (28)]* days of receipt of the notice, order the resumption of such performance or request and subsequently order a change, excluding the performance of the suspended obligations from the Contract.

- (b) If the Contractor is unable to carry out any of its obligations under the Contract for any reason attributable to the Owner, including but not limited to the Owner's failure to provide possession of or access to the Site or other areas;

Then the Contractor may by *[fourteen (14)]* days' notice to the Owner suspend performance of all or any of its obligations under the Contract, or reduce the rate of progress. If the Contractor's performance of its obligations is suspended or the rate of progress is reduced, then the Time for Completion shall be extended, and any and all additional costs or expenses incurred by the Contractor as a result of such suspension or reduction shall be paid by the Owner to the Contractor in addition to the Contract Price, except in the case of suspension order or reduction in the rate of progress by reason of the Contractor's default or breach of the Contract.

- (c) During the period of suspension, the Contractor shall not remove from the Site any Plant and Equipment, any part of the Facilities or any Contractor's Equipment, without the prior written consent of the Owner.

4.45 Termination

(a) Termination for Owner's Convenience

The Owner may at any time terminate the Contract for any reason by giving the Contractor a notice of termination. Upon receipt of the notice of termination, the Contractor shall either immediately or upon the date specified in the notice of termination

- (i) cease all further work, except for such work as the Owner may specify in the notice of termination for the sole purpose of protecting that part of the Facilities already executed, or any work required to leave the Site in a clean and safe condition.
- (ii) terminate all subcontracts, except those to be assigned
- (iii) remove all Contractor's Equipments from the Site, repatriate the Contractor's and its Subcontractors' personnel from the Site, remove from the Site any wreckage, rubbish and debris of any kind, and leave the whole of the Site in a clean and safe condition
- (iv) The Contractor, subject to the payment, shall
 - ✓ deliver to the Owner the parts of the Facilities executed by the Contractor up to the date of termination
 - ✓ to the extent legally possible, assign to the Owner all right, title and benefit of the Contractor to the Facilities and to the Plant and Equipments as at the date of termination, and, as may be required by the Owner, in

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 50-	25.09.2014

any subcontracts concluded between the Contractor and its Subcontractors

- ✓ Deliver to the Owner all non-proprietary drawings, specifications and other documents prepared by the Contractor or its Subcontractors as at the date of termination in connection with the Facilities.

In the event of termination of the Contract for Owner's convenience, the Owner shall pay to the Contractor the following amounts

- ✓ the Contract Price, attributable to the parts of the Facilities executed by the Contractor as on the date of termination
- ✓ the costs reasonably incurred by the Contractor in the removal of the Contractor's Equipment from the Site and in the repatriation of the Contractor's and its Subcontractors' personnel
- ✓ any amounts to be paid by the Contractor to its Subcontractors in connection with the termination of any subcontracts, including any cancellation charges
- ✓ costs incurred by the Contractor in protecting the Facilities and leaving the Site in a clean and safe condition
- ✓ the additional cost of satisfying other obligations, commitments and claims that the Contractor may in good faith have undertaken with third parties in connection with the Contract.

(b) Termination for Contractor's Default

- (i) The Owner, without prejudice to any other rights or remedies it may possess, may terminate the Contract forthwith in the following circumstances by giving a notice of termination and its reasons thereof to the Contractor:

If the Contractor becomes bankrupt or insolvent, has a receiving order issued against it, compounds with its creditors, or, if the Contractor is a corporation, a resolution is passed or order is made for its winding up (other than a voluntary liquidation for the purposes of amalgamation or reconstruction), a receiver is appointed over any part of its undertaking or assets, or if the Contractor takes or suffers any other analogous action in consequence of debt

If the Contractor assigns or transfers the Contract or any right or interest therein in violation of the provision.

If the Contractor, in the judgement of the Owner has engaged in corrupt or fraudulent practices in competing for or in executing the Contract.

For the purpose of this Sub Clause:

"corrupt practice" means the offering, giving, receiving or soliciting of anything of value to influence the action of a public official in the procurement process or in contract execution.

"fraudulent practice" means a misrepresentation of facts in order to influence a procurement process or the execution of a contract to the detriment of the Owner and includes collusive practice among Bidders (prior to or after bid submission) designed to establish bid prices at artificial non-competitive levels and to deprive the Owner of the benefits of free and open competition.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 51-	25.09.2014

(ii) If the Contractor

- has abandoned or repudiated the Contract
- has without valid reason failed to commence work on the Facilities promptly the progress of Contract performance for more than *[twenty eight (28)]* days after receiving a written instruction from the Owner to proceed
- persistently fails to execute the Contract in accordance with the Contract or persistently neglects to carry out its obligations under the Contract without just cause
- refuses or is unable to provide sufficient materials, services or labor to execute and complete the Facilities in the manner specified in the program at rates of progress that give reasonable assurance to the Owner that the Contractor can attain Completion of the Facilities by the Time for Completion as extended

then the Owner may, without prejudice to any other rights it may possess under the Contract, give a notice to the Contractor stating the nature of the default and requiring the Contractor to remedy the same. If the Contractor fails to remedy or to take steps to remedy the same within *[fourteen (14)]* days of its receipt of such notice, then the Owner may terminate the Contract forthwith by giving a notice of termination to the Contractor.

(iii) The Contractor shall, either immediately or upon such date as is specified in the notice of termination,

- cease all further work, except for such work as the Owner may specify in the notice of termination for the sole purpose of protecting that part of the Facilities already executed, or any work required to leave the Site in a clean and safe condition
- terminate all subcontracts, except those to be assigned to the Owner pursuant to paragraph (d) below
- deliver to the Owner the parts of the Facilities executed by the Contractor up to the date of termination
- to the extent legally possible, assign to the Owner all right, title and benefit of the Contractor to the Works and to the Plant and Equipment as at the date of termination, and, as may be required by the Owner, in any subcontracts concluded between the Contractor and its Subcontractors
- Deliver to the Owner all drawings, specifications and other documents prepared by the Contractor or its Subcontractors as at the date of termination in connection with the Facilities.

(iv) The Owner may enter upon the Site, expel the Contractor, and complete the Facilities itself or by employing any third party. The Owner may, to the exclusion of any right of the Contractor over the same, take over and use with the payment of a fair rental rate to the Contractor, with all the maintenance costs to the account of the Owner and with an indemnification by the Owner for all liability including damage or injury to persons arising out of the Owner's use of such equipment, any Contractor's Equipments owned by the Contractor and on the Site in connection with the Facilities for such reasonable period as the Owner considers expedient for the supply and installation of the Facilities.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 52-	25.09.2014

Upon completion of the Facilities or at such earlier date as the Owner thinks appropriate, the Owner shall give notice to the Contractor that such Contractor's Equipment will be returned to the Contractor at or near the Site and shall return such Contractor's Equipments to the Contractor in accordance with such notice. The Contractor shall thereafter without delay and at its cost remove or arrange removal of the same from the Site.

- (v) The Contractor shall be entitled to be paid the Contract Price attributable to the Facilities executed as at the date of termination, the value of any unused or partially used Plant and Equipments on the Site, and the costs, if any, incurred in protecting the Facilities and in leaving the Site in a clean and safe condition. Any sums due to the Owner from the Contractor accruing prior to the date of termination shall be deducted from the amount to be paid to the Contractor under this Contract.
- (vi) If the Owner completes the Facilities, the cost of completing the Facilities by the Owner shall be determined.

If the sum that the Contractor is entitled to be paid, plus the reasonable costs incurred by the Owner in completing the Facilities, exceeds the Contract Price, the Contractor shall be liable for such excess.

The Owner and the Contractor shall agree, in writing, on the computation described above and the manner in which any sums shall be paid.

(c) Termination by Contractor

- i. If
 - the Owner has failed to pay the Contractor any sum due under the Contract within the specified period, has failed to approve any invoice or supporting documents without just cause pursuant to [-----] (Terms and Procedures of Payment) of the Form of Contract Agreement, or commits a substantial breach of the Contract, the Contractor may give a notice to the Owner that requires payment of such sum, requires approval of such invoice or supporting documents, or specifies the breach and requires the Owner to remedy the same, as the case may be. If the Owner fails to pay such sum, fails to approve such invoice or supporting documents or give its reasons for withholding such approval, fails to remedy the breach or take steps to remedy the breach within [fourteen (14) days] after receipt of the Contractor's notice, or
 - the Contractor is unable to carry out any of its obligations under the Contract for any reason attributable to the Owner, including but not limited to the Owner's failure to provide possession of or access to the Site or other areas or failure to obtain any governmental permit necessary for the execution and/or completion of the Facilities which the Owner is required to obtain as per provision of the Contract or as per relevant applicable laws of the country,

then the Contractor may give a notice to the Owner thereof, and if the Owner has failed to pay the outstanding sum, to approve the invoice or supporting documents, to give its reasons for withholding such approval, or to remedy the breach within [twenty eight (28) days] of such notice, or if the Contractor is still unable to carry out any of its obligations under the Contract for any reason attributable to the Owner within twenty eight

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 53-	25.09.2014

(28) days of the said notice, then the Contractor may terminate the Contract forthwith by giving a notice of termination to the Owner.

- ii. If the Owner becomes bankrupt or insolvent, has a receiving order issued against it, compounds with its creditors, or, being a corporation, if a resolution is passed or order is made for its winding up (other than a voluntary liquidation for the purposes of amalgamation or reconstruction), a receiver is appointed over any part of its undertaking or assets, or if the Owner takes or suffers any other analogous action in consequence of debt, then the Contractor may terminate the Contract forthwith by giving a notice of termination to the Owner.
- iii. If the Contract is terminated, then the Contractor shall immediately
 - cease all further work, except for such work as may be necessary for the purpose of protecting that part of the Facilities already executed, or any work required to leave the Site in a clean and safe condition
 - terminate all subcontracts, except those to be assigned to the Owner pursuant to paragraph (d)(ii)
 - remove all Contractor's Equipment from the Site and repatriate the Contractor's and its Subcontractor's personnel from the Site
 - In addition, the Contractor, subject to the payment, shall
 - ✓ deliver to the Owner the parts of the Facilities executed by the Contractor up to the date of termination
 - ✓ to the extent legally possible, assign to the Owner all right, title and benefit of the Contractor to the Facilities and to the Plant and Equipments as of the date of termination, and, as may be required by the Owner, in any subcontracts concluded between the Contractor and its Subcontractors
 - ✓ Deliver to the Owner all drawings, specifications and other documents prepared by the Contractor or its Subcontractors as of the date of termination in connection with the Facilities.
- iv. If the Contract is terminated, the Owner shall pay to the Contractor all payments, and reasonable compensation for all loss or damage sustained by the Contractor arising out of, in connection with or in consequence of such termination.
- (d) The expression "Facilities executed" shall include all work executed, Erection Services provided, any all Plant and Equipments acquired (or subject to a legally binding obligation to purchase) by the Contractor and used or intended to be used for the purpose of the Facilities, up to and including the date of termination.
- (e) In calculating any payment due from the Owner to the Contractor, account shall be taken of any sum previously paid by the Owner to the Contractor under the Contract, including any advance payment paid.

4.46 Assignment

The Contractor shall not, without the express prior written consent of the Owner, assign to any third party the Contract or any part thereof, or any right, benefit, obligation or interest therein or there under, except that the Contractor shall be entitled to assign either absolutely or by way of charge any monies due and payable to it or that may become due and payable to it under the Contract

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 54-	25.09.2014

5 SPECIAL CONDITIONS OF CONTRACT (SCC)

5.1 Contract Details

- **Name of Contract:** Renovation & Modernization of Electrical Balance of Plant (eBOP) Package for [-----]
- **Bid Document No. :** [-----]
- **The Owner is:**

Name of Owner: [-----]

Address of Owner: [-----]

Telephone No. : [-----]

Fax No: [-----]

E-Mail: [-----]
- **The Project Manager is:**

Name of Project Manager: [-----]

Address of Project Manager: [-----]

Telephone No. : [-----]

Fax No: [-----]

E-Mail: [-----]

5.2 Effective Date

The Owner shall inform the successful Bidder of its acceptance of the Tender by a formal Letter of Acceptance. This Letter of Acceptance will be the Effective Date for determining the Time for Completion of the facilities and other milestones for execution of the Renovation & Modernization work as per the scope of work under this tender by the Contractor.

The following three activities will be completed within [two (2)] months from the date of Letter of Acceptance:

(a) The contract agreement will be executed by the Owner and the Contractor. (b) The Contractor will submit to the Owner the Contract Performance Bank Guarantee, any Additional Contract Performance Bank Guarantee by assignee if applicable, and the Advance Payment Bank Guarantee.

(c) The Owner will pay the Contractor the Advance Payment as per the Terms of Payment.

The Owner will make the advance payment promptly once Contractor has fulfilled the necessary conditions specified in Terms of Payment. If payment of Advance is delayed beyond two months from the date of Letter of acceptance for reasons attributable to the Owner, the date of payment of advance shall be the effective date for determining the time for completion of facilities. However, failure of the contractor to provide all the required Bonds/Guarantees within the prescribed period will cause the Bid Security to be forfeited.

5.3 Time for Commencement and Completion

The Time Schedule for the execution of the scope of work by the Contractor under this tender and commencement of unit shut down by Owner shall be as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 55-	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

1.	Time for completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network	By [.....] months from Effective Date
2.	Time for Commencement (by Owner) of Unit Shut Down. (Note: In case Contractor fails to complete the engineering, supply and mobilization activities as at serial no.1, Owner may, at its discretion, reschedule commencement of unit shut down	By [.....] months from Effective Date
3.	Time for Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender	By [.....] days from start of unit shut down
4.	Performance Guarantee Test (By Contractor)	By [.....] months from the completion of trial operation after completion of R&M activities

5.4 Liquidated Damage for Delay

5.5 Rate of Liquidated Damage for Delay

If the Contractor fails to successfully achieve completion of R&M activities and commissioning of the retrofitted facilities as per the scope of work within the time period specified in SCC, the Contractor shall pay to the Owner amount calculated as per the rates given in the following table as Liquidated Damage and not as penalty.

1.	Delay in completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network	Liquidated Damage payable at the rate Rs.[.....] for each week of delay
2.	Delay in Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender	Liquidated Damage payable at the rate Rs [.....] for each day of delay

The Liquidated Damage for Delay in completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network and Liquidated Damage for Delay in Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender are independent and shall be applied separately.

5.6 Liquidated Damage for Non-fulfillment of Functional Guarantees

If the Contractor fails to successfully achieve the Functional Guarantees during Performance Guarantee Test as per the Tender Specification, the Contractor shall pay

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 56-	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

to the Owner amount calculated as per the rates given in the following table as Liquidated Damage and not as penalty.

Sl. No.	Functional Guarantee Parameter	Rate of Liquidated Damage
1	Copper Losses	[.....] INR per kW increase
2	Iron Losses	[.....] INR per kW increase
3	Auxiliary Power in kW	[.....] INR per kW increase

The reference condition for Performance Guarantee Parameters shall be as per Volume-II Technical Specification.

The Liquidated Damage for non-fulfillment of the different Functional Guarantee Parameters are independent of one another and shall be applied separately.

{Note: The rate of LD for any functional guarantee parameter shall be at least 1.5 times the corresponding Bid Evaluation Factor}

5.7 Maximum Leviable Liquidated Damages

The amount of Liquidated Damage for delay shall be limited to a maximum of 10 % of the total contracts price (i.e. sum of Ist, IInd and IIIrd)contracts, as applicable) price including price variation as per the provisions of the contract and excluding price of Mandatory Spares. This limit is applicable for the Liquidated Damage for Delay in completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network and Liquidated Damage for Delay in Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender taken together.

The aggregate amount **of Liquidated Damage for non-fulfilment of functional guarantee shall be limited to** a maximum of 10 % of the total contracts price (i.e. sum of Ist, IInd and IIIrd)contracts, as applicable) price including price variation as per the provisions of the contract and excluding price of Mandatory Spares.

The limit on maximum leviable Liquidated Damage for Delay and maximum leviable Liquidated Damage for non-fulfillment of functional guarantee are independent of each other and shall apply separately.

5.8 Payment of Liquidated Damages

Contractor shall pay to the owner any Liquidated Damages that are payable as per the provisions of the Contract within thirty (30) days of receipt of Owner's invoice setting forth amount of Liquidated Damages that are then due and payable. If Contractor delays payment of Liquidated Damages that are payable under the provisions of the Contract beyond thirty (30) days, Owner, at its discretion, shall be entitled to recover such amounts by either setting off the relevant unpaid amount against any payment(s) due to the Contractor or by making a demand under Contract Performance Bank Guarantee.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors– Electrical Balance of Plant Volume-I	- 57-	25.09.2014

5.9 Contract Price

- a) The Contract Price shall be as (Contract Price and Terms of Payment) of the Form of Contract Agreement.
- b) The Contractor shall be deemed to have satisfied itself as to the correctness and sufficiency of the Contract Price, which shall, except as otherwise provided for in the Contract, cover all its obligations under the Contract.

5.10 Terms of Payment

- a) The Contract Price shall be paid as Terms and Procedures of Payment to the Form of Contract Agreement. The procedures to be followed in making application.
- b) No payment made by the Owner herein shall be deemed to constitute acceptance by the Owner of the Facilities or any part(s) thereof.
- c) The currency or currencies in which payments are made to the Contractor under this Contract to the Form of Contract Agreement, subject to the general principle that payments will be made in the currency or currencies in which the Contract Price has been stated in the Contractor's bid.

5.11 Contract Securities (Bank Guarantees)

- a) The Contractor shall provide the Bank Guarantees specified below in favour of the Owner at the times, and in the amount, manner and form specified below.
- b) Advance Payment Bank Guarantees
 - The Contractor shall, within *[thirty (30)]* days of the Notification of Contract Award, provide a security for an amount equal to the advance payment, and in the same currency or currencies, with a initial validity of up to *[ninety (90)]* days beyond the date of Completion of Facilities.
 - The security shall be in the form of an Unconditional Bank Guarantee. The Advance payment Bank Guarantees shall be reduced prorata every three (3) months after First Running Account Bill/Stage Payment under the Contract based on the value of equipment/facilities received. The cumulative amount of reduction at any point of time shall not exceed ninety percent (90%) of the advance corresponding to cumulative value of the Facilities supplied and received as per a certificate issued by the Project Manager and the balance of 10% shall be released on Completion of those Facilities. It should be clearly understood that reduction in the value of security for advance shall not in any way dilute the Contractor's responsibility and liabilities under the Contract including in respect of the Facilities for which the reduction in the value of security is allowed.

c) Performance Bank Guarantees

The Contractor shall, within *[thirty (30)]* days of the notification of award, provide a Bank Guarantees for the due performance of the Contract for ten percent (10%) of the Contract Price with an initial validity upto *[ninety (90)]* days beyond the Defects Liability Period. If the Owner enters into the Contract with the Assignee of a foreign Contractor, the said Assignee, in addition to the Contract Performance Bank Guarantees to be provided by the Contractor for ten percent (10%) of the value of all the Contracts shall provide within *[thirty (30)]* days of the Notification of Award, a separate Contract Performance Bank Guarantees equivalent to five percent (5%) of the value of Contract entered into with the assignee (i.e. five percent of the aggregate value of the component Contracts entered to with the Assignee), for the due performance of Contract with an initial validity up to *[Ninety (90)]* days beyond the Defects Liability Period.

SCHEDULE – F3

DEVIATION SCHEDULE TO TENDER DOCUMENT VOL-I (COMMERCIAL)

All deviations to commercial condition (Tender Document Vol-I) shall be filled in by the Bidder clause by clause in this schedule.

S.No	Clause	Deviation	Reason for Deviation

The Bidder hereby certifies that the above mentioned are the only deviations from the commercial condition (Tender Document Vol-I) . The Bidder further confirms that in the event any other data or information presented in the Bidder's proposal and accompanying documents are at variance with the specific requirements laid out in the commercial condition (Tender Document Vol-I) , then the latter shall govern and shall be binding on the Bidder for the quoted price.

SCHEDULE - F6
CONTRACTOR'S RESOURCE DEPLOYMENT SCHEDULE

A) Construction Equipment

The Bidder shall indicate the schedule of construction equipment, proposed to be deployed at the site for executing the works as per the pro-forma below:

S. No.	Type of Resource	Months							
1									
2									
3									
...									
...									

B) Resource Deployment Schedule

The Bidder shall indicate the schedule of manpower resources proposed to be deployed at the site for executing the works as per the pro-forma below:

S. No.	Type of Resource	Months							
2.	Human Resources								
2.1	Engineering Category								
2.1.1	Project Engineers								
2.1.2	Mechanical Engineers								
2.1.3	Electrical Engineers								
2.1.4	Civil Engineers								
2.1.5	C&I Engineers								
2.1.6	Commissioning Engineers								
2.1.7	Structural Engineers

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-I, Annexure & Schedules	[1]	26.09.2014

Form of Contract Agreement

THIS CONTRACT AGREEMENT is made the _____day of _____, 20_____.
 BETWEEN (1) [Name of Employer], a corporation incorporated under the laws of [country of Employer] and having its principal place of business at [address of Employer] (hereinafter called “the Employer”), and (2) [name of Contractor], a corporation incorporated under the laws of [country of Contractor] and having its principal place of business at [address of Contractor] (hereinafter called “the Contractor”)

WHEREAS the Employer desires to engage the Contractor to dismantle/disassemble, design, manufacture, test, deliver, install, complete and commission certain Facilities, viz.

[.....]
 [.....]
 [.....]

(“the Facilities”) and the Contractor have agreed to such engagement upon and subject to the terms and conditions hereinafter appearing.

NOW IT IS HEREBY AGREED as follows:

1.1 Contract Documents

- a) Contract Documents means this signed Contract agreement and its annexure/appendices, and the complete documents, which are the basis of finalization of the contract, including correspondence exchanged from issue of tender till date of signing the contract. The following will constitute the Contract Documents:
 - i. The signed Contract Agreement & the annexure/ appendices thereto (highest precedence)
 - ii. Letter of award.
 - iii. Special Condition of Contract
 - iv. General Condition of Contract
 - v. Technical specification & Tender Drawing.
 - vi. The bid & its schedules/ attachment submitted by the contractor.

- a) All documents forming part of the Contract (and all parts thereof) are intended to be correlative, complementary and mutually explanatory. The Contract shall be read as a whole.

- b) The Contract will be signed in three originals and the Contractor shall be provided with one signed original and the rest will be retained by the Employer.

1.2 Order of Precedence of Contract Documents

In case there is any ambiguity of conflict between different contract documents, the order of precedence shall be as follows:-

- i. The signed Contract Agreement & the annexure/ appendices thereto (highest precedence)
- ii. Letter of award.
- iii. Special Condition of Contract
- iv. General Condition of Contract
- v. Technical specification & Tender Drawing.
- vi. The bid & schedules/ attachment submitted by the contractor.

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

1.3 Definitions

" The Definitions of terms and expressions shall be as per GCC clause 4.1. Terms and expressions not defined in GCC shall have the same meaning as are assigned to them in the Indian Sale of Goods Act (1930), failing that in the Indian Contract Act (1872) and failing that in the General Clauses Act (1897) including amendments thereof, if any.

1.4 Contract Price

The Employer hereby agrees to pay to the Contractor the Contract Price in consideration of the performance by the Contractor of its obligations hereunder: The Contract Price shall be the aggregate of: [amount of foreign currency in words], [amount in figures], and [amount of local currency in words], [amount in figures], or such other sums as may be determined in accordance with the terms and conditions of the Contract.

1.5 Term of Payment

The terms and procedures of payment according to which the Employer will reimburse the Contractor are given in Contract Schedule 1 (Terms and Procedures of Payment) hereto.

1.6 Time for Commencement and Completion

The Time Schedule for the execution of the scope of work by the Contractor under this tender and commencement of unit shut down by Employer shall be as follows:

1.	Time for completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network	By [.....] months from Effective Date
2.	Time for Commencement (by Employer) of Unit Shut Down. (Note: In case Contractor fails to complete the engineering, supply and mobilization activities as at serial no.1, Employer may, at its discretion, reschedule commencement of unit shut down	By [.....] months from Effective Date
3.	Time for Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender	By [.....] days from start of unit shut down
4.	Performance Guarantee Test (By Contractor)	By [.....] months from the completion of trial operation after completion of R&M activities

The detailed Time Schedule shall be as per Contract Schedule 2.

Contract Schedule-1

Terms of Payment

The Owner shall pay the Contractor in the following manner and at the following times, on the basis of the Price Break down given in the Section on Price Schedules. Payments will be made in the currencies quoted by the Bidder unless otherwise agreed between the parties. Application for payment in respect of part deliveries may be made by the Contractor as work proceeds.

I. Terms of Payment for Supply of Plant and Equipment (excluding Mandatory Spares and Recommended Spares) supplied from Abroad:

1	10% of the total FOB price	Initial Advance on Acceptance of Letter of Award by the Contractor, Signing of Contract Agreement and submission of Contract Performance Bank Guarantee, Additional Contract Performance Bank Guarantee and Advance Payment Bank Guarantee by Contractor
2	50% of FOB price for each identified equipment as progressive payment and 100% of Ocean Freight and Marine Insurance Charges pro-rata to the value of the equipment	Upon dispatch of the identified equipment after dispatch clearance by employer on raising of Invoice by the Contractor and submission of evidence of shipment
3	15% of FOB price for each identified equipment	On receipt of equipment at site and physical verification and certification by the Employer
4	20% of the total FOB price	On Completion of Facilities
5	5% of the total FOB price	Successful completion of Performance Guarantee Test

II. Terms of Payment for Supply of Plant and Equipment (excluding Mandatory Spares and Recommended Spares) supplied from within India:

1	10% of the total Ex-Works price	Initial Advance on Acceptance of Letter of Award by the Contractor, Signing of Contract Agreement and submission of Contract Performance Bank Guarantee, Additional Contract Performance Bank Guarantee and Advance Payment Bank Guarantee by Contractor
2	50% of Ex-Works price for each identified equipment as progressive payment	Upon dispatch of the identified equipment after dispatch clearance by employer on raising of Invoice by the Contractor and submission of evidence of shipment
3	15% of Ex-Works price for each identified equipment	On receipt of equipment at site and physical verification and certification by the Employer

Document Number	Rev No	Description	Page No.	Date of Issue

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

4	20% of the total Ex-Works price	On Completion of Facilities
5	5% of the total Ex-Works price	Successful completion of Performance Guarantee Test

III. Terms of Payment for Supply of Mandatory Spares and Recommended Spares

1	70% of the CIF Price of each Spare from Abroad or 70% of the Ex-Works Price of each Spare from within India	Upon dispatch of the identified Spare after dispatch clearance by employer on raising of invoice by the Contractor and submission of evidence of shipment
2	30% of the CIF Price of each Spare from Abroad or 30% of the Ex-Works Price of each Spare from within India	On receipt of Spare at site and physical verification and certification by the Employer

IV. Terms of Payment for Local Transportation, Inland Transit Insurance and port clearance charges & port charges

For Plant & Equipment except Spares		
1	100% of Local Transportation, Inland Transit Insurance and Port Clearance & Port Charges pro-rata to value of the equipment	On receipt of Equipment at site and upon raising of Invoice by the Contractor
For Spares		
2	100% of Local Transportation, Inland Transit Insurance and Port Clearance & Port Charges pro-rata to value of Spare	On receipt of Spare at site and upon raising of Invoice by the Contractor

V. Terms of Payment for Erection of Plant & Equipment

1	10% of Total Price for Erection of Plant & Equipment	Initial Advance on Acceptance of Letter of Award by the Contractor, Signing of Contract Agreement and submission of Contract Performance Bank Guarantee, Additional Contract Performance Bank Guarantee and Advance Payment Bank Guarantee by Contractor
2	75% of Price for Erection of Plant & Equipment as progressive payment pro-rata to value of plant & equipment erected	On certification by Employer of successful erection of plant & equipment and successfully passing of quality checks
3	10% of Total Price for Erection of Plant & Equipment	On Completion of Facilities
4	5% of Total Price for Erection of Plant & Equipment	Successful completion of Performance Guarantee Test

VI. Terms of Payment for Civil Works

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-I, Annexure & Schedules	[6]	26.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

1	10% of Total Price for Civil Works	Initial Advance on Acceptance of Letter of Award by the Contractor, Signing of Contract Agreement and submission of Contract Performance Bank Guarantee, Additional Contract Performance Bank Guarantee and Advance Payment Bank Guarantee by Contractor
2	75% of Price for Civil Works as progressive payment	On certification by Employer regarding value of work completed & successfully passing of quality checks
3	10% of Total Price for Civil Works	On Completion of Facilities
4	5% of Total Price for Civil Works	Successful completion of Performance Guarantee Test

VII. Terms of Payment for Price Adjustment Amount

Any increase in the Price of any component Contract shall be paid as per the Terms of Payment for base price. The initial 10% advance payment pertaining to increase in price shall be paid along with progressive payment of that equipment. Reduction to the Contract Price, if any, due to price adjustment provisions, shall be effected by recovering 100% of the reduction amount (including advance) from any of the Contractor's bills falling immediately due for payment.

VIII. Terms of Payment for Taxes & Duties

Any Tax or Duty payable by Employer as per the Terms & Conditions of Contract and is directly payable to Statutory Authorities/Government as per law shall be directly paid to the concerned authority or Government by the Employer. Any other Tax or Duty payable by Employer as per the Terms & Conditions of Contract shall be reimbursed to the Contractor/Assignee upon receipt of corresponding Plant & Equipment or Spare at site and submission of evidence by the Contractor/Assignee to the Employer as to the Contractor/Assignee having paid such Taxes & Duties.

IX. Terms of Payment for Statutory Variation in Taxes & Duties

Any amount towards statutory variation in Taxes & Duties payable by Employer as per the Terms & Conditions of Contract shall be reimbursed to the Contractor/Assignee upon submission of evidence by the Contractor/Assignee to the Employer as to the Contractor/Assignee having paid such variation.

Document Number	Rev No	Description	Page No.	Date of Issue

Contract Schedule-2

PRICE ADJUSTMENT

- (i) The Contract Price shall be subject to price adjustment during performance of the Contract to reflect changes in the cost of labour and material in accordance with the provisions described below.
- (ii) Only following components of the Contract Price will be subject to Price adjustment :
 - (a) Ex-Works (India) price of plant and equipment excluding Mandatory Spares manufactured within India and FOB price component for plant and equipment excluding Mandatory spares supplied from abroad. The price adjustment amounts towards these price components shall be without any ceiling.
 - (b) Erection Services component of the Contract Price. The price adjustment amounts towards this price component shall be without any ceiling.
 - (c) Civil Works component of the Contract Price. The price adjustment amounts towards this price component shall be without any ceiling.
- (iii) Price adjustment amounts towards aforesaid components of Contract Price shall be paid in the respective currencies of Contract.
- (iv) The indices for price adjustment shall necessarily be of the country of origin of goods/labour and shall be well established and nationally recognized in that country. Preferably Government indices shall be used.
- (v) The price adjustment formula for the components of the Contract Price above shall be as stipulated hereinafter.
- (vi) **Ex-Works/FOB price component of Plant and Equipment excluding mandatory spares**

The price component of the equipment for any shipment/ dispatch comprises of a fixed portion (designated as 'F' and the value of which is specified hereunder) and a variable portion linked with the indices for various materials and labour.

The amount of price adjustment towards variable portion payable/recoverable on each shipment/dispatch shall be computed as under:

$$ES = ES_1 - ES_0$$

ES₁ will be computed as follows:

$$ES_1 = ES_0 \left\{ F + a \times \frac{A_1}{A_0} \times f_1 + b \times \frac{B_1}{B_0} \times f_2 + c \times \frac{C_1}{C_0} \times f_3 + Lb \times \frac{L_1}{L_0} \times f_{lb} \right\}$$

Where

ES = Adjustment to Ex-Works/FOB price component expressed in the currency of the Contract payable to the contractor for each shipment/dispatch

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-I, Annexure & Schedules	[8]	26.09.2014

ES₁ = Adjusted amount of Ex-works/FOB price component expressed in the currency of the Contract payable to the Contractor for each shipment/dispatch

ES₀ = Ex-works/FOB price for the plant and equipment in the currency of the Contract, shipment/dispatch wise.

- The fixed portion of the ex-works/FOB component of the Contract Price (F) shall be 0.15.

- a, b, c etc. shall be co-efficient of major materials/items involved in the ex-works/FOB component of the Contract Price. The sum of these co-efficient shall be between 0.50 to 0.60.

- A, B, C etc. shall be published price indices of corresponding major materials/items. Such indices shall necessarily be of the country of origin of goods.

- 'Lb' shall be co-efficient for labour component in the ex-works/ FOB component of the Contract Price which shall be between 0.25 to 0.35.

- 'L' shall be labour index.

- Sum of all the material co-efficient and the labour co-efficient shall be 0.85.

f₁, f₂, f₃, f_{lb} etc - f₁, f₂, f₃ etc. are Exchange rate correction factors for the respective materials and f_{lb} is the exchange rate correction factor for labour with reference to the currency of the country of origin of index and the respective contract currency, such that

$$f = \frac{Z_0}{Z_1}$$

where Z is the no. of units of the currency of the country of the origin of index, which is equivalent to one unit of the respective contract currency. The exchange rates to be used for calculation of factor 'f' shall be as per State Bank of India Bills Selling Exchange Rates.

For the indices(A, B, C etc.), subscript 'o' refers to indices as on 30 days prior to original scheduled date for opening of Part-I Bid.. For 'Z₀', subscript 'o' refers to value as on the date of opening of Part-I Bid.

Subscript '1' refers to indices/exchange rates as of:

(a) three months prior to the date of shipment/dispatch for labour, and

(b) six months prior to the date of shipment/dispatch for material.

In case of shipments/dispatches which are delayed beyond the schedule date of shipment/dispatch for reasons attributable to the Contractor, the price adjustment provision shall not be applicable for the period of time between the schedule date of shipment/dispatch and the actual date of shipment/dispatch.

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-I, Annexure & Schedules	[9]	26.09.2014

The above formula for price adjustment will be applicable if the currency in which the contract price is expressed is different from the currency of the country of origin of labour and material indices. In other case, formula shall be applied without the exchange rate correction factor 'f'.

(vii) Erection Services Component

The price component for erection services comprises of a fixed portion and a variable portion linked with the index of labour.

The monthly price adjustment amount for the erection services component of the Contract Price will be computed separately for Indian currency and for foreign currency part, if any, related to expatriate supervision/labour as per the formula given below:

(a) Indian Rupee part of the Erection Services

$$ER = ER_1 - ER_0$$

ER₁ will be computed as follows:

$$ER_1 = ER_0 \left(0.15 + 0.85 \frac{FL_1}{FL_0} \right)$$

Where:

ER	=	Adjustment to erection services component of contract price expressed in Indian Rupees payable to the contractor for each billing.
ER ₁	=	Adjusted amount of erection services component of Contract Price expressed in Indian Rupees payable to the Contractor.
ER ₀	=	Value of the Erection work done in the billing period (month)
FL	=	Indian field labour index namely, All India Consumer Price Index for Industrial Workers (All India Monthly Average) as published by Labour Bureau, Simla, Government of India.

(b) Foreign Currency portion of the Erection Services

$$EE = EE_1 - EE_0$$

EE₁ will be computed as follows:

$$EE_1 = EE_0 \left(0.15 + 0.85 \frac{EF_1}{EF_0} \times f \right)$$

Where:

EE = Adjustment to erection services component of Contract Price expressed in foreign currency payable to the contractor for each billing.

EE₁ = Adjusted amount of erection services component of Contract Price expressed in foreign currency payable to the contractor for each billing.

EE₀ = Value of foreign currency portion of Erection work done in the billing period (month)

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-I, Annexure & Schedules	[10]	26.09.2014

EF = Index for Expatriate field labour component of the Erection Price of Installation work. Such index shall necessarily be of the country of nationality of the labour.

f = Exchange rate correction factor for expatriate labour with reference to currency of country of origin of index for expatriate labour and the respective contract currency, such that

$$f = \frac{Z_0}{Z_1}$$

where Z is the no. of units of the currency of the country of origin of index, which is equivalent to one unit of the respective contract currency. The ex-change rates to be used for calculation of factor 'f' shall be as per State Bank of India Bills Selling Exchange.

For the indices, subscript 'o' refers to indices as on 30 days prior to date set for opening of bids. For 'Z₀', subscript 'o' refers to value as on the date of opening of Part-I Bid.

For the indices, subscript '1' refers to the indices as applicable for the month of execution of the erection work. For the exchange rates, subscript '1' refers to the exchange rates as applicable on the last day of the month of execution of the erection work.

In case of erection activities which are delayed beyond the schedule date for reasons attributable to the contractor, the price adjustment provision shall not be applicable for the period of time between the schedule date of completion and actual date of completion of the respective erection activity.

(viii) The following components of the contract price shall not be subject to price adjustment and shall remain firm during the execution of the contract :

- (1) Ocean Freight and Marine Insurance for Plant and Equipment, mandatory spares and recommended spares.
- (2) Ex-works/FOB price component for Mandatory spares & Recommended Spares.
- (3) Inland Transportation charges (including Inland Transit Insurance, port clearance, port handling & port charges) for plant & equipment and Spare Parts.

(ix) Civil Works Component

The Price of Civil Works for any month comprises a fixed part designated as 'F' and variable parts linked to indices for labour, steel, cement, other commodities and Fuel & Power. The monthly price adjustment amount for the civil works component of the Contract Price will be computed as per the formula given below:

$$EC = EC_1 - EC_0$$

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-I, Annexure & Schedules	[11]	26.09.2014

EC₁ will be computed as follows:

$$EC_1 = EC_0 \left\{ F + a \times \frac{MI_1}{MI_0} + b \times \frac{LI_1}{LI_0} + c \times \frac{FI_1}{FI_0} + d \times \frac{SI_1}{SI_0} + e \times \frac{CI_1}{CI_0} \right\}$$

Where

EC = Adjustment to Civil Works price component expressed in the currency of the Contract payable to the contractor for each month

EC₁ = Adjusted amount of Civil Works price component expressed in the currency of the Contract payable to the Contractor for each month

EC₀ = Value of Civil Works done expressed in the currency of the Contract for the billing period (month).

- The fixed portion (F) of the Civil Works component of the Contract Price shall be 0.15.

- 'a' is the coefficient for material cost other than cement and steel involved in the Civil Works component of the Contract Price and it shall be 0.15.

'b' is the coefficient for labour cost involved in the Civil Works component of the Contract Price and it shall be 0.3.

'c' is the coefficient for Fuel & Power cost involved in the Civil Works component of the Contract Price and it shall be 0.05.

'd' is the coefficient for steel cost involved in the Civil Works component of the Contract Price and it shall be 0.25.

'e' is the coefficient for cement cost involved in the Civil Works component of the Contract Price and it shall be 0.10.

- MI shall be All India Whole Sale Price Index for all commodities as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry.

LI shall be All India Consumer Price Index for industrial labour as published by Labour Bureau, Government of India

FI shall Index Number of Wholesale Price for group Fuel & Power as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry

SI shall Index Number of Wholesale Price for Steel as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry

CI shall Index Number of Wholesale Price for Cement as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry

For the indices(MI, LI,FI, SI and CI), subscript 'o' refers to indices as on 30 days prior to original scheduled date for opening of Part-I Bid. Subscript '1' refers to indices as of one prior to the month for which Civil Works is being billed.

To:

[Name & Address of Owner (Utility)]

.....
]

Dear Sirs,

1 In consideration of the [.....] hereinafter referred to as the 'OWNER', which expression shall, unless repugnant to the context or meaning, thereof include its successors, representative and assignees, having awarded in favour of M/s.....[Contractor's Name] having its registered office at.....hereinafter referred to as the 'CONTRACTOR', which expression shall, unless repugnant to the context or meaning thereof include its successors, administrators, representatives and assignees, a Contract, hereinafter referred to as the "CONTRACT" for the.....on terms and conditions set out inter alia, in the OWNER's Contract/Letter of Award No.....dated.....as well as 'CONTRACT' documents, valued at [amount of foreign currency in words], [amount in figures], and [amount of local currency in words], [amount in figures] and the same having been unequivocally accepted by the CONTRACTOR and the CONTRACTOR having agreed to provide a **Contract Performance Bank Guarantee** for the faithful performance of the entire CONTRACT including the Warranty Obligations /Liabilities under the CONTRACT equivalent to 10% (ten percent) of the said value of the CONTRACT to OWNER amounting to Rs.....(Rupees.....only) as Contract Security in the form of a Bank Guarantee.

2 We,.....[Name & Address of Bank] and having its Head Office at....., hereinafter referred to as the 'Bank' which expression shall, unless repugnant to the context or meaning thereof, include its successors, administrators, representatives and assignees do hereby irrevocably guarantee and undertake to pay the OWNER merely on demand without any previous notice and without any demur and without referring to any other source, any and all monies payable by the CONTRACTOR by reason of any breach of the said CONTRACTOR of any of the terms and conditions of the said CONTRACT including non-execution of the 'CONTRACT AGREEMENT', to the extent of(%)..... of the Contract price to OWNER amounting to Rs.....(Rupees.....only). Any

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-I, Annexure & Schedules	[1]	26.09.2014

such demand made by the OWNER on the Bank shall be conclusive and binding, absolute and unequivocal notwithstanding any difference between the OWNER and CONTRACTOR or any dispute or disputes raised/ pending before any Court, Tribunal, Arbitrator or any other authority. The Bank agrees that the guarantee herein contained shall continue to be enforceable till this sum due to the OWNER is fully paid and claims satisfied or till the OWNER discharges this Guarantee.

- 3 The Bank further irrevocably guarantees and undertakes to pay any amount due and payable by the CONTRACTOR by reasons of non-fulfilment of any of the following obligations of the Contractor:
 - (a) Successful and satisfactory operation of the plant & equipment supplied and erected under the said Contract as per the Technical Specifications and other Tender/Contract documents.
 - (b) That the equipment installed under the said Contract shall be new and in accordance with Contract Documents and be free from all defects in design, engineering, material workmanship and performance for a period of 12 calendar months after final takeover of the equipment by the OWNER and that upon written notice from the OWNER, the CONTRACTOR shall remedy free of any expense to the OWNER, such defects as noticed and developed under the normal use of the said plant & equipment, within the said guarantee period.
- 4 The OWNER shall have the fullest liberty without affecting in any way the liability of the Bank under this guarantee, from time to time, to extend the time of Performance by the CONTRACTOR. The Bank shall not be released from its liabilities under these presents by any exercise of the OWNER of the liberty with reference to the matter aforesaid.
- 5 The OWNER shall have the fullest liberty, without affecting this guarantee to postpone from time to time the exercise of any powers vested in them or of any right which they might have against the CONTRACTOR and to exercise the same at any time in any manner, and either to enforce or to forbear to enforce any covenants, contained or implied in the CONTRACT between OWNER and the CONTRACTOR or any other course or remedy or security available to the OWNER and the Bank shall not be released of its obligations/liabilities under these presents by any exercise by the OWNER of his liberty with reference to the matters aforesaid or any of them or by reasons of any other act or forbearance or other acts of omission or commission on the part of the OWNER or any other indulgence shown by the OWNER or by any other matter or thing whatsoever which under law would, but for this provision, have the effect of relieving the Bank Guarantee. The Bank further undertakes not to revoke this guarantee during its currency without the previous consent of the OWNER.
- 6 The Bank further agrees that the decision of the OWNER as to the failure on the part of the CONTRACTOR to fulfill their obligations as aforesaid and/or as to the amount payable by the Bank to the OWNER hereunder shall be final, conclusive and binding on the Bank.
- 7 The OWNER shall have the fullest liberty to lodge their claim for encashment of the guaranteed sum either in full or part, in the manner suitable to them. However, payment made for a sum lesser than the guaranteed amount shall not relieve or discharge the bank from their obligations guaranteed under the bank guarantee, till the contractual obligations are fully performed by the Contractor or the Bank Guarantee is discharged by the OWNER, as the case may be and the Bank Guarantee shall continue to be in force till such time.
- 8 The Bank also agrees that the OWNER shall be entitled at his option to enforce this guarantee against the Bank as a Principal Debtor, in the first instance notwithstanding any other security or guarantee that it may have in relation to the CONTRACTOR's liabilities.

1 INTENT OF SPECIFICATION

- 1.1 The intent of this specification is to Renovate and Modernize various Electrical equipment/s & systems of Electrical Balance of Plant Package (eBOP) including but not limited to [Switchyard and its Auxiliaries, Substation Automation System (SAS), Control & Protection Panel of Switchyard, Generator Transformer (GT), Unit Transformer (UT), Station Transformer(ST), Control, Protection and Metering panel of Station Transformer, Plant Communication system, Electrical Lab equipments, Energy Management system, Cable carrier system, Illumination System, Earthing and Lightning protection system. Switchyard Auxiliaries shall include equipments of LV Transformer, 415V Switchgear/MCC and DBS, Motor& motorized actuators, 220V DC& UPS system, 415V non Segregated Phase Bus duct(NSPBD), Variable frequency drives, HV Cable, LV Cable, Control & Instrumentation Cables and associated Civil & Structural work]. The renovated Equipment/s or System should be capable of operating to its design parameters. Technical particulars of Equipments, Bidder's scope of services and Terminal points of eBOP Package of the R & M of Unit No. [...] Of [Name of the Power Plant] is given in subsequent section of this Specification.
- 1.2 The Bidder shall carry out the required replacement / refurbishment / retrofitting of the Switchyard & its Auxiliaries and Power Transformers and associated auxiliary equipments of Switchyard as per the requirements of his design so as to make the same capable of operating for an extended life of [20/25] years and producing the output at the desired parameters mentioned in the respective equipment tabulation of this specification. The scope of replacement / refurbishment / retrofitting shall include but shall not be limited to the scope of work mentioned at clause 4 which is based on the recommendation of RLA/CA and EA studies conducted during [.....]. However, any other items/systems which have not been specifically mentioned but are considered necessary by the Bidder for giving the intended performance of equipments of eBOP package, shall also be included in the scope of Bidder and shall be separately highlighted by the Bidder in his proposal.
- 1.3 The modified/replaced/retrofitted equipment will conform to the requirements of the Specification prescribed in Section-II of Volume-II.
- 1.4 Bidders are required to carry out necessary modifications / replacement in the existing electrical equipment or systems including related civil/structural works as per Specification requirement and also based on their own assessment. Bidders are required to quote performance guarantee values for

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[1]	25.09.2014

Transformer output, Transformer Efficiency, Losses etc. in their Bid. Bidder shall guarantee the Transformer output and Transformer Efficiency after R&M. Suitable credit shall be given to the Bidder offering higher output & better efficiency during evaluation of the Bid.

- 1.5 The scope of work for R&M shall include designing / re-designing, basic and detailed engineering, re-engineering, refurbishing / retrofitting, supply, inspection and testing at supplier's works, packing, forwarding to site, forwarding from site to Bidder's facilities, unloading and storage at site, pre-assembly, machining if required, site fabrication, erection, replacing of various equipment and systems, carrying out all pre-commissioning checks/ tests and any other work required to complete the system, commissioning and trial operation, performance tests of various equipment and systems covered under this Specification. Bidder's scope shall also include dismantling of the existing equipment/ facilities, including unloading & transportation to designated storage / disposal yard, wherever required as a result of augmentation of existing electrical, mechanical, I&C and civil/structural/ architectural works. The Bidder shall restore the equipment/ facilities, whenever applicable, after carrying out necessary renovations/modifications under the scope of R&M works.

All the tools & tackles, labour and other facilities required for dismantling and restoration shall also be in the scope of the Bidder.

Bidder shall also put back into service all the systems/equipment of the units after completion of R&M works, whether any modification is carried out on the same or not. All necessary tools, tackles, labour, instruments, spares, consumables etc. required for putting back into operation shall also be provided by the Bidder.

- 1.6 It is not the intent to specify completely herein all aspects of services and equipment to be provided by the Bidder who in any case shall be responsible for fulfillment of the intent of Specification. Irrespective of whether specifically mentioned or not, the services, equipment and systems to be provided in accordance with this Specification shall also form a part of the scope of work and shall conform in all respects to the highest standard of engineering, design, quality and workmanship so that after completion of R&M work by the Bidder, the equipment shall be capable of performing completely in a safe, reliable and sustained manner as acceptable to the Owner.

- 1.7 Unless otherwise specifically clarified by the Owner, interpretation by the Owner in respect of scope of supplies & services and the meaning of the Specifications, drawings, requirements of operation, maintenance, redundancy etc., shall be final and binding on the Bidder. Owner shall have the right to reject or accept any work or material which in his assessment is not technically complete and proven to meet the requirements of this

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[2]	25.09.2014

Specifications and/or applicable National and International Codes & Standards mentioned elsewhere in this Specification.

- 1.8 The requirements, conditions, appendices etc, given in various parts/ sections of technical Specifications shall form integral part of this Specification. Bidder is required to carefully examine and understand the Specifications and seek clarifications, if required, to ensure that he has understood the Specifications as intended by the Owner. In the absence of any specific clarifications made to the Owner during Bidding stage, the interpretation of Owner shall be final. The Bidder's offer should not carry any sections like clarifications, interpretations and/or assumptions. All such points are required to be clarified & resolved during Bidding stage.
- 1.9 Any deviation or variation from the scope of supply and services or the intent of the Specification shall be clearly brought out under the schedule of Technical / Commercial deviations, irrespective of the fact that such deviation / variation may be standard practice or possible interpretation of the Specifications by the Bidder. In case, no clear and specific deviation is taken by the Bidder in the relevant schedule of Bid Proposal Sheet while making his Bid proposal, it will be construed that the Bidder shall comply with the stipulations of the Specification fully with regard to scope of services and supplies to be provided by him to achieve the objective of R&M. Further, unless otherwise specifically clarified by the Owner, the interpretation by the Owner in respect of scope of supplies and services to be performed by the Bidder shall be final and binding.
- 1.10 If the Bidder feels that, in his opinion certain features brought out in his offer are superior to what has been specified, these may be highlighted separately in the Bid. The Bidder at his own discretion may also make Alternate offers, which in his opinion are of superior technology, material etc. to the specified requirements leading to better performance like efficiency / output etc. of the units after renovation. In such case, the Bidder shall carry out a comprehensive study and clearly identify the scope of offer in his alternate proposal. The Bidder shall furnish that detailed study to Owner along with the Bid where the Bidder shall bring out in detail the scope of modifications required to be carried out by him in the various systems and equipment including but not limited to *[Switchyard and its Auxiliaries, Substation Automation System (SAS), Control & Protection Panel of Switchyard, Generator Transformer (GT), Unit Transformer (UT), Station Transformer(ST), Control, Protection and Metering panel of Station Transformer, Plant Communication system, Electrical Lab equipments, Energy Management system, Cable carrier system, Illumination System, Earthing and Lightning protection system. Switchyard Auxiliaries shall include equipments of LV Transformer, 415V Switchgear/MCC and DBS, Motor& motorized actuators, 220V DC& UPS system, 415V non Segregated Phase Bus*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[3]	25.09.2014

duct(NSPBD), Variable frequency drives, HV Cable, LV Cable, Control & Instrumentation Cables and associated Civil & Structural work].

Such Alternate proposals shall be supplemented with sufficient amount of information like specified design standards and performance requirements, Bidder's experience, operating feedback, provenness, etc. for justifying such proposals. Implications of such Alternate offers on the performance, output, efficiency, auxiliary power consumption, etc. shall be clearly brought out in the Bid to enable the Owner to determine the advantages, superiority and acceptability of the proposals.

However the Bidder's Base offer shall necessarily be in line with the Specification requirements. Under no circumstances the equipment and services as specified shall be brought out as an Alternate offer.

The Base offers will be evaluated as per procedure outlined in the Bid documents and the Alternate Offers of the lowest evaluated Bidder will only be considered for acceptance or otherwise. Owner may reject alternative proposals submitted by the Bidder at his sole discretion, without assigning any reason what so ever.

- 1.11 In the event of conflict between requirements of any two clauses of the Specification documents or requirements of different Codes/ Standards specified, the more stringent requirement as per the interpretation of the Owner shall apply, unless confirmed otherwise by the Owner in writing.
- 1.12 The General technical conditions pursuant to the Contract, placed separately in this Specification, shall form an integral part of the Specification. These conditions shall supplement all the detailed technical Specification and requirement identified in this Specification.
- 1.13 Out of complete unit comprising of mechanical, electrical, C&I systems and equipment, some components/systems are envisaged to be replaced with new ones having better design features while some of the other components are to be refurbished / upgraded by the Bidder under present R&M Work. It shall be the responsibility of the Bidder to ensure that components/ equipment/ systems being supplied new OR components/ equipment/ systems being refurbished / upgraded by him are fully compatible and integrated with the existing equipment / systems so as to give safe, reliable and sustained operation of the complete unit. Modifications needed on the assembled equipment to ensure complete integration are to be brought out by the Bidder in the Bid and such modifications, if any, after Owner's approval shall be carried out by the Bidder to the satisfaction of the Owner.
- 1.14 The equipments shall be designed to operate continuously in base load and cyclic load operation. The systems shall operate without any restriction over the entire range of operating conditions. The Bidder shall ensure that after R&M there are no restrictions/ alterations in modes of operations of this unit,

Document Number	Rev No.	Description	Page No.	Date of Issue

as per the original/existing plant operation philosophy, including achieving base load, peak load and cyclic load operation.

- 1.15 As the various equipment/ systems/ components are to be fitted in the unit, Bidder is advised to visit the plant site to get fully conversant with the job, site conditions, and constraints, and collect all the information as required and as available before quoting against this Specification.
- 1.16 A brief extract of the existing equipment/systems, the original design details/ performance parameters along with plant details, operating history and known problem areas; wherever possible are brought out in the successive section of this Specification. Relevant plant layout drawings and certain key schematic drawings, as available, have also been provided in Annexure-I of this section of the specification for the purpose of familiarization & guidance only. The successful Bidder shall prepare and provide the additional drawings and documents describing the design and engineering details and the manuals for carrying out erection, commissioning and operation of the renovated unit.

2 SITE & PROJECT SPECIFIC INFORMATION

2.1 Project Name

Project Title: [...]

Existing Capacity: [X xMW]

2.2 Project Location

The proposed project site is located at [...], in District [...] in the state of [...]. The location details of the project site are as indicated below:

Table: 2.1

Latitude	[... ° ...' ..."] N
Longitude	[... ° ...' ..."] E
Height above mean sea level	[...] m
Seismic Zone	Zone - [...]
Distance from [.....] town	[...] km
Distance from national highway No. [...]	[...] km
Distance from state highway No. [...]	[...] km
Distance of nearest airport [...]	[...] km
Distance of nearest seaport [...]	[...] km

2.3 Climatological Data

Table: 2.2

Highest monthly mean of daily maximum temperature	[...] °C
Lowest monthly mean of daily maximum temperature	[...] °C
Highest monthly mean of daily minimum temperature	[...] °C

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[6]	25.09.2014

Lowest monthly mean of daily minimum temperature	[...] °C
Annual mean of daily maximum temperature	[...] °C
Annual mean of daily minimum temperature	[...] °C
Extreme highest temperature	[...] °C
Extreme lowest temperature	[...] °C
Design ambient temperature (unless specified otherwise)	{50} °C
Relative Humidity: Maximum	[...] %
Minimum	[...] %
Average annual rainfall	[...] cm
Heaviest rainfall in 24 hours so far	[...] cm
Number of rainy days in a year	[...]
Highest monthly mean of wind speed	[...] km/h
Lowest monthly mean of wind speed	[...] km/h
Maximum wind speed	[...] km/h

Table: 2.3

Season	Dry bulb temperature	Wet bulb temperature
Summer	[...] °C	[...] °C
Monsoon	[...] °C	[...] °C
Winter	[...] °C	[...] °C

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[7]	25.09.2014

3 EXISTING PLANT DETAILS

The Power Plant, having a configuration of [...x...MW] is located at [...], in District [...] in the state of [...]. The Unit no. [...] of the power plant, which is proposed to be taken up for Renovation and Modernization was first commissioned in the year [...]. For the above unit, M/s [...] and M/s [...] are the Original Equipment Manufacturers (OEMs) for the Boiler and Turbo-Generator, respectively. The Original Equipment supplier of respective eBOP equipment are provided in the respective equipment's section at Clause No. 3.2 of this section of the specification. Power generated from the unit is being supplied to [...State/Central grid]. Power is being evacuated through [...numbers of 220/400kV Double/Single Circuit lines] to [... substation.] The primary fuel is [domestic/imported/blended] [coal/lignite] fuel being sourced from [...&...] coal mines. The consumptive water for the power plant is being sourced from [...river/...sea].

3.1 Operational Background

Unit No [...] of [...] Thermal Power Station having a Generating Capacity of [210 MW] was commissioned in the year [...]. The boiler is of [...] design and the turbine is of [LMZ] design. Various Electrical equipment of Electrical Balance of Plant system has under gone degradation in its original design parameters with respect to its name plate design parameters and also in terms of parameters like efficiency, losses and number of outages etc over the years of its life. The deterioration experienced over the years in Plant's Equipment performance parameters and its current operating parameters is shown below.

3.1.1 Equipment's Average Performance Parameters over the life

{Indicate in the table below the average performance parameters of individual equipments which are being taken out for retrofit/replacement as per RLA, LE study for past [25] years.}

Equipm ent Name	Years after Install ation	Effici ency (%)	Availabi lity (%)	Output (MVA/Am p/ KW)	Losses (%)	Forced Outages (Nos)	Insulation Strength
[...]	5	[...]	[...]	[...]	[...]	[...]	[...]

3.1.1 Feedback from the Plant Operators

Detailed discussions were held with the Plant operators who provided the feedback about the design and operation related problems of various Equipment. These are listed in the Table below.

Feedback from the Plant Operators

S. No.	Name of the Equipment	Type of Problem	Probable Solution as per the Operators
1	[.....]	[.....]	[.....]
2	[.....]	[.....]	[.....]
3	[.....]	[.....]	[.....]
4	[.....]	[.....]	[.....]
5	[.....]	[.....]	[.....]
6	[.....]	[.....]	[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[10]	25.09.2014

S. No.	Name of the Equipment	Type of Problem	Probable Solution as per the Operators
7	[.....]	[.....]	[.....]
8	[.....]	[.....]	[.....]
9	[.....]	[.....]	[.....]
...	[.....]	[.....]	[.....]

3.1.3 Tripping and Maintenance Record

{Indicate in the table below the tripping and maintenance record of individual equipment which are being taken out for retrofit/replacement as per RLA, LE study for the past [3] years.}

Equipment Name	Year	Total Trippings	No. of Tripping due to Generator Trip	Other Major Causes of Trippings	Maintenance carried out
	Two Years Back	[.....]	[.....]		[.....]
	One Year Back	[.....]	[.....]		[.....]
	Current Year	[.....]	[.....]		[.....]

3.1.4 Record of Reportable Accidents

{Indicate in the table below the reportable accidents for the past three years of individual equipment which are being taken out for retrofit/replacement as per RLA, LE study for the past [3] years.}

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[11]	25.09.2014

Equipment Name	Year	Man hours lost due to accidents	No. of Fatal Accidents	No. of Accidents leading to Permanent Disablement	Actions taken to reduce the number of accidents
	Two Years Back	[.....]	[.....]	[.....]	[.....]
	One Year Back	[.....]	[.....]	[.....]	[.....]
	Current Year	[.....]	[.....]	[.....]	[.....]

3.1.5 Operation & Maintenance Difficulties due to Plant Limitations

[Difficulties are being experienced in day to day maintenance of the plant due to design deficiency, layout of the plant, obsolescence of equipment and non availability of spare parts etc. These are mentioned in the Table below]

S.No.	Nature of Difficulty	Specific Reason (Design deficiency/ layout of the plant / obsolescence of equipment / non availability of spare parts etc)
1	[.....]	[.....]
2	[.....]	[.....]
3	[.....]	[.....]
4	[.....]	[.....]
5	[.....]	[.....]

3.2 Salient Technical Features of Power Plant

{Describe in this chapter, the Important Design Parameters and Salient Features of all the Equipment and Systems of Electrical Balance of Plant package of the Power Plant is mentioned below}

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[12]	25.09.2014

3.2.1 Substation & Auxiliaries

[The Substation is 220kV/400kV Air/Gas Insulated or Hybrid substation, type. The Major design parameters of the Substation are furnished below:]

Description	Units	Design Parameters
Make/Manufacturer		[....]
Model No		[If applicable]
Installation		[Indoor/Outdoor.]
Insulating Medium		[Air/SF6]
Nominal voltage	kV	[....]
Highest System voltage	kV	[....]
Short circuit current	kA	[....]
Insulation Level		
Impulse withstand voltage	kV (Peak)	[....]
One minute power frequency withstand voltage	kV (rms)	[....]
Switching Impulse withstand Voltage	kV (Peak)	[....]
Creepage Distance	mm/kV	[....]
Reference ambient temperature	°C	[....]
Rated Current	Amp	[....]
Switching Scheme		[....]

[And in addition to Control and Protection panels of substation, separate Protection & Metering Panel for Station Transformer is also provided. There are two groups of protection each are physically, mechanically and electrically separated into two separate systems. Separate Metering systems

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[13]	25.09.2014

Tender Document for R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

are provided which comprises of Metering requirements of Station transformer. The design parameters of Station Transformer Protection panel and Metering Panel are furnished below:]

Description	Unit	Design Parameters
Make/Manufacturer of Panel		[.....]
Model No		[.....] {For Protection/Metering panel}
Panel Designation		[.....] {Relay/Metering panel of Station Transformer}
Type of Panel		[.....] {Simplex/Duplex}
Sheet Steel Thickness		
(a) Load bearing members	mm	[.....]
(b) Non-loading members	mm	[.....]
Colour Shade of Panel		[.....]
Cable Entry of Panel		[.....] {Top/Bottom}
Degree of protection		[.....]
Auxiliary Voltage Requirement of Panel		
(a) AC		[.....]
(b) DC		
Minimum rating of contacts for auxiliary relays :		
(a) Voltage	V, DC	[.....]
(b) Continuous current	A, DC	[.....]
(c) Make & carry for 1 sec.	A, DC	[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[14]	25.09.2014

Description	Unit	Design Parameters
(d) Breaking capacity (i) Resistive (ii) Inductive	Watts	[.....] [.....]
Weight of Each Panel	kg	[.....]
Dimension of each panel	mm	[.....]
Relay type and protection [For Station Transformer]		[.....] <i>{List out protections envisaged for Station Transformer in Group I and Group II separately}</i>
Tripping Relays		
(a) Make / designation		[.....]
(b) Static / Electromagnetic		[.....]
(c) Rated voltage	V, DC	[.....]
Trip circuit Super Vision Relays		
(a) Make / designation		[.....]
(b) Static / Electromagnetic		[.....]
(c) Rated voltage	V, DC	[.....]
Indicating Lamps		
Type		[.....]
Ratings		
(a) Voltage	V	[.....]
(b) Wattage	W	[.....]
Energy Meters		
Make		
Type of measurement		[.....]

Description	Unit	Design Parameters
Measuring range in primary watts.		[.....]
CT ratio	A/A	[.....]
VT ratio	V/V	[.....]
Accuracy class		[.....]
Burden		[.....]
(a) Current coil	VA	[.....]
(b) Voltage coil	VA	[.....]
Transducers		
a) Output		[.....]
b) Accuracy		[.....]
c) Burden	VA	[.....]

3.2.2

Substation Automation System (SAS):

[The Substation Automation system based on IEC 61850 is provided for integrated protection, control, and communication and monitoring of the various switchyard equipment in the 400 kV/200kV switchyard. The design parameters of the Substation Automation System are furnished below:]

Description	Units	Design Parameters
BAY CONTROL UNIT		
Make/Manufacturer		[.....]
Model		[.....]
Communication Protocols supported		[.....]
Protocol for time synchronization		[.....]
Communication		
Serial		[.....]
IRIG-B		[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue

Description	Units	Design Parameters
Make		[.....]
Cable Type		[.....]
Fibre Type		[.....]

3.2.3 Generator Transformer

[The Generator Transformer is designed to evacuate individual unit output power under Valve Wide Open (VWO) condition without considering units auxiliary consumption. The design parameters of the Generator Transformer are furnished below:]

Description	Units	Design Parameters
Make/Manufacturer		[.....]
Transformer application		[..GT
No of Winding		[..2/3
Installation		[.....]
Rating of transformer	MVA	[.....]
No load voltage ratio at principal tap HV/LV	kV	[.....]
Rated frequency	Hz	[.....]
Rating at different cooling methods	MVA	
ONAN		[..... %.....]
ONAF		[..... %.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[18]	25.09.2014

Description	Units	Design Parameters
OFAF/ODAF		[.....%.....]
Impedance value at principal tap on rated MVA base.	%	[.....]
Tolerance on impedance at nominal tap		[.....]
Winding connection and vector group		[.....]
Temperature Rise above [50 deg] ambient a) In Oil by Thermo meter b) In winding by Resistance.	Deg C Deg C	[.....] [.....]
System fault level	kA	[HV.....]; [LV.....]
Insulation Level: a) One minute Power frequency withstand voltage b) Impulse withstand voltage c) Switching impulse withstand voltage(if applicable)	kV KV(peak) kV(Peak)	[.....] [.....] [.....]
System earthing (a) HV		[...Solidly earthed.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[19]	25.09.2014

Description	Units	Design Parameters
(b) LV		[...Non effectively earthed.....]
Type of tap changer		[.....Off circuit/OLTC.....]
a) Range of Taps		[.....]
b) No of steps.		[.....]
Guaranteed no load loss	kW	[.....]
Guaranteed load loss	kW	[.....]
Guaranteed efficiency at	%	[.....]
a) Full load		
b) 75% load		
No of Cooler Bank and Capacity	No & %	[.....]
Online Dissolved Gas Analyzer (DGA) provided	Yes/No	[.....]
CT details		[.....]
a) HV side		[.....]
b) HV Neutral Side		[.....]
c) LV side		[.....]

3.2.4 Unit Transformer

[The Unit Transformer is designed to cater 50% of unit load and 2 x50% configuration is followed for each unit. The design parameters of the Unit Transformer are furnished below:]

Description	Units	Design Parameters
Make/Manufacturer		[.....]
Transformer application		[..UT] { Feeding Unit auxiliaries load}

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[20]	25.09.2014

Description	Units	Design Parameters
No of Winding		[..2/3]
Installation		[.....]
Rating of transformer	MVA	[.....]
No load voltage ratio at principal tap HV/LV	kV	[.....]
Rated frequency	Hz	[.....]
Rating at different cooling methods	MVA	
ONAN		[..... %.....]
ONAF		[..... %.....]
Impedance value at principal tap on rated MVA base.	%	[.....]
Tolerance on impedance at nominal tap		[.....]
Winding connection and vector group		[.....]
Temperature Rise above [50 deg] ambient		
a) In Oil by Thermo meter	Deg C	[.....]
b) In winding by Resistance.	Deg C	[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[21]	25.09.2014

Description	Units	Design Parameters
System fault level	kA	[HV.....]; [LV.....]
Insulation Level: a) One minute Power frequency withstand voltage b) Impulse withstand voltage	kV (rms) KV(peak) kV(Peak)	[.....] [.....] [.....]
System earthing (a) HV (b) LV		[.....] [...Non effectively earthed.....]
Type of tap changer a) Range of Taps b) No of steps.		[.....Off circuit/OLTC.....] [.....] [.....]
Guaranteed no load loss	kW	[.....]
Guaranteed load loss	kW	[.....]
Guaranteed efficiency at a) Full load b) 75% load	%	[.....]
No of Cooler Bank and Capacity	No & %	[.....]
Online Dissolved Gas Analyzer (DGA) provided	Yes/No	[.....]
CT details a) HV side b) HV Neutral Side c) LV side		[.....] [.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[22]	25.09.2014

Description	Units	Design Parameters
		[.....]

3.2.5 Station Transformer

[The Station Transformer is designed to cater 100% of Power plant Common load and 2 x100% configuration is followed for the entire power plan of plant having units more than one. The design parameters of the Station Transformer are furnished below:]

Description	Units	Design Parameters
Make/Manufacturer		[.....]
Transformer application		[..ST] { Feeding Common loads of station }
No of Winding		[..2/3]
Installation		[.....]
Rating of transformer	MVA	[.....]
No load voltage ratio at principal tap HV/LV	kV	[.....]
Rated frequency	Hz	[.....]
Rating at different cooling methods	MVA	
ONAN		[.....%.....]
ONAF		[.....%.....]
OFAF/ODAF		[.....%.....]

Document Number	Rev No.	Description	Page No.	Date of Issue

Description	Units	Design Parameters
(b) LV		[...Non effectively earthed.....]
Type of tap changer		[.....Off circuit/OLTC.....]
a) Range of Taps		[.....]
b) No of steps.		[.....]
Guaranteed no load loss	kW	[.....]
Guaranteed load loss	kW	[.....]
Guaranteed efficiency at	%	[.....]
a) Full load		
b) 75% load		
No of Cooler Bank and Capacity	No & %	[.....]
Online Dissolved Gas Analyzer (DGA) provided	Yes/No	[.....]
CT details		[.....]
a) HV side		[.....]
b) HV Neutral Side		[.....]
c) LV side		[.....]

3.2.6

LV Transformer

[The LV transformer of Oil/Dry type is designed to cater 100% of Switchyard auxiliary loads with 2 x 100% configuration is followed. The design parameters of the Service Transformer are furnished below:]

Description	Units	Design Parameters
Make/Manufacturer		[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[25]	25.09.2014

Description	Units	Design Parameters
Type		[Oil/Dry.....]
Transformer application		[..Service
Installation		[...Indoor/Outdoor.]
Rating of transformer	MVA	[.....]
No load voltage ratio at principal tap HV/LV	kV	[.....]
Rated frequency	Hz	[.....]
Impedance value at principal tap on rated MVA base.	%	[.....]
Tolerance on impedance at nominal tap		[.....]
Winding connection and vector group		[.....]
System fault level	kA	[HV.....]; [LV.....]
Insulation Level: a) One minute Power frequency withstand voltage b) Impulse withstand voltage	kV (rms) KV(peak)	[.....] [.....]
System earthing (c) HV		[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[26]	25.09.2014

Description	Units	Design Parameters
(d) LV		[.....Solidly earthed.....]
Type of tap changer		[.....Off Circuit.....]
a) Range of Taps		[.....]
b) No of Steps		[.....]
Guaranteed no load loss	kW	[.....]
Guaranteed load loss	kW	[.....]
Guaranteed efficiency at	%	[.....]
a) Full load		
b) 75% load		

3.2.7 Neutral Grounding Resistor (NGR)

[The Unit auxiliary load and Station Common Auxiliaries loads are fed by Unit Transformer and Station Transformer respectively at 6.6kV level. Further in order to feed LV loads, 6.6kV level is stepped down by using Service Transformers. In power plant it is followed that 6.6kV system is non effectively earthed through resistor and LV system is solidly earthed. The Design parameters of Neutral Grounding Resistor (NGR) are furnished below]:

Description	Units	Design Parameters
Make/Manufacturer		[.....]
Application		[.....](For UT/ST)
Installation		[.....]
Current Rating	Amp	
a) For UT		[.....]
b) For ST		[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[27]	25.09.2014

Description	Units	Design Parameters
Rated Voltage a) For UT b) For ST	kV	[.....] [.....]
Frequency	Hz	[.....]
Duty Rating	Sec	[.....]
Resistance		
a) For UT b) For ST	Ohm	[.....] [.....]
a) For UT b) For ST	Ohm	[.....] [.....]

3.2.8 415V Switchgear, MCC & DBs

[415V Switchgear/MCC is provided with two incomers and bus coupler or single bus with one incomer (DB) with outgoing feeders intend for specific Auxiliary services of Switchyard. The design parameters of the LV Switchgear /PDB are furnished below:

Description	Units	Design Parameters
Make/Manufacturer		[.....]
Rated voltage, phases & frequency	V, Hz	[.....]
System neutral earthing		[.....]
Maximum system voltage	V	[.....]
One minute power frequency Voltage		[.....]
Continuous current		[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[28]	25.09.2014

Description	Units	Design Parameters
rating of bus bars		
Short Circuit rating of Bus bar with duration	kA & sec	[.....]
Bus bar Material	Al/Cu	[.....]
Type- Fully Draw out/Fixed		[.....]

3.2.9

220V DC System

[The 220V DC system of Switchyard is provided with 2 x100% battery with Battery Charger. The design parameters of the DC system comprising of Battery and Battery Charger are furnished below:]

Description	Units	Design Parameters
BATTERY		
Make/Manufacturer		[.....]
DC System Voltage	V	[220V.....]
Battery Type		[.....]
AH Rating/Rated Capacity	AH	[.....]
Number of cells		[.....]
End Cell Voltage	V	[.....]
Expected fault level at bus due to battery	kVA	[.....]
AH Efficiency at Rated load	%	[.....]
BATTERY CHARGER		[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue

Description	Units	Design Parameters
frequency voltage withstand		
Continuous current rating at 50°C design ambient air temperature	A	[.....]
One second short circuit withstand rating	KA (rms)	[.....]
Momentary short circuit withstand current	KA (Peak)	[.....]

3.2.12

HV Cables

[The HV cables of 6.6kV UE Voltage grade is used for feeding Switchyard LV transformer from Station Board. The design parameters of the HV Cables are furnished below:]

Description	Units	Design Parameters
Make/Manufacturer		[.....]
Voltage Grade		[.....]
Nominal Power System Voltage	kV	[.....]
Maximum System Voltage	kV	[.....]
System Neutral Earthing		[.....]
No. of Cores		[.....]
Conductor Material		[.....]
Conductor (stranded/solid)		[.....]
Conductor Screen		[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[33]	25.09.2014

Description	Units	Design Parameters
Insulation		[.....]
Insulation Screen		[.....]
Inner Sheath		[.....]
Outer Sheath		[.....]
Armoured/Unarmoured		[.....]
Material of cable drum		[.....]
Type of End Sealing		[.....]

3.2.13

LV Cables

[The LV cables of 1.1kV Voltage grade are used for feeding LV Auxiliary load of switchyard as well as for sub distribution system boards. The design parameters of the LV Cables are furnished below:]

Description	Units	Design Parameters
Make/Manufacturer		[.....]
Voltage Grade		[.....]
Nominal Power System Voltage	kV	[.....]
Maximum System Voltage	kV	[.....]
System Neutral Earthing		[.....]
No. of Cores		[.....]

Description	Units	Design Parameters
Insulation		[.....]
Insulation Screen		[.....]
Inner Sheath		[.....]
Outer Sheath		[.....]
Armoured/Unarmoured		[.....]
Material of cable drum		[.....]
Type of End Sealing		[.....]

3.2.15

Instrumentation (Pair) Cables

[The Instrumentation cables of 0.6kV Voltage grade are used for transmitting Process related field signals of equipment in terms of 4-20mA as well as analog information and feedback signals of equipments covered in eBOP package. The design parameters of the Instrumentation Cables are furnished below:]

Description	Units	Design Parameters
Make/Manufacturer		[.....]
Voltage Grade		[.....]
Nominal Power System Voltage	kV	[.....]
Maximum System Voltage	kV	[.....]
No. of Pairs		[.....]
Type of Cables		
Conductor Material		[.....]
Color Coding		[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[36]	25.09.2014

Description	Units	Design Parameters
Insulation		[.....]
No of Twist		[.....]
Inner Sheath		[.....]
Outer Sheath		[.....]
Material of Amour		[.....]
Material of cable drum		[.....]
Type of End Sealing		[.....]

3.2.16

Illumination System

[The illumination system is categorized mainly as Normal, Emergency and DC lighting. The illumination system of indoor area/Building (Other than Boiler area, TG Building, Ash Handling Plant and Coal Handling Plant), Outdoor area and Road lighting of Switchyard and Power Transformer area are covered in this eBOP Package. Lighting Distribution Board (LDB) is getting normal supply from 415V Switchgear. Each LDB is provided with lighting transformer for isolation of lighting circuit from power circuit and also for limiting short time current rating. Outgoing circuits of LDB feeds Lighting panels which is placed local to fixtures. Separate LDB for indoor as well as for outdoor area is provided. Emergency Lighting system is same as normal system however gets supply from Emergency 41V Switchgear backed up with DG set. The Design parameters of Illumination System and its major components comprising of LDB with transformer, Lighting Panel, Lighting Fixtures, Lighting wires and Lighting Poles are furnished below]:

{Note: Lighting system for Boiler area, TG area, AHP, CHP and mechanical BOP are covered in respective package itself. However complete plant illumination and common road/street lighting other than above mentioned package are covered in eBOP Bidder scope of work.}

3.2.17 Cable Carrier System

[The Cable Carrier system is described as below: Indoor Buildings are provided with Cable cellar/Trench and outdoor areas are provided with Pipe cum cable rack/Duct bank/Trench. Separate Tray is provided for HV cables. LV cables, Control cables and Instrumentation cables in the order that HV cables Tray at the top followed by LV, Control and Instrumentation Tray. Ladder type tray is used for MV, LV and Control cables; however Perforated Tray is used for Instrumentation cables. The Design parameters of Cable Carrier System are furnished below]:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[39]	25.09.2014

{Note: The Cable carrier system of Boiler, TG, AHP, CHP and Mechanical BOP are covered in respective package itself. However cable carrier system for equipments and system covered in eBOP package and complete interplant cable carrier system is in eBOP Bidder scope of work.}

3.2.18 Earthing and Lightning System

[The Earthing & Lightning System is described as below: Switchyard, Transformer yard and BTG area are provided with earth mat of [...] mm dia MS Rod conductor buried below 600mm from ground level. System Neutrals are earthed through Treated Earth Pit. All areas of power plant are interconnected to form an integrated single earthing system. Lightning system comprises of shield wire/Lightning Mast protection and down comers and connecting to Lightning rod with test link. The Design parameters of Earthing and Lightning System are furnished below]:

{Note: Above ground earthing by taking risers from earth mat and connecting to equipments and peripheral earthing for building of eBOP battery limit as well as complete plant earthing and Lightning system (Other than Boiler, TG, AHP, CHP and Mechanical BOP). are in the scope of eBOP Contractor. However underground peripheral earthing of other packages is in eBOP Contractor scope of work.}

3.2.20 Energy Management System

{The Energy Management System for the entire plant with remote end packages like AHP, CHP etc is covered in this specification. EMS acquires data from relay as well as meters and from PLC and same is communicated to Data Concentrator through Fiber Optic Communication. The Design parameters of existing EMS shall be indicated in this section.}

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[44]	25.09.2014

3.2.21 Electrical Lab Equipments

{The details of the existing Electrical Lab Equipment shall be furnished in this section.}

3.2.22 Civil Works

Bidder shall go through the details of the existing Buildings / Structures / Foundations / Facilities mentioned hereunder (but not limited to) for thorough understanding of conditions of the same. In order to assess the quantum of Civil / Structural / Architectural R&M work within the package, Bidder shall also carry out a brief or detailed survey (as required) of the site to acknowledge and obtain any other information/data about present conditions at site and identification of modification requirements in any other structure or foundation not included here. Conditional details of important buildings / structures / foundations / facilities which require major modifications have been described below:

{Details of the existing buildings / structures and their foundations in the Electrical Balance of Plant area like substation & switchyard structures, transformer pits, control rooms, ~~GCB foundation structures~~, fire walls, illumination system structures etc. shall be indicated in this section. Also the available GA/Construction Drawing including Load Data shall also be provided.}

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[45]	25.09.2014

4 SCOPE OF SUPPLY & SERVICES

4.1 The scope of supply and services to be provided by the Bidder shall include all such activities as required to meet the target and intent of this specification. The scope for each equipment shall generally cover, but will not be limited to the following:

- i. Replacement of some of the existing components with new components of improved and better design.
- ii. Incorporation of new systems / components wherever required in line with the specification.
- iii. Refurbishing / retrofitting of some of the components in the existing equipment/system.
- iv. All types of civil/structural works like modification and strengthening of foundation of existing and upgraded equipment, making new structures or foundations (if applicable), dismantling, restoration, supply and erection of any temporary supports or any other construction work required for implementation of renovation work.

All structural modifications/strengthening of existing structures or buildings of [substation & switchyard structures, transformer pits, control rooms, GGB supporting structures, fire walls, illumination system structures] etc. including supply, fabrication and erection of any new structure and provision of any additional platform if required for access to new equipment etc.

- v. Design, engineering, submission of design calculations for review and approval, manufacturing, inspection and testing at suppliers' works, packing, forwarding to site, unloading, erection, supervision, pre-commissioning, testing and commissioning and performance testing of the equipment / system and works indicated in this technical specification.
- vi. Mandatory spares, start-up and commissioning spares. The general requirements in respect of various types of spares are given in Clause 9 of this section of Technical Specification.
- vii. Packing, transportation and transit insurance of all materials required for renovation / replacement work as per this specification from the supplier's/sub supplier's works to [Name of the Plant], unloading, preservation and storage at site. Packing, transportation, transit insurance, clearance from all concerned agencies etc. of all components/materials required to be forwarded from [Name of the Plant] to Bidder's facilities and back to [Name of the Plant].
- viii. Dismantling of the systems, reassembly and re-erection / reinstallation along with associated inspection, testing, commissioning and trial run of equipment individually as well integrated with the overall plant trial operation.
- ix. Materials which are removed from the existing machines but are not re-used during the re-assembly of the machines as well as those components which are found to be beyond refurbishment shall be the property of Owner and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[46]	25.09.2014

shall be deposited at Owner's designated stores. Bidder shall prepare a record of all such dismantled material and hand it over to the Owner.

- x. Loading, transportation, unloading and disposal of scrap to scrap yard.
- xi. It shall be responsibility of the Bidder to obtain on behalf of the Owner the necessary approvals of Inspection Authority as may be required for design and design calculations, manufacturing, erection procedure repairing / servicing and renovation as called for. Bidder shall also be responsible for obtaining approval from the other statutory authorities in India, as may be required, for other plants and systems supplied by him. All such documentation submitted to statutory authorities shall also be submitted to the Owner for his review.
Handling of materials at site including handling / transportation as required to take equipment components to the workshop for carrying out the modification work and to bring it back for installation. All arrangement for such activities is to be done by the Bidder.
- xii. Erection of all material supplied new for renovation (including erection of components, replacing old components). Re-erection of any component / equipment removed for modification so as to make complete equipment//system ready for commissioning.
- xiii. Insurance for all items / activities in line with the provisions of General Condition of Contract, Erection condition of Contract, General Technical Condition under Technical Specification.
- xiv. Making arrangement for proper electrical grounding of all systems, supplied by him as required by the system design and as per scope of work as mentioned in this specification.. All required accessories including grounding cables are also included in Bidder's scope.
- xv. Installation, Interconnection laying and termination of all Bidder supplied cables, testing and commissioning of all equipment/systems furnished by the Bidder.
- xvi. Civil / Mechanical work (such as grouting, cutting, welding etc.) related to mounting of New Cabinets, CRT / Keyboards, laying & termination of associated Cables.
- xvii. Supply of all necessary tools, tackles, commissioning spares, test instruments and deputing of experienced personnel for completion of the above erection, testing and commissioning work.
- xviii. Dismantling of existing instrument cabinets along with associated cabling, for eBOP package related to the equipment for retrofitting the new instrument systems, based on requirement.
- xix. Providing all site supervision by qualified and experienced engineering personnel during execution of all works under the scope of Bidder. Also providing all facilities and qualified personnel for implementing the approved quality assurance programme.
- xx. Dismantling of the existing Instrumentation Cables and relaying of new cables as may be required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[47]	25.09.2014

- xxi. Provision of facilities for inspection and witness of shop and site tests by representatives of Owner. The Bidder shall conduct all shop and site tests as per the requirements of this specification and Owner approved "Quality Assurance Program" to be finalized before the award of this Contract.
- xxii. Construction Water
[Construction water shall be made available to Bidder at a single point in a suitable location. The Bidder shall arrange at his own cost the required pumps, distribution pipe line network for further distribution as required to carry out construction work.]
- xxiii. Construction Power
[Construction power shall be made available to bidder at single point at [...] kV level. Further distribution as required to carry out the construction work shall be carried out by Bidder at his own cost. Bidder to indicate the construction power requirement in kVA in his Bid]
- xxiv. Providing all other services necessary for meeting the intent and requirement of this specification. This shall include but not limited to system engineering, furnishing drawings, data, information for owner's review, participation in meeting & reviews, system warranty.

4.2 Tools & Tackles

One (1) set of special tools and tackles required for the maintenance of equipment/systems have to be supplied by the Bidder. These tools and tackles shall be separately packed and brought to site. These shall not be used for erection/commissioning purposes and shall be in an unused and new condition, when they are handed over to the Owner. A list of all such special tools and tackles shall be submitted along with the offer.

For C&I system, Bidder shall supply one set for each unit of special non standard tools, module testing kit, cables, and any other equipment required for erection commissioning, testing, trouble shooting, calibration, maintenance and inspection of all systems / equipment provided. Any tools required to make changes (DIP shunt cutter, soldering irons, tips, wire wrap guns and bit unwrapping tools, strippers, terminal guard, connector repair tool, dies etc.) shall also be supplied.

Bidder's scope shall also include supply of all scaffolding, special tools and tackles, jigs and fixtures as may be required during modification / erection and commissioning. Those items specifically brought to site solely for erection / modification purpose and if no more needed for regular maintenance of the equipment, can however, be taken back by the Bidder after completion of the work at site.

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[48]	25.09.2014

4.3 Safety

The design of the equipment shall incorporate every reasonable precaution and provision for the safety of all personnel and for the safety and security of all persons and property. The design shall comply with all appropriate statutory regulations relating to safety.

Newly constructed structures and equipment shall be designed and constructed to withstand every foreseeable static and dynamic loading condition, including loading under earthquake conditions, with an adequate margin of safety.

Ready and safe access with clear head room shall be provided to all the newly supplied parts of the plant for operation, inspection, cleaning and maintenance.

While carrying out the R&M work as per this specification, the Bidder may have to modify the existing equipment foundations, or do the excavation work and make new foundations. The Bidder may also have to make new supporting arrangements with / without modified loads for the items/ equipment supplied by him. Under all such conditions Bidder shall be solely responsible for ensuring the safety of the adjacent equipment / foundations and of the existing supporting structures. The R&M work by the Bidder shall be carried out in such a manner that no damage is caused to existing equipment / foundations / structure and all precautions, including strengthening of existing structures, as may be necessary, shall be taken by the Bidder to ensure safety of existing plant / equipment / foundation / structures.

4.4 Training Requirements

Bidder shall include in his offer the training programme for Owner's Operation & Maintenance staff in view of introduction of new systems/ equipment. This training shall be organized before handing over the unit.

4.5 In case there is any difference in scope of work and services as described in this section of the specifications and individual specification volumes, then more stringent of the Scope of work and services shall prevail.

4.6 Detail Scope of Work:

{Describe in this chapter, all the equipment/components which need to be replaced/refurbished/retrofitted as finalized in the DPR on the basis of RLA/CA and EA report. Scope with regard to Electrical, Civil, structural and architectural work as required for the Power Plant due to incorporation of new Electrical equipment/components shall also be incorporated in this chapter.}

4.6.2 Miscellaneous

- a. In addition to the above listed works, scope of civil / structural / architectural works and supplies shall be as detailed below.

Bidder shall carry out a brief or detailed survey (as required) of the site to acknowledge and obtain any other information/data about present conditions of the buildings, structures, foundations & facilities mentioned in this

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[70]	25.09.2014

specification and identification of modification requirements in any other structure or foundation not included here.

Subsequently Bidder shall prepare and submit for approval by Owner, a detailed scheme including methods techniques, requirements etc. for carrying out civil/structural/architectural R&M works to executed in the plant.

Bidder shall be provided with the following drawings and documents by the Owner to facilitate the civil / structural / architectural repair, refurbishment and replacement works.

- 1) [Geotechnical Investigation Report of the site]
- 2) [Construction/As built drawings of the existing structures & foundations in the package, if available]
- 3) [Design documents of the existing structures in the package, if available]
- 4) [Road, drains, trench layouts etc.]

Bidder to refer Annexure-I of Section-I for exhaustive list of as Build/RFC drawing.

b. The scope of Civil / Structural / Architectural works to be carried out by the Bidder under this package shall generally cover the following:

- Inspection and checking the design adequacy of the foundations of existing structure like [substation & switchyard structures, transformers, control rooms, fire walls, illumination system structures etc.] for all the applicable loads and construction of new foundations / modification of existing, wherever required.
- Inspection and checking the design adequacy of existing structures [substation & switchyard structures, transformer pits, control rooms, fire walls, illumination system structures etc.] for any corrosion/damage and rectification / strengthening of the same.
- Carrying out all interior / exterior architectural repair and replacement works [such as flooring, painting, plastering, door/windows, roof finishing, water proofing, sheet cladding, roof sheeting, new false ceiling, glass partitions, lighting works replacement or modification of AC duct where ever applicable] is also included in contractors scope. etc.
- Any other civil related work required in buildings / structures of the package from aesthetics ambience & ease of operation point of view.

In addition to this any other modification/alteration to existing nearby foundation/structural steel/concrete/underground pipes work if required for satisfactory execution of intended work covered under this specification shall be carried out by the Bidder. Supply of all material required for the above work is included in Bidder's scope

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[71]	25.09.2014

c. Supplies for Civil/Structural Work

The Bidder shall supply all material needed for completion of all civil, structural and architectural **works** as per this specification. The Bidder's scope of supply generally includes but is not limited to the following:

- Supply of cement, steel (for reinforcement as well as for any other use), grout, admixture for RCC work, sand and all other construction/ architectural / building materials as may be required for any repair/modification of existing civil works / foundation or for construction of new foundation / civil works.
- Supply of structural steel for all structural erection / modification / strengthening.
- Supply of all foundation bolts, and nuts base plates, embedments with lugs, miscellaneous steel where ever needed
- *[Supply of steel helical springs and viscous dampers for new equipment (if any)].*

d. Construction Enabling Works

[The owner shall provide the following facilities to the by Bidder to carry out the construction work.

- *Temporary Stores to store construction material.*
- *Fabrication Yard]*

e. Quality Control Laboratory

[To conduct acceptance test on all construction material, weldments, concrete cubes etc laboratory facilities if available in the existing unit shall be used. In case the laboratory facility is not available within the unit, Bidder shall get the testing at his own cost from a reputed test laboratory approved by the Owner.]

- f. Construction Tools & Materials Supplied By the Bidder.** The Bidder shall arrange adequate number and type of machinery and equipment for proper setting out and timely completion of the various works covered under the scope of the work. All arrangements for transporting the equipment to and from the site shall be done by the Bidder at his own expense.

The Bidder shall provide all fuels and lubricants required for the operation and maintenance of construction machinery and equipment as well as his transport vehicles at his own cost.

- g.** The Bidder shall furnish manufacturer's test certificate for all the manufactured items supplied by him. Representative specimens of the material shall also be submitted to the Owner and shall be tested at a recognised testing laboratory at the Bidder's cost in case Owner so desire.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[72]	25.09.2014

h. Work Execution and Supervision:

The Bidder shall have at the site accredited and qualified engineers and foremen / supervisors with adequate number of years of experience in execution of similar works and also operators of machinery and equipment, for satisfactory progress and timely completion of the works.

i. The Bidder shall be fully responsible for the correctness and accuracy of the tests performed, results obtained / tabulated, interpretation of test results and recommendations made. The work shall be executed in a professional manner with full understanding of the importance of work for a R&M project of this magnitude.

j. In the event of occurrence of any accidents at / near the site of the work or in connection with execution of the work, a report shall be made immediately to the Owner, giving full details of the accident. He shall also report such accidents to all the competent authorities wherever such reports are required by those authorities.

k. Owner reserves the right to order in writing, from time to time, during the progress of the work, removal and re-execution of any work which in the opinion of the Owner is not in accordance with the specification / bid document.

l. During inclement weather, rains etc., the Bidder shall suspend all works for such time as the Owner may direct and shall protect from damage all works already in progress or completed just then. All such temporary protective measures shall be at the Bidder's cost and any damage to works shall be made good by the Bidder at his own expense.

m. **Safety of Adjacent Plant/Equipment and Civil Structure**

While carrying out the R&M work as per this specification, the Bidder may have to modify the existing equipment foundations, or do the excavation work and make new foundations. The Bidder may also have to make new supporting arrangements with / without modified loads for the items / equipments supplied by him. Under all such conditions Bidder shall be solely responsible for ensuring the safety of the adjacent equipments / foundations and of the existing supporting structures. The R&M work by the Bidder shall be carried out in such a manner that no damage is caused to existing equipments / foundations / structures and all precautions, including strengthening of existing structures, as may be necessary, shall be taken by the Bidder to ensure safety of existing plant / equipment / foundation / structures.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[73]	25.09.2014

4.6.3 Spares

All spares as specified in Annexure -II of this section of the specification in accordance with Clause 9 of Part-B of this Technical Specification.

4.6.4 Consumable, Oil & Lubricants

All the first fill and consumables such as greases, oil, lubricants, servo fluids/control fluids, gases and essential chemicals etc. required up to commercial operation of the equipment are covered in the scope of Bidder. Suitable standard lubricants as available in India are preferable. Efforts should be made to limit the variety of lubricants to minimum.

4.6.5 Embedded Parts & Fixture

All fixtures, embedded parts, steel embedment including fixing lugs and welding between them, foundation plates, grouting, nuts, bolts etc. for fixing all the equipment, piping on civil works shall be included in scope work of this package. All structures which would be required by the bidder for supporting the piping shall also be included in scope of work of this package.

4.6.1 Other Services

The scope of Erection, Commissioning and Testing shall include the following:

- a) Complete pre-commissioning work.
- b) Supply of all consumables.
- c) Supply of all temporary equipment for successful conductance of pre-commissioning and commissioning activities. All temporary equipment and instruments shall be clearly listed out in the Bid.
- d) Providing safety barricades and signage during dismantling, erection and testing etc.
- e) Supply of all labour, skilled/semi skilled supervisors, engineers and any other manpower.
- f) All the erection materials and consumables like shims, welding rods, soldering and brazing alloys, industrial gases insulating tapes, compounds, chemicals etc. required for the erection and commissioning works.

Note: The temporary equipment specifically brought by the Bidder solely for the pre-commissioning and commissioning work shall, on completion of these activities, remain the property of the Bidder.

The selection of material of all the temporary equipment/instruments shall be compatible with the service conditions expected during pre-commissioning/ commissioning activities.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[74]	25.09.2014

5 TERMINAL POINTS & EXCLUSIONS

5.1 Terminal Points

Between equipments which are covered under eBOP package, supply and termination at both ends are in the scope of eBOP contractor. Between equipment supplied by eBOP contractor and others, scope of work is defined as below, However for control cables, supply and termination at both ends is covered in this package.

- **Substation:**

- a) Termination at the switchyard line take off gantry for [220/400] kV lines with line side insulators. Line will be provided by others, but all line equipment such as CTs, EMVTs, CVTs, and PLCC equipment, LAs, clamps & connectors for droppers to equipment connections are included in eBOP contractor scope of work.
- b) HV terminal of Switchyard LV Transformer for termination and supply are in the scope of eBOP contractor.
- c) Emergency ACDB incomer for Supply and Termination of incoming cables.
- d) Control cable and Termination at switchyard equipments/panels to other equipments supplied by others.

- **Generator Transformer:** LV terminals for connection with IPBD. IPBD with adaptor boxes and termination at LV side of GT are in the scope of TG package Contractor.

- **Unit Transformer:** HV terminals for connection with IPBD and LV terminals for connection with 6.6kV SPBD. IPBD tap-offs and SPBD with adaptor boxes and termination are in the scope of TG package Contractor.

- **Station Transformer:** LV terminals / Cable termination box for connection with 6.6 kV SPBD / 6.6kV cable. SPBD with adaptor boxes / 6.6kV cable and termination are in the scope of TG package.

- **6.6 KV Power Supply for Switchyard Auxiliary Service Transformer:** At the terminal of 6.6 kV Station switchgear of TG package. All Power and control cables from the terminals of 6.6 kV Station Switchgears and termination are included in the scope of eBOP package.

- **6.6kV Power Supply for Mechanical BOP Package:** At the terminal of 6.6 kV Station/Unit switchgear of TG package. All Power and control cables from the terminals of 6.6kV Station/Unit Switchgears are included in the scope of Mechanical BOP package

- **415 V Emergency Power Supply for Switchyard:** Power supply at 415V level at the outgoing terminals of 415 V Unit Emergency Switchboard of TG package. All cables from the terminal point are included in the scope of eBOP package.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[75]	25.09.2014

- **415 V Power Supply for Power Transformers:** Power supply at 415V level at the outgoing terminals of 415 V Unit/Station Switchboard of TG package. All cables from the terminal point are included in the scope of eBOP package.
- **UPS Power Supply:** At the outgoing terminals of Unit UPS ACDB. Power Cables interconnection between Unit UPS ACDB to the UPSDBs of Switchyard & Power Transformers and termination is included in scope of eBOP Package.
- **Grounding & Lightning:** Complete plant underground grid is in eBOP package scope of work. Under Ground earthing grid & interconnections of BOP package and grounding connection to all equipment / structures are included in scope of BOP package.
- **Cable Carrier system:** Complete plants inter cable carrier system which inter connects other package of Boiler, TG, AHP, CHP, Mechanical BOP are in the scope of eBOP Bidder.

Note:

- a) Only relay contacts (1 NO/1 NC) shall be provided by the other package contractor. The required auxiliary relays, control cables including their laying & termination shall be in the scope of eBOP Bidder. Similarly, necessary contact (1 NO/1 NC) required by other package Contractors shall be provided by eBOP Bidder.
- b) Wherever Power is tapped from Purchaser's board, Bidder's scope starts from the outgoing terminals of the respective board. Bidder has to include all necessary termination materials, cables, trays, conduits, supporting structure, terminations, and necessary earthing accessories in his scope.

5.2

Exclusions

Following equipment / systems are excluded from the scope of BOP package.

- a) Generator Bus duct (IPBD) with adopter boxes
- b) 6.6kV Unit and Station switchgears
- c) DG set & associated system
- d) SPBD / Cable for connecting UT& ST to the 6.6kV boards.
- e) Fire Detection and alarm system
- f) Fire protection System.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[76]	25.09.2014

6 GENERAL TECHNICAL REQUIREMENTS

6.1 Codes & Standards

Apart from some specific application, the proposed R&M equipment shall comply with the appropriate Indian Standard / DIN or equivalent international Standard. Specification as listed below in this section and mentioned in detailed specifications, each incorporating the latest revisions at the time of tendering.

Wherever specified or required the Plant & Equipment shall conform to various statutory regulations such as Indian Electricity Rules/Act, Factories Act, etc.

In the event of any conflict between the codes and standards referred above, and the requirements of this specification, the requirements, which are more stringent, shall govern.

In case of any change of code, standards and regulations between the date of purchase order and the date, the Bidder proceeds with manufacturing, the Owner shall have the option to incorporate the changed requirements.

6.2 Name Plates

Instruction plates, nameplates or labels shall be permanently attached to each main and auxiliary item of equipment in a conspicuous position. These plates shall be engraved with the identifying name, type and manufacturers serial number, together with the loading conditions under which the item of plant has been designed to operate.

All trade nameplates and labels shall be in English language. All measurements shall be in M.K.S Units.

The size and location of nameplates shall be subject to Approval of the Engineer.

6.3 Operation, Maintenance & Availability

Equipment/works offered shall be designed for high availability, high reliability, low maintenance and ease of operation & maintenance. The Bidder shall specifically state the design features incorporated to achieve high degree of reliability, availability, operability and ease of maintenance. He shall also furnish details of availability records in plants stated in his Experience list.

6.4 Materials

In selecting materials of construction of equipment, the Bidder shall pay particular attention to the atmospheric conditions existing at the Site and the nature of material/fluid handled. Wherever deviations are taken in respect of materials specified, the reasons shall be spelt out clearly in the proposal.

All materials shall be new, and shall be of the quality most suited to the proposed application.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[77]	25.09.2014

As far possible; materials shall be in accordance with Indian or international standard specifications and shall be used in accordance with Indian or international codes of practice. Where such standards or codes of practice are not available, sufficient information shall be provided to allow the Engineer to assess the suitability of the material for the particular application.

All materials used shall have performed lengthy satisfactory service in similar or more arduous conditions to those proposed by the Bidder.

All parts which could deteriorate or corrode under the influence of the atmospheric, meteorological or soil conditions at the Site, or under the influence of the working conditions shall be suitably and effectively protected so that such deterioration or corrosion is a minimum over the life of the plant.

6.5 Plant Life and Mode of Operation

On completion of the R&M project, the plant/equipment and systems individually and collectively shall be possible to operate continuously with routine maintenance and overhauls for an economic service life of not less than fifteen [20/25 years] under the prevailing site conditions and for the type of duty intended.

After R&M of respective equipment/System, the equipment/System shall be able to operate to its rated capacity continuously and there shall be no restriction of the operation of the equipment.

6.6 Packaging & Marking

All the equipment shall be suitably protected, coated, covered or boxed and crated to prevent damage or deterioration during transit, handling and storage at site till the time of erection.

While packing all the materials, the limitations from the point of view of availability of railway wagon sizes in India should be taken account of. The details of various wagons normally available with Indian Railways for transportation of heavy equipment shall be considered by the Bidder. The Bidder shall be responsible for all loss or damage during transportation, handling and storage due to improper packing.

The identification marking indicating the name and address of the consignee shall be clearly marked in indelible ink on two opposite sides and top of each of the packages. In addition the Bidder shall include in the marking gross and net weight, outer dimension and cubic measurement. Each package shall be accompanied by a packing note (in weather proof paper) quoting specifically the name of the Bidder, the number and date of contract and names of the office placing the contract, nomenclature of contents and Bill of Material.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[78]	25.09.2014

6.7 Protection

Equipment having antifriction or sleeve bearings shall be protected by weather-tight enclosures. Coated surfaces shall be protected against impact, abrasion, discoloration and other damages. Surfaces that are damaged shall be repainted.

Electrical and C&I equipment shall be protected against moisture and water damages. All external gasket surfaces and flange faces, couplings, rotating equipment shafts, bearings and like items shall be thoroughly cleaned and coated with rust preventive compound as specified above and protected with suitable wood, metal or other substantial type covering to ensure their full protection. All exposed threaded parts shall be greased and protected with metallic or other substantial type protectors.

All piping, tubing and conduit connections on equipment and other equipment openings shall be closed with rough usage covers or plugs. Male threaded openings shall be closed with rough usage covers or plugs. Female threaded openings shall be closed with forged steel plugs. The closures shall be taped to seal the interior of the equipment. Open ends of piping, tubing and conduit shall be sealed and taped.

Returnable containers and special shipping devices shall be returned by the manufacturer's field representative at the Bidder's expense.

6.8 Painting

General

All exposed metallic surfaces subject to corrosion shall be protected by shop application of suitable coatings. Surfaces not easily accessible after shop assembly shall be treated before-hand and protected for life of the equipment. Surfaces to be finish painted after installation shall be shop painted with at least two (2) coats of primer. Steel surfaces, which are not to be painted, shall be coated with suitable rust preventive compound subject to the approval of the Owner.

All paints shall be used in accordance with the manufacturer's instructions. No thinners or other substance shall be added to the coating material without the approval of the Owner/Owner's Engineer. The quality and vendor of the paints shall require approval of the Owner.

All paints, when applied in a normal full coat, shall be free from runs, sags, wrinkles, patchiness, brush marks or other defects.

All primers shall be well marked into the surface, particularly in areas where pitting is evident, and the first priming coat shall be applied as soon as possible after cleaning, within four hours maximum. If the drying interval between successive coats, which should not exceed one week, has been so long as to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[79]	25.09.2014

endanger the adhesion of the following coat, the paint already applied shall be lightly rubbed down with fine abrasive paper before putting on the next coat.

Paint spraying on large surfaces shall not normally be done indoors, except with the approval of the Owner/Owner's Engineer. Spray guns shall not be used outdoors in windy weather or near unprotected surfaces of a contrasting colour and under no circumstances shall spray guns be used where spray may be carried into or onto exposed electrical equipment.

Paint containers shall not be opened until required and the paint shall be mechanically mixed thoroughly before use, and agitated occasionally during use.

Electrical equipment shall be shop finished with one or more coats of primer and two coats of high-grade oil resistant enamel. The interior of all panels' cabinets and enclosures shall be finished with gloss white enamel.

The Bidder shall furnish sufficient touch up paint for one complete finish coat on all exterior factory surfaces of each item of equipment. The touch up paint shall be of the same type and colour as the factory applied paint and shall be carefully packed to avoid damage during shipment. Complete painting instructions shall be furnished.

Shop primer for steel and iron surfaces which will have a continuous operating temperature below [35 °C] shall be selected by the Bidder, in accordance to the relevant standard. Special high temperature primer shall be used on surface exposed to operating temperature above [35 °C].

The colour scheme shall be submitted during execution of contract for approval by the Owner/Owner's Engineer.

Preparation

Oil and grease shall be removed from the surface by washing with a suitable detergent, rinsing with clean water, and drying.

Surfaces to be shot blasted shall be cleaned, and all dust remaining after cleaning shall be removed.

The priming coat shall be applied without delay.

Damaged Paintwork

Any damaged paintwork shall be corrected / modified as follows:

- a) The damaged area, together with an area extending 25mm around its boundary, shall be cleaned down to bare metal.
- b) A priming coat shall be immediately applied, followed by a full paint finish equal to that originally applied and extending 50mm around the perimeter of the original damage.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[80]	25.09.2014

- c) The repainted surface shall present a smooth surface. This shall be obtained by carefully chamfering the paint edges before and after priming.

Painting Systems

The requirements for the dry film thickness (DFT) of paint and the materials to be used shall be as stated below, unless otherwise specified elsewhere in this specification.

Surfaces Subject to Weathering

All surfaces shall have a minimum of four coats of paint made up as follows:

Primer coat	:	35 micron DFT
Tie coat	:	35 micron DFT
Finishing coat (2 Nos.)	:	35 micron DFT per coat

The total minimum DFT shall be 140 micron.

Surfaces Inside Buildings

All surfaces shall have a minimum of three coats of paint made up as follows:

Primer coat	:	35 micron DFT
Tie coat	:	35 micron DFT
Finishing coat (2 Nos.)	:	25 micron DFT per coat

The total minimum DFT shall be 120 micron.

The type and colour of primer & finish coat shall be selected by the Bidder after approval by the Owner.

6.9 Environment Protection

Environment Protection

The plant & equipment under this R&M project shall be designed for installation and operation in harmony with the surrounding environment and all measures of pollution control shall be ensured by the Bidder to restrict pollution from the liquid effluent within the limits as given below with due consideration of Environment (Protection) Rules.

For Liquid Effluent

During construction activities, Bidder shall maintain the statutory compliance of State Pollution Control Board and MoEF in respect of pollution control and environmental protection within and around plant boundary. Any specific requirement of State Pollution Authorities over and above shall be maintained. In absence of Indian Standard for emission from power plants as on date, for certain gaseous effluents, the internationally accepted World Bank Standard is to be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[81]	25.09.2014

Noise Level Requirement

The plant & equipment under this R&M project will be designed, constructed and provided with suitable acoustic measures to ensure the noise level criteria as per the following stipulations of MoEF & State Pollution Control Board.

Maximum noise level shall not exceed 85 dB (A) when measured at 1.0 m away from the noise emission source.

Maximum noise level from its source within the premises shall not exceed 70 dB (A) as per Environment (Protection) Rules 1986, Schedule-III, 'Ambient Air Quality Standards' in respect of noise.

Any statutory changes in stipulations regarding noise limitation that may occur in future according to State Pollution Control Board or Central pollution Control Board or Ministry of Environment & Forest regulation during tenure of the contract, the bidder shall comply with the updated/amended requirement.

6.10

Inspection and Testing

Inspection and Tests during Manufacture

The method and techniques to be used by the Bidder for the control of quality during manufacture of all plant and equipment shall be agreed with the Owner prior to the Award of Contract.

The Owner's general requirements on quality control as mentioned in section II of this volume and shop tests as mentioned in the respective volumes of this tender documents.

Owner shall be informed for witnessing the shop tests of any item of the plant or equipment for checking the compliance with the specification requirement and or related standards prior to leave place of manufacturing.

Advance notice shall be given to the Owner as agreed in the Contract, prior to the stage of manufacture being reached, and the piece of equipment must be held at this stage until the Owner has inspected the piece, or has advised in writing that inspection is waived. If having consulted the Owner and given reasonable notice in writing of the date on which the piece of equipment will be available for inspection, the Owner does not attend, the Bidder may proceed with manufacture having forwarded to the Owner duly certified copies of his own inspection and test results.

The Bidder shall forthwith forward to the engineer duly certified copies of the Test Certificates in [six copies] (one to the Owner and five to the O&M Consulting Engineer) for approval. Further [nine (9)] copies of Shop Test Certificates shall be bound with Instruction Manuals.

All the individual and assembled rotating parts shall be statically and dynamically balanced in the works.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[82]	25.09.2014

Where accurate alignment is necessary for component parts of machinery normally Assembled on site, the Bidder shall allow for trial assembly prior to dispatch from place of manufacture.

All materials used for the manufacture of equipment covered under this specification shall be of tested quality. Relevant test certificates shall be made available to the Owner. The certificates shall include tests for Electrical and mechanical properties of representative material.

Performance Tests at Site

The full requirements for testing the system shall be agreed between the Owner and the Bidder prior to Award of Contract. The completely erected System shall be tested by the Bidder on site under normal operating conditions. The Bidder shall also ensure the correct performance of the System under abnormal conditions, i.e. the correct working of the various emergency and safety devices, interlocks, etc.

The Bidder shall provide complete details of his normal procedures for testing, for the quality of erection and for the performance of the erected equipment.

The Bidder shall furnish the quality procedures to be adopted for assuring quality from the receipt of material at site, during storage, erection, pre-commissioning to tests on completion and commissioning of the complete system/equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[83]	25.09.2014

7 LAYOUT CONSIDERATION

{Effort should be given to keep the Layout of the newly equipped system / packages under the R&M project unchanged to the extent possible with respect to existing layout to avoid disturbance to the existing equipment & facilities for which any modification/changes are not envisaged based on RLA/LA and EA assessment.}

The Existing layout details of the plant are indicated in the enclosed drawings as Annexure-I. However, the Bidder to suggest his own modified layout arrangement which shall be subject to approval of the purchaser.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[84]	25.09.2014

8 PERFORMANCE GUARANTEES

The term "Performance Guarantees" wherever appears in this Section shall have the same meaning and shall be synonymous to "Functional Guarantees".

Similarly the term "Performance Tests" wherever appears in this Section shall have the same meaning and shall be synonymous to "Guarantee Test(s)".

8.1 General Requirements

- 8.1.1 The Bidder shall guarantee that the equipment offered shall meet the ratings and performance requirements stipulated for various equipment covered in this technical Specification.
- 8.1.2 The guaranteed performance parameters furnished by the Bidder in the Bid proposal, shall be without any tolerance values and all margins required for instrument inaccuracies and other uncertainties shall be deemed to have been included in the guaranteed figures.
- 8.1.3 The Bidder shall demonstrate all the guarantees covered herein under Category I & III during functional guarantee / acceptance test. The various tests which are to be carried out during performance guarantee/acceptance test are listed elsewhere in this specification. The guarantee tests shall be conducted by the Bidder at [manufacturer's work/site] as per approved FAT in presence of Owner on the equipment.
- 8.1.4 All costs associated with the tests including the cost associated with the supply, calibration, installation and removal of test instrumentation shall be included in the price offered by Bidder.
- 8.1.5 It shall be the responsibility of the Bidder to make the plant ready for the performance guarantee tests.
- 8.1.6 All instruments required for performance testing shall be of the type and accuracy required by the code and prior to the test, the Bidder shall get these instruments calibrated in an independent test institute approved by the Owner. All test instrumentation required for performance tests shall be supplied by the Bidder and shall be retained by him upon satisfactory completion of all such tests at site. All calibration procedures and standards shall be subjected to the approval of the Owner.
- 8.1.7 Tools and tackles, instruments/devices etc. and any special equipment, required for the successful completion of the tests, shall be provided by the Bidder free of cost.
- 8.1.8 The Performance/ Acceptance test shall be carried out as per the agreed procedure. The PG test procedure including demonstration tests shall be submitted within [90 days] of the date of Notification of Award and finalization of the PG test procedure shall be done within [180 days] from the date of Notification of Award. After the conductance of Performance test, the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[85]	25.09.2014

Bidder shall submit the test evaluation report of Performance test results to Owner promptly but not later than one month from the date of conductance of Performance test. However, preliminary test reports shall be submitted to the Owner after completing each test run.

8.1.9 The PG test procedures shall be submitted for equipment/ system & subsystem under Bidder's scope for all Guarantees under Category I and III as mentioned below, as per latest International codes & standard including correction curves, meeting the Specification requirements along with sample calculations & detailed activity plan of preparation (including test instrumentation), conductance and evaluation of Guarantees.

8.1.10 The Bidder shall submit for Owner's approval the detailed Performance Test procedure containing the following:

- Objective of the test.
- Various guaranteed parameters & tests as per Contract.
- Method of conductance of test and test code.
- Duration of test, frequency of readings & number of test runs.
- Method of calculation.
- Correction curves.
- Instrument list consisting of range, accuracy, least count, and location of instruments.
- Scheme showing measurement points.
- Sample calculation.
- Acceptance criteria.
- Any other information required for conducting the test.

8.1.11 In case, during performance guarantee tests, it is found that the equipment/systems has failed to meet the guarantees, the Bidder shall carry out all necessary modifications and/or replacements to make the equipment/system comply with the guaranteed requirements at no extra cost to the Owner. However, if the Bidder is not able to demonstrate the guarantees, even after the above modifications/replacements within [ninety (90) days] or a reasonable period allowed by the Owner after the initial performance guarantee tests have been completed, the Owner will have the right to impose the stipulated clauses under Guarantee Category I, III as specified in this Specification:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[86]	25.09.2014

8.1.12 For Category-I Guarantees

Reject the equipment/system/plant and recover from the Contractor payments already made

(OR)

Accept the equipment/system/plant after levying Liquidated Damages (LD) as specified in Clause No. 5.6 of Volume I of this specification. The LD's shall be prorated for the fractional parts of the deficiencies.

8.1.13 For Category-II Guarantees

Reject the equipment/plant/system and recover, from the Contractor, the payments already made. Conformance to the performance requirements under Category-II is mandatory.

8.1.14 For Category-III Guarantees

Reject the equipment/system/plant & recover, from the Contractor, the payments already made.

(OR)

Accept the equipment/system after assessing the deficiency in respect of the various ratings, performance parameters and capabilities and recover from the contract price an amount equivalent to the damages as determined by the Owner. Such damages shall however be limited to the cost of replacement of the equipment/systems replacement of which shall remove the deficiency so as to achieve the guaranteed performance.

8.2 Performance Guarantees under Category-I

The performance guarantees which will attract liquidated damages shall be as follows:

- (i). **Transformer losses:** Losses covered in Power Transformers. Loss per kW of GT, ST and UT shall be as follows;

A. Guaranteed Copper Losses

B. Guaranteed Iron Losses

8.2.1 Limit of Technical Parameters under Liquidated Damages Applicable For Category-I Guarantees:

Table: 8.1

S.No.	Parameter	Performance Limit
1	Transformer losses at rated load	If Exceeds beyond [0.5%] of guaranteed value [(i.e. + 0.5 %)]
2	Auxiliary Power	Increase beyond [1%] of guaranteed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[87]	25.09.2014

value.(ie. + [1.0 %])

8.2.2 Auxiliary Power Consumption

The auxiliary power consumption shall be calculated using the following relationship.

$$P_{au} = \sum P_u$$

P_{au} = Guaranteed Auxiliary Power Consumption.

P_u = Power consumed by each of the auxiliaries of eBOP package Equipment/System.

While guaranteeing the auxiliary power consumption the bidder shall necessarily include all continuously operating auxiliaries of equipments.

[The auxiliaries to be considered shall include but not be limited to the following:

- i) Generator Transformer Auxiliary power consumption for fans and pumps.*
- ii) Station Transformer Auxiliary power consumption for fans and pumps.*
- iii) Unit Transformer Auxiliary power consumption for fans and pumps.*
- iv) Generator Circuit Breaker Auxiliary power consumption (if applicable).*
- v) Switchyard Auxiliary Power Consumption*
- vi) Power consumption of any other Equipment/system]*

Note:

1. The Bidder shall furnish a list of equipment/system to be covered under auxiliary power consumption, which shall be subject to Owner's approval.

8.3 Performance Guarantees under Category-II

Not Applicable.

8.4 Performance Guarantees under Category-III

The parameters/capabilities to be demonstrated for various systems/equipment shall include but not be limited to the following:

8.4.1 Temperature rise at rated load

The temperature rise of Oil and Windings under rated conditions shall be within limits as prescribed in the Tender Specification when measured under specified ambient temperature. In the event, the rated load is not available;

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[88]	25.09.2014

the temperature rise may be determined by calculation/extrapolation from measured values at any other load as per standards.

8.4.2 Noise

All the equipment and systems covered under this Specification shall perform continuously without exceeding the noise level over the entire range of output and operating frequency specified.

Noise level measurement shall be carried out using applicable and internationally acceptable standards. The measurement shall be carried out with a calibrated integrating sound level meter meeting the requirement of IEC 60651 or BS 5969 or IS 9779.

Equivalent "A" weighted Sound pressure shall be measured all around the equipment at a distance of 1.0 m from the Noise emitting source.

A minimum of 6 points around each equipment shall be covered for measurement. Additional measurement points shall be considered based on the applicable standards and the size of the equipment. The measurement shall be done with slow response on the A - weighting scale. The average of A-weighted sound pressure level measurements expressed in decibels to a reference of 0.0002 micro bar shall not exceed the guaranteed value. Corrections for background noise shall be considered in line with the applicable standards. All the necessary data for determining these corrections, in line with the applicable standards, shall be collected during the tests.

If the noise level recorded is beyond the limits specified above, the Bidder should provide suitable acoustic cladding to mitigate the noise level to within allowable limits.

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[89]	25.09.2014

9 SPARE PARTS

The bidder shall include in his scope of supply all the necessary mandatory spares, start up and commissioning spares and recommended spares and indicate these in the relevant schedules. The general requirements pertaining to the supply of these spares is given below:

9.1 Mandatory Spares

The list of mandatory spares considered essential by the purchaser is enclosed in Annexure -II of this specification. The bidder shall indicate the prices for each and every item (except for items not applicable to the bidders design) in the 'Schedule of mandatory spares' whether or not he considers it necessary for the Owner to have such spares. If the bidder fails to comply with the above, the cost of such spares shall be deemed to be included in the contract price. The bidder shall furnish the population per unit of each item in the relevant Schedules. Whenever the quantity is mentioned in "sets" the bidder has to give the item details and prices of each item.

Whenever the quantity is indicated as a percentage, it shall mean percentage of total population of that item in the station (project) unless specified otherwise, and the fraction will be rounded off to the next higher whole number. Wherever the requirement has been specified a 'set' it will include the total requirement of the item for a unit, module or the station or as specified. Where it is not specified a 'set' would mean the requirement for the single equipment/system as the case may be. Also the 'set' would include all components required to replace the item; for example, a set of bearings shall include all hardware normally required while replacing the bearings.

The Owner reserves the right to buy any or all the mandatory spare parts.

All mandatory spares shall be delivered at site at least two months before scheduled date of initial operation of the first unit. However, spares shall not be dispatched before dispatch of corresponding main equipment.

Wherever quantity is specified both as a percentage and a value, the bidder has to supply the higher quantity until and unless specified otherwise.

9.2 Recommended Spares

In addition to the spare parts mentioned above, the Bidder shall also provide a list of recommended spares for five [5] years of normal operation of the plant and indicate the list and total prices in relevant schedule. The list shall take into consideration the mandatory spares specified and should be independent of the list of the mandatory spares. The purchaser reserves the right to buy any or all of the recommended spares. The recommended spares shall be delivered at project site at least two months before the scheduled

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[90]	25.09.2014

date of initial operation of first unit. However, the spares shall not be dispatched before the dispatch of the main equipment.

Prices of recommended spares will not be used for evaluation of the bids. The price of these spares will remain valid up to execution of the contract. However, the Bidder shall be liable to provide necessary justification for the quoted prices for these spares as desired by the Owner.

9.3 Start-up & Commissioning Spares

Start up and commissioning spares are those spares which may be required during the start-up and commissioning of the equipment/system till the commercial operation of the Plant. The Bidder shall provide all such start up and commissioning spares and keep an adequate stock of the same to be brought by him to the site for the plant erection and commissioning. These must be available at site before the equipment is energized. The unused spares, if any, should be removed from there, only after commercial operation of the plant. All start up spares which remain unused at the time shall remain the property of the Bidder.

9.4 General Requirements

The Bidder shall indicate the service expectancy period for the spares parts (both mandatory and recommended) under normal operating conditions before replacement is necessary.

All spares supplied under this contract shall be strictly inter-changeable with the parts for which they are intended for replacements. The spares shall be treated and packed for long storage under the climatic conditions prevailing at the site e.g. small items shall be packed in sealed transparent plastic with desiccators packs as necessary.

All the spares (both recommended and mandatory) shall be manufactured along with the main equipment components as a continuous operation as per same specification and quality plan.

The Bidder will provide Owner with cross-sectional drawings, catalogues, assembly drawings and other relevant documents so as to enable the Owner to identify and finalize order for recommended spares.

Each spare part shall be clearly marked or labeled on the outside of the packing with its description. When more than one spare part is packed in a single case, a general description of the content shall be shown on the outside of such case and a detailed list enclosed. All cases, containers and other packages must be suitably marked and numbered for the purposes of identification.

All cases, containers or other packages are to be opened for such examination as may be considered necessary by the purchaser.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-I	[91]	25.09.2014

The Bidder will provide the Owner with all the addresses and particulars of his sub-suppliers while placing the order on vendors for items/ components/ equipment covered under Contract and will further ensure with his vendors that the Owner, if so desires, will have the right to place order for spares directly on them on mutually agreed terms based on offers of such vendors.

The Bidder shall warrant that all spares supplied will be new and in accordance with the Contract documents and will be free from defects in design, material and workmanship.

In addition to the recommended spares listed by the Bidder, if the Owner further identifies certain particular items of spares, the Bidder shall submit the prices and delivery quotation for such spares within 30 days of receipt of such request for consideration by the Owner and placement of order for additional spares if the Owner so desires.

The Bidder shall guarantee the long term availability of spares to the Owner for the full life of the equipment covered in the Contract. The Bidder shall guarantee that before going out of production of spare parts of the equipment covered under the Contract, he shall give the purchaser at least 2 years advance notice so that the latter may order his bulk requirement of spares, if he so desires. The same provision will also be applicable to Sub-Bidders. Further, in case of discontinuance of manufacture of any spares by the Bidder and/or his sub-Bidders, Bidder will provide the purchaser, two years in advance, with full manufacturing drawings, material specifications and technical information including information on alternative equipment makes required by the Owner for the purpose of manufacture/procurement of such items.

The prices of all future requirements of spares beyond 5 years shall be derived from the corresponding FOB/Ex-works price at which the order for such spares have been placed by the purchaser as a part of the mandatory spares or recommended spares. FOB/Ex-works order price of future spares shall be computed in accordance with the price escalation formula to be furnished by Bidder indicating base price reference variation indices for material, labour etc. Based on the formula and considering escalation indices prevailing at the time of order of spares, order price shall be worked out. The base indices will be counted from the scheduled date of successful completion of trial operation of the last plant/equipment under the project. The above option for procuring future recommended spares by the purchaser shall remain valid for the period of fifteen (15) years from the date of successful completion of trial operation of the last plant/equipment. In case the spare parts from the same sub-vendor are not available due to obsolescence or any other reason, the Bidder shall supply the spares for a period of fifteen [15] years from an alternative source.

1 400/220 KV SWITCHYARD EQUIPMENTS

1.1 General

This specification is intended to cover [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of 400/220kV kV switchyard equipments complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table-1

IS-335	New Insulating Oils
IS-398	Aluminum conductors for overhead line purpose
IS-731	Specification for porcelain insulators for overhead power lines with a nominal voltage greater than 1000V
IS-2071	Method of High Voltage Testing
IS-2099	Bushing for Alternating Voltages above 1000V
IS-2121	Conductors and earth wires accessories for overhead power lines
IS-2486	Metal fittings of Insulator for overhead power lines with nominal Voltage greater than 1000V
IS-2544	Porcelain post insulators
IS-2705	Current transformers
IS-3024	Specification for core material
IS-3043	Code of practice for earthing
IS-3070-3	Lightning Arresters for alternating current systems metal oxide surge arresters with gap
IS-3156	Voltage transformers
IS-3188	Characteristics of String Insulator units
IS-3347	Dimensions for porcelain transformer bushings for use in lightly polluted areas
IS-4146	Application guide for Voltage Transformers
IS-4201	Application guide for current transformers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[1]	25.09.2014

IS-5082	Wrought Aluminum and aluminum alloy bar rods, tubes and sections, plates and sheets for electrical application
IS-5216	Guide for safety procedure and practices in electrical works
IS-5547	Application guide for Capacitive Voltage Transformers
IS-5621	Hollow Insulators for use in electrical equipment
IS-6209	Methods for partial discharge measurement.
IS-9135	Guide for testing of circuit breaker
IS-9920	HV Switches
IS-9921	Alternating current disconnectors (isolators) and earthing switches for voltages above 1000V
IS-10136	Code and practice for selection of disc insulator fittings of highest system voltages of 72.5 kV and above.
IS-13118	High voltage alternating current Circuit Breakers
IS-3070-3	Lightning Arresters for alternating current systems metal oxide surge arresters with gap
IEC-600044-1	Instrument transformers- Current transformers
IEC-60044-2	Instrument transformers- Voltage transformers
IEC-60044-5	Instrument transformers- Capacitive Voltage transformers
IEC-60099-4	Surge arresters- Metal oxide surge arresters with gaps for AC systems
IEC-60099-5	Surge arresters-Selection and application recommendations
IEC-60050-421	International Electro-Technical vocabulary- Power transformers and reactors
IEC-60060	High Voltage Test Techniques
IEC-60071	Insulation Coordination application guide
IEC-60129	Specification for alternating current disconnectors and earthing switches
IEC-60168	Tests on indoor and outdoor post insulators of ceramic material or glass for systems with nominal voltages greater than 1000V
IEC-60185	Current transformers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[3]	25.09.2014

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3 Design Criteria

- Switchyard shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The Switchyard shall be suitable for operation in a highly polluted environment.
- Wind velocity, Ice loading and other relevant parameters for sag tension calculation shall be as per relevant project site data.
- 220kV/400kV Switchyard shall be suitable for following voltage & frequency variations as follows:

Table-2

Voltage Variation	(±) 10%
Frequency Variation	(+) 3% to (-)5%
Combined Variation of Voltage & Frequency	10% (absolute sum)
For DC System	(+)10% to (-)15%

- Switching schemes shall be [Double bus/ Double main & transfer bus scheme] for 220 kV systems & [One & Half breaker scheme/ Double main & transfer bus scheme/Double bus scheme] systems for 400kV.
- 220 kV and 400 kV System data shall be as per below table.

Table-3

Sr No	Details	Unit	220kV System	400kV System
1	Rated Voltage	kV	220	400
2	Highest System Voltage	kV	245	420
3	Rated Frequency	Hz	50	50

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[4]	25.09.2014

Tender Document for R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

4	Creepage Distance	Mm/kV	[31]	[31]
5	Fault level	KA	[40kA for 1sec]	[40kA for 1 sec]
6	One min power frequency withstand voltage of complete string with corona control rings:	kV _{rms}	460	630(Dry) 680Wet)
7	Switching Impulse withstands Voltage (250/2500μs)-dry and wet.	kV _p	NA	1050
8	Lighting Impulse withstand voltage(1.2/50 μs)	kV _p	1050	1425

- f. For renovation/augmentation of existing substation [AIS, GIS & Hybrid substation] option may be adopted considering space constraints and techno economic viability.
- g. Safety clearances shall be as per voltage level and manufacturer standard practice. [Applicable for GIS and Hybrid substation for all equipment except bus bar].
- h. Thermal rating for all current carrying parts shall be [a minimum of 1 sec at rated voltage] for the rated symmetrical short circuit current. If the maximum short circuit time is extended, the I²x t value shall remain constant.
- i. Safety clearances & bay width for different voltage level shall be as per CBIP Manual, IEC 61936 and IS 10118 Part III. [Applicable for AIS & Hybrid substation]
- j. The lightning protection shall be provided by lightning masts and/or shield wires.
- k. Switchyard control building shall be air conditioned. [If applicable]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[5]	25.09.2014

- I. Fencing shall be provided around the outdoor switchyard to restrict unauthorized entry.

1.4 Specific Requirements

1.4.1. Construction

- a. Civil works/structure shall be as per Volume-2/Part D of this specification.
- b. For Hybrid substation bus bar arrangement shall be air insulated and all other switching equipments shall be enclosed in a gas compartment as like as GIS. Therefore all features for bus bar shall be as per AIS and rest of all equipment features shall be as per GIS.
- c. The bays shall be arranged suitably such that skew/deviation of outgoing and incoming connections shall not exceed 30°.
- d. The generator transformer and station transformer shall be suitably connected through overhead lines to switchyard. TG building support/take-off gantry support shall be provided at the opposite ends of each of the above mentioned transformers.
 - i. [Equipment shall be suitable for hot line washing.]
 - ii. Suitable access ways and roadways shall be provided for ease in maintenance of all switchyard equipment and appropriate drainage facilities shall also be provided for outdoor sub-station.
- e. GIS shall be of compact and modular design, fully metal-clad and of the sulphur-hexafluoride (SF₆) insulated type. It shall be constructed for the indicated bus bar system, and shall include all necessary switches and current and voltage transformers, as detailed in the respective attachments. It shall be supplied complete with all auxiliary equipment necessary for operation, routine maintenance, repairs or extensions. [Applicable for GIS & Hybrid]
- f. GIS shall be constructed of suitable material and thickness to withstand the mechanical and thermal stresses due to short circuits and internal arc faults confirming IEC-62271. [Applicable for GIS & Hybrid]
- g. GIS shall be designed for continuous operation under all system operating conditions including sudden change of load and voltage and short circuits within its ratings. The equipment shall be designed to withstand normal operating voltage even if the gas pressure decreases to atmospheric pressure as long as no switching operations are performed. [Applicable for GIS & Hybrid]
- h. Components that may require to be renewed and standard assemblies that may be transferred from one circuit to another, shall be interchangeable and where required this shall be demonstrated by the Bidder. [Applicable for GIS & Hybrid]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[6]	25.09.2014

- i. The arrangement of GIS shall be such as to enable dismantling a bay without affecting the adjacent bay. However, to remove the bus bar disconnecter, a shutdown of the relevant section of the bus bar shall be required. *[Applicable for GIS & Hybrid]*
- j. The enclosure and seals shall be designed to withstand the gas pressure encountered under normal and short circuit conditions. The thickness of the enclosures shall be in compliance with relevant code and standard. *[Applicable for GIS & Hybrid]*
- k. Viewing windows shall be provided at the disconnectors and earthing switches to ensure that each contact position can be inspected. Each section shall have plug-in or easily removable connection pieces to allow for easy replacement of any component with the minimum of disturbance to the operative equipment. *[Applicable for GIS & Hybrid].*
- l. Materials used in the manufacture of the GIS equipment shall be of the type, composition and physical properties best suited to their particular purposes and in accordance with the latest engineering practices. All joint surfaces shall be machined, and all castings shall be spot faced for all bolt heads or nuts and washers. All screws, bolts, studs and nuts shall conform to metric system. *[Applicable for GIS & Hybrid]*
- m. The initial gas filling of the switchgear and sufficient extra SF₆ gas (10% of total) for compensation of possible losses during installation and service shall be supplied. A wheeled maintenance device shall be supplied with pressure vessel, vacuum pump and all required gauges and fittings for the service of the switchgear. Bidder shall guarantee that the pressure loss within each individual gas filled compartment shall not be more than *[0.5 percent per year]*. *[Applicable for GIS & Hybrid]*
- n. Each gas filled compartment shall be equipped with static filters. These filters shall be capable of absorbing any water vapour, which may penetrate into the enclosures. *[Applicable for GIS & Hybrid]*
- o. GIS line-up, when installed and operating under the ambient conditions shall perform satisfactorily and safely under all normal and fault condition. Even repeated operations up to the permissible servicing intervals, under full rated fault conditions, shall not lead to diminished performance or significantly shortened useful life of GIS. Arc faults caused by external reasons shall be positively confined to the originating compartment and shall not spread to other parts of the switchgear. *[Applicable for GIS & Hybrid]*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[7]	25.09.2014

- p. Temperature rise of current carrying parts shall be limited to the values stipulated in relevant code and standard under rated current and the climatic conditions at site.
- q. GIS shall be of free-standing, self-supporting dead-front design, with all high-voltage equipment installed inside the gas-insulated, metallic earthed enclosures, and suitably sub-divided into individual arc and gas-proof compartments, at least for
- Bus bar section with associated bus bar Disconnecter
 - Circuit breaker
 - Line disconnectors
- [Applicable for GIS & Hybrid].
- r. The bus bars shall be sub-divided into compartments including the associated bus bar disconnectors. [Applicable for GIS]
- s. Arrangement of the individual substation bays shall be such as to achieve optimum space-saving, neat and logical arrangement, and adequate accessibility to all external components. [Applicable for GIS & Hybrid].
- t. Each line up of substation shall be suitable, and prepared for future extension on one end without any drilling, cutting or welding on the existing equipment. To add equipment, it shall not be necessary to move or dislocate the existing switchgear bays. [Applicable for GIS & Hybrid].
- u. It shall be impossible to touch live parts of the switchgear unwillingly, i.e. without the use of tools or brute force, or to perform operations that lead to arcing faults. [Applicable for GIS & Hybrid].
- v. The primary design goal shall be the avoidance of all known reasons for internal arcing. The release of pressurized gas into the atmosphere must occur in such a controlled way that personnel standing at the operating position of the switchgear shall not be hurt directly in the process. Furthermore, no part of the enclosure, or any loose parts, may fly off the switchgear in such an event. All earthing connections must remain operational during and after an arc fault. The arc fault withstand duration shall comply with relevant code and standard. [Applicable for GIS & Hybrid].
- w. All interlocks that prevent potentially dangerous mal-operations shall be constructed such that they cannot be defeated easily, i.e. the operator must use tools or brute force to over-ride them.
- i. The actual position of disconnectors and grounding switches shall be positively displayed by means of reliable optical indicators visible from the operating position.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[8]	25.09.2014

- ii. Counter measures shall be provided against expansion, vibration and noise of the equipment.
- iii. All the equipment of a GIS shall be electromagnetically compatible and should conform to relevant Indian/international standards.
- iv. The GIS equipment shall be furnished with specially designed stainless steel compensators/bellows to preserve the mechanical strength of the equipment at the connection portions to deal with the following problems:
 - To absorb the expansion and Contraction of outer enclosure and conductor due to temperature variations.
 - Mismatch in various components of GIS
 - To absorb the vibration of the transformer and switching equipment
 - To absorb the dimensional variations due to uneven settling of foundation
 - To withstand seismic forces

[Applicable for GIS & Hybrid]

1.4.2. Bus bars:

- a. [Bus bar current rating shall be as per requirement.]
- b. The bus bar shall be rigid type/strain and flexible type. [Applicable for AIS & Hybrid].
- c. In the rigid type, pipes shall be used for bus bars for making connections to the various equipment wherever required. The bus bars and connections shall be supported on pedestal mounted insulators. In case of a rigid type bus, special care has to be taken in respect of aeolian vibration. Aluminum pipes of grade 63401 WP confirming to IS: 5082 and IS 2673 shall be used for rigid type. [Applicable for AIS & Hybrid].
- d. ACSR/AAC shall be used for connection of the strain / flexible type bus-bars. The Aluminum strands of the steel cored aluminum conductor shall be hard-drawn electrolytic Aluminum rods of E.C Grade, having purity not less than 99.5%. [Applicable for AIS & Hybrid].
- e. The 400kV or 220kV GIS shall be of single phase encapsulated.i.e Bus bar, bus ducts and feeders are single phase enclosures and mounted in horizontal/vertical configuration to suit the switchgear layout. [Applicable for GIS].
- f. The conductors of the bus bars shall be fabricated of either [Copper/Aluminum Alloy] tubular sections with cross sectional area suitable to meet the current rating requirements. The tubular bus sections shall be housed in an aluminum enclosure, filled with pressurized SF₆ gas. [Applicable for GIS]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[9]	25.09.2014

- g. The conductors shall be supported from the enclosures by homogeneous epoxy resin insulators shaped to ensure uniform electrical field distribution at rated voltage. *[Applicable for GIS]*
- h. Adequate provision shall be made for absorption of thermal expansion of the conductors and of differential thermal expansion between the conductors and the enclosures. Metal bellow type compensators with adjustable tensions shall be provided, where required. The enclosures shall be designed to eliminate as much as possible all external effects of the flux created by normal and fault currents.
 - i. The power losses in the system shall be kept to a minimum, and induced voltages on the enclosures shall not be allowed to exceed reasonable limits of safety for operating personnel.
 - ii. The Supplier shall furnish supporting calculations in respect of induced voltage and losses guaranteed for the enclosure.
 - iii. Bus end connections shall be made with multi-contact connectors to allow for axial thermal expansion of the bus. Enclosure end connections shall be flanged, and shall be fitted with gaskets or O-ring seals to provide an effective gastight joint between sections. *[Applicable for GIS]*
 - iv. The common point of the two bus bars should be in a separate enclosure with an earthing switch in order to ensure availability of one bus bar in service at all times. *[Applicable for GIS]*
 - v. Each end of the bus bars shall be designed for convenient future extension of the GIS. Bus conductor end connectors and enclosure flanges shall be designed accordingly. *[Applicable for GIS]*
 - vi. All necessary steel supporting structures required for proper erection, the manufacturer shall provide leveling and alignment of the bus bars and bus ducts. *[Applicable for GIS]*
 - vii. In order to provide an improved dielectric withstand capacity, the interior of enclosures may not be required to be painted. *[Applicable for GIS]*
 - viii. The metal enclosure shall be bonded throughout and a sufficient number of defined earthing points shall be provided. *[Applicable for GIS]*

1.4.3. Circuit breaker

- a. *[Circuit breaker rating shall be as per requirement].*
- b. Circuit Breakers shall be outdoor type, comprising three identical single pole units, complete in all respects with all fittings and wiring. *[Applicable for AIS]*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[10]	25.09.2014

- c. Each circuit breaker shall comprise of three metal clad breaker poles. They shall be designed for installation in SF₆ gas insulated metal clad switchgear, and shall use SF₆ gas for both insulation and arc quenching. *(Applicable for GIS & Hybrid Substation)*
- d. SF₆ gas shall be as per IEC-60376, 60376A and B. SF₆ Circuit breaker shall be supplied with gas for first filling and *[20% extra gas]* with sealed container shall be provided. *(Applicable for AIS)*
- e. Spring Operating Mechanism / Hydraulic / Pneumatic or any combination of these, one for each pole, shall be employed for closing and tripping the circuit breakers. 220 V DC shall be used for control / tripping. Each circuit breaker shall be designed for single pole switching and auto reclosing.
- f. Circuit breaker shall be spring operated, SF₆ type & shall provided with 2 trip coils and 1 close coil per operating mechanism. It shall be possible to trip the circuit breaker even in the event of failure of auxiliary power supply to the mechanism.
- g. The circuit breakers and accessories shall conform to IEC- 62271-1 and 100.
- h. Mechanical & Electrical Endurance class of these breakers shall conform to relevant Indian/International Standards.
- i. The circuit breakers shall be horizontal/vertical mounted and shall withstand the forces imposed by the earthquake requirements.
- j. Dis-agreement circuit for pole position discrepancy shall be provided for all circuit breakers and auto-re-closing features shall be provided for line feeders and transfer bus.
- k. The interlocking shall prevent any incorrect switching sequence and enable the breakers to be operated without risk, either from the local control cabinet or from the GIS control room. Actuation of the manual operating device shall also disable the electrical control circuits. Interlocks shall be provided to prevent hunting and other dangerous or undesirable operations of the circuit breaker. *(Applicable for GIS & Hybrid Substation)*
- l. The circuit breakers shall be interlocked electrically with their associated disconnectors such that the disconnector cannot be opened or closed unless the associated circuit breakers are open.
- m. The state of the breaker arc quenching and insulating gas shall be monitored by a temperature-compensated density switch with two alarm levels. The first stage alarm shall be set well before any dangerous condition is reached; the second stage shall inhibit breaker operation. *(Applicable for GIS & Hybrid Substation)*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[11]	25.09.2014

- n. Circuit breaker shall be controlled from local and remote. Local operation shall be by means of an open/close control switch located in the local control cabinet. Remote control via a remote/local control transfer switch shall be from the power house/ Switchyard control room.
- o. For 400kV systems, circuit breakers shall be provided with pre-Insertion closing resistor (wherever applicable for line feeders) or controlled switching devices (wherever applicable viz. reactor and Transformer switching breakers) suitably designed to limit switching surges.
- p. 400kV circuit breaker shall be provided with single step PIR of class C2-M2 class as per IEC 62271-1. The maximum rating/pre-insertion time shall be 400 ohm/8ms.
- i. Pre Insertion resistor (PIR): The resistor shall have thermal rating for the following duties:
 - Terminal fault: Close-1Min-Open-Close Open 2min-Close-1 min-Open Close Open.
 - Reclosing against Trapped Charges: Duty same as (i) above. The first, third and fourth closing are to be de-energized line while second closing to be made with lines against trapped charges of 1.2 p.u. of opposite polarity.
 - Out of phase closing: One closing operation under phase opposition that is with twice the voltage across terminals.
 - No allowance shall be made for heat dissipation of resistor during time interval between successive closing operations. The resistors and resistor supports shall perform all these duties without deterioration. The calculation shall take care of adverse tolerance on resistors values and time settings.
- ii. Controlled Switching device: The control relay shall have facility to record and monitor the switching operations. It shall be provided with self diagnostic facilities, alarms, and downloading and display for the setting and measured values. The controller shall be PC compatible.
- q. For circuit-breaker Mechanical endurance class shall be M2 as per relevant code and standard. *[(Applicable for GIS & Hybrid Substation)]*

1.4.4. Isolators

- a. *[(Isolator current rating shall be as per requirement)].*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[12]	25.09.2014

- b. An Isolator is a mechanical switching device, which provides in the open position, an isolating distance meeting the specified requirements. A disconnecter can open & close a circuit when either a negligible current has to be broken or made or when no significant change in voltage across the terminals of each pole of the disconnecter occurs.
- c. System Disconnecter and earth switches shall be motor operated.
- d. Safety Interlocks shall be provided to prevent closing of disconnectors at earth switch closed position.
- e. Disconnecting switches (isolators) covered by this specification shall conform to the latest editions of IS 9921 (Part 1 to 5) and IEC-129. Porcelain post insulators for the isolators shall conform to IS 2544 and IEC 168.
- f. Isolator shall be outdoor [horizontal centre break/double break/ pantograph type] [with/without earth switch] as per IEC 62271-102. It shall be possible to interchange position of earth switch on either side. [Applicable for AIS]
- g. 400kV disconnectors and earth switches shall be individual pole operated and 220kV and below disconnectors shall be gang operated type. However, 220kV tandem disconnectors shall be individual pole operated type.
- h. Disconnectors/ Isolator shall be single pole, group operated with motor operated mechanism as per IEC 62271-102. The provision of emergency manual operation shall also be included. [Applicable for GIS & Hybrid Substation]
- i. All the disconnecting switches shall have arrangement allowing easy visual inspection of the travel of the switch contacts in both open and close positions, from the outside of the enclosure. [Applicable for GIS & Hybrid Substation]
- j. Disconnectors shall be of mechanical endurance class [M2] type as per IEC 62271-100.

1.4.5. Current transformer

- a. [CT current rating shall be as per requirement].
- b. CT shall be of multi-ratio type and secondary current rating shall be [1A]. The rated burden and the knee point voltage of various CT cores shall be decided based on the application with a safe design margin. The minimum requirement of accuracy class of the CTs shall be as follows:
 - i. For differential protection -Class PS
 - ii. For other protection -Class 5P20
 - iii. For general metering -Class 0.5
 - iv. For tariff metering (for main & check meters) -Class 0.2S

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[13]	25.09.2014

[Main and Back-up protective relays shall be fed from separate CT cores]

- c. CT shall be ring/hair pin type, Single phase, oil immersed (with class A Insulation)/SF6 gas filled and self cooled as per IEC 60041-1. It shall be either dead tank or live tank type. The secondary terminals shall be brought out at the bottom to a weather proof (IPW 55) terminal box.
- d. CT shall be ring type and mounted inside metal enclosure. CT shall be provided with effective electromagnetic shields to protect against high frequency transients. CT shall have multi cores with multi ratio, which shall be changeable by means of a taps on the secondary side. *[Applicable GIS and Hybrid]*.
- e. CT secondary winding shall be positioned preferably within the GIS such that the current in the enclosure does not affect the accuracy and the ratio of the device and does not distort the conductor current being measured. Primary insulation for the CT shall preferably be SF6. In 3-phase type design, CT secondary shall be shielded from the high voltage conductor. CT core space shall be dimensioned to accommodate the required number of cores of required capacity and accuracy class. *[Applicable GIS and Hybrid]*
- f. CT terminal box shall be provided with removable gland plate and gland (s) suitable for 1100 volts grade PVC insulated, PVC sheathed, multicore 4 Sq. mm stranded copper conductor cable. The terminal blocks shall be stud type and provided with ferrules indelibly marked or numbered. The terminals shall be rated for not less than 10 Amps. The terminal box shall be dust and vermin proof. Suitable arrangements shall be made for drying of air inside the secondary terminal box. The dimensions of the terminal box and its openings shall be adequate to enable easy access and working space with the use of normal tool.
- g. Polarity shall be indelibly marked on each primary and secondary terminal. Facility shall be provided for short circuiting and grounding of the C.T. secondary terminals inside the terminal box.
- h. CT shall have a short time primary current rating not less than that of the associated switchgear. Secondary windings of each CT shall be earthed at one point only. *[The thermal rating of the current transformer shall allow, at site conditions, a 20% continuous overloading referred to nominal rating of the current transformer]*

1.4.6. Voltage transformers

- a. *[VT current rating shall be as per requirement].*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[14]	25.09.2014

- b. Voltage Transformer shall be capacitive voltage divider type (CVT) or Electromagnetic type (EMVT). VT shall single phase oil immersed (with Class A Insulation)/SF6 gas filled and self cooled.
- c. VT shall be of electromagnetic type (EMVT) with SF6 gas insulation as per IEC 60044-2 and mounted inside metal enclosure. [Applicable for GIS & Hybrid]
- d. CVT on line shall be suitable for carrier coupling.
- e. EMVT/CVT shall be provided with [three secondary windings; two windings for protection and one winding for metering].
- f. To prevent ferroresonance, suitable damping devices shall be provided for connector to the transformer secondaries.
- g. Voltage transformers (VT) with multiple secondary windings shall be provided on lines and bus bars for metering, protection and synchronizing requirements. Separate cores with Class 0.2 accuracy shall be provided for Main and Check tariff metering.
 - i. For protection - [Class 3P]
 - ii. For general metering - [Class 0.5]
 - iii. For Tariff metering - [Class 0.2]

VT burden for metering class shall not be less than [50VA].

1.4.7. Lightning arrestors

- a. Lighting arrestor shall be heavy duty, station class and gapless metal oxide type confirming IEC-60099-4.
- b. Arrestor shall be hermetically sealed units suitable for outdoor installation on self supporting base. 220kV SA shall have discharge energy equivalent to class 3 and 400kV SA shall have discharge energy equivalent to class 4.
- c. The surge arrestors shall be designed to incorporate a pressure relief device to prevent shattering of the blocks/ or housing.
- d. The positioning of the arrestors to other equipment shall provide protection to the other equipment according to the requirement of IEC-60099.
- e. Self contained non-resettable discharge counters without any auxiliary supply, suitably enclosed for outdoor application shall be provided for each single pole unit. Leakage current meter (mA) shall be provided. Leakage current meter and surge monitor with discharge counter shall have mechanical protection of IP-66.
- f. The surge arrestor ground connection must be insulated from the enclosure in order to permit monitoring of the leakage current. The ground connection shall be sized for the fault level of the GIS.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[15]	25.09.2014

1.4.8. Power Line Carrier Communication

a. General

- i. The carrier terminals shall include transmitter, receiver, high/low filter, HF hybrid filters, Line traps, LMU, telephone, Co-axial cables, and telephone cables etc. and shall be as per relevant codes & standard.
- ii. Telephone handsets and cord and jack shall be provided with carrier sets for the service engineer's use. Space shall be provided inside the carrier terminal cabinet for storing the handset when not in use.
- iii. *[The PLCC equipment for 400 kV lines shall be used for establishment of a PLCC link across the 400 KV Transmission Lines between 400 KV Switchyard of Power Plant and 400KV PGCIL / ----Substations, which is about --- KM & --- KM respectively from site.
The PLCC equipment for 220 kV lines shall be used for establishment of a PLCC link across the 220 KV Transmission Lines between 220 KV Switchyard of Power Plant & existing 220 KV ----- for looping in/out, which is about ----- KM from site.]*
- iv. The PLCC link shall be complete with carrier protection of the 400 KV /220 kV transmission lines with facilities for tele-metering / tele-signaling and speech communication in dialing mode. The required interfacing equipments to facilitate tele metering / tele signaling shall be included as part of PLCC supply.
- v. Wave trap shall be inserted into the extra high voltage transmission lines to prevent undue loss of carrier signal for all power system conditions. The impedance of the wave trap shall be negligible at power frequency (50 Hz) so as not to disturb power transmission but shall be relatively high over the frequency band appropriate to carrier transmission.
- vi. The design shall conform to the best and current engineering practice. It shall ensure reliability, simplicity and provide long continuous service with high economy and low maintenance.
- vii. All equipment shall operate without undue heating, vibration and with minimum possible noise.
Adequate margin shall also be provided while selecting rating of equipment.
- viii. Coupling Device (Line Matching Unit and Protective Devices) for power line carrier circuit is to be interposed between the capacitor voltage transformer and the connection line (Co-axial Cable) to the PLCC terminals to ensure:
 - The efficient transmission of signals from the PLCC equipments to the high voltage line and vice versa.
 - The safety of personnel and protection of low voltage parts of the installation against the effects of power frequency voltage and over voltages.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[16]	25.09.2014

- ix. A lightning arrestor shall be connected as directly as possible between the primary and earth terminals and shall be capable of protecting the coupling device and the carrier frequency connection. The lightning arrestor shall have power frequency spark over voltage co-ordinated with the equipment.
- x. The contractor shall specify the capacitance of the CVTs with which the coupling unit may be used for the above transmission band.
- xi. The contractor shall also provide suitable earthing switches for grounding the low voltage terminals of CVT for carrying out maintenance or any other works on coupling unit.
- xii. The coupling device should be suitable for outdoor mounting and shall be fitted on the steel structure. Temperature of metallic equipment mounted [outdoor is expected to rise up to 65°C during maximum ambient temperature of 50°C specified.] The equipment offered shall satisfactorily operate under these conditions.
- xiii. The coupling device shall conform to relevant IEC/IS standards.
- xiv. The connection between coupling device and CVT shall be done [by means of 6 sq.mm. copper wire] taped with 11 KV insulation.

b. High Frequency Cable

High frequency cable shall be supplied to connect coupling unit installed in the switchyard to the PLCC terminals installed indoors. The high frequency cable to be offered by the contractor shall be suitable for being laid directly to the ground or in trenches or in ducts. The cable shall be PVC sheathed and round steel wire armoured. The capacitance of the cable shall be low so as to minimize attenuation at the carrier frequency range. The impedance of the cable shall be so as to match with the output impedance of PLCC terminals and secondary impedance of the coupling units (LMU). The cable shall be insulated to withstand a test voltage of 4 KV rms. for one minute between conductor & outer sheath. Bidder shall offer [Co-axial H.F. cable with 75 Ohms impedance (unbalanced).]

The H.F. cable shall conform to the latest edition of IS Publication No. 5802.

c. Power Line Carrier Terminals

- i. Single side band PLCC terminals of latest version equipped for fixed frequency duplex system working shall be offered for superimposed channels (multipurpose) for speech, tele-metering, and tele-signalling and protection purpose. The PLCC terminals shall be complete with H.F. Hybrid filters and shall have necessary frequency stability so that adjacent channel working is possible.
- ii. The PLCC terminals shall be located at a suitable location in Switchyard Control room. Each PLCC terminals shall be mounted in floor mounting sheet

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[17]	25.09.2014

metal [(min 2 mm thick)] cabinets. The terminals shall be provided with built in indicating instruments to facilitate checking of important voltage and signal values at different points of the PLCC terminal. Protective fuses should be provided in all important circuits and the fuses shall be so mounted as to allow their easy inspection and replacement. The carrier set shall be provided with suitable supervision and alarm facilities. The individual parts of the carrier set should be accessible from the front, making it possible to place the carrier set cabinets side-by-side, back-to-back, against wall. All component parts of the carrier set shall be suitably tropicalised and protected against bad effects of humidity, fungus etc.

- iii. The PLCC terminals shall be provided with emergency call facilities from the carrier sets for point to point carrier communication (RSI facility) with required telephone set.
- iv. The PLCC terminals should be of vermin proof and provided with, ventilating fan, if required. Necessary socketing arrangement for connection of the H.F. cable from the coupling device shall have to be provided.

d. Wave Trap

- i. The wave trap shall comply with IS: 8792 and shall be broad band type, tuned for the entire carrier frequency range. The resistive component of impedance of the line trap within its bandwidth shall not be less than 570 ohms.
- ii. The coil of wave trap shall be designed to tolerate the short circuit current of the line for a short period and shall withstand the mechanical stress resulting from it. HF tuning elements shall be placed in a separate sealed unit.
- iii. The wave trap shall be provided with a protective device which shall be designed and arranged so that neither significant alteration in its protective function nor physical damage shall result from either temperature rise of the magnetic field of the main coil at continuous rated current or rated short time current. The protective device shall neither enter into operation nor remain in operation following transient actuation by the power frequency voltage developed across the wave trap by the rated short time current.
- iv. The protective device in the form of surge arrester shall be gapless or gapped type. For proper co-ordination with the lightning arresters installed in the substation, its [rated discharge current shall be 10 kA.]
- v. Wave trap shall be provided with suitable corona rings to meet corona and radio interference performance.
- vi. Wave trap shall be outdoor type suitable for mounting on post insulators. The wave trap shall be equipped with suitable bird barriers painted with grey colors.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[18]	25.09.2014

1.4.9. Steel Structures

- a. Manufacturer shall supply all equipment supporting structures, required access ladders / stairway/ walkways, transverse and longitudinal beams and supporting members, complete with all necessary hardware. Any temporary scaffolding or a movable platform, required for maintenance, shall also be supplied.
- b. All steel structure members shall be hot-dip galvanized after fabrication. All field assembly joints shall be bolted. Field welding shall not be acceptable. Non-corrosive metal or plated steel shall be used for bolts and nuts throughout the work.
- c. Manufacturer shall provide suitable foundation channels and anchor bolts to support the switchgear assemblies. All mounting bolts, nuts and washers shall be provided to fasten the switchgear base frames to the foundation channels. Foundation channels and anchor bolts shall be installed in the civil works in accordance with instructions provided by manufacturer. *[Applicable for GIS].*

1.4.10. Reactor (If Applicable)

- a. Shunt reactor shall be connected to the 400kV/220kV bus for reactive load compensation and shall be capable of controlling the dynamic overvoltage occurring in the system.
- b. Reactor shall confirm to IEC 60076/IS 2026.400kV reactor shall be tree/single phase type as per rating & transportation limitations.
- c. Reactor shall be oil immersed with natural cooling (ONAN).The Insulating oil supplied with reactor shall confirm all parameter as per IEC-60296.
- d. The shunt reactor shall be either grapped core type or magnetically shielded air core type construction.
- e. Shunt reactors shall be capable of operating continuously at a 5% higher than rated voltage. The thermal & cooling system shall be designed accordingly.
- f. Neutral grounding reactor shall be provided for grounding the neutral point of shunt reactors to limit the secondary arc current and recovery voltages to a minimum value. The NGR of switchable reactor may be bypassed during switching in/out of the reactor.
- g. Temperature rise of reactor shall be as per relevant codes and standard.

1.4.11. GIS Termination Arrangement *[Applicable for GIS and Hybrid]*

- a. For connecting overhead lines with the GIS, SF6-to-Air bushings, mounted on suitable steel structures shall be installed. The bushings shall be Composite Insulator bushing and shall generally conform to relevant code and standard. The bushings shall have adequate Mechanical strength to withstand the Short circuit forces, Wind force and loading for the type connection.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[19]	25.09.2014

- b. The SF6-to-Air terminations shall include all necessary materials such as SF6 Bus duct, gas monitoring devices, bus bar extensions and removable links to ensure complete termination. Bimetallic (Al/Cu) material shall be used for the connection and necessary technical characteristics to the dimensioning of connection shall be provided by the bidder during detail engineering.
- c. For Cable termination at GIS, Division of responsibility (DOR) shall be as per relevant code and standard.
- d. For SF6/Air bushings, the GIS Bidder shall provide detailed drawings and information.

1.4.12. Gas monitoring [Applicable for GIS and Hybrid]

- a. All gas zones shall be filled to the design pressure with pure SF6 gas (to IEC 60376/BS5207) and shall be monitored individually by temperature compensated pressure switches and pressure gauges.
- b. A three-stage alarm system (high, falling and low) shall be provided for each gas section adjacent to circuit breakers, including all relays, fascias, etc., These shall be accommodated adjacent to the switchgear. A two stage alarm system shall be provided for all other gas sections. Additional repeat alarms to announce remotely each alarm stage for the group alarms of each switch bay shall be provided. The local control cubicle shall be adequately labeled to allow easy identification of signals from each gas section.
- c. The low pressure/density alarm switches shall be arranged to provide a local and remote alarm to indicate the necessity for manual operation of the circuit breakers and disconnectors adjacent to a faulted gas zone and to subsequently inhibit their further operation until suitable action has been taken.
- d. In view of the dependence of system security on the reliability of the gas density relays, and in view of the large number of relays involved in any regular relay checking procedure, the gas density relays shall have a high degree of reliability. The relay shall be designed to allow easy checking of its proper operation.
- e. Facilities shall be provided to constantly monitor the gas density. A two stage low gas pressure alarm and lock out system with local and remote indications shall be provided on each circuit breaker.
- f. Each gas density device shall be connected to the gas compartment via a self sealing valve to facilitate easy removal of the device for maintenance. The use of stop valves for this purpose is not acceptable.

1.4.13. Sulphur Hexafluoride Gas (SF6)

- a. The sulphur hexafluoride SF6 gas shall comply with the requirements of IEC 60376, IEC 60694 and BS 5207. The SF6 gas shall be supplied in 45 Kg cylinders. The dew point of the gas shall be lower than -45°C.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[20]	25.09.2014

- b. Sufficient quantity shall be provided to fill all SF6 equipment supplied under this contract plus an additional 20%.
- c. The high-pressure cylinders in which the SF6 gas is transported to, and stored on site, shall comply with the requirements of local regulations and bye-laws.
- d. It is important that all personnel working on GIS equipment should be fully informed of the potential risks and appropriate health and safety regulations.
- e. It is the responsibility of the GIS equipment supplier to provide:
 - i. Adequate safety training to the owner's staff regarding gas detection, the disposal of arced products and storage.
 - ii. Sufficient numbers of face masks, goggles, hand gloves and
 - iii. Respirators and protective clothing.
 - iv. First aid equipment including an eye wash bottle filled with distilled water.

1.4.14. Gas handling equipment

- a. A mobile gas handling plant for filling, evacuating, and processing the SF6 gas in the switchgear equipment, shall be supplied as part of the Contract to enable any maintenance work to be carried out. The plant shall include all the necessary gas cylinders for temporarily storing the evacuated SF6 gas as well as any other gases that may be used in the maintenance process.
- b. The capacity of the temporary storage facilities shall be at least sufficient for storing the maximum quantity of gas that could be removed when carrying out maintenance or repair work on the largest section of the switchgear and associated equipment.
- c. The plant provided shall be suitable for evacuating and treating the SF6 gas by the use of desiccants, driers, filters etc., to remove impurities and degradation products from the gas. The capacity of the plant shall be such that the largest gas zone, with the exception of the circuit breaker, can be evacuated in less than one hour.
- d. The plant shall also be capable of reducing the gas pressure within the circuit breaker to a value not exceeding 8 millibars within a time not greater than two hours.

1.4.15. Switchyard Accessories

- a. The bidder shall include all required connectors, clamps, fittings etc required for the erection of the overhead line, tubular conductors and insulators. The bidder shall verify that the buses which are used in tension and overhead ground wire shall be free from joints or splices. The equipment used for stringing the conductors and overhead ground wires shall be such that the conductors are not damaged or injured. All sections of conductors damaged by the application of gripping attachment shall be replaced before the conductors are pegged in place.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[21]	25.09.2014

All data such as stringing tables given tension with temperature variations shall be supplied by the Bidder for approval.

b. Clamps and Connectors

- i. All power clamps and connectors shall conform to IS: 5561 & NEMA CC1 and shall be made of materials listed below:

Table - 4

For connecting ACSR conductors	Aluminum alloy casting, conforming to designation A6 of IS:617 and shall be tested for all test as per IS:617
For connecting equipment terminals made of copper with ACSR conductors	Bimetallic connectors made from aluminum alloy casting, conforming to designation A6 of IS 617 with 2mm thick bimetallic liner and shall be tested for all test as per IS 617
For connecting G.I.	Galvanized mild steel shield wire
Bolts, nuts & Plain, washers	Electro galvanized for size below M12, for others hot dip galvanized.
Spring washers for above items	Electro galvanized mild steel suitable for at least service condition 3 as per IS 1573.

- ii. Each equipment shall be supplied with the necessary terminals and connectors, as required by the ultimate design for the particular installation. The conductor terminations of equipment shall be either expansion, sliding or rigid type suitable [for 4.0" IPS aluminum tube or suitable for Quad/ Twin ACSR/ AAAC Conductor].
- iii. Where [copper to aluminum] connections are required, bi-metallic clamps shall be used, which shall be properly designed to ensure that any deterioration of the connection is kept to a minimum and restricted to parts which are not current carrying or subjected to stress. The design details of the joint shall be furnished to the Purchaser by the bidder.
- iv. Clamp shall be designed to carry the same current as the conductor and the temperature rise shall be equal to or less than that of the conductor at the specified ambient temperature. The rated current for which the clamp/ connector is designed with respect to the specified reference ambient temperature, shall also be indelibly marked on each component of the clamp/ connector, except on the hardware.

c. Disc Insulator

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[22]	25.09.2014

- i. All disc insulators shall be dimensioned appropriately so as to have the required Electro - Mechanical strength for EHV outdoor duties.
 - ii. All Insulators and fittings shall generally be supplied as per relevant IS amended to date.
 - iii. Insulator shall be wet-process porcelain, brown glazed and free from all blemishes. Metal parts and hardware shall be hot-dip galvanized.
 - iv. When operated at maximum system voltage there shall be no electrical discharge. Shielding rings, as necessary, shall be provided.
 - v. Insulation shall be coordinated with basic impulse level of the system. The creepage distance shall correspond to very heavily polluted atmosphere (31mm/kV).
 - vi. For disc insulator [120KN] of 11KV class shall be considered for 400KV/220KV switchyard.
- d. Post Insulator Stack[Applicable for AIS & Hybrid]
- i. Post insulator stack shall be used to support the [tubular aluminium bus or ACSR conductor] of outdoor EHV switchyard. Height of the stack shall be adequate in order to maintain proper clearance of live conductor from ground surface. Post insulator shall be solid core type.
 - ii. Each post insulator shall be mounted on pipe steel structure. Post insulator shall be complete with necessary fixing clamp at top for clamping of tubular aluminum bus/ACSR conductor, as required. The insulators shall be provided with necessary nuts, bolts and washers.
 - iii. Creepage distance shall be [31 mm/kV]
- e. Galvanized Steel Shield Wire
- i. Galvanized steel shield wire shall conform to the relevant IEC, BS or IS. The steel strands shall be drawn from high carbon steel rods produced by either acid or basic open-hearth process, the electric furnace process or basic oxygen process. The wire shall be hot dip galvanized.
 - ii. Zinc used for galvanizing shall be electrotype high-grade zinc of 99.5% purity and shall conform to IS: 209 - 1966 or equivalent BS specification. The hot dip galvanizing shall be done as per IS: 4826 - 1968 for heavy coating.
 - iii. There shall be no joint of any kind in the finished strand wire entering into the construction of earth wire.
 - iv. [The wire shall be 7/8 SWG galvanized steel wire. The ultimate strength of individual strand shall not be less than 1000 Kgs and that of complete wire shall not be less than 6972 Kgs.]
- f. Bundle Spacers [Applicable for AIS & Hybrid]
- a. Bundle spacers shall have enough strength so as to restore normal spacing of conductors after displacement by winds, short circuits etc. without damage or permanent deformation. The spacers shall have long life without fatigue or wear and shall have gentle but firm grip on conductor. They shall be able to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[23]	25.09.2014

withstand all the electromagnetic and electrostatic forces under different operating conditions including dead short circuit.

- b. They shall be of one piece construction and shall not have separate small components.
- c. The materials used in spacers shall be corrosion resistant and made of aluminum alloy of an approved type. All type of nut/bolt/washers shall be made from Stainless Steel.
- d. The spacers shall be flexible enough so as to avoid distortion or damage to the conductor or themselves. Rigid spacers are not acceptable.
- g. Corona Control Rings
 - a. Corona control rings shall be provided in 400kV/ 220KV system with all string hardware fittings.
 - [Corona control rings shall be made of high strength heat-treated aluminum alloy tube with a minimum wall thickness of 2.5mm.]
- h. Fittings and accessories of insulators
Each insulator shall be furnished complete with the fittings and accessories.

1.4.16. Bellows or compensating units[Applicable for GIS]

Adequate provision shall be made to allow for the thermal expansion of the Conductors and of differential thermal expansion between the Conductors and the Enclosures. The Bellows shall be Metallic (preferably of Stainless Steel) of following types or other suitable equivalent arrangement shall be provided wherever necessary.

- a. Lateral / vertical mounting units: These shall be inserted, as required, between Sections of Bus Bars, on Transformer, Shunt Reactor and XLPE Cable etc. Lateral Mounting shall be made possible by a sliding Section of Enclosure and Tubular Conductors.
- b. Axial compensators: These shall be provided to accommodate changes in Length of Bus Bars due to Temperature Variations.
- c. Parallel compensators: These shall be provided to accommodate large linear expansions and angle tolerances.
- d. Tolerance compensators: These shall be provided for taking up Manufacturing, Site Assembly and Foundation Tolerances.
- e. Vibration compensators: These Bellow Compensators shall be provided for absorbing vibrations caused by the Transformers and Shunt Reactors when connected to SF6 Switchgear by Oil - SF6 Bushings.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[24]	25.09.2014

Tender Document for R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

1.4.17. Grounding

- a. The grounding system shall be designed and provided as per IEEE-80-2000 and CIGRE-44 to protect operating staff against any hazardous touch voltages and electro-magnetic interferences.
- b. As the area involved is small, contractor has to take special measures for the same.
- c. The GIS supplier shall define clearly what constitutes the main grounding bus of the GIS. The GIS supplier must supply the entire material for grounding bus of GIS viz. conductor, clamps, joints, operating and safety platforms etc. The GIS supplier is also required to supply all the earthing conductors and associated hardware material for the following:
 - i. Connecting all GIS equipment, enclosures, control cabinets, supporting structure etc. to the ground bus of GIS.
 - ii. Grounding of transformer and other outdoor switchyard equipments/ structures etc.
- d. Reinforcement bars in concrete slabs, foundations and duct banks shall be connected to the grounding grid by using appropriate thermoweld joints. However care should be taken to ensure that no discharge current flows through the reinforcement bars to the grounding grid. [Applicable for GIS & Hybrid]
- e. If a continuous floor slab is used, a good adjunct measure is to tie its reinforcing steel mesh to the common ground bus (main ground bus) so that both the GIS enclosures and the structural steel in and above the foundation will be approximately the same potential level. The assumption is that this measure should produce better ground and reinforcing bars, being considerably closer together than the wires of a typical ground grid, should produce more even potentials within the floor and at the surface. [Applicable for GIS& Hybrid]
- f. The enclosure of the GIS may be grounded at several points so that there shall be grounded cage around all the live parts. A minimum of two nos. of grounding connections should be provided for each of circuit breaker, transformer terminals, cable terminals, surge arrestors, earth switches and at each end of the bus bars. Subassembly to subassembly bonding shall be provided to provide gap & safe voltage gradients between all intentionally grounded parts of the GIS assembly & between those parts and the main grounding bus of the GIS.

[Applicable for GIS& Hybrid]

Each marshalling box, local control panel, power and control cable sheaths and other noncurrent carrying metallic structures shall be connected to the grounding

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[25]	25.09.2014

system of GIS via connections that are separated from GIS enclosures.
[Applicable for GIS& Hybrid]

- g. The grounding connector shall be of sufficient mechanical strength to withstand electromagnetic forces as well as capable of carrying the anticipated maximum fault current without overheating. At least two grounding paths shall be provided to connect each point to the main grounding bus. Necessary precautions should be under taken to prevent excessive currents from being induced into adjacent frames, structures of reinforcing steel and to avoid establishment of current loops via other station equipment.
- h. All flexible bonding leads shall be tinned copper. All connectors, for attaching flexible bonding leads to grounding conductors and grounding conductors to support structures shall be tinned bronze with stainless steel or tinned bronze hardware.
- i. The contractor shall provide suitable measure to mitigate transient enclosure voltage caused by high frequency currents caused by lightning strikes, operation of surge arrestor, ph. / earth fault and discharges between contacts during switching operation. The grounding system shall ensure safe touch & step voltages in all the enclosures. The contractor shall provide suitable barrier of non-linear resistor/ counter discontinued SF6/ Air termination, SF6/ Transformer termination, SF6/ HV cable bushing etc. to mitigate transient enclosure voltage.
- j. The bidders shall provide lightning mast/GS shield wire at suitable place for protection of whole sub-station including transformers, GIS cum control room building etc. The bidder shall submit detailed proposal for grounding system of whole substation including indoor and outdoor equipments with Earthmat using [40mm.] dia MS rod for approval of purchaser. The riser shall be GS flat of size [75X12mm] for outdoor equipments and [50X6mm] for indoor.
- k. The bidder shall submit detailed proposal for grounding system for approval of purchaser. Any provision to be made in the building design to take care of earthing requirement shall also be clearly spelt-out.

1.4.18. Partial discharge monitoring system and dew point meter [Applicable for GIS & Hybrid]

- a. Static Contact Resistance Meter and Dynamic Contact Resistance Meter, CB Operational Analyser, SF6 Gas Detector Meter, Partial Discharge Meter (UHF Type) and Dew Point Meter shall be provided.
- b. Dew point meter:
 - i. The Meter shall be capable of measuring the Due Point of SF6 Gas of the Circuit Breaker / GIS Equipment. It should be portable and adequately protected for outdoor use. The Meter shall be provided with Due Point Hygrometer with digital indication to display the Due Point Temperature in

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[26]	25.09.2014

degree Centigrade, degree Fahrenheit or PPM. It should be capable of measuring the corresponding pressure at which due point is being measured.

- ii. The measurement and use of the instrument must be simple, direct without the use of any other material / chemical like dry ice / acetone etc.
- iii. It should be suitable for operation on 220 Volts, 50 Hz, and AC Mains Supply.
- iv. Measuring Range: Up to - 50 degree Centigrade Dew Point.
- v. Accuracy: ± 2 degree Centigrade
- vi. Display: 4 digit LCD, 0.5 inch. High

c. Portable PD Monitoring System

- i. The Equipment shall be used for detecting different types of defects in Gas Insulated Stations (GIS) such as Particles, Loose Shields and Partial Discharges as well as for detection of Partial Discharges in other types of Equipment such as Cable Joints, CTs and PTs.
- ii. It shall be capable for measuring PD in charged GIS environment as EHV. The instrument shall be able to detect Partial Discharges in Cable Joints, Terminations, CTs and PTs etc, with the hot sticks
- iii. Detection and Measurement of PD and bouncing particles shall be displayed on built - in large LCD display and the measurement shall be stored in the instrument and further downloadable to a PC for further analysis to locate actual source of PD such as free conducting particles, floating components, voids in spacers, particle on spacer surfaces etc.
- iv. Measurement shall be possible in noisy environment.
- v. Stable reading shall be possible in presence of vibrations within complex GIS Assemblies, which can produce signals similar to PD.
- vi. The Equipment shall be battery operated with built - in - battery charger suitable for 230 V, 50 Hz A. C. Input.
- vii. Measurement shall be possible in the charged Switchyard in the presence of EMI / EMC. Supplier should have supplied similar detector for GIS application to other utilities.
- viii. Instrument shall be supplied with standard accessories including laptop and software.
- ix. The Function of Software shall be covering the following: -
 - Data Recording, Storage and retrieval in Computer
 - Data Base Analysis
 - Template Analysis for easy location of fault inside the GIS
 - Evaluation of PD Measurement i.e. Amplitude, Phase Synchronization etc
 - Evaluation of Bouncing / Loose Particles with flight time and estimation on size of particle

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[27]	25.09.2014

- Report generation
- To prove the suitability in charged Switchyard condition, practical demonstration shall be conducted before acceptance.
- Instrument shall be robust and conform to relevant standard.

1.4.19. Air Conditioning, Ventilation and Handling Equipment System for Switchyard (If Applicable)

a. Air Conditioning System

Table-5

SL. NO	PREMISES	TYPE OF AC TO BE PROVIDED.
1	Relay and Control Room	Water-cooled packaged Air-conditioners, Cooling towers, Pumps, Ducting, Piping, Electrics etc. [3 x 50% configuration shall be followed for all equipments.]

b. Ventilation System

Table-6

SL. NO	PREMISES	TYPE OF VENTILATION TO BE PROVIDED.
1	400 kV/220kV Gas Insulated Switchgear Building, Stores, Battery room, maintenance room, toilets and any other rooms which generate heat.	Exhaust Ventilation with Propeller Fans/axial flow fans
2	LT switchgear room & Cable galleries	Pressurised Ventilation system comprising of Centrifugal Fan /Tube Axial Fan (2 x 50%) with ducting, Filters, grilles, dampers, inlet louvers as required.

1.5 Tests

a. Type Test

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[28]	25.09.2014

For each type & rating of equipment for [220 kV/400 kV] substation, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

b. Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

i. Current transformer

Each current transformer shall be subject to the following routine tests. As far as practical, the procedure of IEC shall be followed.

- Construction inspection
- Verification of terminal markings
- Power frequency withstand tests (primary and secondary)
- Partial discharge measurement
- Power frequency withstand tests between sections of primary and secondary windings
- Inter turn overvoltage test
- Determination of errors
- Ratio test
- Accuracy test

ii. Capacitor voltage transformers

Each capacitive voltage transformer shall be subject to the following routine tests. As far as practical, the procedure specified by IEC/IS shall be followed:

- Construction Inspection
- Capacitance and dissipation factor measurement of the capacitor divider before and after power frequency withstand voltage (dry) test.
- Power frequency withstand voltage (dry) test for capacitor divider
- Dielectric tests for electromagnetic unit.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[29]	25.09.2014

iii. Isolators

Each isolator shall be subject to the following routine tests. As far as practical, the procedure specified by IEC/IS shall be followed:

- Construction inspection
- power frequency voltage dry test
- measurement of resistance of main circuit
- control and secondary wiring check tests
- Mechanical operations test.

iv. Circuit breaker

Each circuit breaker shall be subject to the following routine tests. As far as practical, the procedure specified by IEC/IS shall be followed:

- Construction inspection
- Leakage tests (for SF6 circuit breaker)
- Operating speed check
- Dielectric test
- Control and secondary wiring check test
- Mechanical operations test
- Operating mechanism system check
- Voltage withstand test on Auxiliary circuits
- Measurement of resistance of main circuit of each pole
- Power frequency withstand voltage withstand test on main circuit of each pole and the combination of poles and breaker frame.

v. Lighting Arrester

Each capacitive voltage transformer shall be subject to the following routine tests. As far as practical, the procedure specified by IEC/IS shall be followed:

- Construction Inspection
- Measurement of reference voltage
- Residual voltage test
- Internal partial discharge test.

c. Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[30]	25.09.2014

parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

d. Test Certificates

- i. Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- ii. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

- e. The Electrical Connections across the Bellows or Compensating Units shall be made by means of suitable Connectors.

1.6 Drawings, Data and Manuals

The following minimum Drawings, data & manuals for the Switchyard and its auxiliaries shall be submitted as indicated below:

- a. *[Dimensional GA drawing of each individual equipment.*
- b. *Data sheets of each individual equipment*
- c. *Switchyard Layout & Single line diagram.*
- d. *Sag Tension Calculation and Short circuit force Calculation.*
- e. *Type test report (short circuit, temperature rise test) for similar rating of equipment manufactured by the proposed manufacturer for each individual equipment.*
- f. *The bidder may note that the drawings, data and manuals listed are minimum requirement only. The bidder shall ensure that all other necessary write-ups, curves and information required to fully describe the equipment offered are submitted with his bid.]*

1.7 Ratings & Requirements

1.7.1 400kV & 220kV Switchyard

Table - 7

S.NO	DESCRIPTION	UNIT	220 kV	400 kV
1	Nominal / Rated voltage	kV	220	400
2	Maximum System Voltage	kV	245	420
3	Rated Frequency	Hz	50	50
4	No. Of Phases		3	3
5	Rated power frequency	kV	460	630

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[31]	25.09.2014

S.NO	DESCRIPTION	UNIT	220 kV	400 kV
	withstand voltage (1 min)	(r.m.s)		
6	Rated lighting impulse withstand voltage (1.2/50 μ s)	kVp	1050	1425
7	Rated switching impulse withstand voltage (250/2500 μ s)	kVp	NA	1050
8	Rated Normal Current bus bar	A	[2000]	[2000]
9	Rated Normal Current feeder	A	[2000]	[2000]
10	Rated short breaking Current	kA	40	40
11	Rated peak withstand current	kAp	100	100
12	Rated Short-time withstand current	kA	40	40
13	Leakage rate per year and gas compartment	%	[≤ 0.5]	[≤ 0.5]
14	Auxiliary DC supply (2 wire ungrounded)	V DC	220 \pm 10%	220 \pm 10%
15	Auxiliary AC supply (3 ph. 4 wire, 50 Hz)	V	415 \pm 10%	415 \pm 10%
16	Seismic Acceleration	g	[0.3]	[0.3]
17	Ambient temperature range		[As per specific project site data]	[As per specific project site data]
18	Creepage Distance	mm/kV	31	31

1.7.2 Circuit Breakers

Table - 8

S.No.	DESCRIPTION	220 kV	400 kV
	Service	Ourdoor	Ourdoor

S.NO	DESCRIPTION	UNIT	220 kV	400 kV
7.	One minute power frequency withstand voltage at minimum operating gas pressure	kVp	460	630
8.	Creepage distance at rated voltage	mm/kV	[31]	[31]

1.7.9 Power Line Carrier Communication

Table – 15

S NO	DESCRIPTION	DATA
1	Mode of Transmission	Single Side Band, Amplitude modulated, with suppressed/reduced carrier.
2	H.F. range	40-500 kHz, programmable
3	Nominal carrier frequency band	1no x4(for single channel sets) 2nox4(for twin channel sets)
4	Effectively transmitted speech frequency band or signal frequency band when only speech or signal is transmitted	300-3400Hz or more
5	Effectively transmitted speech plus signal frequency band in case of multipurpose use	Speech: 300-2000 Hz Signal : 300-3400 Hz or more
6	Nominal Impedance	
	a) Carrier Frequency Side	[150 ohms, balanced/ 75 ohms unbalanced]
	b) VF Side	600 ohms
7	Nominal carrier Frequency Power	As required to maintain the required S/N ratio under adverse case
8	Supply voltage	48V DC, + 15%, -10%
9	Frequency difference	As per relevant IEC/IS

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[47]	25.09.2014

S NO	DESCRIPTION	DATA
	between voice frequency band transmitter and receiver in a pair of PLC terminals	
10	Stability of carrier frequency from its nominal value	± 10 Hz
13	Telephone signaling channel:	<p>i. Frequency shift keying (pulse distortions) of the telephonic signaling channel at signaling speed of 10 pulse per second shall be less than 5 m. sec. for one pair of terminals.</p> <p>ii. The Signaling channel shall be operated by a potential free open or closed contact at the transmit side and provide a potential free change over contact at the receiver side. All relays to be provided in the speech circuits shall be hermetically sealed.</p>
S NO	DESCRIPTION	DATA
Wave Trap		
1.	Rated Voltage (Nominal/Max)	400/420KV 220/245KV
2.	Rated Frequency	50Hz 50Hz
3.	Rated continuous current at 50 °C	[2000 A]
4.	Rated short time current for 1sec	[40kA] [40kA]
5.	Nominal discharge current of protective device	[20 kA] [20 kA]
6.	Rated inductance	[0.5 mH] [0.5 mH]
7.	Resistive component of impedance within carrier frequency blocking	[Not less than 570 ohms] [Not less than 570

Document Number	Rev No.	Description	Page No.	Date of Issue

2 220 KV/400 KV SWITCHYARD CONTROL AND PROTECTION SYSTEM

2.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of 220 kV/400 kV Switchyard Control, metering and Protection System, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] Of [Name of the Power Plant] at [District], [State] for [Name of the Client].

2.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

Codes	Name of Standard
IS : 1248	Direct acting indicating analogue electrical measuring instruments and their accessories
IS: 2551	Danger notice plates
IS :2705	Current transformers-specification
IS :3156	Voltage transformer specification
IS :3231	Specification for electrical relays for power system protection
IS :8686	Specification for static protective relays
IS: 13947	Degree of Protection
IS :9000	Quality Management Systems
IEC 60068	Environmental Testing
IEC 60255	Electrical Relays
IEC 60801	Electromagnetic compatibility for industrial-process measurement and control equipment
IEC 61000	Electromagnetic compatibility
IEC 61850	Substation Automation

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[56]	25.09.2014

Codes	Name of Standard
IEEE/ANSI 37.901(1989) ENV 50140 CLASS III	Electromagnetic compatibility
C37.91-2000	IEEE Guide for Protective Relay Applications to Power Transformers
C37.101-1993 (R2000)	IEEE Guide for Generator Ground Protection
ENV 50204	Radiated electromagnetic field from digital radio telephones - immunity test
CEA	CEA regulations for installation and operation of meters 2006.
CEA	Standard technical specifications for main plant package

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

2.3

Design Criteria

- a. 220 kV/400 kV Switchyard Control And Protection panels shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%.
- b. All equipment shall be suitable for following voltage & frequency variations as well:
 - i. Voltage Variation : (±) 10%
 - ii. Frequency Variation : (+) 3% to (-)5%
 - iii. Combined Variation of Voltage & Frequency : 10% (absolute sum)

2.4

Specific Requirement

2.4.1

Control Philosophy for 400 kV Switchyard

The substation automation system (SAS) based on IEC- 61850 shall be provided for integrated protection, control, communication and monitoring of the various switchyard units / equipment in the [400/220] kV switchyard and shall provide two levels of control viz. at the individual bay level and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[57]	25.09.2014

centrally at the HMI level. The equipment comprising the Substation Automation System viz Bay Control Unit / Bay Protection Unit / Bay Metering Unit for respective bays, HMI etc. shall be located in the control room of switchyard.

The SAS comprises of HMI, (OWS), OES, SAS panels, marshalling cabinets, communication links, Ethernet, printers, scanners, UPS etc. SAS is an integrated system to control, monitoring, protection, metering and communication functions of all the 400/ 220kV feeders. It has facility of SCADA function as well. It has the capability to link with LDC and energy management. All the meters e.g. kV, kA, MW, MVAR, PF, Hz etc. for all the feeders are located in SAS panel. The requirement of UPS for SAS shall be supplied by SAS manufacturer

Control via SAS shall be possible at the following levels:

- a) At the bay level, the following are envisaged
 - i. Bay control unit (BCU)
 - ii. Bay protection unit (BPU)
 - iii. Bay metering unit (BMU)
- b) At the [220/400] kV switchyard control room level the following are envisaged.
 - i. 2 Nos. data concentrators and controllers providing hot dual redundancy.
 - ii. [2 numbers Operator Work Stations and one number Engineering Work Station with differentiated levels of access. They shall be 64 bit PC based HMI on Windows OS preloaded with application interface software, configuration software, Network management software with dual Ethernet communication, High resolution 21-inch TFT colour monitor with minimum pixel resolution of 1600x1280, non-interlaced refresh rate of min 85 Hz, 32 bit color support as minimum and key board and optical mouse. In addition, the scope shall also include one no. laptop/notebook computer of latest configuration with configuration software for onsite modifications of the control and protection devices.]
 - iii. Two Nos. Ethernet compatible color Laser Jet printers (A3 size) - One printer for event logs and another printer for alarm / fault logs.
 - iv. Industrial, rugged, managed ethernet switches with required number of Fiber optic and copper wire ports and required dual power supply modules. Ethernet switches shall be suitable for dual FO ring. Two additional switches shall be provided to interface the SAS with other systems.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[58]	25.09.2014

- v. An industrial, Ethernet network interconnecting all Ethernet switches. Network shall be a dual ring of FO cable.
- vi. It is envisaged that one Bay Control Unit (BCU) shall be provided for each bay. Bus bar protection shall be deemed as an additional bay. The control room shall be provided with air conditioning system. However, the equipment provided shall not degrade in performance if air conditioner fails for a period of 4 hours.
- c) At the Power plant Control room
Two Nos. Engineering cum operating Work Station and One No. Ethernet compatible color Laserjet printer (A3 size)- for event logs shall be provided by extending the SAS data bus, through redundant link on Fibre optic cable in the Central Control Room of Power Plant in TG building for which space will be provided by TG package contractor.

2.4.2 Substation Automation System

- a. The entire sub – systems, items, components etc comprising the SAS shall be latest, state-of-the-art, based on industry standards, suitable for operation under electrical environment present in the EHV switchyards. The architecture of the SAS shall allow for free future extension or maintenance without causing a system shut down. At the sub- system / component level, a single failure shall not result in loss of system functionality. To this end, the components shall be provided with self – diagnostic features and shall be capable of self – supervision. The sub – systems shall be provided with on line testing sub- routines so as to preclude the requirement of periodic testing and maintenance.
- b. The system provided shall be such that it provides for obsolescence guarantee for a period of [25] years and required support from the bidder to meet the hardware and software aspects of obsolescence protection is mandatory.
- c. All software provided as part of supply shall be licensed and the nature of the license shall be such that fresh license / renewal of license is not called for whenever any hardware is updated or changed.
- d. The PC-based Substation Automation System shall monitor and control the entire 400 and 220 kV switchyards. It shall be a fully integrated system and has to fulfill all tasks but not being limited to the following:
 - i. Interface to IEDs for each Bay (Bay Control Unit, Bay protection Unit, Bay Metering Unit) for display of status / alarm / event / disturbance recording on PC,
 - ii. Generation of dynamic mimic on PC and acquisition
 - iii. Preprocessing and display of measured values.
 - iv. Control of switchgear devices. e.g. CBs / Isolators from HMI.
 - v. Sequence of event recording (SOE) / disturbance recording

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[59]	25.09.2014

- vi. Archiving of data comprising of measured values, event and alarm data, including those obtained from the protection relay such as the disturbance recording.
- e. Software Requirements
 - i. The system shall be based on standard and proven firmware and software which has already been implemented in other systems supplied elsewhere. Software configuration tools shall be available to adapt the system to the specific switchgear layout, to do settings, to create displays, to define event and alarm text etc. Configuration software shall require no knowledge in programming languages or system source code. *[The system must have an open architecture to ease data exchange between different applications and systems.]*
 - ii. System hardware and software shall be configurable and standard type as employed for other similar projects. For future modifications or extensions, it is to be easily extendible by adding new components. For new components, having the same functionality as the original system, additional programming shall not be required, only the configuration data shall be adapted. All software tools required for this purpose have to be included in the scope of supply.
 - iii. The system must be a fully coordinated system, and shall ensure:
 - A common database for all alarms and fault records which come from metering units or protection relays
 - Complete operation and analysis using the same software package.
- f. System Reliability and Availability
 - i. Each component and equipment offered by the bidder shall be of established reliability. The minimum target reliability of each piece of equipment shall be established by the bidder considering its MTBF, MTTR such that the availability of the complete system is assured. If requested the bidder shall furnish back up calculations to prove the system availability figure quoted by him. The guaranteed annual system availability shall not be less than 99.9%. Adequate redundancy shall be built into the system design at hardware and software levels to ensure this availability.
 - ii. The substation automation system shall be self-monitoring. Failure of a module or component shall be immediately detected and displayed thus guaranteeing the highest availability. Depending on the type of fault detected the affected module shall either be reset or blocked. Failure of a single module shall not impact operation of other system components.
 - iii. Self - monitoring and diagnostics shall comprise of:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[60]	25.09.2014

- Live monitoring for modules and apparatus
 - Monitoring of internal auxiliary voltages
 - Memory checks
 - Software supervision by watchdog circuit
 - Continuous monitoring of all interfaces
 - LED's on the BPU to indicate internal and external faults
 - Software tools for the diagnosis of the faults
- iv. A loss of power may not cause the loss of configuration data. An additional battery shall not be required for same. After restoration of power the system shall restart automatically. During start-up all output contacts shall be reset and blocked until after the completion of the restart with all settings being set to the default status. To enhance availability neither fans nor mechanical disk drives or any other constantly moving mechanical components are acceptable for use in the system except for the PC.

g. Electromagnetic Interference (EMI)

To avoid electromagnetic interference causing malfunction, the system shall be suitable for operation under the ambient conditions present in EHV switchyards. IEDs as well as the system's Substation Controllers must be shielded and be based on hardware components designed for operation under such conditions. These components shall be of tested design according to applicable international standards.

2.4.3

Functional requirements of Substation Automation System

- a. Operation shall be possible from only one place at a time. Normally operation from the bay controller shall be possible only upon receipt of permission from the Control Room and in such case; the operation of particular bay equipment only shall be possible after verification of all interlocks. The priority for control shall be with the lowest possible control level and this shall be indicated at all levels for the awareness of the operator.
- b. Select-before-execute principle

The command for operation of any field equipment shall always be given in the following stages:

- i. Selection of the object
- ii. Command for operation
- iii. If a permitted command is not executed within a set time, which shall be configurable for each operation, the command shall be cancelled / locked out and the operator shall be required to reset the operation command. A time stamped fault log shall be generated in this event.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[61]	25.09.2014

c. Bay level functions

In the decentralized architecture, the functionality shall be as close to the controlled equipment as possible. In this respect, the following functions are allocated at bay level:

- i. Bay control functions including data collection functionality
- ii. Bay protection functions
- iii. Bay metering function

Separate IEDs shall be provided for bay control function and bay protection function. Bay metering system shall take into account the operational state of the switchyard.

d. Bay control functions

- i. Bay level safety and control interlocks for safe switching of equipment
- ii. Operation of CBs / Isolators / Earth switches / Tap change
- iii. Blocking of duplicate / simultaneous commands
- iv. Cancellation of commands if set time is exceeded and fault log generation
- v. Operation count for circuit breakers
- vi. Operating pressure supervision for SF6 gas
- vii. Supervision of faults in operating mechanisms of switching devices/tap changing device
- viii. Display of status of equipments in the bays (MIMIC)
- ix. Alarm/fault annunciation
- x. Display of concurrent measurements
- xi. Local HMI with display on BCU
- xii. Interface to Ethernet switches
- xiii. Local Data storage for fault events
- xiv. Waveform display on request
- xv. Disturbance record on request
- xvi. CT/PT selection scheme for protection and measurement
- xvii. Operation under conditions of dead line – live bus, live line – dead bus, dead bus – dead line
- xviii. Tap position, winding and oil temperature displays for transformer bays
- xix. Facility for changeover of control from HMI to bay controller unit upon failure of HMI operation.

e. Bay protection functions

- i. The bay protection function IED shall be distinct from bay control IED.
- ii. Bay protection IEDs shall be connected to the communication infrastructure for data sharing and shall meet the real-time

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[62]	25.09.2014

communication requirements for automatic functions. The data presentation and the configuration of the various IEDs shall be compatible with the overall system communication and data exchange requirements.

- iii. Each Bay Protection Unit shall comprise one or more numerical relays to meet the protection requirements specified for each type of feeder. The BPU's shall be capable of interfacing with PLCC equipment directly.
- iv. Bay Protection Units for Switchyard Bays shall interact with BCUs over Network to share information related to Bay Level Interlocking, fault data, alarms/events etc. However, the trip commands from Bay Protection Units shall be hard-wired directly to appropriate switchyard equipment. Critical interlocks such as bus differential, bus earth switch etc shall be hard wired additionally to ensure operation of critical functions even when LAN is out of order.
- v. The relay should have high immunity to electrical and electromagnetic interference. It should be compliant with IEC 61850 protocol.
- vi. The offered relay shall have a comprehensive local operator interface. It shall have the following minimum elements so that the features of the relay can be accessed and setting changes can be done locally.
 - Alphanumeric display unit
 - Fixed LEDs for trip/alarm relay available and relay out of service.
 - Keypad for browsing, setting the relay parameters
- vii. The relays should have two communication ports viz. front serial port for local communication for reading / modifying relay settings, extraction and analysis of fault/event/ disturbance records from a laptop and a Rear port on IEC – 61850 standard for connection to network.
- viii. The relays shall have the following features:
 - Fault record – The relay shall have the facility to store fault records with information on cause of trip, date, time, trip values of electrical parameters.
 - Event record – The relay shall have the facility to store time stamped event records with 1ms resolution.
 - Disturbance records – User configurable disturbance records shall be provided in the offered numerical relays.
 - It shall be possible to store this information in the event of an auxiliary supply failure with the help of a battery backup.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[63]	25.09.2014

- The relay settings shall be provided with password protection.
 - It shall be possible to change the relay setting from the front panel using the keypads.
 - The relay shall have comprehensive self-diagnostic feature. This feature shall continuously monitor the healthiness of all the hardware and software elements of the relay. Any failure detected shall be annunciated through a output watchdog contact. The fault diagnosis information shall be displayed on the LCD and also through the communication port.
 - The Numerical Relays shall be provided with 1 set of common Windows based software, which shall allow easy settings of relays in addition to uploading of event, fault, disturbance records, measurements. The relay settings shall also be changed from local or remote using the same software.
- f. Bay measurement function
- i. The values of active power (W), reactive power (VAR), frequency (Hz), and the rms values for voltage (U) and current (I) shall be calculated. Threshold limit values shall be selectable for alarm indications.
 - ii. Bay Measurement IED shall directly interface with the communication infrastructure. Further, the measurement shall be on true RMS basis with the possibility to read harmonics, if any.

2.4.4 System Level Functions

- a. Status supervision
- i. The position of each switchgear e.g. circuit breaker, isolator, earthing switch, transformer, tap changer etc. shall be supervised continuously. Every detected change of position shall be immediately displayed in the single line diagram on the station HMI screen, recorded in the event list, and a hard copy printout shall be produced. Alarms shall be initiated in the case of spontaneous position changes.
 - ii. The switchgear positions shall be depicted by normally closed (NC) or normally open (NO) contact, which shall give ambivalent signals. An alarm shall be initiated if the time required for operating mechanism to change position exceeds a predefined limit. Further operation on the same switching element shall require a reset command from the operator.
- b. Multi – level password protected access

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[64]	25.09.2014

The system shall provide password protected access to various user groups and it shall be possible to configure the jurisdictional limits for each user group at the highest access level. The system shall provide a log for any changes made in the security configuration which shall provide the identification of the person making the change, date, time and area of the system modified. The highest security level shall be the system administrator who shall have unlimited access to the SAS and shall be able to modify the user list and assign access rights to various levels of access.

- c. Display and Archiving of Analogue and metered Values
 - i. The HMI in Central control room shall store historical analogue data continuously with a time interval user- definable from 500 msec to 1 day in the database. The archived data shall cover measured analogue values and metered values.
 - ii. The data is to be displayed in diagrams and charts. The operator may select the values and the time period to be displayed, zoom the diagrams and read out values. Settings for recording and display e.g. time resolution or values to be stored can be modified by the operator on-line.
 - iii. An additional tool which comprises at least the functions listed below shall be available to process the data stored in the data base:
 - Read out the data from the data base
 - Display the data in diagrams and tables, calculate and display average values (15 min, per hour, per day)
 - Calculate and display minimum and maximum values (15min, per hour, per day)
- d. Operation of Switchyard through HMI
 - i. On the HMI, the object has to be selected first. In case blocking or interlocking conditions are not met, the selection shall not be possible and an appropriate alarm annunciation shall occur. If a selection is valid the position indication shall show the possible direction and the appropriate control execution button shall be pressed in order to close or open the corresponding object.
 - ii. Control operation from other places shall not be possible in this operating mode.
- e. Visual Presentation and dialogues
 - i. The normal screen shall be the one line overview of the entire switchyard. However, no control shall be possible in the overview which shall only represent the status of the switching elements. For controlling the equipment of any bay, the operator shall have to zoom to a detailed one-line diagram for a bay.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[65]	25.09.2014

- ii. By pointing the cursor at any element of the bay one line diagram and clicking on the mouse, a dialogue box of the controllable element shall open up. The dialogue box shall display the current status of the element/measured value and shall allow the operator to execute the desired action viz opening/closing/tap, raise/ lower tap etc. If the action initiated by the operator is not complying with the safety/control interlocks, the inconsistency shall be highlighted through a pop up alarm window.
 - iii. An alarm line at the top of the screen shall display the latest fault recorded along with time on a FIFO basis.
 - iv. An acoustic alarm shall indicate abnormalities, and all unacknowledged alarms shall be accessible from any screen selected by the operator.
 - v. Consistent design principles shall be adopted for the HMI display concerning labels, colours, dialogues and fonts.
 - vi. The object status shall be indicated using different status colours for
 - vii. Selected on the screen
 - Not updated, obsolete values, not in use or not sampled
 - Alarm or faulty state
 - Control blocked
 - Normal state etc
 - viii. Objects under transition following a command from the operator shall be shown as rapidly blinking till desired switching state is attained.
- f. Event and alarm handling
- Events and alarms as generated shall be recorded in an event list in the station HMI. Alarms shall be recorded in a separate alarm list and appear on the screen. All or a freely selectable group of events and alarms shall also be printed out on an event printer. The alarms and events shall be time-tagged with a time resolution of 1 ms.
- g. Event list
- i. The event list shall contain events that are important for the control and monitoring of the switchyard.
 - ii. The event and associated time (*with 1 ms resolution*) of its occurrence has to be displayed for each event.
 - iii. The operator shall be able to call up the chronological event list on the monitor at any time for the whole switchyard or sections of it.
 - iv. The events shall be registered in a chronological event list in which the type of event and its time of occurrence are specified. It shall be possible to store all events in the computer for at least

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[66]	25.09.2014

one month. The information shall be obtainable also from a printed event log.

v. The chronological event list shall contain:

- Position changes of circuit breakers, isolators and earthing devices
- Indication of protective relay operations
- Fault signals from the switchgear
- Indication when analogue measured values exceed upper and lower limits. Suitable provision shall be made in the system to define two level of alarm on either side of the value or which shall be user defined for each measure.
- Loss of communication

vi. Filters for selection of a certain type or group of events shall be available. The filters shall be designed to enable viewing of events grouped per:

- Date & time
- Bay
- Device
- Function e.g. trips, protection operations etc.
- Alarm class

h. Alarm list

i. Faults and errors occurring in the switchyard shall be listed in an alarm list. It shall contain unacknowledged alarms and persisting faults. The date and time of occurrence shall be indicated.

ii. The alarm list shall consist of a summary display of the present alarm situation. Each alarm shall be reported on one line that contains.

- The date and time of the alarm
- The name of the alarming object
- A description text
- The acknowledgement state
- Acknowledged and cleared

iii. Whenever an alarm condition occurs, the alarm condition must be shown on the alarm list and must be displayed in a flashing state along with an audible alarm. After acknowledgement of the alarm, it should appear in a steady (i.e. not flashing) state and the audible alarm shall stop.

iv. The alarm should disappear only if the alarm condition has been cleared and the operator has reset the alarm with a reset command.

v. The state of the alarm shall be shown in the alarm list (Unacknowledged and persistent, Unacknowledged and cleared, Acknowledged and persistent).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[67]	25.09.2014

- vi. Audible alarm shall be hooter type to alert the operator and not buzzer (e.g. PC buzzer). Hardware necessary to drive the hooter shall be included.
- vii. Filters for selection of a certain type or group of alarms shall be available as for events.
- i. Input / Output signals

The required Input/Output signals that are not covered by the serial links shall be obtained through hard wiring.

The lists of I/Os shall be finalized during the detailed engineering & execution. The bidder shall provide the number of I/Os as required.

j. Reports

- i. The reports shall provide time related follow ups of measured and calculated values. The data displayed shall comprise:

ii. Trend reports:

- Day (mean, peak)
- Month (mean, peak)
- Semi-annual (mean, peak)
- Year (mean, peak)

iii. Historical reports of selected analogue Values:

- Day (at 15 minutes interval)
- Week
- Month
- Year

iv. It shall be possible to select displayed values from the database in the process display on line. Scrolling between e.g. days shall be possible. Unsure values shall be indicated. It shall be possible to select the time period for which the specific data are kept in the memory.

v. Following printouts shall be available from the printer and shall be printed on demand.

- Daily voltage and frequency curves depicting time on X-axis and the appropriate parameters on the Y-axis. The time duration of the curve is 24 hours.
- Weekly trend curves for real and derived analogue values.
- Printouts of the maximum and minimum values and frequency of occurrence and duration of maximum and minimum values for each analogue parameter for each circuit in 24 hr period.
- Provision shall be made for logging information about breaker status like number of operation with date and time indications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[68]	25.09.2014

- Equipment operation details shift wise and during 24 hours.
- Printout on adjustable time period as well as on demand for MW, MVAR, Current, Voltage on each feeder and transformer as well as Tap Positions, temperature and status of pumps and fans for transformers.
- Printout on adjustable time period as well as on demand system frequency and average frequency.

k. Trend display (Historical data)

It shall be possible to illustrate all types of process data as trends – input and output data, binary and analogue data. The trends shall be displayed in graphical form as column or curve diagrams with a maximum of 10 trends per screen. Adjustable time span and scaling ranges must be provided.

It shall be possible to change the type of value logging (direct, mean, sum or difference) on-line in the window. It shall also be possible to change the update intervals on line in the picture as well as the selection of threshold values for alarming purposes.

l. Automatic disturbance file transfer

All disturbance record data from the IEDs shall be automatically uploaded (event triggered) to the station HMI data concentrator and displayed in the HMI display on request.

m. IED parameter setting

It shall be possible to access all protection and control IEDs for reading the set parameters as well as parameterizing the IEDs from the station HMI. The setting of parameters or the activation of parameter sets shall only be allowed after entering a password. The functionality shall include down loading and uploading of control logic and protection settings, automatic uploading of fault waveforms and fault data. Software for remote parameterization of numerical relays shall also be provided.

n. Automatic sequences

The available automatic sequences in the system should be listed and described (e.g. sequences related to the bus transfer). It must be possible to initiate pre-defined automatic sequences by the operator and also define new automatic sequences.

o. Mass Storage

The SAS shall include mass storage device in the form of sufficiently sized hard disks as well as disk writing facility to enable mass storage of all information such as application programs, database configurations, historical

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[69]	25.09.2014

data, alarm and event logs etc. The size of the hard disk shall be adequate for storing data for one month with a minimum size of 200GB.

2.4.5 Managed Ethernet Switches

- a. The Ethernet switches forming a part of the network shall be rugged, industrial type and shall be IEC 61850 compliant. They shall be suitable for the electric environment prevalent in high voltage switchyards as well as the harsh climatic conditions encountered.
- b. In general, the switches shall be suitable for a temperature of 60 °C without performance degradation.
- c. The switches shall include dual power supply and shall be suitable for dual redundant FO bus.
- d. All switches in the control room shall be suitable to connect the FO cable directly & not through FO to Ethernet (Copper) converter.
- e. The number of Ethernet switches shall be as per actual requirement.
- f. Network Management System
 - i. The scope shall include Network Management System (NMS) software for following management functions.
 - Configuration Management
 - Fault Management
 - Performance Monitoring
 - ii. This system shall be used for management of communication devices and other IEDs in the system. This NMS can be loaded in HMI and shall be easy to use, user friendly and menu based. The NMS shall monitor all the devices in the SAS and report if there is any fault in the monitored devices. The NMS shall:
 - Maintain performance, resource usage, and error statistic for all managed links and devices and present this information via displays, periodic reports and on demand reports
 - Maintain a graphical display of SAS connectivity and device status
 - Issue alarms when error conditions occurs
 - Provide facility to add and delete addresses and link

2.4.6 Remote Interfaces

- a. The SAS shall have provision, including software and hardware, to provide remote interfaces with local LDC.
- b. Gateway/modem, LAN switches etc as required shall be provided in the switchyard control room.
- c. The communication with local LDC shall be over IEC – 60870-5-101 protocol by providing dedicated gateway for 400 kV & 220 kV switchyards.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[70]	25.09.2014

- d. The selected information such as bus voltage, active and reactive power, status of breakers etc to be shared with the LDC shall be finalized during detailed engineering and the effective communication shall be demonstrated on – site.
- e. The required interfacing equipment to provide tele-metering / tele-signalling information through PLCC shall also be included as part of SAS.
- f. Bidder shall include one no. gateway to be located in the Control Room of Power Plant. In addition, two nos. engineering cum Operator Work Station to be supplied which shall be located in the Control Room of Power Plant. It shall be possible to obtain the energy/power data from the metering bus for ABT meters at these terminals as also to trend the data using appropriate energy management software over adjustable time periods.

2.4.7

DDCMIS Communication Link

- a. The SAS shall be networked with the central DDCMIS (this networking shall be under the scope of bidder) on communication link Ethernet TCP/IP based using bidirectional OPC connectivity. Necessary hardware, software and engineering required for the same shall be provided by the bidder. The communication links shall be redundant using fiber optic cable. The link shall be as two physical cables routed in two different physical paths.
- b. SAS shall provide necessary process graphics, alarm status, real time and history trends to the DDCMIS for centralised monitoring. The SAS shall maintain the required controls, logics and interlock required for the Switchyard / sub-station equipments. The GT feeders and tie feeder breakers shall also be controlled from DDCMIS which can be used at time of synchronization with grid. The necessary connection from SAS to DDCMIS shall be provided by bidder.
- c. The spare Ethernet ports shall be provided by the bidder on the DDCMIS side. Bidder shall provide the communication cable (FO cable), necessary interface hardware required on the SAS side, necessary interfacing hardware on the DDCMIS side and OPC connectivity client / server software (as required) on the SAS side.
- d. The bidder shall implement the OPC tags & graphics and establish the communication link. Bidder shall also be responsible to integrate the SAS with the DDCMIS on OPC links and demonstrate the same at site. Bidder shall co-ordinate with the central DDCMIS for proper implementation of communication link and graphics. The parameters to be exchanged between the DDCMIS and SAS shall be finalised during detail engineering.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[71]	25.09.2014

2.4.8 Protection Philosophy

- a) Each element of the [400/220kV] system shall be provided with high-speed discriminative protection (main protection) capable of detecting all "credible" faults and issuing tripping commands to the associated circuit breakers within the prescribed time. "Credible" faults shall include all faults whether phase/phase or phase/earth irrespective of whether maximum or minimum plant is connected, account being taken of the fault impedance. "Non-credible" faults are those involving a second order plant failure, for example, a broken conductor lying on high resistance ground and for which extended fault clearance time may be acceptable.
- b) There shall be two sets of main protection such that the loss of one set or the failure of one sets to clear a fault will not result in time tripping for an electrical fault. Redundant auxiliary supplies shall be used and there shall be redundant tripping systems.
- c) In the event of an uncleared external fault or any other abnormal operating condition which may cause damage to plant, time delayed tripping shall be initiated as a back-up action to prevent plant damage.
- d) All relays performing measuring function shall be of numerical design with continuous self-monitoring and supervision. The main numerical relays shall offer instrumentation, disturbance recording, and event logging functions in addition to providing protection. All monitored and recorded information available from the protection relays up to and including the main LV circuits shall be accessible in the central control room via substation automation system (SAS). Protection relays shall be from approved suppliers and they shall be type-tested according to relevant sections of IEC 60255 and IEC 60068.
- e) On the occurrence of an electrical fault on the main generating plant or on the [400/220kV] power system, the high speed discriminating protection systems (main protection) shall rapidly detect the fault and initiate the opening of only those circuit breakers which are necessary to disconnect the faulted plant or circuit from the network. Protection equipment associated with adjacent plant or circuits may detect the fault, but there must be discrimination between this protection and that of the faulted plant or circuit. Time delayed tripping is not permitted except where main protection has failed to clear a fault or where plant damage would otherwise occur.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[72]	25.09.2014

- f) All back-up protection systems shall be able to discriminate with main protection systems, circuit breaker fail protection and with other back-up protection systems installed elsewhere on the electrical system. The protection systems shall be designed for a service life of [25 years], allowing for normal maintenance in accordance with manufacturers recommendations being performed during the service life. The period for which life time support will be provided for the protection system equipment shall be stated.
- g) Circuit breaker fail protection shall be provided to cater for the possibility of a single circuit breaker failing to clear fault current when commanded to do so, by either of the two main protection systems. The breaker fail protection shall initiate rapid back-tripping and intertripping of other circuit breakers, as necessary. Automatic reclosing equipment shall be provided for line circuit breakers, to facilitate the rapid reinstatement of transmission circuits following transient fault clearance.
- h) Each [400/220kV] circuit breaker shall be equipped with two independent, separately triggered trip coils. All protection systems shall be divided into two independent groups for detecting and clearing electrical faults, in order to ensure that failure of any single item of protection equipment does not result in shutdown of plant.
- i) The protection systems shall be provided with an adequate numbers of trip and alarm contacts to fulfill all necessary functions and the contacts shall be suitable rated for making, carrying and breaking currents in service. The protection systems shall be suitably interfaced with the SAS.
- j) The protection systems shall continuously supervise the dc auxiliary supplies and the integrity of all EHV circuit breaker tripping circuits with the CBs in the closed or open state. All protection relays shall incorporate comprehensive continuous self-monitoring and diagnostic facilities.
- k) The protection systems shall provide comprehensive records for trip and alarm conditions, including the voltage and current vector parameters at the time of trip initiation, with indications of which element initiated a trip of alarm. Voltage and current waveform disturbance recording and event-logging shall be included as part of the protection system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[73]	25.09.2014

- l) Back-up protection shall be provided to trip the protected plant item in the event of a sustained external fault condition or a sustained power system abnormality that would otherwise damage or significantly reduce the life expectancy of the protected plant.
- m) The [400/220kV] protection panels shall be located in substation relay and control room.
- n) The protection relays shall be from reputable suppliers subject to approval by the Owner/Engineer and shall be type-tested according to relevant sections of the IEC 60255, including the latest Electromagnetic Compatibility (EMC) sections.
- o) Wherever protection relays include monitoring facilities, all monitored and recorded information available shall be accessible in the central control room via the SAS.
- p) Each group of numerical protection relays shall be interfaced to the SAS such that on-line and recorded information can be accessed at control room workstations. There shall be one point of serial communications access for each protection group to facilitate the SAS interfacing. All the necessary interface units and software for the communication with groups of relays shall be engineered and provided by the Contractor to allow remote interrogation of individual protection relays and the uploading of recorded data and relay settings.
- q) The protection system shall be designed to minimize the number of metallic cable connections and on-site wiring required for the plant protection, monitoring and control systems, however the protection tripping and intertripping and circuit breaker closing control shall be effected via hard-wired links.

2.4.9 Transformer Protection

a) Generator Transformer Feeder Protection

As a minimum, the protection system shall comprise the following individual protection functions.

- i. Overhead line connection differential protection (87L)
- ii. Pole discrepancy protection of breaker (EHV) if single pole breakers are used.
- iii. Breaker (EHV) back up protection (protection against breaker failure)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[74]	25.09.2014

All other protections of generator transformer like dedicated differential protection, the restricted earth fault protection, overall differential protection, HV side IDMT phase over current protection, transformer back-up earth fault protection including all mechanical protections viz, Buchholz, Oil Temperature Indicator, Winding Temperature Indicator, Pressure Relief Valve operated trip are covered in TG and Auxiliaries Package, under Chapter 2: Protection and Metering.

b) Station transformer protection

As a minimum, the protection system shall comprise the following individual protection functions:

- i. Line Differential Protection (wherever required)
- ii. Transformer differential protection (87T) (2 Nos. for 400kV system only)
- iii. Restricted earth fault protection (64) for [400/220kV] side.
- iv. Restricted earth fault protection (64) for 6.6 kV side.
- v. Back-Up earth fault protection (51N) for [400/220kV] side.
- vi. Back-Up Standby earth fault protection (51N) for 6.6kV side.
- vii. HV side phase over current protection (51).
- viii. Thermal replica overload protection (49).
- ix. Over fluxing protection (99T).
- x. Buchholz Protection (63) for alarm and trip.
- xi. Winding temperature high (49 T) for alarm and trip
- xii. Oil temperature high (49Q) for alarm and trip
- xiii. OLTC oils surge relay [If Applicable]
- xiv. Pressure relief valve (PRV) operated trip

c) Following minimum protection shall be provided for shunt reactor:

- i. Reactor differential protection
- ii. Backup impedance protection
- iii. Restricted earth fault protection
- iv. Mechanical Protection, Viz. Buchhloz protection, Winding temperature protection, Oil temperature Protection, Pressure relief valve Operated.

d) Following minimum protection shall be provided for ICT:

- i. Line differential Protection(Wherever required)
- ii. Transformer differential protection
- iii. Restricted earth fault protection

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[75]	25.09.2014

- iv. Directional over current (67) on 400 kV and 220 kV.
- v. Directional earth fault on (67N) 400 kV and 220 kV
- vi. Overload protection
- vii. High voltage side Over fluxing protection
- viii. Tertiary over current protection
- ix. Neutral side back up over current protection (51N)
- x. Tertiary Grounding O/C Protection
- xi. Mechanical Protection, Viz. Buchholz protection, Winding temperature protection, Oil temperature Protection, Pressure relief valve Operated.
- e) Following minimum protection shall be provided for Bus coupler:
 - i. Inverse Definite Minimum Time over current protection (51).
 - ii. Inverse Definite Minimum Time earth fault protection (51N).

2.4.10 Overhead line protection requirements

- a) Main-1 distance and directional earth fault protection (21-1, 67G, F/L) – Permissive overreach distance teleoperation scheme with supplementary directional earth fault teleoperation to cover earth fault with levels of resistance that could not be detected by the distance protection elements without the risk of load impedance encroachment. The protection shall also offer three-step basic distance protection and an accurate fault location feature. The distance protection relays shall be compatible with those existing on the network.
- b) Main-2 distance and directional earth fault protection (21-1, 67G) – As for the Main-1 protection, but without the fault location feature.
- c) Protection signaling equipment – two sets of equipment to operate from separately fused dc auxiliary supplies and to utilize redundant communications paths for tele protection and intertripping.
- d) Auto reclose equipment – Single and three phase high-speed and delayed auto reclose equipment with integral synch check equipment or with interfacing to the substation synch check equipment.

2.4.11 Busbar and breaker fail protection requirements

- a) Busbar differential protection scheme (87B1/B2) – Numerical busbar differential protection scheme with differential current measurement for each section of bus bar on each side of the bus sectionalizing bays shall be provided. An auto-testing facility shall also be provided.
- b) Breaker fail protection shall be provided
- c) Pole discrepancy protection – Pole discrepancy protection shall also be provided for the [400/220kV] circuit breakers.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[76]	25.09.2014

2.4.12 Digital Fault & Disturbance Recording System

The disturbance recorder for each [400/220kV] line shall meet following requirements:

- a) Used to record the graphic form of the instantaneous values of analog inputs such as voltages and currents in all the three phases, open delta voltage and neutral current in the primary circuits in case of a short circuit (fault) and a disturbance in the Power System, as per technical parameters.
- b) Used to record digital inputs such as protection relays and breaker auxiliary contacts, clearing the system fault or disturbance.
- c) The acquisition unit shall store the fault/disturbance data in its non-volatile solid state memory and transfer the data to its Master station automatically. However, last two disturbance/fault record data shall be always available in it and shall not be erased by the software automatically after its transfer to the Master evaluation unit.
- d) Operation of Digital Fault Recorder (DFR) shall be based on the program stored in the non-volatile solid state memory. The software shall be stable and no inadvertent change of software shall occur. Master station software shall be user-friendly graphic user interface with point & click operation. Fault Record Manager shall be flexible and simple fault/disturbance archiving shall be possible. Suitable mass storage shall be provided in Master station for archiving. Fault / disturbance display logs shall be displayed by any of the following fields:
 - i. Fault date & time (hour, min., sec & ms)
 - ii. Recording module ID
 - iii. Fault ID on one recording module

The sorts shall be in ascending or descending order.

- e) Software analysis capabilities - Master station software shall be capable of harmonic analysis and power system analysis on the fault/disturbance record. The following functions shall be possible:
 - i. RMS/Peak envelop display of any voltage or current input
 - ii. Fundamental power frequency deviation
 - iii. Power calculations such as:
 - Instantaneous Real Power
 - Instantaneous Reactive Power
 - Power Factor angle

Instantaneous values of these quantities shall also be displayed graphically.

- f) The technical parameters as detailed above are tabulated below:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[77]	25.09.2014

Table 2.0

1.	Purpose	To record the fault data graphically
2.	No. of Analog Channels	8 Nos. (1R,1Y,1B,1N, V RY , V YB, V BR & Open delta)
3.	No. of digital channels	16
4.	Scan rate of each analog channels or better value	2000Hz
5.	Frequency response of analog channels or better	500 Hz
6.	Pre-fault memory	160 ms
7.	Post-fault memory for max. scan rate	5 sec
8.	Amplitude resolution of the analog channel(min	16 bit
9.	Event resolution of the digital channel (min.)	1 ms
10	No. of records to be stored in the acquisition unit without data compression	2
11	Aux. voltage	220V DC (+10%, -20%)
12	CT Secondary current	1A
13	Voltage input (Phase to neutral)	63.5V

2.4.13 Sequence of Event Logger (EL).

The EL shall be provided as a function of the substation automation system and shall be used to record the state of [400/220kV] Switchyard equipment, relays & alarms. The equipment shall be designed with objectives

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[78]	25.09.2014

of flexibility, reliability & simplicity for maintenance, repairs and suitability for hostile electrical environment.

The EL shall meet the following requirements:

- a) Record all changes of alarms and state (plant state) of switchyard equipment with alphanumeric display of not less than 60 characters per event.
- b) The date and time of all alarms and plant state changes of switchyard equipment to the nearest one ms.
- c) Have facilities to commit 50 points of sequential memory or 25% of alarm, whichever is greater
- d) Cope with 500 alarms and changes of state [400/220kV] switchyard equipment.
- e) On receipt of an alarm the equipment must
 - i. Print out a message on the printer.
 - ii. Set off an audible alarm and beacon.
- f) Allow normal inputs of
 - i. Accept
 - ii. Alarm demand log.
 - iii. Plant state demand log.
 - iv. Date & Time.
- g) Events occurring whilst a previous event is in process of being printed are to be stored to await printing. Over 100 such events must be stored.
- h) Input point shall be field programmable through use of EEPROM
- i) The system shall have its own time generator, which will be synchronized with the time generator from time synchronization system to be supplied under the contract.
- j) The complete system with all auxiliaries shall work from the switchyard DC supply only. Inverters shall be provided wherever necessary.
- k) The system shall be fully type tested to the relevant international standards.

2.4.14 Distance to Fault Locator.

- a) It shall be provided for each [400/220kV] line and shall be electronic or microprocessor based type.
- b) Shall be 'on-line' type.
- c) Shall be suitable for breaker operating time of 2 cycles.
- d) Shall have built-in display unit.
- e) The display shall be directly in percentage of line length or kilometers without requiring any further calculations.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[79]	25.09.2014

- f) Shall have an accuracy of 3% or better for all types of faults and fault levels.
- g) The above accuracy should not be impaired under the following conditions
 - i. Presence of remote end in-feed
 - ii. Predominant DC component in fault current
 - iii. High fault arc resistance
 - iv. Severe CVT transients
- h) Have facility for remote data transmission
- i) Shall meet IEC:60255 or equivalent standards
- j) Shall have mutual zero sequence compensation unit if fault locator is to be used on double circuit transmission line
- k) Distance to fault location function as a built-in feature of Disturbance Recorder / Numerical Distance Protection is also acceptable, provided it meets the above mentioned requirements.

The minimum requirement for measurement of switchyard bay parameters at Owner's DDCMIS shall be as follows:

Table 3.0

Sl. No.	Feeder Description	DDCMIS HMI
1.0	GT Bays	Voltage (all phases) , Amps (all phases) , MWh , MW , MVAR , Winding & Oil Temperature
2.0	ST Bays	Voltage (all phases) , Amps (all phases) , MWh , MW , MVAR , Winding & Oil Temperature
3.0	Line Bays	Voltage (all phases) , Amps (all phases) , MWh , MW , MVAR , MVARh
4.0	400 kV buses	Voltage & Frequency

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[80]	25.09.2014

2.4.15 Tariff Metering Panel

- a) A tariff metering panel consisting of the following meters:
 - i. Main meter at each Line Feeder- [400/220kV] (Line Feeder Main Meter)
 - ii. Main meter at HV side of each station transformer (Import Main Meter)
 - iii. Main meter at HV side of each Generator Transformer
- b) A tariff metering panel consisting of the following meters :
 - i. Check meter at each Line Feeder - [400/220kV] (Line Feeder Check Meter)
 - ii. Check meter at HV side of each station transformer (Import Check Meter)
 - iii. Check meter at HV side of each Generator Transformer
- c) Each meter comprising the Metering System shall have an accuracy class of ± 0.2 .
- d) Each meter comprising the Metering System shall be active or reactive energy meter and as to their technical standards, description, accuracy and calibration, shall comply fully with any applicable requirements of the Electricity Rules, IE Act 2003, Grid Codes & related notifications, and in particular shall meet the followings :
- e) Shall comply with the requirements of IEC: 60687, IEC: 1036, IEC: 13779 and IS: 14697, and shall be microprocessor based with ABT compatibility.
- f) Shall carry out measurement of active energy (both import and export) and reactive energy (both import and export) by 3 phase, 4 wire principle suitable for balanced / unbalanced 3 phase load.
- g) C.T.'s shall have accuracy of energy measurement of 0.2S.

2.4.16 Relays

- a. Relays shall be furnished in rectangular /square dust tight, draw out or rugged plug in type, flush /semi flush mounting cases.
- b. The hardware design for protection and associated equipment shall use latest state-of-the-art technology and shall generally be integrated numerical/digital, modular in nature. Where design is based on microprocessor technology, adequate self testing/monitoring/diagnostic facilities shall be provided.
- c. All protective relays shall be in draw out or plug-in type / modular cases with proper testing facilities. Necessary test plugs / test handles shall be supplied loose and shall be included in contractor's scope of supply.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[81]	25.09.2014

- d. All AC operated relays shall be suitable for operation at 50 Hz. AC voltage operated relays shall be suitable for 110 Volts VT secondary and current operated relays for [1 A/5A] CT secondary. All DC operated relays and timers shall be designed for the DC voltage specified, and shall operate satisfactorily between 80% and 110% of rated voltage. Voltage operated relays shall have adequate thermal capacity for continuous operation.
- e. All protection relays shall be numerical type with communication interface compliant to IEC-61850 protocol. It is proposed to fully utilize the metering, protection and control features of the numerical relays. They shall have programmable logic facility with built-in timers. Apart from the status of operation of the protection functions inbuilt in the relay, it is proposed to utilize the binary inputs of the relay for taking the operation of other non communicable relays (if any) in the protection panel to DDCMIS. The numerical relays shall be selected with suitable number of binary/analog inputs and outputs. Static relays have to be provided for any other protections not adequately afforded by the multifunction numerical relays.
- f. The protective relays shall be suitable for efficient and reliable operation of the protection scheme described in the specification. Necessary auxiliary relays and timers required for interlocking schemes for multiplying of contacts suiting contact duties of protective relays and monitoring of control supplies and circuits, lockout relay monitoring circuits etc. also required for the complete protection schemes described in the specification shall be provided. All protective relays shall be provided with at least two pairs of potential free isolated output contacts. Auxiliary relays and timers shall have pairs of contacts as required to complete the scheme. Contacts shall be silver faced with spring action. Relay case shall have adequate number of terminals for making potential free external connections to the relay coils and contacts, including spare contacts.
- g. Timers shall be of solid state type. Time delay in terms of milliseconds obtained by the external capacitor resistor combination is not preferred and shall be avoided.
- h. Provision shall be made for easy isolation of trip circuits of each relay for the purpose of testing and maintenance.
- i. All protective relays and alarm relays shall be provided with one extra isolated pair of contacts wired to terminals exclusively for future use.
- j. Any alternative / additional protections or relays considered necessary for providing complete effective and reliable protection shall also be offered

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[82]	25.09.2014

separately. The acceptance of this alternative / additional equipment shall lie with the purchaser.

- k. The design of the integrated generator protection shall be based on numerical techniques. Integrated numerical protection along with other standard protections shall be provided. All the analogue signals will be converted into digital data, using analogue-to-digital conversion circuit. The data will be processed by a microprocessor, which will perform digital signal processing and executes various protection algorithms.
- l. The relay shall be provided with one number Laptop-PC of latest generation, for user interfaces, monitoring, testing facility etc. In addition to above a unitized PC based with 21" color monitor shall be provided for configuration and diagnostics of all the numerical relays.
- m. Such Station shall be complete with licensed version of all software for analysis and retrieval of disturbances occurred in the system/equipment. Data/signal from numerical relays will go to SAS through communication protocol and shall be time synchronized through the same.
- n. The relay shall be designed to perform satisfactorily under highly noisy electrical environment. Sufficient degree of high frequency disturbance immunity and impulse voltage withstand capacity shall be built into electronic designs as stipulated in relevant standards.
- o. Relay characteristics shall be coordinated for proper functioning in conjunction with associated relays. The Contractor shall co ordinate the characteristics of all relays to suit the system and equipment parameters. Relay ranges and settings shall be selected accordingly.
- p. The relays shall function satisfactorily being located in non AC physical environment.
- q. All protections shall be furnished complete with necessary auxiliary, supervisory, lock out etc, relays. Suitably separate sets of single phase auxiliary C.T with multiple taps shall be provided with relay whenever required.
- r. Visual and audible alarm annunciation shall be initiated in the event of operation of protective/supervisory relay.
- s. D.C circuits shall be supervised by relays.
- t. Tripping shall be done through high speed lock out relays.
- u. Tripping relays shall be offered with sufficient redundancy. Operating of these relays shall be continuously monitored through supervising relays.
- v. All protective relays and meters shall be provided with test terminal blocks for secondary injection testing of protection relays and meters.
- w. Relay shall be provided with self reset contacts except trip, lock out relays and interlock relays which shall be manual reset type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[83]	25.09.2014

- x. High speed trip relays: Adequate number of high speed trip relays for each category tripping for both the groups will be provided for the protection of the unit. The quantity of the trip relays will also consider the requirement due to the following:
 - i. Contact requirements from these relays to various systems covered under the scope of this contract.
 - ii. Contacts from each category of tripping relay for annunciation, data acquisition, sequential event recorder and fault disturbance recorder.
 - iii. Contacts for control, protection and interlock in system viz. [400kV] circuit breakers/transfer breaker tripping / close permissive, [6.6] kV aux. Supply breakers trip / close permissive, transformer cooler circuit interlocks, LBB protection etc.
 - iv. 10% spare contacts (both NO and NC).
- y. All alarm and trip conditions of Generator Transformer and Unit Transformer shall be made available in the DDCMIS.

2.4.17

Panel

- a. The Relay Panels shall be totally enclosed, floor mounted, free standing, dead front assemblies conforming to IP-54 degree of protection.
- b. Design, material selection, and workmanship shall be such as to present a neat appearance outside and inside with no welds, rivets, screws or bolt heads apparent from the exterior surface of the Boards. The boards shall have a smooth and uniform matt finish, free from scratches, dents and other imperfections.
- c. The panels shall be liberally sized so as to provide spacious layout of equipment and devices with sufficient working space in between.
- d. Each board may consist of a number of panels mounted side-by-side, in which case, these shall be bolted together to form a compact unit. Where two panels meet, the joints shall be smooth and close-fitting.
- e. The boards shall be of folded sheet steel construction, assembled on channel/angle base plates with ant vibration mountings.
- f. The boards shall be fabricated of minimum 2 mm thick sheet steel, free from all surface defects. The boards shall have sufficient structural reinforcement to ensure a plane surface, to limit vibration, and to provide rigidity during shipment and installation.
- g. All doors and removable covers shall be provided with neoprene gaskets all around and latches sufficiently strong to hold them in alignment when closed. The door operating handle shall have locking arrangement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[84]	25.09.2014

- h. All panels shall have rear door with concealed type hinges and pad locking arrangement. Doors shall be grounded by flexible copper braid.
- i. The boards shall be complete with vibration damping pads, stainless steel kick plates, floor channel sills, anchor bolts, and other necessary hardware for mounting.
- j. Cable entries to the panels shall be from the bottom. Cable gland plate fitted on the bottom of the panel shall be connected to earthing of the panel / station through a flexible braided copper conductor rigidly.
- k. The panels shall be provided with removable gland plates with glands made of brass suitable for armoured cables. Cable glands shall be double compression type. Cable gland support plate shall be 3 mm thick and mounted not less than 200 mm above floor level
- l. The panels shall have provision of cable entry from the bottom. Bottom plate shall be provided to make entry dust-tight.

2.4.18

Panel Internal Wiring

- a. All wiring shall be carried out with 650/1100 V grade, single core, and stranded copper conductor wires with FRLS PVC insulation and shall be vermin, rodent proof. The minimum size of the stranded copper conductor used for panel wiring shall be as follows
 - i. All circuits except CT & PT circuits: 2.5 mm² per lead
 - ii. CT & PT circuits : 4 mm² per lead
- b. All devices and terminal blocks shall be identified by symbols corresponding to those used in applicable schematic or wiring diagram. Each wire shall be identified, at both ends, with interlocking type permanent markers bearing wire numbers as per Bidder's Wiring Diagrams. AC / DC wiring shall have separate colour-coding.
- c. Wire termination shall be made with crimping type connectors with insulating sleeves. Wires shall not be spliced between terminals.
- d. Contractor shall be solely responsible for the completeness and correctness of the internal wiring and for the proper functioning of the connected equipments.

2.4.19

Terminal Block

- a. Terminals shall be box clamps and clip-on type, suitable for terminating up to two wires of 4 sq. mm. cross section and provided with marking strips. Terminals for CT secondary leads shall have built-in disconnecting links with facility for shorting. Terminals for CT leads should have adequate cross section for terminating associated CT leads.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[85]	25.09.2014

- b. Not more than two wires shall be connected to one terminal. If necessary, a number of terminals shall be shorted together to provide wiring points.
- c. Each terminal shall be identified with designation as per approved schematic. At least 20% of the total number of active terminals shall be furnished as spare in each panel.
- d. The wiring shall be so arranged that individual wires of an external cable can be connected to consecutive terminals.
- e. The terminal blocks shall be located to allow easy access and also to suit floor openings for cable entry.
- f. Terminal blocks shall generally be mounted vertically with adequate spacing (not less than 100 mm) between adjacent rows.
- g. The bottom of the terminal blocks shall be at least 200 mm above the incoming cable gland plate.
- h. There shall be a minimum clearness of 250mm between the first row of terminal blocks and the associated cable gland plate or panel side wall. Also the clearances between two rows of terminal blocks edges shall be minimum of 150mm.
- i. The number and sizes of the Owner's multi core incoming external cables will be furnished to the Contractor after placement of the order. All necessary cable terminating accessories such as gland plates, supporting clamps & brackets, wiring troughs and gutters etc. (except glands & lugs) for external cables shall be included the scope of supply.

2.4.20 Equipment Mounting

- a. All instruments, relays, switches, etc. mounted on the front face of the panels shall be flush or semi flush type.
- b. No equipment shall be mounted on panel door.
- c. All equipment shall be so mounted that removal and replacement may be accomplished individually without interruption of service to others.
- d. All equipment inside the panels shall be so located that their terminals and adjustments are readily accessible for inspection or maintenance.
- e. In case cut-outs are provided on any panel for future mounting of equipment, the same shall be properly blanked off.
- f. All equipment on and in panels shall be mounted and completely wired to the terminal blocks ready for external connections.
- g. The Contractor shall carry out cut out, mounting and wiring of the free issue items supplied by others which are to be mounted in his panel in accordance with the corresponding equipment manufacturer's drawing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[86]	25.09.2014

- h. The centre lines of switches, push buttons and indicating lamps shall be not less than 750mm from the bottom of the panel. The centre lines of relays, meters and recorders shall be no less than 450mm from the bottom of the panel.
- i. The centre lines of switches, push buttons and indicating lamps shall be matched to give a neat and uniform appearance. Likewise, the top lines of all meters, relays and recorders etc. shall be matched.

2.4.21 Illumination, Space Heating and Receptacles

- a. Each panel shall be provided with interior fluorescent tube with door switch, space heater with thermostat and switch and 240V, 5A, 3 pin receptacles with plug. Third pin of the socket shall be effectively grounded through the metallic structure.
- b. Lamp, heater and receptacle circuits shall be suitable for available 240V A.C. supply and furnished with individual ON-OFF switch.
- c. The tube shall be located at the ceiling and guarded with protective cage. Space heater shall be located near the floor so as not to pose any hazard to service personnel.

2.4.22 AC/DC Power Supply

- a. Necessary A.C and D.C supplies to each panel as required for control and service shall be arranged by the Contractor. Single feeder shall be arranged for A.C supply but redundant feeders shall be arranged for D.C supply by purchaser.
- b. Indication lamps and audible alarms shall be provided to annunciate failure of main incoming D.C supplies in each panel. Flag relay shall be provided for A.C. supply failure.
- c. MCCB/MCB shall be provided for the incoming AC/DC power supplies. Bus wires shall be run for power distribution to different panels. Power supply isolation switches shall be 4-pole, single throw, for A.C. (considering single feeder) and 2-pole, double throw with OFF, for D.C.

2.4.23 Name Plate

- a. Nameplates shall be provided on each panel and on each instrument or device mounted in the panel.
- b. The material of the nameplates shall be plastic, 3 mm thick, with white letters on black background.
- c. The nameplates shall be held by self tapping screws. The size of nameplate shall be approx. 20 mm x 75 mm for equipment and 40 mm x 150 mm for panels.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[87]	25.09.2014

- d. Nameplates for panels shall be provided both on the front and the rear. Nameplates for all devices shall be located below the respective devices.
- e. Instrument and devices mounted on the face of the control boards shall also be identified on the rear with the instrument or device number. The number may be painted on or adjacent to the instrument or device case.
- f. All relays and other devices shall be clearly marked with manufacturer's name, manufacturer's type, serial number and electrical rating data.

2.4.24

Grounding

- a. Tinned copper ground bus of adequate size shall be provided in each panel, extending along the entire length of the assembly.
- b. Location of earth bus shall ensure no radiation interference for earth systems under various switching conditions of isolators and breakers.
- c. When several panels are mounted adjoining each other, the earth bus shall be made continuous and necessary connectors and clamps for this purpose shall be included in the scope of supply of Contractors. Provision shall be made for extending the earth bus bars to future adjoining panels on either side.
- d. Provision shall be made on each bus bar of the end panels for connecting Substation earthing gird. Necessary terminal clams and connectors for this purpose shall be included in the scope of supply of Contractors.
- e. Looping of earth connections which would result in loss of earth connection to other devices when the loop is broken, shall not be permitted. Earthing may be done in such a manner that no circulating current shall flow in the panel.
- f. VT and CT secondary neutral or common lead shall be earthed at one place only at the terminal blocks where they enter the panel. Such earthing shall be made through links so that earthing may be removed from one group without disturbing continuity of earthing system for other groups.
- g. An electrostatic discharge point shall be provided in each panel connected to earth bus via 1 Mega Ohm resistor.
- h. The ground bus shall have two-bolt drilling with GI bolts and nuts at each end and shall be suitable for connection to 50 x 6 mm G.S. flat.
- i. The ground bus shall be bolted to the panel structure and effectively ground the entire assembly. The cases of meters, relays and switching devices shall be grounded through the steel structure.
- j. Whenever a circuit is grounded, a single wire from the circuit shall be run independently to the ground bus and connected to it.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[88]	25.09.2014

2.4.25 Relay test kit

Relay Test kit shall comprise the following:

- a) One dynamic portable relay test system based on type Multi-Amp. PULSAR Cat. 10 E3T3N or equivalent] with 3 current and 3 voltage modules allowing dynamic and steady state testing capabilities The DR recording of the line/generator in standard IEEE COMTRADE or EMTP simulations shall be compatible for transient testing of protections with this test system. Required software for steady state/dynamic testing of the protection relays, energy meters and transducers, along with a Lap top PC shall also be supplied.
- b) Other auxiliary items like phantom loads, etc. shall also be supplied as required for protection relay testing.
- c) Test plugs for modular protections and two relay tool kits.
- d) All commissioning tests on protection relays, energy meters and transducers shall be carried out with the relay test kit being supplied under this contract and the test reports shall be maintained as per agreed protocols.

2.5 Tests

I) Type Test

For each type of relays and equipments, Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the switchgear similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

The minimum tests shall be conducted at manufacturer work/site are as follows:

- a) Wiring continuity tests
- b) Insulation tests before and after high voltage test

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[89]	25.09.2014

- c) Functional tests to ensure operation of the control/protection/metering schemes and individual equipment.
- d) All switches, meters, relays and other devices shall be tested and calibrated in accordance with relevant IEC/IS standards.
- e) HV test on control circuits
- f) Secondary injection of all protection relays by using service settings and simulation of all protection functions.
- g) Secondary injection of all metering circuits.
- h) Functional tests to demonstrate the specified control and interlocks

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates:

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

2.6 Drawing & Documents

Drawings, data & manuals for the Protection panel and metering panel shall be submitted as indicated below

- a) *[General Arrangement drawings and cross-section showing constructional features & cable entry with bottom view with opening of panels.*
- b) *Bill of Materials.*
- c) *Technical Data sheet and Catalogue.*
- d) *Heat loss of panels*
- e) *Foundation drawing details with bottom view of Panels.*
- f) *Descriptive write-ups and literature for the main equipment offered i.e relays, meters, etc.*
- g) *Control Schematics & Wiring diagram.*
- h) *Inspection and Test Plan (ITP).*
- i) *Suggestive list of protective relays.*
- j) *Transport/shipping dimensions and weights].*

3 POWER TRANSFORMER

3.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning] of Power Transformers (Generator Transformer- GT, Station Transformer-ST, Unit Transformer-UT & Inter Connecting Transformer-ICT) complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

3.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS 325	:	Three phase induction motors
IS 335	:	New insulating oil for transformers and switchgears
IS 354	:	Method of sampling and test for resins for paints
IS 1271	:	Classification of insulating materials for electrical machinery and apparatus in relation to their stability in service
IS 1866	:	Code of practice for electrical maintenance and supervision of mineral insulating oil in equipment
IS 2026	:	Power Transformers
IS 2071	:	Method of high voltage testing
IS 2099	:	Bushings for alternating voltages above 1000 V
IS 2147	:	Degree of protection
IS 2705	:	Current transformers
IS 3202	:	Code of practice for climate proofing of electrical equipment
IS 3347	:	Dimensions for porcelain transformer bushings for use in different polluted atmosphere
IS 3637	:	Gas operated relays
IS 3639	:	Specification for Fittings and accessories for power transformers
IS 5561	:	Electric power connectors
IS 5578	:	Guide for marking of insulated conductor

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[98]	25.09.2014

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

3.3

Design Criteria

- a) The Power transformers shall be installed in hot, humid and tropical atmosphere. All equipment, accessories and wiring shall be provided with tropical finish to prevent fungus growth.
- b) All Power Transformers shall be suited for uninterrupted operation under the following variations in voltage and frequency:
 - a. Voltage Variation : $\pm 10\%$
 - b. Frequency Variation : 50Hz (+)3% to (-)5%
 - c. Combined Variation of : 10% (absolute sum)
Voltage & Frequency
- c) The transformer shall be so designed that it shall be capable of operation at 110% of rated voltage continuously, 125% rated voltage for a period of one minute and 140% rated voltage for a period 5 seconds due to sudden load throw off.
- d) The transformer shall be capable of withstanding the short circuit stresses due to a terminal fault on one winding for minimum period of two (2) seconds for GT/ST/ICT and [three (3) to five (5)] seconds for UT.
- e) The transformer shall be free from annoying hum or vibration. The design shall be such as not to cause any undesirable interference with radio or communication circuits.
- f) Generated power shall be stepped up to 400 kV/220kV for evacuation into the grid by Generator Transformers.
- g) Unit Transformers (UT), which shall step down generation voltage to 6.6 kV voltage level for supply of power to all unit auxiliaries.
- h) Inter Connecting Auto Transformers shall be installed for interconnection between 400 kV and 220 kV Substations (if applicable).
- i) The Startup/ Shut down (HP-LP By pass) power shall be taken from Station Transformers.
- j) The impedance of the Unit transformers shall be chosen such that the fault level on the MV switchgear does not exceed 40kA including the motor contributions and also voltage dip while starting the motor does not exceed 15% at motor terminal.
- k) Transformers shall accept without injurious heating, combined voltage and frequency variation which produce an over fluxing condition of 120% for one (1) minute.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[99]	25.09.2014

- l) Noise level of the transformer shall not exceed the values specified in NEMA TR-1.

3.4 Specific Requirements

3.4.1 Scope of work

The following power transformers along with their fittings and accessories shall be supplied by the bidder:

- a) [Generator Transformers with accessories
- b) Interconnecting Auto-Transformers with accessories (if applicable)
- c) Station Transformer with accessories
- d) Unit Transformers with accessories.
- e) 6.6 kV, [...] Ω , [300 A] Neutral Grounding Resistors (NGR) for the above Unit & Station Transformers
- f) Power/Control cables from OLTC (On Load Tap Changer) /MB (Marshalling Box) /Cooler Control Panel to respective Transformers.
- g) Oil filtration plant (Oil centrifuging unit).
- h) Civil works (if required) like transformer foundations with soak pits, Fire protection walls etc for all Transformers including concrete cable channel for all the Transformers.
- i) Complete civil works like cable trenches with cover, pavements, drainage arrangement to a common sump to be provided within the transformer yard by Bidder for GTs, STs, UTs in the transformer yard and for ICTs in Switchyard.
- j) Rail tracks for movement of GTs, STs, UTs in the transformer yard and also for ICTs in the Switchyard up to and connection to rail for taking the transformers to maintenance bays. Maintenance bays are located in the Power Plant building.
- k) Transformer yard fencing.
- l) Fabricated oil storage tank.]

3.4.2 Construction Requirements

- a) Tank
 - i) The Tank shall be of Bell Type and welded construction and fabricated from good commercial grade low carbon steel of adequate thickness. All seams shall be double welded. All welding

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[100]	25.09.2014

shall be stress relieved. The core grounding shall be made available outside the tank by means of a disconnectable link for all transformers. The switching devices of the tap changer are to be fitted in a separate part of the transformer tank with its own oil conservator and protection.

- ii) The tank wall shall be reinforced by stiffener to ensure rigidity so that it can withstand without any deformation
 - mechanical shock during transportation
 - oil filling by vacuum.
- iii) All removable covers shall be provided with weatherproof, hot oil resistant, resilient gaskets. The design shall be such as to prevent any leakage of water into or oil from the tank.
- iv) Each transformer tank shall be provided with one set of bi-directional flanged wheels for rolling the transformer parallel to either centre line over rail gauge. Jacking pads, lifting eyes and pulling lugs shall be provided to facilitate movement of the transformer. All heavy removal parts shall be provided with eye bolt for ease of handling.
- v) Transformer tank shall be completely insulated from its wheel so as to have transformer protection as envisaged. Tank shall be provided with necessary valves.
- vi) Manholes / hand holes of sufficient size shall be provided for access to leads, windings, bottom terminals of bushings and taps. Suitable guide shall be provided in the tank for positioning the core and coil assembly.

b) Core

- i) The transformer shall be of core type. The core shall be constructed with high grade, non-aging, low loss, high permeability, grain oriented, cold-rolled silicon steel laminations free from scales and burrs, especially suitable for core materials.
- ii) The Core flux density shall be defined to limit the transformer inrush current.
- iii) The framework and the core bolts shall be efficiently insulated from the core so as to reduce the eddy currents to a minimum.
- iv) The core and its mechanical parts shall be designed to withstand forces produced during normal transportation, short-circuits and earthquakes. The core and winding assembly shall be fixed firmly both at tank bottom, sides and tank top at suitable number of points, to withstand severe impact during transport.
- v) Adequate lifting lugs will be provided to enable the core and windings to be lifted.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[101]	25.09.2014

c) Windings

- i) The windings shall be manufactured from electrolytic copper with electrolytic grade and free from scales and burrs and fully insulated for rated voltage. All windings of transformers having voltage less than 66 kV shall have uniform insulation.
- ii) Insulating material shall be of proven design. Windings shall be so insulated that impulse and power frequency voltage stresses are minimum.
- iii) Coil assembly shall be suitably supported between adjacent sections by insulating spacers and barriers. Bracing and other insulation used in assembly of the winding shall be arranged to ensure a free circulation of the oil and to reduce the hot spot of the winding.
- iv) All leads from the windings to the terminal board and bushings shall be rigidly supported to prevent injury from vibration or short circuit stresses. Guide tube shall be used where practicable.

3.4.3

On-Load Tap Changer

- a) The transformer (As Applicable), shall be equipped with motor driven bi-directional On-load tap changer (OLTC) and shall be provided with remote control and monitoring.
- b) The winding including the tapping arrangement shall be designed to maintain electromagnetic balance between HV and LV windings at all voltage ratios.
- c) The on load tap changing will be affected by a 3-phase gang operated switch. Arrangement shall be such that switch can be operated at standing height from ground level. The tap changer shall conform to IEC 60214.
- d) The operating handle can be padlocked at any tap position. The design shall be such that lock cannot be inserted unless the contacts are correctly engaged. The mechanism shall be provided with a mechanical tap position indicator and an operation counter.
- e) All contacts shall be silver plated and held in position under strong contact pressure to ensure low contact resistance and avoid pitting. The OLTC switch contacts shall be located in a separate oil-filled chamber complete with its own oil preservation system, Oil Surge relay, shut-off valves, oil level gauge, gas vent, pressure relay etc.
- f) OLTC mechanism and associated controls shall be housed in an outdoor weather-proof cabinet. Internal illumination lamp and thermostat controlled space heater shall be provided in the cabinet. The tap change

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[102]	25.09.2014

equipment shall be so designed that if the mechanism is stuck in an intermediate position, the transformer shall be capable of delivering full load without any injury.

- g) The OLTC gear shall be suitable for local and remote electrical control and local manual control. Further, there shall be provision of automatic operation through voltage sensing relay wherever specified.

h) Local Tap Changing Cubicle

The local tap changer cubicle shall be provided for housing motor drive mechanism for OLTC. The cubicle shall be fabricated of minimum 2 mm thick sheet steel complete with Control mechanism, all wiring, fuses, links, cubicle illumination lamps, anti-condensation heater with thermostatic control switch, gland plate etc. The Cubicle shall conform to IPW 55 degree of protection. The cubicle shall include the following:

- i) Driving motor (415 V, 3 phase, 50 Hz, AC squirrel cage).
- ii) Mechanically & electrically interlocked motor starting contactors with thermal overload relay, isolating switch and MCCBs.
- iii) Duplicate sources of power supply with automatic changeover from the running source to the standby source and vice versa shall be provided in transformer cooler control cabinet / marshalling box and one no. outgoing feeder extending to OLTC driving motor cabinet, with appropriate provision for receiving the same.
- iv) Control switch for Raise / off / lower. Remote / local selector switch lockable in remote position.
- v) Mechanical tap position indicator and re-settable maximum and minimum indicators.
- vi) Limit switches to prevent motor over-travel in either direction or final mechanical stops.
- vii) Brake or clutches to permit only one tap change at a time on manual operation. Emergency manual operating device (hand crank or hand wheel).
- viii) Tap Position Indicator, suitable electrical impulses shall be transmitted for remote indication.
- ix) A five digit operation counter.
- x) Interior lighting fixture with lamp door switch and HRC fuses.
- xi) Gasketed and hinged door with locking arrangement.
- xii) Terminal blocks, internal wiring, earthing terminals and double compression cable glands for power and control cables. Necessary relays, contactors, current transformers etc.
- xiii) The following indication/alarms shall be provided locally as well as for remote annunciation.

- AC supply failure

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[103]	25.09.2014

- Active Tap position.
- Tap changer in Local mode.
- Tap changer in Remote Mode.
- Tap changer faulty.
- Tap change delayed.
- Value of set point of voltage control device.

xiv) It shall be possible to control (issue raise/lower commands, changing the set point of voltage control device) the tap changer locally as well as from plant DDCMIS/RTCC.

i) Remote Tap Changer Control Panel (RTCC)

i) A Remote Tap Changer Control Panel shall be provided and located in the relay room. The following facilities shall be provided in each control cabinet.

- RTCC provided shall be able to communicate to DDCMIS.
- Tap position indicator of each transformer.
- Remote / local selector switch.
- Auto manual selector switch.
- Voltage regulating relay with time delayed under voltage cutout (for out operation only).
- Automatic Voltage Regulator.
- DC supply supervision.

ii) The following indication shall be provided in remote panel:

- Tap change in progress.
- Tap changer faulty
- OLTC in local mode.
- OLTC in remote mode.
- Tap change delayed.
- Value of set point of voltage control device

iii) It shall be possible to control (issue raise/lower commands, changing the set point of voltage control device) the tap changer from plant DDCMIS. Necessary interposing relays and hardware as required shall be provided.

3.4.4 Off-Circuit Tap Changer (As Applicable)

a) Off-circuit taps as specified shall be provided on the high voltage winding.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[104]	25.09.2014

- b) The transformer shall be capable of operation at its rated KVA on any tap provided the voltage does not vary by more than $[\pm 10\%]$ of the rated voltage corresponding to the tap.
- c) The winding including the tapping arrangement shall be designed to maintain electromagnetic balance between HV and LV windings at all voltage ratios.
- d) A warning plate indicating that switch shall be operated only when the transformer is de-energized shall be provided.
- e) Off circuit tap changer switch where provided shall be 3 phase, hand operated, by an external handle with position markings and pad locking facility and mechanical stops to prevent over cranking beyond extreme positions.
- f) Arrangement shall be such that switch can be operated at standing height from ground level.
- g) The operating handle can be padlocked at any tap position. The design shall be such that the lock cannot be inserted unless the contacts are correctly engaged. The mechanism shall be provided with a mechanical tap position indicator with pad locking facility.

3.4.5 Insulating Oil

- a) The transformer shall be filled with mineral insulating oil suitably inhibited to prevent sludging.
- b) First filling of oil along with 10% excess shall be furnished for each transformer. Oil shall be supplied in non-returnable containers suitable for outdoor storage.
- c) Oil preservation shall be by means of bellows/ diaphragm sealed conservator tank with silica gel breather to avoid direct contact between atmosphere and transformer oil. It shall be complete with level gauges, pipes, drain valve etc. The level gauges shall be so placed that same can be readable standing from ground. Necessary device shall be kept to provide annunciation in the event of rupturing of bellow.

3.4.6 Bushing

- a) All bushings exposed to the open atmosphere shall have increased creepage distance of 31 mm/kV. Bushings shall be arranged to facilitate easy access for mounting and dismounting. Where built-in current transformers are provided, bushings shall be arranged to permit their removal without interfering with the current transformers.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[105]	25.09.2014

- b) Bushing rated 72.5kV class and above shall be condenser type. Bushing rated 36kV class and below shall be solid porcelain or oil communicating type. Condenser type bushing shall be provided with oil level gauge, bottom drain plug and test terminal for measurement of loss factor (tan-delta) and capacitance.

3.4.7 Terminations

- a) All Terminals shall be brought out through top cover mounted bushings along with necessary turret. HV bushings for GT & ICT shall be suitable for connection to overhead ACSR conductors. LV terminals for GT shall be suitable for isolated phase bus duct (IPBD) connection. LV terminals of ICT shall be suitable for connection to [ACSR conductor / IPS tubes.]
- b) HV bushings for ST shall be provided with necessary clamps and connectors for connection to overhead ACSR conductors. HV terminals of UT shall be suitable for isolated phase bus duct connection. LV terminals of UT shall be suitable for phase segregated bus duct connection. LV terminals of STs shall be suitable for Busduct termination.
- c) LV neutral terminals for UT/ ST shall be housed in neutral air insulated cable box

3.4.8 Transformer Cooling

- a) Detachable type cooler shall be provided for each bank. Nos. of cooling units and capacity of each unit will be decided as required. However, required no. of coolers to be provided with one (1) no. cooler as standby for each phase transformer bank. Each unit cooler shall have its own cooling fans, oil pumps, oil flow indicator, with shut off valves both at top and bottom.
- b) The design shall be such that rated transformer output with specified temperature rise can be maintained:
- (i) Continuously with one pump and one fan in any of the cooling bank out of service.
 - (ii) For at least ten (10) minutes in case of failure of the complete cooling system when the transformer was delivering its rated output.
- c) The radiators shall be detachable type with top and bottom isolation valves to permit the removal of the same without drainage of oil from the tank.
- d) All fans shall have safety guard. Pumps shall be provided with flow indicators for visual indication of oil flow.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[106]	25.09.2014

- e) Convenient means shall be provided to remove or replace any pump or fan with the transformer in service.
- f) Complete control for pumps and fans inclusive of all switches, fuses, starters, relays and wiring shall be furnished. Each motor circuit shall have over load and short-circuit protection.
- g) Pump and fan motor controls will be actuated automatically from winding temperature indicator contacts. Provision shall however be kept for manual operation both from local and remote.
- h) Cooler control cabinet
 - i) The transformer cooler control cabinet shall be installed outdoor near the transformer.
Sheet steel, weatherproof, IPW 55 cooler control cabinet shall be provided for each transformer. The frames and the load bearing panels shall be fabricated of not less than 2 mm. thick sheet steel. The doors shall be provided with channel rubber/neoprene gaskets all round.
 - ii) The starting and stopping impulses for fans and oil pumps shall be given by winding temperature detectors at a preset temperature limit. Control shall be such that hunting, i.e., frequent start stop operations for small temperature differentials shall not occur.
 - iii) Selector switches shall be provided for selection of fans and pump equipment to be in 'service' or on 'stand by'.
 - iv) A magnetic contactor with thermal overload relays and MPCBs (motor protection circuit breakers) for short circuit protection shall be provided for each individual oil pump motor and for a maximum of 2 fans. Suitable means shall be provided for isolating any fan or oil pump from supply. Overload relays shall be of hand reset type.
 - v) The following alarm initiating devices having normally open contacts shall be included as applicable for the method of cooling:
 - Cooler power supply auto changeover
 - Cooling fan/fans failure for each radiator bank and/or unit cooler
 - Oil pump failure
 - Low oil flow for each pump.
 - vi) The following initiating contacts shall be provided:
 - Cooling fans start
 - Oil pump start
 - Cooling system on automatic control
 - Cooling system on manual control

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[107]	25.09.2014

- vii) All contacts shall be potential free and separately brought out to separate terminals. Necessary contacts shall be made available for remote alarm/indication in plant DDCMIS

3.4.9 Neutral Grounding Resistor Requirements:

- a) The neutral grounding resistor (NGR) shall be used for non effective grounding of 6.6 kV system of the plant. Each NGR shall be connected between neutral point of secondary side winding of station, Unit transformers & earth.
- b) The NGR shall limit the magnitude of earth fault current to 300A so that damage of electrical equipment is reduced, enhanced safety of personal is ensured and sensitive as well as selective earth fault can be provided. The NGR shall be air cooled type and suitable for outdoor installation in dust prone, hot, humid and tropical atmosphere. The resistor shall have minimum 10Sec.rating according to IEEE32.
- c) The resistor element shall be made of non-aging stainless steel or equivalent corrosion resistant material having high electrical resistivity and low temperature coefficient of resistance. All element connections shall be bolted type to ensure stable resistance value throughout the working life of the unit.
- d) Each NGR shall have structural steel work enclosed on all sides and also on top by sheet steel. Suitable ventilating louvers shall be provided on sides to ensure proper ventilation. The louvers shall be provided with fire wire mesh to make it vermin proof.
- e) Removable bolted disconnect link shall be provided for the purpose of isolation.
- f) Each cubicle shall be provided with 5A, 3 pin plug socket and door switch controlled cubicle illumination lamp.

3.4.10 Fittings and Accessories

- a) Bushing Current Transformer
 - i) Where bushing CT's are specified, the same shall conform to the specification indicated in the data sheet. Hot spot temperature of CT's shall be as specified for transformers.
 - ii) It shall be possible to remove the CT's at site, without opening the transformer tank cover/active part.
 - iii) All secondary leads shall be wired with 2.5 sq.mm stranded copper wire and including tapings shall be brought to a weatherproof terminal box. Rating and terminal marking plate of the CT shall be mounted on the terminal box. It shall be terminated in a box with

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[108]	25.09.2014

stud type termination. Conduit wiring from this outlet box up to the transformer marshalling box or control cabinet shall be provided.

- iv) Neutral bushing CTs for back up earth fault protection and restricted earth fault protection shall be provided for transformers as specified in a box with stud type termination.

b) Conservator

- i) All conservator shall be Air Cell type.
- ii) Conservator shall be located in such a position as not to obstruct the electrical connections to the transformer. The conservator volume shall be sufficient to maintain the oil seal from ambient temp. of 5 °C to oil temp. of 90 °C, with oil level varying within min. and max. Levels.
- iii) 150 mm dial type magnetic level gauge with alarm and trip connection shall be provided. In addition, prismatic type oil level gauge with min. and max. levels marked shall also be provided. Taps or valves shall not be fitted to the oil gauge.
- iv) Drain valve shall be designed so that conservator can be completely drained by means of the drain valve provided when mounted as in service. One end of conservator shall be bolted into position so that it can be removed for cleaning purposes. If the sump is formed by extending the feed pipe into the conservator vessel, the extension shall be for at least 25 mm. Oil filling hole with cap shall be provided.
- v) Filling plug and sump valve of 15mm size shall be provided for conservator of diameter up to 650mm and 25 mm size valve shall be provided for conservator above 650mm diameter. Valve for shutting off oil to the transformer shall be provided for conservator.
- vi) A silica gel breather with inspection window and oil seal shall be mounted at 1.4 meter above transformer base with suitable supports and connected to the conservator.
- vii) Separate conservator shall be provided for OLTC.

c) Buchholz Relay

- i) All transformers shall be provided with double float buchholz relay fitted in the pipe connecting the tank and the conservator pipe and shall have the following dimension,
 - 25 mm dia. for transformers up to and including 1000 KVA.
 - 50 mm dia for ratings from 1 MVA to 10 MVA.
 - 80 mm dia for ratings above 10 MVA.
- ii) In addition oil surge relay shall be provided for OLTC.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[109]	25.09.2014

- iii) Pipe shall be arranged at a rising angle of 3 to 9 degrees to the horizontal, up to the buchholz relay. Valves shall be provided on either side of relay after providing necessary length of straight pipes.
- iv) The relay shall have pet cocks at the top and bottom, drain plug, inspection windows, calibrated scale to indicate gas present, built in test facility and terminal box with oil tight brass gland.
- v) The relay shall have electrically separate; potential free self reset contacts for alarm and trip. Contacts shall be rated to make, carry & break 0.5 Amp. at 220 V DC. The contacts shall be wired to Marshalling box. The relay shall conform to IS: 3637 (C 1966).
- vi) Copper pipe of nominal diameter 5mm shall be connected from the relay test cock to a valve located about 1.25 M above ground level to facilitate sampling of gas when the transformer in service.

d) Valves and Connections

- i) Valves shall be of forged carbon steel up to 50 mm size and of gunmetal or of cast iron bodies with gunmetal fittings for sizes above 50 mm. They shall be of full way type with screwed ends and shall be opened by turning counter clockwise when facing the hand wheel. There shall be no oil leakage when the valves are in closed position.
- ii) All valves shall be provided with an indicator to show clearly the position of the valve. Oil sampling valves shall be provided at top and bottom of the main tank and these shall not be fitted on the filter valves. Non-return valves in pump scheme shall be provided. All transformers shall have bottom drain valve, top and bottom filter valves suitable for connecting to oil filtration unit. All transformers shall have bottom drain valve and shall be connected to oil pit through necessary pipes.
- iii) Each transformer shall be provided with following valves on the tank,
 - Two filter valves on diagonally opposite corners, suitable for connecting to oil filtration unit.
 - Oil sampling valves not less than 8 mm, at top, middle and bottom of main tank with provision for fixing PVC pipe.
 - One 15 mm air release plug at all required locations.
 - Valves between radiators and/or coolers.
 - Two plugged pipe outlets for applying vacuum.
 - Drain valve so located as to completely drain the tank to oil choke pit through necessary pipes and with locking arrangements.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[110]	25.09.2014

- Shut off valves between OLTC and its conservator.
 - Valves for connecting Online DGA (Dissolved Gas Analyzer) / Monitoring System.
- iv) All screwed valves shall be furnished with pipe plugs for protection.
- e) Joints and Gaskets
- All gaskets used for making oil tight joints shall be of proven material such as granulated cork-bonded synthetic rubber or synthetic rubber gaskets compatible with oil.
- f) Explosion Vent/Pressure Relief Device
- i) Pressure relief device shall be provided for GT, ICT, ST & UT. For all other Transformers, Pressure relief device / Explosion vent shall be provided. Pressure relief device provided shall be of sufficient volume for rapid release of any pressure that maybe generated within the tank and which might result in damage to the equipment. The device shall operate at a static pressure of less than the hydraulic test pressure for transformer tank. Means shall be provided to prevent ingress of rainwater.
 - ii) The relief device shall be mounted on the main tank and if on the cover shall be fitted with skirt projecting 25mm inside the tank and of such a design to prevent gas accumulation.
 - iii) If diaphragm is used, it shall be of suitable design and material and situated above max oil level
 - iv) The equaliser pipe connecting the pressure relief device and conservator shall be provided for relieving or equalising the pressure in the pressure relief device.
- g) Temperature Indicators
- i) 150 mm & dial type top oil, and winding temperature indicator for the HV & LV windings shall be provided for all transformers. Further an additional terminal of winding temperature indicator for automatic control of Blowers shall be provided.
 - ii) Each thermometer shall have potential free NO alarm contact and trip contact. No multiplying contactor / relay shall be used. Temp. Setting of each contact shall be independently adjustable at site. A manual reset type maximum temperature indicator shall be provided for each thermometer.
 - iii) The temperature-sensing element mounted in pockets of oil on the top cover of the transformer shall be connected to the indicating elements through capillary tube.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[111]	25.09.2014

- iv) Each winding temp indicator shall have temp. Sensing element, image coil and bushing mounted current transformer.
- v) Each thermometer shall be provided with remote temp. Indicator along with associated Accessories. The remote temperature Indicators shall be mounted on relay panel.
- vi) The local winding temperature indicator shall be provided with necessary contacts for Automatic starting and stopping of cooling fans, alarm and trip functions. Settings for closing and opening contacts shall be independently adjustable.
- vii) All contacts shall be rated to make 0.5A(min) and break 0.2 A (min) at 220V DC. All contacts shall be wired to Marshalling box.
- viii) In addition to the above winding temperature indicators /controllers shall be provided, for control of forced cooling system of the transformer.
- ix) 4-20 mA signals for oil and winding temperatures shall be made available for interfacing with SAS / DDCMIS.

h) Marshalling Box

- i) The transformer marshalling box shall be used for control, interlocking, metering and indication for transformer and shall be installed outdoor near the transformer.
- ii) Sheet steel of 2 mm thick enclosed, outdoor, weather proof Marshalling box conforming to IP-55 enclosure shall be provided for auxiliary equipment of the transformer. The doors shall be provided with channel rubber/neoprene gaskets all round.
- iii) Marshalling box shall accommodate control and protection equipment of transformer, temp. Indicators, bushing CT secondary terminals, stud type terminal blocks, 415V voltmeter etc.
- iv) Tap changing gear cubicle shall accommodate motor drive and associated control Equipment of tap changing gear, terminal block, mechanical indicators etc.,
- v) Space heaters with temperature controller, illuminating lamp and toughened glass windows shall be provided
- vi) All indication. alarm, trip contact etc. shall operate on 220 V \pm 10 % DC and Cooler Control supply shall work on 110 V AC
- vii) Bidder shall supply necessary 415/110 V transformers.
- viii) Mechanical indications, temperature indicators, double compression brass glands with necessary gland plates for terminating cables etc. shall be provided in each box. All auxiliary equipment, protection and signaling contacts shall be wired to these transformer-mounted cabinets.
- viii) Transducers, Auxiliary relays etc required for linking to bidder's SAS system / DDCMIS and spare potential free contacts (for all

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[112]	25.09.2014

alarm & trip signals) for purchaser's use would be provided in the Marshalling box. All contacts shall be potential free and separately brought out to separate terminals. Necessary contacts shall be made available for remote alarm/indication in plant DDCMIS

- ix) Cabling between the transformers and common Marshalling box shall be through cable trenches included in the scope of this contract. Sufficient space shall be provided in cable trays for cabling from Marshalling box by other vendors.

i) Earthing

- i) Two earthing pads, located on the opposite sides of the tank, shall be provided for connection to ground mat.
- ii) Earthing terminals shall also be provided on marshalling box to ensure its effective earthing. For continuity of earth connection, all gasketed joints shall be provided with braided copper wire jumpers.

j) Wiring

- i) All control, alarm and indication devices provided with the transformer shall be wired up to the terminal blocks.
- ii) Wiring shall be done with [650] V PVC wires in conduit or PVC armored cable. *[Minimum wire size shall be 1.5 sq.mm stranded copper. Not more than two wires shall be connected to a terminal. 20% spare terminals shall be provided.]*
- iii) Multi-way terminal block complete with mounting channel, binding screws and washers for wire connections and marking strip for circuit identification shall be provided for terminating the panel wiring. *[Terminals shall be stud type, suitable for terminating 2 nos. 2.5 mm² stranded copper conductor and provided with acrylic insulating cover.]*
- iv) All devices and terminal blocks shall be identified by symbols corresponding to those used in applicable schematic or wiring diagram. Each wire shall be identified, at both ends, with interlocking type permanent markers bearing wire numbers as per Bidder's Wiring Diagrams. AC / DC wiring shall have separate colour-coding.
- v) Wire termination shall be made with crimping type connectors with insulating sleeves. Wires shall not be spliced between terminals.

3.4.11 Terminal Block

- a) Terminal blocks shall be [650] V grade, 10 Amps rated, one piece moulded, complete with insulated barriers, stud type terminals, washers,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[113]	25.09.2014

nuts, lock nuts and identification strips. Markings on the terminal strips shall correspond to wire numbers on the wiring diagrams.

- b) Not more than one wire shall be terminated on either side of a terminal. When it is required to terminate two or more wires on the same terminal, the wires shall be terminated on adjacent terminals and these terminals shall be shorted using suitable shorting links.
- c) At least 10% spare terminals shall be provided.
- d) Unless otherwise specified, terminal blocks shall be suitable for connecting the following conductors of the suppliers wires on the same terminal
 - i) All circuits except CT circuits: Minimum of 2.5 mm² copper
 - ii) CT circuits: Minimum of 6 mm² copper
 - iii) For instrument signals: Minimum of 0.5 mm² for paired cable 1.5 mm² for core cable.

3.4.12 Auxiliary Supply

- a) A.C. supply will be made available to each transformer by two separate feeders one normal and the other standby.
- b) Isolating MCCB shall be provided for each of the incoming supply along with automatic changeover scheme to switch on to the standby source in case of failure of the normal supply.

3.4.13 Transformer Oil Centrifuging Plant (wherever applicable)

One no. mobile transformer oil centrifuging plant shall be provided. It shall be of sufficient capacity suitable for generator transformer with the following features:

- a) The capacity of the transformer oil centrifuging plant shall not be less than 10KLPH and vacuum in three stage degassing plant shall be better than one torr.
 - i) First stage will be evacuated by a two stage rotary oil sealed pump.
 - ii) Second stage of degassing column will be evacuated by a mechanical booster pump.
 - iii) Third stage of the degassing column will be evacuated by a roots pump.
- b) The plant shall be rated for continuous operation.
- c) The plant shall be mobile with four (4) wheel pneumatic tyres and suitable for being towed on motorable roads.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[114]	25.09.2014

- d) The plant shall also be supplied along with transformer evacuation system consisting of roots pump backed by a two stage rotary pump. Provision at suitable place in the path of oil being processed shall also be made for connecting an ionic reaction column to be used for the removal of acidity and product of oxidation and ageing in used transformer oil. The ionic reaction column shall also be supplied with the plant.
- e) The plant shall be complete with on-line testing instruments and annunciating panel.
- f) The following shall be prerequisites for the transformer oil centrifuging plant:
 - i) Dielectric strength : Suitable for 70kV or better with spark gap of 2.5 mm for 1 minute
 - ii) Water content in purified oil : Better than 20 ppm in single pass
 - iii) Suspended particles : 1 Micron
 - iv) Gas content : 0.1% by volume
 - v) Dissipation factor of oil at 90°C after filling into the equipment: 0.05
- g) The centrifuging plant shall be supplied with the essential testing equipments including but not limited to the following :-
 - i) Neutralization valve or total acidity test set to measure neutralization value of or total acidity content of transformer oil (organic or inorganic) as per IEC 296 and IS 335.
 - ii) Gas content measuring instrument to measure dissolved gas content in percentage of volume of same sample of transformer oil.
 - iii) Karl Fischer Apparatus to measure precisely dissolved moisture content in transformer oil.
 - iv) Inter facial tensiometer to measure the inter facial tension of insulating oil against water under non-equilibrium conditions in dynes/cm.
 - v) Relative humidity (RH) and Oil dryness test set to measure accurately water vapor pressure dew point and RH of a sample of insulating oil which in turn shall be used to assess the state of dryness of oil immersed solid insulation.
 - vi) Electronic vacuum gauge to measure with precision high vacuum inside the tank if new transformer supplied with protected nitrogen blanket while the same is being evacuated for filling of oil.
 - vii) Dew point meter to measure the dew point of the gas/ air surrounding the insulation of windings inside the transformer tank in order to determine surface mean moisture content of insulation.
 - viii) Automatic Dissolved Gas Analyzer to extract and measure various gases dissolved in electrical insulating oil of EHV transformers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[115]	25.09.2014

which are in service and also the estimation of hydrocarbon gases present in the layers above the transformer oil.

3.4.14 Painting

- a) All Steel surfaces shall be thoroughly cleaned by using seven tank process or by sand blasting, to produce a smooth surface free of scales, grease and rust. Pre treatment of sheet using solutions wire brush etc. shall not be done.
- b) Internal surface which shall be in contact with oil shall be painted with at least two coats of heat resistant, oil insoluble, insulating varnish.
- c) External surfaces, after cleaning shall be given a coat of High quality red oxide or Zinc chromate primer followed by filler coats. Over the filler coat, two coats of epoxy paint of grey shade shall be applied as a finishing coat to a thickness of 80 microns.
- d) The paints shall be carefully selected to withstand tropical heat, rain etc. The paint shall not scale off or crinkle or be removed by abrasion due to normal handling.
- e) All supporting structures and hardware shall be hot dip galvanized.

i. Name Plate

Nameplates of approved design shall be furnished at each cubicle (one no. each at front as well as at backside of cubicle) and at each instruments & device mounted on or inside the cubicle. The material shall be lamicaid or approved equal, 3 mm thick with white letter on black background. Self-tapping screws shall hold the nameplate. *[Nameplate size shall be minimum 20 x 75mm for instrument/device and 40 x 150mm for panels. Caution notice on suitable metal plate shall be affixed at the back of terminal Box.]*

3.5 Tests

I. Type Tests

For each type & rating of LV Transformers, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards, that is IS 2026 and carried out within *[last five]* years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within *[last five]* years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II. Routine tests

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

The following tests shall be performed on each transformer as a minimum:

The following tests constitute routine tests and they are not in specific order:

- a) Measurement of winding resistance.
- b) Measurement of voltage ratio and check of phase displacement.
- c) Measurement of short-circuit impedance and load losses between pair of windings at rated frequency with approximately sinusoidal voltage.
- d) Measurement of no-load loss and excitation current at 90%, 100%, 110% and 120% of rated voltage at rated frequency with approximately sinusoidal voltage.
- e) Dielectric tests.
- f) Measurement of capacitances and tan delta of winding to earth and between windings.
- g) Measurement of capacitances and tan delta of capacitor bushings that are to be installed on the ordered transformers.
- h) Measurement of Frequency response (Frequency Response Analysis - FRA).
- i) Test on Tap Changer.
- j) Magnetic balance test.
- k) Measurement of single phase short circuit impedance of each limb with single phase 50 Hz, low voltage.
- l) Measurement of single phase excitation current at low voltage at 50 Hz.
- m) Check of core and frame insulation for oil immersed transforms with core or frame.
- n) Winding insulation test, polarization index and absorption Index.
- o) Transient saturation. In rush current test.
- p) Tests on transformer oil. This shall be performed before starting tests on transformers.
- q) Measurement of Sound level as per IEC 60076-10.
- r) DGA test as per IEC 60567, IEC 60599 & IEC 61181.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[117]	25.09.2014

III. *Special Tests* (As per agreement between manufacturer and purchaser)

- a) *Measurement of the harmonics of the no-load current.*
- b) *Determination of sound levels. (IEC: 60076-10) for each method of cooling for which a guaranteed sound level is specified.*
- c) *Vibration test.*
- d) *Measurement of zero-sequence impedance(s) on three phase transformers.*
- e) *Measurements of the power consumption by cooling system.*
- f) *Determination and measurement of transient voltage transfer Characteristics.*
- g) *Short-circuit withstand test.*
- h) *Vacuum deflection test.*
- i) *Pressure deflection test.*
- j) *Vacuum tightness test on site.*

Further details have been provided in ient voltage transfer Characteristics.r which a guaranteed so

IV. Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

V. Test Certificates

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.

The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

3.6 Drawings/ Data and Manuals

Drawings, data, and manuals for the transformers shall be submitted as indicated below:

- a) *[General Arrangement Drawing*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[118]	25.09.2014

- b) Dimensioned general arrangement drawing showing enclosure, core coil assembly, terminal arrangement, marshalling box and various fittings.
- c) Transport/shipping dimensions with weights, wheel base detail etc.
- d) Foundation plan & loading.
- e) Bus duct/cable termination arrangement.
- f) Control schematics and wiring diagrams.
- g) Test reports and QAP
- h) Any other relevant drawing or data necessary for satisfactory installation, operation and maintenance.
- i) Instruction manuals on Transformer and its various fittings The manual shall clearly indicate method of installation, checkups and tests to be carried out before commissioning of the equipment.]

Note: The drawings, data and manuals listed are minimum requirement only. The Bidder shall ensure that all other necessary write-ups, curves and information required to fully describe the equipment offered are submitted.

4 ELECTRICAL TESTING LAB EQUIPMENTS

4.1 General

This specification is intended to cover *the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning]* of the minimum electrical laboratory and testing instruments that shall be provided complete with necessary hardware, software and other accessories such as main cables, calibration leads, clamps, connectors, operating manual, calibration certificates etc. for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

4.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC except where modified and/or supplemented by this specification.

equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

4.3 Design Criteria

- a) The electrical laboratory and testing instruments shall be installed in hot, humid and tropical atmosphere. All equipment, accessories and wiring shall be provided with tropical finish to prevent fungus growth.
- b) All electrical laboratory and testing instruments shall be suited for uninterrupted operation under the following variations in voltage and frequency:
 - i. Voltage Variation : $\pm 10\%$
 - ii. Frequency Variation : 50Hz (+)3% to (-)5%
 - iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency
- c) The test equipments shall be suitable for working on the following:
 - i. 3 phase, 4 wire, 415V, 50Hz solidly earthed.
 - ii. 1 phase, 240V, 50Hz solidly earthed system.
 - iii. 220V, 2 wire, DC system with following neutral and (+) 10% to (-) 15% variation.

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[131]	25.09.2014

4.4 Specific Requirements

4.4.1 Portable 5 kV Digital Insulation Tester

Features

Complete with test leads, mains lead, carrying case, PC down load software, instruction manual, test/calibration certificate etc.

Measuring Ranges

- a) Purpose : For checking the insulation level and polarization index of electrical equipments.
- b) Resistance : < 100 kilo ohm -> 1 Terra ohm
- c) Current : < 100 pico A -> 5 mA
- d) Test Voltages : [500, 1000, 2500 and 5000V]
- e) Accuracy : Better than 2%
- f) Test Time : Adjustable < 15 Sec.-> 10 minute
- g) Display : LCD 3½ digit with analog bar graph for Resistance, test voltage, current, PI
- h) Data Storage Capacity : > 75 Values
- i) Power Supply : 240V, 50Hz and rechargeable DC battery
- j) MMI : Via RS232
- k) Printer/PC interface : Via RS232
- l) Safety Standard : IEC 1010-1
- m) EMC Standard : EN50081-1 and EN 50082-1

4.4.2 Portable HV Decade resistance box in Polystyrene case with lid and carrying handle.

It shall be used for testing and calibration of insulation testers.

- a) Overall range : 1 kilo ohms to 1 Terra ohms
- b) Resolution : 1k Ohms
- c) Accuracy : 0.1% - 2%
- d) Connection : Shielded Plugs with 1 Meter cable

4.4.3 Portable HV AC Test Set comprising

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[132]	25.09.2014

- a) Shall be used for checking the high voltage with-stand level of electrical equipments viz, transformers, switchgears, cables, motors/ generators etc.
- b) An epoxy cast, single phase, 50-200kV/240V, 5kVA (continuous) and 10kVA (5minute) rated low discharge transformer with maximum discharge level of 1 PC mounted in a steel tank fitted with swivel cast or wheels, HV bushing.
- c) A control unit with microprocessor based automatic control, programming key pad LCD display analog ammeter and voltmeter with 2% accuracy trip push button, safety protections etc.
- d) A zero interlock circuit shall be provided to prevent energization of HV output on less voltage control is set to zero.
- e) Necessary power and metering cables, removable earth link fuses etc. shall be provided.

4.4.4 Automatic Capacitance And Tan-Delta Test Set (Schering Bridge) With Oil Resistivity Test Cell.

Equipment and material conforming to any other standard, which ensures Fully automatic, microprocessor-based, accurate AC Voltage Bridge. Shall be used for monitoring the condition of insulation of electrical instruments.

- a) Input : 120/240V, 50 Hz
- b) Output : 0-12kV, 100 mA (Cont.), 200mA (15 min) Extendible to 4A with resonating inductor
- c) Capacitance : 1.6 pF to 8 μ F (with 100pF std. capacitor)
- d) Measurement with $\pm 0.02\%$ to $\pm 0.05\%$ accuracy and 0.0001 pF resolution
- e) Tan-delta : 1×10^{-6} to 9.999 with accuracy $\pm 0.5\%$ and 1×10^{-6} resolution
- f) Capacitive current : 0-5A
- g) Measurement : 2.5 kV (RMS), 150°C, 100 cm³, 100 pF
- h) Display : Large graphic TFT (4-5 digit) Test voltage, frequency, capacitance, Tan-delta.
- i) Interface : RS232 for Printer 1 PC

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[133]	25.09.2014

4.4.5 Portable Transformer Oil Breakdown Test Set

To test the dielectric strength of transformer oil.

- a) Test Voltage : 0-100kV (RMS)
- b) Accuracy : $\pm 2\%$ of reading
- c) Switch-off response : < 4 mA current.
- d) Switch-off response : < 6 mS time
- e) Rate of rise of : 0.5/1/2/3/5KV per sec.
- f) Test voltage : Manual/Auto adjustable
- g) Display : Alpha numeric LCD.
- h) Interface : RS 232, RS232C
- i) Standard : IEC 156, ASTM D877
ASTM D1816, BS 5874, IEC 1010-1

4.4.6 Portable Karl-Fischer Test Set

Coulometric test set for oils with specific gravity ranging from 0.6 to 1.4, with a built-in printer. It shall be used to measure the percentage of moisture contamination of transformer oil.

- a) Titration Method : Coulometric, Karl-Fischer
- b) Display : 40 character alpha numeric with backlit LCD
- c) Sample Volume : 0.1, 0.2, 0.5, 1.0, 2.0, 5.0, 10.0 ml
- d) Sp. Gr. range : 0.6 to 1.4 in 0.01 steps
- e) Moisture range : 1 ppm – 100%
- f) Measuring range : 1 μ g – 10 mg water
- g) End point detection : ac polarization
- h) End point indication : Visual display/ printout/ acoustic beep
- i) Titration speed : 2 mg/ minute maximum
- j) Maximum current : 400 mA
- k) Drift compensation : Automatically controlled
- l) Start delay : 10 seconds
- m) Stirrer speed : Microprocessor-controlled
- n) Accuracy : $\pm 3 \mu$ g to $\pm 0.5\%$
- o) Calculation mode : Volume/ density or weight/ weight
- p) Printer : High Speed Thermal

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[134]	25.09.2014

q) Power supply : 90-264V ac, 12V dc rechargeable Battery.

4.4.7 3- Phase Portable Transformer Turns Ratio and Vector Group Meter

Fully automatic, microprocessor based having automatic tap changer control with internal chip card reader and built-in keyboard. In a robust mobile case having following features:

- a) Ratio : [Range : 0.75 to 10000]
- b) Ratio accuracy : $\pm 0.1\%$ to $\pm 0.3\%$ ± 1 digit
- c) Measuring Voltage : Yes
- d) Frequency Range : Yes
- e) Phase angle range : $\pm 90^\circ$
- f) Phase angle accuracy : $\pm 0.1^\circ \pm$ digit
- g) Magnetizing Current : $< 1 \text{ mA} \rightarrow 500 \text{ mA}$
- h) Magnetising Current accuracy : Better than $\pm 2\%$
- i) Measuring time : 5-20 seconds
- j) Data Storage : 200 sets of measurement
- k) Display : Backlit LCD 256 x 128 pixels
- l) Data displayed : Vector group, phase, tap position, ratio, Ratio deviation, phase angle, phase angle deviation, mag. current, pass-fail result
- m) Interface : RS232C, printer port
- n) Accessories : Windows compatible software for control Via PC HV/LV, main lead, clamps, operating manual, guarantee certificate.

4.4.8 Digital Low Resistance Ohmmeter

Features

Dual channel , direct – reading ohm meter having a safe discharge circuitry and in built printer with date and time stamping, software for remote PC control heavy duty connecting cables, clamps, operating manual, test/calibration certificate and transportable case.

Shall be used for for simultaneous measurement of HV and LV winding resistance and check on OLTC operation.

- | | | |
|-----------------------|---------------------------------------|--------------|
| a) Measuring ranges | Nominal range | Resolution |
| | 0-2m ohm | Micro Ohm |
| | 0-20m ohm | 1.0micro Ohm |
| | 0-200 Ohm | 1.0micro Ohm |
| | | milli Ohm |
| | 0-2 Ohm | milli Ohm |
| | 0-20 Ohm | 10 milli Ohm |
| | 0-2000ohm | |
| b) Accuracy | 0.1 % of reading over entire range | |
| c) Excitation Current | 0.1-25 A with compliance open circuit | |
| d) Display | 4 1/2 Digit backlit LCD | |
| e) Data Storage | Upto 700 measurement | |
| f) Interface with | RS232 | |
| | remote control | |

4.4.9 Portable High Current Digital Micro Ohm Meter

Suitable for carrying out measurements in charged EHV (>400kV). Supplied with built-in charger, mains lead, operating manual, test/calibration certificate, mounted in a light weight portable case with clip-on clamps and voltage leads for 4-wire measurement system having the following features:

- | | |
|----------------------------|-------------------------------------|
| a) Measurement ranges: | |
| i. 100 micro ohm | |
| ii. 600 micro ohm | |
| iii. 6000 micro ohm | |
| iv. 10.0 – 60000 micro ohm | |
| v. 600 m ohm | |
| vi. 1.0 – 6000 m ohm | |
| b) Resolution | : 0.01 micro ohm to 1.0 milli Ohm |
| c) Accuracy | : (±) 0.2% --- (±) 0.5% |
| d) Display | : with 4 digit LED or LCD (backlit) |
| e) Data Storage | : > 300 readings |

- f) Interface : RS232
g) Test Current : Up to 200A

4.4.10 Portable Primary and Secondary Current Injection Test Kit with Separate Control and Loading Units

- a) Control Unit
- ii. Current Output : 0-25A/0-50A (cont.),
0-50A/0-100A (upto 5 min)
 - iii. Voltage Output : 0-230V
 - iv. Current and Voltage : By true RMS, 4 digit digital meters
With measurement $\pm 0.6\%$
accuracy (+ 6 digit)
 - v. Timing Units : For ON and OFF
 - vi. Range : 0 – 1000 Sec.
 - vii. Resolution : 1 m sec.
 - viii. Accuracy : $\pm 0.1\%$ + 2 digits
 - ix. Power supply : 230V $\pm 10\%$, 45-551/2, 1-phase
 - x. Display : LCD/ LED
- b) Loading Unit
- i. Ranges : 0-500A/0-1000A/0-2000A/0-3000A

4.4.11 Portable Automatic Earth Tester

Microprocessor-controlled, user-friendly, with self-diagnostic features and alphanumeric display, re-chargeable battery shall be used in this equipment. Mounted in a robust case and provided with hammer and 4 GI spikes and 50m long cable on a cable winder.

Shall be used for measuring earth electrode resistance and soil resistivity using Warner 4-terminal method.

- a) Earth resistance : 0-20 k Ohms(Auto ranging)
range with 1 M Ω resolution
and 60.5% 62 digit accuracy
- b) Test frequency : 100-160 Hz in 0.5 Hz steps
- c) Test current : 50 mA
- d) Max. output voltage : <50V (RMS)
- e) Max. Interference : 40V peak to peak (50 Hz)
- f) Display : 3½ digit Alpha numeric LCD
- g) Standards : IEC 1010-1, EN 50081-1, EN

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[137]	25.09.2014

50082-1

4.4.12 Portable three phase Universal Protective Relay Test Set

Microprocessor-based user-friendly with digital signal processing. Having large LCD display with programmable menu. Having programmable output current and voltage waveforms and phase angles. Having following additional features and specifications:

- a) Input power : 90-250V, 1 Ph, 50 Hz
- b) Outputs : One AC Current 0-100A
One AC Voltage 0-300V
One AC Voltage/Current, 0-240V/0-2.5A
- c) Output frequency : Selectable from 16.66 Hz – 300 Hz
- d) Output AC voltage : 0-360deg. independently controlled phase shift
- e) Reading accuracy : $\pm 1\%$ for AC/DC Volts, Current
 ± 0.5 deg. In phase angle
 $\pm 0.02\%$ in power factor
 $\pm 1.5\%$ in active/reactive power
 $\pm 0.005\%$ in time
- f) Memory : Non volatile RAM
- g) Interface : RS port for PC and parallel printer Port
- h) Capacitive measurement : Resolution : 1pF
Accuracy : $\pm 0.2\% + 20$ digits

4.4.13 Precision Digital Multimeter

7½digit precision multi-meter for calibration of voltage/ current sources, decade resistance boxes, frequency sources with a large 24-digit vacuum fluorescent display, a bar-graph function allowing user programming of high and low pass/ fail limits, audible and visual indication of component specification and Auto Dynamic Filter (ADF) to enable automatic selection of suitable filter.

- a) Input Power : 110/220/240V AC 50 Hz
- b) DC Voltage Measurement Range: 3 MV to 10 kV
Resolution : 10 nV
Accuracy : $\pm 12\text{ppm} + 6\text{digits}$
- c) DC Current Measurement Range: 3 μ A to 30A

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[138]	25.09.2014

		Resolution	: 10 pA
		Accuracy	: $\pm 75\text{ppm} + 10\text{digits}$
d) Resistance Measurement	:	30 M ohm to 1 G ohms	
		Resolution	: 10 n Ohm
		Accuracy	: $\pm 200\text{ppm} + 6\text{digits}$
e) Frequency Measurement	:	1 Hz to 100 K Hz	
		Resolution	: 1Hz
		Accuracy	: $\pm 10\text{ ppm} + 1\text{digit}$
f) AC Voltage Measurement	:	3m V to 3 KV	
		Resolution	: 100 nV
		Accuracy	: $\pm 0.05\% + 40\text{digits}$
g) AC Current Measurement	:	3 Micro Amp to 30A	
		Resolution	: 100 pA
		Accuracy	: $\pm 0.1\% + 80\text{digits}$

4.4.14 Portable Digital Frequency Meter

Rugged, high accuracy portable frequency meter/calibrator in a dust tight, water resistant case.

Having LCD display complete with test leads, carrying case, 9V battery and instruction manual.

a) Ranges	:	0-100 KHZ / 0-1000 Hz
b) Resolution	:	1 KHZ / 0.1 Hz
c) Accuracy	:	$\pm 0.1\% \text{ FS } \pm 1 \text{ LSD}$
d) Step Size	:	10% of range
e) Scroll Size	:	0.1 % of range
f) Input	:	1V to 100V p-p
g) Output	:	5V p-p Square Wave
h) Maximum load	:	5 mA

4.4.15 Digital Sound Level Meter

Condenser type microphone, frequency and time weighting functions, AC and DC outputs supplied with 9V battery and calibration screw driver.

a) Range	:	[0-130dB] $\pm 1.5\%$ of reading
b) Battery operated	:	Yes
c) Portable, handheld, rugged	:	Yes

4.4.16 Digital Tachometer:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[139]	25.09.2014

Non-contact photoelectric optical type. Having features like reading hold, memory recall and low battery indication

- a) Display : 5 digit LCD
- b) Range : [0-10000 rpm or better]
+/-5 % of reading
- c) Resolution : 0.1 rpm to 1 rpm
- d) Accuracy : $\pm 0.1\%$ ± 1 digit to $\pm 0.15\%$
 ± 1 digit
- e) Optical Range : Up to minimum 300mm
- f) Non- Contact type : Yes
- g) Auto ranging : Yes
- h) Battery operated : Yes
- i) Portable, handheld, rugged : Yes

4.4.17 Cable Fault Locator

Working on pulse reflection (echo) technique. Capable of discriminating between inter-core and core to earth fault with facility to detect high resistance faults (>10 ohms) complete with surge generator, acoustic receiver, input filters, head phones etc.

- a) Input : 240V, 1 phase, 50 Hz
- b) Range : 10 nano sec. To 2000 ns
- c) Impedance range : 25 ohms to 100 ohms
- d) Surge Generator : 15kV, 100 mA, <512 joules,
capacity 10-20 pulses per minute
- e) Display : Backlit LCD

4.4.18 Portable Hand held SF6 Gas Leakage Detector

(With audio-visual indication)

- Sensitivity : 3 to 5 ppm

4.4.19 Portable Hand held Hydrogen Gas Leakage Detector

(with audio-visual indication)

- Sensitivity : 50 to 100 ppm`

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[140]	25.09.2014

4.4.20 Portable Vacuum Tester

For testing the condition of vacuum in medium voltage switchgear with automatic discharging facility and high voltage screened cable and over load/over voltage protection

- a) Display : Digital display of applied voltage in kV and leakage current in mA. Red and green indications for defective and acceptable chambers.
- b) Resolution : 0.1 kV and 0.01 mA
- c) Input : 240V AC, 50 Hz
- d) Output : 0-60 kV DC Adjustable
0-9.99 mA Adjustable
- e) Loading time : Upto 30 seconds

4.4.21 Portable Light Intensity Meter

- a) With selenium photocell, 2 metres lead and filters.
- b) Ranges : 0-15/30/100/300/1000/3000 lux
- c) Accuracy : $\pm 4\%$ of full scale

4.4.22 Portable Circuit Breaker Motion Analyser

For analyzing performance of SF6/Vacuum/air circuit breakers upto 400kV Microprocessor-based capable of measuring, recording and printing opening/ closing times and velocity, coil currents, dynamic contact resistance of main/aux. and arcing contacts, pole discrepancy etc. The instrument shall have user-friendly menu driven software for easy operation and reduced set up time. It shall have communication ports for downloading of data from memory on to a PC. It should have a built-in DC battery and printer. Other specifications shall be as follows :

- a) Input Supply : 110-240V, 50Hz with built-in DC battery backup with charger
- b) Current injection : Up to 100A DC
- c) Timing Range : 0-9.99 S. with a resolution of 0.1mS and accuracy of $\pm 0.01\%$
- d) Number of channels : 12 analog, 24 digital
- e) Display : 16 character alphanumeric LCD

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[141]	25.09.2014

4.4.23 Generator On-line Partial Discharge Real Time Monitoring System

To detect and monitor partial discharge activity in generator stator windings and vibrations in generator end windings by acoustic sensors. To generate alarms in case of excessive partial discharge or end winding vibrations. Should have the capability to acquire partial discharge patterns and determine PD quantities as apparent charge, quadratic rate and average discharge current for each phase. Standalone type with facility for storage of trend data and patterns. With facility to download patterns and trends on to PC or LAN; visualization software and automatic report generation shall be provided. Having noise suppression circuitry for input and signal transfer. The surge capacitors connected on the line Terminals of the generators shall be used as PD sensors. Necessary surge capacitor connection kit shall be included and the instrument shall be compatible with surge capacitors of 0.25 micro farads/ 24 kV supplied with the generators the instrument shall be in 19" rack-mounted design and shall be housed in a wall-mounted IP65 case. Other specifications as below:

- a) PD Input : 4 channels, 0-30 V rms
- b) Frequency Ranges : 0.3 MHz - About 10 M Hz
- c) Acquisition Software : Standalone C-based
- d) Evaluation Software : Standalone Java based
- e) Data Storage : Up to 48 values per channel 1
Pattern per day
- f) Visualization : Web server with standard web-Browser and Windows based internet capable software
- g) Communication : 100 M Bit Ethernet interface with TCP/ IP protocol and fiber-optic communication

4.4.24 Interfacial Tension Meter for Transformer Oil

Motorised operation using a Platinum Iridium Ring. In dust tight IPW55 enclosure

- a) Range : 0-90 Dynes/per cm.
- b) Zero Drift : < 0.1 Dynes/m in 24 Hours
- c) Resolution : 0.05 Dynes
- d) Accuracy : \pm 0.5 Dynes/cm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[142]	25.09.2014

4.4.25 Portable, Hand-held Thermal Imaging Camera

Having voice recording and alarm facility, double ocular view finder and clear CCD lens, multi-spot (Minimum 4) temperature measurement and High End image analysis software capable of generating wizard guided reports and trend analyses etc. Battery operated.

- a) Temperature Range : -10°C to 2000°C
- b) Detector Type : Un-cooled Focal Plane Array
- c) Thermal Sensitivity : 0.08°C @ 30°C
- d) Frame Rate : 50 Hz
- e) Field of View : 20° x 20°
- f) Spectral Response : 8 to 14 microns
- g) Battery Operation : For at least 2-hours

4.4.26 Portable High Voltage/Live Line Detector

Electronic type, giving audio-visual indication for presence of voltage/charge, having in-built self-diagnostic check feature.

- a) Insulating stick shall be class 'F' insulated.
- b) Range : Up to 300 kV

4.4.27 Tong Testers

Digital clamp-on volt-ammeters Ranges:

- a) 0-5/ 25A, 0-60/ 300/ 600V
- b) 0-1/ 5A, 0-60/ 300/ 600V
- c) 0-10/ 30/ 300/ 1000A, 0-60/ 300/ 600V

4.4.28 Portable Phase Sequence/Continuity Indicators

To indicate phase continuity and phase rotation sequence of 3-phase power circuits. Complete with colour-coded and insulated 1 Meter long fused leads with boot-protected alligator clips and carrying case. It shall have an impact resistant plastic body with encapsulated circuitry incorporating neon indicators for phase continuity and phase sequence.
Rated 100-600V, 40-60 Hz.

4.4.29 Relay Tool Kit

Comprising following minimum tools:

- a) Spring setting tool

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[143]	25.09.2014

- b) Inspection mirror and torch
- c) Ring spanners
- d) Box spanners
- e) Burnishing tool
- f) Contact pressure gauge
- g) Factor gauges
- h) Test plugs with link plugs
- i) Screw drivers
- j) Nose pliers
- k) Scissors

4.4.30 HV Discharge Rod and Portable Earthing Equipment

Class 'F' insulated. Having non-linear carbon film resistor with negative temperature co-efficient. Non-hygroscopic

- a) Dimensions : ID : 25 mm
OD : 31 mm
Length : 1250 mm (main rod and each Extension)
Total Length: 6 meters
- b) Discharge hook : 100 mm (dia)
12.5 mm (dia) copper rod
- c) Earth lead : Flexible braided copper
- d) Voltage rating : Up to 400 kV

4.4.31 Hot Sticks (Live/ Dead Line Tester)

Class 'F' insulated, upto 400kV, extendible from 1.25 meter to 6.0 meters with inbuilt self-check feature. Contact or proximity type in a special carrying case.

4.5 Tests

a) Type Test

For each type & rating of equipment for [220 kV/400 kV] substation, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[144]	25.09.2014

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

b) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

c) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

d) Test Certificates

- iii. Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- iv. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

4.6 Drawings, Data and manuals

The engineering services scope and the documentation to be issued with the bid are described hereafter. The list shows the minimum requirements for the documentation, so that any additional documentation considered as necessary will be added to this.

a) Engineering, manufacturing, delivering and test schedule

b) Sub-Supplier lists.

c) General arrangement drawings(plan, elevation, section view) with dimensions

d) Foundation drawing including loading data.

e) Technical Data sheets.

f) Electrical and control wiring diagram.

g) Terminal arrangement drawing, interconnection wiring diagram.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[146]	25.09.2014

5 ENERGY MANAGEMENT SYSTEM

5.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Energy management system complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

5.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC / IEEE standard.

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

5.3 Design Criteria

- a. The EMS shall acquire electrical parameters like 3 ph voltage, 3 ph current, KW, KVA, KVAR, PF, frequency, KWh and KVARh from numerical relays and energy meters of various feeders subject to availability of the above parameters on communication port of numerical relays & energy meters.
- b. The communication server shall poll the data concentrator and energy meters for data acquisition. The communication server shall act like Master and the data concentrator and energy meters as slaves in the communication network. The data so collected shall be stored in data base for further use.
- c. Energy parameters are displayed in workstation and viewer PCs for meters in various feeders in the form of single line diagram.
- d. Energy data shall be logged in the server and Energy consumption reports shall be generated for analysis. Reports shall be generated on daily, monthly or periodically basis. Facility to print reports on laser printer shall also be provided. The following reports shall be provided.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[147]	25.09.2014

- i. Power consumption report – Shift wise, Daily, Weekly, Monthly and Yearly basis. For each switchgear board, power consumption parameters of incoming / outgoing feeders shall be displayed.
 - ii. Single Line Diagram: For each switch board, presence of energy meter / numerical relay is indicated as bitmap. Instantaneous values like V, A, PF, KWH, KVAR, F shall be displayed below each feeder.
 - iii. Load flow: Direction of load (active & reactive power) flow along with the present value of load (active & reactive power) shall be indicated for each switch board.
- e. Numerical relays are being supplied as part of various station and unit switchgear boards for this project. Energy consumption parameters for various feeders located in the switchgear boards (KW, KVAR, KWH, KVARH etc) are acquired from these numerical relays through the communication port on suitable protocol by EMS system. All the numerical relays pertaining to a switchboard shall be looped and connected to a data concentrator. Data concentrator shall be interfaced to EMS system for acquiring energy data from numerical relays.
- f. Similarly for switchboards where energy meters are provided in place of numerical relays, the energy meters shall be interfaced to EMS system. Energy meters shall be looped to form RS485 network within that switchboard. Further energy meters shall be networked from switchboards to EMS system panel. For noise reduction RS485 signals shall be converted to TCP/IP or fiber optic communication depending upon distance.
- g. Alternately, the data, if available, can be realized from the PLCs of sub-package before giving input to DDCMIS. However, this acquisition of data should not affect or slow down the operation of DDCMIS and PLCs.
- h. In the unit control room location, Network panel of suitable dimension shall have to be provided. [Color of panel shall be RAL9002 powder coated with IP42 protection class.] At MCC/switchgear room, wall mounted network enclosures of suitable dimensions shall have to be supplied. These enclosures shall not pose any hindrance to the Electrical panels. Enclosures shall be of steel construction with holes for wall mounting brackets, Gland plate at bottom for cable entry, Ventilation

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[148]	25.09.2014

slots and front tinted glass door. *[Color of enclosure shall be RAL7032 powder coated with IP20 protection class]*

- i. Network Panel and wall mounted enclosures installed in the power plant unit control room shall be powered from the control room UPS.
- j. For remaining wall mounted enclosures, 1 KVA online UPS with 30 min back up time shall be provided.
- k. Network panel and wall mount enclosures shall house TCP/IP based RS485 serial server devices, Ethernet to fiber converter, Light guide Interface Units (LIUs) for fiber termination as per requirements. Data concentrators and energy meters forming RS485 loops from one area shall be terminated at serial servers in the enclosures. Ethernet of serial server is the converted to fiber format by employing Ethernet to fiber converters for further connection to communication server (HMI) system at Unit Control Room.
- l. For interconnection of different locations (i.e. switchgear rooms) where cabling is running outdoor, optic fiber based network shall be deployed. Fiber optic network shall be single mode fiber based with 4 cores armored cable. Two cores of the fiber shall be utilized for interconnection between locations and balance cores shall be terminated on the LIUs.
- m. At the [Unit Control Room], workstation PCs shall be provided with Energy Management Software which work as communication servers. These workstations acquire online data from network of geographically distributed numerical relays and energy meters. Separate PCs shall be provided for data viewing purpose. For printing of reports,[network A3 size color laser printer] shall be provided.
- n. HMI system comprises of Workstation computers with TFT monitor, QWERTY keyboard and optical mouse in the Unit Control Room. Workstation computers shall be with following minimum specifications or higher versions.
 - i. *[Intel Quad Core processor, 2 GB RAM, 500 GB SATA Hard disk, DVD-ROM, 16x DVD +/-R/W Drive, 10/100/1000 Base-T PCIe Based Ethernet NIC's with RJ45 ports, supporting 1600 x 1280 resolution with true colors, 22" TFT MONITOR with resolution of 1280 x 1024. Microsoft Windows XP Professional with latest service pack.*

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[149]	25.09.2014

ii. *Fiber optic cable specifications: 4 core, single mode fiber optic cable.*

iii. *RS485 cable specification: Low Capacitance Computer Cable for EIA RS232/485, 28AWG stranded tinned copper conductor, 2 pair twisted pair cable with 100-120 ohm characteristic impedance with a drain wire]*

- o. Furniture specification: Ergonomically designed computer table, computer chair & printer table shall be provided as per the requirement.
- p. For data acquisition, customized energy management software shall be loaded in these workstation computers (communication servers). The EMS software shall be programmed to generate reports for energy consumption per feeder and log reports.

5.4 Specific Requirements

5.4.1 The EMS system shall be supplied at following locations.

a. Electrical Control Room

Following equipments shall be supplied in Electrical control room.

- i. *[2 No of Desktop type Workstation for EMS Software.*
- ii. *2 No of Desktop type Workstation for viewing purpose.*
- iii. *1 No of A3 size network ready color Laser printer.*
- iv. *1 No of Network Panel housing Communication network accessories.*
- v. *4 No of Desktop type Tables for Work Stations.*
- vi. *1 No of Printer tables for the above printers.*
- vii. *4 No of chairs for operators.]*

b. MCC / Switchgear Rooms

Following equipment shall be supplied in MCC/Switchgear room

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[150]	25.09.2014

- i. [1 set of wall mounted network enclosures housing serial servers, media converters and LIUs as per requirement in each switchgear room.]

c. Common Items

- i. [1 set of EMS software for various numerical relays and energy meters (approx. 500 Nos).
- ii. 1 set of serial cable for networking meters in switchgears in RS485 loop.
- iii. 1 set of Fiber optics, HDPE pipes with accessories for linking different locations.
- iv. 1 set of 1KVA, 30 min backup UPS for enclosures where UPS supply is not available.
- v. Any other items, to make the system complete].

d. Fiber Optical Cable Construction Specification

i. Secondary Protection

The primary coated fibers may be protected by loose packaging within a tube or tubes, filled with thyrotrophic jelly.

ii. Strength Member

Solid FRP non-metallic strength member / members in the cable core / sheath shall be provided. The strength member (s) in the cable shall be for strength and flexibility of the cable and shall have anti buckling properties. These shall also keep the fibre strain within permissible values.

The non-metallic strength member (s) may be in the cable core or embedded within the sheath.

iii. Cable Core Assembly

Primary coated fibres in loose tube / tubes and / or in groove stranded together around a central strength member using helical or reverse lay techniques shall form the cable core. Alternatively multiple units of fibres may be placed loosely in a single tube with the strength members in the sheath.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[151]	25.09.2014

iv. Core Wrapping

The main cable core containing fibres shall be wrapped by layer / layers of polyester foil tape. The nylon / polyester binder tape or thread shall be used to hold the tape, if required.

v. Moisture Barrier (Protection)

The main cable core (containing fibres & core wrapping) shall be protected by flooding compound (jelly) having properties of non-hygroscopic dielectric material and water swellable tape. The core wrapping shall not adhere to the secondary fibre coating.

vi. Filling Compound

The filling compound used in the loose tube and in the cable core shall be compatible to fibre, secondary protection of fibre, core wrapping etc. The drip point shall not be lower than +70°C. The fibre movement shall not be constrained by stickiness and shall be easily removable for splicing. Reference material test method to measure drop point shall be as per ASTM D 556. The filling and the flooding jelly compound shall be as per the GR No.G/ORM-01/02 MAR 99 and the subsequent amendments if any.

vii. Inner Sheath

A non-metallic moisture barrier sheath may be applied over and above the cable core. The core shall be covered with tough weather resistant High Density Polyethylene (HDPE) sheath black in colour (UV Stabilized) and the colour shall conform to Munsell Colour Standards. Thickness of the sheath shall be uniform and shall not be less than 1.8 mm including the strength members used in the sheath. The sheath shall be circular, smooth, and free from pinholes, joints, mended pieces and other defects. Reference test method to measure thickness shall be as per IEC 189 Para 2.2.1 and Para 2.2.2.

viii. Reinforcement

The aerial optical fiber cable shall be reinforced with Aramid Yarn in the periphery over the inner sheath. The Aramid Yarn shall be uniformly and equally distributed on the entire periphery (circumference) of the cable. The quantity of the Aramid Yarn used per kilometre length of the cable with its D-Tex value shall be indicated by the manufacturer.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[152]	25.09.2014

ix. Outer Jacket

A circular and uniform tough weather resistant polyethylene compound HDPE material. Sheath/Jacket black in colour shall be provided over and above the reinforcement of aramid yarn. The thickness of the outer sheath/jacket shall not be less than 2.0 mm. The sheath shall be free from pinholes, joints, scratches, mended pieces and other defects etc. and it shall have smooth finish.

x. Cable Diameter

The manufacturer shall define the cable diameter. The finished cable diameter shall be within + 0.5 mm from the defined cable diameter.

xi. Rip Cord

The two suitable (minimum) ripcords shall be provided which shall be used to open the inner and outer (HDPE) sheath of the cable. It shall be capable of consistently slitting the sheath without breaking for a length of 1 meter at the installation temperature. The rip cord (s) shall be properly waxed to avoid wicking action and shall not work as a water carrier.

The ripcord used in the cable shall be readily distinguishable from any other components (e.g. Aramid Yarn etc.) utilized in the cable construction.

e. Component Specification

Details of the various components used in the system along with quantity are given in the attached table. The items and quantity shall include but not limited to the followings:

Table: 1

SL. NO.	ITEM	Details
1	RS 485 to TCP/IP converter (RTC) with accessories	N port, multi client, isolated with automatic direction control, 10/100 MBPS, two port RS 485, two wire, ESD protection 15 KV, power supply 12 to 30V DC, operating temperature 0 to 55°C with installation and configuration software.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[153]	25.09.2014

SL. NO.	ITEM	Details
2	TCP/IP to Fiber Optics Converter with one Fiber Optics output (TFCO) with accessories	Un-managed Ethernet / Fiber Optics Switch, one Fiber Optics Interface, one Single Mode 100 Base Fx Port, six TCP/IP Ports, operating temperature 0 to 60°C.
3	TCP/IP to Fiber Optics Converter with two Fiber Optics outputs (TFCT)	Un-managed Ethernet / Fiber Optics Switch, two Fiber Optics Interface, two Single Mode 100 Base Fx Ports, six TCP/IP Ports, operating temperature 0 to 60°C.
4	Light Interface Unit (LIU)	LIU for Fiber Optics connection, Patch Cords, required connectors, etc.
5	Fiber Optics Cable (OFC) along with HDPE Pipe and Hardware & fittings	Six core, armored detailed specification mentioned below

5.5

Tests

a. Factory Acceptance Test (Fat)

The EMS system shall be tested in phased manner. First phase shall include testing of the EMS hardware and second phase shall be testing of the EMS software. During FAT of EMS at EDN works, Panel and enclosures shall be offered for inspection for visual, dimensional, BOQ and verification data collection from sample energy meters (1 No of each type) shall be demonstrated and same shall be verified on configured displays and reports.

b. Site Acceptance (SAT)

During SAT of EMS software, data collection from all energy meters / numerical relays through data concentrators shall be demonstrated and it shall be verified on configured displays and reports.

c. Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B	[154]	25.09.2014

d. Test Certificates:

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

5.6 Drawing & Documents

Drawings, data & manuals for the motors shall be submitted as indicated below

- a) [System Interface diagram.
- b) Bill of materials.
- c) Technical Data sheet and Catalogue of different items.
- d) General arrangement drawing, panel fixing drawings for network panel and wall mounted panels.
- e) Descriptive write-ups and literature for Energy management system.
- f) Wiring diagram.
- g) Inspection and Test Plan (ITP).
- h) Transport/shipping dimensions and weights].

5.7 Ratings & Requirements

Energy management system shall comply with the particulars indicated in the following tables.

1.0 MOTOR

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Electric Motor complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes & Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

IS : 325	:	Specification for three phase induction motor.
IS : 900	:	Code of Practice for installation and maintenance of induction motors
IS : 996	:	Single phase AC motors
IS : 1231	:	Dimensions of three-phase foot-mounted induction motors
IS : 1271	:	Thermal evaluation and classification of electrical insulation.
IS : 2223	:	Dimensions of flange mounted ac induction motors.
IS : 2254	:	Dimensions of vertical shaft motors for pumps
IS : 3177	:	Crane duty motors
IS : 4029	:	Guide for testing three phase induction motors.
IS : 4691	:	Degree of protection for enclosures of rotating electrical machinery.
IS : 4722	:	Specification for rotating electrical machinery.

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E1	[2]	25.09.2014

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All motors shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The motors shall be suitable for operation in a highly polluted environment.
- b. AC Motors shall be of [constant speed, squirrel cage, three/ single phase, induction type.] Motors shall be rated for [continuous duty/intermittent duty]. They shall also be suitable for long period of inactivity. They shall also be suitable for direct online starting (DOL starting).
- c. DC motors provided for emergency service shall be shunt / compound wound type. Motor shall be sized for operation with fixed resistance starter for maximum reliability.
- d. Power supply for AC motors shall be as follows:

Table: 2.0

1.	[Below 0.22 kW]	:	240V, 1 Phase, 50Hz
2.	[From 0.22 kW up to & including 160 kW]	:	415V, 3 Phase, 50Hz
3.	[Above 160 kW]	:	6.6kV, 3 Phase, 50Hz

- e. All AC motors shall be suited for the following range of frequency and voltage variations:
 - i. Voltage Variation : +/-10%
 - ii. Frequency Variation : 50Hz (+)3% to (-)5%
 - iii. Combined Variation of Voltage & Frequency : 10% (absolute sum)
- f. DC motors shall be rated for 220V DC supply with voltage variation of -15% to +10%.
- g. The motor characteristics shall match the requirements of the driven equipment so that adequate starting, accelerating, pull up, break down and full load torques are available for the intended service.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E1	[3]	25.09.2014

- h. Moreover, motors shall be so designed that maximum inrush currents and locked rotor and pullout torque developed by them at extreme voltage and frequency variations do not endanger the motor and driven equipment.
- i. Motors shall be capable of developing the rated full load torque even if the supply drops to 70% of the rated voltage.
- j. For 6.6kV motors, locked rotor current not to exceed [600%] of full load current, including positive tolerance, except for BFP. For BFP the starting current shall be [450%] of FLC. For 415 V motors Locked rotor current not to exceed [600%] of full load current with IS tolerance.]
- k. For DC motors, the starters shall be provided to limit the starting current to [2] times of the full load current.
- l. Maximum continuous motor ratings shall be at least [10%] above the maximum load demand of the driven equipment under entire operating range including voltage and frequency variations.
- m. Accelerating torque at any speed with the lowest permissible starting voltage shall be at least [10%] motor full load torque. Pull out torque at rated voltage shall not be less than 205% of full load torque. It shall be 275% for crane duty motors.
- n. The motors shall be suitable for bus transfer schemes provided on the 6.6kV and 415V systems without any injurious effect on its life. If motors are connected to an automatic bus transfer system, they may be subjected to 150% of the nominal voltage during changeover of buses due to the phase difference between the incoming voltage and motor residual voltage. In such cases, motors shall be capable of restarting under full load after momentary loss of voltage.
- o. Motors shall be of [energy efficient of type Eff-2] as per IS: 12615/equivalent IEC/ International Standards.
- p. Motor shall be designed to keep torsional and rotational natural frequencies of vibration of the motor and driven equipment at least 25% above the motor operating speed range.

1.3.1 System Grounding

Table: 3.0

(a)	6.6 kV	:	Low Resistance Grounded to limit the earth fault current to [300 Amps]

c)	Paint Shade	:	[RAL5012 BLUE]

1.4 Specific Requirements

1.4.1 Locked Rotor Withstand Time

- The starting time of the motor shall be at the minimum permissible voltage.
- For motors with starting time up to 20 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E1	[6]	25.09.2014

condition at highest voltage limit shall be at least 2.5 second more than starting time.

- c) For motors with starting time more than 20 second and up to 45 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot condition at highest voltage limit shall be at least 5 second more than starting time.
- d) For motors with starting time more than 45 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot condition at highest voltage limit shall be more than starting time by at least 10% of the starting time.
- e) Speed switches mounted on the motor shaft shall be provided in cases where above requirements are not met.

1.4.2 Starting Voltage Requirement

I.	All motors (except mill motors):
a)	[85% of rated voltage for motors up to 4000 kW]
b)	[75% of voltage for motors above 4000 kW]

II.	For mill motors:
a)	[85% of rated voltage for motors above 1000 kW]
b)	[90% of rated voltage for motors below 1000 kW]

The motor shall be capable of withstanding the stresses imposed if started at 110% rated voltage.

Pump motor subject to reverse rotation shall be designed to withstand the stresses encountered when starting with non-energized shaft rotating at [125%] rated speed in reverse direction.

The motor may be subjected to sudden application of 150% rated voltage during bus transfer, due to the phase difference between the incoming voltage and motor residual voltage.

1.4.3 Winding and Insulation

a)	6.6 kV AC motors	:	Winding material shall be of copper. Insulation shall be of [Class F with winding temperature rise limited to Class B]. They shall withstand 1.2/50 microsecond switching surges of "4U + 5 KV" (U = Line voltage in KV). The coil inter-turn insulation shall be suitable for 0.3/3 micro second surge of 32 / 12 KV followed by 1 min
----	------------------	---	---

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E1	[7]	25.09.2014

			power frequency high voltage test of appropriate voltage on inter turn insulation.
b)	415V AC & 220V DC motors	:	Winding material shall be of copper. Insulation shall be of [Class B with temperature rise limited to Class B.]
c)	Conveyor motors		Short circuit rings of conveyor motors shall be either joint less or welded type. Brazed joint is not acceptable.

1.4.4 Motor Control

a) For HV Motors

- i. Motors of rating above [160 kW] shall be suitable for 6.6 KV voltage
- ii. Frequent starting motors of rating above [160 kW] shall be suitable to be controlled by vacuum contactors

(b) For LV Motors

- i. Motors of rating less than [132 kW] shall be operated by Contactor from respective MCCs. Motors of rating up to [18.5 kW] shall be provided with MPCBs and Electronic overload relays. Motors of rating above [18.5 kW] and below [45 kW] shall be provided with MCCBs and Electronic overload relays. Motors of rating [45 kW] and above but less than [132 kW] shall be provided with MCCBs and CT operated Electronic over load relays.
- ii. Motors of rating [132 kW] and up to [160 kW] shall be suitable to be controlled by Air circuit breakers from switchgear, PMCCs and shall be provided with comprehensive numerical motor protection relays.
- iii. Only for firefighting system, motor rated [upto 200kW] shall be fed from 415V switch board.

1.4.5 Starting duty

Motors shall be suitable for [3 nos. consecutive Cold starts ups and 2 nos. consecutive Hot starts ups.] Motors shall be suitable for three equally spread starts per hour when the motor is under normal service condition.

1.4.6 Bearings

- a) Anti-friction type radial and thrust bearings (ball, roller) and sleeve bearing shall be rated for minimum standard life of 40,000 hours taking bearing and driven equipment loads (in case the drive is not having

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E1	[8]	25.09.2014

separate thrust bearing) into account. If bearings are lubricated, loss of grease shall be scarce and it shall not creep along shaft into motor housing. Facility of removal of excess grease shall also be provided for grease lubricated bearings.

- b) Vertical shaft motors shall be provided with thrust and guide bearings. Thrust bearing of tilting pad type is preferred. However, if Anti-friction bearings can take vertical thrust, thrust & guide bearings are not required.
- c) Bearing shall be effectively sealed against dust ingress and shall be pressure grease gun lubricated. The bearing and housing shall be so designed that greasing shall be possible while the motor is running, without removal of covers.
- d) Where bearing supports are attached to the motor casing, adequate bracing shall be provided on these supports to reduce vibrations and ensure life of bearings.
- e) If the bearings are oil lubricated, a drain plug shall be provided for draining residual oil and oil level gauge shall be provided to show precisely oil level required under standstill and running conditions.
- f) Unless otherwise approved, bearing lubricating system shall be such that no external forced oil or water is necessary to maintain required oil supply to keep bearing temperature within design limits.
- g) Lubricants shall be selected for prolonged storage and normal use of motors in tropical climate and shall contain corrosion and oxidation inhibitors. Greases shall have suitable bleeding characteristics to minimize setting. The selected lubricants shall be indigenously available.
- h) Motors rated above 1000 kW shall have insulated bearings to prevent flow of shaft currents.

1.4.7 Temperature Rise

- a) For Air Cooled Motors, temperature rise of insulation should be limited to [70 °C] over ambient temperature by resistance method.
- b) For Water Cooled Motors, temperature rise of insulation should be limited to [80 °C] over inlet cooling water temperature mentioned elsewhere, by resistance method.

1.4.8 Cooling

[All motors shall be either Totally Enclosed Fan Cooled (TEFC) or Totally Enclosed Tube Ventilated (TETV) or Closed Air Circuit Air Cooled (CACA) type. However, motors rated 3000 kW or above can be Closed Air Circuit Water Cooled (CACW)]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E1	[9]	25.09.2014

1.4.9 Enclosure

- a) All motor enclosures shall conform to the degree of protection of [IP54] for indoor and IPW-55 for outdoor installation unless otherwise specified. Motor for outdoor or semi outdoor service shall be of weather proof construction. Motors of large output rating located indoor could have screen protected drip proof (SPDP) enclosure conforming to [IP-23.]
- b) For motors located in outdoor & corrosive locations, FRP canopy shall be provided. In case steel canopy is provided, the same shall be epoxy painted to meet the surrounding atmosphere. Motors located in hazardous areas such as Hydrogen plant shall have flame proof enclosures of Group – IIB conforming to IS: 2148.
- c) For hazardous locations such as fuel oil facilities area, the enclosure of motor shall have flame proof construction conforming to IS 2148.

1.4.10 Noise Level and Vibration

Noise level shall be limited to 85 dB (A) at 1.5 meters from the motor. However the same shall be as per IS: 12065 unless otherwise specified. The peak amplitude of vibration shall be within the specified limits laid down in IS: 12075. Motors shall withstand vibrations produced by driven equipment. HV motor bearing housings shall have flats in both X and Y directions suitable for mounting 80mmX80mm vibration pads. Vibration pads with screwed holes for mounting vibration probes shall be provided at both DE and NDE.

1.4.11 Temperature Monitoring

[In HV motors, at least four numbers simplex/ two numbers duplex platinum resistance type temperature detectors shall be provided for each phase of stator winding]. Each bearing shall be provided with dial type thermometer with adjustable alarm contact and two numbers duplex Platinum resistance type temperature detector (3 wire, 100 ohm at zero °C). In case of CACA and CACW motors dial type temperature indicator shall be provided (one each for hot and cold air temperature monitoring for CACA and CACW and one each for inlet and outlet water temperature monitoring for CACW). If alarm and trip are required for cooling air temperature, temperature switch shall be provided. The contact rating shall be minimum 0.5A at 220V DC and 5A at 240V AC. Flow switches shall be provided for monitoring cooling water flow of CACW motor and oil flow of forced lubrication bearing. Low voltage motors rated 100 kW and above shall be provided with two PT100 RTDs per phase of winding.

1.4.12 Earthing

Motor body shall have two earthing points on opposite sides. Motor terminal boxes shall also have separate grounding terminals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E1	[10]	25.09.2014

1.4.13 Termination

- a) HV motors can be offered with either Elastimold termination or dust tight phase segregated double walled (metallic as well as with insulated barrier) cable boxes. In case Elastimold terminations are offered, then protective cover and trifurcating sleeves shall also be provided. Removable gland plates of thickness 3 mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material for single core cables) shall be provided in case of cable boxes. The main cable box / terminal box shall withstand *[a fault current up to 40 kA for 0.25 seconds for HV motors and 50 kA for 0.25 seconds for LV motors]*. Separate terminal boxes shall be provided for space heaters and RTDs and NCT (if applicable).
- b) *[All terminal boxes shall be capable of being turned through 360 degrees in steps of 90 degrees unless otherwise specified.]*
- c) For HV motors the distance between gland plate and the terminal studs shall not be less than 500 mm.

1.4.14 Differential Protection

For motors rated 6.6kV, *[2000 KW & above,]* neutral current transformers of PS class shall be provided on each phase in a separate neutral terminal box for differential protection.

1.4.15 Tropical Protection

- (a) All motors shall have fungus protection involving special treatment of insulation and metal against fungus, insects and corrosion.
- (b) All fittings and hardware shall be corrosion resistant.
- (c) Space Heater
- (d) Suitable single phase space heaters operated at 240V, 50Hz, 1Phase AC supply shall be provided on motors rated for 30KW and above to maintain windings in dry condition when motor is standstill. Separate terminal box for space heaters & RTDs shall be provided.
- (e) The space heater shall be sized to maintain the motor internal temperature above dew point when the motor is in idle condition.

1.4.16 Rating Plate

Motor shall have Stainless steel nameplate(s) showing diagram of connections, all particulars as per IS: 325 / NEMA-MG-1 and following additional information:

- (a) Type of bearing and recommended lubricants along with location of insulated bearing.
- (b) Temperature rise under normal/abnormal conditions.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E1	[11]	25.09.2014

(c) In addition to above, an arrow block shall be screwed on to the body of motor on the non-driving end to indicate normal direction of rotation of motor.

(d) Year of Manufacture

1.4.17 Drain Plug

Motor shall have drain plugs so located that they shall drain the water, resulting from the condensation or other causes from all pockets of the motor casing.

1.4.18 Dowel Pins

Motor shall be designed to permit easy access for drilling holes through motor feet or mounting flange for installation of dowel pins after assembling the motor and driven equipment.

1.4.19 Painting

The complete motor assembly including fan shall be painted with corrosion proof paints of approved class.

1.4.20 Lifting provision

Motor weighing 25 Kg or more shall be provided with eyebolt or other adequate provision of lifting.

1.4.21 Local Push Button Station (LPBS)

- a) Each motor shall be provided with push button station as per process requirement i.e. Start/Stop or Emergency Stop.
- b) The degree of protection of LPBs shall be IPW 55 for outdoor and IP 54 for indoor applications.
- c) All Push Buttons shall be push to actuate type and stop Push Button shall be lockable in off position as per the scheme requirement.
- d) The Emergency local stop push button of Stay put type shall be provided with Press to lock & turn to release keyless mechanism.
- e) All PBs shall be provided with 2 numbers NO and 2 numbers NC contacts for various interlocking purposes. One contact of stop PB shall be directly wired to switchgear module for direct tripping and another contact to control system.
- f) Terminals to be suitable for 2 cores of 2.5 Sq.mm. cable with 20% spare terminals.
- g) All LPBS shall be of Poly Carbonate /FRP / Die Cast Aluminium material.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E1	[12]	25.09.2014

I) TestsType Test

For each type & rating of HV and LV motors of rating above [50 kW], the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last[five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The following shall constitute the type tests:

- (a) Visual and dimensional check
- (b) Winding resistance measurement
- (c) No load test
- (d) Mechanical vibration
- (e) Direction of rotation versus phase sequence
- (f) Insulation resistance measurement
- (g) High potential test
- (h) Locked rotor test
- (i) Speed/torque test
- (j) Over speed test
- (k) Temperature rise test
- (l) Determination of characteristic
- (m) Degree of protection test for the enclosure.
- (n) Noise level
- (o) Shaft current and bearing insulation test (Applicable for HV motors)

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E1	[13]	25.09.2014

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.5 Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

Dimensional General Arrangement drawing

- a) [Motor sizing calculation
- b) Foundation Plan & Loading
- c) Cable end box details
- d) Space requirement for rotor removal
- e) Thermal withstand curves hot & cold
- f) Starting and speed torque characteristics at 80% & 100% voltage
- g) Complete motor data
- h) Erection & Maintenance Manual
- i) Test reports
- j) QAP]

1.6 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

S. No.	Technical Particulars	Unit	Parameters	Remarks
1	Motor application		[As per requirement]	
2	Rated Output, kW	kW	[As per requirement]

ANNEXURES-E2

1.0 MOTORIZED ACTUATORS

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Motor Operated Actuator complete with all accessories for efficient and trouble-free operation of valves, dampers and gates for R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes & Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS : 325	Specification for three phase induction motor.
IS : 900	Code of Practice for installation and maintenance of induction motors
IS : 996	Single phase AC motors
IS : 1271	Thermal evaluation and classification of electrical insulation.
IS : 2223	Dimensions of flange mounted ac induction motors.
IS : 4029	Guide for testing three phase induction motors.
IS : 4691	Degree of protection for enclosures of rotating electrical machinery.
IS : 4722	Specification for rotating electrical machinery.

CEA	CEA Regulations
CEA	Standard Technical Specifications For Main Plant Package
IEC: 60034-1	Rotating electrical machines.
NEMA, MG-1	Motors and Generators

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- All motor operated actuators shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%.
- Depending on the required type of services, the rating of motor operated actuators shall be selected. For isolating service, the actuator shall be [rated for three successive open-close operations of the valve/ damper or 15 minutes continuous operation whichever is higher.] Whereas for regulating service, the actuator shall be suitably [time rated for required number of duty cycle or 150 start per hour whichever is higher].
- The actuator shall be accompanied with constant speed, squirrel cage, three/ single phase, induction motor. The motor shall be designed for high

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E2	[2]	25.09.2014

torque and reversing service. They shall also be suitable for direct online starting (DOL starting).

- d. Motors of actuators shall be suited for the following range of frequency and voltage variations:

- i. Voltage Variation : +/-10%
- ii. Frequency Variation : 50Hz (+)3% to (-)5%
- iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency

- e. The motor operated actuator shall be sized for performing open / close operation at rated speed against designed differential pressure at [90%] of rated voltage. The motor shall have [10%] design margin on the shaft design power.

The actuator shall meet the following performance requirements:

- i. Open & Close the valve completely and make leak tight valve closure without jamming.
- ii. Attain full speed of operation before valve load is encountered and impart an unseating blow to start the valve in motion (hammer blow effect).
- iii. The motor reduction gearing shall be sufficient to lock the shaft when the motor gets de energized and prevent drift from torque switch spring pressure.
- iv. The entire mechanism shall withstand shock resulting from closing with improper setting of limit switches or from lodging of foreign matter under the valve seat.
- v. The actuator shall be designed for mounting in any position without any lubricant leakage or operating difficulty.

1.4 Specific Requirements

1.4.1 Construction

- a) The actuator shall essentially comprise of drive motor, limit switches, gear train, clutch, hand wheel, position indicator/ transmitter, space heater and internal wiring.
- b) The actuator enclosure shall be totally enclosed, dust tight, weather proof with [IPW 55] degree of protection.
- c) All electrical equipment, accessories and wiring shall be provided with tropical finish to prevent fungus growth.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E2	[3]	25.09.2014

- d) Gear train shall be made of metal (fiber gears are not acceptable). Self locking feature shall be provided to prevent drift under torque switch (wherever applicable) spring pressure when motor is de energized.
- e) Manual wheel shall disengage automatically during motor operation.

1.4.2 Type

- a) The actuators shall have integral starters along with overload relays with built-in single phase preventer.
- b) A 415 V, 3 phase, 3 wire, 50 Hz power supply will be provided from power plant 415 V switchgear through MCCB. Control voltage of the starter circuit shall be 110 V AC or depending on manufacturer's practice. But the same shall be derived from incoming 415 V, 3 phase, 3 wire supply.

1.4.3 Motors

- a) Type: The drive motor shall be three phase, squirrel cage induction motor suitable for direct on line starting with starting current limited to six times the rated current
- b) Enclosure: The motor shall be totally enclosed, self ventilated with [IPW 65] degree of protection.
- c) Insulation: The motor winding shall be insulated with [Class – B] insulation having temperature rise limited to [Class – B].
- d) Bearing: The motor bearing shall be [double shielded, grease lubricated and antifriction type].
- e) Earthing: At least two earthing terminals shall be provided for the motor body. Separate earthing terminal should be provided for terminal box.
- f) Protection: The following electrical protections should be provided for the motor:
 - i. Single Phasing Protection
 - ii. Overload Protection
 - iii. Overheating Protection through thermostat
 - iv. Wrong Phase Sequence Protection
- g) Limit Switches: Each actuator shall be accompanied with following switches:
 - i. Four nos. positional limit switches (2 for open & 2 for close), each adjustable at any position from fully open to fully closed positions of the valve / damper.
 - ii. Two torque limit switches, one for each direction of travel, self blocking & adjustable torque type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E2	[4]	25.09.2014

- iii. Four nos. end travel limit switches, two for each direction of travel.
 - iv. A single shaft shall actuate all contacts of limit switches at each position.
- h) Interface: Open/close command termination logic with position and torque limit switches, positioned circuit shall be suitably built in the PCB inside the actuator.
- i. For binary drive, open/close command and status thereof and disturbance monitoring signal (common contact for overload, thermostat, control supply failure, L/R selector switch at local, other protections operated) shall be provided. Interface with the control system shall be through hardwired signal only. Interposing relays provided (with coil burden 2.5 VA) in the DCS shall be energized to initiate opening and closing, by 24V DC signal from the external control system. Potential free contact provided by the IPR shall be utilized in the control circuit of the contactor of motorized actuators.
 - ii. For modulating drive, the command to actuator shall be in form of 4- 20mA signal. The necessary positioning circuit and motor protection shall be provided.
 - iii. Open/close command termination logic shall be suitably built inside actuator.
- i) Hand Wheel: Each actuator shall be provided with a hand wheel for emergency manual operation. The hand wheel shall disengage automatically when the motor is energized.
- j) Position Indicator / Transmitter: The actuator shall have
- i. One built in local position indicator for 0 – 100% travel.
 - ii. One position transmitter of modulating / inching type for remote indication suitable to stabilize 4-20mA signal and operated with [24V DC].
- k) Space Heater: Space heater of suitable rating shall be provided. The power supply shall be derived from main power supply available in the actuator.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E2	[5]	25.09.2014

- l) Wiring: All electrical devices shall be wired up to and terminated in a terminal box. The internal wiring shall be done with [2.5 sqmm] copper wires. All wiring shall be well identified at both ends with ferrules.
- m) Terminal Box:
- i. The terminal box shall be weather proof with removable front cover and cable glands suitable for cable connection. The terminals shall be suitable for connection of [2.5 sq.mm copper conductor].
 - ii. Necessary double compression cable glands with nickel coating and tinned copper lugs for cables shall be provided.
 - iii. The terminal block shall be suitable for 650V grade power cable.
- .
- n) Rating Plate : Motor and actuator shall have Stainless steel nameplate(s) showing all particulars as per relevant IS/ IEC and following additional information:
- i. Type of bearing and recommended lubricants.
 - ii. Temperature rise under normal/abnormal conditions.
 - iii. Degree of Protection
 - iv. In addition to above, an arrow block shall be screwed on to the body of motor on the non-driving end to indicate normal direction of rotation of motor.
 - v. Year of Manufacture

1.5 Tests

The actuator and all components thereof shall be subject to routine factory tests as per relevant IS standards. In addition, if any special test is called for in equipment specification, the same shall be performed.

1.5.1 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum [7] days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc.]

1.5.2 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished with requisite no. of copies for approval of the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E2	[6]	25.09.2014

- b) The equipment shall be dispatched from works only after receipt of owner's written approval of shop test reports.

1.6 Drawings Data and Manuals

The drawings, data & manuals for the motorized actuators shall be submitted as indicated below:

1. [Actuator Data Sheet]
2. General arrangement drawing
3. Internal wiring Diagram and Control Schematic.
4. Torque switch and Limit switch contacts development.
5. QAP for Test Reports
6. Manufacturer's Catalogue.
7. Instruction manuals on Installation methods.]

1.7 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

S. NO.	DESCRIPTION	UNIT	DATA
1.	Type		Integral
2.	Application		[As per project specific]
3.	Motor type		Squirrel Cage
4.	Supply voltage	V	415 V, 3 ph, 3 wire.
5.	Phase, frequency	Hz	3ph, 50 Hz
6.	Motor rated voltage	V	415V/230 V
7.	Control Voltage	V	[110 V AC]
8.	Voltage and its variation	V	± 10%
9.	Frequency and its variation	Hz	+ 3 to -5%
10.	Combined V & f variation	%	10%

TECHNICAL SPECIFICATION FOR LV TRANSFORMERS

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E3

1.0 LV TRANSFORMER (DRY TYPE/OIL TYPE)

1.1 General

This specification is intended to cover [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of LV Transformers (Dry type/Oil type) complete with all accessories for efficient and trouble free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

CODE	NAME OF STANDARD
IS:334	Dimensions for porcelain Transformer bushing
IS:335	New insulating oil for transformers and switchgears
IS:1271	Classification of insulating materials for Electrical Machinery and apparatus in relation to their stability in service.

CODE	NAME OF STANDARD
NEMA ST 20	Dry Type Transformers for General Applications
CEA	CEA Regulations
CEA	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) The transformers shall be dry type (AN) for indoor location and shall be oil type (ONAN) for outdoor location.
- b) The oil type transformer shall be installed in hot, humid and tropical atmosphere with ambient temperature equal to 50°C. All equipment, accessories and wiring shall be provided with tropical finish to prevent fungus growth.
- c) The transformer shall be capable of continuous operation at specified rating under the following condition:
 - i) Voltage variation - $\pm 10\%$
 - ii) Frequency variation - $[+3\%, -5\%]$
 - iii) Combined voltage and frequency variation (absolute sum) - $[10\%]$
- d) The transformer shall be capable of withstanding the short circuit stresses due to a terminal fault on one winding with full voltage maintained on the other winding for minimum period of two (2) seconds.
- e) The noise level shall be limited to the value specified by NEMA Standard Publication No. TR-1-1993 when measured in accordance with conditions outlines in ANSI/IEEE C57.12.90-1999/IS13964/CBIP publication.
- f) The design shall be such as not to cause any undesirable interference with radio or communication circuits.
- g) Transformers shall accept without injurious heating, combined voltage and frequency variation which produce an over fluxing condition of 120% for one (1) minute.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E3	[3]	25.09.2014

- h) Each transformer shall be sized based on actual load with 10% margin and considering voltage regulation factor. It shall be sized by considering 100% load connected on the bus considering other transformer outage. An appropriate load factor of 0.9 for continuous and 0.2 for intermittent shall be considered.
- i) The impedance of the transformers shall be chosen such that the fault level on the LV switchgear does not exceed 50kA including the motor contributions and also voltage dip while starting the motor does not exceed 15% at motor terminal.

1.4 Specific Requirements of Transformers

1.4.1 Enclosure (for dry type)

- a) The encapsulated cast resin transformer shall be housed in naturally ventilated floor mounted cold rolled sheet steel cubicle with louvers backed by fine brass wire mesh. The enclosure shall be of bolted type fabrication and degree of protection shall be at least IP32. The minimum sheet steel thickness shall be 2 mm.
- b) Enclosure shall be provided with lifting lugs and grounding terminals at both ends. Further the enclosure door shall have pad locking provision.
- c) The enclosure door shall be interlocked with service transformer incoming breaker such that.
 - The door can be opened only when the service transformer HV side circuit breaker is in Test/Isolated position.
 - [6.6] kV side circuit breaker can be closed only when the doors are closed.
- d) Necessary illumination with controls shall be provided in the enclosure.
- e) Thermostatically controlled space heater inside the enclosure of suitable rating shall be provided if necessary.

1.4.2 Tank (for oil type)

- a) For LV transformers, the tank shall be of conventional type.
- b) Tank shall be made from good commercial grade low carbon steel and shall be of welded construction.
- c) Tank shall be designed to permit lifting, by crane or jacks of the complete transformer assembly filled with oil. Suitable lugs and bosses shall be provided for this purpose.
- d) Tank together with radiators, coolers, conservator, bushings vessel and other fittings, shall be designed to withstand full vacuum without permanent distortion.
- e) The transformer top shall be provided with a detachable tank cover with a bolted flanged gasket joint. Lifting lugs shall be provided for removing the cover. The surface of the cover shall be suitably sloped so that it does not retain rain water.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E3	[4]	25.09.2014

- f) The material used for gaskets shall be cork-neoprene or approved equivalent. Gasketed joints for tank and manhole covers, bushings and other bolted attachments shall be so designed that the gasket will not be exposed to the weather. Spare gaskets shall be provided for all openings as shipping gaskets will not be reused.
- g) Tank shall be provided with all necessary valves.
- h) Tank shall be provided with a pressure release device which shall operate at a pressure below the test pressure for the tank and radiators. This device shall be of sufficient size for rapid release of any pressure that may be generated in the tank and which may result in damage to the equipment. The device shall be rain proof after blowing and shall be provided with a device visible from ground to indicate operation. An equaliser pipe connecting the pressure relief device to the conservator shall be supplied. This device shall be provided for all transformers. Pressure relief device shall be equipped with remote monitoring/alarm contacts

1.4.3 Core

- a) The transformers shall be three phase core type. The core shall be built up with high grade, non-ageing, low loss, high permeability grain oriented cold rolled silicon steel laminations especially suitable for core material. Laminations shall be annealed in a non-oxidizing atmosphere to relieve stresses and restore the original magnetic properties of CRGO sheets after the cutting and punching operations.
- b) CRGO sheets shall be coated with insulation varnish. Insulation shall be able to withstand the curing temperature and shall reduce eddy current to minimum. The core shall be protected from corrosion with a rust-resistant coating.
- c) The core clamping brackets shall be designed to provide an even distribution of clamping forces to the core, yokes and legs and shall be rigidly braced to reduce sound levels and losses.

1.4.4 Winding

- a) The coils shall be manufactured from electrolytic copper conductor with sufficient number of radial supports and fully insulated for rated voltage.
- b) The insulating material shall conform to Class F. Coils shall be so insulated that impulse and power frequency voltage stresses are minimum and shall withstand even the severest of temperature fluctuations.
- c) Coil assembly shall be suitably supported between adjacent sections by insulating spacers and barriers. The windings shall be arranged to ensure a free circulation of the air and to reduce the hot spots in the winding.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E3	[5]	25.09.2014

- d) All leads from the windings to the terminal board and bushings shall be rigidly supported to prevent injury from vibration or short circuit stresses. Guide tube shall be used where practicable.
- e) The core and coil assembly shall be securely fixed in position so that no shifting or deformation occurs during movement of transformer, under short circuit stresses, switching or other transients.
- f) All coils rated 1200V or higher shall be subjected to partial discharge tests to ensure a properly cured and void free casting.

1.4.5 Encapsulation (for dry type)

- a) HV and LV coils shall be separately cast under vacuum in fibre glass reinforced epoxy resin compound. The insulation shall be fire resistant, non-inflammable, non-hygroscopic and resistant to temperature fluctuations.
- b) The epoxy shall contain filler material providing characteristics superior to unfilled epoxy including higher temperature rating, better heat conductivity, better arc resistance and adhesion to the conductor, plus a coefficient of expansion closer to that of the conductor material. The epoxy resin shall be self extinguishing.
- c) Encapsulated winding shall be free of internal voids, surface irregularities, etc. No surface finishing of encapsulated winding shall be undertaken after the process of encapsulation.

1.4.6 Insulating Oil (for oil type)

- a) The transformer shall be filled with mineral insulating oil suitably inhibited to prevent sludging.
- b) The quality of oil to be supplied for the transformer shall conform to the parameter specified in IS: 335 with latest amendments. No inhibitors shall be used in oil. Prior to filling oil shall be tested as per IS: 335 for tan delta, specific resistivity, breakdown voltage, moisture content etc.
- c) Transformer shall be dispatched oil filled. 10% excess oil for topping up shall be supplied in non-returnable container suitable for outdoor storage.
- d) Oil preservation shall be by means of conservator tank complete with silica gel breather and oil seal.
- e) Oil preservation shall be by means of bellows/ diaphragm sealed conservator tank with silica gel breather to avoid direct connection between atmosphere and transformer oil. It shall be complete with level gauges, pipes , drain valve etc. The level gauges shall be so placed that same can be readable standing from ground.
- f) Necessary device shall be kept to provide annunciation in the event of rupturing of bellow.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E3	[6]	25.09.2014

1.4.7 Tappings (OCTC)

- a) Off-circuit taps as specified shall be provided on the high voltage winding.
- b) The transformer shall be capable of operation at its rated KVA on any tap provided the voltage does not vary by more than $\pm 10\%$ of the rated voltage corresponding to the tap.
- c) The winding including the tapping arrangement shall be designed to maintain electromagnetic balance between HV and LV windings at all voltage ratios.
- d) A warning plate indicating that switch shall be operated only when the transformer is de-energized shall be provided.
- e) Off circuit tap changer switch where provided shall be 3 phase, hand operated, by an external handle with position markings and pad locking facility and mechanical stops to prevent over cranking beyond extreme positions.
- f) Arrangement shall be such that switch can be operated at standing height from ground level.
- g) The operating handle can be padlocked at any tap position. The design shall be such that the lock cannot be inserted unless the contacts are correctly engaged. The mechanism shall be provided with a mechanical tap position indicator with pad locking facility.

1.4.8 Fittings and Accessories:

The following fittings and accessories shall be provided :

- a) Earthing pads: Two earthing pads of copper or other non-corrodible material shall be welded at the bottom corners of the transformer tank and supplied with clamp type terminals suitable for the purchaser's earthing conductors. Suitable earthing terminals on cable boxes shall also be provided.
- b) Terminal marking and rating plates shall be as per the specified standard.
- c) In case of oil type, the conservator shall be of sufficient volume to maintain the oil seal from the minimum ambient temperature of -5°C up to an oil temperature of 100°C , with oil level varying within the minimum and maximum visible levels with necessary accessories.
- d) In case of oil filled type, Valves shall be supplied on the transformer tank and radiators.
- e) Pressure relief device: Pressure relief device shall be provided for transformers rated 2 MVA and above which shall be of sufficient size for rapid release of any pressure that may be generated within the tank and which may result in damage of the equipment
- f) Gas and Oil Actuated Relay (Magnetic Reed Type Gas & Oil Relay):

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E3	[7]	25.09.2014

A double float type magnetic reed type gas and oil relay as per applicable standard shall be provided for all oil filled transformers. All gas evolved in the transformer shall collect in this relay. The relay shall be provided with a test cock suitable for a flexible pipe connection for checking its operation. The device shall be provided with two electrically independent ungrounded contacts, one for alarm on gas accumulation and the other for tripping on sudden rise of pressure. These contacts shall be wired up to the transformer marshalling box. The relay shall be provided with shut off valves on the conservator side as well as the tank side.

g) Temperature Indicators

i Oil temperature indicator (OTI)

All oil type transformers shall be provided with a 150 mm dial type thermometer for top oil temperature indication. The thermometer shall have adjustable, electrically independent ungrounded alarm and trip contacts, maximum reading pointer and resetting device. The contacts shall be rated minimum 0.5A making and 0.2A breaking at 220V DC.

ii Winding Temperature Indicator (WTI):

A device for measuring the hot spot temperature of the winding shall be provided. The accuracy class of winding temperature indicator shall be $\pm 20^{\circ}\text{C}$ or better.

iii Oil Level Indicator:

A magnetic type oil level indicator shall be provided to indicate oil level in the tank.

iv RTD/transducers for remote annunciation:

In addition to the above mentioned indicators, the Oil and winding temperature measurement, RTDs / transducers shall be provided for remote indication in the DCS. RTDs shall be duplex platinum type with nominal resistance of 100 ohms at zero degree centigrade.

h) Bushing Current Transformers for stand by earth fault protection shall be provided in the neutral bushing and lead shall be brought to Marshalling box.

i) Radiator (oil filled type): Tank mounted radiators banks shall have bolted flanged connections and pipe extensions to permit withdrawal of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E3	[8]	25.09.2014

transformer tank without disturbing the radiators. Flexible joints shall be provided in the interconnecting pipes (unless otherwise approved) to facilitate erection and dismantling and reduce transfer of vibrations from tank to radiator. The interconnecting pipes shall be provided with drain plug and air release vents.

- j) Conservator (For oil filled type): The transformers rated below 7.5MVA shall be provided with conventional single compartment conservator with dry air filling the space above the oil.

1.4.9 Bushings

- a) The bushing shall conform to the requirements of IS:2099 and IS:3347.
- b) All transformer bushings shall be of porcelain (for oil filled)/ epoxy (for dry type).
- c) The neutral terminal of 433V winding shall be brought out on a bushing along with the 433V phase terminal to form a 4 wire system for the 433V. Neutral CTs shall be located in the lead coming out of the winding and location of these CTs shall not be inside the tank.
- d) The neutral terminal of secondary shall be brought out through an outdoor. Further this neutral terminal shall be connected by a copper flat of size [50 mm x 6] mm, which shall be brought down upto 100 mm above ground. The copper flat shall be insulated and supported from the tank body.

1.4.10 Terminal arrangement

- a) Cable boxes
- Wherever cable connections are specified, suitable cable boxes shall be provided and shall be air insulated.
 - Cable boxes shall have drilled gland plate of adequate size to receive cables and to allow easy termination.
 - Removable drilled gland planes shall be provided in the cable boxes.
 - The additional supports for the cable boxes shall be galvanised iron.
 - The contractor shall provide earthing terminals on the cable box, to suit [50mmx6] mm GI flat.
- b) Bus duct
- Wherever Bus duct termination is specified a flanged throat or equivalent connection shall be provided for termination of bus duct enclosure. The winding termination shall be outdoor type bushing. The material of the bus duct termination arrangement of the transformer shall be nonmagnetic. The bus duct may be either phase-segregated or non-segregated.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E3	[9]	25.09.2014

- ii. Tolerance permissible for the height of terminals and bus duct flange location specified for bus duct termination over ground level is $\pm 5\text{mm}$. Contractor has to ensure that radiator, conservator and explosion vent do not obstruct the path of the bus-ducts.

1.4.11 Marshalling box

- a) A sheet steel weather, vermin and dust proof marshalling box shall be furnished. The sheet steel used shall be at least 2.0 mm (CRCA) thick. The box shall be free standing floor mounted/tank mounted type and have a sloping roof. The degree of protection shall be IP-55 in accordance with IS:2147.
- b) The marshalling box shall have a glazed door of suitable size for convenience of temperature indicators reading.
- c) All incoming cables shall enter the marshalling box from the bottom.

1.4.12 Wiring

- a) All control, alarm and indication devices provided with the transformer shall be wired up to the terminal blocks.
- b) Wiring shall be done with 650V PVC wires in conduit or PVC armored cable. *[Minimum wire size shall be 1.5 sq.mm stranded copper. Not more than two wires shall be connected to a terminal. 20% spare terminals shall be provided.]*
- c) Multi-way terminal block complete with mounting channel, binding screws and washers for wire connections and marking strip for circuit identification shall be provided for terminating the panel wiring. *[Terminals shall be stud type, suitable for terminating 2 nos. 2.5 mm2 stranded copper conductor and provided with acrylic insulating cover.]*
- d) All devices and terminal blocks shall be identified by symbols corresponding to those used in applicable schematic or wiring diagram. Each wire shall be identified, at both ends, with interlocking type permanent markers bearing wire numbers as per Bidder's Wiring Diagrams. AC / DC wiring shall have separate colour-coding.
- e) Wire termination shall be made with crimping type connectors with insulating sleeves. Wires shall not be spliced between terminals.

1.4.13 Painting

- a) All steel surfaces shall be thoroughly cleaned by sand blasting and / or by chemical agents, as required to produce a smooth surface free of scales, grease and rust.
- b) The external surfaces, after cleaning, shall be given a coat of high quality red oxide or yellow chromate primer followed by filler coats.
- c) The transformer finished with two coats of epoxy based powder coated paint. The paints shall be carefully selected to withstand tropical heat,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E3	[10]	25.09.2014

rain etc. The paint shall not scale off or crinkle or be removed by abrasion due to normal handling.

- d) Painting shade shall be subject to owner's approval.
- e) Sufficient quantity of touch-up paint shall be furnished for application at site.

1.4.14 Name Plate

Nameplates of approved design shall be furnished at each cubicle (one no. each at front as well as at backside of cubicle) and at each instruments & device mounted on or inside the cubicle. The material shall be lamicaid or approved equal, 3 mm thick with white letter on black background. Self-tapping screws shall hold the nameplate. *[Nameplate size shall be minimum 20 x 75mm for instrument/device and 40 x 150mm for panels. Caution notice on suitable metal plate shall be affixed at the back of terminal Box.]*

1.5 Tests

1.5.1 Type Tests

For each type & rating of LV Transformers, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within *[last five]* years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within *[last five]* years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The following shall constitute the type tests:

- a) Temperature rise test
- b) Dielectric test

1.5.2 Routine Tests

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

The following tests shall be performed on each transformer as a minimum:

- a) After assembly, each core shall be pressure tested for one minute at 2KV (r.m.s.) A.C. between all bolts, side plates, structural steel works and the core.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E3	[11]	25.09.2014

- b) The wiring for auxiliary power and control circuitry shall be subjected to withstand one minute power frequency test with 2.0KV (r.m.s.) to earth
- c) Measurement of winding resistance
- d) Measurement of voltage ratio and check of phase displacement
- e) Measurement of short circuit impedance and load loss
- f) Measurement of no load loss and current
- g) Dielectric routine tests
- h) Excitation loss and current measurements shall be made at 90%, 100% and 110% of the rated voltage as routine test.
- i) Partial discharge test
- j) Tan delta test

1.5.3 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

1.5.4 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings/ Data and Manuals

Drawings, data, and manuals for the transformers shall be submitted as indicated below:

- a) *[General Arrangement Drawing]*
- b) *Dimensioned general arrangement drawing showing enclosure, core coil assembly, terminal arrangement, marshalling box and various fittings.*
- c) *Transport/shipping dimensions with weights, wheel base detail etc.*
- d) *Foundation plan & loading.*
- e) *Bus duct/cable termination arrangement.*
- f) *Control schematics and wiring diagrams.*
- g) *Test reports and QAP*
- h) *Any other relevant drawing or data necessary for satisfactory installation, operation and maintenance.*
- i) *Instruction manuals on Transformer and its various fittings The manual shall clearly indicate method of installation, checkups and tests to be carried out before commissioning of the equipment.]*

ANNEXURES-E4

1.0 415V SWITCHGEAR, MCC AND DB

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of 415V Switchgear MCC and DBs, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

Codes	Name of Standard
IS : 1248	Direct acting indicating analogue electrical measuring instruments and their accessories
IS: 2551	Danger notice plates
IS :2705	Current transformers-specification
IS :3156	Voltage transformer specification
IS :3231	Specification for electrical relays for power system protection
IS: 8084	Specification for interconnection busbars for AC voltages above 1kV up to and including 36kV.
IS :8623	Specification for low-voltage switchgear and control gear assemblies
IS :8686	Specification for static protective relays
IS :10118	Code-of practice for selection installation and maintenance of switchgear and control gear
IS :12021	Specification for control transformers for switchgear and control gear for voltages not exceeding 1000 v ac
IS : 13947 (Part 1)	Specification for low-voltage switchgear and control gear
IS : 13947 (Part 2)	Specification for low-voltage switchgear and control gear –part 2: circuit breakers
IS : 13947 (Part 4)	Specification for low-voltage switchgear and control gear -part 4 : contactors and motor feeders

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[1]	25.09.2014

Codes	Name of Standard
IS : 13947 (Part 5)	Low-voltage switchgear and control gear specification Part 5 : control circuit devices and switching elements
IEC 61439	Low voltage switchgear and control gear assemblies.
CEA	CEA regulations for installation and operation of meters 2006.
CEA	Standard technical specifications for main plant package

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- All 415V Switchgear, MCC and DB shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The Switchgear shall be suitable for operation in a highly polluted environment.
- All 415V Switchgear, MCC and DB shall be suitable for following voltage & frequency variations as follows:

Voltage Variation	:	(±) 10%
Frequency Variation	:	(+) 3% to (-) 5%
Combined Variation of Voltage & Frequency	:	10% (absolute sum)
For DC system	:	-15% to +10%

- 415 V switchgear & MCCs shall be of indoor /outdoor, double front/single front [Preferably single front] and fully draw out type. ACB feeder may be of single tier/two tier configuration depending upon rating. DBs (ACDB / DCDB) shall be of single / double front [Preferably single front] and fixed type. These shall be CRCA sheet metal enclosed and assembled to form a rigid, free-standing floor mounted structure. Vertical units shall be assembled to form a continuous line up of panels. Compartmentalized multi-tier configuration shall be provided.
- All AC motor starters shall be suitable for Direct on Line (DOL) starting. Motors rated below [132]kW shall be provided with combination starters consists of MCCB/MPCB, contactors and electronic over load relay and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[2]	25.09.2014

the motor starter shall comply with Type – 2 coordination conforming to relevant code and standards. Motors rated [132] kW and above shall be breaker controlled and shall be provided with comprehensive motor protection relay. Motors rated above [160]kW shall be fed from MV Switchgear [Only for firefighting system Motor rated up to 200kW shall be fed from 415V switch board].

- e) For 415 V switchgear & MCCs Feeders rated [630A] and above shall be equipped with Air Circuit Breaker (ACB). Outgoing/Incoming feeders rating below [630] A shall be MCCBs.
- f) For DBs Incomer rated 630A and above shall be ACB. Incomer below 630A shall be MCCB. Outgoing feeder may be MCCB/MCB depending upon the bus fault level.
- g) All ACB shall be draw out type & should have Service, test and disconnected positions with positive indications for service & test positions. It shall be possible to charge the springs manually, if, required
- h) Local/remote selection shall be provided for all incoming/Outgoing ACB module. Incoming/Outgoing breaker shall be closed at service position from remote (DCS) and at test position from Local(Switchgear).
- i) Two out of three breaker logic shall be considered for switchgear/MCC. However mechanical interlock shall be considered for income of MCCB operated DBs.
- j) Also, Local/remote selection switch shall be provided for all motor modules for control from Remote(DCS). Also for breaker operated motor, breaker shall be closed in Test position from local(Switchgear).
- k) All motors shall be provided with Emergency stop push button.
- l) Control circuits shall operate at suitable voltage of 110V AC or 220V DC. Necessary control supply transformers having primary and secondary MCCB/MCB shall be provided for each MCC, 2 x 100% per section. However breaker shall operate on 220V DC. The auxiliary bus bars for control supply shall be segregated from bus bars. This control supplies shall be monitored.
- m) All the numerical relays shall have communication on two ports, local front port communication to laptop and a second port with [IEC 61850 protocol] to communicate with DCS.

1.4 Specific Requirements

1.4.1 Construction

All 415V switchgear, MCC and DBs shall have following minimum features.

- a) All 415V switchgear, MCC and DBs shall be metal enclosed, indoor, floor mounted and free standing type. The panels shall be suitable for cable entry at bottom and busduct connection at top.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[3]	25.09.2014

- b) Between 415V Switchgear and dry type transformers, non segregated phase bus duct is considered. Hence switchgear shall be suitable for this connection and necessary flange connection and co ordination with busduct manufacturer in this regards is covered in this specification.
- c) All frames and load bearing members shall be fabricated using mild steel structural sections or pressed and shaped cold rolled sheet steel of thickness not less than 2 mm.
- d) Frame shall be enclosed in cold rolled sheet steel of thickness not less than 2 mm. Doors and covers shall also be of cold rolled sheet steel of thickness not less than 1.6 mm. Removable gland plates of thickness 3mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material)shall be provided for all panels. Suitable removable type lifting hooks and / or jacking pad shall be provided on each panel or shipping section for ease of lifting of switchgear. These hooks when removed shall not leave any opening in the panels
- e) Each breaker shall be housed in a separate cubicle, complete with an individual front access door. Each vertical section shall have a removable back cover.
- f) The switchgear enclosure shall confirm to the degree of protection IP-54 (for outdoor). For indoor, enclosure shall confirm to IP52, however for Busbar chamber of switchboards rated above 1600A, degree of protection shall be IP-42.
- g) Paint shade for complete panels excluding end covers shall be [RAL 9002] and [RAL 5012] for extreme end covers for all board.
- h) The switchgear assembly shall comprise a continuous, line-up of single / multi tier cubicles. The installations of circuit breakers however shall be limited to the bottom two tiers only. Working height shall be limited to [250 mm to 1800 mm] from the floor level.
- i) Metallic barriers shall be provided between vertical sections and also between adjacent modules to ensure prevention of accidental contact with live parts during routine inspection/maintenance of functional units or cable terminations of one or more functional units when working on those of adjacent units. These barriers shall have insulating inserts as necessary for taking the interconnections etc
- j) A nameplate with switchgear designation shall be fixed at the top of the central panel. A separate nameplate giving feeder details shall be provided for each compartment. A separate nameplate giving details of bus section shall also be provided for switchgears having more than one bus section.
- k) Name plate shall be provided for each equipment (lamps, push buttons, switches, relays, auxiliary contactor, etc) mounted on the switchboard. Special warning plates one each on each feeder of a shipping section shall be provided on removable covers of doors giving access to cable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[4]	25.09.2014

terminals and busbars. Name plate size shall be minimum of 20x75 mm for Instruments/devices and 40x50 mm for panels. Thickness shall be minimum 3 mm.

- l) For MCC/DB a full height vertical cable chamber with cable supports shall be provided in each section to facilitate unit wiring.
- m) 2x100%, 415V/110V AC control transformer shall be provided for control, Indication and annunciation supply for contactor operated motor feeder. All the necessary auxiliary and main contactor shall be provided suitable for this control supply.
- n) Two 220V DC feeders shall be provided for control, Indication and annunciation of breaker operated module.
- o) Compartment door shall be interlocked with main power isolating device for safety with provision for defeating it by authorized person.
- p) Supplier shall provide total 20% or minimum one (1) no. spare feeder of each type & rating with respect to total requirement of the switchgear.
- q) Motors of rating 30 kW and above shall be provided with anti-condensation heaters. Necessary provision for supply of motor space heating shall be considered in the switchgear.
- r) The incoming connection to transformer of more than 1000kVA and inter-connecting sections between switchboards shall preferably be of bus ducts.
- s) It should be possible to carryout maintenance on a feeder with adjacent feeders alive.

1.4.2

Bus and Bus taps

- a) The main buses and connections shall be of high [conductivity Aluminum / Copper] alloy sized for specified current ratings with temperature rise limited [to 40°C over ambient temperature of 50°C].
- b) Silver plating shall be done on copper bar wherever copper to copper and copper to aluminum contacts are envisaged. All connection hardware shall be non-magnetic and shall have high corrosion resistance. Adequate contact pressure shall be ensured by means of two bolts connection with plain & spring washers and locknuts. Temperature rise shall not exceed 105 degree for silver plated joints over an ambient temperature of 50 degree.
- c) Bus bars and connections shall be fully insulated for working voltage with adequate phase / ground clearances. Insulating sleeves for bus bars and shrouds for joints shall be provided.
- d) Bus insulators shall be flame-retardant, track resistant type with high creepage surface. All buses and connections shall be supported and braced to withstand the stresses due to maximum short-circuit current and also to take care of thermal expansion.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[5]	25.09.2014

- e) Bus bars shall be color coded for easy identification and so located that the sequence R-Y-B shall be from left to right, top to bottom or front to rear, when viewed from the front to switchgear assembly.
- f) Power shall be distributed to each module or compartment by a set of vertical bus bars. The vertical bus bars shall run behind the modules. Necessary tee off connectors shall be used for distributing auxiliary supply to each vertical panel. Rubber grommets shall be used for all wire entries to make the entries dust and vermin proof.
- g) The clearance between the individual bare phase power bus bars and between the phase and earth bus bars in air shall be not less than [25.4] mm.
- h) Three phase, neutral (with at least [50] % rating of main Bus bar and continuous earth bus shall be provided. Bus bar and tapping shall be provided with color coded PVC sleeves.

1.4.3

Air Circuit Breaker

- a) All Circuit Breakers for incoming feeders and Bus couplers shall be [four] poles; single throw, motor operated and air break type. Circuit breaker for outgoing feeders shall be triple pole, single throw and air break type. However for supply feeders it shall be [four] pole.
- b) Circuit Breakers shall be [draw out type] having Service, Test & Disconnected positions with positive indication for each position.
- c) Circuit breakers of identical rating shall be physically and electrically interchangeable.
- d) Bolted disconnected links shall be provided for all outgoing feeders for isolation of neutral, if necessary.
- e) For motor wound mechanism, spring charging shall take place automatically after each breaker closing operation. One open – close – open operation of the circuit breaker shall be possible after failure of power supply to the motor when the spring is charged after a closing operation.
- f) Mechanical safety interlock shall be provided to prevent the circuit breaker from being racked in or out of the service position when the breaker is closed.
- g) Automatic safety shutters shall be provided to fully cover the female primary disconnects when the breaker is withdrawn.
- h) Each breaker shall be provided with an emergency manual trip, mechanical ON-OFF indicator, an operational counter and mechanism to indicate spring charge / discharge condition.
- i) In addition to the auxiliary contacts required for normal breaker operation and indication, each breaker shall be provided with followings for interlocking purpose:-
 - i. Position / cell switch with 4 No + 4 NC contacts.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[6]	25.09.2014

- ii. Limit / auxiliary switches shall be convertible type that is facility for changing N.O. contact to N.C. and vice-versa.
- iii. Mechanical stopper to prevent accidental falling while withdrawing.
- j) Breaker cannot be racked in from 'isolated' to 'test' position with the door open together with provision for defeat of this interlocking, however, the door can be closed only when the breaker is brought back to 'isolated' position. Insertion of breaker into 'Service' position not possible if the shutters are not free.
- k) Door can be opened only when breaker is OFF and is in 'Isolated' position. Remote closing of breaker not permitted with door open.
- l) Anti pumping relay / device to ensure that there can be only one closing operation for each closing command.
- m) Suitable trolley arrangement shall be provided for breaker/starter modules. Two trolleys per switchgear room shall be provided so that top most breaker module of all types, sizes and rating can be withdrawn on trolley and lowered for maintenance purpose.
- n) Closing and tripping coil shall operate satisfactorily under the following conditions.
 - i. Closing Coil: 85% to 110% of rated voltage.
 - ii. Tripping Coil : 70% to 110% of rated voltage.

1.4.4 Contactors, MCCB and MPCB

- a) Incomers for MCCs and DBs rated below 630A shall be MCCB.
- b) Incomer and bus coupler rated below 630A shall be mechanically Interlocked.
- c) Motor starter contactors shall be of air break, electromagnetic type. Suitable for DOL starting of motor, and shall be of utilization category AC-3 for ordinary and AC-4 for reversing starters. DC contactor shall be of DC-3 utilization category.
- d) The contactors shall be three pole, air break type designed for [duty class III category A.C. –3 with non-bouncing silver / silver alloy.]
- e) Each contactor shall be provided with two (2) normally open and two (2) normally closed auxiliary contacts unless otherwise specifically stated. Rating shall be decided by the bidder.
- f) Reversing contacts shall be electrically and mechanically interlocked.
- g) Contactors with delayed dropout feature shall be provided for some essential auxiliaries. These contactors shall not dropout on power failure if the voltage is restored within 3 seconds.

1.4.5 Electronic over load relays

- a) Electronic overload relays shall conform to IEC:292-1 and shall be triple pole, ambient temperature compensated with adjustable setting, inverse time lag, built in single phase preventer and hand/auto reset type

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[7]	25.09.2014

provided as per requirement along with necessary command, feedback cable, coupling relays etc.

- b) Provided with 1 NO and 1NC contact of rating same as the auxiliary contact of the contactors.
- c) The relay shall be able to withstand prospective short circuit current without damage or injurious heating till the motor protection MCCB/MPCB clears the fault.
- d) Relays may be direct acting or CT operated, depending on current rating. CTs shall be included in the scope of supply.

1.4.6 Bus Transfer scheme:

Each switchgear of two incomer and bus coupler shall be provided with the following provisions.

- i) Dead bus closing.
- ii) Manual live change over (Momentary paralleling)
- iii) Automatic bus transfer scheme.

1.4.7 Current Transformer

- a) Current Transformers shall be cast-resin type. All secondary connections shall be brought out to terminal blocks where wye or delta connection shall be made.
- b) CTs shall have polarity makings indelibly marked on each transformer at the lead terminations and at the associated terminal block. Facility shall be provided for short circuiting and grounding the CT secondary at the terminal blocks. Secondary terminals shall be provided with protective cap.
- c) CT terminal block shall be disconnecting type and suitable for round type lugs with facility for testing and short circuiting of individual CT.
- d) All CTs shall be provided with supports independent of busbars / busbar supports. The CTs shall be located in such a way that they can be easily approached for maintenance without necessitating shutdown of adjacent feeders.
- e) CTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.8 Voltage Transformer

- a) Voltage transformers(VT) shall be cast-resin type with an accuracy class of 1.0 for metering and 3P for protection.
- b) VTs shall be of the single-phase type. VTs shall be protected on their primary side by MCCBs with interrupting ratings corresponding to breaker rating and by MCB (with auxiliary contacts) on the secondary sides.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[8]	25.09.2014

- c) VTs shall have continuous over voltage factor of 1.2 and short time over voltage factor of 1.5 for 30 seconds for effectively earthed system
- d) It shall be possible to replace VTs without having to de-energise the main busbars.
- e) VTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.9 Transducer

For all the incoming and the outgoing of 415V Switchgear / MCC/ DB Feeders requiring remote metering and/or current monitoring shall be provided with multi-functional transducers. The output shall be 4-20 mA DC which shall correspond to the normal range.

1.4.10 Secondary Wiring

- a) The switchgear shall be fully wired at the factory to ensure proper functioning of control, protection and interlocking schemes.
- b) Fuse /MCB and links shall be provided to permit individual circuit isolation from bus wires without disturbing other circuits. All spare contacts of relays, switches and other devices shall be wired up to terminal blocks.
- c) Secondary wiring within the switchgear shall be carried out in a neat and systematic manner and securely held in position (either loomed or run in conduit / trunking). Wherever wiring passes through compartment, it shall be run in conduit / trunking, if metallic shall be bonded to the main earth busbar.
- d) Wiring shall be done with flexible, 1.1/0.650kV grade, PVC insulated switchboard wires with [stranded copper conductors of 2.5 mm² for CT & PT circuits and 1.5mm² for control circuit wiring.]
- e) Each wire shall be identified, at both ends, with permanent markers bearing wire numbers as per bidder's wiring diagrams. Wire terminations shall be made with crimping type connectors with insulating sleeves, wire shall not be spliced between terminals.

1.4.11 Terminal Blocks

- a) Terminal blocks shall be 660V grade box-clamp type with marking strips, similar to 10 mm² or equal. Terminals for C.T. secondary leads shall have provision for shorting.
- b) Not more than two wires shall be connected to any terminal. If more than two wires at one terminal are required, separate terminals with function wise shorting links shall be provided. [Spare terminal equal in number to 20% of active terminals shall be furnished.]
- c) Terminal blocks shall be located to allow easy access. Wiring shall be so arranged so that individual wires of an external cable can be connected to consecutive terminals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[9]	25.09.2014

1.4.12 Ground bus

- a) A ground bus, rated to carry maximum fault current, shall extend full length of the switchgear. The ground bus shall be provided with two-bolt drilling with G.I. bolts and nuts at each end to for connection to the grounding conductor / flat.
- b) Each unit shall be connected directly to the ground bus. The frame of each circuit breaker and draw out V.T. unit shall be grounded through heavy multiple contacts at all times except when the primary disconnecting devices are separated by a safe distance.
- c) C.T. & V.T. secondary neutrals shall be earthed through removable links so that earth of one circuit may be removed without disturbing others. All hinged doors shall be earthed by flexible copper bride.

1.4.13 Space Heater

- a) Each vertical section shall be provided with thermostat controlled space heater 5A, 3 pin socket plug.
- b) In addition, motor feeders rated [30 KW and above] shall be wired up for feeding the motor space heater through suitably rated breaker auxiliary NC contact and/or contactor.
- c) Cubicle heater, Motor heater, and Plug socket circuit shall have individual switch fuse units/MCB.

1.4.14 AC Distribution Boards (ACDBs)

- a) AC Distribution Boards shall have MCCB/MCB at incomer depending upon the short circuit rating. Distribution Boards may be fed from switchgear and shall have two incomers. AC distribution Boards shall be of two types - one with 415V, 4-wire, triple pole and neutral (TPN) outgoing feeders and the other with 240V, 2-wire, single pole and neutral (SPN) outgoing feeders.
- b) For small loads, MCB boards with TPN MCB as incomer and TPN/SP MCBs for outgoing may be considered. The feeder rating and quantity shall be as per requirement.
- c) Board shall be single/double front [preferably single front], metal clad, front matched, dust and vermin proof, fixed type, compartmentalized and extensible on both sides.
- d) Bus bars shall have same cross section throughout the length. Rating of the neutral bus bar shall be 50% of the main bus bar. Earth bus bar shall run in bottom chamber throughout the length of the Board.

1.4.15 DC Distribution Boards

DCDBs shall have two incomers and a bus coupler. Incomers and outgoing feeders of DCDBs shall be MCB/MCCB modules. They shall be fixed type and floor mounted. Other constructional features shall be similar to ACDB.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[10]	25.09.2014

The feeder rating and quantity shall be as per requirement.

1.4.16 Control & Indication

The circuit breaker shall be wired up for local & remote operation. Each breaker cubicle shall be equipped with following:

- a) Remote selector switch with pistol grip handle and key interlock for breakers with motor wound spring charging mechanism. In Remote position, the breaker can be operated in service position with all interlock and protections. In switchgear position, the breaker shall be operated from switchgear only in test position with only protection (no interlock).
- b) Two (2) heavy duty, oil-tight, push buttons for Trip & Close.
- c) Circuit breaker shall be indicated electrically. The following indication colour shall be used.

Breaker open - GREEN

Breaker closed - RED

Spring Charged - WHITE

Breaker Auto Trip- AMBER

- d) However, any other indication shall be provided as per owner's requirement.
- e) Lamps shall be LED type with resistance for voltage protection. Lamp and lens shall be replaceable from the front.
- f) For all MCCB feeders, trip indication lamp shall be provided on front of the compartment.
- g) For all starters, ON, OFF and trip indication lamps shall be provided on front of the compartment.

1.4.17 Relays, Protection & Metering

- a) The hardware design for protection and associated equipment shall use latest state-of-the-art technology and shall generally be integrated numerical/digital, modular in nature. Where design is based on numerical technology, adequate self testing/monitoring/diagnostic facilities shall be provided.
- b) All numerical relays, auxiliary relays and devices shall be of types, proven for the application; satisfying requirements specified elsewhere and shall be subject to Purchaser's approval. Numerical Relays shall have appropriate setting ranges, accuracy, resetting ratio, transient overreach and other characteristics to provide required sensitivity to the satisfaction of the Owner.
- c) All protective relays shall be in draw out or plug-in type / modular cases with proper testing facilities. Necessary test plugs / test handles shall be supplied loose and shall be included in supplier's scope of supply.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[11]	25.09.2014

- d) All AC operated relays shall be suitable for operation at 50 Hz. AC voltage operated relays shall be suitable for 110 Volts VT secondary and current operated relays for [1 or 5] amp CT secondary. All relays and timers shall be rated for control supply voltage as mentioned elsewhere under parameters and shall be capable of satisfactory continuous operation between 80-120% of the rated voltage. Voltage operated relays shall have adequate thermal capacity for continuous operation.
- e) Energy meters shall be provided for incomer of 415V Switchgear and MCC and shall be able to communicate with DCS. These meters shall be as per CEA regulation 2006 "Installation and operation of meters". Accuracy class shall not be less than 1.0S.
- f) Provision shall be made for easy isolation of trip circuits of each relay for the purpose of testing and maintenance.
- g) All protective relays and alarm relays shall be provided with one extra isolated pair of contacts wired to terminals exclusively for future use.
- h) The relay shall be designed to perform satisfactorily under highly noisy electrical environment. Sufficient degree of high frequency disturbance immunity and impulse voltage withstand capacity shall be built into electronic designs as stipulated in relevant standards.
- i) All protections shall be furnished complete with necessary auxiliary, supervisory, lock out relays. Suitably separate sets of single phase auxiliary C.T with multiple taps shall be provided with relay whenever required.
- j) Visual and audible alarm annunciation shall be initiated in the event of operation of protective/supervisory relay.
- k) D.C supply shall be supervised by DC supervision relays.
- l) Trip circuit shall be supervised by Trip circuit supervision.
- m) Tripping shall be done through high speed lock out relays.
- n) All meters/ instrument shall be flush mounted on front panel, at least 96mm² size with 90° linear scales and accuracy class of 2.0.
- o) Interposing relays for ON/OFF command or any other command shall be as per system requirement.
- p) For alarm and Indication at DCS end necessary contacts shall be provided at switchgear end.
- q) Metering and protection shall be as per below table

a)	Incomers	
	Protections	Metering
i	Time graded short circuit protection	Local Current (single phase) indication and remote indication through transducer.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[12]	25.09.2014

ii	Over current protection	Voltage Measurement for all three phases and remote indication through transducer.
iii	Earth fault protection	KW, Kwhr
b)	Bus coupler	
	Protections	Metering
i	Over current protection(51)	Local Current (single phase) indication.
ii	IDMT Earth fault protection(51N)	
c)	Contactor controlled motor feeders [90kW and above motor only]	
	Protections	Metering
i	Time graded short circuit protection	Local Current indication and remote indication through transducer.
ii	Over current protection	
c)	[Motor Feeders [of 132KW and above only]]	
	Protections	Metering
	Composite motor protection to cover a minimum of protections such as over current, short circuit, earth fault, locked rotor, Negative phase sequence, thermal overload etc.	Local Current indication and remote indication through transducer.
[Other feeders]		
a)	Bus PT / Line PT Modules	
	Protections	Metering
	Under voltage protection	[Voltage – phase to phase,]
	Fuse failure protection	
b)	Motor feeders (MPCB/MCCB with Contractors)	
	Protections	Metering
	Electronic Overload relay (with single phase preventor), short circuit protection (through fuse/MCCB/MPCB as specified)	
c)	Incoming feeders for ACDB/DCDB	
	Protections	Metering

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[13]	25.09.2014

	Short circuit protection (if MCCB)	[Voltage (single phase and, Phase Current (1 Phase))] Local indication only.
d)	Outgoing feeders of ACDB/DCDB	
	Protections	Metering
	Short circuit protection (through fuse/MCCB)	

1.5

Tests

I) Type Test

For each type & rating of 415V Switchgear, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the switchgear similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

The minimum tests shall be conducted are as follows:

- Measurement of insulation resistance of Circuit Breaker in closed and open positions.
- Measurement of milli-volt drop across Circuit Breaker main contacts and other joints.
- Measurement of Circuit Breaker/Contactor operating time for close & open at nominal voltage and 80% of rated voltage.
- Measurement of resistance, IR value and drop-off/pick-up voltage of close and trip coils.
- Healthiness of limit switch contacts.
- Spring charging motor functional checks.
- Verification of phase sequence and checking of clearances of busbars between phase to phase and phase to earth.
- Measurement of milli-volt drop across busbar joints

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[14]	25.09.2014

- i) Torque tightness test.
- j) High voltage test on busbar.
- k) Measurement of CT/PT polarity, ratio and knee point voltage.
- l) Electrical and mechanical interlock checks.
- m) Secondary injection of all protection relays by using service settings and simulation of all protection functions.
- n) Secondary injection of all metering circuits.
- o) Functional tests to demonstrate the specified control and interlocks

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates:

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawing & Documents

Drawings, data & manuals for the motors shall be submitted as indicated below

- a) [General Arrangement drawings and cross-section showing constructional features & cable entry with bottom view with opening.
- b) Bill of Materials.
- c) Technical Data sheet and Catalogue.
- d) Foundation drawing details with bottom view of switchgear.
- e) Descriptive write-ups and literature for the main equipment offered including relays, meters, etc.
- f) Control Schematics & Wiring diagram.
- g) Inspection and Test Plan (ITP).
- h) Suggestive list of protective relays.
- i) Transport/shipping dimensions and weights].

1.7 Ratings & Requirements

415V switchgears, MCC and DB shall comply with the particulars indicated in the following tables.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E4	[15]	25.09.2014

Table- 2.0

S. No.	DESCRIPTION	UNIT	DATA
1.0	General		
1.1	Name of Manufacturer		
1.2	Place & Country of manufacture		
1.3	Specifications and Standards		
2.0	Switchgear Details		
2.1	Rated voltage, phases & frequency		415 Volts, 3 Phase, 4 wire 50 Hz.
2.2	System neutral earthing		Solidly earthed
2.3	Voltage & frequency variation	%	+/-10%, -5%to +3% Hz.
2.4	Rated frequency	Hz	50Hz
2.4	One minute power frequency Voltage a) For power Circuits b) For Control Circuits		a) 2.5kV b) 1.5kV
2.5	Continuous current rating of busbars under site reference ambient temp.		[As per Project requirement]
2.6	Reference ambient temperature		50°C
2.7	Maximum temperature of bus bars and droppers/connectors under site conditions specified		90°C for busbars having non-silver plated joints 105°C for busbars having silver plated joints
2.8	Short circuit current withstand for busbars and droppers		
a	Short time	kA (rms)	50
b	Dynamic Rating	kA (peak)	105
2.9	Whether busbars have been insulated	Yes	Required
2.10	Type of insulation		[By Bidder]
2.11	Material of bus bar supports		[By Bidder]

**TECHNICAL SPECIFICATION FOR 415V NON
SEGREGATED PHASE BUS DUCTS**

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E5**1.0 415V NON SEGREGATED PHASE BUS DUCT****1.1 General**

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of 415V Non Segregated Phase Busduct, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

IS 8084	Interconnecting Bus bar for AC Voltage above 1KV up to and Including 36kV
IEC 60947	Low Voltage Switchgear and Control gear
ANSI/IEEE C37.20	Metal-Clad and Station-Type Cubicle Switchgear
ANSI/IEEE C37.24	Guide for Evaluating the Effect of Solar Radiation on Outdoor Metal Enclosed Switchgear
IEC 60439	Low-voltage switchgear and control gear assemblies.
BS 159:1957	Bus bar and Bus bar connection
CEA	CEA regulations and standards

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3 Design Criteria

- a) The 415V Non-segregated phase bus duct shall serve as an interconnection between the 415V Switchgear and 11/0.433kV LV Transformer. The Non-segregated phase bus duct shall be installed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E5	[1]	25.09.2014

indoor/Outdoor in a hot, humid and tropical atmosphere. All panels associated with Non-segregated phase bus duct shall be located indoors/Outdoors.

- b) Bus duct, associated equipment and wiring shall be provided with tropical finish to prevent fungus growth. All ventilation openings shall be screened and drains shall be filtered to prevent entrance of dust and insects.
- c) For continuous operation at specified ratings, temperature rise of the bus duct and auxiliary equipment shall be as specified in Clause 1.7 Rating and requirements.
- d) Bus duct and auxiliary equipment shall be capable of withstanding the mechanical forces and thermal stresses of the required short-circuit currents.
- e) The bus ducts and supporting structures shall be designed & constructed so as to withstand without damage the horizontal / vertical ground accelerations due to earthquake.
- f) The bus ducts shall be self cooled and shall not be equipped with blower or any other type of forced ventilation.
- g) The equipment rating shall be based on an ambient temperature. Same phase disposition shall be maintained throughout the run of the bus duct. Phase crossover units, if required, shall also be provided inside the Busduct itself.
- h) Bus ducts shall be suitable for continuous operation at maximum system voltage and shall be adequately sized to withstand short circuit current.

1.4 Specific Requirements

1.4.1 General

- a) 415V Non Segregated Phase Busduct is provided for connection between low voltage side of 11/0.433kV cast resin dry type /oil type transformers and associated 415V Switchgears shall be of TPN (3 phase and neutral) along with necessary bends, flexible at both transformer & switchgear ends, flanges, phase crossover chambers (if required), support structures & accessories including terminations at the equipment ends.
- b) The 415V bus duct shall be metal enclosed, non-phase segregated enclosure type, self cooled and insulated for 1.1kV voltage. The cooling medium inside the duct shall be air.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E5	[2]	25.09.2014

- c) All parts and accessories shall have appropriate match mark and part numbers for easy identification and installation at site.
- d) The 415V non-segregated phase bus duct will be installed indoor or partially indoor & outdoor depending upon the location of equipment being interconnected in a hot, humid and tropical atmosphere. All panels associated with LV non-segregated phase bus duct will be located indoors.
- e) The continuous current rating and momentary peak withstand current rating of the Busduct between transformers & their associated switchgears shall be same as that of the associated switchgears and as indicated in the specification.
- f) All supporting steel structures shall be hot dip galvanized.
- g) The bus ducts shall be provided with space heaters to control moisture. Slicagel breather if required same shall be provided.

1.4.2 Enclosures

- a) The enclosure shall be rectangular and shall be made of [aluminium alloy/Mild steel] of grade [19000H2] as per IS-5082. The entire bus duct shall be designed with dust, weather and vermin-proof construction. The inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The bare enclosure with above painting shall be designed so as not to exceed the temperature specified in IS: 8084.
- b) *[Phases shall be enclosed in a weather-proof, dust-tight, non-magnetic metal (aluminum alloy) of 3mm for bus rating including and above 3000A whereas enclosures for normal bus current rating (<3000 A) shall be sheet steel fabricated type of 2.5mm thick].*
- c) Enclosures shall be provided with flange ends with drilled dimensions to suit the flanges at the switchgear and transformer ends.
- d) Circumferential neoprene rubber gaskets shall be provided for dust tight joints with adjacent enclosure section.
- h) The bus enclosure shall have extended bellows or equivalent means to allow for temperature changes and vibrations. Flexible joints shall be provided in enclosures at all points where the bus duct terminates at equipment to withstand vibration, expansion / contraction and at suitable intervals in any straight run of the bus duct where expansion and contraction would otherwise result in stresses in the supporting structures.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E5	[3]	25.09.2014

- i) All outdoor bus-enclosures shall be so designed & constructed as to prevent accumulation of rain water on top sheet. Similarly all Gasketed flanged joints shall be suitably protected against direct splashing of rain water in case of outdoor runs. The connection flanges shall be sufficiently stiffened so as not to bend while tightening the bolts.
- j) Outdoor portions of the bus duct, if any, shall have continuous rain hood of non magnetic material or with suitable arrangement for rainwater prevention.
- k) Suitable inspection openings shall be provided for access to support insulators, bus joints, transformer terminals, switch gear terminals etc. All inspection openings shall have reliable sealing arrangement with neoprene gaskets.
- l) Seal-off bushings complete with wall-frame and support plates shall be provided where the bus duct penetrates the building wall. The seal is to prevent free exchange of air between indoor and outdoor portions of the bus duct.
- m) In case, the bus duct penetrates the firewall, the wall frame assembly and the seal shall be designed for the same fire rating as the firewall.
- n) Silica-gel breather shall be provided on both indoor and outdoor portions of the bus duct. Space Heaters shall be provided in the bus duct.
- o) Filtered drains for drainage of condensate shall be provided at the lowest points and at such locations where accumulation of condensate can be expected.
- p) Shipping length of the Busduct shall be not more than three (3) meters in length.
- q) Minimum Degree of protection of Busduct enclosure shall be IP-52 for indoor and IPW-55 for outdoor section of the Busduct.

1.4.3

Bus Conductor

- a) The bus conductor shall be of high conductivity, [Aluminium alloy / Aluminium].
- b) The bus conductors shall be given a coat of matt black paint to facilitate heat dissipation. However the sizing of the bus conductor shall consider the conductor as bare.
- c) The bus conductor shall be designed for bolted connections throughout the run.
- d) Flexible connection shall ensure an efficient and trouble-free connection.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E5	[4]	25.09.2014

- e) Silver plating shall be done on copper bar wherever copper to copper and copper to aluminium contacts are envisaged. All connection hardware shall be non-magnetic and shall have high corrosion resistance.
- f) The bus conductors and their support insulators shall be designed to withstand, without damage, the forces developed while carrying the short circuit current.
- g) The bus bar shall be sleeved with FRLS heat shrinkable, colour coded PVC sleeves at intermittent points for phase identification.
- h) The material of the conductor shall be aluminium alloy of grade [63401WP] as per IS: 5082. The temperature rise of conductor shall be 40 degree over design ambient temperature of 50 degree. Also, the temperature of the bus shall not exceed 250°C while carrying the specified short circuit current for one second when a fault occurs at the operating temperature.

1.4.4 Disconnect Link

- a) Removable bolted disconnected link shall be provided in the bus for the purpose of isolation.
- b) Disconnect link shall consist of a removable section of conductor and shall be so constructed as to permit easy removal or reinsertion without alignment difficulties.
- c) The bus on both sides of the link shall be rigidly supported so that the disconnect link is equal in mechanical strength to any other section of the bus.
- d) A minimum clearance of [300 mm. (12")] shall be provided between the disconnected bus sections with the link removed.

1.4.5 Insulators

- a) The bus conductor supporting insulators shall be flame retardant, non-hygroscopic, high impact and high dielectric strength material with an anti tracking contour.
- b) Material of insulator shall be [Epoxy SMC moulded /FRP].
- c) Spacing of the bus support insulators shall be considered by giving due factor of safety to withstand the forces due to the short circuit current assigned to the bus duct.
- d) Bus support insulators shall be interchangeable, high creepage, high strength, wet process, fine glazed porcelain. Alternatively good quality cast resin insulators may be offered.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E5	[5]	25.09.2014

- e) Insulator shall be mounted in such a way so as to permit easy removal or replacement without disassembly of the bus. The insulator mounting plate shall be designed for cantilever loading to withstand the short circuit.
- f) The conductor shall be fastened on the insulator through fixed and slip joints so as to allow conductor expansion or contraction without straining the insulator.
- g) Space heater shall be provided preferably located near to each insulator to avoid moisture condensation within bus duct.

1.4.6 Connections & Terminations

- a) All matching flanges, seal-off bushings, gaskets, fittings, hardware and supports required for termination of the Busduct at the switchgear, transformers and other equipment shall be furnished.
- b) In this connection the bidder is required to coordinate with the switchgear and auxiliary transformers manufacturer with regard to connection details, mechanical and thermal stresses.
- c) Flexible connections both for conductor and enclosure shall be furnished at all equipment termination to provide for misalignment up to 25 mm in all directions.
- d) The equipment terminal connections shall be readily accessible and shall provide sufficient air gap for safe isolation of equipment during testing.

1.4.7 Supporting Structures

- a) All supporting structures required for hanging and/or supporting the complete bus duct shall be furnished. These include all members, indoor/outdoor posts, bolts, shims, base plates, beams, hangers, brackets, bracings and hardware.
- b) All buses shall be adequately supported and braced to successfully withstand normal operation, vibration, thermal expansion, short circuit forces and all specified design loads including wind & earthquake forces.
- c) Support shall be designed to provide tolerance of ± 12 mm in the horizontal and vertical directions.
- d) All steel members shall be hot-dip galvanized after fabrication. All hardware shall be of high strength steel with weather resistant finish.
- e) The mounting arrangement of Busduct on the supporting structure shall be designed to allow movement of the Busduct during expansion and contraction.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E5	[6]	25.09.2014

- f) All structure shall be self supporting and in no case rely for support on equipment to which the busbars are connected.

1.4.8 Ground bus

- a) The ground bus of two numbers of separately run [50x10 mm] minimum GS flat shall be provided along the run of the bus duct. All parts of the bus enclosure, supporting structures and equipment frames shall be bonded to above ground bus.
- b) Ground bus shall be finally to connected to power plant earth grid at one end.

1.4.9 Wiring

All wiring for space heaters shall be done with insulated stranded copper conductor of not less than [2.5 mm² cross-section]. Each wire shall be identified at both ends with wire designation as per bidder's wiring diagram and shall be brought out to a terminal box outside the bus duct.

Terminal blocks shall be box-clamp type minimum 10 mm² with marking strips.

At [least 20% spare terminals] shall be furnished in the terminal block.

1.4.10 Name Plate

Suitable name plate shall be furnished with each piece of equipment.

[Materials for name plate shall be plastic / lamicaid, 3 mm thick, using white letters on black background.]

1.4.11 Space Heater

Thermostatically controlled Space heaters shall be provided in the bus ducts, wherever the manufacturer considers them necessary and recommends their provision for preventing harmful moisture condensation. At least one number space heater with thermostat shall be provided at each transformer and switchgear end.

The space heaters shall be suitable for continuous operation on single phase supply, and shall be automatically controlled by thermostats. Necessary wiring up to junction boxes mounted on bus duct and from junction boxes to switchboards shall be provided.

1.4.12 Painting and Finish

- a) All surfaces to be painted including interior and enclosures and other metal parts shall be shot or sand blasted or chemically treated to remove all rust, scale, grease and other adhering foreign matters as far as

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E5	[7]	25.09.2014

possible shall be painted with not less than two (2) coats of Acid and corrosion resistant paint

- b) Steel surfaces, exposed to weather shall be given two (2) coats of zinc chromate and two (2) coats of an 'approved' Manufacturer's paint of 'approved' colour.
- c) All metal parts not accessible for painting shall be made of corrosion resistant materials. All machine finished or bright surfaces shall be coated with a suitable rust preventive compound and wrapped or otherwise protected.
- d) Inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The shade of exterior surface finish shall be [RAL 5012].
- e) The interior surface finish shall be as per manufacturer's standard.
- f) Pretreatment consisting of degreasing, de-rusting etc. shall be done on all fabricated parts before painting or galvanizing.
- g) Paints shall be carefully selected to withstand heat and weather conditions. The paint shall not scale-off or crinkle or get removed by abrasion due to normal handling.
- h) Sufficient quantities of all paints and preservatives required for touching up at sites shall be furnished.
- i) The paint shade shall be subject to owner's approval.

1.5 Tests

l) Type Test

For each type & rating of 415V Non segregated phase bus duct, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the Busduct similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E5	[8]	25.09.2014

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

Some of the specific tests required are listed below.

- a) Visual inspection and verification of dimensions
- b) Dry power frequency voltage withstand for 1-minute
- c) Milli-volt drop test & Water tightness test

1.6 Drawings and Documents

Drawings, data & manuals for the 415V Non segregated phase bus duct shall be submitted as indicated below:

- a) [Dimensional GA drawing]
- b) Data sheets
- c) Typical calculation for arriving at the size of conductor and the insulator spacing.
- d) Type test report (short circuit, temperature rise test) for similar bus duct manufactured by the proposed manufacturer.
- e) Foundation layout and requirements
- f) The bidder may note that the drawings, data and manuals listed are minimum requirement only. The bidder shall ensure that all other necessary write-ups, curves and information required to fully describe the equipment offered are submitted with his bid.]

1.7 Ratings and Requirements

Major technical parameters of 415V non segregated Bus Duct are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

Table: 2.0

S. No.	Technical Particulars	Unit	Parameters	Remarks

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[3]	25.09.2014

IS : 9000	:	Basic environmental testing procedures for electronic and electrical items.
IS:13703	:	Low voltage fuses for voltages not exceeding 1000 V AC, 1500VDC.
EEUA-45D	:	Performance requirements for electrical Alarm Annunciation system

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity (IE) Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- 220 V DC Systems shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The system shall be suitable for operation in a highly polluted environment.
- The permissible voltage variation for 220V battery shall be from -15% to +10%.
- The battery shall be of storage type [Lead Acid Plante Positive Plate/Ni-Cd] Type. The Battery shall be of high discharge performance type. The plates shall be designed for maximum durability during all service conditions including high rate of discharge & rapid fluctuation of load.
- While estimating the battery size, temperature correction factor [based on lowest expected temperature 5 Deg C], margin on capacity [10%] and aging factor [1.0 for Lead Acid Plante and 1.2 for Ni-Cd] shall be considered.
- Cell Voltages for Lead Acid batteries:

i.	Nominal Discharge Voltage/cell	2.0 V
ii.	Float Voltage/cell	2.2 V
iii.	Boost Voltage/cell	2.7 V
iv.	Capacity for ten(10) hour rate at 27°C any time during the entire duty	1.85 V/Cell

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[4]	25.09.2014

	cycle	
--	-------	--

f) Cell Voltages for Ni-Cd Batteries

i.	Nominal Discharge Voltage/cell	1.2 V
ii.	Float Voltage/cell	1.42 V
iii.	Boost Voltage/cell	1.7 V
iv.	Capacity for five(5) hour rate at 27°C any time during the entire duty cycle	1.14 V/ Cell

- g) 2x100% sets, 220V of either Lead-Acid Plante Type or Nickel-Cadmium battery banks with 2 x100% float cum boost charger catering to 100% of unit as well as station loads shall be provided.
- h) Permissible voltage variation for 220V battery shall be from 190V to 240V.
- i) The Ampere-Hour capacity of DC Storage Battery shall be based on [Three] hours' continuous DC supply at rated voltage to essential auxiliaries.
- j) Batteries shall be suitable for being boost charged to fully charged condition from fully discharged condition within 10 hours.
- k) Lead acid batteries shall be boost charged at about 2.7 volts per cell maximum and float charged at about 2.2V/cell.
- l) Ni-Cd batteries shall be boost charged at about 1.54 to 1.7 volts per cell maximum and float charged at about 1.42V/cell.
- m) The float-cum-boost charger shall be rated to cater to the following:
- Trickle charging current of the battery
 - Equalizing charging of the Battery
 - Boost charging of the Battery
 - Continuous load on the DC system
 - 25% spare capacity over above loads.

1.4 Specific Requirements

1.4.1 Constructional requirements of battery

a) Containers

Container shall be made of transparent glass for lead acid and polypropylene for Ni-Cd batteries. It shall be robust, heat resistance, leak

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[5]	25.09.2014

proof, non-absorbent, acid resistant, non-bulging type and free from flaws, such as wrinkles, cracks, blisters, pin holes etc. Electrolyte level lines shall be marked on container. The marking for the electrolyte level should be for the upper and lower limits. Container shall be closed / sealed lid type.

The pole sealing arrangement should be such that no acid particle gets entrapped due to acid creep as a result of capillary action and it should be possible to remove and refix the sealing to carry out the maintenance.

b) Vent Plugs

Vent plug shall be provided in each cell. They shall be anti-splash type, having more than one exit hole shall allow the gases to escape freely but shall prevent acid from coming out. The design shall be such that the water loss due to evaporation is kept to minimum. In addition the ventilator shall be easily removed for topping up the cells and of such dimensions that the spring type hydrometer can be inserted into the vent to take electrolyte sample.

c) Plates

The plates shall be designed for maximum durability during all service conditions including high rate of discharge and rapid fluctuation of load. The construction of plates shall conform to latest revisions of standards as applicable for type of battery.

The separators shall maintain the electrical insulation between the plates and shall allow the electrolyte to flow freely. Separators should be suitable for continuous immersion in the electrolyte without distortion. The positive and negative posts shall be clearly marked.

The plante positive plates shall be supported from the ledges of the SAN container. They should not be supported at the bottom of container. Sufficient space shall allowed to allow the creepage of the plates.

d) Sediment Space

Sufficient sediment space shall be provided so that the cells shall not have to be cleaned out during normal life and prevent shorts within the cells.

e) Cell Insulators

Each cell shall be separately supported on PVC / Porcelain / Hard rubber insulators fixed on the racks with adequate clearances between adjacent cells. Minimum distance between adjacent cell shall be more than the bulge allowed for two cells in accordance with relevant IS standard.

f) Electrolyte

The electrolyte shall be prepared from battery grade sulphuric acid conforming to IS: 266 and distilled water conforming to IS: 1069 for lead

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[6]	25.09.2014

acid batteries and battery grade potassium hydroxide for Ni-Cd batteries. The cells shall be shipped dry uncharged. The electrolyte shall be supplied separately in a separate non-returnable container. 10% extra electrolyte shall be furnished to cover spillage in transit or during erection.

g) Connectors and Fasteners

Lead or Lead coated copper connectors (For Lead acid Plante Type batteries) and Nickel coated copper connectors (for Ni-Cd batteries) shall be used for connecting up adjacent cells and rows. Bolts, nuts and washers shall be effectively lead coated/Nickel coated to prevent corrosion. The thickness of lead coating of connectors should not be less than 0.025 mm. All the terminals and cells inter-connectors shall be fully insulated or have insulated shrouds. End take-off connections from positive and negative poles of battery shall be made by single core cables having stranded aluminum conductors and XLPE insulation. Necessary supports and lugs for termination of these cables on battery shall also be supplied. All connectors and lugs shall be capable of continuously carrying the 30 minutes discharge current of the respective battery and through fault short circuit current which the battery can produce and withstand for the period declared. Suitable number of inter rack connectors shall be supplied by the bidder to suit the battery room layout during the detail engineering.

h) Battery Racks

Steel racks with anti-corrosive epoxy paint for all the battery shall be provided. They shall be free standing type mounted on porcelain / hard rubber / PVC pads insulators. Battery shall be located in the single tier arrangement. However battery having a complete cell weight of lower than 50 Kg could be located in the double tier arrangement. The battery rack and support for cable termination shall be coated with three (3) coats of anti-acid paint of approved shade. Numbering tags, resistant to acid, for each cell shall be attached on to the necessary racks. The bottom tier of the stand shall not be less than 150 mm above the floor.

Wherever racks are transported in dismantled condition, suitable match markings shall be provided to facilitate easy assembly.

i) Manufacturer's Identification Systems

The following information shall be indelibly marked on outside of each cell:

- i. Manufacturer's name and trade marks
- ii. Country and year of manufacture
- iii. Manufacturer type of designation
- iv. AH capacity at 10 hour discharge rate
- v. Serial number

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[7]	25.09.2014

1.4.2 Constructional Requirements of battery charger

- a) The Charger shall be indoor, floor mounted, self supporting sheet metal enclosed cubicle type. All necessary base frames, anchor bolts and hardware shall be supplied. The charger shall be fabricated using cold rolled sheet steel shall not less than 1.6 mm and shall have folded type of construction. The panel frame shall be fabricated using cold rolled sheet steel of thickness not less than 2.0 mm. Removable undrilled gland plates of at least 3.0 mm sheet steel and lugs for all cables shall be supplied. The lugs for cables shall be made of electrolytic copper with tin coat. The chargers shall be tropicalised and vermin proof. Ventilation louvers shall be backed with fine brass wire mesh. All doors and covers shall be fitted with synthetic rubber gaskets. The chargers shall have hinged double leaf doors provided on front / or backside for adequate access to the charger internals. All the charger cubicle doors shall be properly earthed. The degree of protection of charger enclosure shall be at least IP-42.
- b) All indicating instruments, control and selector switches and indicating lamps shall be mounted on the front side of the charger.
- c) Electronic equipments shall be of modular design consisting of plug in modules in standard 19 inches metallic racks with metallic card guides. The cards should be provided with proper handles. Card to card wiring should be preferably through a motherboard. Unplanned jumpering and track modifications are not permitted and track modifications are not permitted. Mechanical interlocks to prevent wrong insertion of cards should be provided. Each card shall have its junction and test points identified. Maintenance aids such as extension printed wiring boards and jumper leads shall be provided.
- d) The layout of charger equipment shall be such that their heat losses do not give rise to excessive temperature within the charger panel surface. Location of the electronic modules shall be such that temperature rises of the location, in no case, shall exceed 10°C over ambient air temperature outside the charger.
- e) Printed Circuit Boards (PCB)
PCB shall be made of glass epoxy of 1.6 mm thick, fire resistant, bonded with 99.8% pure copper foil, free of wrinkles, blisters, scratches and pinholes. The contact surface of the edge connectors of the PCBs shall be plated with hard gold to a minimum thickness of 5 microns. Component identification shall be printed on PCB by silk screen method. All PCBs shall be tropicalised and masked.
- f) Contactors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[8]	25.09.2014

All battery chargers shall have an AC contactor on the input side. It shall be of air break type and suitable for continuous duty. The operating coil shall be rated for 415 Volts AC.

g) Thermal Overload Relay

A thermal overload relay incorporating a distinct single phase protection (using differential movement of bimetal strips) shall also be provided for the AC input. The relay shall trip the above contactor.

h) Rectifier-Transformer and Chokes

The rectifier-transformer and chokes shall be dry and air cooled (AN) type. The rating of the rectifier transformers and chokes shall correspond to the rating of the associated rectifier assembly. The rectifier-transformers and chokes shall have class-B insulation with temperature rise limited to class A insulation value.

i) Rectifier Assembly

The rectifier assembly shall be full wave bridge type and designed to meet the duty as required by the respective charger. The rectifier cells shall be provided with their own heat dissipation arrangement with natural air cooling. The rectifier shall utilize diodes / thyristors and heat sinks rated to carry 200% of the load current continuously and the temperature of the heat sink shall not be permitted to exceed 85 °C absolute duly considering the maximum charger panel inside temperature. Calculations to show what maximum junction temperature shall be and what the heat sink temperature shall be when operating at 200% and 100% load current continuously duly considering the maximum surrounding air temperature of 50°C outside the panel have to be submitted. Necessary surge protection devices and rectifier type fast acting fuses shall be provided in each arm of the rectifier connections.

1.4.3 System Concept for 220 V DC system

- a) First float cum boost charger shall be normally ON in float mode, supplying the D.C. load and at the same time trickle charging the battery and shall (a) provide occasional equalizing charge (b) boost charge the battery up to 2.7/1.7 Volts per cell as required.
- b) The characteristics shall be such that if load is high and exceeds the charger capacity, the excess load shall be supplied by the battery.
- c) The second float-cum-boost charger shall be normally in stand-by (auto float/charge) mode and shall come into the circuit automatically (a) to take over the functions of first float cum boost charger in case of its failure (b) to provide occasional equalizing charge as required, (c) boosting charge the battery up to 2.7/1.7 Volts per cell.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[9]	25.09.2014

- d) The float-cum-boost charger shall also have provision for float, equalizing, and boost charging the battery through manual selection. On failure of station A.C. supply, float-cum-boost charger shall go out of service and battery shall take over to supply emergency loads.

1.4.4 Operational requirements of charger

- a) The float-cum-boost charger shall be sized to restore the fully discharged battery to full charge condition in ten (10) hours with 10% margin over maximum charging rate and also to operate as a float charger.
- b) The batteries & chargers shall be so designed that the maximum fault level on DC DB is limited to 15KA (Indicative only; the actual value shall be decided by the contractor after substantiating the same by calculation.)
- c) The battery shall be trickle charged at 2.15 to 2.25 V per cell and 1.4 to 1.42V per cell for lead acid and Ni-Cd battery respectively. All chargers shall also be capable of boost charging the associated battery at 2.0 to 2.7 V per cell for lead acid and 1.53 to 1.7V for Ni Cd at the desired rate. The chargers shall be designed to operate, as mentioned above, at an ambient air temperature of 50 °C.
- d) Necessary interlocks shall also be provided to avoid accidental boost mode operation when loads are connected to the bus.
- e) The battery chargers as well as their automatic regulators shall be of static type. Battery chargers shall be capable of continuous operation at the respective rated load in trickle mode i.e. trickle charging the associated lead acid battery/Ni-Cd battery while supplying the DC loads.
- f) Battery chargers shall have a selector switch for selecting the battery charging mode i.e. whether trickle / float or Boost charging.
- g) All battery chargers shall be provided with facility both automatic and manual control of output voltage and current. A selector switch shall be provided for selecting the mode of output voltage / current control, whether automatic or manual. Means shall be provided to avoid current / voltage surges of harmful magnitude/ nature which may arise during changeover from Auto to Manual mode or vice versa under normal operating condition.
- h) Soft start feature shall be provided to build up the voltage to the set value slowly within fifteen (15) seconds. The chargers shall have load limiters which shall cause, when the voltage control is in automatic mode, a gradual lowering of the output voltage when the DC load current exceeds the load limiter setting of the charger. The load limiter characteristic shall be such that any sustained overload or short circuit in DC system shall neither damage the charger nor shall it cause blowing of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[10]	25.09.2014

any of the charger fuses. The charger shall not trip on overload or external short circuit. After clearance of fault, the charger voltage shall build up automatically when working in automatic mode.

- i) When on automatic control mode, during trickle / float charging, the charger output voltage shall remain within (\pm) 1% of the set value for AC input voltage variation of (\pm) 10%, frequency variation of (+) 3 / (-) 5%, a combined voltage and frequency variation of 10% (absolute sum) and a continuous DC load variation from zero to full load. Uniform and step less adjustment of voltage setting (in both manual and automatic modes) shall be provided on the front of the charger panel covering the entire trickle / float charging output range specified. Step less adjustment of the load limiter setting shall be possible from 80% to 100% of the rated output current for trickle / float charging mode.
- j) During boost charging, the battery chargers shall operate on constant current mode (when automatic voltage regulator is in service). It shall be possible to adjust the boost charging current continuously over a range of 50% to 100% of the rated output current for Boost charging mode. The charger output voltage shall automatically go on rising, when it is operating on boost mode, as the battery charges up. For limiting the output voltage of the charger, a potentiometer shall be provided on the front of the panel, whereby it shall be possible to set the upper limit of this voltage anywhere in the output range specified for boost charging mode. All voltage and current setting potentiometers shall be vernier type.
- k) Energizing the chargers with fully charged battery connected plus 10% load shall not result in output voltage greater than 110% of the voltage setting. Time taken to stabilize, to within the specified limits as mentioned elsewhere shall be less than fifteen (15) seconds.
- l) Momentary output voltage of the charger, with the battery connected shall be within 94% to 106% of the voltage setting during sudden load change from 100% to 20% of full load or vice versa. Output voltage shall return to, and remain, within the limits specified as mentioned elsewhere in less than 2 seconds after the above mentioned change.
- m) The charger manufacturer may offer an arrangement in which the voltage setting device for trickle/ float charging mode is also used as output voltage limit setting device for Boost charging mode, and the load limiter of the trickle / float charging mode is also used as Boost charging current setting device.
- n) Suitable filter circuits shall be provided in all the chargers to limit the ripple content (peak to peak) in the output voltage to 1% irrespective of the DC load, even when they are not connected to a battery.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[11]	25.09.2014

1.4.5 Auxiliary Equipment

- a) DC Voltmeter, DC ammeter and AC voltmeter in 96 mm square shall be provided for each charger. The instruments shall be 240 scale, antiglare glass, flush mounted type, dust proof and moisture resistant. The instrument shall have easily accessible means from zero adjustments. The instruments shall be of 1.5 accuracy class.
- b) In addition to above, following metering provision shall be given for remote metering / recording at PLC/DCS
 - i. Battery Voltage
 - ii. DC voltage of float & Boost charger
 - iii. DC current of float & Boost charger
 - iv. DC load voltage
 - v. DC load current
 - vi. DC Voltage and Current at FCBC
 - vii. Centre Zero Ammeter with Shunt to read Discharge/Charge current
 - viii. Ammeter for Battery Trickle Charge current
 - ix. DC Bus Voltmeter indicating - +ve to Earth, -ve to Earth and +ve to -ve with Selector switch.

The following indications shall be provided

- i. AC Supply – R,Y,B Healthy
- ii. DC supply – Available
- iii. Charger in Float Mode
- iv. Charger in Equalising mode
- v. Charger in Boost mode
- vi. Charger tripped on fault
- vii. D.C Earth fault sensing & alarm

Suitable soft link to be provided for interfacing with DDCMIS.

c) Air Break Switches

All chargers shall have AC input and DC output switches of air break, single throw, load break and fault make type. The contacts of the switches shall open and close with a snap action. Switches shall be rated for 120% of maximum continuous load. 'ON' and 'OFF' position of the switch shall be clearly indicated.

d) Control and Selector Switches

Control and selector switches shall be rotary, stay put type with escutcheon plates showing the functions and positions. The switches shall be of sturdy construction and suitable for mounting on panel front. Switches with shrouding of live parts and sealing of contacts against dust ingress shall be preferred. The contact ratings shall be at least the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[12]	25.09.2014

- i. Make and carry continuously - 10 Amps
- ii. Breaking current at 220V DC - 0.5 Amp (inductive)
- iii. Breaking current at 240V AC - 5 Amp. at 0.3 p.f.

e) Fuses

Fuses shall be of HRC cartridge fuse link type. Fuses shall be mounted on fuse carriers which are mounted on fuse bases. Wherever it is not possible to mount fuses on fuse carriers, fuses shall be directly mounted on plug in type bases. In such cases one insulated fuse pulling handle shall be supplied for each charger. Kick-off fuses (trip fuses) with alarm contacts shall be provided for all DC fuses.

f) Indicating Lamps

Three (3) indicating lamps shall be provided to indicate AC supply availability. The indicating lamp shall be of panel mounting, LEDs and capable of clear status indication under the normal room illumination. The lamps shall be replaceable from front. The lamp covers shall be preferably screwed type, unbreakable and moulded from heat resistant material.

g) Blocking Diode

Blocking diode shall be provided in the output circuit of each charger to prevent current flow from the Battery into the charger.

h) Annunciation System

Following annunciation shall be provided for local and remote indications in all chargers(List is indicative only)

- i. AC supply failure
- ii. Rectifier fuse failure
- iii. Surge circuit fuse failure
- iv. Filter capacitor fuse failure
- v. Load limiter operated
- vi. Charger fail / trip
- vii. Battery on Boost
- viii. Battery on Trickle
- ix. DC output fuse failure
- x. Positive grounded
- xi. Negative grounded
- xii. Battery fully discharged
- xiii. AC input under voltage
- xiv. DC voltage low
- xv. DC voltage high
- xvi. DC system earth fault

The annunciation system shall have audio-visual arrangement and shall incorporate acknowledge, reset and test push buttons. On occurrence of fault, the corresponding window lights up and shall stay in lighted

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[13]	25.09.2014

condition till the fault is cleared and the reset push button is pressed. At least 20% spare annunciation windows with accessories shall be provided.

i) Lamp / Space Heaters / Receptacles

The charger panels shall be provided with:

- i. Internal illumination lamp with door switch.
- ii. Space heater with thermostat control.
- iii. 3-pin 5A receptacle with plug.
- iv. Lamp, heater and receptacle circuits shall have individual switch fuse units/MCB.

1.4.6 Battery Accessories

Each battery shall be furnished complete with following:

- a) First charge of electrolyte plus 10% extra.
- b) Teak wood racks with 3 coats of anti-acid paints.
- c) Stand insulators 5% extra.
- d) Cell inter-connectors 5% extra and one extra end take-off.
- e) Lead-coated connection hardware 5% extra
- f) Cell numbering tag with fixing arrangements
- g) Insulated cable clamps with hardware
- h) Six (6) extra cell with all accessories but without acid
- i) In addition to the above each battery shall be furnished with a set of following accessories.
- j) One (1) Interconnector bolt wrench
- k) One (1) Hydrometer syringe
- l) One (1) Thermometer with specific gravity correction scale.
- m) One (1) Cell testing voltmeter with leads.
- n) One (1) Pocket thermometer
- o) One (1) set of Acid resisting funnels
- p) One (1) set of Acid resisting jugs of adequate capacity
- q) One (1) set of Rubber aprons
- r) One (1) set of Rubber gloves
- s) PVC spill trays under the battery cells
- t) Spanner for cells

Catalogues and Instruction manuals of battery and battery charger to be furnished.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[14]	25.09.2014

1.4.7 Painting

- a) All surfaces shall be sand blasted, pickled and grounded as required to produce a smooth, clean surface free of scale, grease and rust.
- b) After cleaning, the surfaces shall be given a phosphate coating followed by 2 coats of high quality lead oxide primer and stoved after each coat.
- c) The equipment shall be finished in Siemens Gray RAL: 9002 color with two coats of epoxy based powder coated paint except end covers and RAL 5012 for end covers. The coating shall be done electro statically followed by stoving.
- d) Sufficient quantity of touch-up paint shall be furnished for application at site.

1.4.8 Installation

- a) The battery room floor shall be acid resistant type and walls shall have acid resistant tiles up to a suitable height. Alternatively acid resistant paints are also acceptable. Adequate ventilation shall be provided in the battery room for the removal of hydrogen.
- b) The Battery charger along with D.C. distribution board shall be located in separate rooms.
- c) After erection and connection of the Battery Charger, the contractor shall complete the charging discharging cycles recommended by the manufacturer. The contractor shall rig up a suitable discharge resistor for this purpose.
- d) Connection from Battery terminals shall be made by means of cables. Lead coated terminal connector shall be furnished for this purpose.

1.5 Tests

1) Type Test

For each type of Battery and battery charger, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[15]	25.09.2014

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

All Battery, Battery chargers, Inverters and its components thereof shall be subject to shop tests as per relevant IS/IEC standards. The tests on Battery chargers shall include but not limited to the following:

- a) Voltage regulation check from 0 to 100% loads with $\pm 10\%$ input voltage variation.
- b) Ripple content measurement.
- c) D.C short circuit test to prove ability of current limit.
- d) Measurements of transient overshoot/undershoot during switching ON/load throw-off.
- e) Current limiter operation.
- f) Special tests for electrical equipment, when specified in relevant Indian / International standard shall be carried out on at least one item of each rating.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports. Drawings, Data & Manuals:

1.6

Drawings, Data & Manuals

1. Following drawings/ data and Manuals to be submitted for approval:

- a) [Dimensional battery layout diagram and plan & section.
- b) Connection details of take-off terminals.
- c) Dimensional general arrangement drawings of battery charger clearly showing device dispositions, cable entry, space requirement, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E6	[16]	25.09.2014

- d) Sectional views of battery charger.
- e) Charger foundation plan and loading.
- f) Charger schematics and wiring diagrams.
- g) Test reports
- h) Detailed bill of materials
- i) Any other relevant drawing or data necessary for satisfactory installation, operation and maintenance.
- j) Instruction manuals of battery and battery Charger. The manual shall clearly indicate method of installation, check-ups, and tests to be carried out before commissioning of the equipment.
- k) Bidders shall note that the drawings, data and manuals listed herein are minimum requirements only. The Bidders shall ensure that other necessary write-ups, curves and information required to fully describe the equipment are submitted with their bids].

1.7 Rating and Requirement

S.No	Technical Particulars	Unit	Parameters	Remarks
1.0	General			
1.1	Bidder's Name			
1.2	Make			
1.3	Application		[For Main plant/BOP]	
2.0	Battery			
2.1	Make and country	:	[By bidder]	
2.2	Type	:	Lead acid(Plante)/Ni Cd

TECHNICAL SPECIFICATION FOR HV CABLES

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E7

1.0 HV CABLEs

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of HV cables complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified or supplemented by this specification.

Table: 1.0

IS: 2982	:	Copper conductor in insulated cables and cords.
IS: 3961	:	Recommended current ratings for cables.
IS: 3975	:	Mild steel wires, strips and tapes for armouring cables
IS: 5609	:	Specification for low frequency wirers and cables with PVC insulation and PVC sheath
IS:5831	:	PVC insulation and sheath of electric cables
IS: 6380	:	Specification of elastomeric insulation of sheath of electric cables.
IS:7098(Part II)	:	XLPE insulated PVC sheathed cables for working voltage from 3.3kV up to and including 33kV
IS: 8130	:	Conductors for insulated electric cables and flexible cords
IEC: 60	:	High voltage test techniques
IEC: 230	:	Impulse tests on cables and their accessories
IEC: 287	:	Calculation of the continuous current rating of the

		cables(100% load factor).
IEC: 288	:	Nominal cross sectional area and composition of conductor of insulated cables.
IEC-331	:	Fire resisting characteristics of electric cables
IEC: 332-1	:	Test on electric cables under fire conditions.
IEEE: 383	:	Standard for type test for class IE electric cables, filled splices and connection for nuclear power generation station.
IEC: 502	:	Extruded solid dielectric insulated power cables for rated voltages from 1kV upto 30kV.
IEC: 540	:	The methods for insulations and sheath of electric cables and cords(elastomeric and thermoplastic compounds)
IEC-754-I	:	Test method for acid gas generation
NEMA-WC-5	:	Thermoplastic insulated wires and cables for transmission and distribution of electrical energy.
ASTM-D-2843	:	Standard test method for density of smoke from burning/decomposition of plastics.
ASTM-D-2863	:	Test for determination of oxygen index.
CEA	:	CEA Regulations
CEA	:	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended upto date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E7	[2]	25.09.2014

1.3 Design Criteria

- a) The cables shall be installed in hot, humid tropical atmosphere with ambient temperature of 50°C.
- b) All HV cables shall be suitable for operation under the following voltage & frequency variations:

Voltage Variation : (±) 10%

Frequency Variation : (+) 3% to (-)5%

Combined Variation of Voltage & Frequency : 10% (absolute sum)

- c) The HV power cables shall be 6600V unearthed grade, single/multi core stranded Aluminum conductor, extruded XLPE insulated with extruded PVC inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-2). These cables shall conform to IS 7098 (Part II).
- d) The continuous and short time current carrying capacity of XLPE insulated cables shall be based on maximum operating temperature of 90°C and 250°C respectively.
- e) HV power cables shall be sized taking into account the following derating factors:
 - i. Max Ambient air temperature
 - ii. Max Ambient ground temperature
 - iii. Grouping of cables/Method of laying
 - iv. Depth of laying for cable buried in ground.
 - v. Soil thermal resistivity for cable buried in ground.
- f) HV cables shall be chosen taking into account the following factors:
 - i. System Fault level.
 - ii. Maximum time for fault clearance (i.e, operating time of the backup protection relays plus the time of operation of the circuit breakers).
 - iii. Full load current of the circuit.
 - iv. Short circuit current and duration (for breaker protected cables)
 - v. Installation conditions.
 - vi. Voltage drop under normal running and starting condition
 - vii. Voltage drop at motor terminals shall be within permissible limit during starting & normal running. i.e 5% during steady state and 15% during transient or starting at motor terminal.
 - viii. The cable should withstand the maximum fault current corresponding to the particular voltage level for the minimum time before the fault is cleared.
 - ix. Consideration shall also be given to limit the cable to the nearest standard sizes instead of using too many types.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E7	[3]	25.09.2014

1.4 Specific Requirements

1.4.1 Type of Cable

- a) HV cables shall be 6600V unearthed grade, heavy duty, stranded aluminium conductor, XLPE insulated, extruded black FRLS PVC inner sheathed, armoured and overall FRLS extruded black PVC outer sheathed (Type ST-2) cables conforming to IS: 7098 part II.

1.4.2 Conductor

The cable conductor shall be made from standard Aluminum to form compact conductor having a resistance within the limits specified.

1.4.3 Conductor Shield

The conductor having a semi-conducting screen shall ensure perfectly smooth profile and avoid stress concentration. The conductor screen shall be provided over the conductor by applying non metallic semi conducting tape or by extrusion of semi conducting tape or by extrusion of semi-conducting compound or a combination of the two. The semi conducting polymer shall be cross linked for XLPE cables.

1.4.4 Insulation

The insulation of the HV cables shall be XLPE type. It shall be designed and manufactured for the specified system voltage. The manufacturing process shall ensure that insulation shall be free from voids. The insulation shall withstand mechanical and thermal stresses under steady state and transient operating conditions. The extrusion method should give a very smooth interface between semi conducting screen and insulation. The insulation of the cables shall be of high standard quality.

1.4.5 Insulation Shield

A non magnetic semi conducting shield shall be put over the insulation to confine electrical field to the insulation. The XLPE cable insulation shield shall be strippable.

The metallic layer of the insulation shield shall be grounded at least at one location in the cable's run. In the case of single conductor cable, care should be taken with regard to ampacity when grounding at more than one point.

For all the cables having insulation shield, it shall have some form of stress relief measure at every splice at termination. This can be stress cones, moulded devices, heat shrink or cold shrink kits. All kits must be suitable for the voltage class and cable size.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E7	[4]	25.09.2014

1.4.6 Inner Sheath

The sheath shall be suitable to withstand the site conditions and the desired temperature. It shall be of adequate thickness and applied by a continuous process to produce a sheath of consistent quality free from all defects. PVC sheath shall be extruded with FRLS properties.

1.4.7 Armour

HV cables shall be provided with galvanized steel wire/strip armouring. The hard drawn aluminium wire for armour shall be of H4 grade, as per IS-8130 (having tensile strength above 150 N/mm²). The diameter of the aluminium wire shall be as per the table for the dimensions of the galvanized steel wire armour given in the relevant standard.

1.4.8 Outer sheath

Outer sheath shall be extruded layer of FRLS PVC compound (ST-1). Sheath shall be resistant to water, Ultra Violet radiations, fungus, termites and rodent attacks. The color of the sheath shall be black.

1.4.9 Packing

[Cables shall be supplied in non-returnable drums]. Drum lengths shall be such so that cable joints are totally avoided. The drums shall be of heavy construction. *[All wooden parts shall be manufactured from seasoned wood.]* All ferrous parts used shall be treated with suitable rust preventive finish or coating to avoid rusting during transit or storage. *[Wooden cable drum shall be treated by immersing in copper-nitrate solution.]*

The ends of each cable length shall be sealed before shipment. Heat shrinkable cable cap shall be used for this purpose.

[A label shall be securely attached to each end of the reel indicating the Purchaser's order number, Owner's identification mark, length, type, voltage grade, conductor size and number of cores of the cable.] A tag containing the same information shall be attached to the leadings end of the cable inside. An arrow and necessary instructions shall be marked on the drum indicating the direction in which it should be rolled. Drum numbers are to be indicated on the cable drums. Drum length shall not be less than 500m or as per required length.

1.4.10 Identification of cores:

HV power cables shall be identified by color code.

1.4.11 Constructional Requirements

- a) Cable shall have suitable filters laid up with the conductors to provide a substantially circular cross section before the sheath is applied. Fillers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E7	[5]	25.09.2014

shall be suitable for the operating temperature of the cable and compatible with the insulating material. All materials shall be new, unused and of finest quality.

b) Workmanship shall be neat, clean and of the highest grade.

c) Special Properties:

All the above cables shall be conforming to the relevant Indian/IEC standard in general, with the following special properties:

- i. Oxygen Index of the outer sheath shall not be less than 29, when tested as per ASTM-D-2863.
- ii. Temperature Index of the outer sheath shall not be less than 250 °C, when tested as per ASTM-D-2863.
- iii. Halogen acid contents in outer sheath shall not be more than 20%, when tested as per IEC-60754.
- iv. The maximum smoke density in percent light absorption should not exceed 60% in case of PVC compound and 20% in case of fire survival cables, when tested as per ASTM-D-2843.
- v. Swedish chimney test as per SS-4241475 class F3 and ladder test for flammability as per IEEE-383.
- vi. The cables shall be tested for resistance to Ultraviolet radiation. The retention values of tensile strength and ultimate elongation after test shall be minimum 60% of tensile strength.
- vii. Outer sheath of cable shall be subject to tests for water absorption. The methodology shall be as per IS 10810 part 33.

1.4.12 Joints and Terminations

Materials of construction for a joint/termination shall perfectly match with the dielectric chemical and physical characteristics of the associated cables. The material and design concepts shall incorporate a high degree of operating compatibility between the cable and joints. The protective outer covering (jacket) used on the joints/terminations shall have the same qualities as that of the cable outer sheath in terms of ambient/operating temperature withstand capability and resistance to hazardous environments and corrosive elements. No joints shall be allowed unless the cable drawn length is exceeded.

1.4.13 Cable Identification

Cable identification shall be provided by embossing the following on the outer sheath:

- a. [Manufacturer's name or trade mark]
- b. Voltage grade
- c. Year of manufacture
- d. Type of insulation.
- e. Type of outer sheath e.g. "FRLS" etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E7	[6]	25.09.2014

- f. ISI marks
- g. Nominal cross sectional area of the conductor & no of cores
- h. Sequential marking
- i. Owner's identification mark]

1.4.14 Fire Proof sealing system

- i) General
 - a) Fire proof sealing system shall consist of Fire-stops/fire-seals for sealing of cable/cable tray and conduit/pipe penetrations, both horizontal and vertical, through brick or RCC walls/floors, to prevent the spread of fire from one area, which is separated from others by fire-resistant barriers.
 - b) 'Fire-breaks' provided on long runs of cable racks/trays to prevent the propagation of fire along the cable rack, within a single fire-area or fire- zone.
 - c) The FPS system shall also include all the necessary accessories and equipment required for supporting, holding in position, fixing and installation of the fire-stop/fire-break.
 - d) The FPS system shall comply in all respects with the requirements of the codes and standards listed below

IEEE-634 ASTM-E-814

ANSI-IEEE-383 IEC-331 IEC-332

ii) Fire stop/ seal

The FPS system adopted for cables or cable trays penetrating through walls and floor constitute a openings, or cables passing through embedded conduits / pipes / pipe- sleeves, fire stop / seal', which is meant to prevent spreading of fire between areas separated by fire-resistant barriers.

iii) Fire Break

The fire proofing system, other than fire-stops, adopted to retard flame propagation long runs of horizontal or vertical cable trays in the same fire zone or area, in an event of a fire, shall constitute a `fire-break' and shall be provided by applying a suitable fire –resistance coating on cables and cable trays for the required length, with or without a fire resistant panel, at the point of the fire break to obtain the fire-rating specified.

iv) Application of fire proof sealing system

Fire stops shall be provided for cable penetration openings listed below

The passage of cables/cable trays pipe sleeves/embedded conduits through walls / floors.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E7	[7]	25.09.2014

Vertical raceways, which carry cables between successive floors, through openings provided in the RCC floor slab, shall be sealed by fire stops at each floor level.

Cable entry through openings in floor slabs below HT/LT switchgear, MCCs, various Control and relay panels and other bottom entry panels, shall be effectively sealed by fire stop

Location of fire breaks

Firebreaks shall be provided on both cable rack and trenches at all cable tray Intersections and tee-offs.

On linear runs of cable trays between fire stops or fire breaks, fire breaks shall be provided at intervals of 15 metres on horizontal cable runs and 5 m on vertical cable runs.

Fire breaks in linear runs of cable trenches between intersections and tee-offs shall be provided at intervals of 30 metres.

Bidder shall furnish the test certificates for the fire stops and fire breaks after award of contract for Owner/Owner's Representative review. If the certificates are not satisfactory all the tests shall be conducted free of cost. The offered system i.e. fire stops and fire breaks shall be identical (or better) with the system which is successfully type tested for the specified rating i.e. the composition density of the material, thickness of coating in case of fire breaks and any other properties of the material / system offered shall be identical or better than the tested system and shall be subject to Owner / Owner's Representative.

v) Test on fire stops

The fire stops shall be subjected to the following type tests:

- a. Fire Rating Test
- b. Hose Stream Test

Type tests shall be conducted on different fire stop test specimens described above as per IEEE-634. The sizes of the fire stop test specimens shall be similar to the largest of the sizes being used in the plant.

Preconditioning of fire stop test specimens before conducting the fire rating and hose stream tests, each test specimen shall be preconditioned for thermal ageing, water immersion and vibration.

Test on Fire Stops

During the fire rating test, the transmission of heat through the cable penetration fire stop shall not raise the temperature on its unexposed surface above the self ignition temperature of the outer cable covering, the cable penetration fire stop material, or material in contact with the cable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E7	[8]	25.09.2014

penetration fire stop, with a maximum temperature limit on the unexposed surface of 200°C.

Tests on fire breaks

Firebreaks shall undergo the following tests as per ANSI-IEEE-383:

- Ampacity test
- Flame test

1.5 Tests

1.5.1 Type Test

For each type & rating of HV cables, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The list of type tests are as follows:

- Tests on conductor:
 - Annealing test (for copper)
 - Tensile test (for aluminum)
 - Wrapping test (for aluminum)
 - Conductor resistance test.
- Test for armouring wires/strips
- Test for thickness of insulation and sheath
- Physical tests for insulation and outer sheath:
 - Tensile strength and elongation at break
 - Ageing in air oven
 - Shrinkage test
 - Hot deformation
 - Loss of mass in air oven
 - Heat shock test
 - Thermal Stability
- Insulation resistance test
- High voltage test (water immersion test)
- High voltage test at room temperature
- Flammability test

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E7	[9]	25.09.2014

1.5.2 Routine Test

Cables shall be subject to acceptance and routine tests as per IS codes. Acceptance tests and FRLS test as specified earlier shall be conducted on cables and the same shall be witnessed by purchaser.

The FRLS test shall be carried out on one cable of each batch of compound used. Other acceptance tests shall be carried out on drums selected as per sampling plan as indicated in IS. Test certificates for routine acceptance and special tests shall be furnished by the Bidder for review and approval of purchaser.

1.6 Drawings, Data and Manuals

The following drawings/documents and calculation as listed below but not limited to shall be furnished along with the bid for review

- [Cable datasheets and cross sectional drawings]
- [Cable sizing calculation]
- [QAPs & Test Reports]
- [Relevant catalogues]
- [Estimated weight of cable and cable drum]

IEC: 230	:	Impulse tests on cables and their accessories
IEC: 287	:	Calculation of the continuous current rating of the cables(100% load factor).
IEC: 288	:	Nominal cross sectional area and composition of conductor of insulated cables.
IEC-331	:	Fire resisting characteristics of electric cables
IEC: 332-1	:	Test on electric cables under fire conditions.
IEEE: 383	:	Standard for type test for class IE electric cables, filled splices and connection for nuclear power generation station.
IEC: 502	:	Extruded solid dielectric insulated power cables for rated voltages from 1kV upto 30kV.
IEC: 540	:	The methods for insulations and sheath of electric cables and cords(elastomeric and thermoplastic compounds)
IEC-754-I	:	Test method for acid gas generation
NEMA-WC-5	:	Thermoplastic insulated wires and cables for transmission and distribution of electrical energy.
ASTM-D-2843	:	Standard test method for density of smoke from burning/decomposition of plastics.
ASTM-D-2863	:	Test for determination of oxygen index.
CEA	:	CEA Regulations
CEA	:	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E8	[2]	25.09.2014

The electrical installation shall meet the requirements of Indian Electricity Rules as amended upto date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) The cables shall be installed in hot, humid tropical atmosphere with ambient temperature of 50°C.
- b) All LV cables shall be suitable for operation under the following voltage & frequency variations:

Voltage Variation : (±) 10%

Frequency Variation : (+) 3% to (-)5%

Combined Variation of Voltage & Frequency : 10% (absolute sum)

- c) The LV power cables shall be 1100V grade, single/multi core stranded Aluminum conductor, extruded XLPE/PVC insulated with extruded PVC inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-1). These cables shall conform to IS 7098 (Part I) for XLPE and 1554(part 1) for PVC insulation.
- d) The control cables shall be 1100 V grade, multi core, stranded annealed high conductivity copper with extruded PVC insulated inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-1).
- e) The continuous and short time current carrying capacity of XLPE insulated cables shall be based on maximum operating temperature of 90°C and 250°C respectively.
- f) The continuous and short time current carrying capacity of PVC insulated cables shall be based on maximum operating temperature of 70°C and 160°C respectively.
- g) LV power cables shall be sized taking into account the following derating factors:
 - i. Max Ambient air temperature
 - ii. Max Ambient ground temperature
 - iii. Grouping of cables/Method of laying
 - iv. Depth of laying for cable buried in ground.
 - v. Soil thermal resistivity for cable buried in ground.
- h) Power cables shall be chosen taking into account the following factors:
 - i. System Fault level.
 - ii. Maximum time for fault clearance (i.e, operating time of the backup protection relays plus the time of operation of the circuit breakers).
 - iii. Full load current of the circuit.
 - iv. Short circuit current and duration (for breaker protected cables)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E8	[3]	25.09.2014

- v. Installation conditions.
- vi. Voltage drop under normal running and starting condition
- vii. Voltage drop at motor terminals shall be within permissible limit during starting & normal running. i.e 5% during steady state and 15% during transient or starting at motor terminal.
- viii. The cable should withstand the maximum fault current corresponding to the particular voltage level for the minimum time before the fault is cleared.
- ix. Consideration shall also be given to limit the cable to the nearest standard sizes instead of using too many types.
- x. The minimum size of cables to be used shall be as follow :
 - Aluminium conductor : 6 Sq. mm.
 - Copper conductor : 2.5 Sq. mm

1.4 Specific Requirements

1.4.1 Type of Cable

- a) LV power cables shall be 1100V grade, heavy duty, stranded aluminium conductor, XLPE/ PVC insulated, extruded black FRLS PVC inner sheathed, armoured and overall FRLS extruded black PVC outer sheathed (Type ST-1) cables conforming to IS: 1554(Part 1) for PVC insulation and IS 7098(Part 1) for XLPE insulation.
- b) Control Cables shall be 1100 V grade, heavy duty with annealed high conductivity stranded copper conductor, PVC insulated, FRLS PVC inner sheathed, armoured and FRLS extruded black PVC outer sheathed (Type ST-1) cables conforming to IS : 1554.
- c) LV power cables of size above 35 sq. mm may be provided with XLPE insulation. Bidder shall clearly indicate the type of insulation provided in the technical bid.

1.4.2 Conductor

The cable conductor shall be made from standard Aluminum for LV Power cables and Copper for control cables to form compact conductor having a resistance within the limits specified. All the cables of size 25mm² and above shall have sector shaped conductors.

1.4.3 Insulation

The insulation of the LV power and control cables shall be [XLPE/PVC] type. It shall be designed and manufactured for the specified system voltage. The manufacturing process shall ensure that insulation shall be free from voids. The insulation shall withstand mechanical and thermal stresses under steady state and transient operating conditions. The extrusion method should give a very smooth interface between semi conducting screen and insulation. The insulation of the cables shall be of high standard quality.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E8	[4]	25.09.2014

1.4.4 Inner Sheath

The sheath shall be suitable to withstand the site conditions and the desired temperature. It shall be of adequate thickness and applied by a continuous process to produce a sheath of consistent quality free from all defects. PVC sheath shall be extruded with FRLS properties.

1.4.5 Armour

LV power and control cables shall be provided with galvanized steel wire/strip armouring. The hard drawn aluminium wire for armour shall be of H4 grade, as per IS-8130 (having tensile strength above 150 N/mm²). The diameter of the aluminium wire shall be as per the table for the dimensions of the galvanized steel wire armour given in the relevant standard.

1.4.6 Outer sheath

Outer sheath shall be extruded layer of FRLS PVC compound (ST-1). Sheath shall be resistant to water, Ultra Violet radiations, fungus, termites and rodent attacks. The color of the sheath shall be black.

1.4.7 Packing

[Cables shall be supplied in non-returnable drums]. Drum lengths shall be such so that cable joints are totally avoided. The drums shall be of heavy construction. *[All wooden parts shall be manufactured from seasoned wood.]* All ferrous parts used shall be treated with suitable rust preventive finish or coating to avoid rusting during transit or storage. *[Wooden cable drum shall be treated by immersing in copper-nitrate solution.]*

The ends of each cable length shall be sealed before shipment. Heat shrinkable cable cap shall be used for this purpose.

[A label shall be securely attached to each end of the reel indicating the Purchaser's order number, Owner's identification mark, length, type, voltage grade, conductor size and number of cores of the cable.] A tag containing the same information shall be attached to the leadings end of the cable inside. An arrow and necessary instructions shall be marked on the drum indicating the direction in which it should be rolled. Drum numbers are to be indicated on the cable drums. Drum length shall not be less than the following:

- a) Power cables: 500m
- b) Control cables: 1000m

1.4.8 Identification of cores and spares:

LV power cables shall be identified by color code. However LV control cables shall be identified by the number of its cores.

[Multi-core control cables shall have 20% spare core, minimum one spare.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E8	[5]	25.09.2014

1.4.9 Constructional Requirements

- a) Cable shall have suitable filters laid up with the conductors to provide a substantially circular cross section before the sheath is applied. Fillers shall be suitable for the operating temperature of the cable and compatible with the insulating material. All materials shall be new, unused and of finest quality.
- b) Workmanship shall be neat, clean and of the highest grade.
- c) Special Properties:
All the above cables shall be conforming to the relevant Indian/IEC standard in general, with the following special properties:
 - i. Oxygen Index of the outer sheath shall not be less than 29, when tested as per ASTM-D-2863.
 - ii. Temperature Index of the outer sheath shall not be less than 250 °C, when tested as per ASTM-D-2863.
 - iii. Halogen acid contents in outer sheath shall not be more than 20%, when tested as per IEC-60754.
 - iv. The maximum smoke density in percent light absorption should not exceed 60% in case of PVC compound and 20% in case of fire survival cables, when tested as per ASTM-D-2843.
 - v. Swedish chimney test as per SS-4241475 class F3 and ladder test for flammability as per IEEE-383.
 - vi. The cables shall be tested for resistance to Ultraviolet radiation. The retention values of tensile strength and ultimate elongation after test shall be minimum 60% of tensile strength.
 - vii. Outer sheath of cable shall be subject to tests for water absorption. The methodology shall be as per IS 10810 part 33.

1.4.10 Joints and Terminations

Materials of construction for a joint/termination shall perfectly match with the dielectric chemical and physical characteristics of the associated cables. The material and design concepts shall incorporate a high degree of operating compatibility between the cable and joints. The protective outer covering (jacket) used on the joints/terminations shall have the same qualities as that of the cable outer sheath in terms of ambient/operating temperature withstand capability and resistance to hazardous environments and corrosive elements. No joints shall be allowed unless the cable drawn length is exceeded.

1.4.11 Cable Identification

Cable identification shall be provided by embossing the following on the outer sheath:

- a. [Manufacturer's name or trade mark]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E8	[6]	25.09.2014

- b. Voltage grade
- c. Year of manufacture
- d. Type of insulation.
- e. Type of outer sheath e.g. "FRLS" etc.
- f. ISI marks
- g. Nominal cross sectional area of the conductor & no of cores
- h. Sequential marking
- i. Owner's identification mark]

1.5 Tests

1.5.1 Type Test

For each type & rating of LV power and control cables, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The list of type tests are as follows:

- a) Tests on conductor:
 - i. Annealing test (for copper)
 - ii. Tensile test (for aluminum)
 - iii. Wrapping test (for aluminum)
 - iv. Conductor resistance test.
- b) Test for armouring wires/strips
- c) Test for thickness of insulation and sheath
- d) Physical tests for insulation and outer sheath:
 - i. Tensile strength and elongation at break
 - ii. Ageing in air oven
 - iii. Shrinkage test
 - iv. Hot deformation
 - v. Loss of mass in air oven
 - vi. Heat shock test
 - vii. Thermal Stability
- e) Insulation resistance test
- f) High voltage test (water immersion test)
- g) High voltage test at room temperature
- h) Flammability test

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E8	[7]	25.09.2014

1.5.2 Routine Test

Cables shall be subject to acceptance and routine tests as per IS codes. Acceptance tests and FRLS test as specified earlier shall be conducted on cables and the same shall be witnessed by purchaser.

The FRLS test shall be carried out on one cable of each batch of compound used. Other acceptance tests shall be carried out on drums selected as per sampling plan as indicated in IS. Test certificates for routine acceptance and special tests shall be furnished by the Bidder for review and approval of purchaser.

1.6 Drawings, Data and Manuals

The following drawings/documents and calculation as listed below but not limited to shall be furnished along with the bid for review

- [Cable datasheets and cross sectional drawings]
- [Cable sizing calculation]
- [QAPs & Test Reports]
- [Relevant catalogues]
- [Estimated weight of cable and cable drum]

1.7 Ratings and Requirements

1.7.1 L.V. Power and control cables, 1100 V grade

Table: 2.0

S.No.	Technical Particulars	Unit	Parameters	Remarks
1.	System voltage		415 V	
2.	Voltage Grade		1.1 kV	
3.	Ambient Temperature		50°C	
4.	Maximum conductor temperature for continuous operation for XLPE/PVC cables		For XLPE: 90°C For PVC: 70°C	
5.	Maximum conductor temperature for		For XLPE: 250°C For PVC: 160°C

TECHNICAL SPECIFICATION FOR ILLUMINATION SYSTEM

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E9

1.0 ILLUMINATION SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Illumination System complete with luminaries and all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

Code		Name of Standard
IS 1913	:	Electrical lighting fittings- General and safety requirements
IS 2418 - Part I	:	Tubular fluorescent Lamp
IS 3480	:	Flexible steel conduits for electrical wiring
IS 3646 (Part I to III)	:	Code of Practice For Interior Illumination
IS 4012	:	Dust proof electric lighting fittings
IS4013	:	Flame proof enclosure
IS 6665	:	Code of practice for industrial lighting
IS 5077	:	Decorative light fittings
IS 9537 - Part II	:	Rigid steel conduits for electrical installations

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[1]	25.09.2014

IS 9583	:	Emergency lighting units
IS 9900	:	High pressure mercury vapor lamp
IS 9974	:	High pressure sodium vapor lamp
IS 10322	:	Luminaries for street lighting
CBIP Manual	:	Substation Equipment, Illumination and Layouts
IES (Illuminating Engineering Society of North America)	:	Application and Reference Volume
IEC 60598	:	Luminaries
CEA	:	CEA regulations and standard technical specification.

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All illumination systems shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The illumination systems shall be suitable for operation in a highly polluted environment.
- b. Lighting fixtures shall be suited for the following range of frequency and voltage variations:
 - i. Voltage Variation : $\pm 10\%$
 - ii. Frequency Variation : 50Hz (+)3% to (-)5%
 - iii. Combined Variation of Voltage & Frequency : 10% (absolute sum)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[2]	25.09.2014

- c. All emergency DC lighting systems shall be suited for voltage variation from -15% to + 10% of rated voltage.
- d. The design of the lighting systems shall be such that it shall ensure average lux levels specified for different areas.
- e. The illumination system shall comprise of the following:
 - i. Normal AC lighting
 - ii. Normal cum emergency lighting system
 - iii. 220V DC Emergency lighting system
 - iv. Maintenance 24V AC lighting system
 - v. Portable emergency lights with self contained battery packs.

1.4 Specific Requirements

1.4.1 Scope of work

The scope of work shall include design, preparation of Lighting design and manufacture, supply, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with Lighting system for following areas Listed below but not limited to the following:

[Note: With reference to particular package, scope of work shall be modified.]

a) TG Area:

- i) TG Platforms.
- ii) TG area Grade Levels Maintenance area.
- iii) Switchgear room and cable gallery.
- iv) All roads within battery limit.
- v) Perimeter and boundary illumination of the above premises.
- vi) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.

b) Boiler Area:

- i) Boiler Platforms
- ii) Boiler Grade Levels covering coal mill and Maintenance area.
- iii) ESP Platforms
- iv) ESP/FOPH switchgear room and cable gallery.
- v) FOPH area.
- vi) Transfer towers & Conveyor galleries.
- vii) All roads within battery limit.
- viii) Perimeter and boundary illumination of the above premises.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[3]	25.09.2014

- ix) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- c) Balance of plant Area:
 - i) Lighting system for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- d) CHP Area:
 - i) Switchgear rooms
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- e) AHP Area:
 - i) Switchgear rooms.
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard control room
 - ii) GIS building (if applicable)
 - iii) Transformer area
 - iv) All roads within battery limit.
 - v) Perimeter and boundary illumination of the above premises.
 - vi) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.

1.4.2 Illumination System Description

The plant illumination system shall comprise of the following categories:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[4]	25.09.2014

a. Normal AC lighting

In this system, the lighting circuits shall be fed by the 3 phase, 4 wire normal AC supply from the normal lighting distribution boards (LDB). All the lighting fixtures connected to this system shall be available as long as the 415V station / unit auxiliary service supply is available.

b. Normal cum emergency lighting system

Certain lighting fixtures considered essential shall be connected to this system. In this system the lighting circuits shall be fed from lighting distribution board connected to 415V Normal cum Emergency Switchgear. The lighting fixtures connected to this system shall be available whenever normal supply is available in the plant and also whenever DG set supplies the power to 415V Normal emergency switchgear.

These lighting fixtures will go off for a few seconds when normal supply fails but will be automatically restored when the emergency AC bus is re-energized by automatic transfer to standby DG supply.

[20% of the total fittings shall be fed from Emergency lighting for areas such as Switchgear room and control rooms etc.]

c. Emergency 220 V D.C. Lighting

The Emergency DC Lighting System shall be located strategically in critical operating areas and at emergency exits. Emergency DC lighting shall also be provided in the Control rooms, Switchgear/ MCC rooms and other strategically important areas. These fixtures shall be fed from respective Emergency DC Lighting Panels. The Emergency DC Lighting Panels (DC ELLP) shall be fed from 220V DC Distribution Boards (DCDB).

These lights shall remain normally OFF but on failure of AC supply these lights shall be automatically ON. Tube lights with Electronic choke suitable for 230 V, AC / DC operation or other Energy Efficient Lamps may be used for DC emergency lighting.

d. Maintenance 24 V AC Lighting System

For lighting facilities comprising portable hand lamps and/or connection of portable hand tools etc., required during the routine maintenance work, 24V single phase 3 pin sockets with switches shall be provided at selected points in the areas listed below. Such sockets for routine maintenance shall be clearly identified by colour coding in order to distinguish them from the normal 240V power outlets. Necessary outlets shall be made on the inside walls of the building near equipments.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[5]	25.09.2014

- i. Boiler area: Near inspection manholes on the boiler platforms and near boiler drum at different levels on all four sides.
- ii. TG building: Near HP & LP heaters, turbine flash tank, blow down tank, near condenser water box and near bus duct termination of generator end.
- iii. ESP columns: Near inspection manholes
- iv. Near de-aerator.
- v. Cable galleries.

Any other areas considered necessary identified during detailed engineering.

e. Portable Emergency Lights

This system shall be provided by portable self-contained battery / automatic charger / inverter fed compact fluorescent lamps in isolated buildings / areas where station D.C. supply is not available. These portable emergency light units shall be switched on automatically on loss of normal AC supply. *[Battery packs for portable emergency lights shall be rated for minimum 3 hours duty and the battery shall be of Ni-Cd.]*

f. Exit lights

Emergency escape signs shall be provided at the exit doors, escape routes, intersection corridors, at different floor levels/directions, windowless rooms, toilets, firefighting equipment, lifts, control rooms, switchgear rooms and the areas considered necessary by bidder. *[9W CFL]* lamp shall be used for exit lamps.

The contractor shall design emergency exit lighting system based on plant layouts and install escape lights at suitable locations considering the various escape routes. Emergency exit lights will be fed from normal-cum-emergency lighting panel, wherever available, *[and will be with in-built battery (Ni-Cd) back up of 3 hours operation.]*

1.4.3

Illumination Calculation

- a. Standard Lumen method shall be adopted for interior and exterior lighting in order to determine the number of lighting fixtures for obtaining the desired average level of illumination.
- b. The coefficient of utilization shall be considered to take care of Lumen loss due to:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[6]	25.09.2014

- i. Effect of room dimensions.
 - ii. Absorption of light in luminaries.
 - iii. Absorption of light at various room surfaces i.e. ceiling wall etc.
 - iv. Floor cavity, ceiling cavity.
 - v. Mounting height.
- c. Moreover a maintenance factor shall also be considered to account for the fall of illumination due to aging, pollution like dust deposits etc.
 - d. Voltage drop at the fixture terminals from the MLDB shall [not exceed 3%]. Circuit loading of each lighting Panel shall be done in such a way that almost balanced loading in all the phases i.e. R, Y and B is achieved. At least two sub circuits shall be used for illumination of a particular area. Sub circuit loading of each lighting panel shall be restricted to 2000 Watts.
 - e. Design of lighting system shall be such that the average lux level as specified is achieved. The Bidder shall submit illumination calculation/layout for the purchaser's review.

1.4.4 Lighting Distribution System

- a. Separate lighting transformers shall be provided inside the lighting distribution boards located at required location. Lighting distribution system shall be distinct and separate from the LV main distribution. Lighting transformers shall be encapsulated cast resin dry type.
- b. AC lighting panels shall have 240V single-phase, 2 wire incomer controlled by earth leakage circuit breaker and number of single phase outgoing circuits controlled by MCBs. The lights connected to a circuit or few circuits shall be 'ON' automatically through photocell for outdoor lighting. Provision shall be made for switching 'ON' the rest of the lights. Lighting fixtures in indoor areas shall be controlled from the respective lighting panels
- c. Normal 240 V AC Lighting System
For this system, lighting points shall be supplied at 240 V AC through 415 V, 3-phase, 4-wire, 50 Hz, LDB. The supply shall be derived from 415 V, 3-phase, 4-wire, 50 Hz switchgear through delta/star lighting transformer. The secondary of lighting transformer shall be connected to respective 415 V, 3-phase, 4-wire AC lighting distribution board (LDB). The LDBs shall be provided with number of outgoing circuits controlled by double pole MCBs to feed the lighting panels distributed in and around the plant. Different circuits shall be used from different source. The whole lighting network shall be balanced as far as possible.
- d. Normal/Emergency 240V AC System
For these systems, the distribution shall be by 415V, 3-phase, 4-wire, 50 Hz supply. This supply shall be derived from 415 V, 3-phase, 4-wire, 50

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[7]	25.09.2014

Hz normal emergency switchgear for NE & lighting through delta/star lighting transformer. The secondary of lighting transformer shall be connected to respective 415 V, 3-phase, 4-wire AC lighting distribution board (LDB). The LDBs shall be provided with number of outgoing circuits controlled by double pole MCBs to feed the lighting panels distributed in and around the plant.

e. Emergency 220 V DC Lighting System

The power supply shall be obtained from the nearest 220 V DC switchboard. DC lighting panel will have one (1) incomer controlled by double pole MCB, Outgoing circuits will be controlled by DP MCB. Upon failure of the normal-cum-emergency AC supply, emergency DC lighting fixtures will be made automatically ON. The change over in the reverse direction shall also be automatic.

f. Maintenance 24V AC Lighting System

24 V AC supply for maintenance purposes (for hand lamps and/or hand operated tools) shall be supplied from 24 V AC distribution panel, which receives 240 V power supply from 415 V/240V transformer modules of N/E switchgear. 24 V AC distribution panel consists of one incomer controlled by MCB, one 240/26.5 V dry type transformer of adequate rating and number of outgoing circuits controlled by MCB.

1.4.5 Illumination levels and choice of lighting fixtures

The area-wise distribution of average illumination levels and type of luminaries shall be as indicated below:

[Note: These are indicative only. However as per specific Existing project, Bidder may refer section I of this specification for exact details of type of fixtures.]

Table 2.0

Sl. No.	Area/Structure	Average Illumination Level in Lux	Type of Fixture	Type of Luminaries
A - TURBINE GENERATOR BUILDING				
1.1	General (auxiliary equipment areas)	200	Industrial well glass fixture, dust & jet proof, die cast aluminium body, stove enamel finish, vitreous enamel reflector integral mounted control gear/industrial bulk head with integral mounted control gear.	1x70 W/ 1x150 W HPSV lamp

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[8]	25.09.2014

Sl. No.	Area/Structure	Average Illumination Level in Lux	Type of Fixture	Type of Luminaries
1.2	Cable vault	100	Industrial type FTL with vitreous enamel reflector	Energy Efficient FTL
1.3	All switchgear room area (including off-site building control room)	250	Industrial type with vitreous enamel reflector	Energy Efficient FTL
1.4	TG Building operating floor	250	Industrial high bay with anodized aluminium reflector with all accessories including control gear	1x400 W Metal Halide lamp
1.5	Unit control room and Switchyard control room	400	Decorative recessed with wide angle mirror optic antiglare type	Energy Efficient FTL
1.6	Battery rooms	150	Corrosion-proof	Energy Efficient FTL
1.7	TG building ground, mezzanine floor and misc. floors	200	Industrial well glass with integral control gear	1x150 W/ 1x250W Metal Halide lamp
1.8	Air washer room and A/C plant room	200	Totally enclosed vapor proof with clear acrylic cover	Energy Efficient FTL
1.9	Unloading and maintenance bay	300	Industrial high bay with anodised aluminium reflector	250 W HPSV lamp (for mounting height > 9m)

Document Number	Rev No.	Description	Page No.	Date of Issue

Sl. No.	Area/Structure	Average Illumination Level in Lux	Type of Fixture	Type of Luminaries
1.1	Control room	400	Energy Efficient 2x40W FTL industrial type of vitreous enamel finish and with Electronic choke suitable for 220V DC operation	CFL lamp
1.2	Other areas	250	Energy Efficient 2x40W FTL industrial type of vitreous enamel finish and with Electronic choke suitable for 220V DC operation	CFL lamp

1.4.6 Area wise distribution of Lighting system in plant

Area wise lighting distribution shall be as below:

Table: 3.0

Area/building	Percentage Distribution of Lighting		
	Normal	Normal & Emergency	220V DC
Turbine Generator Building (all the bays)	80%	20%	10%
Control rooms	80%	20%	10%
Boiler Area (Grade level & Platforms)	80%	20%	5%
Service building	90%	10%	5%
Various pump houses and electrical switchgear rooms such as AHP, CHP, FOPH switchgear room, etc.	90%	10%	5%
Electro static precipitator	90%	10%	5%
Switchyard and Transformer yard	80%	20%	5%

1.4.7 Lighting System Design

The lighting system design shall comply with the acceptable norms and the best engineering practices. The system design shall consider principles of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[12]	25.09.2014

lighting specified in following paragraph. The lighting layout shall be designed to provide uniform illumination with minimum glare. The layout design shall meet all the statutory requirement, local rules etc.

a. Indoor Lighting

The recommended values of illumination level for various areas in the plant are indicated in the table above. Lighting layouts shall be designed such that the ratio of minimum to average illumination shall not be less than [0.6]. Following factors shall be considered while arriving at the utilization factor to determine the number of fixtures for each area/buildings in the plant.

i. Maintenance Factor:

- Air conditioned clean interiors like office rooms, Laboratories, Auditoriums : 0.8
- Air conditioned clean interiors like office rooms, Laboratories, Auditoriums : 0.8
- Industrial areas with normal interiors such as workshops, stores : 0.7
- Industrial areas with dusty interiors : 0.6
- Industrial areas with very dusty interiors such a crusher house and junction towers : 0.5

ii. Reflection factor for wall/ceiling

- White and very light colors : 0.7
- Light colors : 0.5
- Middle tints : 0.3
- Dark colors : 0.1

iii. The working plane shall be considered at 0.85 m from the floor level.

iv. The value of the ratio of spacing (S) to mounting height (H) shall be commensurate with the type of fittings selected and uniformity of illumination. The suspension height for suspended fixtures shall not exceed 1 meter.

b. Outdoor Lighting

- i) The recommended illumination levels for outdoor areas are indicated in the above table.
- ii) Mounting height, spacing of flood lights shall be based on lamp wattage, uniformity of illumination and vertical angles. Ratio of minimum to average illumination shall not be less than 0.3 and for minimum to maximum shall not be less than 0.05.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[13]	25.09.2014

- iii) Maintenance factor shall be generally 0.6 under average conditions.
- iv) Flood lights for area lighting shall be mounted on building structures. For outdoor lighting i.e. around the power plant building and transformer yard provision to be made with 400W outdoor type lamps mounted on wall/structures.
- v) Automatic switching ON/OFF shall be shall be provided through timers/photo cells.
- vi) For road illumination inside the boundary limit lighting poles shall be provided and the distance between the poles shall not exceed 30m.
- vii) Aviation obstruction lights shall be provided on tall installations (Chimney, Cooling Towers etc) as per Airports Authority and international standards. Aviation warning lights shall be high intensity type-A flashing LED type with varying intensity for day and night.
- viii) In an area, the lighting fixtures shall be arranged in different phase / LPs such that even in case one lighting panel is faulty complete lighting is not affected. In any location the lighting shall be arranged from two phases.
- c. The circuit loading on each circuit shall be restricted to 80% of the MCB rating.
- d. The voltage drop from LDB and any fixture shall not exceed 3%.
- e. All lighting design calculations, layouts, conduit wiring diagrams, LDBs and LPs drawings and technical data sheets etc shall be furnished for Owner/ Owner's consultant's approval.

1.4.8 Lighting system equipment

- a. Lighting Distribution Boards (LDB) & Lighting Panels (LP)
 - i. The Lighting Distribution board shall be fed through 415V/433V lighting transformers with off circuit taps $\pm 5\%$ in steps of 2.5%. The lighting transformer shall be cast resin dry type , vector group of [Dy1], class F insulation with temperature rise limited to class F and shall be housed in a suitable enclosure. In general, the transformers shall conform to the specification covered under 'Service transformers. The lighting distribution boards shall consist of MCCB incomer and required number of double pole MCB controlled out going feeders to LPs. The LDB shall be designed for the required short circuit level of [20] kA. All the distribution boards shall be sheet steel clad, dust and vermin proof, cubicle type with degree of protection conforming to IP-52. Outdoor panels shall be weather proof type with IPW-55 protection. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[14]	25.09.2014

thickness of sheet steel enclosures shall be CRCA, 2 mm minimum for load bearing and 1.6 mm for other members.

- ii. Number of outgoing feeders in each LDB shall be provided as per requirement including the minimum 3 nos spare feeders for "Purchaser use". Each outgoing MCB in LDB's shall be of 15 A, but load to be limited to 2 kW or maximum 10 nos. fittings to be connected to one MCB
- iii. Individual control in office buildings shall be through single pole flush type switches/MCBs. In those areas where group controls are required, rotary switches shall be provided
- iv. External area lighting shall be fed from separate boards located at suitable places. Automatic switching ON/OFF of these circuits shall be done through timers/photo cell.
- v. In high bays, walkway shall be provided for maintaining light fittings. At other places suitable ladder / platform / approach shall be provided for maintaining / replacement of light fittings.
- vi. Each of the LDBs shall be provided with voltmeter and ammeter along with selector switches, "SUPPLY ON" indicating lamps, etc. The switch boxes, receptacle boxes etc. shall be made up of 18 SWG sheet steel.
- vii. Two ground pads with bolts and nuts shall be provided on each board for connection to 50x6/25x3 mm GS flat.

b. Lighting Fixtures and Lamps

- i) Fluorescent fixtures with electronic ballast shall be generally provided for a room height upto 5m. Type of fixture shall be industrial type with gasket, clear acrylic cover and enamelled reflector or decorative type to suit the aesthetics. For areas with false ceiling, recessed mounted decorative fixtures with mirror optic louvres shall be used. In control room / computer rooms, decorative mirror optic fluorescent light fittings with antiglare features shall be provided. The surface finish shall be smooth, unobtrusive and scratch resistant.
- ii) Reflector shall be of sheet steel or aluminium, minimum 20 SWG thick and securely fixed by fastening device of captive type.
- iii) Fixture shall be suitable for 19 mm conduit entry and 16 SWG GI earth wire connection.
- iv) Fixture shall be furnished complete with lamps and integrally mounted accessories. These shall include holders, ballast, capacitor, starter, ignitors (separate type) etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[15]	25.09.2014

- v) For corrosive areas, corrosion proof lighting fixture shall be provided. For hazardous areas, light fittings, conduits, junction boxes etc. shall have to meet the corresponding area classification requirement.
- vi) Medium bay or high bay type of lighting fixtures with HPMV/HPSV lamps shall be used depending on the mounting heights for indoor areas having room height more than 5m. Medium/ High bay fixtures shall be provided with vibration damper wherever required.
- vii) For areas like boiler and outdoor areas such as roads, street, transformer areas and open yards, weatherproof HPSV flood/ street lighting fixtures shall be used. For areas like boiler platforms, weatherproof well glass type HPSV fixtures with wire guards shall be used.
- viii) All type of fluorescent lamps including Compact Fluorescent Lamp (CFL) shall be bi-pin rotary type and either cool daylight or white.
- ix) Mercury / Sodium vapour lamp shall be colour corrected type with screwed cap.
- x) Lamps shall be suitable for use in position and capable of withstanding small vibrations.
- xi) Ballasts shall be of heavy duty, low loss and polyester-filled type with copper winding.
- xii) Ballasts for Mercury / Sodium vapour lamps shall be provided with suitable tappings to set the voltage within range specified.
- xiii) Ballasts shall be free from hum. Ballasts which produce humming sound shall be replaced, free of cost.
- xiv) In multi-lamp fixture, each lamp shall be provided with individual ballast.

c. Switches, Receptacles

- i. In the plant areas, the lighting circuits shall be controlled directly from the MCBs in the lighting panels. Wherever the lighting panel is not in the same area, separate switches shall be provided. For cabins, rooms, etc., separate switches shall be provided for each point. Similarly for entrances, building periphery lighting separate switches shall be provided
- ii. 240V, 50 Hz, 3 pin Power Receptacles (5A, 15A) shall be provided in all building/areas of the plant. Inside a building, receptacles shall be provided at interval of 30m or part thereof for hand tools, water coolers, exhaust fans etc. Inside each cabins at

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[16]	25.09.2014

least two receptacles shall be provided and the same shall be indoor/outdoor/flameproof as per the location. Minimum 2 nos of 5A and 1 no 15A receptacles shall be provided in each room. Receptacles shall be heavy duty, complete with individual plug and switch as described below:

Table: 4.0

S.No.	Type	Description
1	RA	5A, 240V, 2 Pole, 3 Pin with third pin earthed - Suitable for flush mounting in office areas and control room. The switch shall also be flush mounting piano type.
2	RB	15A, 240V, 2 Pole, 3 Pin with third pin earthed - Wall/column mounted, metal clad gasketed construction, suitable for 19 mm conduit entry, screwed metal cover tied with metal chain, weatherproof construction suitable for indoor/outdoor installation. This shall be provided at an interval of 30m, or minimum one in each room.
3	RC	63A, 415V, 3 Phase, 5 pin interlocked plug and switch with fifth pin earthed. Wall/column mounted, metal clad gasketed construction weather proof, suitable for loop in/ loop out connection of 4 Core 35 sq.mm AYWY cable. These receptacles shall be provided at an interval of 50m throughout the Plant Area.
4	RD	100A, 415V, 3 phase, 5 Pin interlocked plug and switch with fifth pin earthed Wall/column mounted metal clad gasketed construction weather proof, suitable for loop in/ loop out connection of 3.5 Core, 95 sq.mm AYWY cable.

d. Cables and Wiring

- i. Wiring from lighting DBs/panels to individual fixtures, plug points, fans, etc. shall be of single core, 2.5sq.mm, 1100 V grade PVC stranded copper conductors through surface mounted or concealed medium duty GI conduits confirming to IS 1239 with earth wire. The wires in the conduits shall not exceed 60% of the conduit area.
- ii. 1100V grade stranded copper conductor, PVC insulated, colour coded, wires laid in GI conduits shall be used for lighting in non-hazardous area. In the hazardous area, outdoor areas like transformer yard and road lighting, cabling shall be adopted. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[17]	25.09.2014

specification of cable shall conform to the details indicated in "Cabling System" section.

- iii. Minimum size of wires in case of conduit wiring shall be 2.5sq.mm copper in case of lighting and 4sq.mm copper in case of receptacle wiring
- iv. Wires of different phases shall be run in separate conduits. However, wires of same phase but having different circuit nos. can be run in same conduit. Wires of lighting and power receptacles shall be carried out in separate conduits and on separate circuits. Wires of AC and DC lighting system shall be carried out in separate conduits
- v. For outdoor lighting, the cable shall be buried at a minimum depth of 750 mm from ground level or run in cable trays. The buried cables shall have suitable bedding, protective covers and markers
- vi. Material used for saddles, clamps, JBs, etc. shall be galvanized
- vii. Office buildings, laboratory buildings shall have concealed wiring with 2.5sq.mm wires using PVC conduits. In heat zones, i.e. in the areas where ambient temperature is 600 C and above, heat resistant control cables shall be used in hot dip galvanised rigid steel surface mounted conduits

e. Fans and Regulators

- i. The fans shall have three well balanced blades, double ball bearings and shall be reasonably free from noise. Fan motor shall be totally enclosed type with copper winding and class-E insulation. Sweep shall be given as 1200 /1400 mm.
- ii. Regulators shall have minimum five steps. Electronic Regulators with smooth control shall be provided.

f. Flame-Proof Equipment

- i. The enclosure of all flameproof equipment for use in hazardous areas where gases/vapors of Group I, IIA, IIB are present, shall be of cast iron/cast aluminum, stove enamel finished. Chemical corrosion resistant epoxy finish shall be provided in corrosive areas. The construction shall comply with relevant applicable standards
- ii. If the enclosures are additionally required to be weather proof, neoprene gaskets shall be provided to make the enclosure dust and weather proof providing a degree of protection of IPW 55.
- iii. All ferrous parts, exposed to atmosphere shall be suitably plated/galvanized

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[18]	25.09.2014

- iv. All internal wiring shall be connected to terminal blocks provided in terminal enclosure on incoming side.
- v. Flameproof cable gland entries shall be provided suitable for the cable sizes. The number of required cable entries for junction/terminal boxes as required for branching, terminating of cables for lighting distribution shall be provided. All unused cable entries shall be closed by flameproof plugs.
- vi. Flameproof receptacle unit (socket with associated switch/MCB and plug) shall have interlocking feature such that plug cannot be inserted or taken out with switch/MCB in "ON" position.
- vii. Adequate mounting lugs with necessary hardware shall be provided for mounting the equipment on wall/structure.
- viii. These enclosures shall have inscription warning against opening the enclosure unless the circuit is isolated. Equipment rating and ON/OFF positions of switches/MCBs shall also be designated.
- ix. The BIDDER shall indicate that the enclosures have been tested and certified by relevant statutory authorities for use in hazardous areas.

g. Lighting poles and towers

- i. Lighting poles for street lights and flood lights shall be of swaged and welded steel, pole of height 9M/11M and shall conform to relevant standard. Poles shall be hot dip galvanized internally and externally after fabrication as per IS 2629 / IS 2633 / IS 4759 standards. The Poles shall be designed to withstand the maximum wind speed as per IS 875. The steel sheet used to manufacture steel poles shall be of minimum thickness of 3 mm and shall conform to relevant standard . Junction boxes shall be provided with weather proof flush doors and locking facility. Bidder shall design and furnish the foundation drawings for the poles to withstand basic wind speed of minimum [50]meter/sec.
- ii. The supply of poles/Towers shall be complete with base plate, foundation bolts, hot dip galvanized brackets / necessary pipe reducer for fixing the fitting and also include the necessary associated pole mounted junction boxes.
- iii. Towers for mounting flood lights shall be e of continuously tapered poly gonol cross section and shall be supplied with all acesssories. Steel structure for towers shall be made of hot dip galvanized steel. A steel ladder and platform at the top shall be provided. The length of each step of the ladder shall be at least

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[19]	25.09.2014

300 mm and spacing between two adjacent steps not more than 300 mm. The structure shall be suitable for mounting the required number of flood lights, weights of maintenance crew and specified wind pressure. The factor of safety shall be [2] for each part and section. The Contractor's structural design drawings shall be approved by the Purchaser before fabrication.

1.4.9 Name Plate

Name plates shall be furnished for identification of devices and circuits. All switches, controls and indications shall be permanently and legibly marked in English regarding the functions.

1.4.10 Painting

All surfaces shall be sand blasted, pickled and grounded as required to produce a smooth, clean surface free of scale, grease and rust.

After cleaning, the surfaces shall be given a phosphate coating followed by 2 coats of high quality primer and stoved after each coat.

The equipment shall be finished in approved color shade by owner with two coats of epoxy based powder coated paint. The coating shall be done electro statically followed by stoving.

Sufficient quantity of touch-up paint shall be furnished for application at site.

1.5 Tests

I) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant /purchaser or his representative.

Tests on Lighting Distribution Boards / Panels shall include:

- a. Wiring continuity tests.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E9	[20]	25.09.2014

- b. High voltage and insulation tests.
- c. Operational tests.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6

Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *Lighting panels & distribution boards.*
- b) *Receptacles & Junction boxes.*
- c) *Street light poles & towers.*
- d) *Lighting fixture complete with lamps and accessories.*
- e) *Non-integral/separate type control gear box for lighting fixtures, as applicable.*
- f) *Lux level calculations for each area.*
- g) *Data sheets for lighting fixture, lamps, accessories with light distribution curves, co-efficient of utilization charts etc. Type and routine test certificates of transformer and cables.*
- h) *Control schematic and wiring diagram of 415V AC/220V DC lighting panel with automatic changeover from AC to DC and vice-versa, 415V normal AC Street/area lighting panel with automatic ON/OFF feature.*
- i) *Technical leaflets and data sheet on each piece of equipment/ device such as MCB, switch, fuse, receptacle etc. Type and routine test certificates of transformer and cables.*
- j) *QAP and relevant test certificates*

- k) Lighting layouts showing the disposition of fixtures, lighting panels/boards, circuit distributions, conduit & wire routing.
- l) Key Single Line Diagram for lighting distribution, board wise single line diagram with feeder loading, cable schedule and interconnection chart, design calculation for lighting.]

1.7

Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

S. No.	DESCRIPTION	UNIT	DATA
1.0	GENERAL		
1.1	Normal Supply Voltage, Phase and Frequency	AC DC	240V, 1Ph, 50Hz 220V DC
1.2	Variation in Supply		
	a) Voltage	%	±10
	b) Frequency	%	±5
	c) Combined voltage & frequency	%	10

R&M CONTRACTORS**

**ELECTRICAL BALANCE OF PLANT (eBOP)
(PACKAGE NUMBER: R&M-SP-06)**

VOLUME-II

SECTION-II, PART-B, ANNEXURE-E10

**TECHNICAL SPECIFICATION FOR CABLE CARRIER
SYSTEM**

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E10**1.0 CABLE CARRIER SYSTEM****1.1 General**

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Cable Carrier system complete with all accessories for efficient and trouble free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS 800	Code of Practice for structural Steel
IS 1646	Code of Practice for Fire Safety of buildings
IS2667	Fittings for Rigid steel Conduits
IS 3419	Fittings for Rigid Non – Metallic Conduits
IS 3837	Accessories for Rigid Steel Conduits
IS 4649	Adaptors for Flexible Steel Conduits
IS 5216	Guide for Safety Procedures and Practices in electrical Work

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E10	[1]	25.09.2014

1.3 Design Criteria

- a) Cable and cable trays shall be installed in an ambient temperature of 50 °C and relative humidity of 95%.
- b) The cable carrier system shall be designed considering the following:
 1. Facility for easy laying of cables.
 2. Access to maintenance.
 3. Neat and aesthetic appearance.
 4. Safety of equipment & personnel.
 5. Ground water seepage.
- c) Cables shall be laid in prefabricated ladder/perforated type trays and in conduits. Direct burial of cable shall be mostly avoided.
- d) Upper cable trays and all vertical cable trays shall be provided with tray covers.
- e) Cable filling in the trays or racks shall not exceed 80%. Conduits if used, the wires in the conduits shall not exceed 40% of the conduit area.
- f) Different voltage grade cables shall be laid in separate trays when trays are arranged in tiers. H.V cables shall be laid in top trays and cables of subsequent voltage grade in lower tier of trays. Instrumentation cables shall be laid at bottom most tray.
- g) At least 300mm clearance shall be provided between HV and LV cables & LV and control/Instrumentation cables.
- h) Support system for cables shall be prefabricated type.
- i) Single core cables shall be laid in trefoil touching formation. Trefoil clamp shall be provided in a staggered manner.
- j) 1100V grade power cables of [120] mm² size and above shall normally be laid in single layer in trays/on racks.
- k) 1100V grade power cables below [120] mm² may be run in double layers in case of space restrictions.
- l) Control and instrumentation cables can be laid up to a maximum of three layers in each tray/rack.

1.4 Specific Requirements

1.4.1 Scope of work:

The scope of work shall include Design, Preparation of Cable Tray, Trench/Duct bank/Conduit Layout, supply of Cable tray and its Accessories, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with the Cable Carrier System

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E10	[2]	25.09.2014

for following package. The below list indicates area where cable carrier system to be provided but not limited to:

[Note: With reference to particular package, scope of work shall be modified.]

a) TG Area:

- i) TG Platforms.
- ii) TG area Grade Levels Maintenance area.
- iii) Preparation of Cable schedules and Inter Connection schedules/Diagram.
- iv) Laying and Termination of power & control cables for all the equipments of TG package.

b) Boiler Area:

- i) Boiler Platforms
- ii) Boiler Grade Levels covering coal mill and Maintenance area.
- iii) ESP Platforms
- iv) ESP/FOPH switchgear room.
- v) FOPH area.
- vi) Preparation of Cable schedules and Inter Connection schedules/Diagram.
- vii) Laying and Termination of power & control cables for all the equipments of Boiler package.

c) Balance of Plant Area:

- i) Cable Carrier System for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, Transformer area, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
- ii) Laying and Termination of power & control cables for all the equipments of BOP package.

d) CHP Area:

- i) CHP Switchgear room
- ii) Conveyor.
- iii) Crusher House
- iv) Stacker and Reclaimer
- v) Any other area covered in this package.
- vi) Laying and Termination of power & control cables for all the equipments of CHP package.

e) AHP Area:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E10	[3]	25.09.2014

- i) AHP Switchgear room.
- ii) Silo Area.
- iii) Any other area covered in this package.
- iv) Laying and Termination of power & control cables for all the equipments of AHP package.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard
 - ii) Transformer yard
 - iii) Inter plant cabling.
 - iv) Any other area covered in this package.
 - v) Laying and Termination of power & control cables for all the equipments of eBOP package.
- g) All civil and structural works necessary for successful installation and commercial operation of all electrical equipment to be erected under this specification. Supply of cement, sand, stone etc. required for the execution of the contract shall be the responsibility of the Bidder.
- h) All other ancillary works in connection with the items of work described above which are not specifically mentioned but are necessary to complete the work.
- i) For Terminal Points and Exclusions of Cable Carrier system and Specific scope of work Bidder may refer section I of this specification.

1.4.2 General Installation Requirements:

- a) Cable trays shall be fabricated from 14 gauge mild steel sheets. Cable trays shall be of hot dip galvanized Steel of ladder/perforated type, complete with all necessary coupler plates, elbows, tees, bends, reducers, stiffeners and other accessories and hardware as detailed in the relevant drawings to be submitted by Bidder. All hardware (i.e. bolts, nuts, screws, washers, etc.) shall be hot dip galvanized.
- b) Constructional details, supporting arrangement and installation details for cable trays shall be furnished by Bidder.
- c) Each 2.5 meter section of all types of cable trays and all elbows, tees, crosses, etc. shall be provided with two side coupler plates and associated bolts, nuts and washers.
- d) Cable tray covers shall be fabricated from 16 gauge MS sheets. Cable tray covers shall be hot dip galvanized and same shall be provided for all outdoor cable trays and vertical raceways/trays. Covers for vertical raceways shall be in individual, easily removable sections to facilitate cable maintenance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E10	[4]	25.09.2014

- e) Cable Tray of Standard width of 600mm shall be followed. However, trays with 450, and 300, 150 mm width may be used in some places considering the requirement and space restrictions. For instrumentation and control purpose, some perforated type cable trays of width 150 mm may be used particularly in Boiler Platform area, and 600, 450, 300 mm perforated trays may be used depending on site requirement.
- f) Cable trays shall be ladder type with maximum rung spacing 250 mm depth 100 mm and rung width not less than 50 mm.
- g) Cable trays in areas subjected to excessive coal dust, or mechanical damage shall have hot-dip galvanized sheet metal tray cover installed on front tray in vertical run and inverted 'V' type on upper tray in horizontal run. Where covers are used on trays containing power cables, consideration should be given to ventilation requirements. Areas where corrosive chemicals are likely to be handled, cable tray and covers shall be epoxy painted.
- h) Suitable embedded steel inserts shall be provided on wall/floor/ ceiling surfaces for welding of cable tray bracket in order to make the cable tray system withstand horizontal / vertical accelerations due to seismic forces for indoor trays and also wind load for outdoor trays such as on Boiler platforms in addition to normal tray cable loadings.
- i) Cable installation work shall mean erection of cable trays/racks, supports, hangers, junction boxes, conduits, laying of cables either in ground or on trays inside trenches tunnels/overhead trays in conduits etc. dressing and clamping, jointing and termination inclusive of supply of necessary jointing/termination kits, lugs, glands, ferrules, tapes etc. and other accessories, grounding of cable armor. In case of direct laying in ground, all excavation work, necessary back-filling, supply of bricks and protective concrete slabs, removal of excess earth shall be part of the installation work.
- j) Erection of cabling work shall be executed keeping in view all necessities and requirements of fire fighting codes for Generating Stations having an adverse industrial environment.

1.4.3 Cable Routing/Laying

- a) Cables shall generally be laid on ladder type cable trays either in trenches or overhead supported from building steel/structures except in some

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E10	[5]	25.09.2014

cases cables may have to be laid underground and for short runs in conduits for protection while crossing roads and other facilities.

- b) For interplant connections, the cables may be routed through an overhead cable bridge or cable trenches/tunnels selection being dependent on site constraints.
- c) For underground crossing of railways, roads etc. hume pipes shall be used and shall be laid at a depth of minimum 1000 mm such that cables shall not be damaged.
- d) In boiler area, trench shall be avoided as far as practicable. The cable racks shall be supported from Boiler structure in vertical configuration with suitable cover to avoid deposition of coal dust as far as practicable.
- e) Different voltage grade cables shall be laid in separate trays when trays are arranged in tiers. Power cables shall be on top trays and Control/Instrumentation cables on bottom trays, and it is recommended that trays for cables of different voltage levels be stacked in descending order with higher voltage level above.
- f) Cables for redundant equipment/system shall be run in separate trays in separate route.
- g) Cables from two different services viz. supply from station board and supply from unit board shall be fully segregated to prevent simultaneous damage due to fire in one of the services.
- h) Low level signal cables and other special Instrumentation and Control cables shall run in separate trays. In general, a minimum of 1500 mm clearance shall be maintained between these cables and noise generating equipment (large motors, generators, transformers etc.).
- i) The cable spreaders of each unit shall be compartmentalized by provision of fire proof partition wall and fire proof doors.
- j) The floor of the cable spreader rooms shall have to be made water proof so that water does not percolate to lower levels in the event of fire fighting operations. Adequate arrangement for efficient drainage of water shall be provided. The cable raceways should also be suitably planned to avoid water entry through this place.
- k) Cables shall generally be laid on cable trays either in concrete trenches or overhead supported from building steel/structures. Cables shall be run in concrete trenches in those electrical rooms at ground level, which are without any spreader room below. In mechanical equipment areas (Indoor), overhead cable trays shall generally be used.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E10	[6]	25.09.2014

- l) For inter plant connections, the cables shall be routed through an overhead cable bridge pipe cum Cable Bridge. For isolated but long outdoor cable route with very few cables of 3/4 nos., the cables may be directly buried with prior permission from the purchaser.

1.4.4 Installation of Cables

- a) The Bidder shall install, terminate and connect up all cables and conduits with supporting arrangements as per drawings, cable schedules and interconnection chart/drawings.
- b) The HV power cables of 6.6kV shall be laid in trays or racks as follows:
- In single layer only.
 - 3 core cables to be laid in touching formation.
 - Cables in trefoil groups of the same circuit shall be laid as indicated below so as to ensure balanced current distribution:

Y Y Y Y

R B B R R B B R and so on.

- c) 1100V grade power cables shall be laid in single layer in trays depends on size of cables. Cable of up to 120 sqmm shall be laid in two layers. Beyond this size single layer will be followed.
- d) Control and Instrumentation cables can be laid up to a maximum of three layers in each tray.
- e) The trays shall be run with a vertical spacing of 300 mm for overhead cable trays as well as inside cable trenches. A minimum of 225 mm clearance shall be provided between the top of tray and beams, cold piping, 500 mm clearance for hot piping/object to facilitate installation of cables in tray.
- f) Adequate pull boxes shall be provided in conduit run to facilitate cable pulling in long runs and also to ensure that there shall not be more than 2 nos. 90 Deg. Bends between pull points.
- g) Cable tray/conduit system shall be installed to accommodate cable manufacturer's recommended maximum pulling tension, minimum bending radius and no. of bends.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E10	[7]	25.09.2014

- h) All openings in the floor and wall for cable access shall be sealed after installation of the cable system with non-inflammable materials, as follows :
- Fire stop/Penetration seal shall be installed in the cable spreaders and cable raceways.
 - Similarly in the trenches fire stop/penetration seals shall be provided at suitable interval to avoid spread of fire.
 - For all HV, LV, Relay and Control panels, Control desk, instrumentation panels, battery charger, D.C. Dist. boards and other miscellaneous panels, fire-stops should be provided below base plate.
- i) All floor/wall openings for cable entry to the electrical equipment and accessories shall be sealed with non-inflammable materials, after completion of cable installation. Thickness of such materials shall be equal to the thickness of floor/wall unless specified otherwise.
- j) The portion of galvanized steel, which, if required, undergoes any welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.

1.4.5 Cable Termination and Joints (if applicable and not covered in cable specification)

- a) The Bidder shall supply cable termination and jointing kits in requisite quantity for HV. Power Cables, LV. Power, Control Cables, etc. along with all accessories & consumables required for making termination and joints complete . All the materials and components of the termination/joints shall be suitable and compatible with the type of cables for which the terminals/joints are intended.
- b) The straight through joints of HV. cables shall be heat shrinkable and pre moulded push on type. The end termination kits for HV. cables shall be of {Raychem/3M/Elastimold} type. Cable joint or end terminations on Electrical equipment shall be suitable for Indoor & Outdoor use, as the case may be.
- c) Glands and lugs required for termination of HV, LV. shall be supplied by the Bidder in required quantity.
- d) Cable glands shall be tinned brass gland, double compression type complete with necessary armour clamp and tapered washer etc. Cable glands shall match with the sizes of different HV/LV/Control cables.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E10	[8]	25.09.2014

- e) Cable lugs shall be suitable for termination of different cross-sections of L.V./Control cables and shall be of following types:
 - i. Aluminium tubular terminal end for solderless crimping to aluminium conductors.
 - ii. Copper tubular terminal end for solderless crimping to copper conductors.
 - iii. Solderless crimping of terminals shall be done by using corrosion inhibiting compound. The cable lugs shall suit the type of terminals provided on the equipment. Lugs for control/instrumentation cables shall be PVC insulated/sleeved type.
 - iv. Cable lugs for control cable termination shall be insulated. These lugs shall be pin type/flat type/ring type/U type to suit the terminals provided in the panels.
 - v. The terminations shall with tinned copper only.
 - vi. For mill area, the cable shall be routed through GI pipes embedded in Ground.
 - vii. In heat zone areas as far as possible the cables shall be taken away from the area to avoid heat. If cabling in the heat zones can not be avoided, the cables shall be terminated in junction box of IP 67 protection class away from the heat zones and small length of cables may be laid from junction box to the respective equipment to facilitate easier replacement in case of fire. Bunching of cables in the heat zones and boiler areas shall be avoided and laid in separate groups.

1.4.6 Identification

- a) The complete cabling system shall be properly identified. Methods for identification of cabling system will be furnished to the Bidder and the Bidder shall strictly adhere to the said methods.
- b) Each cable and conduit run shall be tagged with numbers that appear in the cable and conduit schedule.
- c) Location of cables laid directly underground shall be clearly indicated with cable marker made of galvanized iron plate, projected above ground level.
- d) Cable tags shall be provided on all cables at each end (just before entering the equipment enclosure), on both sides of a wall or floor crossing, on each duct/conduit entry, at each bend and at every thirty (30) meters in cable tray/trench runs. Cable tags shall also be provided

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E10	[9]	25.09.2014

inside the switchgear, MCC, control & relay panels etc. wherever required for cable identification, such as where a number of cables enter together through a gland plate.

1.5 Tests

I) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant /purchaser or his representative.

- a) Checking of continuity / phasing and IR values for all the cables before and after HV test
- b) Checking of continuity / phasing and IR values for all the cables before and after HV test.
- c) HV test and measurement of leakage current after termination of cable kits (for HT cables).
- d) Checking of earth continuity for armour.
- e) Check for mechanical protection of cables.
- f) Check for identification (tag number system) distance placement of cable marker, cable joint etc. as per the cable layout drawing.
- g) Check earthing of cable structures.
- h) Check safe head room in gallery area
- i) Check clearance from ventilation duct and light fittings for cable structures.
- j) Check proper fixing of cable structures.
- k) Check for proper drainage and removal of water (if any).

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors –Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E10	[10]	25.09.2014

obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *[General arrangement drawing Cable Tray]*
- b) *[Cable Tray Accessories like Tee, Cross, Bends, Coupler, Reducer etc]*
- c) *[Cable Tray support materials]*
- d) *[Technical Data sheets for cable carrier system].*

1.7 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

SL NO.	DESCRIPTION	UNIT	DATA
1.	Make/Manufacturer		[By bidder]
2.	Size of Tray	mm	[600/450/300/150]
3.	Material		Galvanised Steel
4.	Application		[As per project requirement]

ANNEXURES-E11

1.0 EARTHING AND LIGHTNING PROTECTION SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Earthing and Lightning Protection System complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS:2309	Code of Practice for the protection of building and allied structures against lightning.
IS:2629	Recommended practice for hot dip galvanizing of iron & steel
IS:2633	Method for testing uniformity of coating on zinc coated articles.
IS:3043	Code of practice for Earthing
IS:9537	Conduits for electrical installation.
IEEE:80	IEEE guide for safety in AC substation grounding
IEEE:142	Grounding of Industrial & commercial power systems
CEA	CEA Regulations and standard technical specification for main plant package.

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[1]	25.09.2014

1.3 Design Criteria

- a) Earthing system design shall consist of earth grids and electrodes buried in soil in the whole plant area, embedded in concrete inside all the buildings to which all the electrical equipment, metallic structures are connected to have earth continuity for safety reasons.
- b) The main objectives of earthing system is to:
 1. Provide safety to personnel from contact of dangerous potential caused by ground fault.
 2. Ensure sufficient grounding current for effective relaying.
 3. Stabilize circuit potential with respect to ground.
- c) The earthing conductor shall be designed for fault current of [50 kA] for duration of 1 second.
- d) It is the responsibility of the Bidder to undertake the soil resistivity measurements at site and select suitable size of conductor based on the soil resistivity.
- e) Ground conductor shall be of galvanized steel for above ground and mild steel for embedded and below ground earthing.
- f) Main earth grid conductor shall be mild steel (MS) of [40] mm dia.
- g) Suitable corrosion allowance shall be considered over ground conductor size depends upon soil resistivity.
- h) The main purposes of lightning protection system are to :
 1. Provide protection to structures from lightning strokes.
 2. Provide a low resistance-conducting path to lightning discharge.
 3. Lightning protection shall be provided as per IS: 2309 for Boiler area and other tall structures within the battery limit.

1.4 Specific requirements

1.4.1 Scope of Work

The scope of work shall include Design, Preparation of Earthing and Lightning Layout, supply, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with the safety earthing and Lightning Protection system for following areas Listed below but not limited to the following:

[Note: With reference to particular package, scope of work shall be modified.]

- a) TG Area:
 - i) TG Platforms.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[2]	25.09.2014

- ii) TG area Grade Levels Maintenance area.
- iii) All equipments, structures etc of TG package.
- iv) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- b) Boiler Area:
 - i) Boiler Platforms
 - ii) Boiler Grade Levels covering coal mill and Maintenance area.
 - iii) ESP Platforms
 - iv) ESP/FOPH switchgear room.
 - v) FOPH area.
 - vi) All equipments, structures etc of Boiler package.
 - vii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- c) Balance of plant Area:
 - i) Earthing and lightning protection system for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, Transformer area, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
 - ii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- d) CHP Area:
 - i) Switchgear rooms
 - ii) All equipments, structures etc of Boiler package.
 - iii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- e) AHP Area:
 - i) Switchgear rooms
 - ii) All equipments, structures etc of Boiler package.
 - iii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard, Transformer yard and BTG area are provided with earth mat of [40] mm dia MS Rod conductor buried below 600mm from ground level. Areas like AHP, CHP, Boiler and TG, and all other

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[3]	25.09.2014

BOP area below grounding system are covered in this eBOP package and above ground earthing for AHP, CHP, Boiler, TG and Mechanical BOP are covered in respective package itself. System Neutrals are earthed through Treated Earth Pit. All areas of power plant are interconnected to form an integrated single earthing system. Lightning system for above ground are covered in respective packages and below ground is covered in this eBOP package in same way as earthing system.

1.4.2 Earthing system

- a) Earthing system shall be designed in accordance with IS 3043 and Indian Electricity Rules and Acts.
- b) Fault current for the earthing system shall be designed for [50] KA for duration of 1 sec.
- c) All electrical equipment, non-current carrying metal parts, structures, building steel, lightning protection system, transformer neutrals shall be connected to station ground grid.
- d) Treated earth pits including riser shall be provided for transformer neutral earthing.
- e) Connection between the equipment earth lead and the grid conductor shall be welded. For rust protection, the welds shall be treated with zinc chromate primer and coated with zinc rich paint.
- f) Entire erection of grounding work shall be carried out in such a way as to be capable of withstanding the intended services of carrying full short circuit level currents to ground mat without any damage/deformation.
- g) All off site area of AHP , CHP etc shall be provide with peripheral earthing with at least two connection to main station earth grid through treated earth pit.

1.4.3 Ground Grid Conductor

- a) Ground grid conductor of mild steel rod shall be used.
- b) *[The minimum conductor section is determined on the basis of ground fault current. This section is then increased by an allowance to account for the soil corrosion loss of 0.12 mm (on diameter of conductor) per year over the design life of 40 years.]*
- c) However bidder shall consider as per CBIP norms “ Manual on Earth mat design” the corrosion allowance as below:
 - For soil resistivity greater than 100 ohm-meter: No allowance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[4]	25.09.2014

- For soil resistivity greater than 25- 100 ohm-meter: 15% allowance.
- For soil resistivity less than 25 ohm-meter: 30% allowance.

1.4.4 Underground Grid

- The ground grid mesh is designed to keep the touch and step voltages within safe limits as per recommendation of IEEE 80.
- [The ground grid conductors shall be buried in earth at a depth of 600 mm]. The length of ground conductors below earth shall be sufficient to ensure a ground resistance less than one (1) ohm.
- The ground grid conductor shall be so laid as to provide short and direct connection to building steel and major electrical equipment.
- Ground rods shall be provided at the points where system neutrals/lightning protections are connected to the ground grid.
- All ground grid conductor connections shall be welded type.
- Ground grid shall be interconnected with the ground grid of neighboring areas at least at two (2) points for further reducing the ground grid resistance.
- Suitable pigtailed shall be provided and shown in the [layout drawing] for connection with ground grid of neighboring areas.
- A minimum earth coverage of [300] mm shall be provided between the ground grid conductor and the bottom of trenches, tunnels, underground pipes, foundations, railway tracks etc. The ground grid conductor shall be re-routed in case it fouls with equipment foundations.
- In some cases, it may happen that the construction work of cable trench, foundation and laying of underground pipes are being taken up after the grounding mat has been laid. It may be required to cut a portion of grounding conductor to avoid fouling with cable trench, equipment foundations, underground pipes etc. In this case, the ground conductor shall be properly rerouted and rejoined/reconnected with the main grounding mat during the construction/laying of above underground objects and good electrical continuity of grounding conductor shall be ensured.
- Grounding conductors crossing the road may have to be laid at greater depth to suit the site conditions.
- Grounding conductor around the building shall be buried in earth at a minimum distance of [1200] mm from the outer boundary of the building.
- The Bidder shall carryout the grounding of all electrical equipments and connection to main earth grid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[5]	25.09.2014

1.4.5 Ground Electrode

Ground electrodes shall be [40] mm dia. and [3] metre long M.S. rod. These are to be fabricated and driven into the ground by the side of mat conductors. All connections to the conductors shall be done by arc welding process.

1.4.6 Above Ground Connections

- Galvanized steel flats shall be used for all connections above earth.
- Inside building, ground conductors shall be run for each floor supported on building steel and/or cable trays. These ground conductors in turn shall be connected to the station ground grid through riser (at least two) coming up along building columns/cable shafts.
- Two separate and distinct ground connections shall be provided for each electrical equipment in compliance with I.E. Rules.
- All steel columns and structures shall be connected to the earth mat through earth leads.

All connections above ground shall be welded type except connection to equipment/structures which shall be bolted type.

1.4.7 Risers

Risers are required for connecting the equipment and structures with the ground mat. Risers are to be provided from underground mat to above ground levels where the ends shall be left free for connecting to the equipment. Each riser shall be 1 No. [40] mm dia. M.S. rod and shall project above grade level/concrete floor level by minimum 300 mm. They are to be clamped or supported along the outer edge of the concrete foundation. Connection to the ground mat shall be done by arc welding.

1.4.8 Equipment Ground Lead

- Equipment ground connections shall be sized to carry the ground fault current. Considerations shall also be given to mechanical ruggedness of the connections and to limit the number of sizes.
- The minimum ground conductor sizes for various equipment and structures are given in below.

Table 2.0

DESCRIPTION	SIZE	MATERIAL
a) Main Grounding Grid Conductor	[40] mm dia Rod	Mild Steel
b) Riser/Pigtail From Grounding Grid/Mat	[40] 40 mm dia Rod	- Do -

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[6]	25.09.2014

DESCRIPTION	SIZE	MATERIAL
c) Electrode	[40] mm dia, [3000] mm long Rod	- Do -
d) Conductor used for connection of various equipment/structures as listed below		
HV motors, Earthing ring, Earthing lead to earth pits etc.	[50 x 10] mm	Galvanised steel
Structures, Control Panels, Cable Trays etc.	[50 x 10] mm Flat	- Do -
415V Power Control Centres, Motor Control Centres, Distribution Boards etc.	[50 x 10] mm Flat	- Do -
Local Panels, Lighting Panels	[25 x 6] mm Flat	- Do -
Motors :		
Above 90 kW	[50 x 10] mm Flat	Galvanised steel
Above 30 kW Upto 90 kW	[25 x 6] mm Flat	- Do -
Above 5 kW Upto 30 kW	[25 x 3] mm Flat	- Do -
Upto 5 kW	[8] SWG	- Do -
Miscellaneous Items, viz. Push Button Station, Junction Boxes etc	[8] SWG	- Do -

{The Above size of Earth flat is indicative only. Bidder shall refer Volume II Section I for size of earth flat used for existing plant or as per design.}

1.4.9

Jointing and Connection

- All ground conductor connections below ground level shall be done by electric arc welding with low hydrogen content electrode. The contact surfaces shall be thoroughly cleaned to provide good electrical continuity.
- The bending of the large diameter ground conductor where necessary shall be done by gas heating.
- The projected portion of riser/pigtail above ground shall be coated with two coats of bitumen paints (anti-corrosive paints) with a minimum thickness of 1 mm after connection.
- The connections between the riser/pigtail and earthing conductors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[7]	25.09.2014

(galvanized steel flats) and between the earthing conductors above ground level shall be made by electric arc welding.

- e) The portion of galvanized steel flats, which undergoes welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.
- f) The earthing connections to equipment grounding pads/terminals and some removable structures shall be bolted type with GI bolts and nuts. The contact surfaces shall be thoroughly cleaned (to free from scale, paint, enamel, grease, rust) before connection to ensure good electrical contact.
- g) Equipment/structures ground connections shall be coated with weather resistant paints/cold galvanizing paints after proper checking / testing.
- h) Whether specifically shown or not, all conduits, trays, cable armour and cable end box, electrical equipment such as motors, switchboards, panels, cabinets, junction boxes, lockout switches, fittings, fixtures, etc. shall be effectively grounded.

1.4.10 Earthing system installation

- a) The spacing between two electrodes shall be at least equivalent to twice the length of the electrode.
- b) Earthing conductor running exposed on column, walls, etc., shall be supported by suitable cleating, at intervals of 750 mm.
- c) The earthing conductor crossing the road / track shall be laid in hume pipe or laid at a greater depth to avoid damage.
- d) When earth conductor passes through floors, walls, etc suitable pipe sleeves shall be provided and the same shall be sealed after installation.
- e) The connection between earthing pads / terminal to the earth grid shall be made short and direct and shall be free from kinks & splices.
- f) Metallic conduits and pipes shall not be used as earth continuity conductor.
- g) Street lighting poles, flood light poles & towers, their junction boxes shall be connected to the earthing conductor to be run along with supply cable. This earth conductor shall be in turn connected to earth grid at two extreme points.
- h) The steel columns, metallic stairs, hand-rail etc. of the building where electrical equipment are located shall be connected to the nearby ground mat by earthing conductor. Electrical continuity shall be ensured by bonding the different sections of handrails and metallic stairs.
- i) Fence within the ground grid shall be bonded to the plant ground system at regular interval not exceeding ten [10] metres. Fence gate shall be separately grounded with flexible connection to permit movement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[8]	25.09.2014

- j) [50 x 10] mm galvanized steel flats(minimum size) shall be run as main earthing conductors above ground along building columns, walls, steel structure, etc. for equipment and other structures earthing. These earthing conductors shall be interconnected between them and to the main ground grid through risers/pigtail. The connection between earthing conductor and riser shall be made above ground. Earthing conductors can be embedded in concrete floor of the building wherever necessary without having direct contact with the reinforcement rods. At the crossing of building walls, floors etc. the earthing conductor shall be passed through galvanised conduit sleeves. Both ends of the sleeve shall be sealed to prevent the passage of water through the sleeves.
- k) All indoor and outdoor electrical equipment and associated non-current carrying metal works, supporting structures, building/ boiler columns, fence, system neutrals, lightning masts/arresters shall be connected to the plant ground system.
- l) Miscellaneous devices such as junction boxes, pull boxes, pushbutton stations, lockout switches, cable end boxes, lighting fixtures, receptacles, switches etc. shall be effectively grounded whether specifically shown or not.
- m) Metallic conduits and pipes shall not be used as earth continuity conductor. These shall be grounded at both ends.
- n) A continuous [50 x 10] mm (minimum size) G.S. flat earthing conductor shall run along the cable trays and supporting structure of all cable routes. This earthing conductor shall be attached to each section of cable tray/trays through [50 x 10] mm G.S. flats. The earthing conductor shall be securely connected to the earth mat at both ends.
- o) Flexible earth conductors shall be provided at expansion joints for earthing the gates, operating handles, etc.
- p) Equipment bolted connection after being checked and tested shall be painted with anti-corrosive paint / compound.
- q) Connection between the equipment earth lead and the grid conductor shall be welded. For rust protection, the welds shall be treated with zinc chromate primer and coated with zinc rich paint.
- r) The cable sheaths, screens armour shall be earthed at both ends for multi-core cables. For single core cables the same shall be done at one end (switchgear end) only.
- s) All bimetallic connections shall be treated with suitable compound to prevent moisture ingress.
- t) Main plant earth grid and switchyard earth grid shall be interconnected each other by minimum two numbers of leads.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[9]	25.09.2014

1.4.11 Lightning Protection System Design

- a) Lightning protection design and installation work shall be provided on the basis of IS 2309 Code of Practice.
- b) Lightning protection system shall consist of vertical air termination rods, horizontal roof conductors, down conductors and pipe electrodes.
- c) The need for providing the lightning protection system shall be established by calculating risk index value for each building structure, etc., as per procedure given in IS-2309 and any building whose risk index is more than value specified in IS shall be provided with lightning protection. However, Boiler areas, station building, switchyard building shall be provided with lightning protection irrespective of the arrived risk index.
- d) Shielding angle for one vertical air termination shall be 45 degrees. For more than one rod, shielding angle between the rods shall be taken as 60 Degrees.
- e) Down conductors shall run along the outer surfaces of the building and shall have a test joint about 1500 mm above ground.
- f) A Lightning electrode shall be provided at the connection point of the down conductor with the station ground.
- g) Galvanized steel rods and flats shall be generally used for air termination and connections. All connections shall be welded type.

1.4.12 Air Terminations

- a) The vertical air terminal rods shall be installed at the roof of Turbo generator building, Boiler and chimney etc to protect these objects from lightning strokes.
- b) The projected length of the Air termination rod shall be as required to protect the object (on which the rod is fixed) from lightning stroke.
- c) The air terminal rod shall be properly fixed on the top of the building/structure to withstand very high wind pressure. In case the air terminal rod is embedded at the top of roof of building, the portion embedded inside the concrete shall not touch the reinforcement bars and shall be duly insulated from them.
- d) All the vertical air terminal rods shall be electrically connected together by means of horizontal conductors of size [50 x 6] mm galvanized steel flats.
- e) For chimney air termination, rods interconnected by circumferential conductors will be provided at the apex of flue and also upon outer shell of the chimney. The air termination system will be formed by lead coated copper conductors to prevent melting and corrosion of conductors due to flue gas.
- f) For cooling towers, air termination system will comprise of horizontal

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[10]	25.09.2014

circumferential conductors at the top

1.4.13 Down Conductors

- a) Galvanized steel down conductors of suitable size [25 x 6] shall be connected with air terminal rod/horizontal conductor at the top of roof/structure and other end connected to the nearest 40 mm dia. mild steel rod riser from ground electrode.
- b) Each down conductor shall have an independent earth termination. In no case conductors of the lightning protection system shall be connected with the conductor of grounding system above ground level.
- c) The connection between each down conductor and rod electrode (by means of 40 mm mild steel rod riser) shall be made by others. However Bringing down comer with test link at a level of 1500mm approximately from above ground level shall be boiler contractor scope of work.
- d) The down conductor shall be laid straight and sharp bends shall be avoided as far as practicable. These shall be cleared on outside of the building wall and column/structure at about 750 mm intervals unless stated otherwise in the drawing.
- e) At all supports for down conductor along the column/wall of the buildings etc. the portion embedded inside the building concrete should not touch the reinforcement bars.
- f) All exposed metallic parts of the buildings shall be bonded to the down conductors. Such parts shall include ladders, balconies, conduits etc.
- g) The down conductors shall be protected at the ground level against mechanical injury by means of non-metallic pipes, viz. PVC pipes filled with bituminous compound.

1.4.14 Switchyard Lightning protection

- a) For switchyard lightning protection shall be provided by lightning masts and/or shield wires.
- b) In case of lightning protection by shield wire, the shield wires provided shall be of GS wire strung across the pinnacles of the gantry tower structures. The size of shield wire shall be based on the lightning impulse current expected and the time duration for which it is likely to flow. Allowance shall be given in the final size to account for corrosion of the shield wire during service at rate of [0.03] mm per annum. However, minimum size of the shield wire shall not be less than [70]sq.mm. The zone of coverage for the shield wire shall be considered as 60 deg between the two shield wires and 45 deg for end shield wires. The down conductors from shield wires shall be run along the towers and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[11]	25.09.2014

connected to rod/pipe electrodes.

- c) In case of lightning protection by lightning protection masts, the down conductors from the masts/peaks/shield wires shall be run along the tower and connected to the test links mounted on the towers at 1500m from the ground level. Conductors from the test links shall be connected to the rod/pipe electrodes which in turn are connected to the main earth grid in the switchyard. Calculations for sizing and determining topography and number of lightning masts shall be furnished for approval.

1.4.15 Electrodes (for Lightning Protection)

The electrodes shall be [40 mm] diameter [3000 mm] long mild steel rod. These shall be driven into the ground.

All the electrodes shall be interconnected by means of one (1) [40 mm] dia mild steel rod which shall be laid under ground at a minimum depth of [600 mm] below finished grade level unless stated otherwise. This ground mats/electrode in turn shall be connected to main grounding grid.

1.4.16 Riser (for Lightning Protection)

All risers connected to grounding mat shall be [40 mm] mild steel rods and shall be projected 300 mm above grade level unless stated otherwise.

1.4.17 Jointing & Connection

- a) All ground conductor connections below ground level shall be done by electric arc welding with low hydrogen content electrode.
- b) The projected portion of riser above ground shall be coated with two (2) coats of bitumen paints (anti-corrosive paints) with a minimum thickness of 1 mm after connection.
- c) The joints in the lightning conductors shall be kept to a minimum and there shall be no joint in the underground portions of conductors.
- d) All the joints shall be done by arc welding process overlapping of the conductors at straight joints shall not be less than 150 mm. The contact surfaces shall be cleaned properly before jointing.
- e) The portion of galvanized steel flats, which undergoes welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.
- f) The bolted joint of the test link shall be covered with thick coating of bitumen paint after successful testing.
- g) The air terminal rods and shielding mast shall be coated with weather resistant anti-corrosive paint (zinc chromate followed by two coats of aluminium paint).
- h) The steel to copper connection shall be brazed type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[12]	25.09.2014

- i) The lightning protection of inflammable liquid storage tanks wherever required, shall be provided with horizontal conductors strung between tall poles covering the entire zones or with air terminal rods mounted on top of poles/structure. These horizontal conductors/vertical air terminal rods shall be connected to rod electrodes, which in turn shall be connected to station ground mat.
- j) The sizes and materials of earthing conductors to be used in lightning protection system are listed below :
- k) Note: The above sizes are indicative only. Actual size shall be as per Bidder design or as per existing plant details as provided in Section I in case of replacement work as called for.

Table 3.0

DESCRIPTION	SIZE	MATERIAL
a) Vertical Air Termination	[20] mm dia Rod	Galvanised steel
b) Horizontal Conductor	[50 x 6] mm flat [25 x 6] mm Flat	-----do-----
c) Down Conductors	[25 x 6] mm Flat	-----do-----
d) Ground electrode / riser	[40] mm dia Rod	Mild Steel
e) Interconnection with earth mat	[40] mm dia Rod	Mild Steel

1.5

Tests

1) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-B,Annexure-E11	[13]	25.09.2014

Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant /purchaser or his representative.

The following test shall be conducted:

- a) Measurement of earth resistance for each electrode.
- b) Measurement of total earth resistance.
- c) Measurement of earth loop resistance for E/F path of biggest LV drive.
- d) Check tightness of all earth connections
- e) Check earthing of all metallic equipments, cable trays, bus bar supporting structures, building column (if steel all elect equipments, pipe lines etc. as per the drawing / specification)

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6

Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *[Earthing Material like conductor , flat , welding description etc]*
- b) *[Air termination rod and its accessories etc]*
- c) *[Technical Data sheets for Earthing and Lightning system].*

1 COMMUNICATION SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of communication system complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [..] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC / IEEE as given below except where modified and/or supplemented by this specification.

- IS 1881-1998 : Code of Practice for Indoor Installation of Public Address System.
- IS 1882-1993 : Code of Practice for outdoor Installation of Public Address System.
- IS 9302-Part 1to 10 : Characteristics and Methods of Measurements for Sound System Equipments.
- IS 7714-Part 1 to 4 : Specification for Loudspeakers.
- IS 2147-1962 : Degrees of protection provided by Telecommunication Equipment.
- IS 11414-1986 : Basic mode control procedures for Data Communication system.
- IS 13176-1991 : PVC Insulation and Sheath of Telecommunication Cables-Specification.
- IS 14438-1997 : Audio cords and cordages for Telecommunication specification.
- IS 14450-1997-Part 1 : Conductors for Electronics and Telecommunication Applications Specification - Part 1: Bare Copper Wire (Round). Etc.,
- IS 1554-1988 : PVC insulated (heavy duty) electric Cables
- IEC 60268-Part 1 to 17 : Sound System Equipment
- ANSI C37.90A/IEEE-472:Surge withstands capacity.
- Indian Electricity Act 2003
- Central Electricity Authority – Regulations
- Indian Electricity Rule (IE) as amended up to date

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[1]	29.09. 2015

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed

1.3

Design Criteria

The Plant Communication System shall consist of the following:

1. Communication System for the entire power plant includes either IP PABX Exchange complete with Telephone system and telephone handsets in the Power Plant and associated administration buildings.
2. Loud Speaker Talk Back System
3. General Announcement system
4. UHF Wireless System
5. Audio Conferencing system
6. DC Power supply system, cables and other accessories.

[Co-ordination with WPC wing for getting Frequency allocation and License from the Ministry of Communication, Govt. of India is in Bidders scope.]

1.3.1

Design Basis

The System/Equipment shall work efficiently in an adverse industrial environment with hot, humid and tropical atmosphere. Equipment in some areas shall withstand vibration, coal dust, fly ash, oil/water vapors as prevalent in a Thermal Power Generating Plant.

1. The system shall have to provide quick and reliable communication between plant personnel located in different areas.
2. Telephone System including telephone exchange (EPABX), maintenance console, MDF provided with Krone terminals, float cum boost charger, battery sets, telephone Instruments etc. complete with cable network, Krone junction boxes and all other accessories.
3. Provision of necessary software and hardware required at this Exchange end shall be under the scope of the Bidder.
4. Loudspeaker talk-back system complete with power and signal cable network and all other accessories.
5. General announcement system consisting of provision to play the announcement/Music from central system with distributed Amplifiers and volume control for each speaker, complete cable network and all other accessories.
6. Audio conferencing system for Conference hall consisting of Controller, Mics amplifier, speakers LCD projection system, collar, cordless mike etc.
7. Bidder shall supply a minimum of quantity of Telephones, loud speakers, walkie-talkies and other items as per the Schedule of Quantities.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[2]	29.09. 2015

8. Supply, Laying, termination, testing of all communication cables and power supply cable required for facilitating the communication systems in the plant.
9. The offered systems shall be complete in all respects and any device, component, materials and accessories, etc. which have not been specifically mentioned in this specification but are required for smooth, trouble free, safe and successful operation of the system is included in the scope of work of the Bidder.
10. The Exchange shall be provided with necessary paging cards so that it can be interfaced with Loud Speaker Talk Back System and the General announcement System.
11. In hazard areas like oil storage, wall telephone sets with explosion proof and corrosion resistant metal cases shall be provided.

1.4 **Telephone System**

1.4.1 General Requirements

1. The telephone exchange covered in this specification shall be IP digital electronic type, initially equipped for [400] extensions and expandable up to [500] extensions in future.
2. The telephone exchange shall be complete with central processing unit, control cards, extension line cards, junction line cards, conference facility card, switching circuits, interfacing modules and devices, required for processing and interconnection of speech, data line and service circuits. The exchange shall also have power supply modules, PC based maintenance console, Operator console, printer, interconnecting cables, wires, connectors and other auxiliary equipment.
3. To meet the functional reliability the hardware for the exchanges shall use redundant CPU, redundant memory and memory control, redundant data bus, high speed RAM backed by non volatile memory, redundant storage devices and system control.
4. Telephone exchange shall be of approved technology of Department of Telecommunications. A copy of the 'DOT' approval letter shall have to be enclosed along with the bid. The exchange shall have facility to connect P&T (D.O.T/Trunk) lines. The exchange shall also have facility for interconnection/ tieup with other telephone exchanges. The bidder shall submit TEC approval certificate for quoted model of Telephone exchange along with the bid.
5. In the Telephone Exchange Room all incoming and outgoing voice communications to and from the operators at any telephone sets (Fixed-Phone, IP-Phone, WLAN-Phone and DECT-Phone) or within the IP-PABX and the Hotline telephone sets must be recorded online. Suitable voice recording equipment, external to or integrated within the IP-PABX, must be provided and connected to the IP-PABX.

1.4.2 Design Requirements

1. The IP digital exchange shall be designed and built to offer utmost reliability and efficiency in operation, ensuring instant communication by suitable configuration of functional units and use of reliable components.
2. All components used in the telephone exchange shall be rated for round the clock continuous operation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[3]	29.09. 2015

3. The telephone exchange shall employ latest state-of-the art digital switching technology and VoIP enabled.
4. The telephone exchange shall be microprocessor based, stored program controlled, employing Time Division Multiplexing (TDM) and Pulse Code Modulation (PCM) technique.
5. Sufficient redundancy shall be provided in the exchange central processor control unit & other critical components to ensure uninterrupted operation of the exchange functions even in case of failure of these units / components.
6. All the common processing and control cards required for functioning of the IP digital exchange shall be duplicated to a 1+1 configuration. The standby cards shall perform the entire functions of the exchange when the main CPU and control cards fail without affecting the functioning of the exchange. Any failure of cards shall be brought to the notice by audio - visual alarm.
7. The exchange shall be provided with EVM interface cards, Paging cards, E&M cards, IP DECT cards, Interfacing PRI cards etc. as per requirement.
8. The exchange shall be provided with modular construction, dispersal of power modules, ringers and interface cards to the respective extension line racks thus helping to localize faults.
9. The exchange shall have the facility for expandability or system up-gradation to meet future requirements without extensive hardware / software modifications. The telephone exchange shall be wired for the expandable capacity and be expanded in small steps by plugging in appropriate cards.
10. The exchange shall adopt universal port architecture so as to install any peripheral cards in any slot.
11. The exchange design shall have flexibility for interchanging same type cards viz. extension cards, tie-line cards, and trunk cards etc without making any modification in hardware as well as the software.
12. The exchange shall be suitable for connecting electronic push button telephones with CLI facility, IP telephone, DECT handsets.
13. The exchange shall be capable of simultaneously accepting, processing and delivering information in various forms such as voice, data and text in a wholly integrated manner.
14. The exchange shall be designed for simultaneous transmission of voice/data at the transmission speed of 64 Kbps in synchronous mode and 19.2 Kbps in asynchronous mode through telephone cable.
15. The insertion of voice / data cards for simultaneous transmission shall not reduce the availability of total number of voice and data extension lines at any instant.
16. Insulation resistance between components and exchange panel shall be more than 20 K ohms.
17. Speech attenuation shall be less than 1 db. Cross talk attenuation between speech circuits shall be more than 70 db.
18. The exchange shall have all familiar distinct tones, such as dial tone, busy tone, NU tone, ring back tone etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[4]	29.09. 2015

19. Adequate protection of exchange shall be provided against electrical short circuits and heavy current flow as a result of induced or conducted lightning or power systems faults. The exchange shall also be protected against electromagnetic and electrostatic interferences of the power plant complex.
20. The exchange shall have a PC based maintenance console. Provision shall be kept for all routine tests, measurements and checks of exchange equipment and subscriber lines. The system shall be capable of monitoring its own performance to detect, analyze, locate and report faults whenever they occur. The console shall also indicate exchange parameters and card level faults.
21. The system shall be provided with audio and visual alarms for continuous indication of system status.
22. The offered telephone exchange shall have remote maintenance facility to test; executing programmes and monitor the functioning of the telephone exchange from a far off remote location.
23. The exchange shall be compatible to ISDN networking.
24. The exchange equipment shall be provided with interface equipment for interconnection with Loudspeaker Talk-back system, UHF Radio trunking system of the plant complex.
25. The exchange equipment shall be capable of working without sacrificing the quality of performance during prolonged absence of air-conditioning.

1.4.3

Equipment Design Requirements

1. All equipment shall be housed in an elegant floor mounted cabinet. The cabinet shall be designed for ease of transportation and facilitate easy assembly at site. Doors shall be provided at both front and back of the cabinet for easy maintenance.
2. The metallic parts of the cabinet shall be rugged in construction and shall be treated with anti-corrosive paints to withstand the tropical conditions & corrosive atmosphere.
3. Test access points and indications shall be located in the front of the panel.
4. All incoming cables for entry bay connection shall be plug-in type.
5. All component units shall be mounted on plug-in type PCBs to facilitate easy replacement.
6. Cards of identical functions shall be interchangeable.
7. All cards and sub assemblies shall be suitably marked for identification on respective locations.
8. Components mounted on cards shall be designated according to the nomenclature used in the circuit diagram.
9. Bus bars / cables for various supply voltages and signals shall be identified by adopting suitable colour scheme throughout the system.
10. Fuses, keys are to be located for easy access at a convenient level.

1.4.4

Functional Requirements

The IP digital exchange shall have the following minimum features:

1. Non-blocking speech path network employing TDM-PCM technique with no restriction on number of simultaneous calls.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[5]	29.09. 2015

2. Redundancy in all critical units such as call processing unit / critical control units, memory modules / data buses / hard disk storage unit and other critical components.
3. Modular expansion capability for future expansion possible by simply plugging in additional cards, modules, sub racks and racks.
4. In-built, on line diagnostic features with print out facility. Display of faults through maintenance console.
5. Flexible extension numbering without changing cabling.
6. Distinct ringing for internal calls and trunk calls.
7. Silent operation.
8. Easy and minimum maintenance.
9. High reliability.
10. Interfacing facility with other exchanges of the plant through PRI/CO trunk cards.
11. Compatibility with VOIP digital national network.
12. Extension to extension dialing.
13. Direct outward dialing access to other exchanges.
14. Direct inward dialing.
15. Caller Line Identification facility
16. Changing the subscriber facility through the maintenance console.
17. Facility of connecting up computer terminals etc.
18. Facility for connecting Public address system.
19. Facility for connecting Radio Communication (UHF) system.
20. Remote maintenance facility.

1.4.5

Subscriber Facilities

The following minimum facilities shall be provided for subscribers of telephone exchange.

1. Calling between subscriber
2. Conference facility (4 party)
3. Call transfer
4. Internal consultation
5. Executive/secretary facility with visual indication for line busy identification.
6. Call forwarding
7. Automatic call back
8. Priority interrupt
9. Call pick up
10. Paging access
11. Emergency reporting
12. Last number re-dial
13. Hotline facility
14. Music on hold

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[6]	29.09. 2015

15. Other common features of the latest IP digital exchanges.

1.4.6 Equipment details

The Telephone exchange system shall broadly comprise of the following:

1. Telephone exchange equipment and peripherals such as PC based maintenance console, printer etc.
2. Main distribution frame with protection devices on the exchange side.
3. Power supply equipment, including rectifier - cum - charger, back up battery set and interconnecting cables & wires.
4. Auto-telephone instruments.
5. Telephone cable network comprising cables, wires, distribution & termination devices and associated erection accessories required for connecting the telephone instruments to the telephone exchange.

1.4.7 Main Distribution Frame

1. Separate main distribution frame (MDF) shall be considered for the telephone exchange.
2. MDF shall serve as a common terminating point of the telephone cable network. The MDF shall be compact with systematic wiring and termination, following a numbering scheme facilitating easy maintenance.
3. KRONE type MDF complete with protection devices shall be considered. The 400 extension lines on exchange side shall be provided with IPM for over voltage/current protection.
4. The MDF at present shall be capable of terminating 400 pair cable in exchange side and 500 pairs cable in the extension side (outgoing - field side). Spare capacity to the tune of 10% shall be provided for terminating additional cables on both the sides of the MDF.
5. The MDF equipment shall be installed in the exchange room. Suitable jumper wires and hardware required to connect the equipment and MDF shall be supplied and installed by the Bidder.

1.4.8 Power supply equipment

1. Linear Power supply cum Boost charger to the telephone exchange's power supply equipment and it's associated devices shall be provided from 230V, 50Hz, single phase, AC supply
2. The power supply unit for exchange shall comprise of the following :
 - Rectifier-cum-Boost charger
 - 48 volt battery set
3. The exchange shall work on - 48 V DC obtained through the rectifier cum chargers.
4. The complete power supply unit shall be designed to support the full load condition of a 500 line telephone exchange.
5. The rectifier cum float charger shall feed the exchange equipment and back up battery set in parallel float working principle.
6. The battery set shall work as a backup for providing un-interrupted power supply to the exchange equipment and its PC based maintenance console in case of AC mains

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[7]	29.09. 2015

failure. The backup battery set shall be of lead-acid type with 300 AH capacity sufficient to supply continuous power to the exchange (at its full load capacity) and the PC based maintenance console and printer in case of AC mains failure.

7. Each battery set shall consist of 24 numbers high performance cells of 2 volts each. Each cell shall have vent plugs, buffers, inter cell connectors etc confirming to IS 1652. The 24 cells shall be connected in series to have 48 volts.
8. The rectifier cum charger shall be suitable for operation to trickle charge as well as boost charge the battery set. The power supply unit shall be designed so as to facilitate charging from "Float" to "Full charge" operation by simple switching in auto as well as manual mode.
9. The rectifier-cum-float charger set shall be capable of taking the full load of the exchange while float / boost charging the backup battery set as per the requirement.
10. A switching circuit shall be provided in the rectifier- cum-charger for automatic change-over from rectifier to battery supply in case of AC mains power supply failure.
11. Necessary protection for overload, short circuit, under voltage and over voltage shall be provided.
12. The DC output generated by the rectifier-cum-charger shall be adequately filtered before going to the exchange equipment.
13. Audio - visual alarm shall be provided to indicate any malfunction / failure in power supply system. Audio and visual indications for charging / discharging mode, AC/ DC ON indications shall be provided.
14. The rectifier-cum-charger and all other necessary equipment and protective devices shall be housed in sheet steel cabinet.
15. The charger units shall be provided with ammeters and voltmeters to indicate charging / discharging mode, AC / DC "ON" indication.
16. Necessary accessories required to install the battery sets and charger shall also be provided.
17. The battery sets shall be installed on a suitable platform in a separate room with acid proof floor. The Bidder shall provide the necessary platform.

1.4.9

Telephone Set

1. All IP-PABX switches and subscriber locations shall be equipped with Dual Tone Multiple Frequency (DTMF) standard telephone sets and mobile DECT handsets.
2. For the selected persons at the power station digital telephone sets allowing for all exchange features shall be supplied. Switchboard extensions attached to these telephone sets shall contain a single push-button facility for important contacts. Pressing a button shall automatically establish a call with the relevant attendant.
3. All telephones and associated equipment installed in the process area or in outdoor locations shall have IP 65 weather protection in accordance to IEC 60529. All telephones and associated equipment installed in hazardous areas shall be certified explosion proof type in accordance with IEC 60079.
4. Suitable telephone booths have to be provided for plant rooms/areas with a high noise level (e.g. STG hall).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[8]	29.09. 2015

- 1.4.9.1 Desk telephone set
Desk telephone sets shall be used only in air-conditioned rooms and offices, and shall have high impact, dust-tight and temperature-resistant plastic cases.
- 1.4.9.2 Wall telephone sets
Wall telephone sets for use in rooms that are not air-conditioned shall have water- and dust-tight (degree of protection at least IP 65) temperature-resistant plastic cases or to be contained in weatherproof container.
- 1.4.9.3 Wall telephone set, Explosion-proof type
In hazard areas such as fuel oil pump house, etc. wall telephone sets with explosion-proof and corrosion resistant metal cases shall be provided.
- 1.4.9.4 Telephone booth
The telephone booths for wall-mounting are to consist of high impact and corrosion-proof steel or aluminium material (resistant to UV radiation) and are to be equipped with the following:
- One internal roof light, type IP 65 enclosure, fully wired with switch
 - One external call light, type IP 65 enclosure, marked on three sides (mounted on roof of telephone booth)
 - IP 65 enclosure, for telephone connection cable and cable connection
 - Telephone relay for auxiliary bell.
- For installing telephone booths in hazardous areas all equipment used shall be exclusively of the explosion-proof type.
- 1.4.9.5 IP DECT (IP based Digital Enhanced Cordless Telephone) Systems
DECT based telephone system shall also be provided in the plant at a number of locations for limited mobility. Outline of the System is indicated below:
- Central Voice Switch or EPABX, as indicated above.
 - DECT controller, a module that can be interfaced with the EPABX and shall connect to a number of radio base stations.
 - Radio Base Station (RBS) Compact units, located strategically at various points over the desired coverage area and connected to controller over air.
 - User Handsets shall be similar to GSM handsets and shall have the provision to work with GSM SIM Cards and shall communicate on regular cellular networks also simultaneously.
- The distance between base station and handset shall be 300 meters. The distance of Base station to Controller shall be 2 km.
- Handset users shall be able to call each other and also wired subscribers. The users shall also have access to various features of the EPABX as well as features of modern cordless devices. The system shall work on IP/cellular technology with seamless roaming and handover between cells. Multiple redundant over the air path shall be available between the base stations to provide reliable and seam less

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[9]	29.09. 2015

communication. Failure of one Base station should not affect the communication from the handsets and the handsets should take automatic alternate shortest route for linking up with the controller. There should not be any limitation to the number of handsets that can work with one base station.

1.4.10

Cable network

1.4.10.1

Cable network for Telephone exchange

1. For facilitating plant telephone connection at various locations within the plant complex a separate cable network is to be provided. The telephone cable network shall facilitate a total of 400 telephones.
2. The telephone exchange and its associated devices shall be provided.
3. The telephone cable network can be divided in the following categories :
 - Main & Tie cable network
 - Distribution telephone cable network
 - Indoor telephone network
4. The main telephone cable network shall comprise of cabling between the MDF of the telephone exchange and the telephone distribution cabinets in various areas / units of the plant complex.
5. To strengthen the reliability of the cable network the distribution cabinets of various areas in the plant complex shall be interconnected through tie cables of adequate capacity.
6. The distribution telephone cable network shall comprise of the cables and termination devices for facilitating telephone connections in various areas of the plant. The distribution cables shall be laid from the above cabinets to various areas & terminated in telephone distribution cabinets / CT boxes / Distribution boxes.
7. Indoor telephone cable network shall comprise of cabling from cable terminal boxes / distribution boxes up to ceiling rose / tag block for further connection to various subscribers. Single & multi-pair un-armoured PVC telephone cables in concealed conduits / surface conduits / PVC casings shall be used for indoor wiring.
8. Cable route for the interplant cable network shall be prepared based on the plant general layout drawing.

1.4.10.2

Cables for Telephone System

1. All telephone cables shall have copper conductor. Each conductor shall consist of a 0.51 mm dia. solid wire of annealed high conductivity copper.
2. The cables shall conform to the latest edition of the following Standard specifications.
 - ITD Spec. no. S/WT-143 B for Petroleum jelly filled armoured telephone cables.
 - ITD Spec. no. S/WS-113 C for PVC insulated, PVC sheathed telephone cables.
 - IS:1554, Part -I & II for armouring & outer sheath of PVC cables.
3. All PVC armoured and unarmoured telephone cables shall be Fire retardant low smoke type (FRLS Type) having protective system of inner and outer sheath specially designed with thermoplastic or thermosetting materials having superior

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[10]	29.09. 2015

resistance to ignition and flame propagation with smoke emission and toxicity or corrosive characteristics. The cable will conform to the following standards -

- IEC -332 (Part 1)
- BS -4066
- IEC -332 (Part 3)
- IEEE -383

1.4.11 Cable Distribution Cabinets

1. The cabinet shall consist of a framework on which cable terminal boxes are mounted. The outer case of the cabinet shall be of hot dip galvanised mild steel sheet.
2. The distribution cabinets shall be suitable for both installations by road side in open air as well inside a building on walls / floors.
3. The doors provided shall be strongly secured to the case of the cabinet with a locking system. Each door shall be provided with hinges, suitably spaced and welded or riveted to the case and the door. The case shall be designed to prevent entry of water into the cabinet during rainy conditions.
4. The MS sheets used for making the cabinet body shall be of 2 mm thickness.
5. Angles, channels & flat iron bars used shall be hot dip galvanised. The iron racks, bolts, nuts & other accessories shall be hot dip galvanised before they are fitted on to the cabinet. Screws, fly nuts etc shall be nickel plated mild steel.
6. Words - "TELEPHONE DISTRIBUTION CABINET" shall be embossed on the external top side of the cabinet.
7. A 100 pair distribution cabinet shall have the facility of termination of 100 pair 0.51 mm dia. conductors in the exchange side & 100 pair's 0.51 mm dia. conductors in the extension line side.

1.4.12 Cable Distribution Boxes (DBs)

1. The Distribution Box (DB) shall consist of a hot dip galvanised mild steel sheet cabinet suitable for both indoor and outdoor mounting, wall mounted with a hinged cover and locking arrangement to prevent unauthorised access. The DB shall be dust & vermin proof and protected from weather.
2. The MS sheets used for making the body shall be of 2mm thickness.
3. The Distribution Boxes shall be provided with suitable mountings to fit tag blocks. The tag blocks shall be Phenolic moulded each having 10 pairs (20 brass inserts) soldered on the brass plate. The brass plate carrying the tag block shall be fitted on the cast aluminium cubicle with 4 brass screws.
4. A 10 pair distribution box shall have the facility of termination of 10 pair cables in the exchange side & 10 pairs of cables in the extension line side.
5. The cubicles will be fitted with two brass or plastic nozzle inlet glands for leading in cables.
6. Words - "TELEPHONE DISTRIBUTION BOX" shall be embossed on the external top side of the box.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[11]	29.09. 2015

1.4.12.1 Telephone socket

1. Two pin socket along with plugs (specially designed for telephone connections) shall be provided at the subscriber locations for plugging in telephones.
2. The incoming cables from the distribution boxes in each block / unit / building shall be terminated in these sockets.

1.4.12.2 Maintenance Facilities

1. The exchange shall provide automatic monitoring of its own performance and to detect, analyze, locate and report faults whenever they occur.
2. The system shall verify the proper execution of call handling and exchange software or hardware malfunctions and report on the condition of interfaces and exchange resources such as memory occupation, CPU utilization etc.
3. The maintenance console shall be PC based having bulk software loading facility. The PC based maintenance console shall have CDD and HDD and shall work on 48 volt exchange supply. All the programming required to provide various facilities shall be possible from this unit. Facility shall be available to ensure automatic print outs of all important events and faults.
4. Provision shall be kept for all routine tests, measurements and checks of all exchange devices and subscriber lines. The console shall also indicate all exchange parameters and card level faults.
5. Malfunctioning in any part/ control unit/ power supply units of the system shall initiate the audio visual alarms. The equipment shall be provided with audio visual alarms in case of failures with facility for cutting off the audible alarm when required.
6. Automatic line testing equipment shall form part of the maintenance facility for telephone exchange. It shall be capable of testing the network without physically disconnecting the telephone cable.
7. It shall be used to test the open loop and closed loop condition of each subscriber, insulation value of telephone cable pair, capacitance, impedance, resistance and foreign potential (AC & DC) for each extension lines. The above values shall be displayed on the automatic line testing equipment.
8. The telephone exchange equipment design shall be such that any special care on the part of maintenance personnel is absolute minimum and no preventive maintenance is required.

1.5 UHF Band Wireless System

[Supply, Installation and commissioning of Multi-channel, Multi user trunked radio, analog type, and systems equipped for 4 channels in 403-470 MHz band]

The supply shall be complete with all details of equipments illustrating and describing drawings with complete literatures. The supplier shall include all minor accessories though not specifically mentioned in this specification but essential for the completeness of the equipment. The required quantity of equipment/ component/items/cables essential for completeness of Trunked Radio System for satisfactory operation shall be supplied.

The Wireless System shall consist below listed items:

- Radio site controller with telephone inter connect

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[12]	29.09. 2015

- Repeater base station sets
- Antenna system consisting of Omni-directional antenna
- Transmitter combiner
- Receiver Multi coupler
- Low loss RF cable to connect antenna to the system
- System Management Terminal
- Portable type programming kit for field use
- Portable subscriber radio (Walkie Talkie set)
- Fixed radio (main set/mobile set)
- Suitable self supported tower of height 45 meters
- Suitable capacity UPS for min. 4 hours backup
- Co-ordination with WPC wing for getting Frequency allocation and License from the Ministry of Communication, Govt. of India is in Bidders scope.

1.5.1

System Design

The 5 channel single site UHF Radio System shall comprise of the following.

- Radio site Controller
- Repeater-Base Stations
- Omni-directional Antenna
- Transmitter Combiner
- Receiver Multi-coupler
- Low Loss RF cable
- Accessories & Cable Connectors
- System Management Terminals (SMT)
- Subscribers:
- Portable –Analog type
- Fixed – Analog type
- UPS for UHF Wireless systems backup

The Radio site Controller, which is the heart of the system, shall be responsible for passing call requests to and from subscriber terminals. The microprocessor based controller boards shall control the UHF systems and its operation. The controller shall be compatible for Hybrid mode of operation.

Each Repeater station, Comprises of Transceivers tuned at different frequencies shall boost the RF signals for required coverage. Each Repeater shall consist of one Transmitter and one Receiver capable to operate at any RF channel. Each Repeater can be programmed for different power options.

Transmitter combiner and Receiver Multi-coupler shall have one transmitting and one receiving antenna and shall be used for the whole repeater system operation.

The antenna shall be minimum 5 dB high gain Omni-directional antenna.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[13]	29.09. 2015

The system shall support 100 or more subscribers with all possible groups and or subgroups. The system shall be of modular construction providing options for both sub equipping and system expansion. Additional sites or radio channels may be added if required for future expansion. The system design shall allow the users to communicate during system failure. During system failure, the system shall switch over to conventional radio repeater operation to pre assigned groups.

One of the RF channels shall be used as control channel. This control channel shall be responsible for all control data transmission. This system feature shall allow any RF channel to act as a control channel in case of control channel failure without disturbing the system operation.

The system shall support wide/Narrow band (25kHz/12.5kHz) operation as applicable. Besides that, the system shall be equipped with a system management terminal (SMT). This SMT shall take care of the system Management & Configuration.

1.5.2 Features

The UHF radio system shall have the following general and system features.

1. It shall also support all the radio features.
2. All equipment (except R/T terminals) shall be supplied rack mounted and shall be compact, solid state construction.
3. The equipment shall be plug in type modular in construction with suitable protection to facilitate removal/insertion of plug in units with power on.
4. Any incoming or outgoing call shall not land on faulty channel. System shall have the facility to lock out the faulty RF channel.
5. It shall be possible to select any RF channel for servicing without affecting the working of other channels.
6. The equipment shall have easy access for servicing and maintenance.
7. The equipment shall be designed for round the clock operation.

1.5.3 Area of Coverage

The Radio System shall provide out-door reliable coverage from the main site as well as in-building RF coverage for the entire plant area.

1.5.4 Traffic Channel

Out of the available 5 channels, the system shall use 4 as traffic or voice channels and one as control channels. These channels shall be used as pool of RF channels from which the UHF Radio system controller utilizes either or all channels simultaneously.

1.5.5 Control Channel

The wireless system shall use one RF channel as control channel. All the units turned on within the coverage area shall monitor this channel. In case of failure of control channel, any of the other RF channels shall take over automatically the role of control channel. There shall be a min of 4-control channel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[14]	29.09. 2015

Tender Document for R&M of Unit No.[..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
---	--------------------------

- 1.5.6 Channel Assignment
- The system site controller shall assign all RF channels so that any or all system users shall have access to all traffic channels via a system priority protocol.
- 1.5.7 Call Types
- 1.5.7.1 Group call:
- Every member of a group shall be able to talk to each other.
- 1.5.7.2 Individual Call:
- It shall allow one-to –one conversation through radio units and that shall not be heard by other radios.
- The system shall allow a free channel immediately, to an emergency call and in case one is not available, it shall be placed at the top of the queue.
- 1.5.7.3 Normal calls:
- The calls from radio unit shall be kept in queue when no channels are available and shall call back when channels become free.
- 1.5.8 Out of Contact Indication
- Any field unit attempting to connect to the system from out of coverage area shall get a visual alert which is different from other audible alert. This shall enable the user to determine that the unit is out of contact with the system.
- 1.5.9 Reporting
- The system manager terminal shall be able to configure the system and manage the users.
- 1.5.10 Call Limit Timers
- This shall allow configuring to impose different time limits for communications to the system as per requirement. It shall be possible to configure separately for normal and peak periods for voice calls.
- 1.5.11 Telephone Interconnect
- The radio users shall be able to initiate and receive telephone calls from the subscriber radio & should be part of controller.
- 1.5.12 Addition of Radios with Channel Expansion
- It shall be possible to add radios in to the system during channel expansion without requirements for recalling radios already being used on the system or reprogramming of radios already in use.
- 1.5.13 Site Controller
- The microprocessor-based site controller shall be the heart of system and responsible for all the controlling functions of the system. It shall monitor the integrity and service ability of the system. It shall generate alarm/report as soon as it diagnosis a fault. The site controller shall be of hybrid type to support analog type and digital type subscribers.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[15]	29.09. 2015

The controller shall be provided with suitable surge suppressor protection devices to withstand variation in line input voltage and any surge current.

A system management terminal (SMT) shall be provided for the UHF wireless system.

1.5.14 Repeater System

The repeater system shall be comprised of 5 repeaters and linked with the system controller. Out of which four shall be used as voice channels and one shall be used as standby channel. However in case of failure of one repeater standby of the repeater stations shall be used without disturbing the operation.

Each repeater station shall have the following features:

1. Each Repeater shall be linked to the system controller and shall have one transmitter and one receiver respectively. However any or all transmitters and receivers shall be able to operate independently and simultaneously with any or all repeaters of the system. Each repeater shall be capable to operate at any of the 403-470 MHz band and shall be tuned for a particular pair of frequencies.
2. Each repeater station shall be microprocessor based & suitable for different power options. Any further up gradation and expansion shall be possible through software. This shall ensure flexibility, simplified set-up, easy field up gradation & easy tuning of each repeater.
3. Each repeater shall be provided with suitable surge suppressor protection to withstand variation in voltages and any surge current.
4. Each repeater design shall ensure of 24 Hrs. of unattended operation.
5. The repeater system shall be redundant, so the failure of one repeater shall not affect the whole operation. Also the hardware redundancy shall ensure the conventional operation of repeaters for pre-selected groups in case of failure of Site controller.

1.5.15 Antenna Sub-System

Each repeater site shall require high gain omni-directional antennas with combiner for each Transmitter/Receiver. Similarly for reception one receiver antenna with one multi-coupler shall be used. Both the Transmitter combiner and Receiver multi-coupler shall be expandable type.

1.5.16 Antenna for the Repeater

Omni-directional co-linear antennas with 5 dB or better gain shall be used for repeater station.

The antenna shall be centre fed co-liner antenna to ensure consistent gain and impedance across the operating band. It shall be properly designed to meet various requirements of mobile radio service.

Copper alloy radiating element shall be encased in a weatherproof fiberglass low loss housing to protect the radiating element from extreme environmental hazard.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[16]	29.09. 2015

1.5.17 Antenna Tower

Suitable antenna tower, as per requirement for the selected UHF system, is to be installed, to support the two Omni-directional antennas and tower top amplifier shall be provided. The necessary accessories like lightning arrestor, civil aviation lights etc, are to be provided. The antenna and tower design shall support to withstand wind velocity of 180 KM/Hr.

1.5.18 Transmitter Combiner

The Transmitter combiner shall be designed to maximize the use of tower space in to one antenna. It shall be highly compact, modular and accommodate closed channel spacing with very high isolation.

The combiner can be expanded one cavity, or more at a time up to 4 channels or more. Temperature compensation devices shall build in to all passive components to help, insure, trouble free, service over, long term, heavy-duty communication system usage

1.5.19 Receiver Multi-Coupler

Receiver Multi coupler shall be used to combine a minimum of 4 receivers onto a single antenna. The device shall have a plug in power supply, and bipolar, low noise RF amplifiers. Channel capacity shall depend on the arrangements, within the multi-coupler. External high performance pre-selector filter shall determine the band-pass response. Any attenuation shall be offset by the RF amplifiers.

1.5.20 Accessories

All the accessories used shall be designed to be compatible with RF cable, to have a long lasting and effective transmissions line system. The following shall be the key accessories for transmission line system:

1.5.20.1 Grounding Straps

The transmission tower system shall be grounded, with grounding straps at three points, the Top, the middle and the bottom of the tower.

1.5.20.2 Hangers

Hangers in the tower shall be used at intervals of no more than three feet to provide maximum support and security for the transmission tower. These hangers shall provide quick and easy attachment in all weather conditions.

1.5.21 Radio Subscribers

Following Type of radios shall be considered-

- Hand held portable radios.
- Fixed station radio

All the radios shall be analog type. All the radios shall be programmable for its ID and other features through radio interfacing unit. All the hand held radios shall have keypad. All the radios shall have its own electronic serial number for its programming to protect unauthorized entry of new radios.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[17]	29.09. 2015

Radio handheld sets shall be battery operated, mobile sets shall be operated from vehicle battery and fixed stations shall be operated from 230 Volt AC power points.

All the system programming shall be done through USB/ RS- 232 port via. PC. All the features and operational instructions shall be incorporated through this PC. Similarly, radios shall be programmed through the PC with the help of Radio interface kit.

The following minimum controls are required for radios:

- On/Off switch
- Multi-group and Talk –group select switch.
- Volume control
- LED indication for transmission

1.5.22 Hand Held Portable Radio

1. The walkie Talkie sets shall be hand held and shall be tough, lightweight, compact design. It shall be dirt, dust and moisture proof.
2. [The walkie-talkie sets shall be of frequency-synthesized version in 403-470 MHz band and shall be tuned to the respective spot frequencies.]
3. All the operation controls are to be located preferably on the topside of the walkie-talkie sets.
4. [Each channel of the Walkie-talkie set shall be able to programmable to deliver RF power from 1W / 4W by the user end.]
5. The walkie-talkie set shall be field programmable type for any radio frequency in the specified band and also shall be able to program the individual characteristic such as PL on unit ID number etc.
6. Each Walkie-talkie set shall be compatible to connect external speaker and microphone assembly to hear or send the messages. Necessary provision to connect the external mic/speaker assembly should be available.
7. The walkie-talkie set shall have battery saver feature to avoid idle current consumption and also should have low battery indication.
8. The Ni-MH batteries of the walkie-talkie sets should be packed in a separate battery box. The battery box shall be able to charge the batteries in the charger separately without need of walkie-talkie sets.
9. Each walkie-talkie set shall be supplied with necessary helical antenna, battery (min 1800 mAH), carrying case, regular battery charger, user manual etc.
10. Walkie-talkie sets shall have a time-out timer facility to limit the transmission time of the radio.

The hand held portable radios shall have the following features and as per the detailed specification:

Radios shall support following call types:

- Individual to Individual.
- Individual to Group call.
- Private Conversation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[18]	29.09. 2015

- The feature shall allow the radio unit to selectively enter into one – to – one call with another radio. The target user can view the ID of the initiating radio. No one can overhear this conversation.
- 1.5.22.1 Multiple system/Talk-group capabilities
Radio unit operation of 5-system/4 talk – groups or more shall be possible. This shall allow the user to access many user groups.
- 1.5.22.2 Incoming call information storage
The radio unit shall give a series of audio and visual indications when received an incoming call.
- 1.5.22.3 LCD Display
User-friendly LCD screen shall be available with radios with keypads. This gives the user instant talk identification.
- 1.5.22.4 Talk Group Scan:
In case the radio is part of multiple talk groups, the user can scan the selected talk groups of which he is part and can switch over to one particular talk group.
Programming software:
Software shall simplify the computer programming and customization of features of radio as per requirement.
- 1.5.23 Fixed Radio
The fixed radios shall have the following features and as per the detailed specifications:
1. The fixed station radio shall be operated from both 12V battery and 230V AC. Necessary power supply unit for the above should be supplied.
 2. The Fixed station radio shall have audio and PTT connection to connect amplifier.
 3. All controls required for operation and external microphone shall be provided. The microphone shall have high impact, resistance plastic housing, a coil cord and connectors
 4. Each set shall have one 3dB gain Omni-directional antenna for both transmission and reception.
- 1.5.23.1 Call Type
Radio shall support following call types
- Individual to individual
 - Individual to group call
- This feature shall allow the radio units selectively enter into one to one call with another radio user.
- 1.5.23.2 Multiple system/talk group capability
Radio unit operation of 5 systems/4 talk groups or more shall be possible. This shall allow the user to access many user groups.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[19]	29.09. 2015

- 1.5.23.3 Incoming call information storage:
The radio unit shall give a series of audio and/or visual indications when receiving an incoming call. This is useful in the noisy environment or the user is away from the radio.
- 1.5.23.4 LCD Display:
A user-friendly LCD screen and keypad shall be available with radios. This gives the user instant talk identification.
- 1.5.23.5 Talk Group Scan:
In case the radio is a part of multiple talk groups the user can scan the selected talk groups of which he is part and can be switched over to one particular talk groups.
- 1.5.23.6 Programming Software:
The software shall simplify the computer programming and customization features of a radio as per requirement
- 1.5.24 System Management Terminal (SMT)
The system management terminal (SMT) shall be used for system configuration, control and monitoring of the whole system and same shall be of latest Make.
The bidder shall supply all necessary connectors, cable with connectors for testing the repeater/fixed/portable radios. The testing cable shall be provided with BNC/UHF/N connector.
A suitable UPS shall be provided to give backup for the UHF wireless system for at least 4hours during power failure.
- 1.5.25 Circuit Diagram and Manuals
The bidder shall supply 6 sets of as built relevant operation and maintenance manuals comprising of block diagram, interconnecting diagram, neat circuit diagrams, circuit description, test voltages, spare parts list, trouble shooting guide, tuning with procedures, list of testing equipment required along with supply. The firm should also supply the programming kit and the required software.
- 1.5.26 Testing Equipments
The firm should recommend the necessary testing equipment's for the maintenance trouble shooting of repeater stations, portable radios and fixed station radios and should quote for the same separately.
- 1.5.27 Specification for Antenna Tower
The self-supporting towers shall be similar to the design adopted by Posts and Telegraphs Department for their Microwave/UHF Towers.
The supply of tower materials should be complete in all respects including all the accessories such as ladders, antenna fixtures, rest platforms, antenna platforms, lightning arrester, base plates, anchor bolts and templates, bolts-nuts, aviation lights, twilight switches and electrical fittings like conduits etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[20]	29.09. 2015

Galvanized steel ladder should be provided form 4.5m from the ground level to the highest point of each tower. Guard loops should be provided to the ladder to protect the climber from falling. No structural members shall intrude into the guard loop.

1.5.27.1 Design Considerations

The tower must be designed for self-weight and wind velocity of [180 KM/Hr.]

The wind pressure on the wind- ward should be taken as 100% of the designed pressure.

The wind pressure for the diagonal case should be taken as 1.18 times those in the normal case. The tower should be designed to support 4 -repeater station antennas and shall be mounted as per the requirement.

The top width of the tower shall be 1.8m.

1.5.27.2 Galvanization

All steel members off the tower shall be hot dip galvanized in accordance with IS 4759-1968 (or as revised).

1.5.27.3 Lightning Arrester

Lightning Arrester shall generally conform to IS – 2309-1969 (or as revised).

1.5.27.4 Earthing System

The maximum value of earth resistance should be of the order 1 ohm.

1.5.28 Material to be used for Fabrication:

Tested steel as per specification given in to be checked (or as revised) shall be used for bolted work. All steel section used shall be cleared rolled to the dimensions, sizes and weights specified for required subject to permissible tolerances as given in IS-802-1995 (or as revised). It shall be free from cracks, surface flaws, laminations, rough and imperfect edges and other visible defects etc.

1.6 Loudspeaker Talk Back System (LSTB)

Loud speaker Talk back system shall be used to issue instructions, calling and conversing with key operating and maintenance personnel.

Master station for the common facilities shall be located in central control room within BTG area. Between the groups, communication shall be permitted between Master to Master only. Power supply to communication system shall be fed from UPS. Loud speaker Talk back system and General Announcement System shall also be hooked up to telephone system.

Loud speaker Talk back system shall have the following features:

1. The system shall provide two independent channel of communication namely page channel and party channel.
2. The page channel shall be used to make any announcement over the system loud speakers. A call attention gong tone shall automatically precede all paging announcements.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[21]	29.09. 2015

3. The party channel shall provide for highly intelligible voice communication between two or more stations without being heard over the loud speakers.
4. Selection between page and party mode shall be through a “Press to Page “switch located at the handset.
5. Master Control Station shall have facility for generating and introducing the siren tone in the page channel.
6. Loud speaker Talk back system and General Announcement System shall be of distributed amplifier type. Number of handsets and loud speakers are to be provided at all locations to cover the respective area for efficient operation of the system.
7. The design of loud speaker Talk back system and General Announcement System shall be such so as to provide highly intelligible two channel voice communication even in areas of high background noise (50 db to 100 db) with the following features:
 - The System characteristic shall be such so as to cover the entire audio range and the speech band, particularly over frequency range of 500 Hz to 5000Hz and dynamic range of 40 to 80 db.
 - The system shall be distributed amplifier type with provision for easy future extension. Each station shall be complete with its own pre-amplifier, signal processing and power amplifier.
 - Equipment shall be self protecting against transients in the input A.C. supply and against failure of any component or cable in the entire communication system.

i) Communication within a group

- To originate a call, the caller shall lift the hand set off the cradle at his station and press the page button.
- The associated loudspeaker shall get muted to prevent acoustic feedback. A call gong shall be heard over all other loudspeakers.
- The caller shall then make his announcement and release the page button. The announcement shall be heard over all loudspeakers except those muted.
- On hearing the announcement, the called party like-wise shall lift the handset off the cradle at his station and establish two-way communication over party channel.
- Party channel busy lamp shall be lit up at other stations as soon as the channel is in use.
- Loudspeaker associated with any station engaged in party channel conversation shall be free to receive any paging announcement.
- In addition, switch shall be provided at each handset to mute the associated loudspeaker, if required, when engaged in party channel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[22]	29.09. 2015

- The system shall have provision to ensure that any number of stations can join in conference on party channel.

ii) Communication between Masters

- To initiate a call, the calling station shall operate the selector switch corresponding to the desired station.
- At the called station, a buzzer shall sound and a lamp corresponding to calling station shall glow.
- The buzzer can be muted but the lamp stays lighted till the calling party reset his switch.
- To attend a call, the called party shall also operate the relevant selector switch at his station.
- The call is now established and communication can now proceed in duplex mode over the handsets.
- After the call is over, the selector switch at both stations shall be reset to terminate the call.
- It shall also be possible to have conference facility, if required by calling other stations through relevant switches.

1.6.1 System Features

1. The system shall be of distributed amplifier type using latest state of the art technology.
2. The system shall be designed for perfectly clear and intelligible speech communication and shall have high operational reliability under adverse environmental conditions including high noise level (90 to 110 db)
3. The system shall be designed for two channels of communication i.e. in paging and private modes. In paging mode the announcement from any station shall be heard at all other stations in the respective system through respective loudspeakers while in private mode close-talk communication shall be possible between two or more stations.
4. The proposed system shall be configured as an open line system.
5. The system shall be provided with call attention tone facility preceding all paging / announcement calls.
6. Each loud speaker talk back station shall be provided with indication such as power ON, channel busy, paging control, private control etc.
7. The system shall have provision for automatic muting of the associated loudspeaker in the paging / announcement mode to avoid acoustic feedback.
8. The system shall have the facility to have interconnection with the telephone exchange for speech communication in private mode and paging mode.
9. The system shall be of modular construction for easy expansion of subscriber stations as and when required without affecting the installed equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[23]	29.09. 2015

10. The system shall be designed for continuous reliable operation and of rugged construction to withstand shock and vibration

11. The system shall be suitable for operation from a centralized 240 V +/- 10%, 50Hz +/- 5%, single phase AC mains power supply. Power supply cable shall be drawn to each subscriber location from this centralized source for each system.

1.6.1.1 Establishment of a call

1. Any person calling to communicate with another person has to go to the nearest subscriber station, lift the handset, press the “page” switch and call for the desired person.
2. A call attention gong automatically precedes the paging announcement. The paging announcement is heard on all the loudspeakers of the system except that of the calling station. After the announcement the calling person releases the “page” switch and waits for the response of the called person.
3. The called person can go to the nearest station and communicate with the calling person directly in private mode by simply lifting the handset.
4. A third person can join the conversation in conference mode. During the private mode the associated loudspeakers are free to receive paging announcement generated by other stations.

1.6.2 Equipment Details

Each system shall be distributed amplifier type and broadly consist of (but not limited to) the following:

1. Subscriber station of both desk and outdoor (pole/wall/structure mounted) type complete with built-in amplifiers, additional extension amplifiers (if required), microphones etc. as per the requirements.
2. Industrial horn type / box type loudspeakers.
3. Power supply unit.
4. Interconnecting cable networks comprising power supply cable, signal cable, loudspeaker cables, junction boxes, cable termination devices, mounting accessories & other erection accessories for the system.

1.6.3 Subscriber Stations

The subscriber stations shall be indoor desk or outdoor wall / pole mounted type as per the requirement. Desk mounted subscriber stations conforming to IP 52 shall be used in control rooms, offices, etc. while outdoor stations conforming to IP 55 shall be used for shop floor areas and outdoor applications.

The desk mounted subscriber station shall broadly comprise a desk top hand set station, an extension amplifier and false ceiling type box type loudspeaker. The desktop hand set station shall consist of line amplifier, signal processing unit, function switches, indicating lamps, etc. all housed in polystyrene case. The wall mounting type extension amplifier shall consist of a power supply unit and a plug in type power amplifier electronic module.

The pole / wall / column mounting subscriber station shall have die cast aluminum alloy (LM6) housing conforming to IP 55 and shall broadly comprise line amplifier,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[24]	29.09. 2015

page / private channels and other functions, noise canceling microphone and receiver hand set, etc. all housed in the above mentioned housing. In addition the outdoor subscriber station shall be provided with dust, weatherproof protection cover suitable for outdoor installation. The re-entrant horn type loud speaker shall be used in conjunction with these stations.

Pilfer proof subscriber stations shall be considered for all outdoor locations where there is scope of pilferage. The subscriber station shall also have provision for direct plugging in additional higher wattage amplifier to raise the power output wherever required.

The press to talk (PTT) micro switch shall be provided in the handset itself. It shall be designed in such a manner that only when this micro-switch is pressed the microphone shall be ON. The PTT micro switch in the handset shall disconnect the line amplifier power supply to cutoff idle current in addition to cutting of microphone.

1.6.4 Amplifiers

The amplifiers shall be fully solid state using integrated circuits/ semiconductor devices and shall generally have a frequency response characteristic of +/- 3 dB between 60 Hz to 10 KHz and the response shall drop off sharply beyond the speech frequency zone to achieve maximum intelligibility under higher noise level conditions.

The design of the amplifiers shall be such as to limit the effects of external interference. It shall essentially be free from hum and have a total harmonic distortion of not more than 5% at full output.

The amplifier dynamic characteristic shall accommodate the entire dynamic range of sound signal and shall provide optimum fidelity ensuring faithful sound reproduction.

The amplifier shall be of suitable wattage and impedance to match with the speakers connected to it. The amplifiers shall be designed to operate from power supply with voltage variation of +/- 10% without much variation in output or gain. The amplifier PCB card shall be of modular construction for easy replacement.

1.6.5 Microphone

Microphone shall be of robust construction matching with amplifier input. It shall be of noise canceling type with proper directional response pattern to suppress ambient noise.

It shall be designed to limit the non-linear effects caused by external interference due to magnetic fields, mechanical vibration and wind. The microphone shall be immune to the stray magnetic fields and mechanical vibration.

It shall be provided with a gooseneck / suitable mounting / fist type for the indoor stations and shall be in built in the handset for outdoor stations.

1.6.6 Loudspeakers

The loudspeaker shall have uniform sensitivity and low frequency cutoff having suitable directional response pattern for efficient and high quality speech reproduction.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[25]	29.09. 2015

It shall match the output of the amplifier. Necessary line matching transformer shall be provided for each loudspeaker. The loudspeaker shall be either industrial re-entrant horn type [(conforming to IP 55) or box type (conforming to IP 52)] depending upon the location where the station shall be used. The indoor box type loudspeaker shall be housed in sheet steel enclosure suitable for wall mounting.

The industrial horn type loudspeaker shall be weather proof version of die cast aluminum body with sturdy mounting bracket suitable for mounting on pole / wall /column. The driver unit shall be concealed in the horn to prevent damage due to environmental conditions and pilferage.

Peak output power shall be 10 watts for indoor box loudspeaker and 15 watts for outdoor industrial re-entrant horn type loudspeaker. Indoor false ceiling speakers shall be provided in control rooms, meeting halls etc wherever required.

1.6.7 Power Supply

The equipment shall be suitable for operation from a centralized power supply. Contractor has to tap the supply for his equipments with necessary cabling.

The power supply equipment shall be provided with protections against short circuit, over voltage, under voltage and transients.

1.6.8 Wireless Full Duplex Public Address System

The radios for the wireless duplex public address stations shall comprise of two way wireless Radio, with suitable Power supply and High gain Omni Directional Antenna, with a Industrial type, Heavy duty amplifier and a suitable Duplex filter to interface both the radios and the wireless public address stations shall be installed at suitable number of locations.

All the wireless public address system stations shall be provided in different places like machines, junction towers etc. The equipments shall be integrated with an Industrial type Horn for clear and loud communication. All the equipments except the horn shall be mounted in a suitable MS enclosure.

The stations shall be equipped for talk back facility with Press to Talk Fist Mike. The radios used shall be of MIL grade type to withstand the Industrial exposure. Individual announcement shall be possible by selective dialing of any station. All call announcements shall be possible.

The Antenna shall be of weatherproof type to avoid Electrical interferences and Lightning problems.

Features

- The Wireless PAS shall cover about 3 kms talk back range.
- Talk back shall be possible.
- It shall be possible to interface with the existing wireless units in the similar frequency band.
- The stations shall be portable and hence shifting shall be easy.
- All calls shall be in full Duplex mode.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[26]	29.09. 2015

1.6.9 Cables for the LSTB Systems

The signal cables shall be separated from wiring of any other circuit of high voltage. When the cables are to be laid in the existing electrical cable trays of the conveyor galleries, sufficient space shall be maintained from the cables of the high voltage circuits.

Each subscriber station shall be connected to the power supply unit through a separate cable network using 3 core power supply cables. The loudspeaker cable shall be twisted pair.

Armored FRLS PVC cable shall be used when the cable is to be laid in the existing trays in cable tunnels / overhead cable galleries / overhead cable trays.

The contractor shall furnish the specification of the signal cable, power supply cable and loudspeaker cable proposed to be used in the system.

All cables used shall be made up of annealed high conductivity multi strand solid copper conductor.

All PVC armored cables shall be fire retardant low smoke type (FRLS Type) having protective system of inner and outer sheath specially designed with thermoplastic or thermosetting materials having superior resistance to ignition and flame propagation with smoke emission and toxicity or corrosive characteristics. The cable shall conform or corrosive characteristics.

The cable shall conform to the following stands:

- IEC –332 (Part 1)
- IEEE – 383
- IEC – 332 (Part 3)
- BS – 4066
- Swedish chimney test as per SS 4241417.

1.7 General Announcement System

The general announcement system shall facilitate for announcement / paging over 100 number of loudspeaker distributed all over the plant complex. All the *[100 nos. of speakers]* shall be provided in different places at TG hall, mill area, boiler floors, switchgear rooms, and common facility area.

The system shall be central amplifier type. The amplifiers shall be located in the telephone exchange premises and the amplifier shall be integrated with telephone exchange to make announcement from any of telephone line& should be interconnected with wireless base station for Walky-talky announcement. An announcement point shall be installed in the Main Plant control room if required.

The amplifier shall have the capacity of suitable output power inclusive of 100% stand-by capacity.

The announcement / paging shall normally be made from the main plant control room with provision of a second announcement point in the shop in charge's office.

The loudspeaker shall be operated group wise or all at a time depending upon the requirement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[27]	29.09. 2015

Two such systems, each having the requisite number of loudspeakers shall be provided for Unit I and Unit II for announcement of instructions and smooth flow of information between process points.

1.7.1 System Feature

General Announcement System shall have the following features:

1. The general announcement system shall ensure quality performance using the latest technology in design and manufacture of audio equipment.
2. The system shall facilitate near total reproduction of original speech or music and shall guarantee trouble free operation.
3. The system shall adopt modular construction. The amplifier rack shall be provided with input and output terminals. All connectors shall be of ELMAX type.
4. The system shall be switched on through press-to-talk (PTT) switch provided on microphone assembly, which has to be provided in main control room.
5. Suitable protection of the system against accidental wrong connection, over loading, short circuit etc. shall be provided.
6. The equipment shall be of rugged construction to withstand shock and vibration. The system shall be capable of withstanding extreme conditions of temperature and humidity.
7. The equipment shall be suitable for operation from 240 V +/- 10%, 50 Hz +/- 5%, Single phase, AC main power supply. The power supply equipment shall be provided with protections against short circuit, over voltage, under voltage & transients.

1.7.2 System Equipment

Each of the system shall broadly consist of Amplifier rack housing preamplifier, power amplifier including working and standby capacity of **[1000 W]** each with changeover facility, monitoring facilities etc.

1.7.3 Microphone Assembly

Loudspeakers (re entrant horn type / indoor box /False ceiling type) complete with mounting accessories such as poles, mounting brackets.

Cable network comprising cables, wires, junction boxes, cable termination devices, GI pipes/conduits, and all other cable laying accessories.

1.7.4 Power Amplifier

The amplifier shall be fully solid-state modular type using semiconductor devices.

The amplifier dynamic characteristics shall accommodate the entire dynamic range of the sound signal and shall provide optimum fidelity ensuring faithful reproduction of speech and music.

The stability of gain shall be fairly high. Reliable and quality components shall be used in its construction to prevent drift in their characteristics.

The amplifier shall be provided with easy to operate filter type volume and tone controls and potentiometer adjustment facility to regulate its input sensitivity.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[28]	29.09. 2015

The amplifier shall be provided with variable high frequency boost for increased clarity of speech and music.

Power Amplifier Shall Have the Following Features-

- *[No. of channels – min. 4]*
- User adjustable input sensitivity for each channel.
- Low distortion, wide bandwidth.
- Electronic protection against overloads.
- Multiple output taps.
- *[Transformer coupled output 70V, 100V.]*
- Individual speech filters for each channel.

1.7.5 Thermal Protection

The amplifier shall be cascaded to have call facility for calling all speakers using selector switches.

1.8 Audio and Video Conference Equipments

1.8.1 General

Supply and installation of Public Address Audio and video conference microphones units in built with monitor amplifier and speaker (corded and cordless type), AF Power controller unit, Power amplifiers, hand held wireless mic, collar type wireless mic, speakers, mic cables, LCD Projector, PA Microphone, DVD Player, LED TV Set with all other accessories to conduct meetings/ seminars/ presentation.

1.8.2 Chairman and Delegate Mic (Cord Type) Units In Built With Monitor Amplifier and Speaker

The chairman and delegate mic units shall be suitable for indoor Conference / meetings / seminars and shall have the following features:

1. The mics shall be indoor desktop type to place freely on the conference table.
2. It shall have ON / OFF and indicator button and also it shall have LED to indicate Mic is ON.
3. The chairman mic shall be prior than delegate mics. It shall have power to cut delegate member's speaking.
4. The mics shall have inbuilt speaker inside with monitor amplifier and echo – control function.
5. When the Mike is being used, the inbuilt speaker shall automatically become silent in order to prevent echo.
6. The required signal cables to connect all the chairman mic and delegates mic with connect boxes shall also be supplied.
7. The mics units shall be supplied with required all other accessories to connect for complete conference.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[29]	29.09. 2015

1.8.3 Chairman And Delegate Mic (Cordless Type) Units In Built With Monitor Amplifier And Speaker

The chairman and delegate wireless type microphones shall be ideal for Boardroom & meeting hall. It shall be possible to operate minimum 4 nos. of mics simultaneously without any frequency interference among the mics. It shall have crisp and clear sound.

The chairman and delegate mic units shall be suitable for indoor Conference/meetings/seminars and shall have the following features:

1. The mics shall be indoor desktop type to place freely on the conference table.
2. It shall have ON / OFF and indicator button and also it shall have LED to indicate Mic is ON.
3. The chairman mic shall be prior than delegate mics. It shall have power to cut delegate member's speaking.
4. The mics shall have inbuilt speaker inside with monitor amplifier and echo – control function.
5. When the Mic is being used, the inbuilt speaker shall automatically become silent in order to prevent echo.
6. The mics shall be supplied with required Receiver, Power control unit and all other accessories to connect for complete conference.

1.8.4 AF Power Control Unit

1. The power control unit, which has to be, connected to the above chairman and delegate mics shall be latest state of art, solid-state amplifier unit and shall have the following functions.
2. It shall have multi – conferences power source provider and signal enlarger system.
3. It shall have connectivity to connect one chairman microphone, and 20Nos delegate member's microphones.
4. It shall have 4-balanced mic input signals and 2 sets of Aux. output for recording or amplification.
5. It shall be possible to control chairman and delegate member's monitor speaker volume.
6. Aux volume button, mics Volume button, treble tone control button, Bass tone control button.
7. It shall be possible to combine pre amplifier and power amplifier function and connect other speakers directly.
8. It shall have voice control feature when all microphones have no input signal then member mics shall automatically turn off after 30 – 45 sec. or adopt open system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[30]	29.09. 2015

1.8.5 Power Amplifier (500 W)

The Power amplifier shall be highly versatile, extremely efficient, high power low distortion, solid-state amplifier. It shall be designed for continuous service and high performances reliability for sound reinforcement. The amplifier also isolate low current, low voltage circuits from high voltage elements. It enhances sonic purity and provides demonstrably superior performance. It shall deliver 500 watts (RMS) at less than 1% distortion and is ideal for use where high power and reliability are required. The unit shall operate from 230V AC (50Hz). The audio power supply capacity is designed to deal with most awkward dynamic load usually associated with real life loudspeakers and these contribute to the amplifiers excellent transient handling capability.

Features

- 500W continuous RMS output.
- Quasi-complimentary, high speed, capacitor coupled output stages.
- Fully protected against accidental short circuits, DC offsets.
- Generous convection cooled heat sinking.
- All heavy-duty chassis.
- Immunity of RF interference.
- Ideally suited for public address and quality sound reinforcement application.
- Protection from short circuit and overload.

1.8.6 VHF FM Wireless Hand Held Mic With Receiver Base Unit.

The excellent response and inbuilt protection against breath and wind noise with capability to capture sound from long distance and wide area ideal microphone for speech in the frequency range of VHF FM operation. Ideal for indoor / outdoor stages, Lecture Halls, Entertainers, TV, Interviewers etc.

- Frequency stability shall be better than +/- 5PPM.
- R F Power output shall be better than 20 milli watts.
- Effective in a range 50-100 feet.
- Standard Battery operation.
- LED indication for correct turning.
- Receiver audio output level shall be better than unbalanced 0-30 mV.
- Receiver unit shall work on 230 volt 50 Hz ac supply.]
- Telescopic Antenna in the receiver for clear and distortion free reception.

The wireless hand held type microphone shall be supplied with necessary wireless receiver/base unit, AC power supply unit, antennas, connect cables etc.

1.8.7 VHF-FM Wireless Coller Type Mic with Receiver Base Unit.

The excellent response and inbuilt protection against breath and wind noise with capability to capture sound from long distance and wide area ideal microphone for speech in the frequency range of VHF FM operations.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[31]	29.09. 2015

- [Effective in a range 50-100 feet.]
- Ideal for stage, Lecture Halls, Entertainers, TV Interviewers etc.
- Standard Battery operation.
- LED indication for correct turning.
- Telescopic Antenna in the receiver for clear & distortion free reception.

The wireless collar type microphone shall be supplied with necessary wireless receiver/base unit, AC power supply unit, antennas, connect cables etc.

1.8.8 PA Microphones:

The excellent response and inbuilt protection against breath and wind noise with capability to capture sound from long distance and wide area ideal microphone for speech & Music.

1.8.9 Microphone Stand

The mic stand shall be floor mounting; self support type functional and resistant to superior quality to hold the above PA mics. The bottom of the stand shall be round type plate to hold the stand. The height of the stand shall be adjustable type. The stand shall be supplied with necessary holders to hold the above PA mics.

1.8.10 Column Speakers

The column speakers shall be with well-defined sound beaming pattern, and shall be ideally suited for Auditorium sound system to reduce unwanted reflection & acoustic feedback. It shall offer improved speech clarity even under different acoustic condition.

Necessary clamp shall also be supplied to fix the column speaker on wall / column.

1.8.11 False Ceiling Speaker

The ceiling speaker to meet the requirement for indoor public address or background music system installation. The unit combines a highly efficient cone speaker with an ABS plastic cover attractive design to suit any décor.

1.8.12 Horn Type Loud Speakers

[Horn type outdoor use where noise level is high. 30 Watts, 70V/100V VFT driver unit for use with a Re-entrant Reflex Horn].

1.8.13 Mic Cables and Signal Cables

The mic and signal cables shall be flexible, multistrand, shielded type for connecting the above mics.

1.8.14 LCD Projector

The LCD projector shall be state of art equipment and the quality shall support standards of RJ 45 network, TCP/IP protocols. The LCD projector shall be of high-resolution data with more than 3000 ANSI using micro lens array. It shall withstand vibrant, and shall be rich audio in focus quality video. The data projector shall be easily portable and compact size to give presentation for conference programmes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[32]	29.09. 2015

The projector shall support USB and PS/2 for mouse control, HDCP and digital video, wireless remote control mouse, RAM memory stick, laser pointer and backlit function for perfect presentation. A screen shall be supplied along with self supporting stand.

The LCD Projector Shall Have The Following Feature:

- IBM, VGA, S.VGA, XGA, S.XGA compatibility.
- HDTV, NTSC, PAL, SECAM standard video compatibility.
- High performance metal halide DC lamp.
- Simple setup and easy operation.
- Digital zoom function.
- Contrast brightness over lamp life time.
- Perfect picture quality in video and data.
- High resolution.
- Automatic keystone correction.

1.8.15 Specification for Portable DVD/VCD Player

1. The audio and video CD player shall be of portable type with play back control and remote control model.
2. The CD player shall function for NTSC,PAL video signals. The DVD/VCD player shall have the following features and controls:
3. Menu button, display, play, pause, stop, head phone jack, audio output terminal, video output terminal, microphone jack etc.
4. The remote control unit shall have the following features and controls:
5. On screen Display button, repeat, voice, stop, recall, program, clear, selection forward, selection previous, pause buttons, numeric buttons etc.
6. The VCD player shall work on 230 Volt.50Hz A/C supply.
7. The DVD/VCD player shall be supplied with all accessories like power cord, AC to DC converter, remote control unit, carrying case etc.

1.8.16 Technical Specification for LED Television Set

1. The LED TV set shall have been the latest band and screen. The size of the screen shall be 48 inches. A remote control unit shall control the TV set. The remote control unit shall have all functions like, band selection, auto tune, memory, timer, on screen display of commands etc.
2. The LED screen shall have input terminals of serial, parallel ports, USB ports, and shall have TV tuners, audio in, audio out, video in, video out terminals / jacks etc.
3. The LED TV set shall be supplied with necessary power cable, audio, video cables, remote unit, operational manual etc.

1.9 Cable Laying Specification

1.9.1 General

Cable shall be laid on the cable tray/racks of concrete cable trench / cable channels / cable tunnels. Wherever such facilities are not available the cable has to be buried directly in underground trench by the contractor. PVC casings shall be used for all

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[33]	29.09. 2015

indoor cables and clamped along structure or buildings as per the site conditions and requirements.

For interplant cabling communication cables shall be generally be laid in the manner as follows:

- Laid on the racks of the interplant concrete cable trench
- Directly buried in underground trench
- On the racks of the underground cable tunnels
- On racks / trays of the overhead cable galleries
- In concrete ducts / pipes buried in ground where direct burial are not possible due to presence of other service lines
- Directly on the walls / structures by clamping the cable on to the walls / structures.

Armored PVC cable shall be used when the cable is to be laid in concrete cable trench / cable tunnels / overhead cable galleries / directly clamped on the walls or structures.

For internal distribution purposes the cables from the distribution box to the individual subscriber, the cables shall be laid in the following manner:

- In office buildings for unarmored communication cables shall generally be laid through PVC casing / concealed conduits embedded in walls.
- In shop floors, sub stations, control rooms etc. communication cables shall generally be taken either through surface conduits along wall / structure or through concealed conduits embedded in wall. The conduit shall be hard PVC
- Joint markers shall be provided at every joint on the cable.
- Where cables are required to cross under roads, surface drains and pipelines, they shall be taken through GI pipes/Hume pipes.
- Whenever cables are entering inside the buildings, they shall be specially protected by means of GI pipe. After cable laying these shall be sealed with bitumen or epoxy compound to make them fully watertight and vermin proof.

1.9.2 Laying Of Cables on Walls & Structures

Perforated aluminum tray with angle iron support shall be provided (wherever required) for cable laying.

[Smaller size cables shall be clamped onto the walls / structures. Clamps shall be provided at 1 meter interval.

Plastic / aluminum cable ties shall be provided at one meter interval.

Cable identification tags on fiber glass / aluminum with nylon cord shall be provided at every 15 M interval.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[34]	29.09. 2015

1.9.3 Laying Of Cables in GI Pipes

Only one cable shall be taken in on pipe in the case of laying cables through GI pipes / conduits. When it is found desirable to install several cables in one pipe total section of cable shall not exceed 40% of the GI pipe internal cross section.

1.9.4 Laying Of Pipes / Conduits

1. All conduits / pipes shall be neatly run and evenly placed.
2. Jointing of conduits / pipes shall be done only in straight portions the contractor shall have at site bending facility for conduits / pipes and dies for threading of conduits / pipes.
3. Junction boxes shall be provided after every 10M run of conduits / pipes, at every bend, at every location where the telephone provision is envisaged.
4. Ends of conduits shall be provided with threads so that DBs / CTBs / conduits / accessories can be attached at a later date.
5. No separate bend pieces shall be used, pipes / conduits shall be bent wherever required.
6. The bending diameter shall not be less than six times the diameter of the conduit / pipes.
7. Exposed portion of the thread shall be painted with non-corrosive paint.
8. The end threads of conduits which shall be left for extension / mounting of accessories shall be protected with grease or any other lubricant to prevent rust / corrosion.
9. 16 SWG steel wires shall be provided inside each conduit for pulling cables.
10. Conduit shall be laid concealed in wall / column at a height of 200 mm from finished floor level.

1.9.5 Installation of Distribution Boxes:

Grouting of the support / welding to iron structures, with frames, shall be done wherever necessary. Cables shall be tested at both the ends after termination.

Junction Boxes

Junction Box shall have ELMEX type connectors. Necessary holes for cable entry for power and signal cable to be provided at the bottom of the Junction Box.

1.10 Installation of Equipment and Commissioning

1. The contractor shall be fully responsible for the satisfactory erection, testing, commissioning, start-up and trial operation of the communication system's equipment and its associated cable network.
2. All erection, testing & commissioning work shall be carried out in accordance with the requirement specified in this tender document, the standard recommended practices and best workmanship. All work shall also comply with standard norms and practices adopted by the purchaser and respective State / Central Government authorities.
3. For complete erection, testing and commissioning, the contractor shall bring all installation aids/ material, consumables, tools, test equipment and qualified and experienced personnel, in order to carry out the job successfully. A list of the same shall be furnished to the purchaser for review.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[35]	29.09. 2015

4. All technical personnel assigned to the site by the contractor must be fully conversant with the system hardware and software.
5. The contractor shall provide and maintain an office at the site during installation, testing and commissioning stage for his staff.
6. The contractor shall make his own arrangement at his own cost for the transport of his own staff and labour to and from the site of works.
7. Appropriate storage of the materials to be supplied shall be arranged by the contractor at the site. The contractor's responsibility shall also include safety and security of the equipment at site.
8. On completion of erection and installation of all equipment, and before start up, each item of the system shall be jointly inspected by the purchaser and the contractor for correctness and completeness of the installation and acceptability to start up leading to commissioning tests.
9. The list of commissioning tests to be performed shall be mutually agreed upon and included in the contractor's quality assurance plan.
10. The commissioning spares for all items / equipment shall be included along with the commissioning services. The consumables required during the commissioning of the system shall be included as part of the commissioning spares.
11. Requisite factory and site test reports shall be supplied by the contractor.

The contractor's scope for testing and commissioning shall also include.

- Preparation for commissioning including time and personnel planning.
- Provision of all necessary measuring instrument / test equipment and qualified personnel.
- Preparation of final commissioning report.
- Demonstration of satisfactory working of the offered systems and cable networks.
- Dissolution of commissioning site and handing over of balance materials at owner store.

2.2 Telecommunication Cable Specification

2.2.1 Telecommunication Cables (Voice & Data)

**Table: 2.4
STP Outside Plant Cable (Copper)**

S.No.	Property	Specific Requirement
1	Conductor	Solid annealed copper; 22 AWG (0.64mm)
2	Insulation	High density polyethylene
3	Pairs	Twisted Pairs
4	Shielding System	ASPIC-F/CASPIC-F
5	Cable Assembly	25 Pair binder; North American Color coding; PMP filling compound.
6	Core Covering	Non-hygroscopic dielectric tape.
7	Jacket	Virgin, black, high molecular weight low density polyethylene.
8	High Voltage Test (dc Voltage for 3 seconds)	
	a) Conductor to Conductor	5000 Vdc
	b) Conductor to Shield	15000Vdc
9	Capacitance Unbalance (pF/km)	
	a) Pair to Pair (less than 12 Pairs)	181(pF/km)
	b) Pair to Pair (larger than12 Pairs)	45.3(pF/km)
	c) Pair to Ground (less than 12 Pairs)	2655(pF/km)
	d) Pair to Ground (larger than12 Pairs)	656(pF/km)

Tender Document for R&M of Unit No.[..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
---	--------------------------

S.No.	Property	Specific Requirement
10	d-c Cond. Res. @20°C	58(Ω/Km)
11	Resistance Unbalance (Max. Ave.)	1.50%
12	Mutual Capacitance Deviation, Max.rms	3%
13	Ave. Mutual Capacitance:	
	a) less than 18 Pairs	52±4 nF/Km
	b) larger than 18 Pairs	52±4 nF/Km
14	Far end Cross Talk loss:150KHz@20°C dB/Km.	
	a) rms minimum	67.8 dB/Km.
	b) Minimum Individual	57.8 dB/Km.
15	Insulation Resistance@20°C/Megohm-Km	16000 Megohm-Km

2.2.2 UTP Distribution Cable (Voice and Data)

- a) Distribution Cable (for voice)
- Unshielded Twisted Pair (UTP)
 - 100 ohms; solid conductor
 - 4-pair x 23 AWG
 - Shall meet Category 6 cable specification
- b) Distribution Cable (for data/indoor type)
- Unshielded Twisted Pair (UTP)
 - 100 ohms; solid conductor
 - 4-pair x 23 AWG
 - Shall meet Category 6 cable specification
 - Ratings shall be in accordance with specific area classifications
- c) Distribution Cable (for data/outdoor type)
- Unshielded Twisted Pair (UTP)
 - 100 ohms; solid conductor
 - 4-pair x 23 AWG
 - Shall meet Category 6 cable specification for outdoor application.
 - Ratings shall be in accordance with specific area classifications

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[45]	29.09. 2015

Table: 2.5
UTP Distribution Cable (Voice and Data)

S.No.	Property	Specific Requirement
1	Conductor	Solid annealed copper; 24 AWG (0.50mm)
2	Insulation	High density polyethylene
3	Pairs	Twisted Pairs
4	Shielding System	Category 3-CMR/CMP
5	Cable Assembly	25 Pair binder; North American Color coding
6	Core Covering	Non-hygroscopic dielectric tape.
7	Jacket	CMR-Flame Retardant PVC (Polyvinyl Chloride); CMP-Low Smoke FR-PVC (Polyvinyl Chloride).

2.2.3

Specifications of Optical Fiber Cables (OFC)

- OFC shall be installed on cable tray, duct bank, cable trench installation as necessary. For outdoor applications the cable shall be armoured with Poly Ethylene sheathing. In all cases cable shall be routed through suitable grade HDPE permanently lubricated protection pipe as per IS-4984, IS-12235 & TEC.G/CDS-08/01 of suitable size @ 53% fill factor.
- The optical fiber core shall be of ultrapure fused silica glass coated with UV cured acrylate suitable to withstand temperature of about 80 deg. Centigrade continuously.
- OFC shall be 4 / 8 / 12 core, galvanized corrugated steel taped armored, fully water blocked with dielectric central member for outdoor / indoor application so as to prevent any physical damage. The cable shall have multiple single-mode or multi-mode fibers on as required basis so as to avoid the usage of any repeaters. The outer sheath shall have Flame Retardant, UV resistant properties & to be identified with the manufacturer's name, year of manufacture, progressive automatic sequential on-line marking of length in meters at every meter on outer sheath.
- The cable core shall have suitable characteristics and strengthening for prevention of damage during pulling viz. steel central member, Loose buffer tube design, 4 fibers per buffer tube (minimum), Interstices and buffer tubes duly filled with

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-C	[46]	29.09. 2015

Thixotropic jelly or better material etc. The cable shall be suitable for maximum tensile force of 2000 N during installation, and once installed, a tensile 1000 N minimum. The compressive strength of cable shall be 3000N minimum & crush resistance 4000 N minimum. The operating temperature shall be -20 DegC to 70 DegC.

5. The splicing loss of any two fibers in any case shall not exceed 0.10db/splice.
6. The total additional attenuation above the nominal attenuation due to regular splices, repair splices, connectors, temperature variation, ageing etc. shall be indicated.
7. Fiber coloring shall conform to EIA/TIA-598. The color-coding shall be permanent thus withstanding normal handling; e.g., during termination, testing, or cable relocation. Refer to EIA – 359 for color identification and coding.
8. Cables shall be designed & tested in accordance with ISO 11801, TIA-568 & ICEA 596 and Performance specifications shall be measured in accordance with the Fiber Optic test procedures(EIA/TIA -455 documents) test procedures of IEC-60793 & IEC-60794
9. The OFC shall generally conform to the following specifications:

Table 2.6
Specifications for Single Mode Optical Fiber

S.No	Feature		Minimum Requirement
1	Maximum Un-cabled Attenuation Coefficient	@ 1310 nm	0.4 dB/km
		@ 1550 nm	0.3 dB/km
2	Mode field Diameter	@ 1310 nm	9.2±0.4 µm
		@ 1550 nm	10.4±0.8 µm
3	Maximum Cable Cut-off Wavelength		1260 nm
4	Maximum Zero Dispersion Wavelength		1321.5 nm
5	Minimum Zero Dispersion Wavelength		1301.5 nm
6	Maximum Zero Dispersion Slope		0.092 ps/nm ² ·km
7	Maximum Polarization Mode Dispersion		0.2 ps/√ km
8	Gigabit Ethernet Length 1000BASE-LX		2-5000 mtrs.
9	Ten Gigabit Ethernet Length	10GBASE-LX	2-10000 mtrs.
		10GBASE-LX4	2-10000 mtrs.

1 CIVIL, STRUCTURAL & ARCHITECTURAL WORKS

1.1 Introduction

This specification covers the design, preparation of general arrangement, construction as well as fabrication drawings, supply of all labour as well as materials and construction of all civil, structural as well as architectural work on EPC basis for Renovation and Modernisation of Electrical Balance of Plant structures for the existing [Name of project...] of [210/215/220/250] MW capacity. Description of various items of work under this specification and nature of work in detail are given hereinafter. The complete work under this scope shall be as per Volume-II, Section-I, CIVIL SCOPE OF WORK.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[1]	25.09.2014

2 [BUILDINGS & STRUCTURES

Design and construction of new buildings, structures, foundations etc. as well as repairing / retrofitting of existing buildings, structures, foundations shall take into account requirement for operation and maintenance of all equipments and its users. The buildings will have good architectural features. The surrounding areas shall be properly micro levelled and graded. The architectural design concept of buildings structure shall be evolved considering the functional, technological and other requirements for efficient operation ensuring comfortable working environment for personnel, satisfying the aesthetic requirements. Special care shall be taken to provide elegance and aesthetics, with effective use of appropriate treatment, materials fittings and finishes.

- *Due consideration shall be given for adequate natural lighting and ventilation for both plant and non-plant buildings.*
- *Retrofitting / repair works / new constructions shall not cause damage to the existing structures. The temporary supports shall not be allowed on the existing structures for any of these works unless the loads are minor and may not cause any damage to any existing structure. However in such a case Bidder shall take approval from the Owner/Consultant prior to initiating the work.*
- *Internal finishes shall be provided with latest available materials approved by Owner/Consultant with due consideration of the functional aspect of the area.*
- *External finishes shall be provided with latest materials approved by Owner/Consultant for improving the aesthetics.*
- *The orientation of the important buildings shall be in line with the existing site condition and function as such.*
- *Each building shall have its own identity. However, a total homogeneity shall be maintained in the design of all buildings.*
- *Adequate frontage shall be provided to all important buildings to create a better visual impact.*
- *All other civil and structural buildings shall be developed in conjunction with the above aspects.*

All Civil, Structural and Architectural works of the following systems shall be covered under this package.

- a) Substation & Switchyard structures*
- b) Transformer pits*
- c) Switch Yard Control Room*
- d) Power Transformers Foundations (GSU, UAT, Etc.)*
- e) GCB foundation and supporting structures*
- f) GIS Building (if applicable)*

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[2]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

- g) Fire walls
- h) Illumination system structures
- i) Any building inadvertently left out in the above list, however required for proper functioning of the power plant as per system requirement stipulated under Electrical & IC section of this specification shall also be included.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[3]	25.09.2014

3 DESIGN REQUIREMENTS

3.1 Location

Geographical location of the plant site is approximately between [11°34'00" N] to [11°35'00" N], Latitude and [79°26'00" E] to [79°27'00" E], Longitude.

3.2 Ground Condition

Subsurface condition: The natural ground surface level approximately varies from [60 m to 74.5 m] from MSL.

[The soil profile in the plant area can be broadly classified into 3 layers namely laterite, cemented sand and cemented silt in general as per detail soil investigation report. Top soil upto a depth ranging from 0.4 m to 0.75 m is entirely non-uniform. The underlying layer is laterite whose depth varies from 4.0 m to 5.5 m followed by deep layers of cemented silt and cemented sand].

The ground water table (GWT) at finished ground level shall be considered for foundation design purposes.

The detailed soil investigation report conducted for plant shall be made available to Bidder for required replacement / refurbishment / retrofitting of Foundations, if any.

Bidder is advised to carefully study the content of detailed Soil investigation report for the existing type of foundations and design of new ones.

The type, size, depth of the foundation shall be based on the detail soil investigation report provided by OWNER.

3.3 Climatic Condition

a) Temperature

Maximum : [.....] °C

Minimum : [.....] °C

For design purpose, maximum temperature to be considered: [50.0] °C

minimum temperature to be considered: [.....] °C.

b) Rain fall

Minimum : [..... mm in May]

Maximum : [..... mm in October]

Peak hourly rain fall: [....mm] (corresponding to 50 years return period)

[Note: Maximum per day rainfall as per weather report has been considered conservatively as peak hourly rain fall which will be used for drainage system design etc.]

Annual average: [..... mm to mm & average mm]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[4]	25.09.2014

3.4 Seismic Zone

The site is located in [Zone II] as per IS: 1893-2002. Zone factor shall be [0.10]. Importance factor shall be considered as [1.75].

3.5 Wind Zone

The site is located in wind speed zone [...] m/s] as per IS: 875 (Part 3)-1987.

3.6 Loads and Load Combinations

All new structures shall be designed and old structures requiring modification shall be checked for the most critical combinations of dead loads, imposed loads, equipment loads, wind loads, seismic loads, temperature loads, forces developed due to differential settlement and any other loading conditions which can occur during the design life of the facility.

(a) Dead Loads

Dead loads consist of the weights of the complete structure with finishes, fixtures, partitions, wall panels and all existing / modified / replaced equipments of semi-permanent nature including storage structures (Tanks, bins etc.) partitions, roofing, piping, cable trays, bus ducts etc. The content of storage structures etc. shall be measured at full capacity for this purpose.

The piping loads (for empty, operating and test conditions), cable tray loads and the contents of the storage structures shall be listed separately so that they can be excluded from dead load when dead loads are acting as stabilizing load for uplift.

The following unit weight of material shall be considered for computation of loads. Loads given in IS: 875 (part-I) shall be made use of for material not listed below.

Table 2.1
Weights of Material

Material	Unit weight (kN/m ³)
Plain cement concrete	24.0
Reinforced cement concrete	25.0
Structural steel	78.5
Brick work	19.0
Cement plaster	21.0
Floor Finish	24.0

(b) Superimposed Live Load (SILL)

Listed below is the minimum SILL for the areas involved. Floors and supporting members subjected to heavy equipment live loads shall be designed on the basis of the equipment loads specified by vendor or specifically defined SILL whichever is greater.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[5]	25.09.2014

The specific minimum floor SILL is listed below:

Table 2.2
Superimposed Live Load (SILL).

S.No	Description	SILL Value
a)	Roof	
	Flat accessible roof	1.5 kN/m ²
	Flat accessible roof with HVAC equipments, etc.	5 kN/m ²
	Flat inaccessible roof	0.75 kN/m ²
	Sloped Roof	As per code IS: 875 (Part-2)
b)	All building floors & Stairs	5 kN/m ²
c)	M.C.C. Floor	10 kN/m ²
d)	Equipment Load	As applicable
e)	Underground basement,	Surcharge of 10 kN/m ²
f)	Vehicular traffic	Surcharge of 20 kN/m ²
g)	Covers for Channels	Surcharge of 10 kN/m ²
h)	Other areas:	
	• RCC floors (Offices, laboratories, conference rooms and general floors)	5 kN/m ²
	• Balconies	5 kN/m ²
	• Chequered plate / gratings	5 kN/m ²
	• Walkways	3 kN/m ²
	• Toilets	2 kN/m ²

- In addition to LL, Hung loads for electrical, ventilation & air conditioning minimum of 0.5 kN/m² shall be considered.
- Load of 1 kN/m² shall be considered as hung load for piping unless otherwise mentioned. However, the actual loads will be as furnished by the supplier. The stringent most will be followed.
- For other areas LL shall be considered as per IS: 875 (Part-2).

(c) Seismic Load

The proposed plant is located in Seismic [Zone-I] as per IS: 1893, Seismic force on the structures will be considered accordingly.

(d) Wind Load

The proposed plant is located in Wind Speed Zone of [...] m/s] as per IS: 875 (Part 3). The wind force on the structures will be considered as follows:

Table 2.3
Wind Speeds

Description	Wind Speed
Basic Wind Speed V _b (at 10m above mean ground level)	[50 m/sec]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[6]	25.09.2014

Description	Wind Speed
Risk coefficient K1 (for 100 years)	[1.07]
Category of terrain	[Category 1]
Factor K2	As per IS: 875
Topography factor K3	As per IS: 875

For the design of structures, wind force on Equipment, supported on frame including all fixtures, piping, staircase, ladder, etc, shall be considered.

Design of structures shall be checked for the condition of wind load with gust factor.

(e) Earth Pressure Loads

For earth pressure the worst condition with dry / submerged and active, passive or at rest shall be considered. The pressure coefficient shall be adopted as recommended in Soil Report or for the backfill material used.

(f) Temperature Loads

The total temperature variation shall be considered as $2/3^{\text{rd}}$ of the average maximum annual variation in temperature. The average maximum annual variation in temperature for this purpose shall be taken as the average between the mean of the daily minimum ambient temperature during the coldest month of the year and mean of daily maximum ambient temperature during the hottest month of the year. The structure shall be designed to withstand stresses due to 50 % of the total considered temperature variation with temperature load applied with positive and negative sense.

For design purpose average maximum annual variation shall be taken as $[+50^{\circ}\text{C}]$ to $+5^{\circ}\text{C}$.

Coefficient of thermal expansion of steel shall be taken as per IS: 800 where the value is given as $12 \times 10^{-6}/^{\circ}\text{C}$. Coefficient for thermal expansion for concrete shall be taken as per IS: 456.

(g) Thermal Loads (during operating condition)

When thermal loads (such as produced by temperature changes in piping, equipment and structures) results in friction between equipment and supports (exchangers) or piping and supports, the friction force will be taken as the operating load on the support multiplied by the applicable friction coefficient given below:

Table 2.4
Thermal Loads

Description	Value
Surfaces	Friction coefficient
Rolling supports	0.05
Steel to steel	0.30 (longitudinal) and 0.10 (lateral)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[7]	25.09.2014

Description	Value
Concrete to steel	0.30

(h) Equipment Loads

Static and dynamic loads of major existing / modified / replaced equipments shall be based on the manufacturer's data of the specified equipments and shall be considered in design in addition to the live load.

Equipments to be tested for hydraulic test, tanks and piping design loading shall include hydraulic test loading. Weight of equipments, ducts, tanks, pipes, conduits, etc. supported by structure shall include maximum possible loading conditions i.e. flooded conditions and associated impacts, test loading, anchorages and constraint effects.

Air and gas duct loads shall include weight of insulation, duct attachments, dust accumulation loads, seismic, wind and other loads applicable.

(i) Cranes, Hoists, Monorail and Elevator loads

All lifting beams and monorails shall have their design loads increased for impact factor. Loads for overhead cranes, hoists, monorails and elevators shall be taken as per IS: 875.

100 % of the lifted load including elevator live load plus the cab weight shall be considered for the elevator support beam design. Pedestals in elevator pits shall be designed assuming impact factor as per IS codes.

(j) Vibration and Noise

The design shall ensure that vibrations from any moving machinery transmitted from its immediate foundations to adjacent buildings or areas of the same building shall be suppressed in accordance with the recommendations of relevant codes of practice.

(k) Other Loads

- Stresses imparted to structures due to differential settlements, variation of water table, erection and maintenance loads, creep and shrinkage shall also be considered in design of all structures.
- Roof girders / trusses in the service / maintenance bay shall be designed for crane erection loads.
- Dust loads

All buildings / structures shall be designed for a dust load of 1 kN/m² for flat roof and 0.5 kN/m² for sloped roof.

- Construction /Erection/Maintenance Loads

The integrity of the structures shall be maintained without use of temporary framing struts or ties and cable bracing as far as possible. However, construction or access considerations may dictate the use of temporary structural systems. Special studies shall be made and documented to ensure

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[8]	25.09.2014

the stability and integrity of the structures during any periods involving use of temporary bracing systems.

- Future Loads

Loads from future expansion shall be considered when so directed by the Owner/Consultant. Future loads may include any of the loads listed above.

- Surge Loads

Surge loads may occur in some vessels or equipment. In such cases, the magnitude and direction of the load shall be given by the equipment supplier.

(l) Basic Load Cases

Following basic loads shall be considered for analysis and design:

Dead load	: DL
Superimposed dead load	: SIDL
Self weight of permanent equipment	: EL
Steam piping (Static & Dynamic) & other piping loads	: PL
Cable loads	: CL
Live load on floor / walkway	: LL
Superimposed live load	: SILL
Live load on roof	: LLR
Seismic load	: SL
Wind load	: WL
Load due to soil pressure	: SP
Load due to surcharge	: SCL
Load due to hydrostatic pressure	: HP
Load due to temperature	: TL
Hoist, monorail loads	: MR1
Crane Loads	: CLR
Special loads	: SPL

(m) Load Combinations

The individual members of the frame shall be designed for worst combination of forces such as bending moment, axial force, shear force and torsion. Permissible stresses for different load combinations shall be taken as per IS: 456, IS: 800 & IS: 875 (all parts) and other relevant IS codes.

Wind and seismic forces shall not be considered to act simultaneously.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[9]	25.09.2014

Criticality of erection / maintenance loads shall also be checked separately in combination with other simultaneously occurring loads for possible design loading.

(n) Load Combinations for underground structures

- For the design of sub structure only liquid pressure from inside and no earth pressure and ground water Pressure and surcharge pressure from outside (applicable only to the Structures which are liable to be filled with water or any other liquid) shall be checked.
- For the design of sub structure combination of earth pressure, surcharge pressure and ground water pressure from outside and no water pressure from inside shall be applied.

(o) Switchyard Structures

The loading for the design of switchyard structures shall be as per IS: 802 Part 1/Sec 1:1995. Following loads shall be considered.

- Dead load due to equipment and structure
- Wind load on towers, gantries, conductors, ground wires and insulator strings calculated as per Clause 8 and 9 of IS: 802.
- Temperature effects consisting of effect of temperature variation and sag tension as per clause 10 of IS: 802
- Climatic loads as per Clause 11.2 of IS: 802
- Anti cascading loads as per clause 11.3.1 of IS: 802
- Torsional and longitudinal loads caused by breakage of conductor as per Clause 11.3.2 and 16 of IS: 802.
- Construction and maintenance loads
- Seismic loads as per IS: 1893
- Short circuit forces including "snap effect" in the case of bundled conductors

Switchyard structure shall be designed for the worst combination of above loads. The factor of safety for design of members shall be considered as 2 for normal & broken wire conditions and 1.5 for combined short circuit and broken wire conditions. Short circuit forces and wind forces shall not be considered simultaneously.

Foundation shall be designed for a factor of safety 2.2 for normal and broken wire condition and 1.65 for combined short circuit and broken wire conditions. Design of foundation shall be carried out as per IS: 4091.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[10]	25.09.2014

4 EARTHWORK AND ROCKWORK

4.1 General

This section applies to all earth and rockwork required for the replacement / refurbishment / retrofitting of existing foundations or construction of new buildings foundations (if any), any types of structure and burying service lines in the ground.

The Bidder shall satisfy himself as to the ground conditions on the site including the nature of the strata to be excavated, obstructions, possibilities of flooding and such like and shall allow for all provisions necessary to carry out the work in the most suitable manner when submitting his tender.

Generally, all buildings and structures must be founded on bearing strata which means that all excavation work for foundations shall meet the requirements of structural analysis based on the results obtained from the detailed soil investigation and of the available information and instruction given in writing by the Owner/Consultant.

Excavation shall be done to the required dimensions and shall be finished according to the specified lines and slopes, in a way acceptable to the Owner/Consultant. All necessary precautions shall be taken to cause the minimum possible alteration or disturbance to the other existing foundations, material lying under and adjacent to the excavation final lines.

4.2 Fill Materials

The fill materials used and source are to be examined and approved. Excavation materials can be used if they fulfil the requirements.

a) Select fill shall have the following properties:

Well graded (uniformity index not less than 5), non-cohesive and nearly silt free (silt content not greater than 5%; up to 10% tolerated, except below footings of structures), salt free (content less than 3%), soils free of organic matter (limit 2%). Decomposing or compressible materials shall not be used.

All materials shall be of such nature and character that it can be compacted to the specified densities in a reasonable length of time. It shall be free of highly plastic clays, of all materials subject to decay, decomposition or dissolution, and of cinders or other materials, which will corrode piping or other metal.

The intention is to use select fill below plinth, floors, roads, parking areas etc.

b) Ordinary fill shall have the following properties:

- Natural inorganic soils: salt content not greater than 5%, organic matter less than 3%. For other properties see under 'Select fill'.
- The intention is to use ordinary fill for non-built areas.

c) Special fill:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[11]	25.09.2014

- Special fill material shall be gravel or crushed rock (for other properties see under 'Select fill'). The intention is to use special fill e.g. as sub-base material for tanks.

4.3 Excavation

The works shall be excavated either by hand or by use of excavating plant and tools acceptable to the Owner/Consultant.

Last 300 mm shall be excavated by hand tools only to ensure that natural conditions of soil at foundation level should not be disturbed. In case if over excavation has been done, the depth of soil over excavated shall be filled with M10 Grade concrete and no earth filling shall be allowed to fill over excavated earth.

Also excavation by hand may be required close to existing installations, existing foundations and/or underground services, but subject to special instruction of the Owner/Consultant.

The Bidder shall carry out all kind of earth and rockwork for the following particular works as defined hereafter (where applicable):-

- Clearing and grubbing
- Excavation of topsoil
- Open cut excavation
- Backfilling
- Safety precaution during earthwork
- Mining or underground excavation (if required)
- Grading
- Replacement of material
- Trench excavation for service lines
- Embankments
- Archaeological findings

4.4 Safety Precautions

The Bidder shall be responsible for all necessary safety measures.

Proper strutting, sheeting and bracing, including re-arrangement of the installations when necessary, stabilization and protection of slopes, methods of excavation to reduce risks of slides etc shall be to the Bidder's debit. The additional moving of soil resulting from such damages will not be paid for.

4.5 Over Excavation

Bidder shall ensure that no excavation work is carried out beyond the founding level of existing nearby building/equipment. Any damage to adjoining structure/ foundation shall be rectified by the Bidder without any extra cost to Owner.

4.6 Stockpiles and Disposal

Excavated material from the works selected by the Owner/Consultant for re-use shall be placed immediately in its final position, if possible, or otherwise may be stockpiled or deposited on site as directed by the Owner/Consultant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[12]	25.09.2014

The Bidder shall not have the right either to additional payment or to claim because of work involved in stockpiling materials, re-use of for carting to the waste disposal areas. Soil unfit for re-use shall be removed to sites approved by the Owner and shall not be permanently deposited elsewhere. The Bidder shall trim and form the edges of spoil to profiles and levels as directed by the Owner/Consultant. Distance of stockpiling of excavated material from the pit edge shall be minimum 1.5 meters or half of the depth of the pit whichever is higher.

The placing of materials within the waste disposal areas shall be made in layers not exceeding 0.50 m in thickness in order to obtain an appreciable degree of compaction by means of transportation equipment and/or if required by appropriate compaction equipment.

All traffic to or from the waste disposal areas shall run over the surface of such areas in order to achieve compaction.

4.7 Preparation of Foundation

All earth surfaces against which concrete is to be poured, shall be clean and free of any detrimental impurities, organic matter or unsuitable material. Immediately after excavation, all such surfaces shall be moistened and treated as directed by the Owner/Consultant and then protected by means of a lean concrete layer, 7.5 cm or PCC thickness as shown in the design drawings, whichever is greater. No concrete is to be poured until formation is inspected and approved by the Owner/Consultant. No structural concrete shall be poured against earth surface. Shuttering shall be used at sides and PCC shall be provided below foundations.

4.8 Backfilling

Foundations and structures shall be backfilled with approved material compacted in layers not exceeding 150 mm by suitable equipment upto the required designed levels. Compacting shall be carried out with special care by means of pneumatic or mechanical rollers or other compactors of a type previously approved by the Owner/Consultant.

Density requirements as per standard Proctor Test shall be in accordance with relevant parts of IS: 2720 and all tests shall be made by/on under the supervision of Owner/Consultant at Bidder's own expenses, at optimum moisture content:

- a) Backfilling of foundations and under grade slabs - 98%
- b) Under roadways and parking areas - 98%
- c) Embankment - 95%

The thickness of fill layers, number of passes and type of equipment to be used shall be proposed to the Owner/Consultant after compaction tests have been made.

Surfaces receiving fill layers shall, if smooth, be previously scarified to obtain a good key between the new fill layer and the sub-grade.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[13]	25.09.2014

Backfilling of foundation work with approved materials shall be carried out only after foundations have been inspected by the Owner/Consultant.

4.9 Soil Replacement

The material to be used for replacement of soil shall not contain soluble or swelling components such as clays, or organic matters. Sand gravel mixtures of favourable grain size distribution shall be used in exchange. The suitability of soil for its use for filling shall be as per provisions of Indian Standards.

Prior to the commencement of work, three samples shall be taken from the anticipated borrow area and tested in respect of IS: 2720 or Proctor density, optimum moisture content, grain size distribution and content of soluble matters.

These three samples shall cover the approximate variation of materials to be expected within the borrow area.

The fill material shall be placed in horizontal layers of not more than 15 cm in compacted thickness. The fill moisture content shall be controlled and adjusted in order to achieve a maximum of compaction. Fresh water shall be used for watering of soils.

The fill material shall be compacted by vibratory roller (min. weight 20T.). However for small compaction works such as small patches etc., comparatively low weight compactors or other compaction methods may be used after taking approval from Owner / Consultant. The minimum required degree of compaction should be as defined under "Tests and Properties". One Proctor and three density tests shall be made at every fourth fill layer prior to continuation of filling work. The testing location will be indicated by the Owner/Consultant. The Bidder shall either provide all required laboratory facilities and staff to perform the tests or he shall co-operate with an experienced soil testing laboratory, subject to the approval of the Owner/Consultant.

Filling work may be continued in case all tests performed show satisfactory results.

4.10 Protection of Existing Utilities and Services

During modification/rehabilitation of existing structures or construction of new structures, the Bidder shall provide all protection for existing utilities and services as may be required by his modification and construction operations. Permanent protection of certain items shall be as included under other sections or as instructed by the Owner/Consultant.

In addition to the requirements as specified, herein the Bidder shall comply with the following requirements:

- a) Use all necessary precautionary and protective measures required to maintain existing structures, utilities, services and appurtenances that must be kept in operation. In particular, the Bidder shall take adequate measures to prevent undermining of existing structures and utilities/services presently in service.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[14]	25.09.2014

- b) Protect existing or new utilities and services where required by the Bidder's operations and/or as directed by the Owner/Consultant. The Bidder shall be responsible for bracing and supporting existing structures, utilities and services to prevent settlement, displacement or damage.

4.11 Dust Control

The Bidder shall use all means necessary to control dust on roads, dismantling/demolition and modification areas, construction areas and borrow pits.

Surfaces shall be regularly watered to prevent dust becoming a nuisance for the public and interfering with the proper execution of the works.

4.12 Dewatering during Construction

This division applies to the methods and techniques of ground water control. Prior to the decision for the method and technique to be applied, a comprehensive knowledge of the soil and ground water conditions have to be obtained from the results of the detail soil investigation and/or information given in writing by the Owner/Consultant.

Ground water control for keeping the construction pits dry shall be included in the Bidder's scope of work.

The method and technique shall be based on the IS: 3764.

The scope of supply includes removal of all equipment, plants, pipes, machinery, etc for modification /rehabilitation of existing foundations and re-installation of all equipment, plants, pipes, machinery, etc and its removal after completion including operation & maintenance of the equipment during the construction period.

The Bidder must ensure that any dewatering works will not cause any interference to his own work and to those of other Bidders working elsewhere on site. Any damage occurring during the above mentioned period should then be made good by the Bidder at his own expense.

During the foundation works, the excavated areas, foundation levels, and pits are to be kept free of water down to at least *[0.50]* m below the foundation level.

4.13 Equipments

All equipments, instruments, machineries, tools, pipelines, etc required for execution of the water control shall be kept in good working condition throughout the operation period.

4.14 Execution

The Bidder shall keep records of all data of importance occurring during operation of the water control system. The records shall be submitted to the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[15]	25.09.2014

Owner/Consultant for information and checking every working day. For that purpose, the lowering of the water table shall be controlled by piezometers. The numbers and position of them shall be submitted to the Owner/Consultant's approval. The Bidder shall provide and maintain these piezometers at his own expenses during the dewatering works or as long as the Owner/Consultant requires it.

Pump operations shall not be stopped nor pipes, channels and equipment for dewatering and water control removed or altered in any way, except with the express permission of the Owner/Consultant. The Owner/Consultant will stipulate the time of removal. Until then, the pumps and water drainage facilities shall be kept in proper working order without extra payment being granted.

Difficulties during dewatering:

The Bidder shall consider all difficulties and additional work due to the presence of unexpected ground water during subsequent construction work. Where it is possible to keep off or divert such water without special dewatering arrangements or where work can be carried out normally under or in water, such a method may only be applied after approval from Owner/Consultant has been obtained.

Ready for service condition:

The Bidder shall maintain ready for service and regularly clean all dewatering equipment and accessories and shall keep all access clear so that they can safely be used without risk of accident. Any recommendations made by the Owner/Consultant in this matter shall be carried out immediately.

Leakage:

Blockouts and pipe connections through structures and their closure, proper grouting of joints, etc or repairs in the event of leakage shall be the responsibility of the Bidder.

Piezometers:

The ground water lowering effect is to be checked by piezometers in unfavourable positions (e.g. in the middle of the building pit) before starting the excavation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[16]	25.09.2014

5 REINFORCED CONCRETE STRUCTURES AND FOUNDATIONS

5.1 General

All structures, building foundations, machines / equipment foundation, water retaining structures, trenches, pits, etc. shall be checked / designed as per latest relevant IS codes in general. Construction in general shall follow provisions of IS: 456 and IS: 3370 for normal and water retaining structures respectively.

5.2 Design Methodology

(a) General

All designs of RCC structures shall be carried out by limit state method as per IS: 456 unless use of working stress method is specifically mentioned. Design strength of materials and design loads shall be calculated using appropriate partial safety factors over characteristic strength and characteristic loads as per IS: 456.

IS: 11384 shall be followed for design of steel concrete composite beam.

For reinforcement detailing IS: 5525 and SP: 34 shall be followed.

The walls shall be provided with reinforcement on both faces for sections 150 mm or more, even if not required from design consideration.

(b) Foundation and Underground Structures

Type of foundation system, i.e. isolated, strip, raft shall be decided based on the loading arrangement, load intensity and soil strata. Design of foundations at various levels shall be dependent upon the soil bearing capacity at that level.

Foundation system adopted shall ensure that settlement / relative settlement is as per provision of IS: 1904 and other Indian Standards. However, the settlement shall be restricted to a lower value, if necessary as per the system requirement.

All foundation including machine / equipment foundations shall be of RCC construction. All foundations shall be designed in accordance with relevant parts of the latest revisions of Indian standards IS: 2974 and IS: 456. Raft foundations shall be designed as per IS: 2950.

All foundations shall be treated as per the guidelines prescribed in IS 456: 2000 against sulphate/other aggressive chemicals if found present in soil or as per the requirements of detail Geotechnical Investigation Report.

For design of underground structures, subsoil water level shall be assumed at Finished Ground level. All underground pits, tunnels, basements, cable and pipe trenches, etc. shall be designed as leak proof RCC structure, where depth of ground water table so warrants. In case of leakage in the above structures injection grouting method shall be applied to repair the structure according to the requirement of IS: 6494. Effects of uplift and reduction in bearing capacity due to underground water table shall also be considered.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[17]	25.09.2014

For Subsoil conditions, Average ground water table, Foundation system, Earth Pressure Coefficient, refer to detail geo-technical investigation report of the site.

The soil conditions met during the foundation works especially in the foundation level are to be checked by the Bidder's soil Engineer, recorded and compared with previous known or investigated results. If essential differences occur, which could be detrimental to the structures, the Bidder has to inform the Owner/Consultant and to propose further measures. Foundation works in such areas are to be continued only after approval of such measures by the Owner/Consultant

If there is any doubt about the soil quality or if discrepancies appear with regard to the previous decisions or investigations stated by the Owner/Consultant, then additional measures are to be taken after consulting the Owner/Consultant (e.g. additional excavation and lean concrete fill)

Allowable settlements, elastic plus consolidation, shall be limited as follows: -

- i) Total settlement : 38 mm
- ii) Differential settlement : 6 mm

Foundations for equipment shall be designed to meet the total and differential settlement established by the equipment manufacturer if they are more stringent than the allowable settlements listed above. Foundations for buildings shall be designed to meet the total and differential settlement as required for the building function if they are more stringent than the allowable settlements listed above.

(c) Movement and Expansion Joints

Joints are to be arranged in such a way that stresses and strains caused by settlements, temperature, differential settlement, etc do not adversely affect the structures. This primarily applies to differently loaded areas and structures having different foundations or foundations of different depths. The settlement joints shall run through the complete structure down to foundation level, the expansion joints however shall stop on the top level of foundations.

The joint width is to be at least 2 cm is to be planned considering all relevant factors (settlements, tilting, movements, aspects etc.).

Settlements of all relevant structures shall be measured, recorded and shown in diagrams according to IS: 8009 – "Code of Practice for calculation of settlement of foundation".

(d) Foundations at Different Depths

Foundations at different levels should be based beyond a load-spread angle of 30° (against the horizontal). Otherwise, the load influence (e.g. earth pressure) of the higher-level structures on the lower ones must be taken into consideration.

(e) Replacement

If unsuitable soils are encountered below the grade slabs or basement floor, they are to be replaced by suitable layer wise compacted material down to the good bearing soil.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[18]	25.09.2014

Materials and compaction method as well as quality control are described in clause 'Earth and Rockworks' of this section. Selected fill is to be employed below all grade paving and basement floors.

(f) Modification of the existing foundation (as required) for the new equipment supplied

The new equipment shall be supported on an RCC deck which in turn shall be supported over steel helical springs and viscous dampers. The steel helical springs and viscous dampers shall be supported over structural steel beams which in turn shall rest over columns. The columns shall be supported over foundation. The modification of existing foundation may involve partial to full dismantling and reconstruction of new foundation as per design & constraints of space.

Precautions shall be taken not to disturb the basic building structure & other foundation and it shall be ensured that no excavation work is carried out beyond the founding level of existing nearby building/equipment. Any damage to adjoining structure/ foundation shall be rectified by the Bidder without any extra cost to Owner.

The contractor shall be responsible for maintaining all safety norms including the stability of existing structures. Any propping, shoring and under pinning required to this effect shall be put in place before the dismantling work is undertaken.

Wherever any existing concrete member is required to be partially dismantled, a coat of epoxy paint shall be applied to the exposed reinforcement and the cut surface of concrete shall be built up by providing 40 mm thick concrete with wire mesh.

(g) Machine Foundations

General

Design of equipment foundation for block type machine foundation (if any) shall be done for the actual equipment loading data. The foundation arrangement shall be decided keeping in mind the existing structural arrangement and space limitation.

The design of machine / equipment foundation shall be as per IS: 456 and IS: 2974. The provisions of DIN 4024 shall also be followed for machine foundations. All machine / equipment foundations and structures subject to vibrations shall be suitably proportioned so that amplitude and frequency of the foundation / structures are within permissible limits.

Dynamic analysis shall be carried out to calculate natural frequencies in all modes including coupled modes and to calculate vibration amplitudes. Frequency and amplitude criteria as laid down by the relevant codes or machine manufacturers shall be satisfied. Minimum reinforcement shall be governed by IS: 2974 and IS: 456.

For the foundations supporting minor equipment weighing less than one ton or if the mass of the rotating parts is less than one hundredth of the mass of the foundation, no dynamic analysis is necessary. However, if such minor

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[19]	25.09.2014

equipment is to be supported on building structures, floors, etc. suitable vibration isolation shall be provided by means of springs, neoprene pads, etc. and such vibration isolation system shall be designed suitably. All such foundation shall be separated from adjoining part of building and other foundations. Joints at floor/ slab shall be suitably sealed. All appendages to such foundations shall be reinforced suitable to ensure integral action.

The extent of foundation shall be based on the general arrangement of the equipment and the design requirement. However minimum width of any foundation shall not be less than one meter. Water table has to be considered at finished ground level for design of all foundations.

Suitable arrangement shall be made for prevention of transmission of vibration from the proposed foundation to the nearby structure/ foundation/ paving slab.

All design calculations and drawings shall be submitted to Owner for approval.

In case any modification to any existing nearby structural steel bracing/support system/ concrete work is required, the contractor shall check the adequacy of the design of the existing structures for the new loads. Suitable modification to the existing structure as required shall be carried out by the contractor.

Loose pockets if any found below the foundation shall be removed and filled up with PCC of grade M10.

Loads

All static and dynamic forces / loads which equipment supplier considers applicable shall be considered for analysis and design of machine foundations.

Foundation Sizing

The outline plan dimensions of foundations as given by the machine supplier will be adopted. The height of foundation will be selected after taking into consideration soil strata and operating level of the machine. The eccentricity of common CG of machine and foundation with respect to the centroid of base area should not exceed 5 % of the corresponding base dimensions of foundation. Partial contact between the foundation and soil strata shall be considered wherever applicable. The footing will be checked for minimum contact area of 80 % and maximum bearing pressure will be calculated for the actual contact area only.

Analysis and Design

The minimum grade of reinforced cement concrete shall be M25, unless specified otherwise.

The analysis and design of machine foundations will be carried out to ensure the following:

- Compliance with the manufacturer's requirements and relevant standards
- No resonance phenomenon of a disturbing nature to machine operation should exist at the normal running speed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[20]	25.09.2014

- Calculations to be performed for dynamic as well as static cases for reinforced concrete block type pedestal
- Soil bearing capacities
- Deep foundation capacities
- Lateral earth pressures
- Allowable settlements
- Structure, equipment and environmental loadings
- Equipment performance criteria
- Access and maintenance requirements
- Temporary construction loadings

The foundation will be designed for the most critical combinations of forces and moments, resulting from all possible combinations of the various loading from the equipment system. The foundation sections will be sized and reinforced adequately for bending moments and shear stresses and uplift.

The foundation shall be checked for overturning, sliding and uplift as per relevant IS Codes. The foundation will be checked for overturning with minimum and maximum vertical loads.

For analysis of machine foundation following data will be furnished by the equipment manufacturer:

- Loading diagram showing static and dynamic loads and points of application of loads
- Operating speed of machine
- Weight of rotating parts, maximum eccentricity of rotating mass from the geometric axis of rotation
- Location of C.G. of machines in all three axis
- Mass moment of inertia
- Allowable amplitude / velocity of vibration at machine bearing points
- Temperatures at various areas during operation

While designing following aspects shall also be taken care of:

- All dynamic foundations shall be isolated from building foundations. The isolation gap shall be of minimum 25 mm.
- Natural frequencies of structures and components shall be away from running speed of equipment by at least 20 % generally but for important ones it shall be away by at least 30 %.
- For design of foundation of large fans etc., provision shall be kept in the foundation for addition of mass / area for retaining of the foundations if required at a later date

However following minimum factor of safety shall be followed:

- Factor of safety against overturning due to wind, seismic or other lateral loads shall be 1.5
- Factor of safety against sliding shall be 1.5

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[21]	25.09.2014

- Factor of safety against uplift due to hydrostatic forces shall be 1.2 and due to any other loads shall be 1.5. Uplift check shall be carried out during construction stage also.

For miscellaneous machines, most suitable type of foundation shall be provided. Foundation for pumps, and minor rotating equipment etc., are usually in the form of solid block foundations, resting on the ground or on a floor of the building. At such machine supports, floor may be thickened and extra reinforcement may be provided. Also the machines, which are almost vibration free, light to moderately heavy, may be supported in the above manner. Rubber or neoprene pads under some of these machines to reduce transmission of vibrations to the supporting floor will be provided if required.

All block foundations resting on soil shall be designed using the elastic half space theory. The mass of the RCC block shall not be less than three times mass of the machine. Dynamic analysis shall be carried out to calculate natural frequencies in all modes including coupled modes and to calculate vibration amplitudes. Frequency and amplitude criteria as laid down by the relevant codes or machine manufacturers shall be satisfied. Minimum reinforcement shall be governed by IS: 2974 and IS: 456. Suitable vibration isolation shall be provided by means of springs, neoprene pads, etc. and such vibration isolation system shall be designed suitably. All such foundation shall be separated from adjoining foundations.

Temperature Control of Concrete

The temperature of fresh concrete shall not exceed 25°C when placed. For maintaining the temperature of 25°C in the top decks of machine foundations, crushed ice shall be used in mixing water.

Non-Shrink Grout for Equipment Foundations

Special non-shrinking grout of approved make shall be provided in strict accordance with the manufacturer's instructions / specifications. Ready mix non-shrink grout of GP2 brand or equivalent, of approved make shall be used for base grouting of major rotating equipments.

(h) Increase in Stresses

Where stresses due to wind (or seismic) and temperature are combined with those due to other loads, the allowable stresses in concrete and reinforcement steel shall be increased by 33.33% in case of working stress design.

Bearing capacity of the soil shall be allowed to be increased by 25 % under seismic/ wind load condition.

(i) Elevated Foundations

Design of all equipment foundations shall be done for the actual equipment loading data. The foundation arrangement shall be decided keeping in view the existing structural arrangement and space limitation. Adequacy of the design of the existing structures, for the new loads shall be, checked by the contractor. Suitable modification as required shall be carried out by the Contractor and complete design for the same shall be furnished to owner for approval. Where

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[22]	25.09.2014

ever new columns/foundation is required the same shall be designed and constructed by the contractor as per relevant Indian Standard Code.

For the foundations of the all equipments details static and dynamic analysis shall be done. The static analysis shall include all operating condition, load cases and abnormal loads like short circuit, loss of blades & unbalance and seismic forces as per IS:1893. The dynamic analysis shall consist of free vibration analysis and forced vibration analysis. Design of RCC foundations/as well as structures, checking of design of existing structure shall be carried out by working stress method. A fatigue factor of 2.0 shall be considered for dynamic forces.

The foundation general arrangement shall be such that the spring units are placed over the structural steel beams. The isolation efficiency for steel helical springs and viscous dampers shall be at least 90%. The vibration amplitudes at the bearing locations shall not exceed the limits as per VDI 2060 or limits specified by the machine supplier whichever is more stringent. The ratio of actual spring supported weight to the nominal spring capacity shall not exceed 0.80. At least 3% to 5% of critical damping shall be provided in the form of viscous dampers.

The grade of concrete for the top deck shall be M35.

(j) Steel Helical Springs and Viscous Dampers

The supporting structural beam and columns shall be designed for the loads transferred through springs and all other loads such as piping loads, seismic loads as per IS:1893. The stiffness of the beams supporting the springs shall be at least 10 times the stiffness of the springs supported over it along both vertical and horizontal direction.

The scope of work shall be deemed to include all activities which may not have been explicitly mentioned but are reasonably implied for the successful completion of the work for which these specifications are intended.

Scope of work of the bidder shall include manufacturing, testing, supply, transport to site, pre-stressing, erection, supervision of erection, release of pre-stress, alignment, commissioning etc of Steel helical springs and viscous dampers:

- Steel helical spring units and viscous dampers along with viscous liquid including associated auxiliaries for installation of the spring units and dampers like steel shims, adhesive pads, etc.
- Frames for pre-stressing of spring elements.
- Suitable hydraulic jack system including electric pumps, high- pressure tubes etc. required for the installation, alignment etc, of the spring units. One set of extra hydraulic jacks, and hand operated pumps shall also be provided.
- Any other items which may be required for the complete installation and satisfactory commissioning of the spring system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[23]	25.09.2014

Supervision of complete erection and commissioning of the steel helical springs and viscous dampers including pre-stressing of elements, placing of elements in position, checking clearances on the shuttering of the RCC top deck, releasing of pre-stress in spring elements and making final adjustments and alignments after machine installation etc.

The steel helical springs and viscous dampers supplied should be of proven make. The bidder or his sub-contractor should have designed spring supported machine foundations, manufactured, supplied and installed steel helical springs and viscous dampers (conforming to DIN 2096 & DIN2089) and viscous dampers (providing damping resistance in all three planes) for not less than 2 (two) machine foundations of heavy rotating machine systems.

The damper units or spring-cum-damper units should be of viscous type offering velocity proportional damping. The damper units should be suitable for temperatures ranging from 0 to 50°C. The damping resistance of individual damper units should be such that the designed damping can be provided using reasonable number of units.

All design calculations and drawings shall be submitted to Owner for approval.

5.3 Stability of Structures

Design shall be checked against buoyancy due to the ground water during construction and maintenance stages for structures like underground storage tanks, pits, trenches, basements, etc. Minimum factor of safety of 1.2 against buoyancy shall be ensured considering empty condition inside and ignoring the superimposed loading. For the purpose of calculating downward load due to any overburden, only the mass located vertically above the projected area of the base slab shall be taken in to consideration.

All building sub-structures including pump houses shall be checked for sliding and overturning stability during both construction and operating conditions for various combination of loads. Factor of safety for these cases shall be taken as mentioned in IS: 456 and other latest relevant IS codes. However following minimum factor of safety shall be followed:

- Factor of safety against overturning due to wind, seismic or other lateral load shall be 1.5 minimum
- Factor of safety against sliding shall be 1.5 minimum
- Factor of safety against uplift due to hydrostatic forces shall be 1.2 and due to any other loads shall be 1.5

Stability of the structure shall also be investigated for loading conditions during construction, repair or other temporary measures. Lower factor of safety may be used for such loading conditions as per relevant IS codes.

In cases where dead load provides the restoring force, only 0.90 times characteristic dead load shall be considered. Imposed loads shall not be considered as restoring force.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[24]	25.09.2014

5.4 Minimum Thickness of Concrete Structural Elements

The following minimum thickness shall be followed:

Table 2.5
Minimum Thickness of Concrete

S.No	Description	Thickness, mm
a)	Suspended floor / slab / walkways /canopy slabs, etc.	125
b)	Ground floor slab (non-suspended)	150
c)	Water Retaining slabs / walls	200
d)	Cable/pipe trenches/underground pits/Launder walls and base slab	125
e)	All footings (including raft foundations)	300
f)	Parapets	125
g)	Sunshades	75 at edge
h)	Precast louvers / fins	50
i)	Precast trench cover slabs / floor slabs / louvers	75
j)	Paving	100
k)	Basement walls and base slab	200
l)	Underground tank:	
	Below ground water table	200
	Above ground water table	150

From fire resistance point of view minimum cover to reinforced concrete members shall be as per Table 16A of IS: 456.

5.5 Minimum Heights for Pedestal of Steel Columns

Pedestals to Steel Columns for building structures:

Top of RCC foundations (pedestals) shall normally be kept at a minimum [250 mm] above finished floor level (FFL) unless specified otherwise. Foundation levels for columns shall be decided to accommodate underground services, pits, trenches, etc.

Stair and ladder pedestal shall be kept [200 mm] above the finished floor level.

Pedestals to Steel Columns for Equipment structures:

a) Equipment in open area : as required [(300 mm min)]

b) Equipment in covered area : as required [(150 mm min)]

c) Structures and equipment

Supplied by vendor : as per vendor's data subject to minimum as specified above.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[25]	25.09.2014

5.6 Minimum heights for encasement of steel columns

In case the top of pedestal is kept at a lower level so that the column base plate together with gussets and stiffeners remain below finished floor level (FFL) the column bases as well as the column sections shall be encased in concrete above FFL as per following:

- a) Open area : [300 mm] above paved level
- b) Covered area : [150 mm] above FFL

5.7 Concrete Works

i) General Description, Proportions and Mixing

Mix Design

At the commencement of the contract the Bidder shall make preliminary tests to determine the proportions by weight of cement, fine aggregates, coarse aggregates and water necessary to produce required grades of concrete. The mix proportions shall be selected to ensure that workability of the fresh concrete is suitable for the conditions of handling and placing and when concrete hardens, it shall have the required strength, durability and surface finish. The Bidder shall get approval of Owner/Consultant to such proportions before he starts concreting. However, such approval shall not relieve the Bidder of his responsibility to produce concrete having compressive strengths as laid down in the foregoing Table.

No departure from the approved proportions will be permitted during the works unless and until the Owner/Consultant gives written authorisation for any change in proportion. The Owner/Consultant shall have authority at any time to check whether the mixing of concrete is being carried out according to the approved proportions.

For the all major and important R.C. works and for all special works, the design of mixes shall be made by the Bidder at his own cost, for each grade of concrete as well as for various workability. The design of mixes shall be made according to I.S. 10262 or any other approved standard methods.

The concrete made by designing the mix is termed hereinafter as "Design Mix Concrete".

The cement content for various grades of concrete shall be based on design mix. However, irrespective of requirement of cement found out from design mix, cement content of concrete shall not be reduced below the quantities specified as under.

Grade of concrete	Minimum cement content per Cu.m finished concrete
M-15	290 kg
M-20	320 kg
M-25	380 kg

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[26]	25.09.2014

Grade of concrete	Minimum cement content per Cu.m finished concrete
M-30	not less than 400 kg
M-35	not less than 400 kg

Water Cement Ratio

Where a particular water cement ratio is stipulated in the design or drawing along with the characteristic grade of concrete the design of mix shall be carried out by adjusting the other variable factors to obtain the characteristic strength of concrete with stipulated water cement ratio.

In the structures where the impermeability and shrinkage of concrete have an important bearing on the durability and serviceability of the structures, such as water retaining structures, basements, underground premises, tunnels, pump houses, pre-stressed structure, thin precast members etc. the water cement ratio shall be kept low and preferably not exceeding 0.45.

The water cement ratio, as achieved in the Mix Design, or as specified in the drawings shall be adhered to strictly and shall not be varied without the permission of the Owner/Consultant.

Workability

The workability of fresh concrete shall be such that the concrete is just suitable for the conditions of handling & placing so that after compaction it becomes completely consistent and homogeneously surrounds all the reinforcement and completely fills the formwork.

The workability of fresh concrete at the place of batching/mixing shall be measured by compacting factor test and at the place of disposition by means of slump test. During the finalisation of Trial Mixes, the relationship between compacting factor and slump test shall be established for each grade of concrete as well as for various levels of workability. The workability tests shall be carried out in accordance with IS:1199.

Normally, in the condition of low water cement ratio as well as for medium/high workability, the workability shall be achieved by increasing the cement content, in consistent with added water.

In cases where the cement content is to be limited to reduce the heat of hydration, and the water/cement ratio is also to be kept low to reduce the permeability or due to other requirements the desired workability may be achieved with use of limited doses of plasticiser or air entraining agent. In such cases the method of mixing and dosage of the plasticiser/air entraining agent shall be according to the manufacturer's specification and with the approval of the Owner/Consultant.

The usual limits of consistency for various types of structures are given below:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[27]	25.09.2014

Limits of consistency

Degree of Workability	Slump in mm with Standard - Cone		Use for which concrete is suitable as per IS : 1199
	Minimum	Maximum	
Very low	0.0	25.0	Large mass concrete structure with heavy compaction equipment, roads and the like.
Low	25.0	50.0	Uncongested wide and shallow R.C.C structures
Medium	25.0	75.0	Deep but wide R.C.C structures with congestion of reinforcement and inserts
High	75.0	125.0	Very narrow and deep R.C.C structures with congestion due to reinforcement and Inserts

Durability

The durability of concrete, depending on the exposure condition, is to be taken into account while designing the mix. For given aggregates, the cement content should be sufficient to make sufficiently low water cement ratio and Appendix A of IS: 456 shall be taken as guideline for durability considerations.

Minimum fire rating of 2 hours shall be considered where fire hazard is expected and accordingly minimum cover shall be taken as per Table 16 A of IS: 456. For structures below ground level which are exposed to sulphate attack, requirement of cement shall be as per Table 5 of IS: 456. Intermixing of different grades of concrete in the same structure shall not be allowed in a particular element.

Mix design concrete shall be used for all areas other than plain concrete work used for lean concrete, screeds and backfill.

The following minimum grades of concrete as per IS: 456 shall generally be used for the type of structures noted against each grade.

Table 2.6
Grades of Concrete

Concrete mix/Grade	Type of structure
1:5:10	Fill concrete
1:4:8	Blinding layer below foundations, trenches and underground structures, foundation below brick wall, etc. Minimum thickness of layer shall be 75 mm
M15	Plinth protection work around buildings

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[28]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

Concrete mix/Grade	Type of structure
M25	Base plate encasement, encasement of structural steel work, all RCC paving work, ground floor slabs, cable and pipe trenches, precast concrete work etc.
M30	All RCC structures and equipment foundations, super structure, grade beams, columns, roof slabs and all underground RCC structures, cable and pipe rack foundation, pedestals etc. water retaining structures below and above ground etc.

Inter mixing of different grade of concrete in the same structure shall not be allowed normally.

ii) Trial Mixes

- Before concreting commences, the Bidder shall, at his own expense, make trial mixes to determine the mix proportions required to produce the strengths specified for each class of concrete and for each degree of workability required to allow placing, transporting and compacting of the concrete with the equipment he proposes to use in any particular situation. Only materials which the Bidder intends to use for concreting (including all admixtures) shall be used in the trial mixes.
- Test cubes from trial mixes shall be made and tested in accordance with IS: 516.
- As per IS: 456 and IS: 516, three separate batches of concrete should be made, workability of each batch determined and three test cubes shall be made from each batch for each age (e.g. for 7 and 28 days) at which tests are required. The strength shall conform to target mean strength as per IS: 456 – Requirements for design mixes.
- The appropriate strength requirements may be considered to be satisfied if none of the strengths of the cubes is below the required characteristic strength and if the average strength of the nine cubes is not less than recommended by IS: 456 and IS: 516, trial mixes.

iii) Quality and Testing

Not more than 5% of the test results may fall below the 28 days specified strength. Making and curing of test specimens shall be in accordance with relevant IS: 456, IS: 516 and IS: 1199.

All mixes can only be placed following approval by the Owner/Consultant. The mean strength shall exceed the characteristic strength by a margin of 1.65 times the standards deviation expected from the batching plant. However, no standard deviation less than 3.5 N/mm² shall be used as a basis for designing a mix.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[29]	25.09.2014

iv) Trial Mixes and Field Tests

Sufficient laboratory trial mixes shall be prepared to show that concrete complies fully with the specified performance criteria. The following tests are to be included:

- Air content < 1%
- Slump: Piles 170 + 25 mm, regular work 80 + 20 mm as per IS: 1199
- Fresh and hardened concrete densities
- Field trial mixes shall be carried out under full-scale site conditions as per IS: 4925 (for structural concrete only).
- Where directed by the Owner/Consultant, concrete incorporating reinforcement details shall be cored to assess stratification of mixes. Cores of 150 x 200 mm (diameter and length) shall be used.
- Each trial mix shall have 9 x (150 x 150 x 150 mm) cubes taken to measure 24 hours/7 days and 28 day compressive strengths. These trials shall be run for three consecutive days (for structural concrete only).
- At least 3 x sets of field trials shall be tested according to the provisions laid down in laboratory testing.
- The average 28 day characteristic strength for trial mixes shall be as per IS: 456.. Failure to comply shall result in the mix having to be re-designed.
- All test results shall have to be complied before approval can be given.

v) Consistency of Concrete

The amount of water used in the concrete shall be adjusted as required to ensure such a consistency that it can be readily transported, placed and compacted without segregation of the materials or bleeding of free water at the surface. Addition of water to compensate for stiffening of the concrete before placing shall not be permitted. Consistency of the concrete shall be checked by slump tests measured in accordance with IS: 1199 and shall not exceed the values given in clause 7.1 of IS: 456-2000.

vi) Mixing of Concrete

- The cement and aggregate shall be thoroughly mixed in a batch-type pull mill mixer. The capacity of the mixer shall not be less than 1 (one) cubic meter and the total capacity of the batching mixing plant shall be such to accommodate the various concrete quantities to be cast in a continuous way and shall comply with the requirements of IS: 456, IS: 1791 and IS: 12119.
- The water shall not be added until all the aggregate and cement are in the drum. Mixing shall continue until the concrete is uniform in colour and for not less than 2 (two) minutes after all the materials and water are in the drum.
- Partly set or excessively wet concrete shall not be used. No concrete shall be mixed by hand.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[30]	25.09.2014

Bidder shall make suitable arrangements for carrying out all the necessary quality tests and ensure that testing work shall be carried out in compliance with the standards.

5.8 Strength of Concrete

i) Testing of fresh concrete by means of test cubes

- a) All test cubes shall be made and tested for compressive strength in accordance with IS: 456, IS: 516 and IS: 1199.
 - b) The minimum required strength for different classes of concrete shall be as shown in clause "General description and proportions and mixing" here above.
- c) The grade of concrete required will depend partly on the particular use and the characteristic strength needed to provide the structure with adequate ultimate strength and partly on the exposure conditions and the cover provided to any reinforcement.
- d) A minimum of four test samples (of six test cubes each) shall be taken on each concreting day (from the same mix) and for at least each 40 m³ of concrete mixed. At least one sample shall be taken for each shift.
- e) For columns, beams and cantilevers seven (7) cubes for every 15 m³ of concrete poured shall be taken. The concrete for test samples shall be taken directly from the concrete mixer and shall be handled (vibrated etc) under similar conditions to those prevailing during the construction. The moulds for the test cubes shall be made of steel. Tests shall be carried out in an approved laboratory.
- f) The strength level of each type and each strength concrete will be evaluated separately and the concrete strength will be considered satisfactory if:
 - Compressive strength: The concrete shall be deemed to comply with the strength requirements when both the following conditions are met:-
 - The mean strength determined from any group of four consecutive test results complies with the appropriate limits in column 2 of table 11 of IS: 456.
 - Any individual test result complies with the appropriate limits in column 3 of table 11 of IS: 456.
 - Flexural strength: When both the following conditions are met, the concrete complies with the specified flexural strength:-
 - The mean strength determined from any group of four consecutive test results exceeds the specified characteristic strength by at least 0.3 N/mm².
 - The strength determined from any test result is not less than the specified characteristic strength less 0.3 N/mm².
- g) If the results are less than those specified, the Owner must suspend all concreting work and order further tests. Any concrete found not to comply

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[31]	25.09.2014

with the specification shall be broken out and replaced to the satisfaction of the owner.

- h) The Bidder shall pay all costs incurred in making, curing, delivering and testing of concrete cubes.

ii) Testing of concrete in structures

- a) The types of tests described hereinafter are applicable to the finished parts of the structures. They may be used in routine inspection and for quality control.

b) Type of tests:

- Cutting cores: The procedure used shall comply with the requirements of IS: 516 or an approved equivalent standard.
- Gamma radiography: The testing shall be carried out in accordance with the requirement of IS: 13311, part 1 or equivalent.
- Ultrasonic test: Such tests may be used to obtain approximate indications of the strength of the concrete in the structures (IS: 13311, part 1).
- Electromagnetic cover measuring devices: Such tests may be used to verify the position of the reinforcement and shall be in accordance with the requirements of design (IS: 13311, part 1).
- Rebound hammer test: Such tests may be used to obtain approximate indications of the strength of the concrete (Ref. IS: 13311, part 2).
- Load tests of structures or parts of structures: If the results of the above mentioned check tests show that the quality of the materials is inadequate or if other defects are revealed, the owner may require a loading test to be made.

- c) For the purpose of testing floors, roofs and similar structures and their supports, the test load shall be equivalent to the sum of the characteristic dead load and one-and-a quarter times (1.25 times) the characteristic imposed load for a period of 24 hours which the works or part thereof to be tested have been designed.

- d) Wherever certain procedures for testing of parts in structures are required by standards or codes of practice, these are to be followed. All tests must be conducted in the presence of the Owner/Consultant.

- e) If within 24 hours of removal of the imposed load, the structure does not recover at least 75% of the deflection under superimposed load, the test may be repeated after a lapse of 72 hours. If the recovery is less than 80%, the structure shall be deemed to be unacceptable.

- f) If the result of the test is not satisfactory, the Owner/Consultant shall instruct that the part of the works concerned be taken down or cut and reconstructed to comply with this specification. The Bidder shall at his own cost take down or cut out and reconstruct the defective work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[32]	25.09.2014

- g) The Owner/Consultant may require other tests to be made. Number of samples, tests and types will be as per Owner requirements.
- h) All the costs for the above mentioned tests shall be borne by the Bidder.

5.9 Materials

a) Storage of materials

All materials shall be stored and handled in a manner that will prevent contamination and/or deterioration. Storage of materials shall conform to IS-4082 "Recommendation on stacking and storage of construction materials and components at site". Deteriorated and/or contaminated material shall not be used for the concrete and shall be removed from the site at the expense of the Bidder.

b) Cement

OPC/PPC Cement of reputed make conforming to relevant codes, shall be used for all Concreting works and the certificate of manufacturer shall be furnished with each batch. Cement used shall be ordinary Portland cement unless the chemical nature of the soil warrants special cement for structures below ground level.

Sampling and Testing of Cement

- All deliveries of cement to the concrete supplier shall be accompanied by a certified mill test report and shall include all of the physical and chemical properties as required by relevant IS: 8112 for grade 43 and IS-12330 for sulphate resistant cement.
- The manufacturer's test certificate will normally be accepted as proof of compliance with the specification, but the Owner may order further tests of a character specified in the appropriate Indian standards. The confirmatory tests are to be conducted by a recognized quality control organization. The Bidder shall bear all expenses required for the preparation, dispatch, and tests of the samples. In case the results of such tests show any sample to be inferior to specifications, the whole consignment from which the sample was taken shall not be used and shall be immediately removed from the site.

Delivery and Storage of Cement

- The following information shall be provided for all cement shipments (either whole or part) which are intended for delivery to site: date of manufacture, date of original loading, destinations en-route, date of unloading, intended date of delivery to site.
- The Bidder shall obtain and provide to the owner the manufacturer's average test certificate for each consignment of cement to the works.
- The certificates shall be provided before the consignments are required for use and shall show the chemical composition and physical properties determined in accordance with the relevant standard.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[33]	25.09.2014

- Samples shall be taken from each consignment of cement and tested as directed by the owner in an approved independent laboratory.
- Consignments shall be used in the order in which they were delivered.
- Bagged cement shall be stored in a weatherproof building having dense impervious bituminous or concrete floors which shall be kept swept clean at all times. The storage arrangements shall be fully completed and approved by the owner before any cement is delivered to site.
- Each consignment of cement shall be separately stored for ease of access, identification, inspection and sampling. Sufficient stocks shall be maintained on site to ensure the proper progress of the works and the stock holdings shall be to the approval of the owner.
- No cement from any consignment shall be used in permanent works without the approval of the owner.
- Cement which contains air-set or hardened lumps, re-powdered air-set material, foreign matter or which has been contaminated or is otherwise unsatisfactory in the opinion of the Owner/Consultant will be rejected and shall be removed from site without delay.
- The Bidder shall be responsible for satisfying himself that the performance characteristics of cement are not such as to necessitate excessive cement content or be likely to cause or accentuate any undesirable properties in the fresh or hardened concrete notwithstanding apparent compliance with this specification.

c) Reinforcing steel

General

Reinforcing steel used in reinforced concrete shall comply with the following standards:-

Deformed bars shall be of grade Fe500 and conform to IS: 1786.

Mild steel shall conform to IS: 432.

Mesh reinforcement shall conform to IS: 1566.

Binding wire

Binding wire for general use shall be annealed wire 16/18/20 BWG conforming to IS 280. The number of strands shall be as per IS specification.

Reinforcement supports

- Reinforcement supports shall include all spacers, chairs, ties, slab bolster, clips, chair bars, and other devices for properly assembling, placing, spacing; supporting, and fastening the reinforcement.
- Spacers shall be cast from concrete of the same quality as that in which they will be embedded.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[34]	25.09.2014

- Concrete block spacers shall be cast in metal moulds with an approved means of separating blocks and of ensuring that the blocks are of the proper size.
- Binding wire shall be incorporated into the blocks to enable them to be securely attached to vertical or horizontal bars and the Bidder shall demonstrate both that the blocks are of the requisite strength and that the means of attachment to the reinforcement are adequate.

Certificates

Each consignment of steel reinforcement shall be accompanied by a test certificate from the manufacturer showing that the steel has been tested and analyzed and the date of such tests and analyses and that such tests and analyses comply in all respects with the standards. The following tests shall be carried out on reinforcement:-

- Cast analysis
- Carbon equivalent value
- Tensile strength, yield stress, elongation
- Bend test
- Bond classification
- Chemical analysis

Stock of reinforcing steel

In order to ensure due progress of the works, the Bidder shall at all times maintain on the site a stock of reinforcing steel sufficient for the following month's work. No reinforcing steel shall be used upon the works until it has been accepted as satisfactory by the Owner/Consultant.

Rejection

The owner at his discretion may order random testing of the reinforcement steel and in the event of any failed test reject the entire lot notwithstanding the manufacturer's or coating applicator's certificates.

The Bidder shall remove all rejected reinforcing steel from the site without delay at his own expense.

Storage

All bars for reinforcement and steel fabric reinforcement shall be stored on the site under cover on timber or concrete supports suitably spaced and of sufficient height to keep the steel not less than 150 mm clear of the ground.

Bar-bending Schedules

The Bidder shall prepare bar bending schedules based on the detailed reinforcement drawings. These shall be presented to the Owner/Consultant for review. The Bidder is fully responsible for their completeness and correctness in every way nor shall any claim for extra cost or time be allowed on the grounds of errors or discrepancies which may arise between drawings and schedules.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[35]	25.09.2014

d) Water

Water used for mixing and curing shall be clean and free from injurious amounts of oils, acids, alkalis, salts, sugar, organic materials or other substances that may be deleterious to concrete or steel. pH value of water shall not be less than 6.

Only potable water shall be used. Tests and quality of water shall be in accordance with IS: 456 or equivalent.

e) Aggregates

General

The aggregates for concrete shall be crushed natural rock subject to Owner's approval.

The aggregate to be used in the work shall be supplied from an established pit or quarry.

The concrete supplier shall obtain from the aggregate producer, or otherwise provide current test, examination, and inspection reports performed and certified by an approved laboratory for submittal to the Owner/Consultant.

As a minimum, this information shall include the following items:-

- **Item 1**

A comprehensive description, with current photographs of the pit or quarry, including but not limited to, identification by name and location, type of deposit, age, potential reserves, primary products by size including average gradation based on previous six (6) months production and the range for each sieve size; mining methods, process equipment, quality control organization and laboratory; the primary and alternate means of product transportation; listing of primary and secondary users of the product.

- **Item 2**

Petrographic examination in accordance with IS: 2386 (Part-8) and ASTM C-295 performed by a qualified concrete aggregate petrographer. This report shall be based on material produced and examined within the previous six (6) months and must be representative of the current production.

- **Item 3**

Coarse aggregate shall be sampled from current production in accordance with IS: 2386 (Part 1 to 8). Three [20 mm, 10 mm & 5 mm] nominal maximum size (NMS) aggregates shall be sampled and tested as follows:

IS 2386(Part 1): Methods of test for aggregates for cement: Part 1
Particle size and shape (Amendments 3)

IS 2386(Part 2): Methods of test for aggregates for concrete: Part 2
Estimation of deleterious materials and organic
impurities (Amendment 1)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[36]	25.09.2014

IS 2386(Part 3):	Methods of test for aggregates for concrete: Part 3 Specific gravity, density, voids, absorption and bulking
IS 2386(Part 4):	Methods of test for aggregates for concrete: Part 4 Mechanical properties (Amendments 3)
IS 2386(Part 5):	Methods of test for aggregates for concrete: Part 5 Soundness
IS 2386(Part 6):	Methods of test for aggregates for concrete: Part 6 Measuring mortar making properties of fine aggregates (Amendments 2)
IS 2386(Part 7):	Methods of test for aggregates for concrete: Part 7 Alkali aggregate reactivity
IS 2386(Part 8):	Methods of test for aggregates for concrete: Part 8 Petrographic examination
ASTM C-295	Standard guide for petrographic examination of aggregates for concrete

Aggregates when subjected to the tests defined in items above, unless otherwise approved by the Owner/Consultant shall meet the requirements of IS: 383 and IS: 456.

Testing is to be carried out at the following intervals:

Table 2.7
Grades of Concrete

Type	Coarse Agg.	Fine Agg.
Grading	Daily	Daily
Specific Gravity	7 days	7 days
Magn Sulphate soundness	30 days	-
Clay, Silt and dust content	Daily	Daily
Shape (elongation and flakiness)	3.5 days	-
Los Angeles Abrasion	Initial stage only	Initial stage only
Moisture content	2 days	Daily
Drying shrinkage	Initial only	Initial only
Organic impurities	30 days	30 days
10% fines value for concrete	7 days	-

Combined grading shall also be done on a daily basis.

Storage and handling of aggregates

- Aggregate stockpiles shall be arranged and used in a manner to avoid segregation and to prevent contamination with other materials or with other sizes of like aggregates. Aggregate delivery trucks shall be covered to prevent wind blown contamination. Aggregate stockpiles shall be located relative to prevailing winds to mitigate the accumulation of wind-borne dust.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[37]	25.09.2014

- Adequate storage shall be provided for each aggregate. The aggregate storage area shall be on concrete pavement sloped to drain excessive moisture. The aggregate storage area shall provide bulkheads to separate piles and protect against wind blown contaminants. Provision shall be made to shade and sprinkle the aggregates with potable water.
- Aggregate stockpiles shall be built in successive horizontal layers not exceeding 1 m in thickness, with each layer being completed before the next is started. No vehicles shall be allowed to operate on top of the stockpiles.
- Rescreening Coarse Aggregate: Rescreening and washing of coarse aggregates is required, if necessary, to reduce total chloride and/or sulphate contents to a level less than the maximum allowed by the specifications. If rescreening is required, the screening and washing shall be just prior to transferring aggregate to batch plant bins. Aggregates shall be dewatered over a screen to remove excess water before being stored in the batch plant bins.
- Natural or manufactured sand shall be allowed to drain until it has reached somewhat uniform moisture content before it is used.

Fine Aggregate

Fine aggregate source shall be manufactured crushed stone or river sand, excluding fines, which are by products/rejects of coarse aggregate production. The crushed stone sand shall be graded from fine to coarse with the coarse sizes predominating to give maximum density.

The amount of fine particles as ascertained by the laboratory sedimentation method shall not exceed 10% for crushed stone nor 4% for natural sand.

The amount of material passing a 75 micron sieve (IS test sieve) shall not exceed the following limits:-

Crushed Stone Sand

- i) Concrete subject to abrasion 1% by weight
- ii) All other concrete 3% by weight

There shall be no clay or fine silt present.

The amount of hollow shells like to form voids or remain partially unfilled and present in material retained on an IS 2.36 mm sieve, determined by direct visual separation, shall not exceed 3% by weight of the entire sample.

Tests are to be executed in accordance with IS: 2386. The grading of fine aggregate for concrete work shall comply with the requirements of IS: 383.

The grading of the aggregates should be such as to produce a concrete of the specified proportions, which will work readily into position without segregation and without the use of excessive water content. The grading should be controlled throughout the work so that it conforms closely to that used for the preliminary tests.

A check on the moisture content of sand should be made at least once a day before concreting. The amount of water to be added to the concrete mix should

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[38]	25.09.2014

be adjusted accordingly. Any washing, screening, classifying and other operations on the fine aggregate required to meet this specification shall be done by the Bidder. Washing is required if the content of silt adhering to the aggregate is found to be unacceptably high.

Coarse Aggregate

Coarse aggregate shall be crushed rock and shall be free from decomposed stone, clay, earth or other deleterious substances. The unit weight of the coarse aggregate shall not be less than 2.5 t/m³. Aggregate of crushed natural stone is deemed adequate if the stone reveals a crushing strength of 1000 kg/cm² when tested. Friable, flaky and laminated pieces, mica and shale shall only be present in such quantities as not to affect the strength and durability of the concrete.

The grading of coarse aggregate for concrete shall comply with the requirements of IS: 383.

Samples of aggregates shall be submitted to the Owner/Consultant, together with sieve analysis showing the proportion by weight passing sieves. When aggregates which are satisfactory to the Owner/Consultant have been selected, the Bidder shall secure his entire supply of each material from the same source so as to maintain the same quality and grading throughout the work. Should it become necessary to change the source or characteristics of the material supplied this shall only be done after additional tests.

f) Concrete additives

Use of Concrete Additives

Concrete additives approved by the Owner/Consultant shall be used to improve consistency, workability, quality and strength of the concrete.

Chemical admixtures manufacturer shall provide certified test reports from qualified independent laboratories showing actual test results indicating material that complies in all respects with the applicable specification.

Admixtures used in concrete shall conform to the appropriate specification and requirements as indicated below:-

- Air entraining admixtures shall conform to IS: 9103.
- Water reducing and retarding admixtures shall conform to IS: 9103. Accelerating admixtures shall not be used.
- High range water reducers shall be naphthalene-sulfonated polymer based material. No admixtures containing chlorides shall be used.
- Chemical admixture suppliers shall provide certified test reports with each shipment indicating compliance with the appropriate specification. The test reports shall include the chloride content of the admixture, specific gravity and solids content.
- Fibers: Polypropylene fibers shall be collated, fibrillated polypropylene fiber of approved manufacture.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[39]	25.09.2014

- Admixtures used in production of concrete shall be the same as used in establishing the required concrete mix and shall be used in accordance with the manufacturer's directions.
- Liquid admixtures shall be stored in such a manner to avoid contamination, evaporation and segregation in accordance with the manufacturers' recommendations

Accelerating and Retarding Additives

Such additives shall only be used in case of necessity and after obtaining the written approval of the Owner/Consultant.

Plasticizers and Air entraining Additives

Plasticizers and air entrainers are intended to reduce bleeding of free water at the surface. It shall only be used after the written approval of the Owner/Consultant and in accordance with the manufacturer's instructions.

5.10 Dismantling/Demolishing and Modification in PCC&RCC

- The dismantling implies, carefully taking up or down and removing without damage. This shall consist of dismantling one or more parts of a structure. This includes chipping work, cutting of reinforcement, making holes/opening etc. in concrete members, according to the required shape, size and profile at all elevations.
- The term demolition implies, taking up or down or breaking up of a structure/member, in part or full, as specified or shown in the drawings or as directed by Engineer.
- In a structural member, both dismantling and demolishing work may be involved. In such case, the portion of work treated as demolishing shall be as shown on the drawing or as directed by the Engineer.
- All material obtained from the demolition/dismantling work shall be property of the Owner, unless otherwise specified.
- All serviceable materials obtained, shall be separated out and stacked properly upto a lead of [500 meter] or shall be returned to OWNER's stores and all unserviceable materials, rubbish etc., shall be disposed off as directed by the Engineer, upto a lead of [2kms].
- The dismantling / demolishing operations shall be carried out in proper sequence so that the serviceable material can be salvaged, without being damaged during the process or work.
- Necessary propping, shoring and under pinning shall be provided for safety of adjoining work or property which is to be left intact, before dismantling/demolishing work.
- All demolition work shall be carried out in conformity with the local safety regulations, extreme caution being exercised to avoid damage to the work and the equipment, which are to be left intact. Necessary precautions shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[40]	25.09.2014

be taken to keep the dust nuisance down. Safety requirements stipulated in IS: 4130 shall also be followed.

- As and where necessary, the dismantled/demolished materials shall be lowered to the ground and not thrown and then properly stacked as directed by the Engineer. Wherever required, temporary enclosures shall be erected to minimize the dust or moisture infiltration.
- Wherever fresh concrete is laid over old concrete, to ensure proper bond between old concrete and fresh concrete, the surface of old concrete shall be thoroughly cleared by removing all loose particles and coat of epoxy paint shall be applied.

5.11 Minimum Cover to Foundation Bolts

Minimum distance from the centre line of foundation / anchor bolt to edge of pedestal shall be the maximum of the following:

Clear distance from the edge of base plate / base frames to the outer edge of the pedestal shall be minimum 50 mm

Clear distance from the face of pocket to the outer edge of pedestal shall be 75 mm

Clear distance from the edge of sleeve or anchor plate to the edge of pedestal shall be 75 mm

5.12 Miscellaneous Requirements

Fillets at the junction of roof and vertical walls shall be provided with cast in-situ cement concrete 1:2:4 (nominal mix) followed by 12 mm thick 1:4 cement mortar.

A screed layer not less than 100 mm thick of cast in-situ concrete of nominal mix 1:3:6 shall be provided below all water retaining structures. A sliding layer of craft paper or bitumen paper shall be provided over the screed layer to destroy the bond between screed and base slab.

Plywood formwork shall be used for all water retaining / conveying structures and for all over ground concrete works. For other areas steel/ plywood formwork shall be used.

Unless specified 20 mm and down graded aggregates shall be used for all structural concrete works. However 40 mm and down graded aggregates may also be used under special conditions for foundation.

Tolerance for formed and concrete dimension shall be as per IS: 456.

5.13 Major Equipment Foundation

Special requirements for concreting of major equipment foundations shall be as given below:

Coarse Aggregates

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[41]	25.09.2014

Sound and durable crushed stone aggregates shall be used. All aggregates shall be tested for alkali aggregate reaction. Materials, which contain high percentage of reactive silica, shall not be used. In exceptional cases of high percentage of reactive silica content, aggregate may be allowed where low alkali cement shall be used. Lime stone aggregate shall not generally be used for foundations, which are subjected to high temperature and repeated temperature cycles (like in the case of all machine foundations).

Temperature Control of Concrete

The temperature of fresh concrete shall not exceed 25° C when placed. For maintaining the temperature of 25° C in the top deck of machine foundations, crushed ice shall be used in mixing water.

Admixture

Plasticizer cum retarder/accelerating type admixture shall generally be added to the concrete for promoting workability in addition to retarding / accelerating setting time for mass concreting work. The Bidder shall submit the mixing proportion/report after conducting the design mix as per the relevant codes and standards. The slump of concrete shall generally be in the range given below:

Block foundation	: 100mm to 150mm
Column	: 100mm to 150mm

Formwork

Plywood formwork shall be used for the top deck of all machine foundations. Any other type of formwork required to be used may be permitted subject to prior approval of the OWNER/CONSULTANT after submission of the required data.

Scheme for Concreting

Batching plants shall be mobilized for all RCC works. Concrete pump shall be mobilized for foundations. Arrangements for stand-by Plant and Equipments shall also be made.

Placing of Concrete

Base mat as well as top deck of machine Foundations shall be cast in a single pour. However the BIDDER shall submit method statements for various structures and shall get the prior approval from the OWNER/CONSULTANT before placing the concrete.

Ultrasonic Testing

Ultrasonic pulse velocity test shall be carried out for the top deck of all machine foundations to ascertain the homogeneity and integrity of concrete. In addition, additional cubes (at the rate of one cube per 150 cum of concrete subject to a minimum of six cubes) shall be taken to carry out Ultrasonic Pulse velocity (UPV) testing on the cubes to serve as reference UPV values. Testing shall be done as per IS: 13311 (Part-1). In case of any defects, the BIDDER shall rectify the defects suitably using cement / epoxy grout etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[42]	25.09.2014

5.14 Transport of Concrete

Immediately after mixing, the concrete shall be conveyed to the place of use as rapidly as possible using methods, which will prevent the segregation, loss or contamination of materials. The concrete shall be placed and compacted within 90 minutes of the addition of water to the mix. Any concrete left unplaced after this time shall be rejected and removed from the site.

The Concrete shall be transported by transit mixers of adequate capacity. Before using concrete pumps, placer pipelines, chutes or spouts it is necessary to have the written approval of the Owner/Consultant.

The Bidder shall obtain permission well in advance of any concrete pour.

5.15 Concreting Operations

Inspection prior to Concreting

All concreting methods shall be subject to the approval of the Owner/Consultant.

Concrete placing shall not be started until the Owner/Consultant has approved all preparation of forms, reinforcement, joints and all mixing, conveying, spreading, curing, finishing and protection equipment.

Placing of Concrete

Concrete shall be placed in the forms as close as possible to its final position in a single operation to the full thickness of slabs and beams and shall be placed in horizontal layers, not exceeding 2.5 m height in a single pour in walls, columns and similar members.

The Bidder shall organize the pouring of concrete in such a manner that once concreting of a section has started the operation shall be continuous and each operation shall be completed prior to a stoppage.

The temperature of concrete shall not exceed 40°C measured at discharge into the works.

The maximum allowable temperature of any point within any cast element is 60°C. The maximum allowable differential temperature between any two points in the same element is 15°C. Additional temperature control measures during construction (such as the use of insulated formwork) will be required. Bidder to prepare a process control chart and method statement verifying measures to achieve these requirements.

Temperature monitoring of concrete work is required where:

The minimum dimension of any casting is 0.8 metres or more, or otherwise instructed by the Owner/Consultant.

Where specified on the drawings, construction, expansion or contraction joints shall be provided and the concrete shall be poured continuously between two adjacent joints. No other joints than shown on the drawings shall be permitted. Stoppage (cold) joints formed between two concreting operations separated by

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[43]	25.09.2014

more than 6 hours time shall be subject to the same treatment as the construction joints.

Concrete shall not be dropped into place from a height exceeding 1.5 metres. Trunking and chutes to Owner/Consultant's approval shall be used for any concrete to be deposited from a height exceeding 1.5 m.

Concrete which has partially hardened shall not be exposed to injurious vibration or shock, except for controlled re-vibration where specified. When concreting of a certain large structural element is specified strictly as to be poured continuously, then the concreting operations shall be organized for day and night working, in long shifts, as necessary.

5.16 Compaction and mechanical vibration of concrete

As concrete is being placed it shall be compacted by mechanical vibrators complying with IS: 2505, IS: 2506, IS: 2514 & IS: 4656, to obtain a dense material free from honeycombing, free from water and air holes.

The Bidder shall ensure that the vibrators are used in such a manner that the reinforcement is not displaced, the formwork not damaged and no segregation/bleeding caused, but complete compaction of the concrete is achieved.

5.17 Finish of concrete

The concrete face shall have the finishes indicated on the drawings or in the present specification. The finished surface of the concrete shall be sound, solid and free from honeycombing, protuberances, air holes or exposed aggregate. No plastering, cement wash, mortar or paint shall be applied to cover defective concrete surfaces.

5.18 Construction, expansion and contraction joints

Construction joints

The number of construction joints should be kept as low as possible consistent with reasonable precautions against shrinkage. Concreting should be carried out continuously up to construction joints.

Where it is necessary to introduce construction joints, careful consideration should be given to their exact location, which should be indicated on the drawings. Alternatively, the location of joints should be subject to agreement between the Owner/Consultant and the Bidder before any work commences. Construction joints should be at right angles to the general direction of the member and should take due account of shear and other stresses.

Concrete should not be allowed to run to a featheredge and vertical joints should be formed against a stop board.

The top surface of a layer of concrete should be level and reasonably flat unless design considerations make this undesirable. Joint lines should be so arranged that they coincide with features of the finished work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[44]	25.09.2014

If a kicker (i.e. a starter stub) is used it should be at least 70 mm high and carefully constructed. The kicker must be incorporated with the previous concrete. Where possible, the formwork should be designed to facilitate the preparation of the joint surface, as the optimum time for treatment is usually two to four hours after placing.

The maximum horizontal length of wall to be poured in one operation in any one direction is 7.5 metres. A period of 7 days to be allowed between adjacent pours except where water stops are provided when this can be reduced with Owner/Consultant's approval. Alternatively a gap of 600 mm width shall be left between adjacent pours and filled after 7 days from the date of formation subject to Owner/Consultant's approval.

Immediately prior to recommencement of concreting on a joint, the surface of the concrete against which new concrete will be cast should be free from laitance and should be roughened to the extent that the largest aggregate is exposed but not disturbed. Care should be taken that the joint surface is clean immediately before the fresh concrete is placed against it.

Particular care should be taken in the placing of the new concrete close to the joint. This concrete should be particularly well compacted and if possible a vibrator should be used.

Where the Owner/Consultant considers that special preparation is necessary, i.e. for an in-situ structural connection, preparation should be carried out preferably when the concrete has set but not hardened, by spraying with a fine spray of water or brushing with a stiff brush, which is sufficient to remove the outer mortar skin and expose the larger aggregate. Where this treatment is impracticable, sand blasting or a needle gun should be used to remove the surface skin and laitance. Hacking of hardened surfaces should be avoided.

A record shall be kept on site of the time and date of placing the concrete in each section of the work.

Expansion and contraction joints

The expansion joints, contraction joints and other permanent structure joints shall be provided in positions as shown in the drawings.

Joints shall be straight and vertical, except where otherwise specified, and concrete surfaces on both sides of the joint shall be flush. Where necessary, water stoppers of a type approved by the Owner/Consultant shall be embedded in the concrete. The water stopper should be made of high quality material, which must obtain its resilience through the service life of the structure for the double function of movement and sealing. The surface of water stoppers should be carefully rounded to ensure tightness of the joint even under heavy water pressure. To ensure a good tightness with or without movement of the joints the water stopper should be provided with anchor parts. The cross-section of the water stoppers should be determined in accordance with the presumed maximum water pressure and joint movements. The complete works of fixed and welded connections must be carried out strictly in accordance with the manufacturer's instructions.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[45]	25.09.2014

All joints between structural steel and concrete parts shall be sealed by a suitable permanent flexible compound.

5.19 Concreting at night

When approval is given to carry out concreting operations (under control of the Owner/Consultant) at night or in places where daylight is excluded, the Bidder has to provide adequate lighting at all points of mixing, transportation and placing of concrete.

5.20 Protective measures for concrete

In general, the cover of rebars shall be as per IS: 456 taking into account the site conditions. However, the minimum concrete cover shall not be less than:

Concrete parts above ground (external surface)	: 40 mm
Concrete exposed to underground & groundwater	: 50 mm
Isolated footings	: 50 mm
Raft	: 75 mm
Slabs	: 25 mm
Beams	: 25 mm
Columns	: 40 mm

Immediately after the compaction of the concrete has been finished, the Bidder shall ensure adequate protection from the weather. Excessive drying can lead to crack formation as a result of plastic contraction. The concrete surface shall be covered with a layer of sacking, canvas, straw mats or similar absorbent material, special protection sprays kept constant moist for at least 7 days.

Curing compounds or other methods of preventing evaporation may be used if approved by the Owner/Consultant. Where formwork cannot be removed within 24 hours after placing the concrete, the formwork shall be kept shaded from the direct rays of the sun and shall be sprayed with water.

Owner/Consultant's approval to the use of a particular curing compound and to the method of application will only be given after the Bidder has completed satisfactory site trials and a sample panel has stood for at least 28 days.

Where large sections of concrete are poured, special precautions to the approval of the Owner/Consultant shall be taken to reduce and dissipate the heat generated by the setting and hardening of the concrete.

The minimum amount of reinforcement shall be present to prevent shrinking cracks.

No load of any kind, however light, shall be allowed on concrete which has not properly set and the Bidder shall prevent any load to be imposed on the concrete structures until it has been declared by the Owner/Consultant to be ready to carry loads.

5.21 Concrete with Special Properties

General requirements

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[46]	25.09.2014

The pre-condition for obtaining concrete with special properties is that it should be made with the appropriate composition, that it is placed in such a way that segregation does not occur and further that it is fully compacted and given appropriate curing.

Waterproof concrete

This concrete must meet the provisions of IS: 3370. Waterproof concrete must be sufficiently dense (impermeable).

Waterproofing and protection of underground concrete structures

Water aggressive to concrete should be kept away from the fresh concrete.

Concrete, which is exposed for a prolonged period to “very severe” chemical attack, must be protected against direct access of the aggressive substances.

The protection, which is to be laid as protection to all concrete surfaces in contact with the ground, shall consist of an approved waterproofing membrane. The membrane shall adhere to all concrete surfaces, including undersides of structures and other surfaces where concrete is cast in contact with the membrane.

Such membranes shall be PVC sheets of minimum 0.35 mm thickness with knobs of Maxlock.

The waterproof membranes shall be installed in strict accordance with manufacturer’s instructions.

The membranes shall extend 15 cm above ground level.

When setting forms and reinforcing steel caution shall be exercised to avoid damage to the impervious membrane. The surface of the impervious membrane extending outside the forms shall be protected during subsequent operations.

Any puncture or damaged areas shall be cleaned and patched according to manufacturer’s instructions.

Concrete with high wearing resistance

Concrete which is exposed to severe mechanical action, e.g., due to intensive traffic, sliding of bulk materials, frequent impact blows or movements of heavy objects, or due to fast-flowing water carrying solids, or other causes, should possess high wearing resistance and correspond at least to grade M30.

The aggregate upto 4 mm size should consist predominantly of quartz or materials of at least equal hardness; the coarser particles should consist of stone or artificial materials possessing high abrasion resistance. In the case of particularly severe mechanical action, it will be necessary to use special hard materials. The particles of all types of aggregate should have a moderately rough surface and be of compact shape. The combined aggregate should be as coarsely graded as possible.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[47]	25.09.2014

Furthermore, the concrete should be as stiff as possible, in order that there will be no concentration of cement slurry or water in the top layer. The concrete should be kept moist for at least 7 days after placing.

Finishing of formed surfaces

Fins and other surface projections shall be removed from all formed surfaces except exterior surfaces that shall be covered with earth backfill. Exterior surfaces that shall be exposed above grade and all interior surfaces, except those not usually exposed to view shall be cleaned and rubbed. Rubbing shall produce a smooth, uniform surface free of marks, voids, surface glaze, and discolorations.

Rubbing shall be done by hand with a carborundum stone using only the mortar produced by the rubbing action and the application of water.

Projecting ends of all form ties shall be removed. The resulting recesses shall be cleaned, wetted, and filled with patching mortar. Patches on rubbed surfaces shall match the texture of the adjacent concrete.

Finishing of unformed surfaces

No surface treatment shall be required for buried or permanently submerged concrete. As a minimum, unformed surfaces shall be finished by screeding and floating. Surfaces requiring a trowelled finish shall be finished by screeding, floating, and trowelling.

Float finished and screeded surfaces shall be finished to provide a flat profile within a 6 mm deviation as measured from a 3 m straightedge. Trowel finished surfaces shall be finished to form a flat plane. The surface profile shall not deviate more than 3 mm when measured from a 3 m straightedge.

Screeding

Screeding shall provide a concrete surface conforming to the designated elevations and contours with all aggregates completely embedded in adjacent mortar. Surface irregularities in screeded surfaces shall be limited to the tolerances specified.

Floating

The surfaces shall be screeded and given an initial float finish as soon as the concrete has stiffened sufficiently to work. Coarse aggregate disturbed by the float or causing a surface irregularity shall be removed and replaced with mortar. Initial floating shall produce a surface of uniform texture and appearance.

Initial floating shall be followed by a second floating at the time of initial set. The second floating shall produce a smooth float finish of uniform texture and colour.

Floating shall be performed with hand floats or suitable mechanical compactor floats.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[48]	25.09.2014

Trowelling

The exposed portions of the tops of equipment bases, tops of interior curbs, and the surfaces of interior slabs not receiving a separate finish shall receive a steel trowel finish. Trowelling shall be performed after the second floating when the surface has hardened sufficiently to prevent excess cement from being drawn to the surface. Trowelling shall produce a dense, smooth, uniform surface free from blemishes and trowel marks.

Surfaces to be covered with neoprene-hypalon coatings shall be lightly trowelled but not burnished.

Brooming

Brooming shall follow the float finish for exterior surfaces where a nonslip surface is required. Brooming shall be done with an acceptable steel or fiber broom not less than 450 mm wide. Brooming ridges shall be transverse to the normal traffic direction and shall be between 1.5 mm and 3 mm deep. Adjacent strokes of the broom shall overlap slightly. Broomed surfaces shall be free of porous spots, irregularities, depressions, and small pockets or rough spots.

Aggregate Exposure

Surface mortar shall be removed and the aggregate exposed from surfaces that shall be covered with mortar, concrete, or grout at a later time.

Edging

Unless specified otherwise, exposed edges of floated or troweled surfaces shall be edged with a tool having a 6 mm corner radius.

Finishing mortar

Finishing mortar shall be added if there is not sufficient mortar available from the concrete mix. The proportions for this finishing mortar shall be 102 kilograms of concrete sand to one sack of Portland cement, mixed with enough water for proper application. Slump for finishing mortar shall not exceed 50 mm.

Separate finishes

Certain slabs surfaces shall be finished with a separate concrete finish or floor covering.

Base slab surfaces shall be ground or filled until each surface is within the specified tolerances. Low areas shall be filled. High spots shall be ground slightly lower than required and then filled and smoothed to the proper elevation and surface.

Surfaces that receive epoxy set quarry tile and resilient tile shall be flat with a profile that shall not deviate more than 3 mm from a 3 m straightedge placed on any part of the surface. These surfaces shall be either trowel finished concrete at the elevation indicated on the drawings or a float finished surface set 3 mm low and levelled with trowel finished fill material.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[49]	25.09.2014

Surfaces that receive a mortar set quarry tile, ceramic tile, or vitrified finish shall be given a smooth, tight, and uniform float finish with a profile tolerance of 6 mm as measured from a 3 m straightedge.

5.22 Formwork

Design and construction

For stability and type of formwork and support framing used, IS: 14687 is to be observed.

The formwork and the supporting structure are to be so dimensioned as to be able to withstand all vertical and horizontal forces safely.

Supporting structures shall be sufficiently rigid to maintain the forms in their correct position and to be true to shape and dimensions so that the final concrete is within the limits of the dimensional tolerances specified in section) "Dimensional Tolerances".

The Bidder shall submit in sufficient time in advance for the approval of the Owner/Consultant the calculations, designs and details of the methods adopted and materials proposed for the formwork.

Particular attention must be paid to the formwork supports and braces to avoid any slip when the concrete is poured.

Materials for formwork

Forms shall be constructed from steel or from sound timber well seasoned and free from shakes. Plywood lining for forms shall be of timber, which is resin-bonded and water repellent.

Formwork surfaces in contact with concrete shall be free from adhering grout, projecting nails, splits or other defects.

Joints shall be sufficiently tight to prevent the leakage of cement grout. Connections shall be constructed to permit easy removal of the shuttering and shall be either nailed, screwed, bolted, or otherwise secured so as to be strong enough to retain the correct shape during consolidation of the concrete. Where a slope exceeds 1 V: 2 ½ H, formwork shall be provided for the top of the concrete faces and anchored to prevent flotation.

The details of fair-faced concrete facades have to be to the satisfaction of the Owner/Consultant. The concrete surface for facades has to be absolutely stainless and all efforts have to be taken to achieve this. All the proposed formwork shall be properly designed before its usage.

Grading of formwork and of finished concrete surfaces

Quality of formwork, materials to be used and treatments of surface are graded according to the finish of the concrete surface as given in IS: 14687.

The type and treatment of the formwork lining (plywood, metal, plastics, etc) should be appropriate to the grade of concrete finish required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[50]	25.09.2014

Preparation and inspection of formwork

Before concrete is placed, all formwork shall be inspected to see if it is built according to the approved plans and to see if it has been cleaned and is free from sawdust, shavings, dust, mud, earth or other contamination and properly oiled. Contact surfaces of panels shall be treated with a suitable release agent (e.g. non-staining mineral oil) where applicable. Surfaces, which are not oiled, shall be wetted thoroughly to prevent warping.

Erection and placing of formwork

All formwork shall be erected and placed in accordance with the construction drawings approved by the Owner/Consultant. Shuttering shall be true to line and braced and strutted to prevent deformation under weight and pressure of the wet concrete, live loads, wind and other forces. The deflections shall not exceed 3 mm.

The formwork for beams and slabs shall be erected so that the form on the sides of the beams and of the soffits of slabs can be removed without disturbing the beam soffit.

If the formwork for columns is erected to the full height of the columns, one side shall be provided with openings for concreting in order to guarantee a proper compaction of the poured concrete.

Formwork for walls and elsewhere shall be arranged for a maximum concreting height of 2.5 m in a single pour. Wherever necessary, panel openings are to be provided in the forms for cleaning, inspection, access of vibrators, etc.

Before placing of concrete, bolts, ties and fixings shall be positioned and all devices used for forming openings, holes, pockets, chases, recesses, etc shall be fixed to the formwork carefully.

Panels shall be put together to ensure a perfect fit at the joint and fixed in both directions.

Where concrete surfaces will be exposed to view (permanently exposed surfaces) the formwork shall be such as to produce a completely true, smooth surface, free from perceptible irregularities or to show clearly the desired texture. Such formwork shall be marked on the drawings as "Fair-faced Formwork".

Where concrete surfaces are covered (non-exposed surfaces), the formwork shall be referred to and marked as "Sawn Formwork".

Internal spacers and ties, if any, shall be so arranged that after removing of the forms no holes shall extend through the concrete, in the case of watertight concrete or to be closed by plastic plugs and epoxy mortar in all other cases.

All formwork will be inspected and approved by the Owner/Consultant before concrete placing commences but this shall not relieve the Bidder of any of his responsibilities under the contract.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[51]	25.09.2014

Striking of formwork

Formwork shall not be removed until the concrete has sufficient strength to carry its own weight plus any constructional or designed loads likely to be applied with a normal factor of safety. It shall be removed in such a manner that no shock or injury shall result to the concrete.

Before removal of the formwork, the concrete shall be examined and removal shall proceed only on the instructions and under the supervision of a competent person.

In accordance with IS: 456 clause 11.3.1, the striking period for cast in-situ concrete under certain conditions may be taken as follows: -

Table 2.8
Formwork

Type of Formwork	Minimum period before striking formwork
Vertical formwork to columns, walls, beams	16 to 24 hours
Soffit formwork to slabs (props to be refixed immediately after removal of formwork)	3 days
Soffit formwork to beams (props to be refixed immediately after removal of formwork)	7 days
Props to slabs:	
1) Spanning upto 4.5 m	7 days
2) Spanning over 4.5 m	14 days
Props to beams and arches:	
1) Spanning upto 6 m	14 days
2) Spanning over 6 m	21 days

Special care is necessary in the case of components, which have to carry nearly the full-calculated load as soon as the formwork is struck.

Columns, piers and walls are to be struck before the beams and slabs supported by them. Scaffolds, formwork supports and self-supporting floor formwork are to be carefully lowered by releasing the devices.

Extreme care shall be taken to avoid chipping of corners during removal of formwork.

To keep deflections through creep and shrinkage to a small amount, auxiliary supports should be left in place or immediately repositioned after striking.

5.23 Water stoppers

Water stoppers shall be of PVC or equivalent and shall be eye-letted with a minimum 25 cm width. Type and manufacturer shall be submitted to the Owner/Consultant's approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[52]	25.09.2014

All intersection pieces shall be prefabricated by the manufacturer and only welding of butt-joints in running lengths will be allowed to be carried out on the site.

The site welding of butt-joints shall be executed by using the manufacturer's purpose-made electrically heated jig and work shall be done by competent and trained personnel only. The manufacturer's instructions shall be carefully observed.

The wings of the water stoppers shall be formed with corrugations or bulbs to achieve a good bond. Moreover, the water stoppers shall conform to the following requirements:-

- The tensile strength not less than 10 N/sq.mm when tested.
- The ultimate elongation shall not be less than 22% when tested.
- The tear resistance shall not be less than 2 N/sq.mm when tested.
- The material shall not crack when tested.
- Under accelerated elongation, the tensile strength shall not be less than 8 N/sq.mm and the ultimate elongation shall not be less than 200%.

The water stoppers shall be installed so that they are securely held in position during the placing of concrete, which shall be fully and properly compacted around the water stoppers to prevent voids or porous areas. Adequate clearance between the reinforcement and all the water stoppers shall be kept to permit proper compaction of concrete.

No holes or nailing shall be made through any water stopper for fixing purposes. Jointing by lapping two pieces of water stoppers shall not be permitted.

The free edges of water stoppers shall at all times be protected from direct sunlight.

5.24 Curing

Concrete shall be protected from loss of moisture for not less than 7 days after the concrete is placed and if required the concrete may be protected for few more days as per the design mix / approved methodology.

Trowelled surfaces except those that receive a separate finish or coating, shall be cured with a membrane curing compound. Float finished surfaces, except those that receive a separate finish, may be cured with either a membrane-curing compound or with water. Only water curing shall be used if the surface receives a separate finish.

Water curing

Water saturation of concrete surfaces shall begin as quickly as possible after initial set of the concrete. Water curing shall begin within 12 hours in dry weather and within 24 hours in damp weather. The rate of water application shall be regulated to provide complete surface coverage with a minimum of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[53]	25.09.2014

runoff. The application of water may be interrupted for surface rubbing. The concrete surface shall not be permitted to dry.

After the rubbing has been completed, rubbed surfaces shall be covered with burlap and kept saturated for the remainder of the curing period.

Membrane curing

Membrane curing compound shall be applied within 30 minutes after final finishing of the surface or as soon as possible after finishing without causing damage to the surface. Membrane curing compound shall be spray applied at coverage of not more than 7.4 sqm/litre. Membrane curing shall not be used on surfaces that shall be covered at a later date with mortar, concrete, damp proofing, tile, or any coating. Membrane curing shall not be used on cast-in-place concrete bases for field-erected tanks. Membrane curing will be permitted only after prior approval of the OWNER/CONSULTANT.

Floor sealer

All concrete floors shall be given two coats of clear floor sealer in addition to that applied as membrane curing compound. The first coat shall be applied at the end of the curing period before any traffic is permitted on the floor. The second coat shall be applied after the floor has been cleaned in preparation for the final inspection. Floor sealer shall be applied in strict accordance with the manufacturer's recommendations.

5.25 Waterproofing/Damp proofing

A waterproofing seal shall be provided for all below grade structures where applicable by external tanking with PVC sheets of 1.0 mm thickness with knobs for membrane type waterproofing. In addition, joints in deep underground structures shall be provided with structural waterproofing.

Damp-proof course 40 mm thick, consisting of cement concrete 1:2:4, with admixture of approved water-proofing compound shall be laid at plinth level for walls of all buildings for protection of super-structure against moisture and dampness.

5.26 Repair of damaged and defective concrete

Concrete after its final setting shall be inspected by the Owner/Consultant and any cracks, honeycomb areas, segregations, etc shall be marked. No repairs shall be carried out until directed by the Owner/Consultant.

Surface defects in formed concrete shall be repaired to the satisfaction of the Construction Manager within 24 hours. Concrete that is porous, honeycombed, or otherwise defective to a depth in excess of 25 mm shall be cut out and removed to sound concrete. Edges shall be square cut to avoid feathering. Cut surfaces shall be coated with epoxy bonding compound before the concrete is placed.

Defective concrete shall be replaced within 48 hours after the forms have been removed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[54]	25.09.2014

6 PRESSURE GROUTING

The work shall consist of drilling grout holes, exploratory holes and check holes, pressure testing, pressure washing, and injecting suspension grout under pressure, and shall include furnishing of all materials, labor, and equipment as described and specified.

6.1 Materials

a) Cement

Portland cement shall be contains less than 0.6 percent alkali.

b) Aggregate

Aggregate shall be non reactive and shall be washed before use. When sources of aggregate are changed, test reports shall be provided for the material from the new source prior to commencing grout work. Fine aggregate shall be sand or crushed stone.

c) Admixtures

Admixtures shall be compatible with the grout and shall comply with the manufacturer's recommendations. Admixtures shall be added to the grout mix separately.

Water Reducing Retarder: Water reducing retarder shall comply with relevant Indian standard or as approved by Owner.

Lubricant: Lubricant additive for cement pressure grouting shall be Intrusion Prepakt Intrusion Aid, Sika Intraplast N, or as approved by Owner.

d) Water

Waste for washing aggregate, for mixing and for curing shall be potable, shall not contain more than 1000 mg/l of chlorides as Cl, nor more than 1300 mg/l of sulfates as SO₄, and shall not contain impurities which may change the setting time by more than 25 percent or a reduction of more than 5 percent of the compressive strength of the grout at 14 days when compared to the results for grout made with distilled water.

e) Grout

Drypack Grout

Drypack grout shall be a mixture of approximately one part cement, 1.5 parts sand, water reducing retarder and sufficient water to make a stiff workable mix, branded Dry Pack or approved equal.

Cement Grout

Cement grout shall be a mixture of one part cement, two parts sand proportioned by volume admixtures for pressure grouting and sufficient water to form a workable mix.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[55]	25.09.2014

Nonshrink Grout:

- Non-shrink expansive flowable grout shall be used for under pinning work below base plate of columns. Non-shrink cum plasticiser admixture shall be added in the grout. For grouting of base of machine foundation high strength ready mixed non-shrink flowable grout shall be used.
- Type and grade of grouting for structural columns and equipment bases shall be as indicated. Crushing strength of the grout shall generally be one grade higher than the base concrete. Minimum grade of grout shall be M 30.
- Nominal thickness of grouting shall be at least 50 mm for building columns and pedestals of major equipment. For secondary posts, stair and ladder base, etc. grouting shall not be less than 25 mm thick.
- Special grout, where specified on the drawings, shall be provided in strict accordance with the manufacturer's instructions/specifications. Pre-mixed Grout Conbextra GP-2 of 'FOSROC' make or equivalent of crushing strength 650 kg/cm² for major equipment foundations and Conbextra GP-1 or equivalent having crushing strength of 450 kg/cm² for other foundations where concrete grade M30 or higher is provided
- Forms and shims used to obtain adequate clearance shall not be removed and the anchor bolts shall not be tightened for at least three days after placing the grout. After the removal of forms and shims, area occupied by shims shall be filled and the area between the base and edge of the foundation shall be finished smooth to allow drainage away from the base. Attachment of interconnecting piping of machinery and complete load transfer of machinery shall not be done before the bolts are tightened. During this period, grouting work shall be properly cured using rags/gunny bags.

In view of extremely small proportion (about 0.01% by weight of cement) of the aluminium powder required, it is necessary to take all precautions to ensure thorough mixing. It is advisable to mix the blend of aluminium powder thoroughly with sand and cement before water is added because aluminium powder has a tendency to float on water.

- Proprietary material of approved manufacture used as an admixture to obtain non-shrinking grout shall be mixed in the proportion of 1:1:1 (1 cement: 1 admixture: 1 sand), or as per manufacturer's instructions.

Pre-mixed non-shrinking grout shall be used as per manufacturer's instructions and without any additional materials/admixtures such as cement, sand and aggregates etc.

Epoxy Grout for Crack Repair and Dowel Anchorage

Except for applications involving pressure grouting or crack injection, epoxy shall be a high modulus, moisture insensitive, two components, 100 percent solids, thermosetting modified polyamid epoxy compound. The material shall equal which is capable of not sagging in horizontal or overhead anchoring applications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[56]	25.09.2014

Epoxy for applications involving pressure grouting or crack injection, shall be a high modulus, moisture insensitive, two components, injection grade, 100 percent solids blend of epoxy resin compounds. The material shall equal which is capable of achieving complete penetration of hairline and larger cracks.

Polymer Concrete for Resurfacing and Patching

Polymer concrete shall consist of a liquid binder and dry aggregate mixed together to make a flowable mortar. The liquid binder shall be a chemical and oil resistant, stress relieved, low modulus, moisture insensitive, two component epoxy resin compound. The binder material shall equal with a consistency similar to light weight oil for proper mixing with the aggregate. The aggregate shall be oven dry, kept in sealed packages until the time of mixing and be of size and consistency compatible with recommendations of the manufacturer of the liquid binder for the intended application.

Adhesive Resin for Dowel Anchorage:

Pneumatically operated caulk gun and automatically mixed at nozzle. Subject to compliance with one of the following: HIT RE500-SD Adhesive Anchoring System, Hilti, Inc. (ICC ESR-2322), HIT-HY 150 MAX-SD Adhesive Anchoring System, Hilti, Inc. (ICC ESR-3013), SET-XP Adhesive Anchoring Systems, Simpson Strong-Tie Co. (ICC ESR-2508).

6.2 Pressure Grouting Equipment

Pressure grouting equipment shall include a mixer and holdover agitator tanks designed to place grout at pressures up to 0.345N/mm² (50 psi). Gauges indicating grouting pressure shall be provided and the mixer shall be equipped with a meter capable of indicating to within 0.003 m³ the volume of grout placed.

6.3 Execution

Bonding compounds for use with grout is to be provided and installed per the manufacturer's recommendations.

a) Drypack Grout

Drypack grout is to be used for built-up surfaces, setting miscellaneous metal items and minor repairs.

Surfaces required to be built-up with drypack grout are to be roughened by brushing, cleaned and coated with the bonding compound before application of grout. The grout is to be applied to the required thickness.

b) Cement Grout

Cement grout is to be used for filling nonbearing portions of equipment pads and pressure grouting.

Except for the specialized requirements for pressure grouting, grout is to be mixed and placed in the same manner as cast-in-place concrete. Grout is to be mixed for at least one minute and diluted grout is to agitated until placed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[57]	25.09.2014

c) **Non-shrink Grout**

Nonshrink, nonmetallic aggregate grout is to be used under equipment, bearing plates and column base plates. Nonshrink, metallic aggregate grout is to be used under rotating equipment where high strength and fatigue are of concern, to grout anchor bolts and to grout reinforcing steel. Grout is to be placed and cured in accordance with the manufacturer's recommendations.

Holes required for grouting shall be blown clean with compressed air and are to be free of dust or standing water. Horizontal holes for grouting are to be drilled at a slight downward angle and with the inserted dowel or bolt bent to match.

d) **Epoxy Grout**

Epoxy grout shall be used for repairing cracks by pressure grouting or gravity, repairing structural concrete and may be used for setting dowels or bolts in holes. Concrete is to be primed in accordance with the grout manufacturer's recommendations.

The use of epoxy grout must comply with the following restrictions:

- Limited to areas where exposure, on an intermittent or continuous basis, to acid, chlorine gas or to machine or diesel oils, is extremely unlikely.
- Limited to applications where exposure to fire or to concrete temperatures above the product heat deflection temperature or 120 deg F (40 deg C)(whichever is less) is extremely unlikely. Overhead applications are not allowed.
- Holes for the anchors shall be drilled (not cored), shall be blown clean with compressed air and shall be free of dust or standing water.
- The anchor type, size and embedment depth shall be as shown on the drawings and the anchor must be installed in accordance with the manufacturer's recommendations.
- The anchor must not be loaded until after the full curing period has elapsed.

e) **Pressure Grouting**

Prior to grouting, cracks and holes to be grouted shall be washed clean. Washing is not required for grouting soil voids. Once started, grouting shall be continuous until completed. In case of a mechanical failure or other stoppage of the work, the grout equipment shall be washed out sufficiently to ensure that fresh only grout is pumped when the work is restarted.

After grouting is completed, the Contractor shall remove the grouting plant and all related parts, equipment, and supplies from the site, including unused materials and waste.

6.4 Field Quality Control

- The Testing Laboratory will Develop and utilize an effective method of field marking anchor and dowel test locations and results.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[58]	25.09.2014

- Testing of grout mixes for conformance to manufacturer's specified strength: The independent testing laboratory shall take four test samples of each day's grout mix and test grout mix samples at 7 and 28 days. Test reports shall be submitted to the Owner for review.
- Test 25 % of reinforcing steel dowels installed with adhesive resin on a given day in tension using pullout procedure. Test to 80% of specified yield strength of the dowel with special inspection. Dowels specifically noted on the drawings as "No test required" do not require tension testing.
- If the failure rate of dowels exceeds 10 percent, testing will be increased to 100 percent of that day's installation of similar anchors or dowels. Testing will be reduced to 25 % of that day's installation when the failure rate is reduced to 10 percent or less. Failed dowels will be replaced at no additional cost to the Owner. The Contractor will produce daily reports of all testing activities; copies of daily reports will be submitted to the Owner in a timely manner.

6.5 Submittal

- Manufacturer's data shall be provided for bonding compounds, dry pack, non-shrink, pressure grout, retardants, epoxy grout, polymer concrete.
- Test reports, accompanied by a manufacturer's statement that previously tested material is of similar type, quality, and manufacture as that which is proposed for use on this projects, shall be submitted for Cement, Aggregates, Retardants, Bonding compounds and Epoxy resin
- The Contractor's testing laboratory shall provide evidence of correction of deficiencies noted in the inspection report before materials specified in this section are delivered to the job site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[59]	25.09.2014

7 RETROFITTING WORKS

7.1 General

- a) The Work shall, in general, conform to other works/items specified in this Specification.
 - If the specifications for any item are not available in this Specification cited above, relevant BIS Specifications should be followed.
 - In case BIS Specifications are also not available, the decision of Engineer-in-Charge given in writing based on acceptable sound engineering practice and local usage shall be final and binding on the contractor.
- b) The work will be carried out in accordance with the architectural and structural drawings to be approved by Owner. The structural and architectural drawings shall have to be properly correlated before executing the work.
- c) For items where so desired, samples shall be prepared before starting the particular items of work for prior approval of the Owner and nothing extra shall be payable on this account.
- d) Materials brought at site of work shall not be used in the work before getting satisfactory Mandatory test results.
 - Equivalents for the various materials and the materials of approved make shall be got approved from the Owner in writing before using them on the work.
- e) The contractor shall submit the required documents regarding the genuineness of materials used such as manufacturer's certification that the firm has manufactured the supplied materials.
- f) The contractor shall get approved from the Owner the storage space for epoxy/polymer/patented/other manufacture of materials to ensure that the storage temperature is maintained between 5° C and 38° C unless recommended otherwise by the manufacturer.
- g) Contractor shall comply with manufacturer recommendations so as to comply with environmental conditions under which the repair materials may be applied.
- h) The contractor shall employ Principal Technical Representative & skilled site workers who shall have adequate qualifications and experience for the proper execution of such works and already performed works of this kind with success.
- i) Contractor shall advise all workers working with epoxies to avoid contact with eyes and skin, inhalation of vapours, and ingestion. Necessary protective and safety equipments in the form of hand gloves, welders' goggles, shall be provided by the contractor and used on site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[60]	25.09.2014

- j) Care shall be taken to ensure that vibrations are well within acceptable limits for structural safety and users of the building.
- k) For the execution of protection and repair works, properly maintained plant and equipment permitting adequate treatment of the concrete substrate, proper execution of the work and determination of the required properties of the construction materials and construction measures must be present on the construction site.
- l) To ensure efficient and effective functioning, all plant and equipment must be checked on-site and at field material testing laboratory prior to first use and at appropriate intervals thereafter.

7.2 Chipping of Unsound/Weak Concrete Material

a) Purpose

To remove weak, loose or carbonated concrete over an area from its surface with pneumatically operated or power driven tools by chiselling, chipping etc.

b) Materials and Tools & Plants (T&P)

Power or pneumatically driven chisel, chipping tools complete with accessories, hand-tools like chisels, hammer, pH indicator (0.2% phenolphthalein solution) with pH range at least up to 10.5 and clinical injection syringe.

c) Safety

Safety shall be ensured in accordance with contract conditions and specifications.

d) Procedure

Step-1: Prop and support to relieve the structural member of stress and strains.

Step-2: Scaffolding, if necessary for the exterior members, shall be done for working upon the area.

Step-3: Working Platforms for interior members, if necessary, shall be erected suitably or provided as mobile.

Step-4: Provide Protective Screen, if necessary.

Step-5: Mark off the area to be repaired using straight lines between corners. The marked area shall have 90° corners with the sides parallel or normal to the direction of the reinforcement. The marked boundaries for the repair area should be a minimum of 50 mm outside the perimeter of the spall. For a single spall, the repair area should have a minimum width of 100mm in any direction. If a number of spalls are closely located to each other, these spalls should be included in a single area marked for repair.

Step-6: Cut shall be made along the marked boundary, normal-to-the surface. It should be made with a diamond cutter blade. However, when diamond cutting is not practical, the normal cut can be made with a power driven chisel. Minimum depth of cut shall be 10 mm. In situations where the diamond saw could cut into the reinforcing steel due to inadequate concrete cover, the boundary edge

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[61]	25.09.2014

should be formed manually by means of chisel and impact hammers. A cover meter could be used to estimate the depth of cover.

Step-7: Chipping to remove all the unsound and weak concrete material shall be done carefully from the damaged portions of structural members by adopting mechanical or manual means up to the required depth to produce sound concrete surface to a near uniform depth for the repair area.

e) **Tolerance**

The chipping tolerances shall be $\pm 5\text{mm}$.

f) **Chiselling**

Hand Tools are typically applicable for concrete removal for smaller, moderate and areas of limited access. Removal should begin at the interior of the repair area and progress toward the boundaries, using suitable hammer. Power Driven Chisels/Hammers are normally applicable for chiselling smaller thicknesses up to about 50 mm. Pneumatic Hammers are normally applicable for chiselling larger thicknesses in excess of 50 mm Mechanical Milling (single drum, rotary cutter head with Tungsten-carbide bits) is applicable for large areas where the concrete cover is to be removed. Care must be taken to avoid contact with the reinforcing steel as both the reinforcement and the cutter drum could be damaged. Rounded And Feathered Edges should be hand cut to form normal-to-the-surface boundaries. All the edges and cavities shall be square shouldered.

Step-8: Test for carbonation shall be carried out at embedded or exposed reinforcement locations, by spraying phenolphthalein indicator on concrete in contact and in the immediate vicinity of reinforcement soon after its chipping. As otherwise, chipped concrete surface in contact with air is likely to get carbonated soon after its coming in contact with atmospheric carbon dioxide.

Step-9: A full-depth chiselling and removal of concrete all round reinforcement shall be carried out, in case the concrete in contact and in immediate vicinity of the reinforcement is carbonated.

Step-10: Inspection and soundness testing, after concrete removal & cleaning, for weaknesses and delamination of exposed surfaces shall be visually carried out. If required, additional removal will be done.

Step-11: Cleaning of debris and dust shall be carried out from within the chiselled/ chipped area and its disposal as per direction of the Engineer-in-Charge.

7.3 Removing concrete all around reinforcement including from its behind

a) **Purpose**

To create an average clear air gap equal to nominal size of coarse aggregate plus 5 mm all around embedded reinforcement, in contact with carbonated concrete for rust removal & passivating its surface with fresh alkaline passivating coat and concrete/ mortar.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[62]	25.09.2014

b) **Materials and T&P**

Power or pneumatically driven chiselling, abrading, chipping tools complete with accessories, hand-tools like chisels, hammer, pH indicator i.e. 0.2% solution of phenolphthalein indicator for pH range preferably up to 11.5 or at least up to 10.5, clinical injection syringe.

c) **Safety**

Safety shall be ensured in accordance with contract conditions and specifications.

d) **Procedure**

Step-1: Prop and support, if not done already, to relieve the structural member of stress and strains.

Step-2: Scaffolding & working platforms for the exterior members, if not already done and if necessary, shall be erected for working upon the area.

Step-3: Working Platforms for interior members, if not already done and if necessary, shall be erected suitably or provided as mobile.

Step-4: Provide Protective Screen, if not already done and if necessary.

Step-5: Test for carbonation shall be carried out at embedded or exposed reinforcement locations, by spraying phenolphthalein indicator on freshly chipped concrete in contact and in the immediate vicinity of reinforcement.

Step-6: A full-depth chiselling and removal of concrete all round reinforcement shall be carried out, if the concrete in contact and in immediate vicinity of the reinforcement is carbonated. The concrete around reinforcement shall be removed so as to have a near uniform air gap of about 5 mm plus the nominal size of coarse aggregate to be used in repair concrete/mortar. However, the air gap shall not be less than 15 mm in any case. Power/pneumatic driven tools/chisels shall be used for such portions of carbonated concrete around reinforcement, which could not be removed manually, to achieve a near uniform required air gap all around including behind the reinforcement. Power Driven Chisels/Hammers are normally applicable for chiselling smaller depths up to about 50 mm. Pneumatic Hammers are normally applicable for chiselling larger depth in excess of 50 mm.

Step-7: Cleaning of debris and dust shall be carried out from within the chiselled /chipped area and its disposal as per direction of the Engineer-in-Charge.

7.4 Rust Cleaning from reinforcement

a) **Materials and T&P**

Chiselling, abrading, chipping, hammering, wire brushes, paint brush, abrading cloth, etc hand tools complete with accessories, tested and approved chemical rust remover.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[63]	25.09.2014

b) **Safety**

Safety shall be ensured in accordance with contract conditions and specifications.

c) **Procedure**

Step-1: Cleaning by manual method-

Remove the rust manually from all round the surface along the length of reinforcement, using hand tools like chisels, hammers, wire brushes, abrading cloth/paper, etc. This shall be continued manually along the length of the rusted reinforcement till such time that the steel surface is cleared of all rust that could be removed manually.

Step-2: Cleaning by chemicals –

Remove the Rust by using tested chemicals, if directed by Engineer-in-Charge, due to unsatisfactory results of manual rust removal. Chemical rust remover shall be brush applied over the reinforcement surface thoroughly all around the circumference and along the full length of rusted reinforcement. After 24 hours (or as prescribed by manufacturer) of its application, the surface shall be cleaned with wire brush and all loose particles removed. It shall be washed with water thoroughly and allowed to dry.

7.5 Cleaning Reinforcement and exposed concrete surface of loose and foreign material by means of sand blasting

a) **Purpose**

Clean the prepared concrete surface of all-loose, lightly sticking materials including the foreign materials, loose concrete, aggregates etc to provide a good bond with the applied repair material and clean the reinforcement surface of any minor rust remaining after manual and chemical cleaning to achieve shining bright metal.

b) **Materials and T&P**

Coarse sand conforming to Zone I or II as per IS: 383, Air compressor of a minimum 35 Kilowatt capacity, spray gun for sand, all related accessories for sand blasting, hand tools like wire brushes, chisels, etc

c) **Testing of Materials and T&P**

The sand shall be tested to conform to the specification.

The air compressor shall be tested to perform to the required standards as laid down in specifications of shotcreting.

d) **Safety**

Safety shall be ensured in accordance with contract conditions and specifications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[64]	25.09.2014

e) Procedure

Step-1: Specified tested coarse sand shall be collected at site in required quantity for sand blasting.

Step-2: Make available mechanical power driven air compressor in working condition at site with all required accessories for carrying out sand blasting as well as air blasting operations.

Step-3: Coarse sand shall be sprayed under pressure over the exposed surface so as remove all loose and foreign material and to cause an intense abrading of the reinforcement and removal of rust from entire surface of reinforcement to achieve shining bright surface. The sand blasted surface shall be subsequently cleaned with oil free air blast.

7.6 Providing drilling and inserting nipples along crack lines

a) Purpose

To fix injection nipples and seal the remaining portion of honey combed or cracked concrete /masonry for grout injection.

b) Materials and T&P

12 mm diameter approved PVC/aluminium /Galvanised Iron nipples, Chisel, hammer, power driven tool for chase cutting & drilling, hand operated blow out pump, sealing putty of polyester/epoxy/polymer modified mortar etc. and all related accessories and materials.

c) Testing

The sealing putty and the nipples shall be tested to conform to the manufacturers specifications. The power driven tools shall be test driven and their drill/cutting bits shall be tested for effectiveness before taking up the repair operation.

d) Procedure

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Personnel, Supervision, Product delivery, Storage and Handling etc.

Step-2: Identify the Cracks and mark the area for injection grouting.

Step-3: Prop & support the structural member, if required, to relieve it of stress and strains.

Step-4: Open up cracked surface by making 'V' notch or groove of size 12 mm x 12mm.

Step-5: Remove plaster, if required, to identify and mark the honey combed area.

Step-6: Drill holes at least 25 mm diameter and 40mm deep along crack lines at spacing of 300 mm or thickness of the structural member, whichever is less. In honey combed area @ 9 nos per sqm. as directed by Engineer-in-Charge and up to 30 mm to 40 mm depth.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[65]	25.09.2014

Step-7: Remove coarse debris and dust in opened up cracks and drilled holes by blowing oil free compressed air, if available with air compressor, otherwise with hand operated blow out pump. Concrete surfaces required to be grouted shall be free from all loose and unsound materials by means of mechanical abrasion using stiff wire brushes, after removing all loose areas with chisel and hammer. Area shall be made free from any deleterious materials, such as oil dust dirt etc. by means of oil free jet of compressed air. All prepared concrete surfaces shall be thoroughly inspected and got approved by the contractor.

Step-8: Insert 12mm dia specified injection nipples in holes drilled along crack lines and fix them by sealing only its sides with epoxy or polymer modified mortar.

Step-9: Seal the crack or the honey combed surface between the nipples by polymer modified mortar as may be approved by Engineer-in charge. The polymer used shall be of approved grade and applied as per specifications mentioned separately elsewhere. The polymer-modified mortar shall be moist cured for 1-3 days and allowed to gain strength before actual grouting commences.

7.7 Sealing of cracks by injection of advance grout

a) Purpose

To inject the specified grout into honeycombed or cracked concrete/ masonry

b) Materials and T&P:

Cement, sand. Water and admixture for cementitious grout shall be as per clause 5 of this specification.

Polymer: It shall be as specified and shall conform to ASTM-C-1059.

Hand/power operated grouting pressure pump/gun with pressure gauge. The grouting equipment shall be capable of supplying, mixing, stirring and pumping grout to the satisfaction of the Owner. The equipment shall have the capacity to inject grout at a pressure upto 7 kg per square centimeter measured at the grout connections. It shall be capable of mixing and pumping of cement sand grout 1:2 with water cement ratio ranging from 0.5 to 1.

Air compressor with all related accessories for carrying compressed air to the required location. Hand operated blow out pump may be allowed by Owner for small crack depths/areas.

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions), Mechanical blender for mixing, Spray equipment/brush for application of polymer modified/ bonding cement slurry

c) Execution:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured material (e.g. specified resin, hardener, polymer, cement, etc as may be required) shall be received at site in factory

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[66]	25.09.2014

sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the storage period shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3: If directed by Owner, collect random samples of materials for test and send to approved laboratories so as to ensure that they satisfy the physical and mechanical properties. The grout pump and the pressure gauge shall be tested before taking up the repair operation.

Step-4: Identify the Cracks and mark the area for injection grouting.

Step-5: Surface Preparation: The appropriate propping/supporting, surface preparation and crack sealing as per site requirements shall be completed, which may sequentially cover one or more of the following items of work:

- Prop & support the structural member to relieve it of stress and strains.
- Provide grouting nipples.

Step-6: Blow the compressed air followed by washing with water through nipples located at the highest level and downwards to ensure removal of even fine dust particles from the cracked surface, which could obstruct the free flow of grout material and impede its bonding with cracked surface (and drying with air blast wherever epoxy injection grout is to be used).

Step-7: Saturate the cracked surface in the vicinity of crack/honeycombed concrete/ masonry with water (but without excess water), only if the cementitious grout is to be injected. Otherwise, this step may be skipped.

Step-8: Prepare the injection grout as specified under clause 5 of this specification.

Step-9: Inject the approved & specified grout into the cracks by means of suitable gun or pump at a pressure of 1- 2 kg./cm² for epoxy grout and 4-7 kg./cm² for cementitious grout. In case of vertical cracks injection shall be started at the lowest nipple and continued until the injected grout begins to flow out at the next higher nipple. Whereas in other cases of horizontal locations, the injection shall be started from one nipple and continued until the injected grout begins to flow out at the other nipple.

The first nipple shall then be closed off and injection continued at the second until the grout flows out at the third. The process shall be repeated until the whole of the crack has been sealed. As soon as the system is cured, the nipples shall be cut.

In case of Honeycombed Area, each grout hole shall be grouted individually. Grouting pressures to be used in the work will vary with the conditions encountered and different areas and the pressure used shall be between 1 to 4 kg/cm². The sequence of injection shall be as per the direction of Engineer-in-Charge.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[67]	25.09.2014

7.8 Providing and inserting shear key bars

a) Purpose

Shear key bars are used for providing a structural connection of the applied repair material with the substrate/parent surface for transfer of forces occurring at the interface.

b) Materials and T&P:

Epoxy cartridges and specified lengths and diameter of steel reinforcement.

Standard Power driven drilling/hammering equipment, Hand operated blow out pump, brushes, epoxy dispenser, epoxy cartridge holder, disposable PVC mixing nozzle for epoxy, and any other incidental accessories and T&P items.

c) Procedure

Step 1: Mark the locations of shear keys and get the same approved for structural connection from the Owner.

Step 2: Drill holes to specified depth and diameter in concrete at marked locations for the specified dia of shear key bars.

Step 3: The drilled hole in dry state shall be cleaned with round brushes and by blowing air through a tube inserted in the hole and connected to hand operated blow out pump.

Step 4: Inject epoxy from the foil pack with the help of epoxy dispenser, epoxy cartridge holder and disposable PVC mixing nozzle inserted inside the drilled hole to fill it from bottom of the hole and upwards.

Step 5: Insert the reinforcing bar and allow the epoxy adhesive to cure.

7.9 Reinforcement for RCC works etc.

a) Purpose

To provide reinforcement in repair concrete for structural purposes, controlling effects of thermal variation or holding shotcrete/gunite material in position. The reinforcement material may comprise specified grade and quality with or without zinc coating.

b) Material & T&P:

Specified reinforcing material, necessary hand or power driven tools for cutting, bending, binding, transportation, handling and placement etc. Reinforcement bars if used shall conform to I.S. 432 (Part-I) or I.S. 1786. Welded wire fabric where used shall conform to I.S. 1566.

c) Procedure

The general requirements, placing in position, measurement etc. shall be generally followed as in clause 4 of this specifications excepting those specifications provided in the following clauses.

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[68]	25.09.2014

Step-2: Testing of Material: The requisite number of test specimens of specified reinforcing material shall be collected from each batch of manufacture or supply received (whichever is less) for these to be tested for conformance to the specified requirements before use on the work.

Step-3: Execution:

The required reinforcement as per approved detailed drawings in the form of round bars or welded wire fabric in such a way so as to cause the least interference with placement of repair material.

d) Overlaps:

Lapped reinforcing bars shall not be tied together. They shall be separated by at least 50 mm wherever possible. Wire mesh shall be lapped by 1-1/2 squares in all direction. Minimum requirement of lap length of bars shall be as specified in I.S. 456.

e) Clearance around reinforcement:

Sufficient clearance shall be provided around the existing exposed and additional reinforcement to permit complete encasement with sound repair material.

f) Cover:

Minimum cover to reinforcement shall be as specified under clause 4 or as per I.S. 456. As far as possible the bars shall be arranged so as to permit shooting from opposite side.

g) Fixing:

Reinforcement shall be fixed to existing shear key bars and depth gauges driven into the concrete with wires and secured rigidly so that the vibration resulting from the deposition of repair material shall not impair or displace them.

h) Where Gunite /shotcrete to be done in more than one layer

In such cases, the additional reinforcement should be so fixed that it is encased in succeeding layer. No additional reinforcement is required to be fixed in first layer of gunite.

Mesh reinforcement shall be fixed in the manner so that it is firmly held at least 12 mm away from the parent concrete surface as well as from the final finished surface. It shall be ensured that it is stiffened enough and cannot belly out during the guniting / jacketing / concrete overlays with consequent lack of cover. It shall be done by tying with parent concrete surface through shear key bars or depth gauges. GI-wire mesh fabric will add sacrificial "Zinc" coating & shall reduce corrosion process in the reinforcement. The wire mesh spacing shall be as specified in the drawings.

7.10 Alkaline Passivating bond coat over Reinforcement

a) Purpose

To protect steel reinforcement with a passivating alkaline layer provided all around its circumference along the length with strong adhesive to bond with applied repair concrete or mortar.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[69]	25.09.2014

b) Materials and T&P:

Specified alkaline passivating & bonding materials e.g. CPCC material, epoxy, epoxy phenolic IPN-RB or specified polymer and cement, mixing water, necessary T&P for mixing and applying bond coat e.g. brush, mechanical mixer, mechanical stirrer, etc.

Epoxy Adhesives shall conform to ASTM C-882.

Polymer Latex shall conform to ASTM C-1059.

Cement shall be ordinary Portland cement conforming to IS: 269.

Patented materials e.g. CPCC or epoxy-phenolic IPN-RB as per licensee's specifications

c) Execution:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured repair materials shall be received at site in factory sealed containers with labels legible and intact, if the shelf life so permits. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3: Prepare the surface for treatment.

Step-4: Thoroughly inspect all the concrete surfaces prior to applications of passivating/ bond coat and get approved from the Engineer-in-Charge.

Step-5: Test the materials by taking random samples and testing in approved laboratories so as to check whether they satisfy the physical and mechanical properties.

Step-6: Make available at site all necessary mechanical equipment as under:

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions),

Mechanical blender for mixing

Brush for application of specified and approved passivating/bond coat.

Step-7: Material Mixing: Components of the passivating/ bond coat mix shall be weigh batched and mixed in specified proportions in a clear container free from harmful residue or foreign particles. The components shall be thoroughly blended with a mechanical mixer to a uniform and homogeneous mixture. Small batches (upto 1 litre) may however be allowed by manual mixing using spatulas, palette, knives etc.

Step-8: Material Application: The alkaline passivating & bonding material shall be applied to prepared reinforcement substrate after tying in new reinforcement wherever specified in the form of bars or welded wire fabric. It shall be applied to reinforcement surfaces by stiff nylon bristle brush. The coating material shall be worked well all round the periphery and along its exposed length using a stiff brush ensuring that no pinholes are remaining. The second coat, if required, the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[70]	25.09.2014

same shall be applied as per manufacturer's recommendation after the first coat is touch dry.

7.11 Bonding coat for hardened concrete with repair concrete/shotcrete/cement mortar

a) Purpose

To provide adequately strong adhesion of parent concrete with applied repair concrete or mortar.

b) Materials and T&P

Specified bonding materials e.g. epoxy or polymer and cement, mixing water, necessary T&P for mixing and applying bond coat e.g. brush, spray gun, mixer, mechanical stirrer, etc.

Epoxy Adhesives shall conform to ASTM C-882

Polymer Latex shall conform to ASTM C-1059.

Cement shall be ordinary Portland cement conforming to IS: 269.

c) Execution

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured repair materials shall be received at site in factory sealed containers with labels legible and intact, if the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer- in-Charge Full quantity shall be worked out as theoretically required for consumption in the whole work

Step-3: Prepare the surface for treatment.

Step-4: Saturate the surface with water but shall be free of excess surface water, debris and dust, where cementitious bond coat is to be applied. Otherwise, surface to remain dry and clean of debris and dust.

Step-5: Thoroughly inspect all the concrete surfaces prior to applications of adhesive and get approved from the Engineer-in-Charge.

Step-6: Test the materials by taking random samples and testing in approved laboratories so as to check whether they satisfy the physical and mechanical properties.

Step-7: Make available at site all necessary mechanical equipment as under:

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions), Mechanical blender for mixing Spray equipment, brush for application of epoxy, polymer modified, bonding cement slurry.

Step-8 Bond Coat Mixing: Components of the bonding coat mix shall be weigh batched and mixed in specified proportions in a clear container free from harmful residue or foreign particles. The components shall be thoroughly blended with a

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[71]	25.09.2014

mechanical mixer to a uniform and homogeneous mixture. Small batches (upto 1 litre) may however be allowed by manual mixing using spatulas, palette, knives etc.

Step-9 Bond coat application for jacket concrete/ shotcrete/ Mortar placement: The specified adhesive shall be applied to concrete surface at atmospheric temperatures below 40°C for epoxy adhesive and below 30°C for polymer modified cement or cement-sand slurry adhesive. Bonding coat shall be applied by spray equipment or stiff nylon bristle brush as approved by Engineer-in-Charge. The bonding material shall be worked well into the surface of the parent body ensuring that no pinholes are visible.

Polymer modified bonding cement slurry shall be applied to a thickness not in excess of 2 mm.

If necessary, a second coat shall be applied at right angles to the first to ensure complete coverage and absence of pin holes.

All concrete surface shall be well protected beyond limits of surface receiving adhesive against spillage.

Step-10 Repair Material Application: Fresh plastic concrete/ shotcrete/ mortar shall be applied while adhesive is still tacky and well within the pot-life/ setting period. If adhesive cures to the extent of losing its tack or has set before plastic concrete/shotcrete/mortar is placed, the same shall be removed or slightly abraded and second coat of adhesive applied. Freshly placed plastic concrete shall be thoroughly consolidated to ensure full bonding of new concrete with the substrate.

d) Bond of repair with parent concrete:

Evaluate bonding of fresh concrete/ shotcrete/ mortar to existing concrete after the fresh material has cured for not less than 7 days by sounding and tapping fresh concrete with a blunt metal instrument to the satisfaction of Engineer-in-charge. Suspect inadequate bonding, if a hollow sound is detected in any area. In case of conflicted location contractor shall extract one core from the repaired surface area at the end of 28 days.

Conduct one core test at random for checking the bond, for every 100 square metre or part thereof. The contractor shall core each area after 28 days of application of concreting/ shotcreting/ repair mortar application for determination of bonding adequacy.

Core drilling shall be done through applied repair material and into the existing concrete. Core diameter shall be not less than three times the nominal size of the coarse aggregate used in repair material or as required by the Engineer-in-Charge. Length of cylindrical cores shall preferably be twice the core diameter or twice the thickness of applied repair material or as instructed by Engineer-in-Charge but in any case not less than the dia of the core.

Cores shall be visually inspected by Engineer-in-Charge for evidence of poor workmanship.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[72]	25.09.2014

Cores shall be tested in tension to evaluate the quality of bond between new concrete/shotcrete/mortar and the parent concrete. If the failure is in the parent concrete the bond of new repair material shall be deemed to be satisfactory.

Failure at the bond line or in the repair material shall be concluded as lack of proper bond or inadequate strength of repair mortar

Dismantle such areas of work failed in bond or repair material and re-prepare the surface after chipping off new concrete/mortar work and abrading the epoxy/polymer/cement slurry interface. Nothing for testing concrete for bond between old and new concrete shall be paid separately.

7.12 Curing of RCC Surfaces etc

a) Purpose

To ensure satisfactory hydration of cement by retaining or replenishing the mixing water lost due to natural drying and evaporation process for a specified period through exposed cementitious surfaces of the freshly placed cement mortar/ concrete.

b) General

Importance of wet curing to all items of work involving use of cement can not be over emphasised. Any surface experiencing discontinuity of dampness of surface with any patch having dried out during the specified period of curing, it shall be prominently marked with lime or other suitable prominent colour.

c) Materials and T&P:

Curing compound, brush or hand operated spraying gun and all other related accessories for application on Concrete/Plastered Surface.

d) Procedure:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of specified manufactured material shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out theoretically for consumption in the whole work.

Step-3

- Moist Curing:**

Cover all exposed surface of concrete, when the concrete begins to harden i.e. two to three hours after compaction with moist gunny bags or any other material approved by the Owner.

Keep the exposed surfaces continuously damp after its final setting (i.e. after a maximum of 8 hours of concreting) by ponding with a sheet of water or by covering with a layer of sacks, canvass, hessian or similar water absorbent materials constantly kept wet by water sprinkling for at least 7 days, where

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[73]	25.09.2014

ordinary portland cement is used and 10 days, where portland pozzolana cement is used from the date of placing of concrete. For concrete work with other types of cement, curing period shall be as per manufacturer's recommendations or as directed by the Owner.

- Using Curing compound:

Testing of Materials:

It must be ensured that curing compound should neither affect the strength nor the surface of concrete. It shall not leave any undesirable stains on surface to affect the bond of plaster or other finishes to be applied later. It should be soluble in water, so that it can be removed by splashing or washing with water without scrubbing the surface.

Test for Efficacy:

The testing of curing compounds shall be done from each lot of curing compound received at site by casting two sets of 15 cm cubes with each set having 6 cubes. One set shall be moist cured by covering with damp gunny bags and subsequently by immersing under water and the other set by applying curing compound on top after 2 to 3 hours of casting and subsequently on de-moulding apply on the remaining faces all around. The cubes shall be kept in an environment similar to which the actual structure is exposed for a period of 7 days after its casting. Three concrete cubes each from both sets shall be tested after 7 days for their crushing strength as per standard test procedure. The average crushing strength of cubes cured with curing compound shall be not less than 95% of the crushing strength of cubes cured under damp or immersion curing.

Test for Staining:

The set of three sample cubes applied with curing compound, remaining after 7-day cube crushing strength test, shall be washed with water with soft brush scrubbing with nylon bristles and allowed to dry for a period of seven days in an atmosphere with relative humidity not exceeding 40% at ambient temperature. The other set of three cubes cured for seven days under damp or immersion conditions shall also be kept for another seven days under identical humidity and temperature conditions. The surface of the two sets of such cubes shall be compared by closely observing for any visible stain and texture that may detrimentally affect its bond with subsequently applied plain plaster or aesthetic appearance. Such observations shall be recorded in three categories as no effect, slight effect and moderate effect. The curing compound shall be considered as acceptable in the 'no effect' category and unacceptable in the 'moderate' category. The decision of Engineer-in-Charge, which shall be final and binding, based on the likely use of finished surface of concrete/plaster shall determine the acceptability of the 'slight effect' category.

Concrete curing compounds, after testing satisfactorily for efficacy, may be used in lieu of moist curing with the permission of the Engineer-in-Charge. Such compounds shall be applied to all exposed surfaces of the concrete by spraying

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[74]	25.09.2014

or brushing within two to three hours of casting and well within an hour of removal of formwork.

7.13 Engineered Steel Tubular double Scaffolding System

a) Purpose

To provide a scaffolding system with adjustable working platforms on the exterior of the building for the workmen to work upon any part of the area to be accessed safely and with ease for surface preparation, application of repairs and construction activity.

b) Materials

The standard proprietary tubular double scaffolding system of repute with all accessories, working platforms etc.

c) Design

It shall be designed for all the incidental dead, live and wind loads as per IS: 875 in steel tubular sections as per general design considerations governed by IS:800. The design of the scaffolding system shall cater to the safety features for the workmen.

d) Fabrication and Erection

Fabrication and erection shall be done as per the design brief and installation instructions of the proprietary firm. It shall be maintained in functional condition for the work duration.

7.14 Temporary barricading using angle iron verticals and sheet panels

a) Purpose

To provide a barricading on ground to physically define the boundaries of the site of construction/repair activity for restricted entry of only those involved with the construction work.

b) Materials

Available Corrugated G.I. Sheet minimum 24 G thick; Framing structural material at least MS Angle iron of size [40x40x5mm] or equivalent.

c) Fabrication & Erection

Size of framing panel shall be decided depending upon site conditions and these could be approximately 2.0 metres long with height as 1.8 metre.

It shall be made up at least of two verticals, each with additional length of about 600 mm for fixing in to ground firmly and two horizontals equal to the length of panel.

It shall be made up by cutting the structural sections to size, shear punching holes in verticals and horizontals for nuts and bolts or making other suitable provision for receiving CGI sheet or other specified panelling material and connection of panel with adjoining panels.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[75]	25.09.2014

Fabrication of frame of an individual panel shall be by welding at corners, welding MS plate at base of verticals or any other acceptable practice approved by Engineer-in-charge.

G. I sheet or other specified panelling material shall be suitably fixed. It shall preferably be done by means of nuts and bolts at its ends spaced at about 300 mm c/c transversely and at about 600 c/c longitudinally along corrugations. The corrugations of CGI sheet shall run along the shorter span of the panel.

In case of newly fabricated panels, these shall be painted with red oxide zinc chromate primer on steel work and approved primer on other material and at least one coat of paint of approved shade. In case of used panels, one coat of paint of approved shade shall be applied over the existing paint. The portion of verticals to be embedded in ground shall be suitably protected against rusting by painting it with bitumen or other suitable paint.

The fabricated panels shall be suitably fixed vertically and firmly in to the ground to the satisfaction of Engineer-in charge by maintaining a uniform height of about 1.8 metres above GL and connecting each panel with the adjoining panels with nut and bolts or other suitable means.

Suitable provision of frame/posts in the openings provided in barricading shall be made for receiving door shutter at locations as approved by Engineer-in-Charge.

7.15 Temporary protective fabric screens

a) Purpose

To protect passersby from falling debris and also to protect the workmen and structure being repaired against direct exposure to sun.

b) Materials:

For screening purpose jute cloth, woven PVC cloth, geo-textile or wire-mesh as specified and approved by Engineer-in-Charge shall be used, which shall conform to their relevant BIS Code. Screen materials shall be fixed by suitable means comprising of M.S.Flats/ J-bolts /nails/clamps, etc with washer or any other suitable means on frames of existing scaffolding etc.

c) Procedure

Scaffolding, if required, comprising of verticals, horizontals and diagonal bracings of steel tubes shall be fixed over ground which is payable separately.

One end of the screening material, brought to site in looms/rolls, shall be properly fixed over top horizontal member with suitable means and suspended so as to cover the required area.

The vertical fall of screen shall be suitably fixed/firmed up at intermediate levels so as to keep it in position during the work duration.

Next strip of the screening material shall be fixed with its sides stitched or suitably jointed or lapped with the previous ones as approved by Engineer-in-charge.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[76]	25.09.2014

Spacing of frame member of scaffolding shall be so selected that the sagging of screen shall not hinder the repair process.

The contractor shall maintain the protective screens in acceptable conditions for the entire work duration as required by the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[77]	25.09.2014

8 CONCRETE RETROFITTING METHODS

In selecting the retrofitting method, the current status of the existing concrete structure as determined through inspection, the performance of the structure, the performance required of the structure after retrofitting, the conditions for retrofitting construction work, the ease of maintenance, economy and other factors shall be considered.

At the stage of selecting the retrofitting method, the current status of the existing structure and its performance shall be obtained, and the performance required for the structure after retrofitting and the conditions for retrofitting work shall be determined. Factors that should be considered in selecting the method include the effectiveness of the various retrofitting methods with respect to the required performance improvements, the viability of execution of the retrofitting work, the impact of the retrofitting work on the surrounding environment, the ease of maintenance after retrofitting, economy and other factors.

Various retrofitting methods listed below shall be used for retrofitting objective:

8.1 Retrofitting of concrete members

a) **Continuous fiber reinforced plate bonding construction method:**

Bonding continuous fiber reinforced plates to the surface of the existing structure to restore or improve load-carrying capacity

b) **Continuous fiber reinforced plate jacketing construction method:**

Jacketing with continuous fiber reinforced plates around the periphery of the existing structure to restore or improve load-carrying capacity and deformation characteristics

c) **Prestressed concrete jacketing construction method:**

Placing pre-stressing wires and pre-stressing stranded steel wires in place of lateral ties around the periphery of existing member sections and using mortar and concrete to bond them in order to reinforce the structure. To increase the restraining effect of the inner concrete, the pre-stressing steel is generally stressed during placement.

d) **Pre-stressing introduction (internal cable) construction method:**

Using internal cables for the existing concrete members to provide pre-stressing and restore or improve the load-carrying capacity of the members.

e) **Repaving method:**

Replacing some or all of the existing concrete members with new members through the use of precast members or concreting on site to restore or improve load-carrying capacity.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[78]	25.09.2014

8.2 Retrofitting as a structural body

a) Beam (girder) addition method:

Adding beams between the main girders of the existing reinforced concrete deck to reduce the deck span and restore or improve the load-carrying capacity of the reinforced concrete deck.

b) Seismic wall addition method:

Placing new reinforced concrete walls between existing reinforced concrete rigid-frame bridge piers and bonding them to form a continuous unit in order to restore or improve the load-carrying capacity as a structural body.

c) Support point addition method:

Supporting the intermediate sections of the beams and other existing concrete members with new members to reduce the span of the members in order to restore or improve the load-carrying capacity as a structure.

d) Seismic isolation method:

Using seismic isolation bearings and the like to reduce the seismic energy applied to the structure in order to improve its various performance values during an earthquake.

8.3 Foundation retrofitting

a) Underground wall (beam) addition method:

Connecting the foundations with cast-in-site diaphragm walls and underground connecting beams to distribute stress and ensure the stability of the entire system.

b) Pile/footing addition construction method:

When pile foundations are damaged or there is residual displacement, adding piles or footings to increase the load-carrying capacity of the foundation.

c) Foundation improvement method:

Improving the ground around the foundation with cement improvement materials to improve the ground bearing capacity and horizontal foundation resistance. Also prevents excessive pore water pressure and liquefaction.

d) Steel sheet-pile coffering construction method:

Placing sheet-piles around the periphery of the footings and bonding them to the footings to improve bearing capacity and horizontal resistance.

e) Foundation compacting method:

When insufficient foundation bearing capacity is a concern due to scouring or the like, using concrete or the like to compact the ground around the foundation in order to restore bearing capacity.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[79]	25.09.2014

8.4 Repair of cracks and missing sections

a) **Cracks fill method:**

Forcing low viscosity resin and ultra-fine cement into the cracks in existing concrete members to seal the cracks.

b) **Fill method:**

Filling cracks, rock pockets, cavities, peeling and other small-scale missing sections in existing concrete members with resin and mortar to repair sections.

c) **Section repair method:**

Removing deteriorated or damaged portions of existing concrete members and then restoring these members to their original sectional status using materials with excellent bonding to existing concrete.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[80]	25.09.2014

9 SHORING AND UNDERPINNING

9.1 Material and Equipment

- a) The contractor shall furnish all materials, tools, equipment, facilities and services as required for providing the necessary shoring and underpinning work and facilities. Jack and jacking equipment shall be more than adequate for the imposed loads and shall be provided with calibrated gauges.
- b) Shoring and bracing materials
Provide heavy timber posts, beams, planks, boards, pipe struts, pin piles, and accessories as required.
- c) Lagging and sheeting material
Provide heavy timber boards, planking or sheeting as required. Lagging board shall be secured in place by steel H-piles, with boards inserted between the H-flanges.
- d) Underpinning Pier
An excavation pit, provided generally by manual excavation, which is carried to a pre-selected bearing surface and then filled with concrete to provide supplementary foundation support for the underpinning structure.
- e) Concrete
Refer clause 4 of this specification for concrete requirements.
- f) Grout
Refer to Clause 5 of this specification for Non-Shrink Grout requirements.
- g) Structural Steel
Refer to Clause 9 of this specification for Structural steel requirements

9.2 Execution

- a) Detection of Movement
 - For each existing structure that may be affected by the work, install settlement markers on each footing, building corners, wall or surrounding improvements to be monitored. Settlement markers shall be capable of being read to an accuracy of 1.52mm.
 - Take and record readings not less than once per week during performance of the work until the permanent structures is complete to the ground level.
 - Stop work; notify the Engineer, and take immediate remedial action if movement of the existing structure occurs during performance of the work.
 - Upon completion of the work, take weekly readings of the measurement points for a period of 4 weeks or longer if movement persists, and report the results to the Engineer.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[81]	25.09.2014

- The detection of movement shall be performed by a qualified licensed land surveyor or civil engineer.

9.3 Shoring and Underpinning

- Existing footings, foundations, pile caps, grade beams, retaining walls, or pavement which may be affected by excavation operations shall be shored or underpinned adequately or otherwise protected against settlement and shall be protected against lateral movement.
- Provide soldier piling, lagging and sheeting, tie-backs, slurry diaphragm wall, and cementitious grouting, as required, to hold back earth at excavations and as required to prevent cave-ins and earth sloughs.
- Footings, foundations, pile caps, grade beams, retaining walls, or pavements which have been undermined by earthwork and pile-driving operations shall be filled and supported with concrete extended to undisturbed bearing earth or bedrock.
- Concrete may be placed as a stiff mix of minimum slump (dry pack), or concrete may be pneumatically placed (shotcrete), or concrete may be placed by conventional methods with concrete formed to hold it in proper position.

9.4 Concrete Piers, Walls and Pile caps

- Install concrete underpinning piers, walls, and pile caps as indicated, with the bottom at the indicated or bearing elevation and the top approximately three inches below the structure to be underpinned. Dry pack the space within three days after concrete placement is completed.
- Where earth forms are indicated, install waterproof building paper or board between the earth and concrete to prevent water loss from the fresh concrete.
- Do not remove support of existing structure until concrete piers, walls, or pile caps have attained design strength.

9.5 Piles and Caissons

- Install pipe pile shells or drilled shafts at locations indicated, and extend from underside of existing footings to indicated elevations, plus additional penetration if required to develop the design working load of the pile or caisson.
- Distribute jacking reactions over the existing structure in a manner that will not overstress or deflect the existing structure.
- Weld splices where indicated. Provide watertight welds capable of developing the full strength of the pile or caisson. Align splices to ensure the straightness of the pile from top to tip. Use outside sleeves and backup rings as necessary.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[82]	25.09.2014

- Where the pile tip is below the ground-water table, maintain the elevation of the water inside the shell at approximately the elevation of the ground-water table during installation of the shell.
- After installation of the shell, apply the full design-working load to the empty pile shell and maintain until there is no measurable settlement over a one hour period.
- Maintain the excavation within the pile shell approximately 12 inches above the tip during driving, and dewater pile shells prior to filling with concrete in a manner which will prevent loss of earth or soil at the tip. An earth plug may be left in the pile tip or a concrete plug may be placed and cured prior to dewatering pile shells.
- After load testing to the design load, dewatering, and inspection of the shell by the Engineer, fill accepted pile shells with concrete in the presence of the Engineer. Keep an accurate record of the volume of concrete deposited in each pile. Deficiencies revealed by comparing the volume of the inside of the pile with the volume of placed concrete will be cause for rejection of the pile or correction of the deficiency.
- Securely wedge in place with steel wedges those piles that have satisfied the load-testing requirements. Weld and encase in concrete all wedges, plates, wedging struts and piles, as indicated or required.
- Following completion of load transfer of underpinned structures, fill the underpinning pits with concrete as indicated. Provide reinforcement, shear keys, dowels, and water stops as indicated or required. Place concrete to within 3 inches of the underside of the existing foundation. After three days, dry pack the space between the foundation and concrete.

9.6 Load testing of piles and acceptance criteria

- After the concrete within the pile or shaft has set for at least 24 hours, test each pile or pier by jacking to a load equal to 150 percent of the design-working load of the pile. Maintain the load until there is no measurable settlement of the pile over a one-hour period.
- Load-test piles in sequences and groupings that will minimize or eliminate eccentric loadings on the existing foundation and piles.
- Piles will be rejected and shall be retested if, in the opinion of the Engineer, there is a danger of unequal loading.
- Should the existing structure fail to furnish sufficient reaction to installed underpinning piles to the test loads specified, provide additional reaction to prevent damage to, and movement of, the structure during installation of piles, and to obtain specified underpinning test loads. The additional reaction shall not detrimentally affect the structure.
- Maximum out-of-plumb tolerance for installed piles: two percent.
- Maximum offset of top of pile from the design center: 3 inches.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[83]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

9.7 Fill and backfill

Provide engineered fill and backfill in accordance with Clause 3 of this specification, after acceptance of the underpinning by the Owner.

9.8 Temporary Supports

Install temporary supports where necessary to support structures to be underpinned and those that will be affected by underpinning and restoration work.

9.9 Restoration

Restore existing structures to conditions equivalent to those existing prior to the start of shoring and underpinning work, including repair of any settlement-related damage.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[84]	25.09.2014

10 STRUCTURAL STEEL WORK

Design of structural steel work shall include generally but not be limited to the steel constructions listed below:

- Steel building structure and open structures including beams, columns, bracings, supporting structures for floors, roof slabs, cladding etc.
- Hoist & monorail supporting beams etc.
- Platforms and walkways
- Ladders, staircases, handrails, etc.

10.1 Design

(a) General

Concrete floors shall be considered to provide continuous lateral support to the top (compression) flange of the support beams. However where large cut outs are to be provided in the floor slabs horizontal floor bracing shall be provided. Grating / Chequered plate floor shall neither be considered to provide lateral support to the top flange of supporting beams nor to provide a shear diaphragm. Adequate lateral support and horizontal bracing shall be provided as required in such cases.

Floors for vibrating machines of all kind together with supporting framework shall be adequately braced in both horizontal and vertical planes. Floors or structure supporting mechanical equipment shall be designed to minimize vibration, avoid resonance and maintain alignment and level.

(b) Design of structure

The Design of steel structures shall be done by Working stress or Limit state method, in accordance with the provisions of IS: 800 and other relevant IS codes as applicable to specific structures. Basic consideration for structural framing shall be stability, rigidity, building usage, ease of fabrication / erection and overall economy. Additional bracings / moment connections shall be used to assure stability of structures. Structure shall be designed such that the surfaces of all parts shall be accessible for inspection, cleaning, painting and maintenance. Most of steel superstructure shall be designed as simple space frame structures. Simple space frame design utilizes single-span beam systems, vertical diagonal bracing at main column lines and horizontal bracing at the roof and major floor levels.

Large span built-up girders shall be single web plate girders of welded construction with bearing and intermediate stiffeners. For lifting / monorails beams ISMB sections shall be preferred and the bottom flange of all beams shall be checked separately for distortion and reinforced suitably if required.

Columns shall be designed to support the load combination which results in maximum interaction ratio. Exterior columns shall be designed to resist moments due to wind & seismic. Columns shall also be designed to resist moments

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[85]	25.09.2014

caused by discontinuous vertical bracing or non-concentric bracing work points. Column base can be fixed or pinned. Lateral forces shall be resisted by rigid jointed moment connections in rigid frame design. For design which requires the use of the minimum column load (such as, uplift on anchor bolts, column axial tension, etc.) use 90 % of the column dead load and no live load. Uplift forces from vertical bracing and Wind uplift on the roof shall be included where applicable.

Permissible stresses for different members shall not be allowed to exceed by 33.33 % under wind and seismic conditions. However, members who shall be designed primarily to resist wind load such as bracing members, no increase in permissible stresses will be permitted. However, permissible stresses in bolts and welds shall be allowed to exceed up to 25 % only.

Base plates shall be placed on foundation pedestal with grouting. For large base plates necessary grout holes shall be provided. All anchor bolts for fastening steel columns on foundation shall be embedded in foundation during concreting itself. No anchor pockets in foundation shall be allowed. Design of base plates shall be based on design pressure on foundation which shall not exceed the following:

Pedestal in concrete grade M30 7.50 N/mm²

The total horizontal shear force at the base of column is transferred to the column pedestals through friction between the base plate and the grout. A coefficient of friction of 0.30 shall be used in conjunction with the minimum column load. If the horizontal shear force exceeds the frictional resistance force or if the column is subjected to a net uplift load, the total force shall then be transmitted through shear bars / shear keys welded to the base plate. Anchor bolts are not assumed to resist any horizontal shear force. Necessary recesses shall be kept in the foundation concrete for shear lugs.

Static analysis of overhead conveyor galleries upto a span of 24 m is allowed. However dynamic analysis shall be carried out for overhead conveyor galleries exceeding 24 m span.

For equipments, the bolt shall be either embedded or placed inside the pedestal and grouted with non-shrink grout.

The following criteria shall be followed for posting loads on the design drawings. For vertical beam reactions, the load shall be posted whenever the value exceeds the maximum allowable uniform distributed load. For axial loads in floor beams, the actual horizontal load which the beam end connection must resist shall be posted for each end of the beam. Note that this value may be different for opposite end of the same beam. For truss members, only one member force shall be noted for each member.

(c) Permissible deflections

The permissible deflections of various steel members under normal loading conditions shall be as specified below. For calculation of deflections in structures and individual members dynamic effects shall not be considered, unless specified otherwise. Also, no increase in deflection limits shall be allowed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[86]	25.09.2014

when wind or seismic loads are acting concurrent with normal loading conditions.

• **Vertical deflection**

a) For beams supporting dynamic equipment	Span / 500
b) For beams supporting floors / masonry	Span / 325
c) For beams supporting pipes (pipe racks)	Span / 400
d) For roofing and cladding components	Span / 250
e) For gratings and chequered plates	Span / 200 subject to a maximum of 6 mm

For crane gantries or any member subjected to working loads, the maximum deflection under dead load and live load excluding impact shall not exceed the following values:

For manually operated cranes and monorails : Span / 500

For electric overhead cranes

i) Up to 50 t capacity : Span / 750

ii) Over 50 t capacity : Span / 1000

• **Horizontal deflections**

The permissible horizontal deflections shall be as per following unless specified otherwise:

a)	Single storey building (without crane load)	Height / 325
b)	Multistoried building (without crane load)	Height / 500
c)	Pipe rack columns	Height / 200
d)	Open Structures	Height / 200
e)	Crane gantry girder due to surge	Span / 2000 limited to maximum of 15 mm
f)	Building main columns at crane rail due to action of crane surge load only	Height / 2500 limited to level maximum of 10 mm
g)	Open gantry columns at crane rail level due to action of crane surge load only	Height / 4000 limited to maximum of 10 mm

Provisions of IS: 800 and relevant latest IS Codes shall be followed for limiting deflections of structural elements not listed above.

(d) Minimum thickness and size of steel elements

• **Minimum Thickness**

The minimum thickness of various components of a structure and hot rolled sections shall be as follows. The minimum thickness of rolled shapes shall mean flange thickness regardless of web thickness. Structural steel members exposed to significantly corrosive environment shall be increased suitably in thickness or

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[87]	25.09.2014

suitably protected otherwise as per good practice and sound engineering judgement in each instance.

Trusses, purlins, girts and bracing	6 mm
Columns and beams	8 mm
Gussets	8 mm
Stiffeners	8 mm
Base plate	10 mm
Chequered plates	6 mm o/p
Grating flats	5 mm

Minimum thickness of structural members other than gratings and chequered plate directly exposed to weather and inaccessible for painting and maintenance shall be 8 mm.

Chequered plate shall conform to IS: 3502 (latest) and minimum thickness of chequered plate for floorings, covers etc shall be 6 mm.

- **Minimum Sizes**

The flange width of purlins supporting light weight concrete slab shall not be less than 65 mm and for those supporting roof sheeting and wall cladding it shall not be less than 50 mm. Width of steel rolled section connected to other member shall be at least 50 mm. The depth of beams for platform of all structures shall not be less than 125 mm.

(e) Slenderness and depth ratios

The slenderness ratio of main members in tension, compression or bending shall be in accordance with IS: 800.

The following limiting ratios of depth to span shall be considered as a general guide.

Truss	1 / 10
Rolled beams and girders for Ordinary floors and rafters	1 / 24
Supporting floor beams for vibrating Machines / equipments	1 / 15
Roof purlins and girts	1 / 45
Gable columns	1 / 30

(f) Design of Connections

Welding will be done in accordance with the recommendations of IS: 816 and IS: 9595.

Shear connections will be designed for 75 % of section strength for rolled sections and 80 % of section strength for built up section or rolled section with cover plates. Designed shear force shall be more than actual shear. Moment connections between beam and column will be designed for 100 % of moment capacity of the beam section.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[88]	25.09.2014

All butt welds will be full penetration butt welds.

Size of fillet weld for flange to web connection for built up section will be as follows:

- i) Able to take full shear capacity or actual shear whichever is more for box section
- ii) Able to take 80 % of full shear capacity or actual shear (if indicated in drawings) or shall be 0.5 times of the web thickness whichever is more. For I-section Weld will be double fillet
- iii) All welds will be continuous. The minimum size of the fillet weld will be 6 mm as per relevant IS code

Connection of vertical bracings with connecting members will be designed for full tensile capacity of the bracings. The connection between top flange & web of built-up girder will be full penetration butt weld & for bottom flange, connection may be fillet weld.

Connection of base plate & gusset members with the columns will be done considering that total load gets transferred through weld.

Splicing

All splicing work will be full strength. Field splicing will be done with web / flange cover plates. For, exceptional cases the field splicing will be designed for 50 % of load carried by the cover plates and remaining 50 % load through full penetration butt weld. Shop splicing for all sections other than rolled will be carried out by full penetration butt welds with no cover plates. Splicing for all rolled sections will be carried out using web and flange cover plate. For design efficiency of site weld shall be considered as 80 %.

Insert plates

Insert plates shall be designed / checked for shear and bending moment. All lugs shall be checked for tension. Bond strength of concrete shall also be checked. Lugs using steel bars shall preferably be fillet welded to the plate to transfer full strength of the lug.

10.2 Fabrication

(a) General

Fabrication drawings shall be prepared according to the provision of IS: 800, IS: 813, IS: 816, IS: 9595, IS: 1367 and IS: 9178.

The work to be provided by the Bidder, unless otherwise specified elsewhere in the contract, shall include, but not be limited to the following:

- i) Preparation of complete detailed fabrication drawings and erection marking drawings required for all the structures covered under the scope of the contract based on design drawings submitted by the Bidder and approved by the Owner/Consultant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[89]	25.09.2014

- ii) To submit revised design with calculations and detailed fabrication (drawings in case any substitution of the designed sections are to be made.
- iii) To submit design calculations for joints and connections developed by the Bidder along with detailed fabrication drawings.
- iv) Furnish all materials, labour, tools and plant and all consumables required for fabrication and supply, all necessary bolts, nuts, washers, tie rods and welding \ electrodes for field connections. The field connection materials supplied by the Bidder shall be to the extent of actual requirement plus 10 % (ten percent).
- v) Furnish shop painting of all fabricated steelwork as per requirements of this Specification.
- vi) Suitably mark, bundle and pack for transport all fabricated materials.
- vii) Prepare and furnish detailed Bill of Materials, Drawing Office Dispatch lists, Bolt List and any other list of bought out items required in connection with the fabrication and erection of the structural steelwork.

(b) Conformity with Design

Except where the standard connection details are furnished, the Bidder shall design all connections, supply and fabricate all steelwork and furnish all connection materials, Shear connectors / shear lugs on the beams in accordance with the approved drawings and / or as instructed by the Owner/Consultant Keeping in view the maximum utilization of the available sizes and sections of steel materials. The methods of painting, marking, packing and delivery of all fabricated materials shall be in accordance with the provisions of the contract and / or as approved by the Owner/Consultant. Provision of all relevant Indian Standard Specifications and Codes of Practice shall be followed unless otherwise specified in the contract.

(c) Quality control

The Bidder shall establish and maintain quality control procedures for different items of work and materials to the extent he deems necessary to ensure that all work shall be performed in accordance with this specification. In addition to the Bidder's quality control procedures, materials and workmanship at all times shall be subjected to inspection by the Owner/Consultant. As far as possible, all inspection by the Owner/Consultant shall be made at the Bidder's fabrication shop whether located at Site or elsewhere. The Bidder shall co-operate with the Owner/Consultant in permitting access for inspection to all places where work shall be done and in providing free of cost all necessary help in respect of tools and plants, instrument, labour and materials required to carry out the inspection. The inspection shall be so scheduled as to provide the minimum interruption to the work of the Bidder.

Materials or workmanship not in reasonable conformance with the provisions of this Specification may be rejected at any time during the progress of the work.

The quality control procedure shall cover but not be limited to the following items of work

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[90]	25.09.2014

- a) Steel Quality, manufacturer's test certificates, test reports of representative samples of materials from unidentified stocks if permitted to be used.
- b) Bolts, Nuts Manufacturer's certificate, dimension & Washers checks, material testing.
- c) Electrodes Manufacturer's certificate, thickness and quality of flux coating.
- d) Welders .Qualifying Tests
- e) Welding sets Performance Tests
- f) Welds Inspection, X-ray, Ultrasonic tests
- g) Paints Manufacturer's certificate, physical Inspection reports
- h) Galvanizing Tests in accordance with IS: 2633 and IS: 4759.

(d) Materials

If desired by the Owner/Consultant, Test Certificates of materials supplied by the Bidder in respect of each consignment shall be submitted in triplicate. Whenever the materials are required to be used from unidentified stocks, if permitted by the Owner/Consultant, a random sample shall be tested at an approved laboratory from each lot of 50 tonnes or less of any particular section.

Materials for main and secondary members shall be selected in line with good engineering practice and shall be arranged within any structure with due regard for maintenance of the structure and Plant and Equipment supported or sheltered by the Structure and also with regard to corrosion.

All steel materials shall be free from all imperfections, mill scales, slag intrusions, laminations, pitting, rusts, etc. that may impair their strength, durability and appearance.

All rolled steel shall conform to the requirements of the Indian Standards.

- i) Structural Steel will conform to IS: 2062 Grade-A for rolled steel members or plates up to 20 mm thickness.
- ii) For plates above 20 mm thickness and welded construction, steel conforming to IS: 2062 Grade-B will be used.

(e) Workmanship

All workmanship shall be equal to the best practice in modern structural shops, and shall conform to the provisions of IS: 800 and other relevant Indian Standards or equivalent.

Straightening Material

Rollled materials before being laid off or worked, must be clean, free from sharp kinks, bends or twists and straight within the tolerances allowed as per IS:1852. If straightening is necessary, it may be done by mechanical means or by the application of a limited amount of localized heat. The temperature of heated areas, as measured by approved methods, shall not exceed 600°C.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[91]	25.09.2014

Cutting

Cutting shall be affected by shearing, cropping or sawing. Use of a mechanically controlled gas cutting torch may be permitted for mild steel only. Gas cutting of high tensile steel may also be permitted provided special care is taken to leave sufficient metal to be removed by machining, so that all metal that has been hardened by flame is removed. Gas cutting without a mechanically controlled torch may be permitted if special care is taken and done under expert hand, subject to the approval of the Owner/Consultant.

To determine the effective size of members cut by gas, 3 mm shall be deducted from each cut edge. Gas cut edges, which will be subjected to substantial stress or which are to have weld metal deposited on them, shall be reasonably free from gouges. Occasional notches or gauges not more than 4 mm deep will be permitted. Gouges greater than 4 mm that remain from cutting shall be removed by grinding. All re-entrant corners shall be shaped notch-free to a radius of at least 12 mm. Shearing, cropping and gas cutting shall be clean, reasonably square and free from any distortion.

Planning of Edges

Planning or finishing of sheared or cropped edges of plates or shapes or of edges gas-cut with a mechanically controlled torch shall not be required, unless specifically required by design and called for on the drawings, included in a stipulation for edge preparation for welding or as may be required after the inspection of the cut surface. Surface cut with hand-flame shall generally be ground, unless specifically instructed otherwise by the Owner/Consultant.

Clearances

The erection clearance for cleated ends of members connecting steel to steel shall preferably be not greater than 2 mm at each end. The erection clearance at ends of beams without web cleats shall be not more than 3 mm at each end, but where, for practical reasons, greater clearance is necessary, suitably designed cleatings shall be provided.

Bolted construction

All bolts and nuts shall conform to the requirements of IS: 1367.

Field connections shall preferably be bolted connections unless specified otherwise. Weld connections at site shall be avoided.

High strength friction grip bolts shall be of property class 8.8 and shall conform to IS: 3757 and shall not be less than 20 mm in diameter unless designated otherwise. High strength bolts shall be installed as bearing type joint except where loads are reversible. Bearing Type connection (H.T. bolts Grade 8.8) shall be used for all removable type connections. Bolts will be tightened to develop the required pre-tension during their installation.

All erection bolts shall be of minimum 16 mm diameter of property class 4.6 conforming to IS: 1367 unless specified otherwise.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[92]	25.09.2014

Holes for bolts shall not be more than 1.5 mm for bolt of diameter equal or lesser than 25 mm and shall not be more than 2 mm for bolt of diameter greater than 25 mm.

Holes through more than one thickness of material for members, such as compound stanchions and girder flanges, shall be drilled after the members are assembled and tightly clamped or bolted together. Punching may be permitted before assembly, if the thickness of the material is not greater than the nominal diameter of bolt plus 3 mm subject to a maximum thickness of 16 mm provided that the holes are punched 3 mm less in diameter than the required size and reamed after assembly to the full diameter.

Holes for turned and fitted bolts shall be drilled to a diameter equal to the nominal diameter of the shank or barrel subject to a tolerance grade of H8 as specified in IS: 919. Parts to be connected shall be firmly held together by tacking welds or clamps and the holes drilled through all the thicknesses in one operation and subsequently reamed to size. Holes not drilled through all thickness in one operation shall be drilled to a smaller size and reamed out after assembly.

Holes for bolts shall not be formed by gas cutting process.

Assembly

Drifting to enlarge un-matching holes shall not generally be permitted. In case drifting is permitted to a slight extent during assembly, it shall not distort the metal or enlarge the holes. Holes that must be enlarged to admit the bolts shall be reamed. Poor matching of holes shall be cause for rejection. The component parts shall be so assembled that they are neither twisted nor damaged and shall be so prepared that the specified cambers, if any, are maintained.

Bolted construction shall be permitted only in case of field connections if called for on the Drawings and is subjected to the limitation of particular connections as may be specified. In special cases, however, shop bolt connections may be allowed if directed by the Owner/Consultant.

Washers shall be tapered or otherwise suitably shaped, where necessary, to give the heads and nuts of bolts a satisfactory bearing. The threaded portion of each bolt shall project out through the nut at least one thread. In all cases the bolt shall be provided with a washer of sufficient thickness under the nut to avoid any threaded portion of the bolt being within the thickness of the parts bolted together. In addition to the normal washer, one spring washer or locknut shall be provided for each bolt for connections subjected to vibrating forces or otherwise as may be specified on the Drawings.

Welded Construction

Welding shall be in accordance with relevant Indian Standards. Welding shall be done by experienced and good welders who have been qualified by tests in accordance with IS: 817. All shop connections shall be welded type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[93]	25.09.2014

Preparation of Material

Surface to be welded shall be free from loose scale, slag, rust, grease, paint and any other foreign material except that mill scale which withstands vigorous wire brushing may remain. Joint surfaces shall be free from fins and tears, Preparation of edges by gas-cutting shall, wherever practicable, be done by a mechanically guided torch.

Parts to be fillet welded shall be brought in as close contact as practicable and in no event shall be separated by more than 4 mm. If the separation is 1.5 mm or greater, the size of the fillet welds shall be increased by the amount of the separation. The fit of joints at contact surfaces which are not completely sealed by welds, shall be close enough to exclude water after painting. Abutting parts to be butt-welded shall be carefully aligned. Misalignments greater than 3 mm shall be corrected and in making the correction the parts shall not be drawn into a sharper slope than 20C.

The work shall be positioned for flat welding whenever practicable.

In assembling and joining parts of a structure or of built-up members, the procedure and sequence of welding shall be such as will avoid needless distortion and minimize shrinkage stresses. Where it is impossible to avoid high residual stresses in the closing welds of a rigid assembly, such closing welds shall be made in compression elements.

In the fabrication of cover-plated beams and built-up members, all shop splices in each component part shall be made before such component part is welded to other parts of the member. Long girders or girder sections may be made by shop splicing not more than three sub-sections, each made in accordance with this paragraph.

When required by the Owner/Consultant, welded assemblies shall be stress relieved by heat treating in accordance with the provisions of the relevant Indian Standard or any other Standard approved by the Owner/Consultant.

All complete penetration groove welds made by manual welding, except when produced with the aid of backing material not more than 8 mm thick with root opening not less than one-half the thickness of the thinner part joined, shall have the root of the initial layer gouged out on the back side before welding shall be started from that side, and shall be so welded as to secure sound metal and complete fusion throughout the entire cross-section. Groove welds made with the use of the backing of the same material as the base metal shall have the weld metal thoroughly fused with the backing material. Backing strips need not be removed. If required, they may be removed by gouging or gas cutting after welding is completed, provided no injury is done to the base metal and weld metal and the weld metal surface is left flush or slightly convex with full throat thickness.

Groove welds shall be terminated at the ends of a joint in a manner that will ensure their soundness. Where possible, this should be done by use of extension bars or run-off plates. Extension bars or run-off plates need not be removed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[94]	25.09.2014

upon completion of the weld unless otherwise specified elsewhere in the Contract.

To get the best and consistent quality of welding, automatic submerged arc process shall be preferred. The technique of welding employed, the appearance and quality of welds made, and the methods of correcting defective work shall all conform to the relevant Indian Standards.

No welding shall normally be done on parent material at a temperature below (-) 50C. However, if welding is to be undertaken at low temperature, adequate precautions as recommended in relevant Indian Standard shall be taken. When the parent material is less than 40 mm thick and the temperature is between (-) 50C and 00C, the surface around the joint to a distance of 100 mm or 4 times the thickness of the material, whichever is greater, shall be preheated till it is hand warm. When the parent material is more than 40 mm thick, the temperature of the area mentioned above shall be in no case be less than 200C. All requirements regarding preheating of the parent material shall be in accordance with the relevant Indian Standard.

Submerged arc welding process shall be used for welding longitudinal fillet welds (connecting flanges with web) and longitudinal / transverse butt joints for fabrication of columns, framing beams and all other built up members unless manual arc welding is specifically required. All electrodes, flux, bare wire etc will be procured from approved manufacturers. All butt welds in beams, girders & columns will be of full penetration. All butt welds will be radio-graphically or ultrasonically tested as per relevant IS codes and standard practice. The base wire electrodes for submerged arc welding will conform to IS: 7280. The combination of wire and flux will satisfy requirements of IS: 3613.

Peening

Where required, intermediate layers of multiple-layer welds may be peened with light blows from a power hammer, using a round-nose tool. Peening shall be done after the weld has cooled to a temperature warm to the hand. Care shall be exercised to prevent scaling or flaking of weld and base metal from over peening.

Equipment

These shall be capable of producing proper current so that the operator may produce satisfactory welds. The welding machine shall be of a type and capacity as recommended by the manufacturers of electrodes or as may be approved by the Owner/Consultant.

Finish

Column splices and butt joints of compression members depending on contact for stress transmission shall be accurately machined and close-buttressed over the whole section with a clearance not exceeding 0.2 mm locally at any place. In column caps and bases, the ends of shafts together with the attached gussets, angles, channels etc., after welding together, should be accurately machined so

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[95]	25.09.2014

that the parts connected butt over the entire surfaces of contact. Care should be taken that those connecting angles or channels are fixed with such accuracy that they are not reduced in thickness by machining by more than 2 mm.

Slab bases and caps

Bases and caps fabricated out of steel slabs, except when cut from material with true surface, shall be accurately machined over the bearing surface and shall be in effective contact with the end of the stanchion. A bearing face which is to be grouted direct to a foundation need not be machined if such face is true and parallel to the upper face.

Miscellaneous

- Lacing bars

The ends of lacing bars shall be neat and free from burrs.

- Separators

Rolled section or built-up steel separators or diaphragms shall be required for all double beams except where encased in concrete, in which case, pipe separators shall be used.

- Bearing Plates

Provision shall be made for all necessary steel bearing plates to take up reaction of beams and columns and the required stiffeners and gussets whether or not specified in Drawings.

- Architectural Clearances

Bearing plates and stiffener connections shall not be permitted to encroach on the designed architectural clearances.

- Shop Connections

- i) All shop connections shall be welded as specified on the Drawings.
- ii) Certain connections, specified to be shop connections, may be changed to field connections if desired by the Owner/Consultant for convenience of erection and the Bidder will have to make the desired changes at no extra cost to the Owner.

- Shop Erection

The steelwork shall be temporarily shop-erected complete or as directed by the Owner/Consultant so that accuracy of fit may be checked before despatch. The parts shall be shop-erected with a sufficient number of parallel drifts to bring and keep the parts in place. In case of parts drilled or punched using steel jigs to make all similar parts interchangeable, the steelwork shall be shop erected in such a way as will facilitate the check of interchange ability.

(f) Shop Painting

All fabricated steel material, except those galvanized or to be embedded in concrete, shall receive paint coatings as specified below. All paints shall be of approved brand and shade as per the Owner's requirement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[96]	25.09.2014

Steel surface, which is to paint, shall thoroughly be cleaned of all loose mill scale, rust, grease, dirt and other foreign matter by wire brush & if required by sand blasting prior to actual surface preparation. The surface shall be cleaned to grade ST-2.5 as per SIS05-5900 or as per IS: 1477 (Part -I).

All steel structures shall receive two primer coats and two finish coats of painting. After fabrication the first coat of primer shall be immediately given over the prepared steel surface. The second coat of primer shall be applied over the dried first primer coat. Two finish coats shall be applied over the primer coats before dispatch of structure at site.

Primer paint shall be red oxide zinc chromate conforming to IS: 2074. Dry film thickness of each coat shall be 50 microns. Adequate care should be taken such that the surface does not possess a slick finish to which paint may not adhere properly. Top coat shall consist of two coats of HB Synthetic enamel of approved shade and colour with glossy finish and DFT as 75 microns (total). Thus the total DFT of painting including that of primer coats shall not be less than 175 microns.

Following care shall be taken while painting:

- i) Joints to be site welded shall have no paint applied within 100 mm of welding zone. Similarly where friction grip fasteners are to be used no painting shall be provided. On completion of the joint the surfaces shall receive the paint as specified.
- ii) Surfaces inaccessible after assembly shall receive two coats of primer prior to assembling.
- iii) Surfaces inaccessible after erection, including top surfaces of floor beams supporting gratings or chequered plate, shall receive one additional coat of finish paint over and above number of coats specified above before erection.
- iv) Portion of steel member embedded / to be encased in concrete shall not be painted.
- v) Areas / Surfaces subjected to chemical attacks shall be painted with acid resistant paint.
- vi) Machine finished surfaces shall be protected against corrosion by a rust inhibiting coating that can be easily removed prior to erection or which has characteristics that make removal unnecessary prior to erection.

(g) Inspection, testing and acceptance criteria

Unless specified otherwise, inspection to all work shall be made by the Owner/Consultant at the place of manufacture prior to delivery. The Owner / Consultant shall have free access at all reasonable times to those parts of the manufacturer's works which are concerned with the fabrication of the steelwork under this Contract and he shall be afforded all reasonable facilities for satisfying himself that the fabrication is being done in accordance with the provisions of this Specification. The Bidder shall provide free of charge, such labour, materials, electricity, fuel, water, stores, tools and plant, apparatus and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[97]	25.09.2014

instruments as may be required by the Owner/Consultant to carry out inspection and / or tests in accordance with the Contract.

The Bidder shall guarantee compliance with the provisions of this Specification.

The Bidder shall carry out sampling and testing in accordance with the relevant Indian Standards and as supplemented herein for the following items at his own cost, unless otherwise specified in the Contract. The Bidder shall get the specimens tested in a laboratory approved by the Owner/Consultant and submit to the Owner/Consultant the test results in triplicate within 3 (three) days after completion of the test.

Steel

All steel supplied by the Bidder shall conform to the relevant Indian Standards, except otherwise mentioned in the Contract, only tested quality steel having mill test reports shall be used. In case unidentified steel materials are permitted to be used by the Owner/Consultant, random samples of materials will be taken from each unidentified lot of 50 ton or less of any particular section for tests to conform to relevant Indian Standards. Cost of all tests shall be borne by the Bidder.

All material shall be free from all imperfections like mill scales, slag intrusions, laminations, pittings, rusts etc. that may impair their strength, durability and appearance.

All raw steel plate of thickness more than 20 mm supplied by the Bidder shall be checked against lamination before procurement & prior to commencement of fabrication work in the following ways as directed by the Owner/Consultant:

- i) Ultrasonic testing along the edge of specified points of the plates shall be carried out to delete lamination in the plates, if any.
- ii) If the results of the tests in (i) are not satisfactory, the whole area of the plates shall be checked by ultrasonic testing at specified nodal points formed at equidistant grid locations. The spacing of the grids shall be determined from tests in (i) or as directed by the Owner/Consultant.

If the results of the above tests are not satisfactory, the plates shall not be taken up for fabrication work. Even after fabrication at shop, if the Owner/Consultant requires any ultrasonic testing to detect lamination of plates, the same shall be carried out by the Bidder. If the plates in the fabricated item are found to be laminated, the component will be rejected.

Welding

All electrodes shall be procured from reliable manufacturers with test certificates. The correct grade and size of electrode which has not deteriorated in storage shall be used. The inspection and testing of welding shall be performed in accordance with the provisions of the relevant Indian Standards or other equivalents. For every 50 tonnes of welded fabrication, the Owner may ask for at least one test-destructive or non-destructive including X-ray,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[98]	25.09.2014

ultrasonic test or similar, the cost of which shall be borne by the Bidder. In the event of further tests as may be desired by the Owner. The cost of such test shall be borne by the Bidder if the results are found to be unsatisfactory; and if the test shows no defect, the cost shall be borne by the Owner. In cases of the test results showing deficiency, the Owner / Consultant shall have option to reject or instruct any remedial measures to be taken free of charge to the Owner.

Bolts, nuts and washers

All bolts, nuts and washers shall be procured from reputed manufacturer approved by the Owner/Consultant and shall conform to the relevant Indian Standards. If desired by the Owner/Consultant, representative samples of these materials may have

- i) Name of the Bidder
- ii) Number and date of the Contract
- iii) Name of the office placing the contract
- iv) Nomenclature of stores
- v) A schedule of parts or pieces, giving the parts or piece number with
- vi) Tolerance

The tolerance on the dimension of the individual rolled steel components shall be as specified in IS: 1852. The tolerances on straightness, length etc. of various fabricated components (such as beams, girders, columns, etc) of the steel structures (other than steel railway and road bridges structure) subjected to dynamic loading (like wind, seismic etc.) and thin walled constructions (like box girders) shall be as specified in IS: 7215.

10.3 Erection

(a) General

The work to be provided for by the Bidder, unless otherwise specified in the Bid, shall include but not be limited to the following:

- i) The Bidder shall provide all transport equipment, lifting equipment, tools, tackle, consumables, materials, labour and supervision required for the erection of the structural steelwork.
- ii) Receiving, unloading, checking and moving to storage yard at Site including prompt attendance to all insurance matters as necessary for all fabricated steel materials arriving at Site. The Bidder shall pay all demurrage and / or wharfage charges etc. on account of default on his part.
- iii) Transportation of all fabricated structural steel materials from Site storage yard, handling, rigging, assembling, bolting, welding and satisfactory installation of all fabricated structural steel materials in proper location according to approved erection drawings and / or as directed by the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[99]	25.09.2014

Owner/Consultant. If necessary, suitable temporary approach roads to be built for transportation of fabricated steel structures.

- iv) Checking centre lines, levels of all foundation blocks including checking line, level, position and plumb of all bolts and pockets. Any defect observed in the foundation shall be brought to the notice of the Owner/Consultant. The Bidder shall fully satisfy himself regarding the correctness of the foundations before installing the fabricated steel structures on the foundation blocks.
- v) Aligning, plumbing, levelling, bolting, welding and securely fixing the fabricated steel structures in accordance with the Drawings or as directed by the Owner/Consultant.
- vi) Touch up paintings, making good any damaged shop painting and completing any unfinished portion of the shop coat shall be carried out by the Bidder free of cost to the Owner.
- vii) All minor modifications of the fabricated steel structures as directed by the Owner/Consultant including but not limited to the following:
 - Removal of bends, kinks, twists etc. for parts damaged during transport and handling.
 - Cutting, chipping, filling, grinding etc. if required for preparation and finishing of site connections.
 - Reaming of holes for use of higher size bolt if required.
 - Welding of connections in place of bolting for which holes are either not drilled at all or wrongly drilled during fabrication. Welding in place of bolting will be permitted only at the discretion of the Owner/Consultant.
 - Re-fabrication of parts damaged beyond repair during transport and handling or re-fabrication of parts which are incorrectly fabricated.
 - Fabrication of parts omitted during fabrication by error, or subsequently found necessary.
 - Drilling of holes which are either not drilled at all or are drilled in incorrect location during fabrication.
 - Carry out tests in accordance with this Specification if directed.

(b) Conformity with design

The Bidder will erect the entire fabricated steel structure, align all the members, complete all field connections and grout the foundations all as per the provisions of this specification and the design criteria detailed in the approved erection drawings and / or other stated document. All work shall conform to the provisions of the relevant Indian Standard Specifications and / or the instructions of the Owner/Consultant. The testing and acceptance of the erected structures shall be in accordance with the provisions of this Specification and / or the instructions of the Owner/Consultant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[100]	25.09.2014

(c) Storage of materials

All material shall be so stored as to prevent deterioration and to ensure the preservation of their quality and fitness for use in the works. Any material which has been deteriorated or damaged beyond repairs and has become unfit for use shall be removed immediately from the site.

(d) Yard

The Bidder will have to establish a suitable yard in an approved location at site for storing the fabricated steel structures and other materials which will be delivered to him by the Owner according to the Contract. The yard shall have proper facilities like, drainage, lighting, suitable access, trailers and other heavy equipments. The yard shall be fenced all round with security / arrangement and shall be of sufficiently large area to permit systematic storage of the fabricated steel structures without overcrowding and with suitable access, trailers and other equipment for use in erection work in proper sequence in accordance with the approved programme of work.

The Bidder should visit the site prior to submission of his Tender to acquaint himself with the availability of land and the development necessary by way of filling, drainage, access roads, fences, sheds etc. All of which shall be carried out by the Bidder at his own cost as directed by the Owner.

(e) Covered Store

All field connection materials, paints, etc. shall be stored on well designed racks and platforms off the ground in a properly covered store building to be built at the cost of the Bidder.

(f) Workmanship

Erection Plant and equipment

The suitability and adequacy of all erection tools and plant and equipment proposed to be used shall be efficient, dependable, in good working condition and shall have the approval of the Owner/Consultant.

Method and sequence of erection

The method and sequence of erection shall have the prior approval of the Owner/Consultant. The Erection shall arrange for most economical method and sequence available to him consistent with the Drawings and Specifications and such information as may be furnished to him prior to the execution of the Contract.

Temporary bracing

Unless adequate bracing is included as a part of the permanent framing, the erector during erection shall install, free of cost to the Owner, temporary guys and bracings where needed to secure the framing against loads such as wind or seismic forces comparable in intensity to that for which the structure has been designed, acting upon exposed framing as well as loads due to erection equipment and erection operations.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[101]	25.09.2014

If additional temporary guys are required to resist wind or seismic forces acting upon components of the finished structure Installed by others during the course of the erection of the steel framing, arrangement for their installation by the erector shall be made free of cost to the Owner.

The responsibility of the Bidder in respect of temporary bracings and guys shall cease when the structural steel is once located plumbed levelled, aligned and grouted within the tolerances permitted under the specification and guyed and braced to the satisfaction of the Owner/Consultant.

The temporary guys, braces, false work and cribbing shall be removed immediately upon completion of the steel erection and shall return to the Owner's store in good condition if the materials are supplied by the Owner otherwise permission shall be given to Bidder to take out the materials from 'the project site. The Owner may remove and return the materials in good condition to the Bidder without any charge if they have been left in place under other agreed arrangement.

Temporary floors for buildings

It shall be the responsibility of the Bidder to provide free of cost planking and to cover such floors during the work in progress as may be required by any Act of Parliament and / or by-laws of state, Municipal or other local authorities.

Setting out

Positioning and levelling of all steelwork, plumbing of stanchions and placing of every part of the structure with accuracy shall be in accordance with the approved Drawings and to the satisfaction of the Owner/Consultant. Concrete foundations, where required, shall be made by other agencies. Anchor bolts and other anchor steel shall be embedded by other agencies. The Bidder shall check the positions and levels of the anchor bolts, etc. before concreting and get them properly secured against disturbance during pouring operations.

He shall remain responsible for correct positioning. For heavy columns, etc. the Bidder shall set proper screed bars if desired by the Owner/Consultant, to maintain proper level. No extra payment shall be made for this.

Each tier of column shall be plumbed and maintained in a true vertical position subject to the limits of tolerance allowable under this Specification.

No permanent field connections by bolting or welding shall be carried out until proper alignment and plumbing has been attained.

Field bolting

All relevant portions in respect of bolted construction of the Specification for Fabrication of Structural Steelwork applicable to the Project shall also be applicable for field bolting in addition to the following:

Bolts shall be inserted in such a way so that they may remain in position under gravity even before fixing the nut. Bolted parts shall fit solidly together when assembled and shall not be separated by gaskets or any other interposed compressible materials. When assembled, all joint surfaces, including those

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[102]	25.09.2014

adjacent to the washers shall be free of scales except tight mill scales. They shall be free of dirt, loose scales, burns, and other defects that would prevent solid seating of the parts. Contact surfaces within friction-type joints shall be free of oil, paint, lacquer, or galvanizing.

Drifting

Correction of minor misfits of bolts will be considered as permissible. For this, light drifting may be used to draw holes together and drills shall be used to enlarge holes as necessary to make connections. Reaming, that weakens the member or makes it impossible to fill the holes properly or to adjust accurately after reaming shall not be allowed.

(g) Testing and Acceptance Criteria

General

Loading tests shall be carried out on erected structures, if required by the Owner/Consultant, to check adequacy of fabrication and / or erection. Any structure or a part thereof found to be unsuitable for acceptance as a result of the test shall have to be dismantled and replaced with suitable member as per the Contract of either fabrication or erection of steelwork whoever is responsible for it and no payment towards the cost of the dismantled portion and any connected work shall be made to the Bidder, unless it is proved that the deficiency is due to reasons beyond the Bidder's scope. If any damage is done to any other parts of the structure or to any fixtures, the same shall be made good free of cost by the Bidder responsible, to the satisfaction of the Owner/Consultant. The cost of the tests specified hereinafter shall be borne by the Owner. Any extra claim due to loss of time, idle labour, etc. arising out of these testing operations shall not be entertained, however, only reasonable and appropriate time extensions will be allowed. The structure or structural member under consideration shall be loaded with its actual dead load for as long a time as possible before testing and the tests shall be conducted as indicated below. The method of testing and application of loading shall be as approved by the Owner/Consultant.

Stiffness Test

In this test, the structure or member shall be subjected, in addition to its actual dead load, to a test load equal to 1.5 times the specified superimposed load, and this loading shall be maintained for 24 hours. The maximum deflection attained during the test shall be within the permissible limit. If, after removal of the test load, the member or structure does not show a recovery of at least 80 % of the maximum strain or deflection shown during 24 hours under load, the test shall be repeated. The structure or member shall be considered to have sufficient stiffness, provided that the recovery after this second test is not less than 90 % of the maximum increase in strain or deflection recorded during the second test.

Strength Test

The structure or structural member under consideration shall be subjected, in addition to its actual dead load, to a test load equal to the sum of the dead load

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[103]	25.09.2014

and twice the specified superimposed load, and this load shall be maintained for 24 hours. In the case of wind load, a load corresponding to twice the specified wind load shall be applied and maintained for 24 hours, either with or without the vertical test load for more severe condition in the member under consideration or the structure as a whole. Complete tests under both conditions may be necessary to verify the strength of the structure. The structure shall be deemed to have adequate strength if, during the test, no part fails and if on removal of the test load, the structure shows a recovery of at least 20 per cent of the maximum deflection or strain recorded during the 24 hours under load.

Structure of same design

Where several structures are built to the same design and it is considered unnecessary to test all of them, one structure, as a prototype, shall be fully tested, as described in previous sub-clauses, but in addition, during the first application of the test load, particular note shall be taken of the strain or deflection when the test load 1.5 times the specified superimposed load has been maintained for 24 hours. This information is required as a basis of comparison in any check test carried out on samples of the structure when a structure of the same type is selected for a check test, it shall be subjected, in addition to its actual dead load, to a superimposed test load, equal to 1.5 time the specified live load, in a manner and to an extent prescribed by the Owner/Consultant. This load shall be maintained for 24 hours, during which time, the maximum deflection shall be recorded. The check test shall be considered satisfactory, provided that the maximum strain or deflection recorded in the check test does not exceed by more than 20 % of the maximum strain or deflection recorded at similar load in the test on the prototype.

Repair after inspection tests

An actual structure which has passed the "Strength Test" as specified above herein before and is subsequently to be erected for use, shall be considered satisfactory for use after it has been strengthened by replacing any distorted members and has subsequently satisfied the 'Stiffness Test' above.

10.4 Requirement for specific structures

Switchyard structures

All switchyard structures comprising of towers, gantries, lightning masts, lighting towers, equipment structures etc. shall be galvanised steel with bolted site connection.

Three dimensional analysis shall be carried out for structures like towers and gantries whereas two dimensional approach may be followed for equipment support structures.

All structural steel shall be of tested quality and shall conform to IS: 2062. Steel tubes where used for equipment support structures shall conform to IS: 1161.

All bolts and nuts shall be galvanised. In addition to heavy washers conforming to IS: 6610, spring washers conforming to IS: 3063 shall be provided at all bolted connections. Bolts shall conform to IS: 12427.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[104]	25.09.2014

Fabrication and erection shall in generally be as per IS: 802 and IS: 800; wherever there is a contradiction between two codes the provision in IS: 802 shall govern.

Galvanising of switchyard structures

Galvanising of the towers shall be as per IS: 4759 and IS: 2633 and as given in the following sections.

Before galvanising, the steel shall be thoroughly cleaned of any paint, grease, rust, scale, acid or alkali or such other foreign matters as are likely to interfere with the galvanising process.

The acceptable values of the coating of zinc on the steel materials shall be in accordance with Table below:

KIND OF MATERIAL	COATING	
	Average value	Minimum value
Structural steel members except bolts, nuts and washers	Over 900 gm/sq. m	800 gm/sq. m
For bolts, nuts and washers	Over 750 gm/sq. m	700 gm/sq. m

The galvanised surface shall consist of a continuous and uniformly thick coating of zinc, firmly adhering to the surface of steel. The finished surface shall be clean and smooth, and shall be free from defects like discoloured patches, bare spots, globules, spiky deposits, blistered surface, flaking or peeling off, etc. The presence of any of these defects noticed on visual or microscopic inspection shall render the material liable to rejection.

There shall be no flaking or loosening when struck squarely with a chisel faced hammer. The galvanised steel member shall withstand minimum four number of one minute successive dips in copper sulphate solution as per IS: 2633 unless specified otherwise.

All galvanised members shall be treated with sodium dichromate solution or an approved equivalent after galvanising so as to prevent white storage stains.

Wherever galvanised bolts, nuts, washers, accessories, etc. are specified these shall be hot-dip galvanised. Spring washers shall be electro-galvanised. Readily available GI nuts, bolts and washers conforming to galvanising requirements may also be used.

BIDDER shall ensure that galvanising is not damaged in transit. In the event of occurrence of any damage, BIDDER shall at his own cost adopt scrapping and re-galvanising the member to satisfy the specific requirements.

Large diameter steel pipes

Design, installation and testing of the pipe shall in general follow the following provision:

“Steel pipe - A guide for design and installation” – AWWA Manual M11 – published by American Water Works Association. Steel used shall conform to IS:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[105]	25.09.2014

2062. Minimum earth cover over the pipe shall be 1500 mm. Internal cement mortar lining of 15 mm shall be provided. External surface shall be provided with coal tar enamel wrapping. Bedding shall be of sand. Thrust blocks shall be provided at all bends. Internal design pressure shall be the shut off head as furnished by the pump vendor, 1.5 times the pump working head or maximum surge pressure computed from surge analysis. However for surge pressure the allowable stresses can be increased by 25%. External pressure due to earth pressure, surcharge pressure of 20 KN/sq.m and at road crossings pressure due to vehicles shall be considered. In addition a vacuum pressure of 9 m water column shall be considered while checking against buckling. All site joints shall be inspected by radiography.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[106]	25.09.2014

11 ARCHITECTURAL WORKS

The architectural design concept of buildings shall be evolved considering the functional, technical and other requirements for efficient operation, ensuring comfortable working environment for personnel, satisfying the aesthetic requirements. Special care shall be taken to provide elegance and aesthetics, with effective use of appropriate treatment, materials, fittings and finishes. To achieve above objective Bidder shall employ a qualified architect / architectural firm to carry out all designs and hold all other architectural responsibilities for the project.

The Bidder shall obtain and be conversant with all laws, by-laws and regulations of local and Statutory Bodies as applicable to the project. The architectural concept evolved should also take care of these requirements. The Bidder shall provide the drawings and documents for such statutory approvals.

11.1 General

The architectural services shall cover finishing work of new buildings and modernised existing buildings/structures, included under the specification starting from masonry work, partition walls, cladding walls, roof protection, finishing of walls, floors and ceilings, false ceiling as required potable water system, sanitation etc.

During execution of the contract, the Bidder shall take approval from the Owner, for all building materials and finish items (e.g. floor tiles, doors, and windows, paints etc.) to be used for the contract by submitting samples and/or product literature as appropriate.

Finishing works including material used for renovation/modernisation work shall be matched with the finishing of existing structures to make similarity in the architectural view of new and existing structures.

11.2 Finishes

All exposed surfaces shall be clean and smooth and members shall be sized to give a pleasing appearance. The Finishes for all Structures and Buildings shall meet the functional requirements and shall be as per the approved Finishing Schedule. However, the finishing schedule shall be pre-approved by the Owner/Consultant.

11.3 Design Requirement

(a) Architectural Concepts

- All buildings and structures shall be architecturally treated in such a way so as to be in complete harmony with the surrounding structures and environment. Local architectural characters may be judiciously imbibed. The building shall be designed initiating an architectural control common to all buildings. The architectural control shall be clearly spelt out in terms of scale, man & form.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[107]	25.09.2014

- Overall colour scheme of the plant and other buildings shall be designed judiciously and in a comprehensive manner taking into account the mass and void of buildings, its facade, equipments, exposed structural elements, piping, trestles, bus ducts and other service elements.
- Overall emphasis shall be on developing an eco-friendly architecture, merging with the nature with its own sustainable energy management systems.
- The scheme shall be conceptually finalized in totality including that of equipments so that the proper co-ordination with other agencies can be taken up at appropriate time.

(b) Architectural Design

- Natural light shall be used to the maximum extent. For adequate light and ventilation, National Building Code recommendation shall be followed.
- Entrance canopies, chajjas (projections, recesses) over openable windows and door openings on exterior facades shall be provided.
- All the buildings shall be architecturally designed to meet the National Building Code.
- Architectural design and detailing aspects of all the buildings shall be rendered through professional services of an Architect Statutory requirement and any clearances from local authority may be required to be met with, wherever essential. The Architect Consultant shall be of national - International repute having experience in similar kind of works. The consultant shall evolve the design philosophy and shall present it in the form of presentation drawings, prospective views, 3-D Models & detail drawings.
- A comprehensive interior design scheme shall be conceived with the intention of projecting a definite theme and aesthetic appearance to inside working environment. It shall take into account the multidisciplinary engineering activities involving plant technology and architectural & civil engineering for a smooth control hierarchy and man machine interface.

The Bidder shall develop the architectural layout of all the buildings listed in this document as per the final approved equipment disposition and other layout considerations indicated elsewhere in this specification. These drawings shall need the approval of the Owner/Consultant before construction. The Bidder shall also have to submit perspective views if so desired by the Owner/Consultant at no expenditure to the Owner. Approval from statutory authorities, e.g. Factories Inspector, Explosives Inspector, Loss Prevention Association of India / Tariff Advisory Committee etc. shall be the responsibility of the Bidder without any obligation of the Owner.

The entire complex shall have an architectural character and style of its own and shall be visually and functionally integrated with the existing landscape. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[108]	25.09.2014

Bidder must visit the site and have a feel of the overall environment, so that a harmonious as well as integrated architectural concept of the proposed phase of development is achieved. Special care must be taken to enhance the visual and technological quality of development by adopting updated technology, materials, finish etc.

11.4 Guideline for Architectural Works

11.4.1 Roof Insulation and Ventilation

Wherever required the roof of buildings shall be insulated with foam concrete. For ventilation requirements relevant section of the specification shall be referred.

11.4.2 Roof Waterproofing

All roofs of buildings shall be provided with 3 layers, first being elastomeric membrane water proofing treatment, secondly screed concrete shall be laid and finally the wearing course. Elastomeric membrane shall be laid as per manufacturer's specifications which shall adhere to specifications as given in IS 2645. Run off gradient shall be given a minimum of 1 in 100. Gradient shall comprise screed concrete 1:2:4 using 12.5 mm or below coarse aggregate. Over the screed concrete waterproofing treatment shall be provided as below:

A wearing course shall consist of pressed clay tiles of size 230x230x18 mm laid in water proofing compound mixed cement mortar (1:3) and sealing of joints using sealing compound.

11.4.3 Brick/stone masonry and parapet wall

All masonry works shall be designed in accordance with IS: 1597, IS: 1905, IS: 2212, IS: 4326 and other relevant IS codes as applicable. Structural design of load bearing and non-load bearing walls constructed with solid or perforated burnt clay bricks or concrete blocks shall be in accordance with criteria specified by National Building Code of India.

All walls shall be non-load bearing infill panel walls. External walls of all buildings shall be at least one brick thick. All internal walls shall be at least one brick thick except for internal partition walls for office area, canteen, change rooms, first aid rooms and toilets, which may be half brick thick.

Minimum 50 kg/sq.cm compressive strength brick shall be used for non-load bearing super structure brickwork. Cement sand mortar 1:6 for one brick thick wall and 1:4 for half brick thick wall shall be used. For half brick walls, RCC transoms and mullions shall be provided to reinforce the wall where required.

All brickwork shall be plastered as per specification.

Even where metal cladding is specified, for initial *[3 m]* height from the ground level, minimum one brick thick masonry wall shall be provided.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[109]	25.09.2014

All up stands and parapet walls on roof shall be of RCC construction, minimum height of parapet walls shall be [1050 mm] and a minimum thickness of [125 mm].

11.4.4 Cement based polymer modified mortar

a) Purpose

To carry out structural repairs to prepared patches of spalled concrete with an alkaline impervious repair material comprised of polymer admixed cement-sand mortar.

b) Materials and T&P

Polymers in emulsion or powder forms as may be specified conforming to ASTM C1059, Ordinary Portland Cement of 43 grade conforming to relevant BIS code, Sand conforming to Zone-II or Zone-III grade of IS: 383, Mixing water conforming to IS: 456-2000, mortar mixer with mechanical water dozer, spatulas, trowels, etc.

c) Procedure

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of specified polymers shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3 Testing of Material: The requisite number of test specimens of mortar shall be cast from each batch of manufactured or supplied materials received (whichever is less). These are to be tested for conformance to the specified requirements before use on the work. Polymer modified cement mortar with cement: sand proportion by weight as (1:3) shall have the following properties

Minimum compressive strength -20N/sq.mm after 28 days at 27oC

Step-4: Identify and mark the area for Polymer modified mortar repair.

Step-5 Surface Preparation: The appropriate propping/supporting, surface preparation and crack sealing as per site requirements shall be completed, which may sequentially cover one or more of the following items of work:

Prop & support the structural member to relieve it of stress and strains.

Removal of existing surface plaster/treatment shall be done.

Chipping unsound/weak concrete material shall be done.

Removing concrete all around embedded rusted reinforcement shall be done.

Removing and cleaning reinforcement of rust from its surface to give it a shining bright metal shall be done.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[110]	25.09.2014

Sealing the cracked or honeycombed concrete with injection grouting shall be done.

Providing and inserting mild steel shear key bars shall be done with minimum 3 nos per square meter of surface area of substrate, which may also be used as depth measuring gauge.

Additional fresh reinforcement, if required, shall be tied with required overlaps or welded.

The rust, if any, persisting over the existing exposed reinforcement or the new reinforcement shall be removed mechanically or chemically.

Cleaning of lightly sticking materials and foreign matter from the exposed concrete surface and steel reinforcement by suitable means shall be done.

Step-6: Clean the dust and saturate the prepared surface of concrete and reinforcement with a clean oil free air blast and water fit for construction.

Step-7: Inspection of concrete surface prior to adhesive application shall be thoroughly inspected and got approved by the Engineer-in-Charge. Surfaces shall be ensured to be free from any deleterious materials such as oil, dust, dirt etc. using oil free air blast.

Step-8: Alignment & thickness Control- Ground wires shall be fixed at reference points to measure and control the thickness of overlay. Shear keys fixed earlier could also function as depth gauges. Adequate ground wires shall be installed to establish thickness and surface planes of the overlay build up. Ground wires shall be tight and true to line and placed in such a manner that they may be further tightened.

Step-9: Apply Passivating & bonding coat over the cleaned existing and new reinforcement.

Step-10: Apply bond coat on the cleaned concrete substrate.

Step-11: Mix and Prepare Polymer Modified Mortar to have a uniform consistency and texture by adding cement sand and polymer as weigh batched ingredients of the design mix, a specified proportion of water through water dozer.

Use of prepacked ready to use components supplied by manufacturers in containers may be allowed subject to approval of Owner. In case where prepacked ready to use materials are to be used, the contractor shall submit the manufacturer's certificate verifying conformance to material specification as specified, manufacturer's mixing and application procedure for approval by Engineer-in-charge.

Plastering with cement based polymer modified mortar shall be done immediately after applying the bonding slurry to the prepared surfaces, preferably in coats of approximately 10mm thickness as greater thickness may lead to delamination/collapse. However, coats shall be applied in fairly rapid successions within 15 to 30 minutes. After applications of mortar the surface shall be finished using a wooden float.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[111]	25.09.2014

Step-12: Moist cure the polymer modified mortar surface for 1-3 days followed by air curing at ambient temperature or as per manufacturer's specification, if specified otherwise. Use of flowing water or ponding of water shall not be done for curing. Steam curing shall not be permitted.

Step-13: Test the Surface of 7-day cured concrete overlay for soundness by tapping or sounding with hard blunt surface.

d) Inspection & Quality control

The mortar application work shall be continuously inspected by a qualified supervisor who shall check materials, application of mortar, curing stoppage of work during low temperatures (minimum working temperature being 8°C in most of the polymer modified mortar or as per manufacturer direction) and high winds etc. Each completed work of mortar shall be systematically sounded with a hammer to check for drummy areas after hardening.

In suspect areas or whenever directed by Engineer-in-Charge, the contractor shall drill the cores from the finished work and in to the host concrete after 28 days of mortar application. The cores shall be examined for evidence of poor workmanship by the Owner, and if he is satisfied that either the bonding work or the subsequent layer of mortar are not of the required workmanship, the contractor at the instruction of Engineer-in-Charge shall dismantle such areas of work as required by the Owner and re-do the same after re-preparing the surface by chipping off mortar work and abrading the bonding slurry interface.

11.4.5 Partition Wall

All intermediate walls shall be full brick thick wall in 1:6 cement sand mortar. Half brick thick wall in 1:4 cement: sand mortar with [2 nos. 6 mm] diameter rod in every fourth layer shall be provided. For long walls intermediate RCC pillars and RCC horizontal tie shall be provided. Full glazed partition in anodized aluminium frame shall be provided for operator's cubicles for clear view of the operating equipment and in Control room area.

11.4.6 Metal cladding

a) Permanent colour coated sandwiched insulated metal cladding system

Trough zinc-aluminium alloy coated (both sides) M.S. sheet having 0.6 mm minimum thickness (or high tensile steel sheet of 0.5 mm minimum thickness) shall be used on external face (outer face) of cladding system. Weight of coating shall not be less than 180 gm / sq.m. The outer side (exposed face) shall be permanently colour coated with Polyfluro Vinyl Coating (PVF2) of Dry Film Thickness (DFT) 20 microns (minimum) over primer. Inner side of external sheet shall be provided with suitable pre-coating of minimum 7 microns.

Galvanised M.S. sheets of minimum 0.6 mm thickness shall be used as inner liner (internal face) of cladding system. The exposed face shall be permanently colour coated with silicon modified polyester paint of DFT 20 microns (minimum) over primer. Inner face of external sheet shall be provided with

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[112]	25.09.2014

suitable pre-coating of minimum 7 microns. The rate of galvanising shall not be less than 180 gm / sq. m.

The permanent colour coated sheet shall meet the general requirements of IS: 14246 and shall conform to class 3 for the durability.

Inner sheet shall fixed directly to side runners and Z spacers made of at least 2 mm thick galvanised steel sheet of grade 375 as per IS: 277. Inner sheet shall be fixed at the rate not more than 0.75 m centre to centre to hold the insulation and external sheeting.

The insulation shall be of bonded mineral wool of minimum thickness 50 mm conforming to IS: 8183, having a density of 32 kg / cu. m for glass wool & 48 kg / cu. m for rock wool.

b) Permanent colour coated (non-insulated) metal cladding system

Trough zinc-aluminium alloy coated not less than 180 gm/sq.m M.S. sheets having 0.6 mm minimum thickness (or High tensile steel sheet of 0.5 mm minimum thickness) shall be used for the cladding system. The outer side (exposed face) shall be permanently colour coated with PVF2 paint of minimum DFT 20 microns over primer and the inner side (internal face) shall be coated with same paint of minimum DFT 12 microns over primer. These shall be fixed directly to runners. The sheets shall meet the general requirement of IS: 14246 and shall conform to class 3 for the durability.

c) Flashings, Cap, Trim Closures etc.

All flashings, trim closures, caps etc. required for the metal cladding system shall be made out of plain sheets having same material and coating specification as mentioned above for the outer face of the sandwiched metal cladding.

11.4.7 Plastering

On the exterior wall & rough side of interior brick wall [18 mm] thick minimum with cement-sand mortar in two layers shall be applied. Where external finish will require rich plastering for special finish plaster shall be of 1:4/1:3.

Interior wall: [12 mm] thick with 1:4 cement-sand mortars

Ceiling: [6 mm] thick with 1:3 cement-sand mortar shall be provided to all exposed ceilings.

11.4.8 Removal of plaster manually from masonry or concrete surface using chisel and hammer and disposal of debris etc

a) Purpose

For removal of all type of loose /delaminated /damaged/weak cement plaster from surface of masonry or concrete.

b) Procedure

Step-1: Safety shall be ensured in accordance with contract conditions and specifications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[113]	25.09.2014

Step-2: Provide double scaffolding, protective screens etc.

Step-3: Existing plaster to be identified for removal by tapping all areas and its boundary shall be marked with a colour marking (in an optimal rectangular shape), which shall be approved by Engineer-in-Charge.

Step-4: Make a cut normal to the surface all along the boundaries with power driven cutters. The depth of cut shall not exceed the thickness of plaster.

Step-5: Remove the plaster manually with the help of chisel and hammers to completely expose the parent masonry or concrete surface, so as not to have any traces of such plaster left behind.

11.4.9 False ceiling and under deck insulation

All air conditioned areas shall be provided with the suspended false ceiling system. Under deck insulation system shall be provided on the under side of the roof / floor slab of the air-conditioned areas based on the functional requirement. Aluminium false ceiling system shall comprise of [84 mm] wide [12.5 mm] deep closed type plain panels of approved colour, roll formed out of [0.5 mm] thick corrosion resistant aluminium alloy AA 5050 fixed on roll formed carriers. Additional hangers and height adjustment clips shall be provided for return air grills, supply air diffusers, light fixtures, AC ducts etc. Suitable M.S channel (minimum ISMC100) grid shall be provided above false ceiling for movement of personnel to facilitate maintenance of lighting fixtures, AC ducts etc.

Bidder shall prepare a layout of the false ceiling system incorporating light fixtures, supply air diffuser, return air grills, fire detectors, fire protection sprinklers etc. such that the ceiling looks aesthetically pleasing. Work shall commence only after the Owner approves the layout. Under deck insulation shall comprise of [50 mm] thick resin bonded mineral wool insulation mat conforming to IS:8183. This mat shall be backed with [0.05 mm] thick aluminium foil and [24 Gx25 mm] wire mesh netting. These shall be fixed to ceiling or wall as the case may be with [100x50x6 mm] slotted mild steel plate welded to M.S. plate inserts embedded at the soffit of the slab at [600 mm c/c and 14 G] steel wire drawn through slots and fixed to wire netting.

11.4.10 Doors

- Generally hollow metal (steel) flush doors with pressed steel frame shall be provided for plant and utility areas.
- Solid core factory made wooden flush doors in hard wood frame shall be used in interior office areas. Aluminium doors shall be provided in at entrances and important areas.
- Special areas like control rooms and other special area shall be provided with minimum 15 micron pre-coated Le. colour anodised aluminium glazed partitions with air lock facilities having two sets of doors.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[114]	25.09.2014

- Fire rated doors with panic bar shall be provided in cable spreader rooms and other areas having fire hazard and also to all fire exists as per TAC requirement.
- Doors shall be provided at appropriate location to prevent dust ingress from outside.
- FRP Doors with FRP Frames shall be provided for all the toilet doors.
- Weather stripping shall be provided to all outside doors as well as air-conditioned areas and all other doors where dust-free environment is required.

11.4.11 Rolling shutters

Rolling steel shutters conforming to IS: 6248 will be used for large openings where frequent use is not envisaged. Unless noted otherwise, main entry doors of width and height to suit the requirements. Rolling shutters with area up to 8 m² shall be pull and push type hand operated, while above 8 m² shall be pull and push type with ball bearings (Electrically operated) as per IS specification.

11.4.12 Windows & Ventilators

In all buildings, full glazed windows and ventilators in minimum [15 micron] colour anodized aluminium window frame shall be provided with [4 to 6 mm] thick (depending on the size of panel) clear float glass and [6 mm] thick clear wired/laminated glass where required from safety point of view. Structural glazing may be considered as an important facade element.

The window area shall be so decided as to allow adequate natural ventilation and light.

Note: Glass thickness and member sizes of Aluminium Glazed doors and windows shall be designed by the manufacturer and to be submitted for approval by the Bidder before execution.

11.4.13 Plywood Covering Panels to Cover Windows etc. During repairs

a) Purpose

To protect the finished items against their spoiling/damage to finishes during the process of carrying out repairs in a building. The items could include finished windows, doors, glass curtain wall or other such items.

b) Materials:

Wooden Battens of size 50mm X 50mm (approximately) or as approved by Engineer-in-charge, free from warping, cracks etc. made from locally available timber.

Plywood of suitable thickness, preferably 6 mm thick, as approved by Engineer-in-Charge.

Nails, screws etc. as per requirement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[115]	25.09.2014

c) Fabrication:

Size of covering panels shall be more than the size of windows etc. to be shielded/ protected, enough to be fixed to the walls without damaging the windows etc.

Wooden battens shall be cut approximately to the size of panels of windows etc. to be protected. The joints of the wooden framework shall be lap joint or as approved by Engineer-in-Charge.

Where the panel size is more than 2 square metres or as specified by the Engineer-in-Charge, the stiffening shall be done with batten backing to impart stiffness enough to provide rigidity against undue deflection due to impact of falling debris, self load, etc.

Plywood shall be fixed with nails/screws over the batten frames. The spacing of nails/screws shall be about 300mm c/c or as may be required at site.

d) Fixing:

The plywood covering panel shall be suitably fixed without damaging the windows etc. being protected by such panels with nails/screws fixed in walls strong enough to resist the forces likely to be imparted during repair work. It shall be done in such a manner that it can be removed with ease without damaging the covered windows etc. after completion of repairs.

e) Removal:

After completion of work, the covering panels shall be removed carefully, so as not to cause any damage to windows etc. covered. The damages, if any, shall be made good.

11.4.14 Facilities in Buildings

Adequate toilet and drinking water facilities shall be provided for personnel working in each building. Each building shall have toilet facilities both for Gents and Ladies. Number of toilet fixtures shall be adequate for the occupancy as per National Building Code.

However minimum 1 Water Closet, 1 washbasin, 1 urinal shall be provided in each toilet.

Each floor shall have drinking water facility connected through water purification system like Aquaguard or similar approved make.

11.4.15 Glazing & Glazed Partition

- Glazing in Control room between AC. and non-AC. areas shall be insulating glass consisting of [two 6 mm] thick toughened float glass sheet hermetically sealed and separated by [12 mm] gap for thermal insulation. Clear glass shall be provided where clear view is required. In other areas tinted glass may be provided.
- [4 mm] thick ground glass shall be provided for toilets.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[116]	25.09.2014

- Glazing between two AC. areas shall be with 6 mm thick clear float glass.
- All glazing shall be in aluminium frame.
- [6mm] thick Wired / laminated glass shall be used for windows / ventilators at higher level for safety.
- [24mm] thick insulated double glazing having 6mm thick tinted heat-reflecting type float glass on outer side and 6mm thick clear float glass on inner side with [12mm] air gap & hermetically sealed shall be mounted on [15 micron] coloured anodised aluminium frame suitable for structural glazing system.

11.4.16 Sealant

Silicon sealant or polyurethane sealant shall be used in all expansion joints exposed to weather. All joints around exterior doors, windows, and expansion joints, etc. shall be sealed for proper water-lightness.

11.4.17 Damp Proof Course

[40 mm thick 1:1.5:3] concrete with waterproofing admixture. Water proofing compound shall be of Zydex, SIKA, or similar approved.

11.4.18 Plinth Protection

Minimum [1000 mm] wide and minimum [100 mm] thick M 15-grade concrete plinth protection along building periphery shall be provided with surface drain of required size and slope, to suit storm water quantity, shall be provided. The plinth protection shall be laid over prepared sub-grade and base formed with locally available broken laterite stone to thickness of [150 mm].

11.4.19 Painting

- Exterior Masonry Surface : Buildings shall be finished with [Acrylic Emulsion pain] as per IS specification with approved colour and scheme.
- Exterior Steel Work : Anti-corrosive synthetic enamel paint over [anti corrosive primer].
- All Woodwork: [Synthetic paint over a coat of primer].
- All Internal Steel Work : [Synthetic enamel over a coat of primer].
- Interior Office Spaces Rooms, All AC Areas : Acrylic emulsion paint over [2 mm] control thick plaster of paris punning.
- Balance areas: As indicated in finish schedule in this document.
- Fire Door: Post Office red shade shall be provided.

11.4.20 Flooring

Unless and otherwise specified, the nominal total thickness of floor finish shall be [50 mm] including under bed and topping. The flooring shall be laid on

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[117]	25.09.2014

already matured concrete base. The under bed for floors shall consist of minimum grade of M 15 with stone chips [12.5 mm] downgraded as coarse aggregates. The under bed shall be provided appropriate slope towards catch pit for floor drainage.

- **False Flooring System**

Removable type false flooring system shall be provided wherever required (computer rooms etc.). RCC floor slab will be sunk to a depth [800 mm], which shall be height of the false floor system. The flooring shall consist of fire resistant phenol formaldehyde bonded particle board panels [600x600x35 mm] size, mounted on steel pedestals of adjustable height and supporting steel grid system to provide under floor space. [2 mm] thick flexible anti-static PVC topping on top and PVC strip edging on sides of each panel shall be provided.

- **PVC Floor Finish**

Two mm thick PVC as per IS: 3462 and laid as per IS: 5318 over concrete under bed of [48 mm] shall be provided in electronic cubicle rooms, conference room, etc. PVC tiles shall ensure anti static surface.

- **Vitrified ceramic Tiles**

Heavy duty vitrified ceramic tiles of appropriate thickness and of minimum size [600 mm x 600 mm] of approved shade & colour shall be provided for control room as per relevant code and manufacturer's specification over concrete bedding to result in an overall thickness of [50 mm].

- **IPS Flooring**

IPS (cement concrete flooring) with metallic floor hardener topping [12 mm] thick with a total thickness of [50 mm] shall be provided in maintenance and unloading area, ground floors, floor of pump house, permanent stores and other plant building areas where heavy duty flooring is required.

IPS flooring with non-metallic floor hardener shall be provided in all MCC and switchgear rooms, which are not air-conditioned.

IPS flooring shall also be provided in areas, which are not provided with any special finish. Areas which are likely to be subjected to oil spillage shall be provided with two coats of oil resistant painting over IPS floor finish. If required, Bidder has to use floor hardeners at appropriate locations.

- **Heavy Duty Ceramic Tiles**

Heavy duty vitrified ceramic tiles with suitable finish shall be used in toilets, pantry, dining hall of canteen, locker rooms etc. The tiles shall be minimum of [300 x 300 x 7 mm] of approved shade, brand and colour.

- **Acid / Alkali Resisting Tiles**

- Battery rooms and other areas coming into contact with acid / alkali vapours or fumes shall be given acid / alkali resistant tiles 25 mm thick, jointed with acid / alkali resistant cement slurry. Bedding shall comprise

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[118]	25.09.2014

of potassium silicate mortar conforming to IS: 4832 (Part-I) and resin based mortar like epoxy for jointing. Total thickness of flooring shall be 50 mm. Ceramic unglazed vitreous tiles conforming to IS: 4457 with minimum thickness of 20 mm may also be used as acid / alkali resistant tile.

- **Integral Floor Finish**

For cable vaults floor finish integral to the concrete base shall be provided as per IS: 2571.

- **Cast-in-situ Terrazzo**

Risers and treads of staircases shall be provided with cast in-situ terrazzo. This shall be laid as per IS: 2114, using white cement or cement with colouring pigment. Chequered finish shall be provided for treads. Total thickness of the finish shall be 25 mm.

11.4.21 Miscellaneous

PVC nosing shall be provided for edge protection of R.C.C. stair treads.

Angles [50x50x6 mm] (minimum) with lugs shall be provided for edge protection of cutouts / openings in floor slabs, edge of drains covering gratings, edge of R.C.C cable / pipe trenches of any other place where breakage of edges / corners is expected.

Floors of switchgear rooms shall have embedded steel channel suitable for easy movement of breaker panel.

11.4.22 Skirting/DADO

- [150] mm skirting matching with floor finish shall be provided in all areas unless specified otherwise elsewhere.
- Toilets and locker rooms shall be provided with dado of [2100] mm high with glazed tiles of minimum [5] mm thickness generally as per IS: 777.
- For Control room and control equipment room minimum 5 mm thick decorative coloured ceramic tiles shall be provided upto false ceiling level.
- For battery room and other areas coming in contact with acid / alkali spillage / fume, dado of acid / alkali resistant tiling as per IS: 4457 shall be provided to a height of [2100] mm set in potassium silicate mortar and joints pointed with resin bonded mortar
- Staircase wall shall be given dado of cast in-situ terrazzo to a height of [2100] mm or as per approved drawings.
- Before wall surfaces are covered with tiles, flags or mosaic to be set in normal mortar bedding, a sprayed coating of cement mortar shall be applied to the base unless otherwise specified. Where no adequately even surface is available for work involving thin beddings, special provisions shall be made to compensate for this, e.g., rendering coat, screed. The concrete surface to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[119]	25.09.2014

which tiles, flags, terrazzo, screed, etc are to be placed, shall be cleaned by wet sandblasting and washed with water under pressure, so as to produce the specified surface condition.

- The exterior brickwork walls shall consist of load bearing and non-load bearing type construction. Exterior surfaces shall be treated with approved chemical waterproofing over cement plaster. Bricks of minimum 75 kg/cm² crushing strength shall be provided. Brickwork shall be carried out in cement sand mortar conforming to IS: 1077. Cement sand mortar shall conform to IS: 2250.

11.4.23 Roof access

All roofs shall be provided with access thorough a staircase / cage ladder. Minimum [1000 mm] wide access path shall be provided with suitable tiles to approach equipment on roof.

11.4.24 Roof Drains

Roof drains design criteria

Minimum diameter of the pipe shall be [150 mm]. The roof drains shall be sized for the roof area runoff for a maximum rainfall per hour at site.

Detailed specification is mentioned elsewhere in this specification.

Roof Drainage and Water Proofing

All roofs of buildings shall be provided with 3 layers, first being elastomeric membrane water proofing treatment, secondly screed concrete shall be laid and finally the wearing course. Elastomeric membrane shall be laid as per manufacturer's specifications which shall adhere to specifications as given in IS 2645. Run off gradient shall be given a minimum of 1 in 100. Gradient shall comprise screed concrete 1:2:4 using 12.5 mm or below coarse aggregate. Over the screed concrete waterproofing treatment shall be provided as below:

A wearing course shall consist of pressed clay tiles of size [230x230x18 mm] laid in water proofing compound mixed cement mortar (1:3) and sealing of joints using sealing compound.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[120]	25.09.2014

12 GENERAL REQUIREMENTS

12.1 Roof

All the buildings having R.C.C slabs over structural steel framing are provided with troughed metal sheet decking which acts as permanent shuttering. These sheets shall meet the general requirements of IS: 14246 and shall conform to class 3 for durability. The sheeting shall be permanently colour coated galvanised M.S. troughed metal sheet decking of approved profile with minimum base metal thickness of 0.8 mm and minimum trough depth of 38 mm. Silicon modified polyester painting shall be used for permanent coating over galvanised surface with minimum rate of galvanising of 180 gm of zinc per sq. m. Dry film thickness of colour coating shall be at least 20 micron.

Roof of all buildings having R.C.C. framework shall have cast in-situ R.C.C. slab with conventional shuttering.

Structural steel roofing wherever required shall be of permanently colour coated galvanised M.S troughed metal sheet of approved profile. Minimum base metal thickness shall be 0.8 mm. The rate of zinc consumption for galvanising shall be 275 gm/sq. m. The external face shall have permanent colour coating of PVF 2 paint of minimum DFT of 20 microns and inner surface shall be coated with silicon modified polyester paint with DFT of 20 microns

12.2 Platforms and walkways

Platforms shall be provided to all major equipment, not directly accessible from the floors, for maintenance. Platforms and connecting walkways shall have a minimum width of 750 mm. Platforms in front of the entry shall be at least 900 mm wide. Platforms located close to each other shall be connected with walkways.

All steel platforms above grade level shall be constructed with kick plates at edge of the platform to prevent tools or materials from falling off. It shall consist of 8 mm thick steel plate projecting 100 mm above the platform surface. Kick plate shall be painted with the same type of coating as the material to which it is attached. Approach to EOT crane shall be ensured by Cage ladder or staircase.

12.3 Stairs and ladders

Steel Stairs

All steel staircases shall normally have minimum clear width (back to back of stringer) of 1000 mm and maximum inclination with horizontal of 35.75°. However, in case of space restriction, minimum clear width up to 750 mm and slope up to 45° may be provided. The vertical height between successive landings shall not exceed 5 m. Channels (minimum MC 200) shall be provided as stair stringers. Treads shall be minimum 250 mm wide of chequered plate/grating, with suitable nosing, and spaced equally so as to restrict the rise to maximum 180 mm (200 mm in exceptional cases).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[121]	25.09.2014

Steel Ladders

Ladders shall be provided to platforms, walkways, instruments and equipments, which do not require frequent access. Ladders shall preferably be vertical and its angle with vertical shall not exceed 50. Ladders shall be of minimum 450 mm clear width with 20 mm diameter MS rungs spaced at 300 mm (maximum).

Ladders shall be provided with a safety cage of minimum 750 mm diameter clear when the top of ladder is more than 4.5 m above the landing level. However safety cages shall start at 2.5 m above the lower landing level.

RCC Stairs

All stairs shall have maximum riser of 180 mm and a minimum tread of 250 mm. However, for public buildings riser shall be limited to 150 mm and tread width of 300 mm. Minimum width of stairs shall be 1200 mm generally. All stairs normally shall not have more than 15 risers in one flight. Aluminium angle nosing with minimum 50X25X3 angle or PVC nosing shall be provided for edge protection of RCC stairs.

12.4 Handrails

Handrails shall be provided at appropriate places to ensure safety e.g. around all floors/roof openings, projections / balconies, walkways, platforms, steel stairs etc.

All handrails shall be of 32 mm nominal bore MS pipes (medium class) as per IS: 1161 galvanised using 900 gm/sq. m of zinc. Handrails for platforms, walkways and projections shall be a two-rail system with the top rail 1000 mm above the walkway surface and the intermediate rail 450 mm below the top rail. Handrail post spacing shall be limited to 1500 mm as far as possible but can be proportioned to the length of the protected horizontal opening. In such a case spacing shall not exceed 1850 mm centre to centre of posts. Handrails shall be shop fabricated for specific locations and field welded or bolted to the erected structural steel. For platforms at elevation more than 30 m, three rail system with top rail at 1500 mm shall be adopted.

For RCC stairs, handrails with 20 mm square MS bar balustrade with suitable MS flat & aluminium / Teakwood handrail shall be provided, unless specifically mentioned otherwise. All hand rails except stairways shall be provided with toe guard plate of 100x8mm thick.

12.5 Edge protection

Wherever possible around floor openings an RCC kerb of 100 mm wide 150 mm high shall be provided. All concrete edges, where breakage of concrete corner is expected, shall be provided with angles at least L 50x50x6 with lugs for edge protection e.g. all round the cut-outs/openings in floor slab, edges of drains supporting grating covers, edges of RCC cable/pipe trenches supporting covers, edges of manholes supporting covers and supporting edges of precast covers etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[122]	25.09.2014

12.6 Vertical Headroom

All accessible areas shall be provided with minimum clear headroom as follows, unless otherwise specified:

Table 2.9

Headroom

Description	Headroom, mm
Finished floors to ceiling (buildings)	3000
Doors, Walkways, Platforms, Stairs etc.	2100
False ceiling of office areas	3000
False ceiling walkway	1000
Safety cage for ladders	2500
Access for forklift trucks	2800
Main roads/Railway crossings & crane access	7000
Other plant roads and truck access	5000
Cable & Pipe rack (except road/rail crossings)	3000

12.7 Waterproofing of underground structures

All underground structures like basements, pump houses, water retaining structures etc. shall have plasticiser cum waterproofing cement additives conforming to IS: 9103. In addition, limits on permeability as given in IS: 6494 shall also be met with. The concrete surface of these structures in contact with soil shall be provided with minimum two coats of bituminous painting of grade 85/25 conforming to IS: 702 @ 1.7 kg/sq.m (minimum) for water/ damp proofing. Also provision shall be made on the inner surface of walls and base slab, so that waterproofing grouting can be injected later in case of leakage.

12.8 Anti-termite treatment/Anti-weed treatment

Pre-constructional anti termite treatment shall be given to all buildings as per IS: 6313 and other relevant Indian Standards.

Reservoirs shall be given an anti-weed treatment of approved quality and quantity as per the manufacturer's specification. Anti weed treatment shall be carried out before carrying out the lining work.

12.9 Plinth Level

The finished floor levels shall be 800 mm higher than the external finished ground level. Finished ground floor level (plinth level) of all buildings shall be minimum 500 mm above the formation level/grade level.

All cable vaults shall be located above ground level i.e. cable vaults shall not be provided as basements in the buildings.

LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[123]	25.09.2014

12.10 Statutory Requirements

All the applicable statutory rules pertaining to Indian Factories act, Factory rules of state government, Fire safety rules of Tariff Advisory Committee, Water act of Pollution Control Boards, Explosives act etc. and stipulations of other relevant statutory authorities shall be taken into consideration at the time of design.

Provisions of safety, health and welfare according to Factories act shall be complied with design stage. These shall include provision of continuous walkway (minimum 500 mm wide) along crane-girder at crane girder level on both sides of the building, comfortable approach to EOT crane cabin, railings, fire escape, locker room for workmen, pantry, toilets, rest room etc.

Adequate number of fire escapes shall be provided in a building. Fireproof doors, number of staircases, fire separation walls, lath plastering on structural steel member (in fire prone areas) shall be made according to the recommendation of TAC. For fire safety requirements of buildings IS: 1641 and IS: 1642 shall be followed in addition to TAC requirements. All masonry firewalls shall be minimum 345 mm thick and RCC firewall shall be minimum 200 mm thick.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[124]	25.09.2014

13 GENERAL CIVIL WORKS AND CONSTRUCTION TOLERANCES

13.1 Basic requirements for all civil works

Design requirements

The design of all structures under this contract shall be such that differential and total settlements or other movements shall not exceed acceptable limits and full provision shall be made for all expansion and other joints. The design shall be to the approval of the Owner/Consultant.

- Structural members subjected to flexure shall be designed to have adequate stiffness to limit deflections or any deformations that affect strength or serviceability of a structure adversely. The maximum allowable deflections of structural members shall be in accordance with the relevant design standards and/or the limits prescribed by the machinery manufacturers (whichever is less).
- The superstructures and foundations subjected to vibrations (the primary source of these vibrations being the unbalanced forces generated by rotating or reciprocating equipment) shall be designed such that vibrations will be neither intolerable nor troublesome to personnel and will not cause damage to the machine or structure.
- The natural frequency of the whole of the superstructures and foundations or parts thereof and all structures adjacent thereto shall not coincide with the operating frequency of the vibrating plant.
- The differences between frequencies and the dynamic analysis of the superstructures and foundations shall be in accordance with the relevant design standard.
- The dimensions of all the buildings shall be such as to provide adequate space for the safe installation and proper operation, maintenance and repair of all plant and equipment.
- Throughout the works all floor slabs above rooms containing electrical equipment shall be watertight. No drainpipes or water pipes are permitted to pass through these rooms.
- All materials used in the works shall be of the best quality of their respective kinds as specified herein, obtained from sources and suppliers approved by the Owner/Consultant and shall comply strictly with the tests prescribed hereinafter or, where tests are not laid down in this specification, with the requirements of the latest issue of the relevant Indian, American, British, German Standards or other Standards approved by the Owner/Consultant.
- Samples of all materials proposed to be used in the works may be called for at any time by the Owner/Consultant.
- The work shall be carried out by competent personnel skilled in their various trades.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[125]	25.09.2014

- Before commencing the works, the Bidder shall ascertain the locations and nature of all existing underground services and shall take every possible precaution against any damage occurring to them or interference therewith, during the execution of the works.
- Suitable access to the roofs of the buildings by means of steel stairs shall be provided for maintenance and repair of any installation.
- All rooms with fire hazard shall be provided with suitable emergency exists.
- Proper access roads with footpaths shall be provided to bring in all the equipment and to take it out in case of maintenance. These access roads shall be suitable for the vehicles, which will be used (cars, forklifts, trucks/trailers etc) to reach up to the point of unloading of the equipment.
- Safe, convenient and straight forward accesses and means are to be provided to take equipment in and out of all rooms, at all levels using suitable stair wells and suitable electric hoists. The dimensions of rooms, stairwells, doors, etc shall be designed to suit the a.m. transport concept.
- Before starting of design works, the Bidder shall submit to the Owner/Consultant for approval the project design manual containing the design data and the detailed design criteria for all civil works. Design works shall commence only after approval of the project design manual by the Owner/Consultant.

13.2 Basic requirements during construction

Basic Cleaning

Basic cleaning includes all floors, walls, ceilings, built-in fittings and equipment, including the furnishings. The basic cleaning operation must result in a degree of cleanness, which permits the fully equipped buildings and rooms and associated outdoor installations and secured surfaces to be taken over without complaint.

Advertising boards and stickers, temporary protective coatings and claddings, remains and splashes of paint, must be removed with water or suitable solvents.

Dust and other dirt must be completely removed from all wall and floor surfaces, as well as from all furniture.

Windows and mirrors must be cleaned so that they are completely clear and without streaks.

Perlator gauges, showerheads, odour traps and floor drains of the sanitary installations must be cleaned and the fittings and bright pipe work must be spotlessly polished.

Petrol and oil separators must be emptied, cleaned and refilled if necessary during basic cleaning.

Lamps, including dishes, lighting units and tubes, switches and sockets as well as bases and skirting boards, doors with frames and glazing, windows, window seats and other furniture and fittings must be included in the basic cleaning operation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[126]	25.09.2014

Initial Equipment

The specification is drawn up on the assumption that the scope of the initial equipment and consumption materials is to be provided complete in every respect; everything required for the use and care of the installations must be supplied, even if this is not expressly specified in the documentation.

Bidder shall ensure that during excavation ground water level shall be lowered by at least 0.50 m below the founding level adopting appropriate method of dewatering. Lean concrete below foundation shall be laid soon after excavation with minimum loss of time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[127]	25.09.2014

14 STANDARDS, CODES AND REFERENCES

14.1 General

The Design of the Steel Structural Works shall be prepared and presented in accordance with IS codes. In absence of guidelines of specific items in the IS codes, International codes viz., American, BS, DIN or Australian code shall be used. All the Indian Standards referred to shall be the latest revision (including all amendments issued thereto) on the date of opening of the price bid. The Standards adopted shall be clearly stated in the calculations.

The Design shall comply with the current Local Authority Building Regulations (National Building Code) where appropriate. Subject to the agreement of the Owner, other International / Foreign National Standards, and, International / Foreign National Standard Codes of Practice, may be used.

To the extent that the Design shall include materials, methods or workmanship to be incorporated into the works, they shall be selected and incorporated into the design in accordance with the recommendations and requirements of the following (as appropriate in order of precedence but not mutually exclusive):

Statutory requirements

The Contract provisions

Bureau of Indian Standard Codes of Practice

International / Foreign National Standards

Agreement Certification for Materials

Manufacturer's recommendations for materials

Competent Trade Association recommendation

Engineering judgment

In case of any deviation / conflict between provisions of IS codes and the design criteria, the provisions that are more stringent shall be followed unless specifically directed otherwise.

Reference to only some of the codes in this document and various clauses of design criteria shall not limit or restrict the scope or applicability of other relevant codes. It shall be ensured that all other codes relevant to a specific job, in addition to those already mentioned, are followed wherever applicable.

Where British / American / DIN or other codes and standards are referred to in this document, equivalent Indian Standards may be substituted if available.

Materials supplied from India shall follow the Indian Standard Specifications.

Field and laboratory testing procedures for materials follow Indian Standard Specifications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	01	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-II, Section-II, Part-D	[128]	25.09.2014

14.2 Codes for Loads

- IS: 875 : Code of Practice for design loads (other than earthquake) for Buildings and structures (All parts)
- IS: 1911 : Schedule of unit weights of building materials
- IS: 1893 (Part 1) : Criteria for earthquake resistant design of structure – General provisions and buildings
- IS: 1893 (Part 4) : Criteria for earthquake resistant design of structure – Industrial structures including stack-like structures

14.3 Codes for RCC

- IS: 456 : Plain and reinforced concrete - Code of Practice
- IS: 2974 : Code of Practice for design and construction of machine foundations
- IS: 2911 : Code of Practice for design and construction of pile foundation
- IS: 4326 : Code of Practice for earthquake resistant design and construction of buildings
- IS: 4995 : Criteria for design of reinforced concrete bins for storage of granular (all parts) and powdery materials
- IS: 4998 : Criteria for design of reinforced concrete chimneys: (All parts)
- IS: 5525 : Recommendation for detailing of reinforced concrete works
- IS: 1786 : Specification for high strength deformed steel bars and wires for concrete reinforcement
- IS: 11384 : Code of Practice for composite construction in structural steel and concrete
- IS: 11504 : Criteria for structural design of Reinforced concrete Natural Draft Cooling Tower
- IS: 11682 : Criteria for design of RCC staging for overhead water tanks
- IS: 13920 : Code of Practice for ductile detailing of reinforced concrete structures subjected to seismic forces

14.4 Codes for Structural Steel

- IS: 800 : Code of Practice for general construction in steel
- IS: 801 : Code of practice for use of cold-formed light gauge steel structural members in general building construction
- IS: 806 : Code of Practice for use of steel tubes in general building construction
- IS: 808 : Dimensions for hot rolled steel beam, column channel and angle section
- IS: 812 : Glossary of terms relating to welding & cutting of metals
- IS: 813 : Scheme of symbols for welding

Document Number	Rev No.	Description	Page No.	Date of Issue

- IS: 814 : Covered electrodes for manual metal arc welding of carbon and carbon manganese steel - Specification
- IS: 815 : Classification coding of covered electrodes for metal arc welding of mild steel and low alloy high tensile steel
- IS: 816 : Code of Practice for use of metal arc welding for general construction in mild steel
- IS: 817 : Training of welders - Code of practice (Part 1 & 2)
- IS: 818 : Code of practice for safety and health requirements in electric and gas welding and cutting operation.
- IS: 819 : Code of practice for resistance spot welding for light assemblies in mild welding
- IS: 822 : Code of practice for inspection of welds.
- IS: 1182 : Recommended practice for Radiographic Examination of Fusion Welded Butt joints in steel plates.
- IS: 1200 : Method of measurement of building and civil engineering works
- IS: 1161 : Steel tubes for structural purpose
- IS: 1363 : Indian standard- Hexagonal head bolts, screws and nuts of product grade C
- IS: 1367 : Technical supply condition for threaded fasteners
- IS: 1477 : Code of practice for painting of ferrous metal in building
- IS: 1852 : Specification for rolling and cutting tolerance for hot-rolled steel products
- IS: 2062 : Structural steel (fusion welding quality)
- IS: 2074 : Ready mixed paint, air drying, red oxide zinc-chrome, priming
- IS: 2645 : Specification for integral cement waterproofing compound
- IS: 2932 : Specification for enamel, synthetic exterior type –I
- IS: 3613 : Acceptance tests for Wire flux combination of submerged arc welding
- IS: 3757 : Specification for high strength structural bolts
- IS: 4000 : Code of practice for High Strength bolts in steel structures
- IS: 7205 : Safety code for erection of structural steel work
- IS: 7215 : Specification for Tolerances for fabrication of steel structures
- IS: 7280 : Specification for Bare wire electrodes for submerged arc welding of structural steel
- IS: 8640 : Recommendations for dimensional parameters for industrial building
- IS: 9178 : Criteria for design of steel bins for storage of bulk material

(All parts)

- IS: 9595 : For Metal arc welding of carbon and carbon manganese steel - Recommendation
- IS: 11592 : Conveyor galleries
- IS: 12843 : Tolerances for erection of steel structures

14.5 Miscellaneous Codes

- IS: 919 : ISO system of limits and fits
- IS: 1038 : Specification for steel doors, windows and ventilators
- IS: 1172 : Code of basic requirements for water supply, drainage and sanitation
- IS: 1346 : Code of Practice for water proofing of roofs with bitumen felts
- IS: 1742 : Code of Practice for building drainage
- IS: 1905 : Code of Practice for structural use of unreinforced masonry
- IS: 2210 : Criteria for design of reinforced concrete shell structures and folded plates
- IS: 2633 : Method for testing uniformity of coating on Zinc Coated Articles
- IS: 3067 : Code of Practice for general design details and preparatory works for damp proofing and water proofing of buildings
- IS: 4759 : Specification for Hot-Dip Zinc coatings on Structural Steel and other allied products
- IS: 10440 : Code of Practice for construction of reinforced brick and reinforced brick concrete floors and roofs
- IS: 13592 : Un-plasticized polyvinyl chloride (UPVC) Injection molded fittings for soil & waste discharge system for inside and outside buildings including ventilation and rail water system specification
- IS: 15658 : Precast concrete blocks for paving
- SP: 6 : Handbook for structural engineers - All parts
- SP: 7 : National Building Code of India
- SP: 16 : Design Aids for reinforced concrete to IS: 456-1978
- SP: 20 : Handbook on masonry design and construction
- SP: 22 : Explanatory handbooks on codes for earthquake engineering (IS: 1893-1975 and IS: 4326-1976)
- SP: 24 : Explanatory handbooks on Indian Standard code of Practice for plain and reinforced concrete
- SP: 25 : Handbook on causes and prevention of cracks in buildings
- SP: 32 : Handbook on functional requirements of industrial buildings

- SP: 34 : Handbook of concrete reinforcement and detailing (SCIP)
- TAC : Traffic Advisory Committee
- : Indian Explosive Act
- : Indian Factory Act and State Factory Act
- : Indian Electricity Act

Any statutory codes / standards / regulations other than listed above, as may be applicable, shall be followed.

Unless covered otherwise by Indian codes & standards and in case nothing to the contrary is specifically mentioned elsewhere in this document, the latest editions of the codes and standards given below shall also apply:

- a) Japanese Industrial Standards (JIS).
- b) American National Standards Institute (ANSI).
- c) American Society of Testing and Materials (ASTM).
- d) American Society of Mechanical Engineers (ASME).
- e) International Organization for Standardization (ISO).
- f) American Welding Society (AWS).
- g) National Electrical Manufacturers Association (NEMA).
- h) National Fire Protection Association (NFPA).
- i) International Electro-Technical Commission (IEC).
- j) German national codes (DIN)
- k) Expansion Joint Manufacturers Association (EJMA)

---	-------------------

1 400KV & 220KV SWITCHYARD

S.NO	DESCRIPTION	UNIT	220 kV	400 kV
1	Nominal / Rated voltage			
2	Maximum System Voltage			
3	Rated Frequency			
4	No. Of Phases			
5	Rated power frequency withstand voltage (1 min)			
6	Rated lighting impulse withstand voltage (1.2/50 μ s)			
7	Rated switching impulse withstand voltage (250/2500 μ s)			
8	Rated Normal Current bus bar			
9	Rated Normal Current feeder			
10	Rated short breaking Current			
11	Rated peak withstand current			
12	Rated Short-time withstand current			
13	Leakage rate per year and gas compartment			
14	Auxiliary DC supply (2 wire ungrounded)			
15	Auxiliary AC supply (3 ph. 4 wire, 50 Hz)			
16	Seismic Acceleration			
17	Ambient temperature range			
18	Creepage Distance			

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[8]	25.09.2014

Tender Document for R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

1.1 Circuit Breakers

S.No.	DESCRIPTION	220 kV	400 kV
1.	Service		
2.	Type		
3.	Auto Reclosing		
4.	Rated Frequency (Hz)		
5.	Nominal system voltage		
6.	Maximum system voltage		
7.	System Neutral Earthing:		
8.	Mechanical Endurance class		
9.	Insulating level (kVp)		
	i. 1.2/50 μ sec Lightning Impulse Withstand Voltage		
	a) Between Line terminals and ground (kVp)		
	b) Between terminals with circuit breaker open		
	ii. 1 min power frequency withstand Voltage (kV rms)(Dry and Wet)		
	a) Between Line terminals and ground (kVp)		
	b) Between terminals with circuit breaker open (kVp)		
	iii. 250/2500 μ sec switching impulse withstand voltage (dry and wet)		
	a) Between Line terminals and ground (kVp)		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[9]	25.09.2014

S.No.	DESCRIPTION	220 kV	400 kV
	b) Between terminals with circuit breaker open		
10.	Rated current (Amp)		
11.	Short time current Rating		
12.	Maximum Noise level		
13.	Min Creepage Distance (mm) b/w ph. To ground and between C.B terminals (heavily polluted atmosphere)		
14.	Rated breaking time (m.sec)		
15.	Total Closing time		
16.	Rated line charging breaking current (Amps)		
17.	Rated cable charging breaking current (Amps)		
18.	Rated operating sequence (O-Operating-C-Closing)		
19.	Operating Mechanism		
20.	Mode of operation		
21.	No of trip coils		
22.	Trip coil and closing coil voltage. (DC Voltage)		
23.	First pole to clear factor		
24.	Supply voltage for operating device		
25.	Corona extinction voltage kV (rms)(Min.)		
26.	Maximum radio interference voltage (micro volt) between 0.5 MHz and 2 MHz in all position of equipment		
27.	Thermal Rating of Auxiliary Contacts	10 A at 220 V DC	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[10]	25.09.2014

1.2 Isolators

S.No	DESCRIPTION	220 kV	400 kV
1.	Maximum System voltage (rms) Um		
2.	Rated continuous current (A) at design ambient temp.		
3.	Rated short time withstand current of isolator and earth switch		
4.	Rated dynamic short circuit withstand current withstand current of isolator and earth switch		
5.	Operating mechanism		
6.	System earthing		
7.	Lightning (Full Wave) impulse withstand voltage (1.25/50 μ sec Wave front) in kVp		
a)	Between line terminals and ground (kVp)		
b)	Between terminals with disconnecter contacts open: <ul style="list-style-type: none"> Lightning impulse voltage applied to one terminal (kVp) Power frequency voltage of opposite polarity applied to other terminal (kVp). 		
8.	Switching Impulse withstand voltage (250/2500 μ sec Wavefront) in (kVp)		
a)	Between line terminals and ground (kVp)		
b)	Between terminals with circuit breaker contacts open: <ul style="list-style-type: none"> Switching Impulse voltage applied to one terminal (kVp) Power frequency voltage of opposite polarity applied to other terminal (kVp). 		
9.	One Minute power frequency withstand voltage <ul style="list-style-type: none"> Between line terminals and ground Between terminals with disconnectors contacts open 		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[11]	25.09.2014

10.	Mechanical endurance class		
11.	No. of spare auxiliary contacts on each isolator		
12.	No. of spare auxiliary contacts on each earthing switch		
13.	Max. radio interference voltage for frequency between 0.5MHz and 2MHz (μ V)		
14.	Auxiliary contacts continuous rating (A)		
15.	Auxiliary contacts breaking capacity (for circuit time constant \geq 20ms)		

1.3 400 kV & 220kV High Voltage Outdoor Bushing-Porcelain Type

S.NO	DESCRIPTION	UNIT	220 kV	400 kV
1.	Max system voltage			
2.	Rated short-circuit withstand current			
3.	Rated peak withstand current			
4.	Material of enclosures			
5.	Lightning (Full Wave) impulse withstand voltage (1.25/50 μ sec Wave front) in kVp pressure			
6.	Switching Impulse withstand voltage (250/2500 μ sec Wavefront) in (kVp)			
7.	One minute power frequency withstand voltage at minimum operating gas pressure			

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[12]	25.09.2014

S.NO	DESCRIPTION	UNIT	220 kV	400 kV
8.	Creepage distance at rated voltage			

1.4 Lightning Arrestor

S. NO	DESCRIPTION	220 kV	400 kV
1.	Max. system voltage		
2.	Type of arrester		
3.	Rated voltage of arrester		
4.	Maximum continuous operating voltage (MCOV)		
5.	Nominal discharge		
6.	Line discharge class		
7.	Service		
8.	Watt loss at MCOV		
9.	Lightning (Full Wave) impulse withstand voltage (1.25/50 μ sec Wave front) in kVp pressure		
10.	One min power frequency with stand voltage of the housing (wet & dry).		
11.	Switching Impulse withstand voltage (250/2500 μ sec Wavefront) in (kVp)		
12.	Long duration discharge class		
13.	High current impulse with stand (4/10 micro sec wave)		
14.	Creepage distance of the insulating housing		
15.	The thickness of		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[13]	25.09.2014

	galvanizing of metal parts		
--	----------------------------	--	--

1.5 Current Transformers

S. No.	DESCRIPTION	220kV	400 kV
1.	Maximum system voltage Um		
2.	Rated Primary Current (Amp)		
3.	Rated short time thermal current		
4.	Rated dynamic current		
5.	System neutral earthing		
6.	No. of cores		
7.	Maximum temperature rise over an ambient temperature of 50°C		
8.	Lightning (Full Wave) impulse withstand voltage (1.25/50 μ sec Wave front) in kVp pressure		
9.	One min power frequency with stand voltage of the housing		
10.	Switching Impulse withstand voltage (250/2500 μ sec Wavefront) in (kVp)		
11.	One minute power frequency withstand voltage between secondary terminal & earth		
12.	Radio interference voltage at 1.1 Um/ $\sqrt{3}$ and frequency range 0.5 to 2 MHz		
13.	Partial discharge level		
14.	Corona extinction voltage (min) (kV rms)		

1.6 Voltage Transformers

S.No.	DESCRIPTION	220 kV	400 kV
1.	Maximum system voltage Um		
2.	Rated burden		
3.	Maximum temperature rise over an		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[14]	25.09.2014

S.No.	DESCRIPTION	220 kV	400 kV
	ambient temperature of 50°C		
4.	System neutral earthing		
5.	System fault level		
6.	Rated primary voltage		
7.	Rated secondary voltage		
8.	Connection group		
9.	Number of secondary windings		
10.	Lightning (Full Wave) impulse withstand voltage (1.25/50 μ sec Wave front) in kVp pressure		
11.	One min power frequency with stand voltage of the housing (wet & dry).		
12.	Switching Impulse withstand voltage (250/2500 μ sec Wavefront) in (kVp)		
13.	One minute power frequency withstand voltage for secondary		
14.	Radio interference voltage at 1.1 Um/ $\sqrt{3}$ and frequency range 0.5 to 2 MHz		
15.	Partial discharge level		
16.	Corona extinction voltage (min) (kV rms)		

1.7 220kV Capacitive Voltage Transformer

S.No.	DESCRIPTION	220 kV	400 kV
1.	Maximum system voltage Um		
2.	Rated burden		
3.	Maximum temperature rise over an ambient temperature of 50°C		
4.	System neutral earthing		
5.	System fault level		
6.	Rated primary voltage		
7.	Rated secondary voltage		
8.	Lightning (Full Wave) impulse withstand voltage (1.25/50 μ sec		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[15]	25.09.2014

S.No.	DESCRIPTION	220 kV	400 kV
	Wave front) in kVp pressure		
9.	One min power frequency with stand voltage of the housing (wet & dry).		
10.	Switching Impulse withstand voltage (250/2500 μ sec Wavefront) in (kVp)		
11.	Connection group		
12.	Number of secondary windings		
13.	Equivalent series resistance over the entire carrier frequency range (ohms)		
14.	Rated total Capacitance (pF)		
15.	Acceptable limit of variation of total capacitance over the entire carrier frequency range		
16.	Creepage distance		
17.	Partial discharge level		
18.	Corona extinction voltage KV (RMS)		

1.8 Power Line Carrier Communication

S NO	DESCRIPTION	DATA
1	Mode of Transmission	
2	H.F. range	
3	Nominal carrier frequency band	
4	Effectively transmitted speech frequency band or signal frequency band when only speech or signal is transmitted	
5	Effectively transmitted speech plus signal frequency band in case of multipurpose use	
6	Nominal Impedance	
	a) Carrier Frequency Side	
	b) VF Side	
7	Nominal carrier Frequency Power	
8	Supply voltage	
9	Frequency difference between voice	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[16]	25.09.2014

S NO	DESCRIPTION	DATA
	frequency band transmitter and receiver in a pair of PLC terminals	
10	Stability of carrier frequency from its nominal value	
13	Telephone signaling channel:	
S NO	DESCRIPTION	DATA
Wave Trap		
1.	Rated Voltage (Nominal/Max)	
2.	Rated Frequency	
3.	Rated continuous current at 50 °C	
4.	Rated short time current for 1sec	
5.	Nominal discharge current of protective device	
6.	Rated inductance	
7.	Resistive component of impedance within carrier frequency blocking range	
8.	Minimum Corona extinction voltage level	
9.	Type of tuning	

1.9 Reactor

S NO	DESCRIPTION	220kV	400kV
1.	Maximum system voltage		
2.	Rated MVAR		
3.	Service		
4.	Type Of reactor		
5.	Phases		
6.	Quantity		
7.	Neutral Earthing		
8.	System fault level		
9.	Connection		
10.	Insulation level (for winding		
	a)	Lightning impulse 1.2/50	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[17]	25.09.2014

Tender Document for R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

S NO	DESCRIPTION		220kV	400kV
		micro-seconds withstand voltage		
	b)	Switching surge withstand voltage		
	c)	One minute power frequency withstand voltage		
11.	Maximum admissible temp. Rise over an ambient temp of 50°C and at highest Voltage			
	a)	of winding measured by resistance method		
	b)	top of oil measured by thermometer		
12.	Cooling system			
13.	Ratio of zero sequence reactance to positive reactance (X0/X1)			
14.	Range of voltage upto which impedance shall be constant			
	Guaranteed max, losses at rated voltage and frequency at rated output at 75 deg. C (KW)			
15.	Noise Level			
16.	Magnetizing characteristic			
17.	Harmonics Level			

1.10 ACSR (Moose) Conductor

S NO	DESCRIPTION	DATA	
1.	ACSR Conductor		
2.	Code Name		
3.	Overall diameter		
4.	Stranding no. of wire Al/Steel:		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[18]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

5.	Nominal Diameter of Strand (Al./Steel)(mm)	
6.	Number of Strands	
	a) Steel centre	
	b) 1st steel layer	
	c) 1st Aluminium layer	
	d) 2nd Aluminium layer	
	e) 3rd Aluminium layer	
7.	Sectional area of aluminium	
8.	Total sectional area	
9.	Appox. Weight	
10.	Calculated DC resistance at 20°. C (calculated from maximum value of resistivity and minimum cross-sectional area)	
11.	Ultimate Strength (min)	
12.	Co. efficient of liner expansion	
13.	Nominal current rating at 30° C	

1.11 IPS Aluminum Tubular Bus Bars

S NO	DESCRIPTION	DATA
1.	Tubular Aluminum Conductor	
	a) Type	
	b) Size	
2.	Material grade	
3.	Continuous current carrying capacity (rms) at 50oC ambient temperature	
4.	Outer diameter	
5.	Inner diameter	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[19]	25.09.2014

Tender Document for R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

S NO	DESCRIPTION	DATA
6.	Tolerance on diameter	
7.	Tolerance on thickness	
8.	Ovality tolerance	
9.	Maximum temperature rise over ambient of 50° C	

1.12 Shield Wire

S NO	DESCRIPTION	DATA
	Size & Material	

1.13 Connectors / Pg Clamp Assembly

S NO	DESCRIPTION	DATA
1.	Material	
2.	Continuous current carrying capacity (rms) at 50° C ambient temperature	
3.	Short time current carrying Capacity	

1.14 Post Insulator

S NO	DESCRIPTION	DATA
1.	Type	
2.	Service	
3.	Voltage	
4.	System neutral earthing	
5.	Insulation Level	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[20]	25.09.2014

S NO	DESCRIPTION	DATA	
a.	One minute Dry Power frequency Withstand Voltage (kV rms)		
b.	One minute Wet power frequency Withstand Voltage (kV rms)		
c.	Lightning Impulse withstand (kVp)		
6.	Creepage distance		
7.	Type of insulator		
8.	Metal parts		
9.	Applicable standards		

1.15 String Insulators

S NO	DESCRIPTION	220 kV	400 kV
1.	Type		
2.	Applicable standard		
3.	Type of insulator		
4.	No. of unit insulators in string		
5.	1 min power frequency withstand Voltage of insulator string (kV rms)(Dry and Wet)		
6.	1.2/50 μ sec Lightning Impulse Withstand Voltage		
7.	250/2500 μ sec switching impulse withstand voltage (dry and wet)		
8.	Electromechanical strength		
9.	Corona extinction voltage kV (rms)(Min.)		
10.	Unit Insulator rating, type		
11.	Minimum creepage distance of each disc (so as to meet the total required creepage distance)		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[21]	25.09.2014

Tender Document for R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

2 220 KV/400 KV SWITCHYARD CONTROL AND PROTECTION SYSTEM

S. No.	Technical Particulars	Unit	Parameters
1.0	General		
1.1	Type (simplex / duplex / panel cum desk)		
1.2	Make		
1.3	Maximum dimensions width x depth x height		
1.4	Weight of each panel		
1.5	Degree of protection		
1.6	Colour shade		
1.7	Cold rolled sheet steel thickness		
a	Load bearing members		
b	Non-loading members		
1.8	Cable entry top / bottom		
1.9	Control cable glands to be supplied		
1.10	Purchaser's external cable sizes		
1.11	Any special interconnecting cable between panels to be provided by vendor.		
1.12	Special requirements:		
a	Matching with existing / new panels of others		
b	Coordination with other suppliers		
c	Hardware and accessories for protocol converter and connection to DCS		
1.13	Earth bus material & size inside the panel		
1.14	Equipment list for each panel		
1.15	Auxiliary voltages		
a	A.C.		
b	DC		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[22]	25.09.2014

3 POWER TRANSFORMER

For GT, ICT

S.N	DESCRIPTION	GENERATOR TRANSFORMER	INTERCONNECTING TRANSFORMER (if applicable)
1	3 Phase power supply system in which transformer is to be used		
a)	HV side max. Voltage		
b)	LV side Max.Voltage		
c)	System earthing		
	- Primary Side (HV)		
	- Secondary Side (LV)		
2	Max. 3 phase fault levels		
	- Primary Side (HV)		
	- Secondary side (LV)		
3	Direction of power flow		
4	Transformer application		
	Applicable standards		
5	Transformer type		
A	Indoor/ outdoor		
B	Dry type / oil immersed		
C	Core type/ shell type		
6	Auto wound / two winding/ three winding		
7	Number of phases		
8	Rated frequency		
9	Rated no load voltage		
	- HV Winding		
	- LV Winding		
10	Cooling		
	a) Method of cooling		
	b) Cooling liquid		
11	Rated MVA at no load voltage & principle tap		
	ONAN		
	ONAF

SL. NO.	DESCRIPTION	UNIT	DATA
	Capacitance per phase		
	Starting current as % of full load current		
19.	Torque at full load in Kgm.		
a)	Break away torque in % of full load torque		
b)	Pull up torque in % of full load torque		
c)	Pull out torque in % of full load torque		
20.	Starting time in sec.		
a)	Without mechanism coupled		
b)	Mechanism coupled through hydraulic coupling when it may be presumed that load is transferred to motor shaft only after attaining almost full speed.		
	i. with rated voltage		
	ii. with 80% of rated voltage		
	iii. with 110% of rated voltage		
21.	Starting time in sec. With mechanism coupled through flexible coupling		
a)	with rated voltage		
b)	with 80% of rated voltage		
c)	with 110% of rated voltage		
22.	Safe stall time (hot motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
23.	Safe stall time (Cold motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
24.	Limiting motor temperature to determine safe stall time		
25.	Permissible maximum accelerating time (hot motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
26.	Permissible maximum accelerating time (cold motor)		

Document Number	Rev No.	Description	Page No.	Date of Issue

SL. NO.	DESCRIPTION	UNIT	DATA
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
27.	Class of Insulation And Material		
28.	Whether insulation is suitable for 415 V, 6.6kV system		
29.	Temperature rise under normal conditions over 50°C ambient temperature		
30.	By resistance method --- °C over cooling water temp. for CACW motors.		
31.	Degree centigrade over cooling air temp. for CACA motor.		
32.	By Thermometer method ---- Degree centigrade over cooling water temp. for CACW motor.		
33.	Degree centigrade over cooling air temp. for CACA motor.		
34.	Method of starting :		
35.	Permissible starting duty cycles :		
36.	Stator thermal time constant :		
37.	Method of cooling (If applicable)		
	Details of water cooling system		
a)	No. of cooler		
b)	Water requirement per cooler		
c)	Losses removed by cooler		
d)	Max. permissible temperature of cooling water at inlet		
e)	Max. permissible temperature of cooling water at outlet		
f)	Maximum permissible pressure at water outlet		
g)	Water pressure drop through the cooler		
h)	Temp. of cold air coming out & entering the machine For permissible cooling water temperature of [31°C]		
i)	Temp. rise of air passing through machine at full load.		
j)	Air pressure drop through The cooler		
k)	Temp. rise of water through cooler		
l)	Protection against leakage of water :		
m)	Arrangement to ensure the water flow

SL. NO.	DESCRIPTION	UNIT	DATA
38.	Bearings		
a)	Number :		
b)	Type :		
c)	Lubrication system :		
d)	Quantity of lubricant reqd. For both the bearings. Life in hours at rated speed :		
e)	Recommended lubricant :		
f)	Bearing end play :		
g)	Inlet oil pressure :		
h)	Temp. rise of oil :		
i)	Max. permissible temp. of bearing :		
j)	Max. Permissible temp. of Oil		
k)	Permissible running time without forced oil at full load & full speed :		
39.	Whether bearings are provided with 4 wire, platinum RTD having 100-ohm resistance at 0°C for remote temp. Indication.		
a)	Whether bearings are provided with local temperature indicator having two adjustable contacts rated for 5A at 240V AC or 0.5A at 220V DC. : Yes/No		
b)	If forced lube oil system provided : Yes / No		
c)	Qty of lubricant required for initial filling.		
d)	Recommended period after which lubricant should be replaced		
e)	Bearing cooling water requirement		
f)	Max. Permissible bearing cooling water inlet temp. (permissible)		
g)	Max. Permissible bearing cooling water outlet temp.		
h)	Terminal designation corresponds to direction of rotation (Facing driving end).		
i)	Terminal boxes with accessories separate terminal boxes provided.		
40.	Winding temp. detectors		
41.	Bearing temp. detectors		
42.	Moisture detectors

10 HV CABLES

S. No.	DESCRIPTION	UNIT	DATA
1.1.	Name of Manufacturer		
1.2	Place & Country of manufacture		
1.3	Specifications and Standards		
1.4	Design ambient temperature	°C	
1.5	System Particulars (Fill separate columns for the following particulars for each type and size of cables)		
1.6	ISI registration and validity date		
1.7	Cable type		
1.8	Whether cable shall carry ISI mark		
1.9	Voltage grade		
1.10	No. of cores and size	in sq.mm	
1.11	Suitable for earthed/unearthed system		
1.12	Permissible voltage and frequency variation for satisfactory operation		
a	Voltage		
b	Frequency		
c	Voltage and Frequency combined Continuous current carrying capacity		
1.13	For standard conditions as per IS		
a	In air	A	
b	In ground	A	
c	In duct	A	
d	In trench	A	
1.14	For site conditions :		
a)	In air	A	
b)	In ground	A	
c)	In duct	A	
d)	In trench	A	
1.15	De-rating factors for various conditions of laying are not worse than the ones specified in applicable IS Yes/No		
1.16	Conductor		
a)	Material reference standard for conductor		

Document Number	Rev No.	Description	Page No.	Date of Issue

S. No.	DESCRIPTION	UNIT	DATA
b)	Grad and Shape of conductor		
c)	Nominal cross section area	mm ²	
d)	Number of wires		
e)	Diameter of wire	mm	
f)	Diameter/size of conductor	mm	
1.17	Screening/Shielding / heat barrier tape (as applicable)		
a)	Material		
b)	Type/applicable std.		
c)	Thickness		
1.18	Insulation		
a)	Material composition and confirming standard and type		
b)	Thickness of insulation		
i.	Between cores	mm	
ii.	Between cores and inner sheath	mm	
c)	Tolerance on thickness of insulation	%	
d)	Diameter of core over insulation	mm	
e)	Specific insulation resistance at 90 degrees centigrade	ohm-cm	
1.19	Screening/Shielding / barrier tape(as applicable)		
a)	Material		
b)	Type/applicable std.		
c)	Thickness		
1.20	Inner sheath		
a)	Material, confirming standard / type		
b)	Extruded	Yes/No	
c)	Calculated diameter over laid up cores		
d)	Thickness (min)	mm	
e)	Diameter of cable over inner sheath	mm	
f)	Whether inner sheath shall be of FRLS material and meet special Tests as per specification for FRLS cables	Yes/No	
g)	Filler Material details		
1.21	Armouring		
a)	Material		
b)	Type of armouring		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[65]	25.09.2014

S. No.	DESCRIPTION	UNIT	DATA
c)	No. and size of strip/wire		
d)	Whether galvanized	Yes/No	
e)	Diameter of cable over armouring	mm	
1.22	Outer sheath		
a)	Material confirming standard/ type		
b)	Extruded	Yes/No	
c)	Minimum Thickness of sheath	mm	
d)	Tolerance on thickness of sheath	mm	
e)	Min. tensile strength	N/sq mm	
f)	Min. elongation percentage at rupture		
g)	Colour of Outer sheath		
h)	Whether outer sheath shall be of FRLS material and shall meet the special tests as per specification and standards	Yes/No	
1.23	Overall diameter of cable and and tolerance for Outer Diameter		
1.24	Scheme for identification of cores		
1.25	Short circuit withstand capacity		
a)	Short circuit current	KA	
b)	Duration of short circuit	sec	
1.26	Allowable/attainable maximum conductor temperature when carrying rated continuous current		
1.27	Allowable/attainable maximum conductor temperature at the termination of short circuit current		
1.28	Cable constants		
a)	Max. DC resistance of conductor at twenty (20) °C	ohm/km	
b)	AC resistance per core at twenty (20) °C	ohm/km	
c)	Reactance per core at 50 HZ	ohm/km	
d)	Capacitance per core at 50Hz	microfarad/k m	
e)	Insulation		
	Insulation resistance constant at 27°C and at max. rated temperature	ohm-km	
	Volume resistivity ohm cm at 27°C and at max. rated temperature		

Document Number	Rev No.	Description	Page No.	Date of Issue

11 LT POWER & CONTROL CABLES

S. No.	DESCRIPTION	UNIT	DATA
1.2.	Name of Manufacturer		
1.2	Place & Country of manufacture		
1.3	Specifications and Standards		
1.4	Design ambient temperature	°C	
1.5	System Particulars (Fill separate columns for the following particulars for each type and size of cables)		
1.6	ISI registration and validity date		
1.7	Cable type		
1.8	Whether cable shall carry ISI mark		
1.9	Voltage grade		
1.10	No. of cores and size	in sq.mm	
1.11	Suitable for earthed/unearthed system		
1.12	Permissible voltage and frequency variation for satisfactory operation		
a	Voltage		
b	Frequency		
c	Voltage and Frequency combined Continuous current carrying capacity		
1.13	For standard conditions as per IS		
a	In air	A	
b	In ground	A	
c	In duct	A	
d	In trench	A	
1.14	For site conditions :		
e)	In air	A	
f)	In ground	A	
g)	In duct	A	
h)	In trench	A	
1.15	De-rating factors for various conditions of laying are not worse than the ones specified in applicable IS Yes/No		
1.16	Conductor		
g)	Material reference standard for conductor		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[68]	25.09.2014

S. No.	DESCRIPTION	UNIT	DATA
h)	Grad and Shape of conductor		
i)	Nominal cross section area	mm ²	
j)	Number of wires		
k)	Diameter of wire	mm	
l)	Diameter/size of conductor	mm	
1.17	Screening/Shielding / heat barrier tape (as applicable)		
d)	Material		
e)	Type/applicable std.		
f)	Thickness		
1.18	Insulation		
a)	Material composition and confirming standard and type		
b)	Thickness of insulation		
iii.	Between cores	mm	
iv.	Between cores and inner sheath	mm	
c)	Tolerance on thickness of insulation	%	
d)	Diameter of core over insulation	mm	
e)	Specific insulation resistance at 90 degrees centigrade	ohm-cm	
1.19	Screening/Shielding / barrier tape(as applicable)		
d)	Material		
e)	Type/applicable std.		
f)	Thickness		
1.20	Inner sheath		
h)	Material, confirming standard / type		
i)	Extruded	Yes/No	
j)	Calculated diameter over laid up cores		
k)	Thickness (min)	mm	
l)	Diameter of cable over inner sheath	mm	
m)	Whether inner sheath shall be of FRLS material and meet special Tests as per specification for FRLS cables	Yes/No	
n)	Filler Material details		
1.21	Armouring		
f)	Material		
g)	Type of armouring		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	00	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III,Part B	[69]	25.09.2014

S. No.	DESCRIPTION	UNIT	DATA
h)	No. and size of strip/wire		
i)	Whether galvanized	Yes/No	
j)	Diameter of cable over armouring	mm	
1.22	Outer sheath		
i)	Material confirming standard/ type		
j)	Extruded	Yes/No	
k)	Minimum Thickness of sheath	mm	
l)	Tolerance on thickness of sheath	mm	
m)	Min. tensile strength	N/sq mm	
n)	Min. elongation percentage at rupture		
o)	Colour of Outer sheath		
p)	Whether outer sheath shall be of FRLS material and shall meet the special tests as per specification	Yes/No	
1.23	Overall diameter of cable and tolerance for Outer Diameter		
1.24	Scheme for identification of cores		
1.25	Short circuit withstand capacity		
a)	Short circuit current	KA	
b)	Duration of short circuit	sec	
1.26	Allowable/attainable maximum conductor temperature when carrying rated continuous currents		
1.27	Allowable/attainable maximum conductor temperature at the termination of short circuit current		
1.28	Cable constants		
a)	Max. DC resistance of conductor at twenty (20) °C	ohm/km	
b)	AC resistance per core at twenty (20) °C	ohm/km	
c)	Reactance per core at 50 HZ	ohm/km	
d)	Capacitance per core at 50Hz	microfarad/km	
e)	Insulation		
	Insulation resistance constant at 27°C and at max. rated temperature	ohm-km	
	Volume resistivity ohm cm at 27°C and at max. rated temperature		

Document Number	Rev No.	Description	Page No.	Date of Issue

S. No.	DESCRIPTION	UNIT	DATA
	Min. tensile strength	N/sq.mm	
	Min. elongation percentage at rupture		
	Loss tangent		
	Dielectric constant		
1.29	Maximum cable charging current at normal operating voltage	A/km	
1.30	Factory tests (Enumerate in detail for each type of cable)		
	a) Type tests		
	b) Acceptance tests		
	c) Routine tests		
	d) Special tests to prove FRLS/FS properties.		
1.31	Is the offered cable guaranteed to safely withstand continuous conductor temperature of 90°C for XLPE	Yes/No	
1.32	Cable weight	kg/km	
1.33	Recommended minimum bending radius	mm	
1.34	Safe pulling force	Kg	
1.35	Maximum allowable spacing for angle iron supports	mm	
1.36	Length of cable per drum	m	
1.37	Cable drum		
a)	Material		
b)	Dimensions of drum		
c)	IS reference		
d)	Standard drum length for each size of cable (single length)		
e)	Cable weight	Kg	
f)	Shipping weight	Kg	
g)	Drum weight	Kg

12 ILLUMINATION System

S. No.	DESCRIPTION	UNIT	DATA
1.0	GENERAL		
1.1	Normal Supply Voltage, Phase and Frequency	AC	
1.2	Variation in Supply		
	a) Voltage	%	
	b) Frequency	%	
	c) Combined voltage & frequency	%	
1.3	Design Ambient Air Temperature	°C	
1.4	System Short-Circuit Level		
	a) At 415V AC	kA(rms)	
	b) At 220V DC (For DC LP)	kA(DC)	
1.4	Luminaries Earthing Terminal Suitable for		
a	Conductor material		
b	Conductor size	SWG	
2.0	Lighting Distribution Board and Lighting panel		
2.1	Manufacturer Name		
2.2	Rated Voltage, phase and Frequency	AC	
2.3	One Minute Withstand Voltage	V	
2.4	Mounting Type		
	a) LDBs		
	b) Single Phase LP		
2.5	Type and no of circuits & feeder rating		
2.6	Colour shade		
2.7	Lighting Transformer		
	a) Type		
	b) Voltage Ratio	V	
	c) Taps	%	
	d) Vector Group		
	e) Impedance	%	
	f) Rating	KVA	
3.0	Fixture details:		
3.1	Name of Manufacturer and Country		
3.2	Luminaries		
	a) Fluorescent		
	b) HPMV		
	c) HPSV		
	d) Metal Halide		
	e) Compact Fluorescent Lamp		
	f) Flame proof		
3.3	Applicable Standards for

1 COMMUNICATION SYSTEM

Table 1.1
Data Sheet for Communication System

S. No.	Description	To be filled by bidder
1	TELEPHONE EXCHANGE	
1	Make and model no of EPABX	
2	Capacity of the offered exchange	
3	Is the exchange microprocessor based stored programme controlled	YES/ NO
4	What is the multiplexing technique and the modulation technique used in the offered exchange?	
5	Does the system have duplicated control unit and redundancy in other critical PCBs for hot stand by mode? Does the system have decentralised peripheral processor card?	YES/ NO
6	Indicate if the system has provision to prevent loss/ corruption of memory content caused due to improper operating procedures & power supply failure.	YES/ NO
7	What is the maximum traffic handling capacity of the exchange?	
8	Is the exchange non blocking in nature? What is the maximum numbers of simultaneous calls possible in the offered exchange?	
9	Whether the system configuration is enclosed with the offer.	YES/ NO
10	Does the exchange support the flexible numbering scheme.	YES/ NO
11	What is the maximum line loop resistance for: the exchange the junction	
12	Is the system suitable for using DP/DTMF/DECT and DMKT telephones?	YES/ NO
13	What are the different types of tones available in the exchange? - Furnish the details of their frequencies & duration.	
14	Capability for simultaneously accepting, processing & delivering information in forms such as voice, data & text in a wholly integrated manner.	
15	Can simultaneous transmission of voice/data through 0.5 mm dia twin pair cable is possible. If yes then indicate: Transmission speed in- Synchronous mode Asynchronous mode	
16	Capability of inter working with different types of switching systems (Exchanges) existing in the country.	
17	Does the system has in-built online diagnostic features to monitor it's own performance, to detect, analyse & locate faults	YES/ NO

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III, Part C	[1]	29.09.2015

S. No.	Description	To be filled by bidder
	when they occur.	
18	What is the provision for routine tests, measurements & checks of the exchange equipment, junction lines & subscriber lines?	
19	What are the protection devices in the system against electrical short circuits & induced heavy currents?	
20	Is the system modular in constructions to allow system up gradation in short?	YES/ NO
21	Whether all compound units are mounted on plug-in type PCB's to facilitate easy replacement.	YES/ NO
22	Whether the exchange design has flexibility for interchanging various cards without making any modification in software as well as the hardware?	YES/ NO
23	What is the type & make of the main Distribution Frame provided. Indicate the offered capacity & the expansion provisions. What types of protection devices are offered with the MDF. Number of lines mounted with protection circuits on both sides of the MDF.	
24	Compatibility of the exchange with ISDN Network.	YES/ NO
25	Maximum permissible distance between operator console and EPAX.	
26	Whether following subscriber features are available in the offered exchange:- Calling between subscribers Calling the operator Conference facility transfer Music on hold Internal consultation Executive/secretary facility Call forwarding Automatic call back Priority interrupt Call pick up Paging access Emergency transfer Hot line facility	YES/ NO
27	Whether following operator feature are available in the offered exchange:- Answering incoming calls Trunk offering	YES/ NO

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III, Part C	[2]	29.09.2015

S. No.	Description	To be filled by bidder
	Setting up external calls Call queuing Operator call intercept Call waiting display Operator call transfer Night service Consultation of calls on Hold Music on hold Position busy Auto hunting facility Abbreviated dialing	
28	Does the exchange has provision access to public exchange network?	YES/ NO
29	Does the exchange has provision for direct inward dialing from public exchange network?	YES/ NO
30	Specify the distance of coverage of DECT Phones	
II	RECTIFIER FLOAT CUM BOOST CHARGER	
1	Make, model and type	
2	Input : a) Voltage b) current c) frequency	
3	Output: a) voltage b)efficiency c)overload protection d)Current	
4	Safety protection details.	
5	Indications details	
6	Float & charging current details	
7	Dimensional details and Weight	
8	Alarm indication details	
III	BATTERY	
1	Make, model and type	
2	Ah rating details	
3	Dimensional details and Weights.	
IV	LSTB SYSTEM	
1	Name of supplier	
2	Names of sub-suppliers their products range and their products	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-006	02	Tender Document for Selection of R&M Contractors – Electrical Balance of Plant Volume-III, Part C	[3]	29.09.2015

S. No.	Description	To be filled by bidder
	range	
3	Make, model and type	
4	Technology used	
5	Standards followed	
6	System-features	
7	Whether system is suitable for areas with high ambient noise level. Specify the noise level up to which the system can work satisfactorily.	YES/ NO
8	Whether the system is amplifier type distributed amplifier type.	YES/ NO
9	Whether the system is intended for perfectly clear and intelligible speech communication under adverse environmental conditions specified in the TS.	YES/ NO
10	Whether the system is designed to operate as open line two" channels of" communication ie., in paging and private" channels.	YES/ NO
11	Whether the system is provided with call attention tone facility preceding all paging or announcement calls.	YES/ NO
12	Whether each communication station is provided with indication such as power ON, channel busy, volume control etc.	YES/ NO
13	Whether the system has provision for automatic muting of the associated loudspeaker while making announcement to avoid acoustic feed back.	YES/ NO
14	Whether the system is of modular construction for easy expansion of subscriber stations as and when required without affecting the installed equipment.	YES/ NO
15	Whether the System is suitable for operation from a centralised power source of 240V +/- 6%, 50Hz +/- 5% , Single phase , AC power supply.	YES/ NO
16	Whether the power supply equipments are provided with protections against short circuit ,over voltage, under voltage & transients.	YES/ NO
17	Whether schematic of system giving cabling scheme has been furnished.	YES/ NO
18	Whether the PTT switch is provided in the handset.	YES/ NO
	Equipment details:	
19	Subscriber station	
i	Desk type Make Model no.

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

1 EXECUTIVE SUMMARY

Central Electricity Authority (CEA) the Project Executing Agency / Employer selected Lahmeyer International India Pvt. Ltd. (LII), the Consultant through ICB route to Develop Standard Procedures and Model Contract Documents for the Renovation and Modernization (R&M) of Fossil Fuel based Power Plants in India. Accordingly a contract was signed between CEA and LII on 16th March 2012. The Assignment awarded to LII constitutes Phase-II Activity and is in continuation to the Phase-I Activity which was performed by M/s Evonik Energy Services (India) Pvt. Ltd. The Assignment under Phase-II Activity is being financed by KfW Entwicklungsbank.

India has a large number of 200/210 MW units which are potential candidates for R&M as they have crossed 20 to 25 years of useful life. Moreover in due course of time, many 500 MW units will also become due for R&M.

The importance of R&M was recognized by the Government of India in 1984 when Phase-I R&M Programme for 34 thermal power stations in the country was initiated by CEA as a Centrally sponsored scheme. After achieving encouraging results from CEA's initiative, Government of India has been making regular programmes for rehabilitating the older units through R&M & LE works during the successive plan periods. However, the progress in R&M projects was quite good till the 9th Plan but considerable shortfalls in the progress were witnessed during the subsequent plan periods.

On the other hand, the new thermal capacity addition has been facing unprecedented challenges in the recent past on account of acute shortages in domestic coal, issues related to environmental clearances and problems of land acquisition. The rising cost of new projects has enabled R&M projects to emerge out as the least cost option for capacity addition, since, cost of R&M Projects is less than 50% cost of a new Project of similar capacity.

However, despite its huge potential the progress of R&M Market in India is stagnant. An analysis of various reasons of its poor growth would indicate that the same is attributed to lack of interest on the part of stake holders due to various factors. R&M Market in India has a great potential to develop provided the factors impeding its growth are properly addressed.

Important concerns on the part of utilities include, their lack of internal expertise to evaluate the health condition of their plants and to formulate strategies for renovation, lack of clarity about the documentation and procedures for going forward, uncertainty about the approval from the Regulator, inability to take a long shut- down in a period of shortages and

Document Number	Rev No.	Description	Page No.	Date of Issue

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

uncertainty about the achievement of objectives after the completion of R&M Projects.

Important concerns of bidders include, long time gap between the completion of R&M studies and execution of R&M works leading to technical surprises, problems in handling increased scope of work and lack of clarity on the methodology of verifying the functional guarantees.

Important concerns of the funding agencies include the delay in obtaining the approval of the Regulator and the impact of technical surprises on the Project Cost and the completion time of the Project. Regulators are concerned about the justification of the expenditure on R&M Project and the justification of the investment as a least cost option.

To facilitate the implementation of R&M Projects, Standard procedures and model tender documents have been prepared under this assignment. These documents include, Model Feasibility Report, Model Detailed Project Report, Model Residual Life Assessment (RLA)/ Condition Assessment (CA) Report, Model Energy Audit (EA) Report, Model Tendering Procedure and Model Contract Documents for the selection of Consultants and R&M Contractors. The standard procedures developed under this assignment, envisage the appointment of an R&M Consultant whose scope will include facilitating the approval from the Regulator. The standard procedures have also made the R&M Consultant responsible for preparing the bidding documents for R&M Contractors and also to assist the utilities in bid evaluation for the appointment of R&M Contractors. The above two provisions will not only expedite the R&M activities but will also reduce the time gap between the completion of R&M studies and execution of R&M works thereby minimizing the technical surprises during execution.

The appointment of an Implementation Support Consultant (ISC) has been envisaged who will do the site supervision of works to be done by the R&M contractors and will assist the utilities in completion of R&M works as per the scope of work defined in the contract packages.

It is, thus, believed that Standardization of Tendering Procedures and Model Contract Documents will help in addressing to a large extent, a majority of concerns of the various stake holders which will enable them to implement the R&M Processes of their units systematically and effectively. However, it is not practicable to standardize the complete documentation. Some parts of the documentation have been deliberately left open for a case-to-case finalization by the utilities as scope of R&M works will vary from project to project depending upon various conditions of a specific project.

LII reviewed the findings of Phase-I Activity and the suggestions of the Task Force. These findings and suggestions have been suitably addressed while preparing the standard documents. Various R&M documents provided by CEA and the Guidelines published by KfW and the World Bank

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[2]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

were also studied by LII before starting the preparation of Standard Documents.

LII also held interactions with the R&M Consultant M/s Energo and R&M Contractors M/s. Alstom as well as M/s. Doosan to obtain the feedback of their experience in implementation of R&M programmes of different power stations.

As per the contract of this assignment, the development of Standard Documents by LII were to be closely linked with the tender documents which were to be developed by MAHAGENCO for the R&M programme for KfW funded Project of Nashik TPS Unit-3. According to the original plan, LII was required to visit the MAHAGENCO HQ as well as Nashik TPS in July 2012 to have discussions with MAHAGENCO and Nashik TPS authorities and to collect the documents developed for Nashik TPS Unit-3 for utilizing the same while standardizing the various documents and procedures. However the above visit and meeting with MAHAGENCO could not take place as planned since bidding documents could not be issued by MAHAGENCO in public domain. Since the issue of NIT for selection of R&M Contract for Nashik TPS Unit-3 was deferred, it was decided that documents issued by MAHAGENCO for the World Bank funded Project of Koradi Unit-6 will be collected and studied.

Standard procedures and documents prepared under this assignment for diagnosing the health status of plant and equipments as also for tendering procedures and documents will go a long way in laying the road map for the utilities to implement the R&M Projects in a smooth, systematic and structured manner. The guidelines provided at the end of the Standard Residual Life Assessment (RLA)/Condition Assessment (CA) Report and Standard Energy Audit (EA) Report will provide detailed knowledge and information to the utilities about the procedures of conducting various tests and the methods to determine the test results. This will encourage the plant engineers to develop their expertise which will help in accelerating the R&M activities.

LII thankfully acknowledges the receipt of valuable suggestions during the course of assignment, provided by Central Electricity Authority, KfW, World Bank, IGEF, VGB, MAHAGENCO, WBPDC, NTPC, DVC, APGENCO, PFC and others. Their valuable comments/suggestions have been of a great help in addressing R&M related concerns & issues and developing the Tendering Procedure and Model Tender Documents.

2 INTRODUCTION

2.1 Background

Central Electricity Authority (CEA) the Project Executing Agency / Employer selected Lahmeyer International India Pvt. Ltd. (LII), the Consultant to Develop Standard Procedures and Model Contracts for the Renovation and Modernization (R&M) of Fossil Fuel based Power Plants in India. Accordingly a contract was signed between CEA and LII on 16th March 2012, as per which LII rendered the consulting services for the same. The Assignment awarded to LII constituted Phase-II of the Activity and was in continuation to the Phase-I of the Activity which was performed by M/s Evonik Energy Services (India) Pvt. Ltd. The Assignment under Phase-II of the Activity is financed by KfW Entwicklungsbank.

2.2 Definitions

Project Executing Agency/Employer	:	Central Electricity Authority (CEA), Ministry of Power, Govt. of India.
Financing Agency	:	KfW Entwicklungsbank.
Consultant	:	Lahmeyer International (India) Pvt. Ltd. (LII)
Task Force	:	Members from Ministry of Power, Govt. of India, CEA, NTPC and representatives of State Generation Utilities of Andhra Pradesh, West Bengal & Maharashtra.

2.3 Scope of Work as per Contract

As per the Article 6.1 to 6.6 of the Contract, the scope of the services of LII, the Consultant includes the following:

- The Consultant shall review the findings under the Phase-I report and incorporate suitably the findings/suggestions of Phase-I report in the standard documents to be prepared under Phase-II activity.
- The Consultant shall define the scope of rehabilitation based on technical, ecological and economic considerations. The consultant shall also prepare a matrix of options which the owner can consider based on the applicable conditions for each individual case and the objectives to be achieved.
- The Consultant will provide the guideline for the content of the tender documents especially related to goals to be achieved, guarantee figures etc.
- The Consultant shall draw up indicative time-line for each stage during the R&M intervention i.e. data review, RLA/CA studies, energy audit,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[4]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- steam path audit, feasibility studies, DPR preparation, tendering process, R&M works implementation/execution, PG test etc.
- e) The Consultant shall elaborate the feasibility of having a single consultant to carry out the activity up to the stage of finalizing the R&M contract and to facilitate approval from regulatory commission.
 - f) The Consultant shall develop the standard documents on tendering procedures and contract for the R&M projects. The following procedures and documents are suggested to be considered for standardization during the Phase-II activities. Documents listed below under items (I) to (VI) were to be prepared by LII for which CEA shared the available documents with them for the ongoing R&M programmes. Apart from this, LII was also required to concentrate on technical specifications under item (VII).
- I. Standard Bidding Procedure for engagement of consultants and R&M Works Contractor where:
 - a) Single Stage Bidding Procedure is most suitable.
 - b) Two Stage Bidding Procedure is most suitable.
 - c) Prequalification is suitable.
 - d) Without prequalification is suitable.
 - e) For which International Competitive Bidding (ICB) is suited.
 - f) For which Local Competitive Bidding (LCB) is suited.
 - g) For which combination of ICB and LCB is suited.
 - II. Request for Qualification (RfQ): The document for pre qualification procedures for Consultancy Services for R&M and LE Studies should include standard formats for the following:
 - III. Letter of invitation (LOI)
 - a) Instructions to applicants (ITA)
 - b) Qualification and Evaluation Criteria
 - c) Application data sheet (ADS)
 - d) Letter certifying ADS
 - i. Power of attorney of lead bidders
 - ii. QR questionnaires
 - e) Application Forms
 - i. Client overview
 - ii. Project profile
 - IV. Request for Proposal (RfP) from qualified consultants for consultancy services for R&M/LE studies including, in particular, the following:
 - a) Letter of invitation (LOI)
 - b) Instructions to Consultants (ITC)
 - c) Qualification and Evaluation criteria
 - d) Data Sheet
 - e) Technical Proposal – standard forms

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[5]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- f) Financial Proposal – standard forms
 - g) Terms of Reference including plant data and information
 - h) Standard forms of contract and annexure including:
 - i. Form of contract
 - ii. General conditions of contract
 - iii. Special conditions of contract
 - iv. Appendices
- V. Standard formats shall be developed for the following reports to be submitted by R&M Consultant:
- a) RLA & LE /CA Report
 - i. Feedback from plant operators system wise / plant operating history /operating data.
 - ii. Failure record and trend analysis of last 10 years.
 - iii. Major replacement in last 10 years.
 - iv. Condition Assessment of each system and major equipment. This shall also include cold walk down & hot walk down survey.
 - v. Standard Test Procedures.
 - vi. Performance Evaluation Test of Boiler, Turbine & other major equipments.
 - vii. Steam Path Audit of turbine.
 - viii. List of obsolete systems & equipment.
 - ix. Analysis of civil structures for equipments.
 - b) Energy Audit (EA)
 - i. Power consumption of all major equipment.
 - ii. Performance check of all major equipment such as Boiler, Turbine, Pumps, Fans, Condensers, HP & LP Heaters, Compressor, APH etc.
 - iii. Efficiency calculation of all major equipment as per standard code.
 - iv. Calculation of heat and mass balance.
 - v. Calculation of emission.
 - c) Feasibility Studies
 - i. Chapterization of the Technical volume.
 - ii. Chapterization of the Financial volume.
 - d) Detailed Project Report (DPR) / Project Design Report (PDR)
 - i. Chapterization of the Technical volume.
 - ii. Chapterization of the Financial volume.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[6]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

VI. Request for Qualification (RfQ): Pre qualification procedure for R&M Works Contractor where pre-qualification is considered suitable including, in particular, format for the following:

- a) Letter of Invitation (LOI)
- b) Instructions to Applicants (ITA)
- c) Application Data Sheet (ADS)
- d) Qualification Criteria
- e) Application Forms

VII. Request for Proposal (RfP) for R&M Works Contractor including, in particular, the following:

- a) For single stage bidding
 - i. Invitation for Bid (IFB)
 - ii. Instructions to Bidders (ITB)
 - iii. Bid Data Sheet
 - iv. Evaluation and qualification criteria (following prequalification)
 - v. Evaluation and qualification criteria (without prequalification)
 - vi. Owner's requirements
 - vii. Conditions of Contract and contract forms
 - General conditions (GC)
 - Special conditions (SC)
 - Contract forms.
 - Performance Security
 - Functional guarantees & liquidated damages
- b) For two stage bidding
 - i. Invitation for Bid (IFB)
 - ii. Instructions to Bidders(ITB)
 - iii. Bid Data Sheet
 - iv. Evaluation and qualification criteria (following prequalification)
 - v. Evaluation and qualification criteria (without prequalification)
 - vi. Bidding forms
 - vii. Eligible countries
- c) Owner's requirements.
- d) Conditions of contract and contract forms.
 - i. General conditions (GC)
 - ii. Special conditions (SC)
 - iii. Contract forms.
 - iv. Functional guarantees & liquidated damages.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[7]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

VIII. Technical Specifications may be standardized to the extent given below:

- a) Chapterization of specification for different types of boiler such as tangential fired, down shot fall & front wall fired boiler etc.
- b) Standard specifications for turbine retrofit options to enhance efficiency/ output particularly for 210 MW LMZ turbines. Different options namely only LP turbine retrofit or HP/LP turbine retrofit or retrofit of HP/IP/LP module including generator.
- c) Grouping into appropriate contract packages with due consideration to:
 - i. Complex nature and technically compatible aspects.
 - ii. To ensure that the package can attract competitive response.
- d) General Technical Conditions.

As per the Article 6.7 of the Contract, the Consultant shall provide the following reports and documents:

- i. Inception Report
- ii. Draft Documents
- iii. Final Documents
- iv. Monthly progress reports
- v. Report on Phase-II activity.
- vi. Other reports as deemed necessary.

2.4 Importance of Standardizing the Documents

From the Quarterly Review Reports of CEA LII noted that the importance of R&M was recognized by the Government of India in 1984 when Phase-I R&M Programme for 34 thermal power stations in the country was initiated by the CEA as a Centrally sponsored scheme. After achieving encouraging results from CEA's initiative, Government of India has been making regular programmes for rehabilitating the older units through R&M & LE works during the successive plan periods. The results of these achievements are presented in the table below in terms of the additional generation in Million Units (MU) and equivalent Megawatt (MW).

Table: 2.1
Plan and Achievements in R&M

Sl. No.	Five Year Plan	No. of Units	Capacity (MW)	Additional Generation Achieved MU/Annum	Equivalent MW
1	7 th	163	13,570	10,000	2,000

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[8]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Sl. No.	Five Year Plan	No. of Units	Capacity (MW)	Additional Generation Achieved MU/Annum	Equivalent MW
2	8 th (R&M) (LEP)	198 (194) (4)	20,869	5,085	763
3	9 th (R&M) (LEP)	152 (127) (25)	18,991	14,500	2,200
4	10 th (R&M) (LEP)	25 (14) (11)	3,445	2,000	300
5	11 th (R&M) (LEP)	129 (76) (53)	16,146	5,400	820

From the information given in the above table, LII noted that the progress in R&M projects was quite good till the 9th Plan but considerable shortfalls in the progress were witnessed during the subsequent plan periods. LII noted that the progress of rehabilitating the older plants through R&M initiatives can be substantially improved provided the concerns of various stake holders are addressed suitably.

2.5 Concerns of the Stake Holders

Phase-I Activity Report has identified the following commonly articulated concerns of the different stakeholders:

2.5.1 Concerns of Utilities

- Limited agencies to carry out R&M studies competently.
- Lack of competent agencies to carry out R&M works.
- Extended shut down periods required for R&M not acceptable in a period of shortages.
- Lack of internal expertise to evaluate actual condition of equipment and costs for repair/renovation.
- Cost escalation on account of surprises found during project execution and the difficulty to build them into the contract
- Regulatory Aspects – including uncertainty of capital cost approval and reasonableness of tariff for recovery of capital cost.
- Financing arrangements.
- Problems of ensuring expected and sustained plant performance after completion of R&M.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[9]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

2.5.2 Concerns of Bidders

- Time gap between study of RLA and actual initiation of R&M bidding process.
- Uncertainty about the exact scope of work which makes it difficult to estimate the actual work to be undertaken.
- Unforeseen items/surprises during execution and impact on cost – how to build them into the estimate and how to reduce risk on this account.
- Functional Guarantees which form part of the contract are often difficult to achieve owing to lack of clarity on how verification will be carried out.
- Problem of ensuring a reasonable LD clause
- Delays in payments of invoices
- Fixed Price insisted upon by State Utilities
- Fluctuations in prices of materials especially steel

2.5.3 Concerns of Funding Agencies

- Accuracy of the estimated costs
- Ensuring a strategy that takes care of unforeseen items/surprises and their impact on project cost and time for execution.
- Delays in regulatory clearances.
- Lack of appropriate infrastructure for project execution.
- Ensuring that the study preceding the preparation of Detailed Project Report reflects actual conditions in the plant.
- Credit worthiness of the utilities.
- Material market fluctuations.

2.5.4 Concern of the Regulators

- Justification that the expenditure on R&M Project is the least cost option.

2.6 Harmonizing the Concerns of the Stakeholders

To facilitate the implementation of R&M program for a large fleet of 200/210 MW units in a planned, systematic, structured and time bound manner, formats for the plant investigative studies like Residual Life Assessment (RLA) & Condition Assessment (CA) Reports, Energy Audit (EA) Reports, Feasibility Reports, Detailed Project Reports, Tendering Procedures, Contract documents and Contract Specifications have been standardized. Standardization will harmonize the requirements of all the stakeholders in the following ways and will lead to their increased participation.

2.6.1 Concerns of Utilities

- Concern: Lack of internal expertise to evaluate actual condition of equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[10]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

The guidelines provided at the end of the Standard Residual Life Assessment (RLA)/Condition Assessment (CA) Report and Standard Energy Audit (EA) Report will provide detailed knowledge and information to the utilities about the procedures of conducting various tests and the methods to evaluate the test results. The extracts of the guidelines are placed at **Annexures-1 to 3**. This will encourage the plant engineers to develop their expertise which will help in accelerating the R&M activities.

- Concern: Cost escalation on account of surprises found during project execution.

The Standard documents provide for the appointment of a Single R&M Consultant whose role also includes bid evaluation for the selection of R&M Contractor. The above provision will reduce the time gap between the completion of studies and the start of R&M works, which is one of the main reasons contributing to huge risk of technical surprises and the corresponding increase in cost.

- Concern: Regulatory Aspects – including uncertainty of capital cost approval and reasonableness of tariff for recovery of capital cost.

The Standard documents provide for the appointment of a Single R&M Consultant whose role includes facilitating the approval from the appropriate regulatory commission on the items of capital cost and reasonableness of tariff for recovery of capital cost.

- Concern: Problems of ensuring expected and sustained plant performance after completion of R&M.

The Standard documents clearly define the achievement of goals and objectives to be demonstrated by the R&M Contractors and the consequential Liquidated Damages to be paid them in case of delay in completion or deficiency in performance.

2.6.2 Concerns of Bidders

- Concern: Time gap between study of RLA and actual initiation of R&M bidding process.

Since the bid evaluation for the selection of R&M Contractor is included in the scope of R&M Consultant, time gap between study of RLA and actual initiation of R&M bidding process will reduce.

- Concern: Uncertainty about the exact scope of work which makes it difficult to estimate the actual work to be undertaken.

The standard documents have provided the formats for correctly defining the scope of work with certain amount of certainty.

- Concern: Unforeseen items/surprises during execution and impact on cost.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[11]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

The detailed methodology provided in the Standard RLA / CA & EA Documents coupled with the reduction in the time gap between the completion of studies and the start of R&M works will reduce unforeseen items/surprises during execution and impact on cost.

- Concern: Functional Guarantees which form part of the contract are often difficult to achieve owing to lack of clarity on how verification will be carried out.

Methods of conducting various Performance Guarantee Tests have been clearly defined. This will eliminate any lack of clarity faced by the bidders till date.

2.6.3 Concerns of Funding Agencies

- Concern: Ensuring a strategy that takes care of unforeseen items/surprises and their impact on project cost and time for execution.

One of the strategies provided in the bid documents is that the bid evaluation for the selection of R&M Contractor is included in the scope of R&M Consultant. This will reduce the time gap between RLA/CA & EA studies and actual time of executing the R&M works. The reduction in the time gap between the studies and R&M works will reduce the surprises and the corresponding increase in cost.

- Concern: Delays in Regulatory Clearances

Facilitating the Regulatory Clearances has been included in the scope of R&M Consultant which will enable the utilities to obtain the requisite clearances expeditiously.

LII opines that Standardization of Tendering Procedures and Model Contract Documents will help in addressing to a large extent, a majority of concerns of the various stake holders which will enable them to implement their R&M Projects in a smooth, systematic and structured manner. However, it is not practicable to standardize the complete documentation. Some parts of the documentation have been deliberately left open for a case-to-case finalization by the utilities as scope of R&M works will vary from project to project depending upon various conditions of a specific project.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[12]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

3 PHASE- I ACTIVITY REPORT

3.1 Information about Phase-I Activity

Phase-I of this activity was carried out by M/s Evonik Energy Services (India) Pvt. Ltd through a grant provided by GTZ. Phase-I activity provided an assessment of tendering procedures currently being followed by public utilities in India and a review of documents used for standard R&M projects and the documents which have already been developed for energy efficient R&M projects financed by particularly World Bank. The scope of work covered under Phase-I activity was as follows:

3.2 Findings and Suggestions of Phase-I Activity

After reviewing the tendering procedures and documents followed by public utilities for renovation & modernization projects, Phase-I activity Report gave the following Findings and Suggestions:

- i) Essentials of the R&M Works to be undertaken become known only after and on the basis of the completion and findings of the studies such as Energy Audit (EA), Residual Life Assessment (RLA), Condition Assessment (CA) studies and these studies are to be done necessarily by specialized and experienced consultancy firms. This would ensure that the status is examined fully and the recommendations focus on the latest available technologies.
- ii) There is enough scope for standardization of Terms of Reference (TOR) including 'Scope of Work of Consultants' to be engaged by the Utilities intending to undertake R&M Works.
- iii) Essentials of R&M Works are bound to vary depending on site conditions. The scope of works in a given bidding document, accordingly, needs to be adjusted to suit the requirements of each unit on the basis of the findings of the studies. However, given the large fleet of 200/210 MW units which require R&M, there is scope to have standard technical specifications particularly for the 'Turbine retrofit' and 'C&I' since this can be managed in about 3 or 4 options. The work pertaining to boiler varies considerably in scope and while there exists a case for some level of standardization; this can be left by and large to individual utilities to develop. A similar situation exists for balance of plant. However, there is enough scope for standardization of formats for Technical Specifications to be followed by the Utilities / Consultants for R&M Works.
- iv) There is scope for reasonable level of standardization of the formats of the reports of the studies to be undertaken such as EA, RLA, CA, PDR/DPR, financial analysis etc; based on the studies conducted and reports available.
- v) There is a strong case for standardization of the various key issues such as qualification requirement, performance guarantee requirement,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[13]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Performance test procedures, liquidated damages, penalties & bonus conditions, shut-down requirement (time-line), which leads to delay in most of R&M tenders.

- vi) There is a strong case for development of standard commercial document for selection of R&M contractor. The World Bank has published Standard Bidding Document in this regard and the same format could be considered as a guide.

3.3 Suggestions of the Task Force

A Task Force on “Development of Tender Procedure and Model Contracts for the Renovation & Modernization (R&M) of Fossil Fuel Based Power Plants” under the chairmanship of Member (Thermal), CEA was constituted vide Ministry of Power, Government of India letter no. 5/33/2009-S.Th. dated 29/10/2009 comprising the members from MoP, CEA, National Thermal Power Corporation (NTPC) and representatives of State Generation Utilities (GENCOs) of Andhra Pradesh, West Bengal & Maharashtra.

The above report of Phase-I Activity was discussed during the first meeting of Task Force held on 20th November 2009 in CEA, New Delhi and the Task Force suggested the following among others to be incorporated in the standard documents to be prepared under Phase-II activity:

(i) The time taken for R&M works need to be cut down to the optimal possible level. It was desired that the report should recommend optimal suitable timeline for each stage during the R&M intervention (e.g. data review, RLA/CA studies, DPR preparation, bidding and implementation etc.)

(ii) During the R&M of the projects, various studies such as RLA, CA, Energy Audit etc. and preparation of DPR is being done by one consultant and the preparation of technical specification for bidding by another consultant. The studies being carried out by the first consultant, in certain cases, are not acceptable by the second consultant. Many a times, there is a big time gap between the studies and the actual implementation of the R&M scheme. The Phase-II study should examine the feasibility of having a single consultant to carry out the activities up to the stage of finalizing the R&M contract and to facilitate approval from regulatory agency.

(iii) The report should have a provision for standard qualification criteria for determining the capability of consultants for carrying out studies and implementation support consultant during the R&M works.

(iv) The representatives from the utilities suggested for standardization of technical specifications for similar capacity / type of turbines to avoid the problems being faced during the retrofitting of the various equipments.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[14]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

(v) It was opined that generally the RLA of BTG foundations and structures in various Balance of Plant (BOP) such as Coal Handling Plant (CHP), Ash Handling Plant AHP (AHP) and Water Treatment Plant (WTP) etc. is not being carried out. The structures in these areas might have become weak over the time of operation for 20-25 years due to corrosion and rusting. It was suggested by the representatives that the structural analysis in such areas should also be carried out for deciding the scope of R&M works. Also, the consultants carrying out such structural analysis may be identified.

(vi) Need was expressed for developing standardized DPR format including various tests to be carried out for establishing plant health and defining scope of works and final performance bench marking.

Document Number	Rev No.	Description	Page No.	Date of Issue

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

4 APPROACH ADOPTED FOR EXECUTION OF ASSIGNMENT

To facilitate the implementation of R&M program for a large fleet of 200/210 MW units in a planned, systematic, structured and time bound manner, there exists a strong need to provide standardized formats for the plant investigative studies like Residual Life Assessment (RLA) / Condition Assessment (CA) Reports, Energy Audit (EA) Reports, Feasibility Reports, Detailed Project Reports, Tendering procedures, Contract documents and Contract Specifications etc to the utilities. Standardization will harmonize the requirements of all the stakeholders and will lead to their increased participation. LII adopted the following approach for execution of the assignment.

4.1 Review of the problems being currently faced by the R&M Projects

Before approaching the assignment, LII did its own due diligence and reviewed the various problems being faced by the old plants in Conducting the investigative studies to identify the exact plant problems and their solutions, Formulating various options for R&M intervention, Selecting the best option on the basis of detailed techno economic evaluation, Preparations of appropriate contract documents, Selection of Consultants , Selection of R&M Works Contractors and Achieving the desired objectives after completion of R&M works in a time bound manner.

4.2 Review of Findings of Phase-I Activity and Suggestions of Task Force

LII reviewed the findings of Phase-I Activity and the suggestions of the Task Force. These findings and suggestions have been suitably addressed while preparing standard documents as explained in detail in Chapter-5.0. (Refer Tables 5.1 and 5.2).

4.3 Due Diligence done by LII while Standardizing the Documents

While standardizing the formats for the R&M processes and tendering procedures, LII did the due diligence on the basis of the following:

- Analysis of the Data provided in the Phase-I Activity Report
- Review of its own experience in the field of R&M of the Thermal Power Projects.
- Review of R&M Documents received from CEA, MAHAGENCO and WBPDC
- Study of KfW's Guidelines for the assignment of Consultants.
- Study of Standard Bidding Document published by the World Bank.
- Discussions with the CEA and members of Task Force.
- Interactions with MAHAGENCO regarding the R&M initiatives for Nashik Unit-3 (210 MW) and Koradi Unit-6 (210 MW).
- Interactions held with M/s Alstom, M/s Energo and M/s Doosan.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[16]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- Analysis of the Data provided in M/s Mercados Reports on 'Reduction of Barriers to Renovation and Modernisation Intervention in Thermal Power Stations in India'.
- Analysis of the Data provided in M/s Mercados Reports on 'Developing Markets for implementation of Renovation and Modernisation Schemes in Thermal Power Stations in India'
- Summary of the Data on procurement of experience provided by CEA as given in **Annexure-4**.

4.4 Visit to MAHAGENCO HQ and Nashik TPS Unit-3

Visit was made to MAHAGENCO HQ at Mumbai and Nashik TPS during April 2013, to interact with these authorities and to obtain the feedback regarding their experience of R&M activities for their power plants namely, Nashik Unit-3 (210 MW) and Koradi Unit-6 (210 MW). Record notes of discussions held with MAHAGENCO HQ and Nashik TPS are placed at **Annexure-5**.

4.5 Interactions with R&M Consultants and R&M Contractors

Interactions were held with the R&M Consultant M/s Energo and R&M Contractors namely, M/s. Alstom and M/s. Doosan to obtain the feedback of their experience in implementation of R&M programmes of different power stations.

4.6 Meetings held with CEA and Task Force

Meetings were held with CEA and Task Force from time to time. Record notes of meetings are placed at **Annexure-6**.

4.7 Concept Adopted For the Preparation of Standard Documents

The Standard formats for the Documents and Tendering Procedures prepared for R&M & LE Projects contain two kinds of texts/ data i.e., fixed and variable, written in black and in blue colours respectively. The variable text/ data written in blue colour in italics and enclosed in square bracket is to be suitably modified by the utilities based on the project's specific requirements which may vary from Project to Project. The text /data in blue colour indicate typical data and values applicable for typical coal fired power plants. In the beginning of each model document, applicable notes & guidelines have been provided for using that model document. The Project Authorities and their Consultants carrying out R&M & LE activities of a particular plant/project have been advised to review this text/data in respect of their plant/project and modify the same with the text/data applicable to their specific Project. In addition, a few guidelines at appropriate places have also been provided in blue italics enclosed within red curly brackets, for some of the documents.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[17]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

5 BASIS OF STANDARDISATION OF PROCEDURES & DOCUMENTS

Since majority of 200/210 MW units are potential candidates for consideration of Renovation as they have crossed 20 to 25 years of useful life, the standard formats have been prepared keeping those 200 MW/210 MW units in view. Since in due course of time, many 500 MW units will also become due for R&M, the Utilities are advised to suitably modify these documents for its application to 500 MW units.

The procedures to be adopted and documents to be used for implementing the R&M schemes of Projects have been standardized based on the mandate as per various items of scope of services, as discussed below:

5.1 Critical Review of Phase-I Report's findings

Item of Scope of Service:

'The Consultant shall critically review the findings under the Phase-I report and incorporate suitably the findings/recommendations of Phase-I report in the standard documents to be prepared under Phase-II activity.'

Conclusion drawn by LII on reviewing the Findings of Phase-I Activity Report

LII agreed with the opening remarks of Phase-I Activity Report that in the past, R&M measures have been hampered by lack of proper planning and uncertainty about costs resulting in excessive implementation time, long shutdown periods of plants and cost overruns and that in the absence of standard commercial rules and policies suppliers showed little interest in R&M work.

LII reviewed in detail the findings of Phase-I Activity Report and noted that tendering procedures being followed by various utilities for the appointment of R&M Consultants and R&M Contractors varied considerably in terms of Qualification Criteria, Scope of Work and Method of Bid evaluation. LII also noted the disparities among the utilities in specifying the key requirements such as Performance Guarantees, Performance Test Procedures, Liquidated Damages, Bonus Conditions and Shut down Time Lines in R&M Contract Documents. LII recognised the need and importance of developing standard commercial terms for the selection of R&M Contractors. LII reviewed the prevailing practice of appointment of R&M Consultants and R&M Contractors as discussed below.

Data Analysis Regarding R&M Consultants

The findings of Phase-I Activity for the appointment of R&M consultants is based on the survey of the documents and procedures adopted by the following seven (7) power utilities, which had taken up R&M activities in the past:

- i) Bokaro TPS (3X 210) MW

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[18]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- ii) KorbaWest TPS (4X 210) MW
- iii) Nasik TPS (1X 210) MW
- iv) Kolaghat (TPS 3X210) MW
- v) Bandel TPS (1X 210) MW
- vi) Koradi TPS (1X210) MW
- vii) Patratu TPS (2 X 110) MW

Practice of Appointing the R&M Consultants

Regarding the practice of appointing the R&M Consultants, LII noted that Expressions of Interest were invited for the World Bank Projects at Bandel TPS (1X 210) MW and Koradi TPS(1X210) MW, while the remaining five power stations adopted open tendering system but the qualification criteria were mentioned in the tender documents. In two cases, namely those of Korba West TPS (4X 210MW) and Patratu (2 X 110) MW power stations, the National Competitive Bidding (NCB) rules were followed. In five other cases including two World Bank projects International Competitive Bidding (ICB) rules were followed.

Assigning the Scope of Work to the Consultants

After reviewing the scope of work assigned to the consultants, LII found from Annexure-3 of Phase –I Activity Report that in case of all the above utilities, the scope of R&M Consultants essentially consisted of conducting the RLA/CA & EA studies and providing recommendations to the utilities for the preparation of Feasibility Reports and Detailed Project Reports. However, LII noted that in the case Korba West (4X 210) MW, Bandel (1X 210) MW, Koradi (1X210) MW and Patratu (2 X 110) MW power stations, the scope of work also included preparation of Tender Documents, assisting the utilities in the bidding process, carrying out bid evaluation and also supervising & evaluating of PG tests to be undertaken by the R&M contractors.

Data Analysis Regarding R&M Contractors

From Phase-I report, LII studied the documents and procedures followed by the following six (6) utilities for the appointment of R&M contractors.

- i) Kothagudem TPS (4 x 110 MW)
- ii) Ennore TPS (2 x 60 + 3 x 110) MW
- iii) Patratu TPS (3 x 50 MW)
- iv) Badarpur TPS (2 x 210 MW)
- v) Bhatinda TPS (2 x 110 MW)
- vi) Bandel TPS (1 x 210 MW)

Practice of Appointing the R&M Contractors

Regarding the practice of appointing the R&M Contractors, LII noted that Bids were invited on the basis of Pre-Qualification and that 'Single Stage Bidding' was followed in case of Kothagudem TPS (4 x 110 MW), Ennore

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[19]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

TPS (2 x 60 + 3 x 110) MW, Patratu TPS (3 x 50 MW) and Bhatinda TPS (2 x 110 MW), whereas 'Two Stage Bidding' was followed in case of Bandel TPS (1 x 210 MW) and Badarpur TPS (2 x 210 MW) had also proposed to follow 'Two Stage Bidding'.

In three cases, namely those of Kothagudem TPS (4 x 110 MW), Ennore TPS (2x60 MW + 3x110 MW) and Bhatinda TPS (2 x 110 MW) power stations, the National Competitive Bidding (NCB) rules were followed. In two cases of Patratu TPS (3x50 MW) and Bandel TPS (1x210MW) International Competitive Bidding (ICB) rules were followed. Badarpur TPS (2 x 210 MW) had also proposed to follow International Competitive Bidding (ICB) rules.

Tendering Conditions for the R&M Contractors

LII noted that validity period of the Tenders varied between 120 to 180 days. Contract Performance Guarantee varied between 5% to 15%. However, the same was 10% in four out of six cases. The warranty period was 12 months in four cases and 18 months in two cases. While Liquidated Damages (LDs) on account of delay were specified in all the cases, LII did not find the mention of Liquidated Damages (LDs) on account of Performance in any of the six cases.

Action Taken by LII for Standardization of Procedures and Documents

LII critically reviewed each of the findings under Phase-I activity Report and took due care in suitably addressing the findings/recommendations of Phase-I report while standardizing the procedures and documents under Phase-II activity, as discussed in the tables below:

**Table: 5.1
Response to the findings of Phase-I Activity Report**

S.No	Findings & Recommendations of Phase-I Activity Report	Action Taken by LII for Standardization of Procedures and Documents
1.	Essentials of the R&M Works to be undertaken become known only after and on the basis of the completion and findings of the studies such as Energy Audit (EA), Residual Life Assessment (RLA), Condition Assessment (CA) studies and these studies are to be done necessarily by specialized and experienced consultancy firms. This would ensure that the status is examined fully and the recommendations focus on the latest available technologies.	Standard Documents include RFQ (Request for Qualification) procedure to enable the utilities to appoint only those R&M consultants who are specialized in this field and possess the requisite expertise to carry out the required studies such as Residual Life Assessment (RLA) & Condition Assessment (CA) Studies and Energy Audit (EA) Studies. Point scoring system has been prescribed for the selection of Consultants as per which only those consultants whose Technical Proposals get a Technical Score of 70 marks or more out of 100 shall qualify for consideration.
2.	There is enough scope for standardization of Terms of Reference (TOR) including 'Scope of Work of	As per the Standard Procedures and Documents prepared by LII, two types of Consultants have been envisaged, namely,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[20]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

S.No	Findings & Recommendations of Phase-I Activity Report	Action Taken by LII for Standardization of Procedures and Documents
	Consultant' to be engaged by the Utilities intending to undertake R&M Works.	<p>R&M Consultant and Implementation Support Consultant (ISC).</p> <p>The consultancy work is initiated by the R&M Consultant whose Terms of Reference (TOR) and 'Scope of Work' covers Carrying out all investigative studies like RLA/CA and EA studies, Providing solutions to various operating problems in the form of formulation of R&M options, Selection of the most attractive R&M option to be implemented, Preparation of DPR (Detailed Project Report), Assisting the utility in getting the approval of appropriate Regulatory Commission and in the Preparation of Bidding Documents as well as appointment of R&M Contractors.</p> <p>The role of Implementation Support Consultant (ISC) comes during the implementation of R&M works. The Terms of Reference (TOR) and 'Scope of Work' of ISC consists of Reviewing of design documents & drawings of the R&M contractors to ensure compliance with the spirit, intent & contents of the EPC contract, Inspection & Testing, Site Supervision and Witnessing of Performance Guarantee Tests of the Equipments.</p>
3.	Essentials of R&M Works are bound to vary depending on site conditions. The scope of works in a given bidding document, accordingly, needs to be adjusted to suit the requirements of each unit on the basis of the findings of the studies. However, given the large fleet of 200/210 MW units which require R&M, there is scope to have standard technical specifications particularly for the 'Turbine retrofit' and 'C&I' since this can be managed in about 3 or 4 options. The work pertaining to boiler varies considerably in scope and while there exists a case for some level of standardization; this can be left by and large to individual utilities to develop. A similar situation exists for balance of plant. However,	<p>LII recognizes that scope of R&M Works is bound to vary depending on the site conditions and also on the results of investigations like RLA/CA and EA studies. Accordingly the scope of R&M work for any plant has to address the needs and requirements of that plant to increase output, efficiency, reliability and extension of life.</p> <p>The Standard Documents prepared by LII have covered in great detail, all conceivable scope of work and requirements of the plants in general and the utilities have been advised to select the applicable areas of work based on the result of studies, in order to finalize the scope of work for their respective plant.</p> <p><u>Retrofitting of Turbines</u> Most of the 200MW/210 MW Turbines are of LMZ design, having LP stage fitted with</p>

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

S.No	Findings & Recommendations of Phase-I Activity Report	Action Taken by LII for Standardization of Procedures and Documents
	there is enough scope for standardization of formats for Technical Specifications to be followed by the Utilities / Consultants for R&M Works.	<p>Baumann Exhaust, design of which does not match with the Indian condensing conditions. The Standard documents prepared by LII envisage the following four options for retrofitting of these Turbines. Each option provides additional output and heat-rate improvements that reduces specific fuel consumption with corresponding reductions in emissions while extending the life of turbine.</p> <p><u>1st Option-LP Retrofit:</u> This gives the greatest improvement in cylinder efficiency and in output (around 6 to 12 MW).</p> <p><u>2nd Option-HP Retrofit:</u> This can deliver up to 7 MW of additional output with improvement in cylinder efficiency.</p> <p><u>3rd Option-IP Retrofit:</u> This can deliver additional output around (1 to 3 MW) with some improvement in cylinder efficiency.</p> <p><u>4th Option-Complete Turbine Retrofit:</u> Retrofitting complete new energy efficient turbine can deliver around 10 to 20 MW additional output with significant improvement in efficiency and extension of life by 25 years. This option may also require a new Generator, Generator Transformer and new static Excitation System.</p> <p><u>Retrofitting of C&I System:</u> The control and instrumentation system existing generally in the old plants is of an old analogue based system and requires large scale replacement owing to obsolescence of the existing equipment. Furnace Supervisory Safeguard System (FSSS) is of obsolete design for which, no spares are available. Soot blowers are of manual type and no online Boiler Tube Leakage detection system has been provided. HP-LP bypass system is in the form of standalone control panel. For the units undergoing R&M with extension of life for another minimum 20 years, modern equipments having state of the art technology have therefore been envisaged in the Standard Documents prepared by LII. These include integrated microprocessor based</p>

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[22]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

S.No	Findings & Recommendations of Phase-I Activity Report	Action Taken by LII for Standardization of Procedures and Documents
		<p>closed loop control, open loop control, sequential control and bulk data acquisition system for Boiler & auxiliaries, TG & auxiliaries, Station C&I including auxiliaries in hierarchical levels and integrated unit monitoring and station monitoring systems in the upper level.</p> <p><u>Retrofitting of Boilers</u> Boilers suffer maximum deterioration in condition & performance primarily due to prolonged operation with abrasive quality of ash in the coal. Condition of boilers gets further adversely affected when operated with much poorer quality of coal than they are designed for. Thermal cycling and poor water & steam chemistry regime also impacts the life of boiler pressure parts. Due to different operating practices and different operating regimes, no two boilers may be requiring the same solutions. Solutions may further vary considerably due to different firing systems of boilers and different types of pulverizers being used by different utilities. Standard Bidding documents and Specifications for the R&M works of the Boilers have been developed by covering all types of solutions generally needed for the Boilers. The utilities have been advised to suitably adjust these documents for the applicable requirements of their specific units. The above logic has also been applied to the Balance of Plant. For describing the existing details of the Boilers in the bidding documents, the Utilities have been advised to clearly explain whether their boilers are of PF or CFBC design and whether the firing system is of front / front & rear/ tangential /down shot type. While the Standard Specifications of Boilers prepared by LII cover in detail the Performance Parameters of Boilers based on the given Coal Quality, Design Criteria, Materials of Construction and Codes & Standards etc, the Standard Specifications have not been prepared to specify a particular type of firing, since this will restrict the competition to one or two bidders who may inflate the prices. It</p>

		<p>may be noted that OEMs having collaboration with Foster Wheeler or Babcock & Wilcox are manufacturing boilers with front / front & rear design, OEMs having collaboration with Combustion Engineering are manufacturing boilers with tangential firing, while OEMs like Doosan or those having collaboration with Alstom are also manufacturing boilers with down-shot type of firing.</p> <p>Among other things, specifications prepared cover membrane wall construction, low NOx burners and ceramic/basalt lined coal piping & bends for special protection due to erosion.</p>
4.	There is scope for reasonable level of standardization of the formats of the reports of the studies to be undertaken such as EA, RLA, CA, PDR/DPR, financial analysis etc; based on the studies conducted and reports available.	<p>The following Documents incorporating Standard Procedures and Formats have been developed by LII for carrying out the investigative processes and studies to determine the health assessment and condition of the Equipment & Systems of the Power Plants to be taken up for R&M as well as for determining the feasibility of various possible options along with the financial impact of various options.</p> <ul style="list-style-type: none"> • Model Residual Life Assessment (RLA) & Condition Assessment (CA) Report. • Model Energy Audit (EA) Report. • Model Feasibility Report. • Model Detailed Project Report.
5.	There is a strong case for standardization of the various key issues such as qualification requirement, the Performance guarantee requirement, Performance test procedures, liquidated damages, penalties & bonus conditions, shut-down requirement (time-line), which leads to delay in most of R&M tenders.	<p>The Standard Bidding Documents of all the Contract Packages prepared by LII have covered in detail all the following key issues which are essential part of any bidding document.</p> <ul style="list-style-type: none"> • RFQ (Request for Qualification) for the Bidders. • Performance Guarantee Parameters for Boiler, Turbo- Generators, and Balance of Plant. • Procedures for conducting the Performance Tests Boiler, Turbo-Generators, and Balance of Plant. • Liquidated damages for delay in completion of work. • Liquidated damages for shortfall in performance.

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

S.No	Findings & Recommendations of Phase-I Activity Report	Action Taken by LII for Standardization of Procedures and Documents
		<ul style="list-style-type: none"> Shut down time of the units.
6.	There is a strong case for development of standard commercial document for selection of R&M contractor. The World Bank has published Standard Bidding Document in this regard and the same format could be considered as a guide.	<p>Volume-I of the Standard Bidding documents prepared by LII for various contract packages constitutes the commercial document for the selection of R&M contractors. LII prepared these commercial documents after studying & reviewing the following documents.</p> <ul style="list-style-type: none"> R&M Documents received from CEA, MAHAGENCO and WBPDC. KfW's Guidelines for the assignment of Consultants . Standard Bidding Document published by the World Bank. Tender documents of leading Indian Public Sector Utilities National Thermal Power Corporation Ltd and Neyveli Lignite Corporation for different packages of power plants. <p>All Standard bidding procedures and documents have been prepared on the basis of prequalification and in single stage two part bidding concept as represented by the flow diagram given below Clause no.7.2.4. The tendering documents consist of RFQ (Request for Qualification) and RFP (Request for Proposal). The details of Standard bidding procedures and documents have been discussed in Chapter-7 of this report.</p>

Table: 5.2
Response to the Suggestions of the Task Force

S.No.	Suggestions of the Task Force	Action Taken by LII for Standardization of Procedures and Documents
1.	The time taken for R&M works need to be cut down to the optimal possible level. It was desired that the report should recommend optimal suitable timeline for each stage during the R&M intervention (e.g. data review, RLA/CA studies, DPR Preparation, bidding and implementation etc.)	Optimal timelines have been discussed in Chapter-6 of this report, starting from Appointment of R&M Consultant to Collection of Data, Conducting of RLA/CA & EA Studies, Finalization of the Scope of R&M Works, Preparation of DPR and obtaining approval of Regulatory Commission, Preparation of Bidding Documents, Appointment of R&M Contractor(s), Completion of R&M works and conducting the PG Tests.

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

S.No.	Suggestions of the Task Force	Action Taken by LII for Standardization of Procedures and Documents
2.	During the R&M of the projects, various studies such as RLA, CA, Energy Audit etc. and preparation of DPR is being done by one consultant and the preparation of technical specification for bidding by another consultant. The studies being carried out by the first consultant, in certain cases, are not acceptable by the second consultant. Many a times, there is a big time gap between the studies and the actual implementation of the R&M scheme. The Phase-II study should examine the feasibility of having a single consultant to carry out the activities up to the stage of finalizing the R&M contract and to facilitate approval from regulatory agency.	LII reviewed this aspect and arrived at the considered opinion that a single R&M Consultant should be appointed for carrying out the investigative studies such as RLA, CA, Energy Audit etc., Preparation of DPR, facilitating approval from regulatory agency, preparation of technical specification for bidding documents and finalizing the R&M contract. Standard Documents containing Qualifying Requirements and Bidding Documents have been developed accordingly. Appointment of a single R&M Consultant will also reduce the time gap between the studies and the selection of R&M Contractor.
3.	The report should have a provision for standard qualification criteria for determining the capability of consultants for carrying out studies and the Implementation support consultant during the R&M works.	Qualification documents (RFQ) for determining the capability of R&M Consultants for carrying out studies and that for the Implementation Support Consultant (ISC) for supervising the work of R&M Contractor(s) have been prepared.
4.	The representatives from the utilities suggested for standardization of technical specifications for similar capacity / type of turbines to avoid the problems being faced during the retrofitting of the various equipments.	Retrofitting of Turbines has already been discussed at item 3 of Table 5.1.2.
5.	It was opined that generally the RLA of BTG foundations and structures in various BOPs such as CHP, AHP, WTP etc. is not being carried out. The structures in these areas might have become weak over the time of operation for 20-25 years due to corrosion and rusting. It was suggested by the representatives that the structural analysis in such areas should also be carried out for deciding the scope of R&M works. Also, the	Normally, the life of Civil and Structural Works should be of the order of sixty (60) years and above, which is much more than the life of Mechanical and Electrical Components of Thermal Power Plants. However, in certain cases like exposure to harsh and corrosive environment or natural calamities, the buildings / structures/ foundations of a plant may get damaged or become weak due to corrosion or rusting etc. Therefore before taking up the R&M activity of any plant, it is utmost important to critically examine the

Document Number	Rev No.	Description	Page No.	Date of Issue

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

S.No.	Suggestions of the Task Force	Action Taken by LII for Standardization of Procedures and Documents
	consultants carrying out such structural analysis may be identified.	condition of all the civil and structural works. Based on the examination, any part(s) of the civil and structural works which might have become weak or defective must be identified and solutions found for their repair, retrofitting or replacement so as to increase their service life. Standard RLA/ CA Report prepared by LII therefore includes guidelines for carrying out the health studies of foundations and structures of Boilers Turbines and structures in various BOPs such as CHP, AHP and WTP etc.
6.	Need was expressed for developing standardized DPR format including various tests to be carried out for establishing plant health and defining scope of works and final performance bench marking.	Standard DPR has also been prepared which defines the scope of work and also the final performance parameters. Various tests to be carried out for establishing plant health are covered in Model RLA/CA Report and Model EA Report.

5.2 Rehabilitation on Technical, Ecological and Economic Considerations

A) Item of Scope of Service:

'To define the scope of rehabilitation based on technical, ecological and economic considerations. To prepare a matrix of options which the owner can consider based on the applicable conditions for each individual case and the objectives to be achieved.'

Before deciding the scope of R&M works, the utilities have to determine the status of health of equipments of various systems as also their residual life by carrying out various Residual Life Assessment / Condition Assessment studies and Energy Audit studies. Depending upon the review of the past performance and results of above studies, decision is taken whether to run, retrofit or replace each of the critical equipments. If equipment is found to have either defective performance or less residual life, root cause analysis is done by the R&M Consultant for diagnosing the specific technical problem(s) with the equipment(s). Based on the above diagnosis, alternative solutions are found for retrofitting the equipment(s) with corresponding cost impact in each of the following cases.

- i) To restore the performance equal to its original design without increasing its life.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[27]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- ii) To improve the performance beyond its original design without increasing its life.
- iii) To restore the performance equal to its original design and also increasing its life by 20 years.
- iv) To improve the performance beyond its original design and also increasing its life by 20 years.

The scope of rehabilitation of the units is essentially based on following considerations:

- i) Technical considerations.
- ii) Ecological considerations and
- iii) Economic considerations.

A) Rehabilitation based on technical considerations

Equipments of the units require rehabilitation on technical considerations in the following events:

- i) When the operating parameters are found below the design parameters.
- ii) When the operating efficiency is below design efficiency i.e., power consumption is more than the design value.
- iii) When the residual life of the equipment(s) is lesser than the remaining design life or extended life of the plant.
- iv) When the equipment(s) are found to fail repeatedly resulting in poor availability/plant load factor of the plant.

B) Rehabilitation based on ecological considerations

Power plants are one of the biggest emitters of Carbon Dioxide and hence are considered a principal culprit for climate change. With growing clamour over global warming, coal fired power plants are increasingly coming under scrutiny for their carbon foot print. The environmental regulations through out the world including India are becoming stricter day by day. Equipments of the units therefore require rehabilitation on ecological considerations in the following events:

- i) When higher heat rate of the units leads to higher atmospheric emissions of SPM, CO₂, NO_x and SO_x, because of increased consumption of fuel.
- ii) When NO_x emission is higher, due to non availability of low NO_x burners.
- iii) When SO_x emission is higher, due to higher percentage of sulphur in fuel.
- iv) When the quality and quantity of liquid effluents exceeds the prescribed limits of environment regulating authorities.
- v) When the methods of collection and disposal of ash is not as per the guidelines of environment regulating authorities.

Document Number	Rev No.	Description	Page No.	Date of Issue

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

C) Rehabilitation based on economic considerations

After the completion of studies, the utilities are likely to be confronted with a host of possibilities and options to be evaluated in order to choose the most feasible and economic option of R&M to be implemented. To make the complex problem simple, the Standard Documents of Feasibility Report and Detailed Project Report have been prepared envisaging the following R&M options to be considered by the utilities. Cost implication of each option is worked out and based on the financial analysis; the most cost effective option is selected for implementation.

Table: 5.3
Matrix of R&M Options

Option	Objectives to be achieved by carrying out R&M
I	<ul style="list-style-type: none"> i) Designing Boiler to suit average coal quality likely to be available for the next 20 Years. ii) Increasing the output of the unit from 200/210 MW by retrofitting the LP turbine without retrofitting Generator. Improving heat rate beyond the original design heat rate and restoring the Auxiliary Power Consumption to the original design values. iii) Replacing the existing obsolete technology. iv) Meeting the revised statutory emission standards. v) Extending the life of the unit by a minimum of 20 years.
II	<ul style="list-style-type: none"> i) Designing Boiler to suit average coal quality likely to be available for the next 20 Years. ii) Increasing the output of the unit from 200/210 MW by retrofitting the LP and HP turbine without retrofitting Generator. Improving heat rate beyond the original design heat rate and restoring the Auxiliary Power Consumption to the original design values. iii) Replacing the existing obsolete technology. iv) Meeting the revised statutory emission standards. v) Extending the life of the unit by a minimum of 20 years.
III	<ul style="list-style-type: none"> i) Designing Boiler to suit average coal quality likely to be available for the next 20 Years. ii) Increasing the output of the unit from 200/210 MW by retrofitting complete new energy efficient turbine without retrofitting Generator. Improving heat rate beyond the heat rate of option 'II' and restoring the Auxiliary Power Consumption to the original design values. iii) Replacing the existing obsolete technology. iv) Meeting the revised statutory emission standards. v) Extending the life of the unit by a minimum of 20 years.
IV	<ul style="list-style-type: none"> i) Designing Boiler to suit average coal quality likely to be available for the next 20 Years. ii) Increasing the Output from 200/210 MW by retrofitting complete new

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[29]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Option	Objectives to be achieved by carrying out R&M
	<p>energy efficient turbine along with new Generator, Generator Transformer and new static Excitation System. Improving heat rate better than the level of option 'III' and restoring the Auxiliary Power Consumption to the original design values.</p> <p>iii) Replacing the existing obsolete technology.</p> <p>iv) Meeting the revised statutory emission standards.</p> <p>v) Extending the life of the unit by a minimum of 20 years.</p>
V	<p>i) In situ major replacement of Boiler on the existing foundations, retrofitting complete new energy efficient turbine along with new Generator, Generator Transformer and new static Excitation System. Designing the boiler to suit the average coal quality likely to be available for the next 25 years.</p> <p>ii) Increasing the Output to 250/300 MW by installing new Boiler / Turbine of higher Capacity after replacing the old one. Achieving Heat Rate and Auxiliary Power Consumption better than Options 'III' & 'IV'.</p> <p>iii) Replacing the existing obsolete technology.</p> <p>iv) Meeting the revised statutory emission standards.</p> <p>v) Extending the life of the unit by a minimum of 25 years.</p> <p>{This option is advised only when the unit to be renovated is either the first or last unit of the power plant, since the intermediate units are likely to have space constraint.}</p>

While considering various options, the following minimum objectives were considered by LII:

- Redesigning the boiler to suit the average coal quality likely to be available for the next 20 years.
- Retrofitting of majority of 200/210 MW units provided with LMZ design having LP Turbines with inherent deficiency in efficiency and output due to Baumann type exhaust.
- Improving the performance parameters at least to the original design values.
- Extending the life of the unit by a minimum of 20 years.
- Replacing the existing obsolete technology, most particularly the control instrumentation.
- Meeting the revised prevailing statutory emission standards.
- Increasing Boiler Efficiency.
- Reducing Turbine Heat Rate.
- Reducing Auxiliary Power Consumption

Before finalizing the above options, LII also studied the R&M options considered for the reference plant of Nashik Unit-3 (210 MW) of MAHAGENCO and had detailed discussions with MAHAGENCO and CEA. It was noted that the Feasibility Report of Nashik Unit-3 (210 MW) had considered eight (8) numbers of options. Out of these five (5) options were incorporated in the Standard feasibility report after making suitable

Document Number	Rev No.	Description	Page No.	Date of Issue

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

modifications. The following three options were not considered in view of the reasons explained below:

Table: 5.4
Options not Considered for Standardization

Option	Objectives to be achieved by carrying out R&M	Reasons for not considering the R&M Option
1.	Extending the life of the unit by 20 years without compensating the inferior coal quality presently available.	The option does not address the basic problem of deteriorating coal quality.
2.	New Unit option considered at a new location in the same plant and utilizing the existing auxiliaries.	Even if an alternative space is available within the plant to relocate the main plant, utilizing the existing auxiliaries will pose many problems of not only rearranging the layouts of piping and cables network but will also require the re-engineering of various pumps and compressors due to the change in their system resistance.
3.	Modification of Boiler and Auxiliaries to achieve Re-heater temperature of 560 +/- 5 deg C by upgrading re-heater with new turbine and accessories suitable for new HRH lines and Regenerative Heaters.	The options will make the implementation of the R&M scheme complicated in view of replacement of HRH lines and all the Regenerative Heaters.

A matrix of options for the rehabilitation of the specific projects have been suggested in the of Feasibility Report / Detailed Project Report documents. The Utilities and their R&M Consultants have been advised to work out the cost of each option after taking into account the scope of R&M measures to be implemented and select the most appropriate option for implementation after carrying out financial analysis of each option.

5.3 Guidelines related to goals to be achieved.

Item of Scope of Service:

'The consultant will provide the guidelines for the content of the tender documents especially related to goals to be achieved and guarantee figures etc'.

Content of the Tender Documents

After reviewing the pros and cons of single vs multi package concepts, standard tender documents have been prepared by LII for the following six packages.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[31]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Table: 5.5
List of Contract Packages

Package No.	Contents of the Tender Documents
1.	Boiler & Auxiliaries (including but not limited to Pulverizes, Feeders, PA Fans, FD Fans, ID Fans), ESP, Auxiliary Steam system and MS, HRH, CRH, HPBP & LPBP piping and associated Electrical, C&I and Civil Works.
2.	Turbo-Generator & Auxiliaries (including but not limited to Heaters, Deaerator, Condenser, BFPs, CEPs), TG Cycle piping including Boiler Feed piping and associated Electrical, C&I and Civil Works. This package will also including R&M of C&I system common to both SG and TG.
3.	Coal Handling Plant and associated Electrical, C&I and Civil Works.
4.	Ash Handling System and associated Electrical, C&I and civil works.
5.	Mechanical Balance of Plant (BOP) System which includes Plant Water System (Raw water intake system, Pre-treatment Plant, D.M.Plant, CW System including Cooling Towers, ACW & CCW System), Compressed Air System, Fuel Oil System, Fire Fighting System and Miscellaneous balance mechanical systems.
6.	Electrical BoP including inter alia Switchyard, Power Transformers and Switchgears.

Tender Documents of each contract package are divided in three volumes, Volume-I, Volume-II and Volume-III as explained in the table below.

Table: 5.6
Description of Different Volumes of Tender Documents

Volume No.	Section	Part	Description
Volume-I	---	---	Commercial Document
Volume-II	Section-I	---	Project Technical Specification
	Section-II	Part-A	Detailed Technical Specifications - Mechanical
		Part-B	Detailed Technical Specifications - Electrical

Goals and Guarantee to be Achieved

Three Categories of Guarantees (Category- I, Category- II and Category-III) have been prescribed in the Tender Documents for the goals to be achieved for each of the Contract Packages as described in the Table below. In case, during performance guarantee tests, it is found that the equipment/systems have failed to meet the guarantees, the Bidder shall carry out all necessary modifications and/or replacements to make the equipment/system comply with the guaranteed requirements at no extra cost to the Owner. However, if the Bidder is not able to demonstrate the guarantees, even after the above modifications/replacements within [say ninety (90) days] or a reasonable period allowed by the Owner after the initial performance guarantee tests have been completed, the Owner will have the right to impose the stipulated clauses of Liquidated Damages under Guarantee Category I, II & III as specified in the Tender Specifications.

Table: 5.7

Types of Guarantees and Goals to be Achieved

Tof Guarantees	Owner's Rights in the event the Bidder fails to demonstrate the Goals	Goals to be achieved	
		Boiler	Turbo Generator
Category- I	Reject the equipment/system/plant and recover from the Contractor payments already made. OR Accept the equipment/system /plant after levying Liquidated Damages (LD) as specified in Volume-I (Commercial Document). The LDs shall be prorated for the fractional parts of the deficiencies.	<ul style="list-style-type: none"> Steaming capacity (TPH) Boiler Efficiency Auxiliary Power Consumption 	<ul style="list-style-type: none"> Gross Output (MW) Turbine Cycle Heat Rate Auxiliary Power Consumption
Category-II	Reject the equipment/plant/system and recover, from the Contractor, the payments already made. Conformance to the performance requirements under Category-II is mandatory.	<ul style="list-style-type: none"> Solid Particulate Emission NOx Emission SOx Emission Discharge of 	<ul style="list-style-type: none"> Discharge of Liquid Effluents

Document Number	Rev No.	Description	Page No.	Date of Issue

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Tof Guarantees	Owner's Rights in the event the Bidder fails to demonstrate the Goals	Goals to be achieved	
		Boiler	Turbo Generator
		Liquid Effluents	
Category-III	Reject the equipment/system/plant & recover, from the Contractor, the payments already made. OR Accept the equipment/system after assessing the deficiency in respect of the various ratings, performance parameters and capabilities and recover from the Contract price an amount equivalent to the damages as determined by the Owner. Such damages shall however be limited to the cost of replacement of the equipment/systems replacement of which shall remove the deficiency so as to achieve the guaranteed performance.	<ul style="list-style-type: none"> Noise Levels from Equipments, Start up loading, unloading and shut down capabilities etc. Performance Parameters of Boiler & Auxiliaries. 	<ul style="list-style-type: none"> Noise Levels from Equipments, Start up loading, unloading and shut down capabilities etc. Performance Parameters of Turbo Generator & Auxiliaries.

5.4 Time Lines for various Stages of R&M Intervention

As per the following stipulation of TOR, indicative timelines for various stages was to be drawn up.

‘The Consultant shall draw up indicative time-line for each stage during the R&M intervention i.e. data review, RLA/CA studies, energy audit, steam path audit, feasibility studies, DPR preparation, tendering process, R&M works implementation/execution, PG test etc.’

Processes / Stages involved in the Renovation and Modernization of Thermal Power Projects involve appointment of R&M Consultant, Collection of data, Conducting of RLA/CA Studies (including steam path audit of Turbines), Conducting of EA Studies, formulation of R&M options, Selection of R&M option to be implemented, Preparation of DPR and getting approval of appropriate Regulatory Commission, Preparation of Bidding Documents, Appointment of R&M Contractors and ISC Consultant etc.

LII has drawn up the indicative time-lines for each stage during the R&M intervention and the same are discussed in Chapter-6 of this report.

5.5 Feasibility of having a Single R&M Consultant

As per the following stipulation of TOR, feasibility of having a single consultant was to be looked into.

‘The consultant shall elaborate the feasibility of having a single consultant to carry out the activity up to the stage of finalizing the R&M contract and to facilitate approval from regulatory commission.’

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[34]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

LII has reviewed this aspect and arrived at the considered opinion that a single R&M Consultant should be appointed for carrying out the investigative studies such as RLA, CA, Energy Audit etc., Preparation of DPR, facilitating approval from regulatory agency, preparation of technical specification and bidding documents and finalizing the contract for R&M Contractor. Standard Documents containing Qualifying Requirements and Bidding Documents have been developed accordingly.

During implementation of many R&M Projects, various studies such as RLA, CA, Energy Audit etc. and preparation of DPR is being done by one consultant and the preparation of technical specification for bidding by another consultant. In certain cases, the studies being carried out by the first consultant are not accepted by the second consultant. Appointment of a single R&M Consultant will solve this problem.

The above aspects as well as the role of Implementation Support Consultant have been discussed in detail in Chapter-8 of this report.

5.6 Development of Standard Documents for R&M Projects

As per the following stipulation of TOR, standard documents on tendering procedures and contracts for the R&M projects were to be developed.

‘The consultant shall develop the standard documents on tendering procedures and contracts for the R&M projects. The following procedures and documents are suggested to be considered for standardization during the Phase-II activities. Documents listed below under items (I) to (VI) will be prepared by the consultant for which CEA can share the available documents with them or can be derived from documents elaborated in ongoing R&M programmes. CEA may assist the consultant in extracting standard forms from those documents. The consultant may also provide suitable standard formats available with him after getting vetted by CEA. Beyond this the Consultant’s activities will also concentrate on technical specifications under item (VII).

The above constitutes the main scope of services of LII. As discussed in detail in Chapter-9 of this report, all the draft documents were progressively submitted by LII. After the incorporation of comments of CEA and the Task Force, the following four documents have been finalized and submitted to CEA.

- Model Residual Life Assessment (RLA) & Condition Assessment (CA) Report,
- Model Energy Audit (EA) Report,
- Model Feasibility Report (FR) and
- Model Detailed Project Report (DPR).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[35]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

5.7 Standardization of Technical and Commercial Specifications

Standard Documents have envisaged maximum of six packages as mentioned below.

- Boiler & Auxiliaries.
- Turbo-Generator & Auxiliaries.
- Coal Handling Plant.
- Ash Handling System.
- Mechanical Balance of Plant.
- Electrical Balance of Plant.

Standard Tender Documents for each package have been prepared in three volumes. Volume-I is a Commercial Document, Volume –II consists of Technical Specifications and Volume-III consists of Technical Schedules which need to be filled up and submitted by the bidders for R&M Contracts during submission of the Bids. Volume–II on Technical Specification consists of two sections. Section-I is for Project Technical Specification & Section-II is for Detailed Technical Specification. Based on RLA/CA and EA studies, Utilities and their R&M consultants need to finalize the scope of work to be carried out for the R&M Project and accordingly modify the technical and commercial specifications in the standard formats of Tender Documents. Project Technical Specification (Section-I) is standardized for each package and R&M consultant should refer to applicable portion of Section-II (Detailed Technical Specification) to prepare project specific detailed technical specification in line with the scope of work as firmed up in Section-I .

5.8 Chapterisation of Specifications for different types of Boilers.

Project Technical Specification (Section-I) covers the Boilers of PF and CFBC type provided with Front & Rear/ Corner /Down shot Firing systems. Detailed Specifications of Boilers covers the Design Criteria, Codes & Standards and Materials of Construction for all components of Boilers including Structures & Platforms, Furnace, Casing, Burners, Firing Systems, Pressure parts, Drum, Air pre-heaters, Draft Systems, Piping & Valves, Mills and ESP etc.

While the Standard Specifications of Boilers prepared by LII cover in detail the Performance Parameters of Boilers based on the given Coal Quality, the Standard Specifications have not been prepared to specify a particular type of firing, since this will restrict the competition to one or two bidders who may inflate the prices. It may be noted that OEMs having collaboration with Foster Wheeler or Babcock & Wilcox are manufacturing boilers with front / front & rear design, OEMs having collaboration with Combustion Engineering are manufacturing boilers with tangential firing, while OEMs like Doosan or those having collaboration with Alstom are also manufacturing boilers with down-shot type of firing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[36]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Among other things, specifications prepared cover membrane wall construction, low NO_x burners and ceramic/basalt lined coal piping & bends for special protection due to erosion.

5.9 Specifications of Turbines and Retrofit options

Most of the 200MW/210 MW Turbines are of LMZ design, having LP stage fitted with Baumann Exhaust, design of which does not match with the Indian condensing conditions. The Standard documents prepared by LII envisage the following four options for retrofitting of these Turbines. Each option provides additional MW output and heat-rate improvements which reduce specific fuel consumption, corresponding reductions in emissions and extension of life.

1st Option-LP Retrofit:

This gives the greatest improvement in cylinder efficiency and in output (around 6 to 12 MW).

2nd Option-HP Retrofit:

This can deliver up to 7 MW of additional output with improvement in cylinder efficiency.

3rd Option-IP Retrofit:

This can deliver additional output around (1 to 3 MW) with some improvement in cylinder efficiency.

4th Option-Complete Turbine Retrofit:

Retrofitting complete new energy efficient turbine can deliver around 10 to 20 MW additional output with significant improvement in efficiency and extension of life by 25 years. This option may also require a new Generator, Generator Transformer and new static Excitation System.

5.10 Matrix of R&M Options and Objectives to be achieved

A matrix of options for the rehabilitation of the specific R&M Projects have been suggested in the Feasibility Report / Detailed Project Report documents. Various R&M options have been suggested with the objective of carrying out necessary repairs, refurbishments and replacement of defective equipments & components so as to extend the life of the power plant by at least 20 years and to restore the performance parameters to equal or better than the original design parameters. Matrix of R&M Options are indicated at Table 5.3.

5.11 Grouping into appropriate Contract Packages

The actual scope of work for any specific R&M Project will depend upon the essential requirements of carrying out repairs, refurbishments and replacement of equipments based on RLA/CA and EA studies. Number of R&M contract packages of any specific Project will therefore depend on the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[37]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

actual scope of work for a specific Project. There are a number of ways in which the packaging can be done. Each method has its own advantages and disadvantages which are discussed below and have also been summarized in Chapter 7.0 of this report.

Single Package on Turnkey Basis:

In contracts finalized on the basis of single package, complete scope of work of the project is included in a single package as a turnkey contract. The advantage of this system is that it reduces the work of utilities since they will have to finalize only one contract and have to coordinate only with a single contractor. On the other hand, this system increases the responsibilities of the turnkey contractor multifold, since the turnkey contractor has to shoulder the responsibility for the scope of work of all of his sub-contractors in addition to his own scope of work. The disadvantage of this method is that there are a limited number of agencies like BHEL, NASL and L&T who have the capability to deliver as a single package turnkey contractor. The other disadvantage is that due to limited competition and in order to cover their multiple risk, the prices quoted by the bidders for the single package turnkey contracts are on higher side.

One Package for BTG and one package for BOP:

In this method of packaging, the utilities have to finalize two separate contracts one for BTG (Boiler, Turbine and Generator) and one for BOP (Balance of Plant) and have to coordinate with two contractors. The main advantages of this method is that BTG contractor can focus fully on his own scope of work and the prices quoted for the BTG packages are more competitive. The only disadvantage is that there are limited numbers of players like Punj Lloyd, TECPRO and UB Engineering who have the capability to satisfactorily deliver all the BOP packages. For the R&M of Koradi Unit-6 (210 MW), Mahagenco has adopted similar packaging system with the following number of packages:

- 1) Boiler Turbine Generator (BTG)
- 2) Balance of Plant (BOP)
- 3) Electrical Package.

One BTG Package and Multiple BOP Packages

This method of packaging is most commonly practiced. In this method the role of the utilities increases since they have to finalize more number of contracts and have to coordinate with more number of contractors. This calls for increased capability and dedication on the part of the utilities. The main advantage of this method is that it increases the competition among the bidders and the total cost of the Project gets optimized. For the R&M of Bandel Unit-5 (210MW), WBPDC has adopted this packaging system with the following number of packages:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[38]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- 1) Boiler Turbine Generator (BTG)
- 2) Coal Handling Plant
- 3) Ash Handling Plant
- 4) Electrical Package

Separate packages for Boiler, Turbine and individual BOP Packages

The main idea of this packaging system is to divide the BTG package into Boiler and Turbine Generator, so as to increase the competition among the main plant suppliers. While this method of packaging can further optimize the cost of R&M Project, it requires increased capability on the part of the utilities first to segregate the responsibilities between the Boiler and Turbo Generator contractors and then to define their Guaranteed Parameters. Because of the inherent complications involved, the utilities do not generally opt for this method of packaging.

Packaging method recommended in Standard Documents:

The standard documents prepared by LII have suggested the following six packages:

- Boiler & Auxiliaries.
- Turbo-Generator & Auxiliaries.
- Coal Handling Plant.
- Ash Handling System.
- Mechanical Balance of Plant.
- Electrical Balance of Plant

Keeping a larger view of all upcoming R&M Projects and the complexities involved with various packages, standard contract documents have been prepared considering a maximum six number of Contract Packages namely, Boiler & Auxiliaries, Turbo-Generator & Auxiliaries, Coal Handling Plant, Ash Handling System, Mechanical Balance of Plant and Electrical Balance of Plant.

5.12 General Technical Conditions

Technical Specifications provided in Volume-II of the Contract Documents consist of two sections. Section-I of the Technical Specification covers the following items:

- Intent of Specifications,
- Existing plant details,
- Scope of supply & services,

Document Number	Rev No.	Description	Page No.	Date of Issue

6 INDICATIVE TIMELINES FOR R&M PROCESSES

6.1 Processes involved

Process of Renovation and Modernization of Thermal Power Projects starts with the appointment of R&M Consultant who surveys the condition of the systems & equipments, collects and reviews the past operating data, conducts the RLA/CA and EA studies, identifies the equipments to be retrofitted / replaced, formulates various R&M options, selects the R&M option to be implemented, prepares the DPR, facilitates approval from appropriate Regulatory Commission, prepares Bidding Documents and evaluates the bids for the appointment of R&M Contractors.

Implementation of the R&M activities starts at an appropriate time after the plant shut down is taken, when the R&M Contractor(s) are mobilized at site and sequential supply of equipment/materials is assured. The progress of R&M works are monitored under the supervision of Implementation Support Consultant. After the completion of erection activities, the plant is re-commissioned. After re-commissioning of the plant the PG Tests are conducted by the R&M Contractors which are witnessed by Implementation Support Consultant. The process of Renovation and Modernization gets successfully completed after the performance results indicate that the goals and objectives have been achieved.

The stages involved in the Renovation and Modernization are listed below in more details.

- Appointment of R&M Consultant
- Conducting of Cold Walk-down and Hot Walk-down Survey.
- Review of the operational history of the power plant.
- Discussion with the Plant Engineers.
- Carrying out of technical studies namely, the Residual Life Assessment (RLA) and Condition assessment (CA) of the power plant equipment.
- Carrying out Energy Audit of BTG and BOP to identify the reasons and sources of excess power consumption.
- Reviewing the results of studies mentioned at v) & vi) above.
- Identification of the equipments needing retrofitting / replacement.
- Studying the variations in the present quality of coal from the quality considered at the time of original design of the plant.
- Studying the average quality of coal likely to be available during the next twenty years.
- Studying the latest environment standards prescribed by the regulating agencies at the national and state level.
- Formulating alternative options including the cost impact for the refurbishment / replacement of specific plant equipments for enhancing their performance and extending their life.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[41]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- Preparing a matrix of R&M options for the plant as a whole for extending the useful life by minimum 20 years by either restoring the performance parameters to the original level or for achieving better parameters than the original design.
- Carrying out detailed economic evaluation of each of the R&M options proposed in the matrix.
- Discussions with Plant Management.
- Selection of R&M option to be implemented.
- Finalizing the scope of R&M Works.
- Preparation of Detailed Project Report.
- Obtaining approval from appropriate Regulatory Commission.
- Preparation of Bidding Documents for the appointment of R&M Contractors and Implementation Support Consultant.
- Evaluation of Bids mentioned at xx) above.
- Appointment of R&M Contractors and Implementation Support Consultant.
- Shutting down the Plant for carrying out R&M works.
- Re-commissioning of the Plant after completion of R&M works.
- Conducting the Performance Test.

6.2 Indicative Timelines for completion of R&M Processes

LII studied the quantum of work involved for completing various processes of R&M Projects and the reasonable time required to complete the same. LII also studied the indicative timelines provided in the National Perspective Plan prepared by CEA for the year 2016-17, which is also mentioned in figure-7 of the Report of M/s. Mercados on 'Reduction of Barriers'. In addition, LII also referred to the timelines given in the draft report of M/s WAPCOS (refer summary placed at Annexure-3) but found that the same needs some clarifications. The indicative timelines suggested by LII are mentioned in the Table below. Basis of arriving at the timelines is discussed in subsequent paragraphs.

Table: 6.1
Indicative Timelines for completion of R&M Processes

S. No.	Activity	Indicative Time Period
1	Appointment of R&M Consultant	6 months
2	Collection of Data, Conducting of RLA/CA & EA Studies and Finalization of Recommendation for the scope of R&M Works.	9 months
3	Preparation of DPR and obtaining approval of Regulatory Commission.	6 months
4	Preparation of Bidding Documents	4 months

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[42]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

S. No.	Activity	Indicative Time Period
5	Appointment of R&M Contractor(s)	9 months
6	Lead Time for R&M Contractor to start the work at site	6 – 12 months
7	Shut-down time /Completion of R&M works.	6–8 months
8	PG Test	3 months
	Total	49 to 57 months

6.3 Basis of Arriving at the Timelines

Appointment of R&M Consultant

LII is of the view that R&M Consultants should be appointed on the basis of Pre-qualification. This method of selection is more suitable owing to the specialized nature of work of R&M consultants which involves considerable knowledge and experience. LII is of the view that a period of about six (6) months may be required to complete the process of selection of R&M Consultant as discussed in the Table below.

Table: 6.2
Process of Appointing R&M Consultant

S.No.	Activity	Tentative Timeline
1	Request for Qualification	
(a)	Publication of RFQ and start of issue of RFQ document	Zero Date
(b)	Last date for issue of RFQ document	15 th Day from zero date
(c)	Last date for submission of response to RFQ	45 th Day from zero date
(d)	Short listing based on response to RFQ	65 th Day from zero date
2	Request for Proposal	
(a)	Issue of RFP	80 th Day from zero date

(e)	Completion of Evaluation of Techno-Commercial Bids	155 th Day from zero date
(f)	Date of Opening of Price Bids	160 th Day from zero date
(g)	Selection of Successful Bidder and Placement of Lol	180 th Day from zero date

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[43]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

With reference to National Perspective Plan of CEA (Up to 2016-17), LII noted that an indicative time frame of three (3) months has been recommended. LII is of the view that a period of three (3) months is possible if selection is made on the basis of post qualification.

Collection of Data, Conducting of RLA/CA & EA Studies and Finalization of Recommendation for the scope of R&M Works

RLA/ CA Studies are conducted when the unit is shut down for overhaul, whereas Energy Audit studies are carried out while the unit is in operation. Based on the detailed interactions with MAHAGENCO who shared their experience regarding Nashik Unit-3 (210 MW) and Koradi Unit-6 (210 MW), LII noted that although a period of about 1.5 to 2.0 months only was taken to complete the RLA/ CA Studies and Energy Audit Studies, finalization of recommendation for the scope of R&M works took about one year, since it involved consultation with engineers of different departments at the site as well as at the HQ. From the data provided by CEA on procurement experience, it is noted that completion of RLA studies at Bandel Unit-5 (210 MW) of WBPDC, also took more than a year to get finalized (23.09.2005 to December 2006). However, LII is of the view that it should be possible to complete the above activity in a period of 9 (nine) months.

Preparation of DPR and obtaining approval of Regulatory Commission.

LII is of the view that a total period of about six (6) months is required for completing this activity, i.e. a period of four (4) months is required for the preparation of DPR and a period of two (2) months is required for facilitating the approval from the concerned regulatory agency.

Preparation of Bidding Documents

Preparation of Bidding Documents constitutes the preparation of RFQ and RFP. Preparation of RFP also includes the work of completing the Tender Specifications based on the scope of R&M works. LII has considered a time line of four (4) months for this activity.

Appointment of R&M Contractor(s)

LII has considered a period of about nine (9) months for this activity as against a period of 6 to 8 months considered in the National Perspective Plan prepared by CEA for the year 2016-17. LII's basis for the period of about nine (9) months is based on the considerations given in the following table.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[44]	29.09.2014

1	Request for Qualification	
(a)	Publication of RFQ and start of issue of RFQ document	Zero Date
(b)	Last date for issue of RFQ document	15 th Day from zero date
(c)	Last date for submission of response to RFQ	45 th Day from zero date
(d)	Short listing based on response to RFQ	75 th Day from zero date
2	Request for Proposal	
(a)	Issue of RFP	90 th Day from zero date
(b)	Pre - Bid Discussion	120 th Day from zero date
(c)	Last date for submission of Both Part –I and Part – II Bid and Opening of Part-I (Techno-commercial) Bid	150 th Day from zero date
(d)	Techno – Commercial Discussion	180 th Day from zero date
(e)	Completion of Evaluation of Techno-Commercial Bids	210 th Day from zero date
(f)	Date of Opening of Price Bids	225 th Day from zero date
(g)	Selection of Successful Bidder and Placement of Lol	255 th Day from zero date

Lead Time for R&M Contractor to start the work at site

Before starting the work at the site, a contractor has to sequentially complete a substantial amount of engineering and manufacturing of equipments / materials including their transportation to the site. LII has considered a period of about 6 to 12 months for this activity, depending upon the scope of work.

Shut-down time / Completion of R&M works

The utility has to shut down the unit and hand over the same to the contractor for starting the R&M Works. The timing of shutting down the unit has to be judiciously planned by the utility after ascertaining the status of complete mobilization of the contractor with his men, materials and the erection machinery at site. The utility has to ensure that once the shutdown is taken, the R&M works continue without any interruption. The period of shut down will vary from Project to Project depending upon the scope of work. LII noted that based on the past experience, an average period of 9 (nine) months has been considered for the shut down in the Report by Mercados on Developing Markets (Table Annexure-4, Page 119). From the data provided by CEA on procurement experience, it is noted that for the R&M contract documents of Bandel Unit-5 (210MW), a shut down time of 6 (six) months has been provided and for Koradi Unit-6 (210MW), a shut down time of 8 (eight) months has been provided. LII is therefore of the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[45]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

opinion that if the programme is properly planned, the shut down period can be limited to a period of 6 (six) to 8 (eight) months. LII has therefore considered a period of about 6 (six) to 8 (eight) months for this activity, which matches with the timeline considered by CEA. For avoidance of doubt, it is to clarify that the period of 8 (eight) months should be applicable when major in-situ modifications of the boiler are proposed and the above period of 8 (eight) months would be insufficient, if total replacement of existing boiler is proposed with a new one, a rare option not considered by LII, but was one of the options considered by MAHAGENCO for Koradi Unit- 6 (210 MW), though not finally decided for implementation. (Refer Box-6, Page 79 of Mercados Report on Reduction of Barriers)

PG (Performance Guarantee) Test

PG Test should be conducted as earlier as possible after the unit gets stabilized after re-commissioning. LII has considered a period of three (3) months for the completion of PG test of the main plant (BTG) as also any of the BOPs covered in the scope of R&M Contractor. A period of three (3) months has been considered, since after this period some OEMs normally insist on the application of correction factors (due to deterioration) on the test results. LII noted that the timelines provided in the National Perspective Plan do not include the PG test.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[46]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

7 STANDARDISATION OF TENDERING PROCEDURES

7.1 Tendering Procedures and Documents for Contractors & Consultants

To facilitate Renovation & Modernization of Thermal Power Plants in a planned, systematic and time bound manner, the tendering procedure and tender documents for engagement of Consultants and R&M Works Contractors have been standardized to a large extent. These are discussed in detail in subsequent paragraphs of this chapter. Tendering Procedure for R&M Works Contractor is discussed first since it is more complex in nature.

7.2 Tendering Procedure for R&M Works Contractor(s)

The Bidding procedure for appointment of R&M works Contractor has been standardized. For hiring of R&M Contractor(s), a two step process comprising Request for Qualification and Request for Proposal is recommended. For the Request for Proposal for selecting R&M Contractor, a Single stage Two Envelope method has been specified.

LII referred KfW guidelines for the Procurement of Supply and Work Contracts under financial cooperation with developing countries particularly with respect to Fair and Transparent Bidding Process, reasons for exclusion and qualification procedure.

LII also reviewed World Bank Guidelines (January 2011) for Procurement of Goods, Works and Non-Consulting Services under IBRD loans and IDA Credits. LII kept in view the World Bank guidelines regarding transparency and fairness of tendering process such as guidelines pertaining to Conflict of Interest and Fraud & Corruption while preparing the Standard Bidding Documents. LII also referred World Bank guidelines for the basic principles governing International Competitive Bidding.

LII also reviewed the tender documents of leading Indian Public Sector Utilities National Thermal Power Corporation Ltd and Neyveli Lignite Corporation for different packages of power plants.

LII's analysis of different options for tendering for the engagement of R&M Works Contractor(s) is summarized below:

Pre-Qualification vs. Post Qualification

Pre-qualification is carried out to assess whether or not the interested bidders are capable of properly delivering as per the contractual scope of work. The capability of the bidders is assessed on the basis of qualification documents submitted as part of the pre-qualification exercise. Only such bidders who are found qualified in the pre-qualification stage are issued the tender documents and are allowed to submit the bid for the R&M work. In tendering process with post-qualification, the qualification documents and the actual bids are submitted simultaneously.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[47]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Advantages of Pre-Qualification

In pre-qualification route, bidders have a fair idea whether or not they are qualified to be considered as prospective contractor for the work being tendered, before spending considerable time and expenses for preparing a detailed bid. Further, prequalification gives the Owner some idea about the qualified bidders who are likely to submit the bid. In case it turns out that inadequate numbers of prospective bidders are qualified to bid; the owner may explore ways to increase participation of qualified bidders.

Advantages of Post-Qualification

Post-qualification route obviates the need for a separate pre-qualification exercise before submission of proposal. Further, as the qualification documents are submitted along with proposal, latest qualification data/status as on the date of submission of proposal can be used for qualification.

Recommended Qualification Procedure for R&M Works Contractor

LII is of the view that Pre – qualification route is more suitable for large or complex work that involves considerable time and effort for preparation of detailed bid / proposal. The Energy Efficient R&M work is technologically complex and challenging in terms of execution. It is important to ascertain the availability and willingness of capable and qualified bidders through a pre – qualification process before inviting tenders. Further, evaluating tenders from a large number of bidders, both qualified and unqualified, will make the tendering process time consuming. Therefore, only parties qualified in a pre – qualification process should be issued Tender Documents and should be allowed to participate in the Tendering process. For all the packages, bids should be invited after conducting a pre – qualification process to shortlist qualified bidders

The objective of the pre – qualification is to allow only the capable and qualified bidders having requisite technical expertise, relevant experience, project execution capability and financial resources to participate in the tendering process. The pre – qualification document should specify the qualification criteria to be met by the prospective bidders to become eligible for participating in the tendering process. The prequalification route is not intended to limit the competition to a predetermined number of potential bidders. While following this route, all the interested parties meeting the specified criteria will be issued tender documents and allowed to submit bid.

Qualification Requirement

Due care should be taken to frame appropriate Qualification Requirement (QR) to ensure adequate participation of competent bidders. While framing the QR, detailed information should be collected from prospective bidders regarding their experience and capability.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[48]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

The Qualification Requirement should include Technical Qualification Requirement, Financial Qualification Requirement and should cover Reasons for Exclusion if any. The Technical Qualification Requirement should call for technological & execution capabilities and experience in the execution of comparable projects. Financial Qualification Requirement should call for evidence of financial soundness; past experience in executing projects of similar magnitude and ability to mobilize financial resources for executing the project. The reasons of exclusion are aimed at excluding parties that may have unfair advantage over other parties or may have past record of wrongdoing. Any bidder who is or was involved as a consultant in the preparation or implementation of the project or whose associate or affiliate is or was involved as a consultant in the preparation or implementation of the project is to be excluded. Any bidder who is legally barred from the procurement process in India on the grounds of previous violations of regulations on fraud and corruption is to be excluded.

Too weak a qualification requirement may lead to the entry of incompetent bidders with lower price quotes. Awarding the R&M Contract to an incapable bidder may severely jeopardize the R&M programme. Similarly, too stringent a qualification requirement may restrict the number of eligible bidders to only a few, thereby restricting competition which may lead to higher price quotes.

The specified Technical and Financial Qualification Requirement should balance the twin objectives of restricting participation in the tendering process to capable and experience bidders with ability to successfully undertake the Renovation & Modernization work and ensuring participation by adequate number of interested parties to encourage competitive bids.

Bidders should be entitled to meet the Qualification Requirements jointly with their associates or consortium partners. In such cases, bidders and their associates and/or consortium partners should be asked to furnish a joint undertaking in the prescribed format to discharge their obligations. A bidder can be a Joint Venture Company as well. In all cases of qualification through Consortium/Associate/JV, all the parties will be jointly and severally liable to the Owner to discharge all contractual obligations.

Qualification Document

The intending Bidders should be asked to furnish documentary evidence and performance certificates in support of their qualification credentials along with their response to Request for Qualification. The documentary evidence should include inter alia list of orders executed along with copies of orders, Performance Certificates indicating date of completion as well as documents of company profile incorporating information about technical man power, financial strength, resources, organization, experience to undertake such jobs and certificates of audited accounts for last three years along with copies of latest income tax return etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[49]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

7.2.1 Single Stage Single Envelope Bidding

In this method of bidding, the bidder is asked to submit the techno-commercial bid along with price bid, which are opened simultaneously. The quoted prices of the bidders are thus known before the evaluation of techno-commercial proposals of the bidders to assess their techno-commercial responsiveness and before any discussion with the bidders regarding deviation in bids with respect to the tender conditions. The advantage with this method is that in case of large number of bids, detailed evaluation of bids can be restricted to the lowest bid and the bids with price quote close to the lowest bid. However, it has two disadvantages. Firstly, in case the bid with lowest price quote turns out to be techno-commercially non-responsive, it becomes a tough call to reject the lowest price bid and accept a bid with higher price quote. Secondly, this method has no provision of inviting supplementary price quotes, in case; the purchaser wants to introduce some changes in the specifications on the basis of post-bid discussions.

7.2.2 Single Stage Two Envelope Bidding

In this method, the bids are submitted in two parts. Both the parts are submitted together. The Part – I bid comprises the techno-commercial bid without prices. The main components of the techno-commercial bid are Bid Guarantee, Scope of Work & Terminal Points, Technical descriptions/details, Technical data sheets, List of Tools & Tackles, Deviations to technical and commercial specifications/conditions, Overall completion period & L-1 Network Schedule, Resource deployment schedule, Detail of Sub-Contractors/Sub-Suppliers/Sub-Vendors, Spares list, Quality Assurance Programme, Details of the present commitments & details of contracts in hand, Indices and Coefficients for Price Variation etc. Part -II Bid will comprise quoted price and Performance Guarantee Parameters. Initially, only the Part-I bid is opened and Part-II bid is kept in safe custody.

After evaluation of the techno-commercial (Part-I) bids, each bidder who has submitted a broadly responsive Part-I bid, is invited for techno-commercial discussion, during which, all the required amendments, additions, deletions and other adjustments are noted and recorded in a Memorandum. Part-II bid (Price Bid) of only those bidders is opened, whose Part-I bid is found to be responsive to tender specifications and conditions.

The Part – II bid comprises quote for Prices and the Performance Guarantee parameters in the form of filled up Schedules of Prices and Performance Guarantees.

However, after the evaluation of Part – I bids (techno – commercial bids) and before opening of Part-II bids (Price Bids), in case a particular bidder is

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[50]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

asked to make changes in his techno commercial offer that may have price implications, then that bidder is allowed to submit supplementary price against such changes before the opening of Part-II bids (Price Bids).

This tendering method has the advantage that the evaluation of techno-commercial bid and techno-commercial discussion is carried out without any influence of price quotes. The price-bid of techno-commercially non-responsive bid is not opened at all. Further, in case any bidder is asked to change his proposal during techno-commercial discussions for conformance to tender conditions, the bidder is given an opportunity to submit supplementary price corresponding to that change. However, in this tendering method, techno-commercial bids of all the participating bidders need to be evaluated in detail. This may consume a lot of time and effort when quite a large number of bids are received.

7.2.3 Two Stage Bidding

In this tendering method, in the first stage, the bidders are asked to submit only the techno-commercial bid without any price quote and guaranteed performance parameters. The techno-commercial bids are evaluated to assess the techno-commercial responsiveness of the bid. Techno-commercial discussion is carried out to freeze the techno-commercial conditions of the contract. In the second stage, only the bidders, whose techno-commercial bids are found to be responsive, are asked to submit price bids comprising quoted price and quoted performance guarantee parameters. The biggest advantage of this tendering method is that the bidders know the final techno-commercial contours of the tender before submitting any price bid. Therefore, they get the opportunity to base their price quotes on the final agreed techno-commercial conditions of the contract. However, the flip side is, that the bidders know who are the bidders, whose techno-commercial bids have been evaluated to be responsive, before making the price quotes. This may lead to uncompetitive price quotes in case where the number of responsive bidders is low (i.e. one/two). Further, in case only one bid is found to be responsive, the bidder is likely to quote largely inflated price to take advantage of the situation. Further, contracts/procurement norms of Government undertakings may not allow inviting price quotes from only one bidder.

7.2.4 Recommended Tendering Procedure

Each R&M project is unique and associated with many complexities regarding assessment of the quantum and nature of retrofit and replacement to be carried out. It is therefore important to firm up the technical contours of the contract before opening price quotations so that all the bidders and the owner have agreement and clarity about the nature and scope of the work on which the price bids are to be based. Considering the complexities of R&M Projects, it is recommended to invite the bids in

Document Number	Rev No.	Description	Page No.	Date of Issue

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

two parts in single stage. The rationale behind inviting Part-II bid along with Part-I bid is that bidders will make their quotes before the number of responsive techno commercial bids is known. This will encourage competitive price quotes. However in case a bidder is asked to make changes in its techno commercial offer that may have price implications, that bidder may be allowed to submit supplementary price against such changes before opening of Part-II bids (Price Bids).

All Standard bidding procedures and documents have therefore been prepared on the basis of prequalification and in Single Stage two part bidding concept as represented by the flow diagram given below. Accordingly the tendering documents consist of RFQ (Request for Qualification) and RFP (Request for Proposal).

7.3 Packaging Concept

When a utility is planning to carry out renovation and modernization of the entire plant covering a number of major equipment and systems, it has the option of doing it as a single package by a single contractor or split it into a number of packages each covering a major part of the plant /system and awarding these packages to separate contractors.

Implementing the Renovation and Modernization of the entire plant as a single package by a single contractor makes the tendering and execution process simple for the owner as it obviates the need to split the work into different packages, to ensure interface between different packages during design and execution and to properly align the completion schedule of different packages. Further, single package allows owner to fix single point responsibility and avoids contractual disputes arising out of acts of omission of one contractor affecting other contractors. However, Renovation and Modernization of different systems of the plant need different expertise and experience. Hence multiple packaging contract is advised and is followed in various Public Sector Utilities as it involves competition and allows participation of varied players with their respective field expertise.

The advantages and disadvantages of single package R&M and multi – package R&M are listed in table 8.2

Table: 7.1
Single Package R&M Vs Multiple Package R&M

Single Package	Multiple Package
<u>Advantages</u> <ul style="list-style-type: none"> ⇒ An all inclusive scope of work can minimize the need for changes in scope of work during execution and minimize disputes pertaining to scope of work. ⇒ Single point responsibility of one R&M Contractor. ⇒ For delay in any part, liquidated damages will be paid by the Contractor based on total contract value. ⇒ In case of deficiency in performance, liquidated damages will be paid by Contractor based on total contract value. ⇒ Less time and effort required in selection of contractor. <u>Disadvantages</u> <ul style="list-style-type: none"> ⇒ Higher contract price. ⇒ Selection of suppliers/vendors for different sub packages at the discretion of the main 	<u>Advantages</u> <ul style="list-style-type: none"> ⇒ Lower contract price and better control on progress based payment. ⇒ Better suppliers/vendors for each package specialized in their respective area. ⇒ Owner can better monitor and control the work at more granular level. <u>Disadvantages</u> <ul style="list-style-type: none"> ⇒ No single point contractor responsibility. Owner responsible for overall R&M work. ⇒ Scope of work, terminal points and interface requirements for different Contractors need to be defined properly to ensure there is no mismatch and no system/equipment is missed. ⇒ Liquidated damage for delay is paid by individual contractor linked to his

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

<p>contractor.</p> <p>⇒ Less transparency in project execution information flow.</p> <p>⇒ Number of competent Contractors available to execute such big R&M Contract is limited which leads to limited competition.</p>	<p>contract value though delay in single package may delay the whole project.</p> <p>⇒ More time and effort required for selection of contractors.</p>
---	--

7.4 Recommended List of Packages

There will be very few contractors, if any, who have in – house expertise and experience to carry out the R&M works of all areas of a coal fired power plant. A single EPC bid for R&M work will thus restrict number of qualified bidders, which will also increase the cost of R&M. In order to balance the conflicting needs of minimizing project/contract management complexities and having adequate number of eligible and willing bidders having relevant expertise and experience to carry out the R&M work under a package, it is recommended to split the R&M work into the following packages:

1. Boiler & Auxiliaries (including but not limited to Pulverizes, Feeders, PA Fans, FD Fans, ID Fans), ESP, Auxiliary Steam system and MS, HRH, CRH, HPBP & LPBP piping and associated Electrical, C&I and Civil Works.
2. Turbo-Generator & Auxiliaries (including but not limited to Heaters, Deaerator, Condenser, BFPs, CEPs), TG Cycle piping including Boiler Feed piping and associated Electrical, C&I and Civil Works. This package will also including R&M of C&I system common to both SG and TG.
3. Coal Handling Plant and associated Electrical, C&I and Civil Works.
4. Ash Handling System and associated Electrical, C&I and civil works.
5. Mechanical Balance of Plant (BOP) System which includes Plant Water System (Raw water intake system, Pre-treatment Plant, D.M.Plant, CW System including Cooling Towers, ACW & CCW System), Compressed Air System, Fuel Oil System, Fire Fighting System and Miscellaneous balance mechanical systems.
6. Electrical BoP including inter alia Switchyard, Power Transformers and Switchgears

Separate RFQ and RFP has been prepared for the individual packages mentioned above. The details of RFQ and RFP are illustrated below.

7.5 Contracting Concepts for R&M Contractor

7.5.1 International vs Domestic Competitive Bidding

International Competitive Bidding (ICB) process will be followed for high value contracts and contracts that are complex in terms of engineering and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[55]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

execution skills to achieve the best possible supply and services at competitive prices. R&M of BTG, BTG auxiliaries, Power Transformers and Switchyard are likely to be technologically complex & involve higher value contracts and hence likely to evoke response from many reputed international bidders. Hence packages covering these systems may be tendered on International Competitive Bidding (ICB) basis. However, R&M of other BoP packages are not likely to see participation by many reputed international bidders and hence may be tendered on Domestic Competitive Bidding (DCB) basis.

Table-7.2
Nature of Bidding Recommended

S. No	Package	Nature of Bidding
1	Boiler & Auxiliaries (including but not limited to Pulverizes, Feeders, PA Fans, FD Fans, ID Fans), ESP, Auxiliary Steam system and MS, HRH, CRH, HPBP & LPBP piping and associated Electrical, C&I and Civil Works.	ICB
2	Turbo-Generator & Auxiliaries (including but not limited to Heaters, Deaerator, Condenser, BFPs, CEPs), TG Cycle piping including Boiler Feed piping and associated Electrical, C&I, and Civil Works. This package will also including R&M of C&I system common to both SG and TG.	ICB
3	Coal Handling Plant and associated Electrical, C&I, and civil works.	DCB
4	Ash Handling system and associated Electrical, C&I and civil works.	DCB
5	Mechanical Balance of Plant (BOP) systems which includes Plant Water System (Raw water intake system, Pre-treatment Plant, D.M.Plant, CW System including Cooling Towers, ACW & CCW System), Compressed Air System, Fuel Oil System, Fire Fighting System and Miscellaneous balance mechanical Systems	DCB
6	Electrical BoP including inter alia switchyard, power transformers and Switchgears	ICB

7.5.2 Lump Sum Price vs. Unit Rate

In a lump sum price contract, the entire scope of supply and services is grouped into a single overall contract price for the contractors to quote their price against. During execution of work, phasing of payment is done against progress of supply and services, but the sum total of all the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[56]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

payments is the contracted price and it remains unchanged irrespective of the quantity of supply and service required to complete the contracted scope of work. The payments are linked to contractual milestones.

The bidder quoting the lowest lump sum price for the overall contract scope of work is treated as the lowest price bidder.

For unit rate contract, the bidders quote the unit rates for each supply and service against an estimated bill of quantity. The bidder with lowest total price for the estimated BOQ is treated as the lowest price bidder. During execution, payment is made based on actual quantity of each item/type of supply and service.

Given the nature of renovation and modernization work, it is difficult to exhaustively indentify all the types/items of supply and service required and estimate quantities for them. Therefore, unit rate contract is difficult to design for renovation and modernization work. It is more practical to contract R&M work on lump sum price basis for the entire scope of plant, equipment, machinery, material, parts and including design, engineering, procurement, supply, assembly, construction, erection, testing & commissioning. Review of tender documents for R&M work of leading public utilities also suggests wide use of Lump Sum Price contracts for Renovation & Modernization work of power plants.

Each package therefore should be awarded on lump sum EPC contract basis based on the Scope and Terminal Points identified in the Bid Documents of the corresponding package.

7.5.3 Scope Change

The scope of Renovation & Modernization is defined in the bid documents of different packages on the basis of Residual Life Assessment / Condition Assessment and Energy Audit. During execution, in case there arises a need for any change in scope of work, change order should be issued by the owner after studying the need of change in scope pursuant to the proposal received from the R&M Contractor. Appropriate change order clause will be built into the contract to deal with the need to change the scope of the contract due to surprises encountered during the execution of the R&M work.

7.5.4 Price Basis & Price Variation

The Contract Price should include price of executing whole scope of work specified in the Contract. The price of the contract should be on lump sum price basis for the entire scope covered in the contract. The contract price should be subject to adjustment during the contract period to reflect change in labour and material price levels as per price variation formula specified in the tender document, which is subject to limits specified in the tender

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[57]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

specification. This price basis is being practiced for procurement of power plant equipment by large utilities in India.

For adjustment in contract price, standard bidding document should specify base date for contract price and price variation formula. The price variation formula breaks down the total price into components that are not adjustable and components that are adjustable by indices specified for the various components. The bidders are asked to indicate the coefficients (in the techno-commercial bid) to distribute the adjustable price into different components.

7.6 RFQ and RFP for the R&M Consultant and ISC

RFQ and RFP for R&M Consultant and Implementation Support Consultant have been standardized.

The scope of work for the R&M Consultant has been bifurcated in two phases. Phase-I covers investigative studies, preparation of FR, DPR and obtaining the approval of regulatory agencies. Phase-II will start only if required after the approval of regulatory agencies. Phase-II covers preparation of bidding documents and bid evaluation till the selection of R&M Contractor(s).

7.7 Request for Qualification for R&M Contractor

For selecting R&M Contractor, the Technical and Financial Qualification Requirements have been standardized. However, the values of financial parameters have not been standardized as it will depend on the estimated cost of the Contract. Request for qualifications (RFQs) for the selection of Contractors for various packages like Boiler, Turbine & Generator, eBOP, Ash Handling plant, Coal Handling Plant and Balance of Plant have been prepared separately as it depends on the field specific qualification requirements. Standard formats and data sheets for all the split packages have been specified to be submitted as Qualification document.

The objective of the pre – qualification is to allow only the capable and qualified Consultancy Firms and Contractors having requisite technical expertise, relevant experience supported by adequate number of competent manpower and having adequate financial resources to fulfill their obligations.

Following aspects have been covered in RFQ document for each the split packages i.e RFQs for Boiler, Turbo – Generator, Electrical – Balance of plant, Ash Handling System, Coal Handling System and Balance of Plant:

1. A brief introduction of the Power plant of the Utility inviting Tender for Renovation & Modernization.
2. An Invitation to the bidders inviting sealed pre – qualification tenders from Experienced and interested bidders for the package wise

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[58]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Renovation & Modernization Works for the specified Plant/ Unit Capacity through International / Domestic Competitive bidding process.

3. The scope of work under the R&M packages covering disassembly and replacement of specified existing equipments / systems by supplying new equipments/ systems including supply of assembly materials, inspection & testing at suppliers works, supply of mandatory spares, packing & forwarding, transportation & insurance, receipt at site, unloading, handling & storage at site, pre – assembly, fabrication, repair, servicing/ overhauling, erection, carrying out of all associated civil works including supply of cement & steel etc., testing & commissioning and successful completion of trial operation & performance guarantee tests for the individual packages.
4. RFQ Details : This provides the following information:
 - Participation Fee
 - Publication date of RFQ
 - Last date for issue of RFQ document
 - Last Date & Time of Receipt of Pre-Qualification Tenders.
 - Date for identification of Qualified Bidders and Issuance of RFP
5. The Technical and Financial Qualification Requirement is also standardized for all the six split packages.

Technical Qualification Requirement

Technical Qualification Requirement for R&M Contractor primarily covers the following two aspects:

- a. Experience in design, engineering, manufacturing, supply, erection and commissioning of relevant package for a power plant unit of 200/210 MW or above capacity which should have completed satisfactory operation for a period of not less than two (2) years as on the date of opening of Pre – Qualification Bid.
- b. Experience in execution of Renovation & Modernization of one (1) unit of the specific package for a power plant unit of 100 MW or above capacity.

The RFQ stipulates that the bidder can be a Joint Venture of two firms who collectively meet the Technical Qualification Requirement specified. Each of the JV partner must have at least 26% equity in the JV and in case of award of contract, must maintain JV arrangement till the successful completion of the R&M work. The bidder can be a Consortium of two firms who collectively meet the Technical Qualification Requirement specified. The Consortium members shall designate one member as the Leader of the Consortium with whom the Contract will be entered into in case the Consortium emerges as the successful bidder.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[59]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Financial Requirement

The Financial Qualification for R&M Contractor primarily covers the following:

- (a) The average annual turnover of the Bidder should be more than a specified value as per audited annual accounts during the preceding three consecutive years. The annual turnover requirement is specified based on the likely contract value. Other income is not considered for arriving at the annual turnover.
- (b) The Net Worth of the Bidder as on the last date of preceding Financial Year should be positive.
- (c) The sum of bank balances (including fixed deposits) and available unutilized credit line of the bidder (including non fund based credit lines) should not be less than a specified value on not more than 30 days prior to the scheduled last date of submission of Pre-qualification Bid
- (d) In case the Bidder/Consortium Leader does not satisfy the Financial Criteria stipulated on its own and the Holding Company having controlling interest in the Bidder / Consortium Partner Company, as the case may be, meets the stipulated turn-over requirements, then Financial Criteria stipulated is deemed to have been met, provided that the Net worth of such Holding Company / Partner Company, as the case may be, as on the last day of the preceding financial year is at least equal to or more than a certain minimum value. In such a case, the Bidder / Consortium Leader has to submit a Letter of Undertaking from the Holding Company/ Partner company pledging unconditional and irrevocable financial support to the bidder for execution of the Contract.

To establish the financial capacity for performance of the contractual obligations, the Bidder is required to furnish documentary proof of their audited annual turnover and net worth for the last three (3) financial years

Exclusion Criteria

In line with KfW guidelines, the following exclusion criteria is specified

- (a) Any firm who is involved as a Consultant in the preparation for the concerned R&M Project for activities such as Feasibility Study or RLA/CA Study or Energy Audit or preparation of DPR/Tender Document or any other preparatory activity or any firm who is as a consultant for implementation of the concerned R&M project or whose associate or affiliate is involved as a consultant in the preparation or implementation of the concerned R&M project cannot participate as a bidder for the R&M Works Tender.
- (b) Any bidder who is legally barred from the procurement process of the owner on the grounds of previous violations of rules/regulations on fraud

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[60]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

and corruption or any other reason cannot participate as a bidder for this R&M Tender.

- (c) Any firm or its associate company or parent company cannot participate as Bidder or JV Partner or Consortium Member in more than one Bid under the tender.

Prequalification Document

The pre-qualification documents requirement has been standardized. These include the following:

- (a) List of orders executed by the bidders along with copies of orders to demonstrate their qualifications.
- (b) Past Performance Certificates clearly indicating date of completion from the facility owner in respect of such completed contract(s).
- (c) Name of any proposed JV partner or Consortium member along with details of equity participation of JV partner or letter of consent of consortium partner.
- (d) Documents of company profile incorporating technical man power, financial strength, resources, organization and experience to undertake such jobs as an evidence of bidder's capacity to the satisfaction of Employer. Firm's audited accounts for last three years along with copy of latest income tax return filed.
- (e) Contracts in hand / pending jobs and their status along with value.
- (f) Major pending legal cases.

Instruction to Bidders for Pre-qualification

The standard RFQ also elaborates the Instruction to Bidders. The bidders who qualify the pre – qualification requirement are only eligible to submit the Bid Proposal for R&M works. In case, certificate(s) /document(s) submitted by the Bidder or JV Partner or Consortium leader or Consortium partner are found to be factually incorrect or manipulated, the Bidder or JV Partner or Consortium leader or Consortium partner as the case may be, will be disqualified for the tender and will be liable to be blacklisted / debarred by the Employer for future tenders. The Contract shall be signed with the successful bidder or the Consortium Leader, and hence all the responsibilities and Liabilities for all the technical and managerial services shall be borne by the Bidder/Consortium Leader. The bidder meeting the Qualifying Requirement on the strength of the JV partners is required to enclose details of equity holding of the JV partners. However, in the event, the bidder is found pre – qualified and issued RFP document, while submitting the techno – commercial Bid Proposal for R&M work, the bidder shall furnish a copy of the Joint Venture Agreement. Further, while submitting the techno-commercial Bid Proposal for R&M work, the JV partners shall furnish a joint undertaking towards joint and several liability to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[61]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

the employer for the successful performance of the Contract. The undertaking shall be furnished as per the format to be specified in the RFP document.

The bidder meeting the Qualifying Requirement as a Consortium is required to enclose the Letter of Consent (as per the prescribed format) from the consortium Partner along with the Pre-Qualification Bid signed by the Consortium Partners indicating the scope of work. However, in the event, the bidder is found pre-qualified and issued RFP document, while submitting the techno-commercial Bid Proposal for R&M work, the bidder (consortium leader) shall furnish a Consortium Agreement with the other Consortium member. No new consortium partner, (other than those qualified at Pre-qualification stage) will be permitted at the time of submitting the Techno commercial Bid. Further, while submitting the techno-commercial Bid Proposal for R&M work, the Consortium leader and Consortium member will furnish a joint undertaking regarding diligent performance of their respective scope of work and towards joint and several liability to the employer for the successful performance of the Contract. The undertaking shall be furnished as per the format to be specified in the RFP document.

The Bidder shall provide satisfactory evidence that he and / or, where applicable, the consortium leader and consortium partners have adequate capability and capacity to perform the work properly and expeditiously within the time period specified. The evidence shall specifically cover, with written details, the installed manufacturing and / or fabrication capacities to meet the requirements appropriate to the works covered in his bid have an adequate field service organization to provide the necessary field erection and management services required to successfully erect, test and commission the equipment / system as required by the bidding documents. Pre-Qualification Bid submitted without the proper documentary evidence to substantiate fulfillment of the qualifying requirements as specified are liable for rejection without assigning any reason.

There is a participation amount as decided by the Employer which is to be given by all the interested Participants to participate in this bidding procedure.

The Pre – Qualification Bids received from the bidders would be opened on a pre decided date, time and venue mentioned in the RFQ document. Any clarification related to the RFQ document or RFQ process should be furnished before 15 days of opening of the bids.

Following standard Forms and the data sheets have been developed along with the RFQ document:

(a) Format for the Pre – qualification Bid

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[62]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- (b) Format for Letter of Undertaking by Holding Company pledging unconditional & irrevocable support to the bidder for the execution of R&M work
- (c) Format for Letter of Consent to be furnished by the Consortium Partners
- (d) Sample format for Data sheet regarding Technical Qualification Requirement
- (e) Sample format for Data sheet regarding Financial Qualification Requirement

7.8 Request for Proposal

The formats of Request for Proposal (RFP) for selection of Contractors have been standardized. The standard terms & conditions are based on practices followed by international funding agencies and leading Indian Utilities.

Selection of Contractor is based on price quoted by qualified bidders whose techno – commercial proposal is responsive to tender specification. Only bidders qualified in pre – qualification stage will be allowed to submit proposal. A single stage two envelope bidding procedure should be followed for selection of R&M Contractor.

The master index for a standardized RFP document is as below:

Table: 7.3
Master index for a Standardized RFP Document

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

General Conditions of Contract (GCC)

The GCC contains the Contracting Concept, the scope of the Contractor, the precedence of the Contract Documents, definitions and Acronyms used in the Contract Document, the severability of the Contract, the governing laws to the Contract, methods for settlement of disputes, Time of commencement and completion of the contract, Contractor's Responsibilities, Owner's Responsibilities, Taxes and Duties applicable, Confidential Clause, methodology for designing/ engineering/ procurement/ installation/ Testing & Inspection/ Completion of the Facilities and Commissioning of the Services. It also covers the Defect Liabilities, Completion Time and Liquidated damages, Conditions to Performance Guarantees, Limitations of Liability, Transfer of Ownership, Insurance, Force Majeure Conditions and Termination of the Contract.

Special Conditions of Contract (SCC)

SCC stipulate specific important terms and conditions of the Contract as explained below:

- i. Effective date: The Owner shall inform the successful Bidder of its acceptance of the Tender by a formal Letter of Acceptance. The date of Letter of Acceptance will be the Effective Date for determining the Time for Completion of the facilities and other milestones for execution of the Renovation & Modernization work as per the scope of work under this tender by the Contractor. The Owner will make the advance payment promptly once Contractor has fulfilled the necessary conditions specified in Terms of Payment. If payment of Advance is delayed beyond two months from the date of Letter of acceptance for reasons attributable to the Owner, the date of payment of advance shall be the effective date for determining the time for completion of facilities. However, failure of the contractor to provide all the required Bonds/Guarantees within the prescribed period will cause the Bid Security to be forfeited.
- ii. Time of Commencement and Completion: The Time Schedule for the execution of the scope of work by the Contractor and commencement of unit shut down by Owner will be specified.
- iii. Liquidated Damages: The Standard RFP envisages two types of Liquidated Damages viz. Liquidated Damage for Delay and Liquidated Damage for Non-fulfilment of Functional Guarantees.
- iv. If the Contractor fails to successfully achieve completion of R&M activities and commissioning of the retrofitted facilities as per the scope of work within the time period specified, the Contractor shall pay to the Owner amount calculated as per the specified rates as

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[64]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Liquidated Damage and not as penalty. Liquidated Damage for Delay is separately payable for two milestones:

1. Delay in completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network.
2. Delay in Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work.

The amount of Liquidated Damage for delay shall be limited to a maximum of 10 % of the total contracts price including price variation as per the provisions of the contract and excluding price of Mandatory Spares.

The aggregate amount of Liquidated Damage for non-fulfilment of functional guarantee shall be limited to a maximum of 10 % of the total contracts price including price variation as per the provisions of the contract and excluding price of Mandatory Spares.

The limit on maximum leviable Liquidated Damage for Delay and maximum leviable Liquidated Damage for non-fulfilment of functional guarantee are independent of each other and shall apply separately.

v. **Contract Securities**

- a) **Advance Payment Security:** The Contractor shall, provide a security for an amount equal to the advance payment, and in the same currency or currencies, with validity of up to ninety (90) days beyond the date of Completion of Facilities.
- b) **Performance Security:** The Contractor shall provide a security for the due performance of the Contract for ten percent (10%) of the Contract Price with an initial validity up to ninety (90) days beyond the Defects Liability Period. If the Owner enters into the Contract with the Assignee of a foreign Contractor, the said Assignee, in addition to the Contract Performance Security to be provided by the Contractor for ten percent (10%) of the value of all the Contracts shall provide a separate Contract Performance Security equivalent to five percent (5%) of the value of Contract entered into with the assignee, for the due performance of Contract with an initial validity up Ninety (90) days beyond the Defects Liability Period. If the bidder is a joint venture of two firms who collectively meet the Qualifying Requirement, in addition to the Contract Performance Guarantee (CPG) of 10% furnished by the bidder, each of the JV partner shall furnish Additional Contract Performance Guarantee equal to 1% of

Document Number	Rev No.	Description	Page No.	Date of Issue

7.9 Guidelines for the Goals/ Guaranteed Parameters to be achieved

Volume –II Section-I of the bidding documents contains the necessary guidelines for covering the Goals & Guaranteed Parameters to be achieved and also to be demonstrated during Performance Guarantee Acceptance Tests. It is clearly discussed in table 5.7 of chapter 5 above.

7.10 Tendering for R&M Consultant & Implementation Support Consultant

The Bidding procedure for appointment of R&M Consultant has been standardized. For hiring of Consultants, a two step process comprising Request for Qualification and Request for Proposal is recommended. For the Request for Proposal for selecting R&M Consultant and Implementation Support Consultant (ISC), a Single stage Two Envelope method has been specified since the consultants to be engaged for R&M services must be specialized in their respective fields and must have requisite experience of similar nature.

LII analyzed the following documents to study the process of hiring consultants:

1. World Bank Guideline (January 2011) for Selection and Employment of Consultants
2. KfW Guidelines for Assignment of Consultants in Financial Cooperation with developing countries.
3. Model Request for Proposal for Selection of Technical Consultants published by Planning Commission, Government of India
4. Request for Tender for Selection of Consultant for Feasibility Study for Renovation & Modernization of Unit-4 of Nasik Thermal Power Station.

The recommended Selection Criteria for R&M Consultant and Implementation Support Consultant broadly conforms to the Quality and Cost Based selection process of World Bank guidelines and Two-Stage selection process with pre-selection as per KfW Guideline. However, it is recommended that the first stage or pre-qualification stage will be Pass / No-Pass type without any limitation on number of consultants to be pre-qualified for quality and cost based competition in second stage. The evaluation criteria are in line with the Model RFP for Technical Consultants published by Planning Commission.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[67]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Only Applicants found pre-qualified on the evaluation of qualification documents submitted in response to the RFQ will be issued RFP documents for the Consultancy work and will be eligible to submit Bid Proposal. The RFQ Documents specify the qualification criteria to be met by the prospective bidders to become eligible for participating in the tendering process. The bidders are required to submit evidence of their technical expertise, relevant past experience, competence of key personnel, project execution capability and financial resources to discharge the scope of service.

Single Stage Two Part Bidding Procedure will be followed for RFP stage.

The bidders are required to submit, the bids for the Consultancy Services in two parts. Both the parts are to be submitted together before the indicated Bid submission Time & Dates.

The Part-I Bid comprises the techno-commercial bid without prices. The main components of the Techno-Commercial Bid are Bid Guarantee, Methodology & Work Plan for discharging the consultancy services as per Terms of Reference, Details of Key Personnel along with their Curriculum Vitae, Deviations to Terms of Reference, Deviation to commercial Conditions, Overall Completion Time Period & Network Schedule, Resource Deployment Schedule, Detail of Sub-Consultants, Details of the present commitments & details of contracts in hand etc. Part-II Bid will comprise Quoted Price. Initially, only the Part-I Bid will be opened and Part-II Bid will be kept in safe custody.

The Part-I Bid will be checked for responsiveness to techno-commercial conditions and a detailed Technical Evaluation will be carried out to assign a Technical Score to each Bid. Part-II Bid (Price Bid) of only those Bidders will be opened, whose Part-I Bid is found to be responsive to Tender Specifications and Conditions and Technical Score is above a specified level.

7.11 Evaluation Criteria for Consultants (R&M Consultant and ISC)

The selection of the successful Bidder for award of the R&M Consultancy Services Contract and Implementation Support Consultancy (ISC) contract will be based on both Quality of the Technical Proposal and Price quoted by the Bidder for the entire scope of work. The selection process will comprise the following steps:

1. First, Techno-Commercial offer will be assessed for completeness and responsiveness to commercial/contractual conditions. Bidders qualifying the criteria would be considered for further evaluation on the basis of Quality and Price.
2. The Bidder's proposed methodology and Work Plan for discharging the Consultancy Assignment, experience of the Bidder and the experience &

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[68]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

expertise of Key Personnel will be assigned a Technical Score 'St'. Only those Bidders whose Technical Proposals get a Technical Score of 70 marks or more out of 100 shall qualify for further consideration.

The Technical score of each Bidder will be equal to the weighted sum scores on three elements with indicated weights

$$S_t = 0.2 \times S_{t-1} + 0.4 \times S_{t-2} + 0.4 \times S_{t-3}$$

Where:

- S_t – Technical score
- S_{t-1} – should be less than or equal to 100 points, depending on the clarity, completeness, soundness of methodology and scope of work. The Bidder with the best submission will be assigned a score of 100 ($S_{t-1} = 100$). Other Bidders will be assigned scores below 100 considering the relative quality of the submission with respect to the best submission.
- S_{t-2} – should be less than or equal to 100 points, depending on the Bidders experience on the grounds of size, nature & complexity of scope and similarity with the subject R&M Consultancy Service / Implementation Support Consultancy Service for at least 5 projects.
- S_{t-3} – should be less than or equal to 100 points, depending on the experience list of at least a specified number of personnel who would be associated with the R&M Project.

- The Price Proposal of each qualified Technical Bidder will be assigned a Financial Score (S_f) on the basis of its cost competitiveness.

$$S_f = 100 \times (\text{Lowest Quoted Total Price} / \text{Total Price quoted by the Bidder})$$

- Each bidder will be assigned a Composite Score (S_c) equal to the weighted sum of Technical Score and Financial Score. Finally, the bidder with the highest Composite Score will be selected as R&M Consultant for the subject R&M Consultancy Services Contract or Implementation Support Consultancy (ISC) contract.

For selection of successful Bidder, the Technical Score will be a weight of 70% and Financial Score will be given a weight of 30%. For each Bidder, the Composite Score S_c will be computed as follows:

$$S_c = 0.7 \times S_t + 0.3 \times S_f$$

7.12 Request for Qualification for Consultants (R&M Consultant and ISC)

The RFQ document for selection of Consultants has been standardized. The Standard RFQ covers the following aspects:

- The scope of works for R&M Consultant
- The RFQ details regarding the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[69]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- i. Participation fee
 - ii. Publication date of RFQ
 - iii. Last date for issue of RFQ document
 - iv. Last date and time for receipt of RFQ applications
 - v. Date for selection of qualified consultancy Firm
3. Qualification Requirement
 4. List of Qualification Document
 5. Instruction to Applicants
 6. Standard Application Forms and Data Sheets

The following Forms and Data Sheets have been standardized

- a. Format for the Pre – qualification Application
- b. Letter of Consent to be Furnished by the Associate
- c. Letter of Consent to be Furnished by the Consortium Partners
- d. Sample format for Data sheet regarding Technical Qualification Requirement
- e. Sample format for Data sheet regarding Financial Qualification Requirement

Qualification Requirement for Consultants (R&M Consultant and ISC)

The Technical Qualification Requirement and Financial Qualification Requirements have been standardized.

- i. **Technical Qualification Requirement** – The RFQ document for Consultants specifies that the Applicant should be an engineering consultancy firm with experience in specified technical consultancy assignments pertaining to at least two 200/210 MW or above unit and at least one technical consultancy assignment for Renovation and Modernization of coal/lignite fired thermal power plant of 50 MW or above capacity

ii. Financial Qualification Requirement

The Financial Qualification for consultant primarily covers the following:

- (a) The average annual turnover of the applicant should be more than a specified value as per audited annual accounts during the preceding three consecutive years. The annual turnover requirement is specified based on the likely contract value.
- (b) The Net Worth of the Bidder as on the last date of preceding Financial Year should be positive.

iii. Other Criteria

Any entity that is legally barred from participation in Consultancy assignments of the concerned utility on the grounds of previous violations of rules/regulations on fraud and corruption or any other

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[70]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

reason cannot participate as an applicant or associate or consortium member for this R&M Consultancy Tender.

Any firm or its associate company cannot participate as Applicant or Associate or Consortium Member for more than one RFQ application under this Consultancy Tender

The Applicant, meeting the Qualifying Requirement on the strength of Associate(s) or as a Consortium, should enclose the Letter(s) of Association (as per the prescribed format) from the Associate(s)/ Consortium signed by the Associate(s)/ Consortium Partners indicating the scope of work along with the Pre – Qualification Application.

The Pre – Qualification Bids received from the bidders would be opened on a pre decided date, time and venue mentioned in the RFQ document.

Prequalification Document

The pre-qualification documents requirement for consultants has been standardized. These include the following:

- (i) List of orders executed by them, their Consortium Partners / Associates along with copies of orders to prove their qualifications.
- (ii) Past Performance Certificates from the previous employers in respect of such completed consultancy assignment(s) clearly indicating scope of and date of completion for each assignment.
- (iii) Names of proposed Associates or Consortium member if any, along with Letters of Consent from each Associate / Consortium Partner.
- (iv) Particulars of Key Personnel that must include inter alia their names, details regarding qualification, areas of expertise, professional experience and names of relevant projects.
- (v) Documents of company profile incorporating details of technical man power, financial strength, resources, organization and experience to undertake such jobs as an evidence of their capacity for the satisfaction of Employer.
- (vi) Firm's audited accounts for last three (3) years along with a copy of latest income tax return filed.
- (vii) Consultancy Assignments in hand / pending jobs and their status along with value.
- (viii) Pending legal cases, if any.

7.13 Request for Proposal for Consultants (R&M Consultant & ISC)

The Standard Request for Proposal for consultants comprises the sections as indicated in the Table below:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[71]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

Table: 7.4
Structure of Request for Proposal for Consultants

Section	Description
Section-I	Commercial <ol style="list-style-type: none"> 1. Invitation For Bid 2. Instruction to Bidder 3. General Project Information 4. General Condition of Contract (GCC) 5. Special Condition of Contract (SCC) 6. Forms and Schedules
Section-II	Terms of Reference

General Conditions of Contract (GCC)

The GCC contains the Contracting Concept, the scope of the Contractor, the precedence of the Contract Documents, definitions and Acronyms used in the Contract Document, the severability of the Contract, the governing laws to the Contract, methods for settlement of disputes, Time of commencement and completion of the contract, Contractor's Responsibilities, Owner's Responsibilities, Taxes and Duties applicable, Confidential Clause. It also covers the Defect Liabilities, Completion Time and Liquidated damages, Conditions to Performance Guarantees, Limitations of Liability, Transfer of Ownership, Insurance, Force Majeure Conditions and Termination of the Contract.

Special Conditions of Contract (SCC)

- Effective date: The Owner shall inform the successful Bidder of its acceptance of the Tender by a formal Letter of Acceptance. The date of this Letter of Acceptance will be the Effective Date for determining the Time for Completion of the milestones for Consultancy work as per the scope of work. The Owner will make the advance payment promptly once Contractor has fulfilled the necessary conditions specified in Terms of Payment. If payment of Advance is delayed beyond two months from the date of Letter of acceptance for reasons attributable to the Owner, the date of payment of advance shall be the effective date for determining the time for completion of facilities. However, failure of the contractor to provide all the required Bonds/Guarantees within the prescribed period will cause the Bid Security to be forfeited.
- Time of Commencement and Completion: The Time Schedule for the execution of the scope of work by the Consultant is to be specified.
- Liquidated Damages: The Standard RFP envisages Liquidated Damage for Delay in achievement of milestones of consultancy work. The amount of Liquidated Damage for delay shall be limited to a maximum

of 10 % of the total contracts price including price adjustment as per the provisions of the contract

iv. Contract Securities

- a) Advance Payment Security: The Contractor shall, provide a security for an amount equal to the advance payment, and in the same currency or currencies, with validity of up to ninety (90) days beyond the date of the Scheduled Completion Date for R&M Consultancy Services.
- b) Performance Security: The Contractor shall provide a security for the due performance of the Contract for five percent (5%) of the Contract Price with an initial validity up to ninety (90) days beyond the the Scheduled Completion Date for R&M Consultancy Services.

The following forms and schedules have been standardized:

8 ROLE OF CONSULTANTS IN R&M PROJECTS

8.1 Need of Consultants

Renovation and Modernization of old Thermal Power Projects involves in-depth study of the power plant equipment, assessment of their health condition, identification of the root causes of the equipments for deficit performance, determination of the residual life of critical components, auditing of auxiliary power consumption of various equipments, finding solutions to various operational problems in terms of Run/ Retrofit/ Replacement options etc. This requires special knowledge, skill and experience which is normally not available with the Operating and Maintenance Engineers of the Power plants. Power plants therefore require the services of consultants who are specialized in the field of conducting various investigative studies and can deliver the services of this nature.

Support of consultants is also needed to review the design and engineering work done by the R&M Contractors, to monitor the progress of R&M works at the site and to evaluate the results of the Performance Guarantee Tests etc. The job of site supervision requires adequate experience of erection and construction activities which is not always available with O&M engineers of the power plants.

8.2 Different Categories of Consultants

Two types of Consultants have been suggested namely, 'R&M Consultants' and 'Implementation Support Consultants'(ISC). The consultancy work is initiated by the R&M Consultant who does all the investigative studies like RLA/CA and EA studies, provides the solutions to various operating problems in the form of formulation of R&M options, selects the most attractive R&M option to be implemented, prepares the DPR (Detailed Project Report), assists the utility in getting the approval of appropriate Regulatory Commission, prepares the Bidding Documents as well as appointment of R&M Contractor(s). Implementation of R&M works is finally done with the help of Implementation Support Consultant (ISC).

8.3 Single R&M Consultant up to approval from Regulatory Commission

LII reviewed this aspect and arrived at the considered opinion that a single R&M Consultant should be appointed for carrying out the investigative studies such as RLA, CA, Energy Audit etc., Preparation of DPR, facilitating approval from regulatory agency, preparation of technical specification and bidding documents and finalizing the contract for R&M Contractor(s). Standard Documents containing Qualifying Requirements and Bidding Documents for the selection of R&M Consultants have been developed accordingly.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[75]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

The scope of work for the R&M Consultant has been bifurcated in two phases. Phase-I covers investigative studies, preparation of FR, DPR and obtaining the approval of regulatory agencies. Phase-II will start only if required after the approval of regulatory agencies. Phase-II covers preparation of bidding documents and bid evaluation till the selection of R&M Contractor(s).

LII noted that during the implementation of many R&M Projects, various studies such as RLA, CA, Energy Audit etc. and preparation of DPR was done by one consultant and the preparation of technical specification for bidding by another consultant. In certain cases, it is quite likely that studies carried out by the first consultant are not accepted by the second consultant. Appointment of a single R&M Consultant will therefore solve this problem.

Appointment of a single R&M Consultant will also reduce the time gap between the completion of studies and the start of R&M works, which is one of the main reasons contributing to huge risk of technical surprises. LII noted that after the completion of investigative studies the process of appointing the R&M Contractor took three years and five months in case of Baruni TPS (110MW) and in other cases even more (Refer Table 9-1). From the data provided by CEA on Procurement, it is inferred that for Bandel Unit-5 (210 MW) of WBPDC, the time gap between the completion of RLA studies and placement of order to M/s Doosan for R&M works was more than 5 (five) years (December 2006 to 29.02.2012) and that in case of Koradi Unit-6 (210 MW) of MAHAGENCO, the time gap between the ordering of RLA studies and the ordering of R&M works contract to BHEL was also more than 5 (five) years (01.03.2008 to June 2013)

Table: 8-1
Time Gap between Studies and Execution of Works

Plant (Unit)	Completion of RLA study	Actual Date of Start of Work	Time Gap
Bathinda Unit 3 (110 MW), PSPCL	March 2001	January 2010	8 yrs 10 months
Bathinda Unit 4 (110 MW), PSPCL	December 2001	November 2011	10 yrs 11 months
Ukai TPS, Unit 2 (120 MW), GSECL	April 2003	August 2008	5 yrs 4 months
Barauni TPS, Unit 6 (110 MW), BSEB	May 2006	November 2009	3 yrs 5 months
Bandel TPS, Unit 5 (210 MW), WBPDC	January 2005	February 2012	7 yrs 1 month

Source* *Mercados Report on Developing Markets*

Once the decision is taken for the R&M intervention of the plant, there is a normal tendency to give it low maintenance priority. If the execution of R&M

Document Number	Rev No.	Description	Page No.	Date of Issue

		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

works is delayed, further deterioration takes place with the passage of time, which is not captured in the studies. As a result of this, when the plant is opened up for renovation, a lot of technical surprises spring up leading to increase in the scope of work requiring contractual settlements and resulting into consequential delay in completion of works.

In view of the above, it is therefore essential that the scope of single R&M consultant should cover the total responsibility starting from the investigative studies till the bid evaluation for the selection of R&M Contractor. This will minimize the time gap between the completion of studies and the start of R&M works.

8.4 Roles and Responsibilities of Consultants

The Roles and Responsibilities of R&M Consultants and Implementation Support Consultants are discussed below:

8.4.1 Role of R&M Consultant

The consultant to be selected for the role of R&M Consultant should have requisite experience of conducting the plant studies as well as for the preparation and evaluation of bidding documents. Role of R&M Consultant consists of the following activities:

Phase-I

- Conducting of Cold Walk-down and Hot Walk-down Survey.
- Review of the operational history of the power plant.
- Discussion with the Plant Engineers.
- Carrying out of technical studies namely, the Residual Life Assessment (RLA) and Condition assessment (CA) of BTG and BOP of the power plant.
- Carrying out Energy Audit of BTG and BOP to identify the reasons and sources of excess power consumption.
- Reviewing the results of studies mentioned at v) & vi) above.
- Identification of the equipments needing retrofitting / replacement.
- Studying the variations in the present quality of coal from the quality considered at the time of original design of the plant.
- Studying the average quality of coal likely to be available during the next twenty years.
- Studying the latest environment standards prescribed by the regulating agencies at the national and state level.
- Formulating alternative options including the cost impact for the refurbishment / replacement of specific plant equipments for enhancing their performance and extending their life.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[77]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- Preparing a matrix of R&M options for the plant as a whole for extending the useful life by minimum 20 years by either restoring the performance parameters to the original level or for achieving better parameters than the original design.
- Carrying out detailed economic evaluation of each of the R&M options proposed in the matrix.
- Discussions with Plant Management.
- Selection of R&M option to be implemented.
- Finalizing the scope of R&M Works.
- Preparation of Detailed Project Report.
- Obtaining approval from appropriate Regulatory Commission.

Phase-II

- Preparation of Bidding Documents for the appointment of R&M Contractors.
- Evaluation of Bids of R&M Contractors.

8.4.2 Role of Implementation Support Consultant

The consultant to be selected for supporting the utilities for implementing the R&M works should have adequate experience of executing the consultancy projects of similar nature. The role of the Implementation Support Consultant consists of the following activities:

- Reviewing of design documents & drawings of the R&M contractors to ensure compliance of scope of works.
- Site supervision and monitoring the progress of works.
- Checking the quality of construction and erection.
- Holding review meetings with the contractor(s).
- Coordination between the Plant head and the R&M Contractor.
- Shop Testing at supplier's works and inspection at site.
- Supervising the commissioning activities.
- Witnessing and evaluation of Performance Guarantee Tests.

9 SERVICES RENDERED

9.1 Services Rendered as per the Scope of Work

The following documents have been submitted by LII as per 'Scope of the Consulting Services' mentioned at Clause 6.0 of the Terms of Reference of the Contract:

**Table: 9.1
List of Documents Prepared**

S. No.	Title of Documents
1.	Model Feasibility Report
2.	Model RLA/CA Report
3.	Model Detailed Project Report
4.	Model Energy Audit Report
5.	Model Tendering Procedure
6.	Model RFQ and Model RFP documents for the following Six (6) numbers of R&M Contract Packages. i) Boiler & Auxiliaries. ii) Turbo-Generator & Auxiliaries. iii) Coal Handling Plant. iv) Ash Handling System. v) Mechanical Balance of Plant. vi) Electrical Balance of Plant.
7.	Model RFQ and Model RFP documents for R&M Consultant and Implementation Support Consultant (ISC).
8.	Report on Phase-II Activity

The detailed list of documents prepared by Lahmeyer is attached at Annexure-1.

9.2 Services Rendered beyond the scope of Work

On the suggestion & advice of CEA, the following services which are beyond the contractual scope of work were rendered by Lahmeyer, the Consultant, without charging additional fee.

1. Preparation of the Guidelines for conducting the following studies for the health assessment of critical power plant equipments:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[79]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

- a) Guidelines for conducting the Residual Life Assessment.
- b) Guidelines for conducting the Energy Audit.
2. Preparation of the following RFQ and RFP Documents.
 - a) RFQ Documents for ISC (Implementation Support Consultant).
 - b) RFP Documents for ISC (Implementation Support Consultant).

9.3 Problems Faced In Execution of Assignment

As per the contract, the development of Standard Documents by the LII was to be closely linked with the tender documents developed for the R&M programme for KfW funded Project of Nashik TPS Unit-3. According to the original plan LII was required to visit the above plant in July 2012, have discussions with MAHAGENCO and utilize the documents developed for Nashik TPS Unit-3 while standardizing the various documents and procedures. Subsequently, CEA and KfW had advised LII to visit Nasik TPP towards the end of September 2012, since NIT for selection of R&M contractor was expected to be issued during September 2012 after the receipt of 'NOC' from KfW. However, the proposed visit to Nashik TPS could not be made as planned, since, the NIT for selection of R&M Contractor could not be issued by MAHAGENCO.

During the meeting held in CEA on 8th January 2013, it was decided to plan the visit to MAHAGENCO and Nashik TPS Unit-3 in February 2013. Since the issue of NIT for selection of R&M Contractor Nashik TPS Unit-3 was deferred, it was decided that documents issued by MAHAGENCO for the World Bank funded Project Koradi Unit-6 would be collected and studied. The visit to MAHAGENCO could actually be made in April 2013 as against July 2012 originally planned.

10 RECOMMENDATIONS

The following procedures are recommended for executing the R&M works:

1. Before deciding the scope of R&M works, the utilities have to determine the status of health of equipments of various systems as also their residual life by carrying out various Residual Life Assessment (RLA) / Condition Assessment (CA) studies and Energy Audit studies. Depending upon the review of the past performance and results of above studies, decision is required to be taken whether to run, retrofit or replace each of the critical equipments.
2. A single R&M Consultant should be appointed for carrying out the investigative studies such as RLA, CA, Energy Audit etc., preparing feasibility report & detailed project report, facilitating approval from regulatory agency, preparing technical specification for bidding documents and finalizing the R&M contract. Appointment of a single R&M Consultant will reduce the time gap between the investigative studies and the selection of R&M Contractor.
3. After the completion of investigative studies, a matrix of possibilities and options for carrying out R&M solutions should be evaluated in order to choose the most feasible and economic option of R&M to be implemented. Table 5.3 of this report may be referred for considering the matrix of such options.
4. Keeping in view the complexities involved with various contract packages and for having adequate number of eligible and willing bidders with relevant expertise and experience to carry out the R&M works under a package, it is recommended that multiple R&M contracts should be awarded for a maximum of six packages as mentioned below.
 - Boiler & Auxiliaries.
 - Turbo-Generator & Auxiliaries.
 - Coal Handling Plant.
 - Ash Handling System.
 - Mechanical Balance of Plant.
 - Electrical Balance of Plant.
5. It is advisable to engage the services of an Implementation Support Consultant (ISC) for supporting the utilities for implementing the R&M works through site supervision, monitoring the progress of works, checking the quality of construction & erection, supervising

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[81]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

the commissioning activities and witnessing and evaluation of Performance Guarantee Tests.

6. To facilitate the engagement of Consultants and R&M Works Contractors in a planned, systematic and time bound manner, a two step process comprising Request for Qualification (RFQ) and Request for Proposal (RFP) is recommended. Pre-qualification is recommended to ensure that the interested bidders are capable of properly delivering as per the contractual scope of work. The capability of the bidders is assessed on the basis of qualification documents submitted as part of the pre-qualification exercise. Only such bidders who are found qualified in the pre-qualification stage are issued the tender documents and are allowed to submit the bid for the R&M work.
7. Considering the complexities of R&M Projects, it is recommended to invite the bids in two parts, Part-I (Techno-commercial Bids) and Part-II (Price Bids) in single stage (Single stage two envelope method). This tendering method has the advantage that the evaluation of techno-commercial bid and techno-commercial discussion is carried out without any influence of price quotes. The price-bid of techno-commercially non-responsive bid is not opened at all.

The rationale behind inviting Part-II along with Part-I is that bidders will make their quotes before the number of responsive techno commercial bids is known. This will encourage competitive price quotes. However in case a bidder is asked to make changes in its techno commercial offer that may have price implications, that bidder may be allowed to submit supplementary price against such changes before opening of Part-II bids (Price Bids).

8. Since the scope of work of the R&M Consultant makes him responsible for preparing the bidding documents for R&M Contractors and also to assist the utilities in bid evaluation for the appointment of R&M Contractors, the above two provisions will reduce the time gap between the completion of R&M studies and execution of R&M works thereby minimizing the technical surprises during execution. In case, some technical surprises are encountered during the course of execution of the R&M works, a change order should be issued by the owner after studying the need of change in scope, pursuant to the proposal received from the R&M Contractor.

LII-GETS12021-G-00100-001	01	Report for Phase-II Activity	[82]	29.09.2014
		Development of Tendering Procedure and Model Contract Documents for R&M of Fossil Fuel based Power plants in India.		

9. Based on the quantum of work involved for completing the R&M Projects, a reasonable time of 49 months to 57 months is recommended. Table 6.1 of this document may be referred, wherein; the indicative timelines for completing the various processes have been mentioned.
10. Performance Guarantee Test should be conducted as earlier as possible after the unit gets stabilized after re-commissioning. A maximum time gap of three (3) months for the completion of Performance Guarantee test of the BTG (Boiler, Turbine, Generator) as also any of the BOPs (Balance of Plant) is recommended since after this period some OEMs (Original Equipment Manufacturers) normally insist on the application of correction factors (due to deterioration) on the test results. Provision of Liquidated Damages (LDs) has been made in the Model Contracts to deal with the aspects of 'delay in completion of R&M works' as well as 'shortfall in performance parameters' demonstrated during Performance Guarantee Test.
