**TECHNICAL SPECIFICATION FOR EARTHING AND
LIGHTNING SYSTEM**

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E11

1.0 EARTHING AND LIGHTNING PROTECTION SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Earthing and Lightning Protection System complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS:2309	Code of Practice for the protection of building and allied structures against lightning.
IS:2629	Recommended practice for hot dip galvanizing of iron & steel
IS:2633	Method for testing uniformity of coating on zinc coated articles.
IS:3043	Code of practice for Earthing
IS:9537	Conduits for electrical installation.
IEEE:80	IEEE guide for safety in AC substation grounding
IEEE:142	Grounding of Industrial & commercial power systems
CEA	CEA Regulations and standard technical specification for main plant package.

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[1]	25.09.2014

1.3 Design Criteria

- a) Earthing system design shall consist of earth grids and electrodes buried in soil in the whole plant area, embedded in concrete inside all the buildings to which all the electrical equipment, metallic structures are connected to have earth continuity for safety reasons.
- b) The main objectives of earthing system is to:
 1. Provide safety to personnel from contact of dangerous potential caused by ground fault.
 2. Ensure sufficient grounding current for effective relaying.
 3. Stabilize circuit potential with respect to ground.
- c) The earthing conductor shall be designed for fault current of [50 kA] for duration of 1 second.
- d) It is the responsibility of the Bidder to undertake the soil resistivity measurements at site and select suitable size of conductor based on the soil resistivity.
- e) Ground conductor shall be of galvanized steel for above ground and mild steel for embedded and below ground earthing.
- f) Main earth grid conductor shall be mild steel (MS) of [40] mm dia.
- g) Suitable corrosion allowance shall be considered over ground conductor size depends upon soil resistivity.
- h) The main purposes of lightning protection system are to :
 1. Provide protection to structures from lightning strokes.
 2. Provide a low resistance-conducting path to lightning discharge.
 3. Lightning protection shall be provided as per IS: 2309 for Boiler area and other tall structures within the battery limit.

1.4 Specific requirements

1.4.1 Scope of Work

The scope of work shall include Design, Preparation of Earthing and Lightning Layout, supply, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with the safety earthing and Lightning Protection system for following areas Listed below but not limited to the following:

[Note: With reference to particular package, scope of work shall be modified.]

- a) TG Area:
 - i) TG Platforms.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[2]	25.09.2014

- ii) TG area Grade Levels Maintenance area.
- iii) All equipments, structures etc of TG package.
- iv) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- b) Boiler Area:
 - i) Boiler Platforms
 - ii) Boiler Grade Levels covering coal mill and Maintenance area.
 - iii) ESP Platforms
 - iv) ESP/FOPH switchgear room.
 - v) FOPH area.
 - vi) All equipments, structures etc of Boiler package.
 - vii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- c) Balance of plant Area:
 - i) Earthing and lightning protection system for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, Transformer area, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
 - ii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- d) CHP Area:
 - i) Switchgear rooms
 - ii) All equipments, structures etc of Boiler package.
 - iii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- e) AHP Area:
 - i) Switchgear rooms
 - ii) All equipments, structures etc of Boiler package.
 - iii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard, Transformer yard and BTG area are provided with earth mat of [40] mm dia MS Rod conductor buried below 600mm from ground level. Areas like AHP, CHP, Boiler and TG, and all other

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[3]	25.09.2014

BOP area below grounding system are covered in this eBOP package and above ground earthing for AHP, CHP, Boiler, TG and Mechanical BOP are covered in respective package itself. System Neutrals are earthed through Treated Earth Pit. All areas of power plant are interconnected to form an integrated single earthing system. Lightning system for above ground are covered in respective packages and below ground is covered in this eBOP package in same way as earthing system.

1.4.2 Earthing system

- a) Earthing system shall be designed in accordance with IS 3043 and Indian Electricity Rules and Acts.
- b) Fault current for the earthing system shall be designed for [50] KA for duration of 1 sec.
- c) All electrical equipment, non-current carrying metal parts, structures, building steel, lightning protection system, transformer neutrals shall be connected to station ground grid.
- d) Treated earth pits including riser shall be provided for transformer neutral earthing.
- e) Connection between the equipment earth lead and the grid conductor shall be welded. For rust protection, the welds shall be treated with zinc chromate primer and coated with zinc rich paint.
- f) Entire erection of grounding work shall be carried out in such a way as to be capable of withstanding the intended services of carrying full short circuit level currents to ground mat without any damage/deformation.
- g) All off site area of AHP , CHP etc shall be provide with peripheral earthing with at least two connection to main station earth grid through treated earth pit.

1.4.3 Ground Grid Conductor

- a) Ground grid conductor of mild steel rod shall be used.
- b) *[The minimum conductor section is determined on the basis of ground fault current. This section is then increased by an allowance to account for the soil corrosion loss of 0.12 mm (on diameter of conductor) per year over the design life of 40 years.]*
- c) However bidder shall consider as per CBIP norms “ Manual on Earth mat design” the corrosion allowance as below:
 - For soil resistivity greater than 100 ohm-meter: No allowance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[4]	25.09.2014

- For soil resistivity greater than 25- 100 ohm-meter: 15% allowance.
- For soil resistivity less than 25 ohm-meter: 30% allowance.

1.4.4 Underground Grid

- The ground grid mesh is designed to keep the touch and step voltages within safe limits as per recommendation of IEEE 80.
- [The ground grid conductors shall be buried in earth at a depth of 600 mm]. The length of ground conductors below earth shall be sufficient to ensure a ground resistance less than one (1) ohm.
- The ground grid conductor shall be so laid as to provide short and direct connection to building steel and major electrical equipment.
- Ground rods shall be provided at the points where system neutrals/lightning protections are connected to the ground grid.
- All ground grid conductor connections shall be welded type.
- Ground grid shall be interconnected with the ground grid of neighboring areas at least at two (2) points for further reducing the ground grid resistance.
- Suitable pigtails shall be provided and shown in the [layout drawing] for connection with ground grid of neighboring areas.
- A minimum earth coverage of [300] mm shall be provided between the ground grid conductor and the bottom of trenches, tunnels, underground pipes, foundations, railway tracks etc. The ground grid conductor shall be re-routed in case it fouls with equipment foundations.
- In some cases, it may happen that the construction work of cable trench, foundation and laying of underground pipes are being taken up after the grounding mat has been laid. It may be required to cut a portion of grounding conductor to avoid fouling with cable trench, equipment foundations, underground pipes etc. In this case, the ground conductor shall be properly rerouted and rejoined/reconnected with the main grounding mat during the construction/laying of above underground objects and good electrical continuity of grounding conductor shall be ensured.
- Grounding conductors crossing the road may have to be laid at greater depth to suit the site conditions.
- Grounding conductor around the building shall be buried in earth at a minimum distance of [1200] mm from the outer boundary of the building.
- The Bidder shall carryout the grounding of all electrical equipments and connection to main earth grid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[5]	25.09.2014

1.4.5 Ground Electrode

Ground electrodes shall be [40] mm dia. and [3] metre long M.S. rod. These are to be fabricated and driven into the ground by the side of mat conductors. All connections to the conductors shall be done by arc welding process.

1.4.6 Above Ground Connections

- Galvanized steel flats shall be used for all connections above earth.
- Inside building, ground conductors shall be run for each floor supported on building steel and/or cable trays. These ground conductors in turn shall be connected to the station ground grid through riser (at least two) coming up along building columns/cable shafts.
- Two separate and distinct ground connections shall be provided for each electrical equipment in compliance with I.E. Rules.
- All steel columns and structures shall be connected to the earth mat through earth leads.

All connections above ground shall be welded type except connection to equipment/structures which shall be bolted type.

1.4.7 Risers

Risers are required for connecting the equipment and structures with the ground mat. Risers are to be provided from underground mat to above ground levels where the ends shall be left free for connecting to the equipment. Each riser shall be 1 No. [40] mm dia. M.S. rod and shall project above grade level/concrete floor level by minimum 300 mm. They are to be clamped or supported along the outer edge of the concrete foundation. Connection to the ground mat shall be done by arc welding.

1.4.8 Equipment Ground Lead

- Equipment ground connections shall be sized to carry the ground fault current. Considerations shall also be given to mechanical ruggedness of the connections and to limit the number of sizes.
- The minimum ground conductor sizes for various equipment and structures are given in below.

Table 2.0

DESCRIPTION	SIZE	MATERIAL
a) Main Grounding Grid Conductor	[40] mm dia Rod	Mild Steel
b) Riser/Pigtail From Grounding Grid/Mat	[40] 40 mm dia Rod	- Do -

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[6]	25.09.2014

DESCRIPTION	SIZE	MATERIAL
c) Electrode	[40] mm dia, [3000] mm long Rod	- Do -
d) Conductor used for connection of various equipment/structures as listed below		
HV motors, Earthing ring, Earthing lead to earth pits etc.	[50 x 10] mm	Galvanised steel
Structures, Control Panels, Cable Trays etc.	[50 x 10] mm Flat	- Do -
415V Power Control Centres, Motor Control Centres, Distribution Boards etc.	[50 x 10] mm Flat	- Do -
Local Panels, Lighting Panels	[25 x 6] mm Flat	- Do -
Motors :		
Above 90 kW	[50 x 10] mm Flat	Galvanised steel
Above 30 kW Upto 90 kW	[25 x 6] mm Flat	- Do -
Above 5 kW Upto 30 kW	[25 x 3] mm Flat	- Do -
Upto 5 kW	[8] SWG	- Do -
Miscellaneous Items, viz. Push Button Station, Junction Boxes etc	[8] SWG	- Do -

{ The Above size of Earth flat is indicative only. Bidder shall refer Volume II Section I for size of earth flat used for existing plant or as per design. }

1.4.9 Jointing and Connection

- All ground conductor connections below ground level shall be done by electric arc welding with low hydrogen content electrode. The contact surfaces shall be thoroughly cleaned to provide good electrical continuity.
- The bending of the large diameter ground conductor where necessary shall be done by gas heating.
- The projected portion of riser/pigtail above ground shall be coated with two coats of bitumen paints (anti-corrosive paints) with a minimum thickness of 1 mm after connection.
- The connections between the riser/pigtail and earthing conductors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[7]	25.09.2014

(galvanized steel flats) and between the earthing conductors above ground level shall be made by electric arc welding.

- e) The portion of galvanized steel flats, which undergoes welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.
- f) The earthing connections to equipment grounding pads/terminals and some removable structures shall be bolted type with GI bolts and nuts. The contact surfaces shall be thoroughly cleaned (to free from scale, paint, enamel, grease, rust) before connection to ensure good electrical contact.
- g) Equipment/structures ground connections shall be coated with weather resistant paints/cold galvanizing paints after proper checking / testing.
- h) Whether specifically shown or not, all conduits, trays, cable armour and cable end box, electrical equipment such as motors, switchboards, panels, cabinets, junction boxes, lockout switches, fittings, fixtures, etc. shall be effectively grounded.

1.4.10 Earthing system installation

- a) The spacing between two electrodes shall be at least equivalent to twice the length of the electrode.
- b) Earthing conductor running exposed on column, walls, etc., shall be supported by suitable cleating, at intervals of 750 mm.
- c) The earthing conductor crossing the road / track shall be laid in hume pipe or laid at a greater depth to avoid damage.
- d) When earth conductor passes through floors, walls, etc suitable pipe sleeves shall be provided and the same shall be sealed after installation.
- e) The connection between earthing pads / terminal to the earth grid shall be made short and direct and shall be free from kinks & splices.
- f) Metallic conduits and pipes shall not be used as earth continuity conductor.
- g) Street lighting poles, flood light poles & towers, their junction boxes shall be connected to the earthing conductor to be run along with supply cable. This earth conductor shall be in turn connected to earth grid at two extreme points.
- h) The steel columns, metallic stairs, hand-rail etc. of the building where electrical equipment are located shall be connected to the nearby ground mat by earthing conductor. Electrical continuity shall be ensured by bonding the different sections of handrails and metallic stairs.
- i) Fence within the ground grid shall be bonded to the plant ground system at regular interval not exceeding ten [10] metres. Fence gate shall be separately grounded with flexible connection to permit movement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[8]	25.09.2014

- j) [50 x 10] mm galvanized steel flats(minimum size) shall be run as main earthing conductors above ground along building columns, walls, steel structure, etc. for equipment and other structures earthing. These earthing conductors shall be interconnected between them and to the main ground grid through risers/pigtail. The connection between earthing conductor and riser shall be made above ground. Earthing conductors can be embedded in concrete floor of the building wherever necessary without having direct contact with the reinforcement rods. At the crossing of building walls, floors etc. the earthing conductor shall be passed through galvanised conduit sleeves. Both ends of the sleeve shall be sealed to prevent the passage of water through the sleeves.
- k) All indoor and outdoor electrical equipment and associated non-current carrying metal works, supporting structures, building/ boiler columns, fence, system neutrals, lightning masts/arresters shall be connected to the plant ground system.
- l) Miscellaneous devices such as junction boxes, pull boxes, pushbutton stations, lockout switches, cable end boxes, lighting fixtures, receptacles, switches etc. shall be effectively grounded whether specifically shown or not.
- m) Metallic conduits and pipes shall not be used as earth continuity conductor. These shall be grounded at both ends.
- n) A continuous [50 x 10] mm (minimum size) G.S. flat earthing conductor shall run along the cable trays and supporting structure of all cable routes. This earthing conductor shall be attached to each section of cable tray/trays through [50 x 10] mm G.S. flats. The earthing conductor shall be securely connected to the earth mat at both ends.
- o) Flexible earth conductors shall be provided at expansion joints for earthing the gates, operating handles, etc.
- p) Equipment bolted connection after being checked and tested shall be painted with anti-corrosive paint / compound.
- q) Connection between the equipment earth lead and the grid conductor shall be welded. For rust protection, the welds shall be treated with zinc chromate primer and coated with zinc rich paint.
- r) The cable sheaths, screens armour shall be earthed at both ends for multi-core cables. For single core cables the same shall be done at one end (switchgear end) only.
- s) All bimetallic connections shall be treated with suitable compound to prevent moisture ingress.
- t) Main plant earth grid and switchyard earth grid shall be interconnected each other by minimum two numbers of leads.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[9]	25.09.2014

1.4.11 Lightning Protection System Design

- a) Lightning protection design and installation work shall be provided on the basis of IS 2309 Code of Practice.
- b) Lightning protection system shall consist of vertical air termination rods, horizontal roof conductors, down conductors and pipe electrodes.
- c) The need for providing the lightning protection system shall be established by calculating risk index value for each building structure, etc., as per procedure given in IS-2309 and any building whose risk index is more than value specified in IS shall be provided with lightning protection. However, Boiler areas, station building, switchyard building shall be provided with lightning protection irrespective of the arrived risk index.
- d) Shielding angle for one vertical air termination shall be 45 degrees. For more than one rod, shielding angle between the rods shall be taken as 60 Degrees.
- e) Down conductors shall run along the outer surfaces of the building and shall have a test joint about 1500 mm above ground.
- f) A Lightning electrode shall be provided at the connection point of the down conductor with the station ground.
- g) Galvanized steel rods and flats shall be generally used for air termination and connections. All connections shall be welded type.

1.4.12 Air Terminations

- a) The vertical air terminal rods shall be installed at the roof of Turbo generator building, Boiler and chimney etc to protect these objects from lightning strokes.
- b) The projected length of the Air termination rod shall be as required to protect the object (on which the rod is fixed) from lightning stroke.
- c) The air terminal rod shall be properly fixed on the top of the building/structure to withstand very high wind pressure. In case the air terminal rod is embedded at the top of roof of building, the portion embedded inside the concrete shall not touch the reinforcement bars and shall be duly insulated from them.
- d) All the vertical air terminal rods shall be electrically connected together by means of horizontal conductors of size [50 x 6] mm galvanized steel flats.
- e) For chimney air termination, rods interconnected by circumferential conductors will be provided at the apex of flue and also upon outer shell of the chimney. The air termination system will be formed by lead coated copper conductors to prevent melting and corrosion of conductors due to flue gas.
- f) For cooling towers, air termination system will comprise of horizontal

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[10]	25.09.2014

circumferential conductors at the top

1.4.13 Down Conductors

- a) Galvanized steel down conductors of suitable size [25 x 6] shall be connected with air terminal rod/horizontal conductor at the top of roof/structure and other end connected to the nearest 40 mm dia. mild steel rod riser from ground electrode.
- b) Each down conductor shall have an independent earth termination. In no case conductors of the lightning protection system shall be connected with the conductor of grounding system above ground level.
- c) The connection between each down conductor and rod electrode (by means of 40 mm mild steel rod riser) shall be made by others. However Bringing down comer with test link at a level of 1500mm approximately from above ground level shall be boiler contractor scope of work.
- d) The down conductor shall be laid straight and sharp bends shall be avoided as far as practicable. These shall be cleared on outside of the building wall and column/structure at about 750 mm intervals unless stated otherwise in the drawing.
- e) At all supports for down conductor along the column/wall of the buildings etc. the portion embedded inside the building concrete should not touch the reinforcement bars.
- f) All exposed metallic parts of the buildings shall be bonded to the down conductors. Such parts shall include ladders, balconies, conduits etc.
- g) The down conductors shall be protected at the ground level against mechanical injury by means of non-metallic pipes, viz. PVC pipes filled with bituminous compound.

1.4.14 Switchyard Lightning protection

- a) For switchyard lightning protection shall be provided by lightning masts and/or shield wires.
- b) In case of lightning protection by shield wire, the shield wires provided shall be of GS wire strung across the pinnacles of the gantry tower structures. The size of shield wire shall be based on the lightning impulse current expected and the time duration for which it is likely to flow. Allowance shall be given in the final size to account for corrosion of the shield wire during service at rate of [0.03] mm per annum. However, minimum size of the shield wire shall not be less than [70]sq.mm. The zone of coverage for the shield wire shall be considered as 60 deg between the two shield wires and 45 deg for end shield wires. The down conductors from shield wires shall be run along the towers and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[11]	25.09.2014

connected to rod/pipe electrodes.

- c) In case of lightning protection by lightning protection masts, the down conductors from the masts/peaks/shield wires shall be run along the tower and connected to the test links mounted on the towers at 1500m from the ground level. Conductors from the test links shall be connected to the rod/pipe electrodes which in turn are connected to the main earth grid in the switchyard. Calculations for sizing and determining topography and number of lightning masts shall be furnished for approval.

1.4.15 Electrodes (for Lightning Protection)

The electrodes shall be [40 mm] diameter [3000 mm] long mild steel rod. These shall be driven into the ground.

All the electrodes shall be interconnected by means of one (1) [40 mm] dia mild steel rod which shall be laid under ground at a minimum depth of [600 mm] below finished grade level unless stated otherwise. This ground mats/electrode in turn shall be connected to main grounding grid.

1.4.16 Riser (for Lightning Protection)

All risers connected to grounding mat shall be [40 mm] mild steel rods and shall be projected 300 mm above grade level unless stated otherwise.

1.4.17 Jointing & Connection

- a) All ground conductor connections below ground level shall be done by electric arc welding with low hydrogen content electrode.
- b) The projected portion of riser above ground shall be coated with two (2) coats of bitumen paints (anti-corrosive paints) with a minimum thickness of 1 mm after connection.
- c) The joints in the lightning conductors shall be kept to a minimum and there shall be no joint in the underground portions of conductors.
- d) All the joints shall be done by arc welding process overlapping of the conductors at straight joints shall not be less than 150 mm. The contact surfaces shall be cleaned properly before jointing.
- e) The portion of galvanized steel flats, which undergoes welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.
- f) The bolted joint of the test link shall be covered with thick coating of bitumen paint after successful testing.
- g) The air terminal rods and shielding mast shall be coated with weather resistant anti-corrosive paint (zinc chromate followed by two coats of aluminium paint).
- h) The steel to copper connection shall be brazed type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[12]	25.09.2014

- i) The lightning protection of inflammable liquid storage tanks wherever required, shall be provided with horizontal conductors strung between tall poles covering the entire zones or with air terminal rods mounted on top of poles/structure. These horizontal conductors/vertical air terminal rods shall be connected to rod electrodes, which in turn shall be connected to station ground mat.
- j) The sizes and materials of earthing conductors to be used in lightning protection system are listed below :
- k) Note: The above sizes are indicative only. Actual size shall be as per Bidder design or as per existing plant details as provided in Section I in case of replacement work as called for.

Table 3.0

DESCRIPTION	SIZE	MATERIAL
a) Vertical Air Termination	[20] mm dia Rod	Galvanised steel
b) Horizontal Conductor	[50 x 6] mm flat [25 x 6] mm Flat	-----do-----
c) Down Conductors	[25 x 6] mm Flat	-----do-----
d) Ground electrode / riser	[40] mm dia Rod	Mild Steel
e) Interconnection with earth mat	[40] mm dia Rod	Mild Steel

1.5

Tests

l) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[13]	25.09.2014

Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant /purchaser or his representative.

The following test shall be conducted:

- a) Measurement of earth resistance for each electrode.
- b) Measurement of total earth resistance.
- c) Measurement of earth loop resistance for E/F path of biggest LV drive.
- d) Check tightness of all earth connections
- e) Check earthing of all metallic equipments, cable trays, bus bar supporting structures, building column (if steel all elect equipments, pipe lines etc. as per the drawing / specification)

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6

Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *[Earthing Material like conductor , flat , welding description etc]*
- b) *[Air termination rod and its accessories etc]*
- c) *[Technical Data sheets for Earthing and Lightning system].*

Document Number	Rev No.	Description	Page No.	Date of Issue

VOLUME-II

SECTION-II, PART-B, ANNEXURE-E12

TECHNICAL SPECIFICATION FOR 6.6kV SWITCHGEAR

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E12

1.1 General

This specification is intended to cover the [design, engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning] of 6.6 Switchgear, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] Of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

Codes	Name of Standard
IS : 226	Structural steel (standard quality)
IS : 375	Switchgear bus bars, main connections and auxiliary wiring, marking and arrangement
IS : 722	AC electricity meters
IS : 728	Galvanized steel structures
IS : 2099	Specification for bushings for alternating voltages above 1 000 volts
IS : 2147	Degree of protection
IS : 2516	Alternating current circuit breakers
IS : 2544	Specification for porcelain post insulators for systems with nominab l voltages greater than 1 000 volts
IS : 2705	Current transformer specification
IS : 3043	Code of practice for earthing
IS : 3156	voltage transformers specification
IS : 3231	specification for electrical relays for power system protection
IS : 3427	A.C. metal enclosed switchgear and control gear for rated voltages above 1 kV and upto to and including 52 kV.
IS : 4710	Switches and switch isolators above 1000 V but not exceeding 11000 v.
IS : 5082	Specification for wrought aluminum and aluminum alloy bars, rods, tubes and selections for electrical purposes.
IS : 6875	Control switches push buttons

Codes	Name of Standard
IS : 8084	Specification for interconnecting bus-bars for ac voltage above 1 kV up to and including 36 kV
IS : 8686	Specification for static protective relays
IS : 9046	Specification for ac contactors for voltages above 1000 v up to and including 11 000 v
IS : 9224	Low voltage fuses
IS : 9385	HV fuses
IS : 9431	Specification for indoor post insulators of organic material for system with nominal voltages greater than 1000 volts upto and including 300 kV
IS : 9921	Alternating current disconnectors (isolators) and earthing switches for voltages above 1 000 v
IS : 10601	Dimensions of terminals of high voltage switchgear and control gear
IS : 11353	Guide for uniform system of marking and identification of Conductors and apparatus terminals.
IS : 13118	Specification for high voltage ac circuit breakers
IEC 6044-1	Current transformer
IEC 6044-2	Voltage transformer
IEC 6056	High voltage alternating current circuit breakers
IEC-60099-1	Non-linear resistor type gapped arrestor for AC systems
IEC-60099-4	Metal oxide surge arrestor without gap for AC system
IEC 60129	A.C disconnectors and earthing switches
IEC 60255	Electrical Relays
IEC-60298	High voltage metal enclosed switchgear and control gear.
IEC 60529	Degrees of protection provided by enclosures
IEC-62271-100	High voltage alternating current circuit breakers.
CEA	CEA regulations
CEA	Standard technical specifications for main plant package

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[2]	25.09.2014

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All 6.6kV Switchgear shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The Switchgear shall be suitable for operation in a highly polluted environment.
- b. All 6.6kV Switchgear shall be suitable for following voltage & frequency variations as follows:

Voltage Variation	:	(±) 10%
Frequency Variation	:	(+) 3% to (-)5%
Combined Variation of Voltage & Frequency	:	10% (absolute sum)
For DC System	:	(+)10% to (-)15%

- c. All motors rated above 160kW shall be feed from 6.6kV switchgear.
- d. Motor rated [160-600kW] shall be provided with [vacuum contactor/vacuum circuit breaker] and motor rated above [600kW] shall be provided shall be provided with vacuum circuit breakers.
- e. 6.6kV switchgear shall be Indoor, metal clad, floor mounted, Single front and fully draw out type. Design and construction shall be such as to allow extension at either end. These shall be CRCA sheet metal enclosed and assembled to form a rigid, free-standing floor mounted structure. Vertical units shall be assembled to form a continuous line up of panels
- f. All 6.6 kV Circuit breaker shall be draw out type & should have Service, Test and Disconnected positions with positive indications for service & test positions. It shall be possible to charge the springs manually, if, required
- g. Local/remote selection shall be provided for all incoming/Outgoing Circuit Breaker modules. Incoming/Outgoing breaker shall be closed at service position from remote (DCS) and at test position from Local (Switchgear).
- h. Two out of three Incomer logic for 6.6kV Switchgear shall be provided. For Unit and station board one Incomer shall be there from Unit Transformer and Station Transformer respectively. Tie feeder shall be provided between Unit and station switchgear such that in case of loss of supplies to unit switchgear from UAT, the same shall be restored from respective station switchgear. In order to achieve the same, fast bus transfer shall be provided at Unit switchgear.
- i. All motors shall be provided with Emergency Stop Push buttons.
- j. Control and Indication voltage level shall be 220V DC.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[3]	25.09.2014

- k. Maximum system fault level at 6.6kV bus including initial motor contribution shall be 40kA for 1 sec.
- l. 6.6kV System shall be earthed through resistance to limit fault current to 300A.
- m. Surge arrestor shall be provided for each motor feeder/Transformer feeder.
- n. The switchgear will be located in a clean but hot humid and tropical atmosphere.
- o. Duty involves direct-on-line starting of large induction motors with motor starting current varying 6 times the full load current. For BFP starting current varying 4.5 times of full load current.
- p. For continuous operation at specified ratings, temperature rise of the various switchgear components shall be limited to the permissible values stipulated in the relevant standards and this specification.
- q. The switchgear and components thereof shall be capable of withstanding the mechanical forces and thermal stresses of the short circuit current without any damage or deterioration of material.
- r. All the numerical relays shall have communication on two ports, local front port communication to laptop and a second port with [IEC 61850 protocol] to communicate with DCS.

1.4 Specific Requirements

1.4.1 Construction

All 6.6 kV switchgear shall have following minimum features.

- a. 6.6 kV switchgear shall be of indoor, metal clad, single front, single tier, floor mounted, horizontal drawout type with vacuum circuit breaker and free standing type. The Panels shall be suitable for cable entry at bottom and bus duct connection at top.
- b. Between 6.6kV Switchgear Incomer and transformer, segregated phase bus duct is considered. Hence switchgear shall be suitable for this connection and necessary flange connection and co ordination with bus duct manufacturer in this regards is covered in this specification.
- c. All frames and load bearing members shall be fabricated using mild steel structural sections or pressed and shaped cold rolled sheet steel of thickness not less than 2 mm.
- d. Frame shall be enclosed in cold rolled sheet steel of thickness not less than 2 mm. Doors and Covers shall also be of cold rolled sheet steel of thickness not less than 1.6 mm. Removable gland plates of thickness 3mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material)shall be provided for all panels. Suitable removable type lifting hooks and / or jacking pad shall be provided on each panel or shipping section for ease of lifting of switchgear. These hooks when removed shall not leave any opening in the panels.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[4]	25.09.2014

- e. Each breaker shall be housed in a separate cubicle, complete with an individual front access door. Each vertical section shall have a removable back cover.
- f. The switchgear enclosure shall confirm to the degree of Protection of the [IP4X] for indoor installation. However degree of protection of LV chamber shall be [IP-52]. No louvers/Opening shall be provided on the top of panel. All the other louvers if provided shall have very fine brash or GI mesh screen.
- g. Paint shade for complete panels shall be [RAL 5012] for extreme end covers for all board.
- h. The working zone shall be restricted to [750mm to 1800mm] from floor level. Total height of the switchgear panels shall not exceed [2600 mm].
- i. Metallic barriers shall be provided between vertical sections and also between adjacent modules to ensure prevention of accidental contact with live parts during routine inspection/maintenance of functional units or cable terminations of one or more functional units when working on those of adjacent units. These barriers shall have insulating inserts as necessary for taking the interconnections etc.
- j. A nameplate with switchgear designation shall be fixed at the top of the central panel. A separate nameplate giving feeder details shall be provided for each compartment. A separate nameplate giving details of bus section shall also be provided for switchgear having more than one bus section.
- k. Name plate shall be provided for each equipment (lamps, push buttons, switches, relays, auxiliary contactor, etc) mounted on the switchboard. Special warning plates one each on each feeder of a shipping section shall be provided on removable covers of doors giving access to cable terminals and busbars. Name plate size shall be minimum of 20x75 mm for Instruments/devices and 40x50 mm for panels. Thickness shall be minimum 3 mm.
- l. Two 220V DC feeders shall be provided for control, Indication and annunciation of breaker operated module at any one cubicle. Further distribution to all verticals shall be in the scope of bidder.
- m. Compartment door shall be interlocked with main power isolating device for safety with provision for defeating it by authorized person.
- n. Supplier shall provide total 10% or minimum one (1) no. spare feeder of each type & rating with respect to total requirement of the switchgear.
- o. Switchgear shall have provision to receive 415V, 3ph, 4wire supply. Single phase 240V balanced supply shall be derived from 415V, 3ph, 4 wire supply. Each cubicle shall be provided with thermostat controlled space heaters suitable for operation from 240 V \pm 10%, single phase, 50 Hz, + 3% - 5% supply and 5A, 240V AC, 3 pin plug socket and cubicle lamp. The space heaters shall be located at the bottom of the switchboards. Cubicle heater, plug/socket/lamp circuits shall have individual switch fuse units. Motors shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[5]	25.09.2014

be provided with anti- condensation heaters at 240V.Necessary provision for supply of motor space heating shall be considered in the switchgear.

- p. All relays, meters, switches and lamps shall be flush mounted on the respective cubicle door or on control cabinet built on the front of the cubicle.
- q. Controls and interlocks as required for the safe switching, operation and maintenance of the switchgear shall be provided. Mechanical interlocks shall be provided in addition to electrical wherever possible.
- r. It should be possible to carryout maintenance on a feeder with adjacent feeders alive.
- s. The Fast Bus Transfer (FBT) panel shall be totally enclosed, floor mounted panel conforming to degree of protection IP-42. The minimum thickness of cold rolled sheet steel used shall be 2.0 mm. The ABT panel shall consist of a lineup of control boards, with cable entry provisions from bottom of panel. The height of FBT panel inclusive of mounting channel, anti-vibration pads etc. shall be restricted to [2400 mm].
- t. The switchgear shall be [natural cooled].
- u. The circuit breakers, contactors, bus VTs shall be mounted on withdrawable truck which shall roll out horizontally from service position to isolated position.

1.4.2

Bus and Bus Taps

- a. The main buses and connections shall be of high conductivity [aluminum / aluminum alloy].Control and auxiliary buses shall be of electrolytic copper/copper wires.
- b. Bus bars and connections shall be fully insulated for working voltage with adequate phase / ground clearances. Insulating sleeves for bus bars and shrouds for joints shall be provided.
- c. Bus insulator shall be flame-retardant, non-hygroscopic, track resistant type with high creepage surface. This shall be of non-carbonizing material such as epoxy bonded fiberglass. Bus bars shall be color coded for easy identification.
- d. The bus bar supports shall be able to withstand stresses due to maximum short circuit and also take care of any thermal expansion.
- e. Bus bars shall be color coded for easy identification and so located that the sequence R-Y-B shall be from left to right, top to bottom or front to rear, when viewed from the front to switchgear assembly.
- f. The continuous rating of the main bus bars shall be same as that of the incomer circuit breaker and shall carry this continuous current without exceeding the temperature of [90 °C]. For silver plated joints maximum temperature shall be limited to [105 °C].

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[6]	25.09.2014

- g. The busbar chamber shall be provided with inter panel barrier with epoxy cast seal off bushings through which the buses will pass through so as to prevent fire from one panel to another.

1.4.3

Circuit Breaker

- a. The circuit breaker shall be of vacuum type.
- b. The circuit breakers shall be fully draw-out type, having service, test and disconnected positions with positive indicators for service & test positions.
- c. The breakers shall have motor operated spring charged mechanism. It shall be possible to charge the springs manually, if, required. Breakers shall be trip free and shall have an anti-pumping device. The operating duty cycle shall be 0 -3 min.-CO-3 min.-CO.
- d. For motor, spring charging shall take place automatically after each breaker closing operation. One 'open-close-open' operation of the circuit breaker shall be possible after failure of power supply to the motor.
- e. Automatic safety shutters shall be provided to ensure the inaccessibility of live parts after the breaker is drawn out. There shall be distinct overall door for the breaker compartment and shall be lockable.
- f. Truck shall have distinct service, Test and Isolated positions. It shall be possible to close the breaker compartment door in isolated position also. The truck and breaker frame shall get earthed while the truck is being inserted in the panel and positive earthing of the truck and breaker frame shall be maintained in all positions.
- g. Outgoing breakers shall be suitable for switching transformers and motors at any load. Motor feeders shall be suitable for frequent direct on-line starting of motor.
- h. Mechanical safety interlocks shall be provided to prevent
 - i. The circuit breaker from being racked in or out of the service position when the breaker is closed.
 - ii. Racking in the circuit breaker unless the control plug is fully engaged
- i. Breakers shall be adequately de-rated to account for design ambient temperature and temperature inside the cubicle.
- j. Equipment and component rating and quantities shall be suitably selected according to the requirements with adequate margin.
- k. Closing and tripping coil shall operate satisfactorily under the following conditions.
 - i. Closing Coil: 85% to 110% of rated voltage.
 - ii. Tripping Coil : 70% to 110% of rated voltage

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[7]	25.09.2014

1.4.4 Contactor

High voltage contactor shall be of AC-3 utilization category and shall be of vacuum type. Fuse and contactor shall be mounted on withdrawable truck. The contactor shall be latched type and shall be complete with mechanical trip indicator, anti pumping relay, surge suppresser, single phasing preventor etc.

1.4.5 Bus Transfer scheme:

The 6.6kV Unit Switchgear shall be connected to their respective unit auxiliary transformer through bus duct. These buses of unit switchgear shall also be connected to 6.6kV buses of station switchgear through tie feeders and breakers located at the unit and station end. Automatic Fast bus transfer scheme shall be provided between 6.6kV unit and station switchgear such that in case of loss of supplies to unit switchgear from UT, the same shall be restored from respective station switchgear. The automatic bus transfer system shall consist of fast, slow etc. transfer in Auto/ Manual mode.

In addition to above, each switchgear shall be provided with the following provisions-

- Dead bus closing
- Manual live change over (Momentary paralleling)
- Automatic slow bus transfer.

1.4.6 Current Transformers

- a. Current Transformers shall be cast-resin type. All secondary connections shall be brought out to terminal blocks where wye or delta connection shall be made. They shall have sufficient thermal and mechanical capacity to withstand the maximum momentary current rating of the breakers.
- b. CTs shall have polarity makings indelibly marked on each transformer at the lead terminations and at the associated terminal block. Facility shall be provided for short circuiting and grounding the CT secondary at the terminal blocks. Secondary terminals shall be provided with protective cap.
- c. CT terminal block shall be disconnecting type and suitable for round type lugs with facility for testing and short circuiting of individual CT.
- d. All CTs shall be provided with supports independent of busbars / busbar supports. The CTs shall be located in such a way that they can be easily approached for maintenance without necessitating shutdown of adjacent feeders.
- e. CTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.
- f. Accuracy class of CT shall be 5P20 for protection, PX for differential protection and 0.5 for metering.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[8]	25.09.2014

1.4.7 Voltage Transformer

- a. Voltage transformers (VT) shall be cast-resin type with an accuracy class of 1.0 for metering and 3P for protection.
- b. VTs shall be of the single-phase type. VTs shall be protected on their primary side by fuse and by MCB (with auxiliary contacts) on the secondary sides.
- c. VTs shall have continuous over voltage factor of 1.2 and short time over voltage factor of 1.5 for 30 seconds for effectively earthed system
- d. It shall be possible to replace VTs without having to de-energise the main busbars.
- e. VTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.8 Transducer

For Incoming and outgoing feeders remote metering transducer shall be provided. The output shall be 4-20 mA DC which shall correspond to the normal range. All the transducer shall be dual output type.

1.4.9 Secondary wiring

- a. The switchgear shall be fully wired at the factory to ensure proper functioning of control, protection and interlocking schemes.
- b. Fuse and links shall be provided to permit individual circuit isolation from bus wires without disturbing other circuits. All spare contacts of relays, switches and other devices shall be wired up to terminal blocks.
- c. Secondary wiring within the switchgear shall be carried out in a neat and systematic manner and securely held in position (either loomed or run in conduit / trunking). Wherever wiring passes through compartment, it shall be run in conduit / trunking, if metallic shall be bonded to the main earth busbar.
- d. Wiring shall be done with flexible, 1.1/0.650kV grade, PVC insulated switchboard wires with *[stranded copper conductors of 2.5 mm² for CT & PT circuits and 1.5mm² for control circuit wiring (applicable for internal panel wiring).]*
- e. Each wire shall be identified, at both ends, with permanent markers bearing wire numbers as per bidder's wiring diagrams. Wire terminations shall be made with crimping type connectors with insulating sleeves, wire shall not be spliced between terminals.

1.4.10 Terminal blocks

- a. Terminal blocks shall be of 1100 V grade, stud type with marking strips. Terminals for CT secondary leads shall have provision for easy shorting, earthing and shall be suitable for connecting 2 cables of 2.5 mm² copper.
- b. Sufficient terminals shall be provided on each terminal block to ensure that

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[9]	25.09.2014

not more than two outgoing wires are connected per terminal. All spare contacts of auxiliary relays, timers etc. shall be wired up to the terminals. [20%] spare terminals shall be provided on each terminal block.

- c. Terminal blocks shall be located to allow easy access. Wiring shall be grouped such that the individual wires of a cable can be connected to consecutive terminals.

1.4.11 Ground bus

- a. A ground bus, rated to carry maximum fault current, shall extend full length of the switchgear. The ground bus shall be provided with two-bolt drilling with G.I. bolts and nuts at each end to for connection to the grounding conductor / flat.
- b. Each unit shall be connected directly to the ground bus. The frame of each circuit breaker and draw out V.T. unit shall be grounded through heavy multiple contacts at all times except when the primary disconnecting devices are separated by a safe distance.
- c. C.T. & V.T. secondary neutrals shall be earthed through removable links so that earth of one circuit may be removed without disturbing others. All hinged doors shall be earthed by flexible copper bride.

1.4.12 Control & Indication

- a. The circuit breaker shall be wired up for local & remote operation. Each breaker shall be equipped with following:
- b. Remote selector switch with pistol grip handle and key interlock for breakers with motor wound spring charging mechanism. In Remote position, the breaker can be operated in service position with all interlock and protections. In Local position, the breaker shall be operated from switchgear only in test position.
- c. Each cubicle shall be provided with Auto/ Manual Switch. Trip selection switch and Trip-Neutral- Close (TNC) switch.
- d. Circuit breaker shall be indicated electrically. The following indication color shall be used.
Breaker closed – Red
Breaker opened – Green
Spring Charged – White
Breaker Auto trip – Amber
- e. However any other indication shall be provided as per owner's requirements.
- f. Lamps shall be LED type with resistance for voltage protection. Lamp and lens shall be replaceable from the front.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[10]	25.09.2014

- g. Breakers shall be controlled locally and/or remotely as per plant operational requirement. Necessary Interposing relays & feedback signal shall be provided based on the DCS IO list.
- h. Breaker control supply shall be of 220 V DC. Breaker spring charging motor shall be suitable for 220 V DC.

1.4.13 Cable termination

Switchgear shall be designed for cable entry from the bottom. Sufficient space shall be provided for ease of termination and connection.

1.4.14 Bus duct connection

Bus duct connection shall be generally from top of the switchgear.

All connection bus work shall have the same continuous rating as associated switchgear bus and shall be fully braced for the short circuit current mentioned in specification.

All provision such as matching flange and other accessories shall be furnished for connection to bus duct.

1.4.15 Painting

All sheet steel surfaces shall be chemically cleaned, degreased and pickled in acid to produce a smooth, clean surface free of scale, grease and rust. After cleaning, the surface shall be given a phosphate coating followed by a coat of high quality primer and baking in the oven.

The paint shade shall be subject to owner's approval. Sufficient quantity of touch up paint shall be furnished for application at site.

1.4.16 Relays, Protection & Metering

- a. The hardware design for protection and associated equipment shall use latest state-of-the-art technology and shall generally be integrated numerical/digital, modular in nature. Where design is based on numerical technology, adequate self testing/monitoring/ diagnostic facilities shall be provided.
- b. All numerical relays, auxiliary relays and devices shall be of types, proven for the application; satisfying requirements specified elsewhere and shall be subject to Purchaser's approval. Numerical Relays shall have appropriate setting ranges, accuracy, resetting ratio, transient overreach and other characteristics to provide required sensitivity to the satisfaction of the Owner. All numerical relays shall be compatible with IEC 61850.
- c. All protective relays shall be in draw out or plug-in type / modular cases with proper testing facilities. Necessary test plugs / test handles shall be supplied loose and shall be included in supplier's scope of supply.
- d. All AC operated relays shall be suitable for operation at 50 Hz. AC voltage

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[11]	25.09.2014

operated relays shall be suitable for 110 Volts VT secondary and current operated relays for [1 or 5] amp CT secondary. All relays and timers shall be rated for control supply voltage as mentioned elsewhere under parameters and shall be capable of satisfactory continuous operation between 80-120% of the rated voltage. Voltage operated relays shall have adequate thermal capacity for continuous operation.

- e. Energy meters shall be provided for incomer of 6.6kV Switchgear and shall be able to communicate with DCS. These meters shall be as per CEA regulation 2006 "Installation and operation of meters". Accuracy class shall not be less than [0.2S]. The accuracy class of CT and VT for energy metering shall have accuracy class of [0.5]
 - f. Provision shall be made for easy isolation of trip circuits of each relay for the purpose of testing and maintenance.
 - g. All protective relays and alarm relays shall be provided with one extra isolated pair of contacts wired to terminals exclusively for future use.
 - h. The relay shall be designed to perform satisfactorily under highly noisy electrical environment. Sufficient degree of high frequency disturbance immunity and impulse voltage withstand capacity shall be built into electronic designs as stipulated in relevant standards.
 - i. All protections shall be furnished complete with necessary auxiliary, supervisory, lock out relays. Suitably separate sets of single phase auxiliary C.T with multiple taps shall be provided with relay whenever required.
 - j. Visual and audible alarm annunciation shall be initiated in the event of operation of protective/supervisory relay.
 - k. D.C supply shall be supervised by DC supervision relays.
 - l. Trip circuit shall be supervised by Trip circuit supervision.
 - m. Tripping shall be done through high speed lock out relays.
 - n. All meters/ instrument shall be flush mounted on front panel, at least 96 mm² size with 90 degree linear scales and accuracy class of [2.0.]
 - o. Interposing relays for ON/OFF command or any other command shall be as per system requirement.
 - p. For alarm and Indication at DCS end necessary contacts shall be provided at switchgear end.
 - q. Interposing relays for ON/OFF command or any other command shall be as per system requirement.
- For alarm and Indication at DCS end necessary contacts shall be provided at switchgear end.
- r. Metering and protection shall be as per below table

1.5 Tests

I. Type Test:

For each type & rating of 6.6kV Switchgear, the Bidder shall submit the reports

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[14]	25.09.2014

of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening for Owner's approval. These reports should be for the tests conducted on the switchgear similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II. Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative. However the following minimum routine tests shall be conduct.

- Power-frequency voltage tests on the main circuit
- Dielectric tests on auxiliary and control circuits
- Measurement of the resistance of the main circuit
- Partial discharge measurement
- Mechanical operation tests
- Heat Run test
- Pressure tests of gas-filled compartments
- Tests of auxiliary electrical, pneumatic and hydraulic devices
- Verification of correct wiring

III. Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV. Test Certificates:

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawing & Documents

Drawings, data & manuals for the motors shall be submitted as indicated below.

- a. *[General Arrangement drawings and cross-section showing constructional features & cable entry with bottom view with opening]*
- b. *Bill of Materials.*
- c. *Technical Data sheet and Catalogue.*
- d. *Foundation drawing details with bottom view of switchgear.*
- e. *Descriptive write-ups and literature for the main equipment offered including relays, meters, etc.*
- f. *Control Schematics & Wiring diagram.*
- g. *Inspection and Test Plan (ITP).*
- h. *Suggestive list of protective relays.*
- i. *Transport/shipping dimensions and weights].*

1.7 Ratings & Requirements

6.6kV Switchgear shall comply with the particulars indicated in the following tables.

Table 2.0

S. No.	DESCRIPTION	UNIT	DATA
1.0	General		
1.1	Name of Manufacturer		<i>[By Bidder]</i>
1.2	Place & Country of manufacture		<i>[By Bidder]</i>
1.3	Specifications and Standards		As per Table 1.0
2.0	Switchgear Details		
2.1	Rated voltage(Nom/Max), phases & frequency		6.6 kV/7.2 kV, 3 Phase, 3 wire, 50 Hz.
2.2	System neutral earthing		Non Effectively earthed (Fault current Limited to 300A by neutral grounding resistor)
2.3	Voltage & frequency variation	%	+/-10%, -5%to +3% Hz.
2.4	Rated frequency	Hz	50Hz

ANNEXURES-E13

1.0 VARIABLE FREQUENCY DRIVE

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Variable Frequency Drives complete with all accessories for efficient and trouble-free operation of of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS-3700	:	Essential ratings and characteristic of semi-conductor devices
IS-3715	:	Letter symbols for semi-conducting devices
IS-4411	:	Code of designation of semi-conducting devices
IS-5001	:	Guide for preparation of drawings for semi-conductor devices
IS-5469	:	Code of practice for the use of semi-conductor junction devices
IS-5621	:	Hollow Insulators for use in electrical equipment
IS-6209	:	Methods for partial discharge measurement.
IS-6297	:	Transformers and indicators for electronic equipment

DIN 41488	:	Electrical engineering dimensions
-----------	---	-----------------------------------

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) All VFDs shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The VFDs shall be suitable for operation in a highly polluted environment.
- b) All VFDs shall be suited for uninterrupted operation under the following variations in bus voltage and frequency:
 - i. Voltage Variation : +/-10%
 - ii. Frequency Variation : 50Hz (+)3% to (-)5%
 - iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency
- c) The VFD shall be of modern design for similar applications in power plants. The system shall be commutated inverter type with minimum [six] pulse design, [IGBT based] and PWM controlled or better control system.
- d) VFD shall consist of Input section (rectifier and filter), control section and output section (PWM module, base drive circuits).
- e) VFD shall include an input filter for limitation of the harmonic current. General requirements of VFD shall conform to IEC 61800-2 and IEEE-519.
- f) VFD shall follow EMC directives as specified in IEC-61000.
- g) VFD model shall be suitably selected based on actual cable length from VFD to motor terminals. Shielded cables suitable for VFD applications shall be provided by the bidder.
- h) For [12 pulse] VFD, required 3 winding transformer and necessary cabling shall be provided by the bidder.
- i) Bidder shall provide inverter duty motor to withstand voltage stresses produced by PWM action

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[3]	25.09.2014

1.3.1 Performance requirements:

- a) The system shall be energy efficient, designed as standard product and shall provide very high reliability, high power factor, low harmonic distortion and low vibration / wear / noise.
- b) The system shall be suitable for the load characteristics and the operational duty of the driven equipment.
- c) The drive system shall be designed to operate in one or more of the following operating modes as to suit characteristics of the driven equipment:
 - i. Variable torque changing as a function of speed i.e. speed squared.
 - ii. Constant torque over a specific speed range.
 - iii. Constant power over a specific speed range where the torque decreases when speed increases.
- d) The drive controller shall be equipped with microprocessor based digital regulator with programmable functions. The system shall be designed for linear continuous speed control from [10% to 100%] of driven equipment's rated speed and shall be of a modern proven design.
- e) The total harmonic distortion (THD) of the voltage and current at inverter output shall be as per IEC 61800-4 and it shall be considered in the design of the motor.
- f) Unless otherwise specified, the overload capacity of the controller shall be 150% of rated current of motor for one minute for constant torque applications, and 115% of rated current for one minute for variable torque applications at rated voltage. If the motor load exceeds the limit, the drive shall automatically reduce the frequency and voltage to the motor to guard against overload. If load demands exceed the current limit for more than one minute, the drive shall shut down to prevent over heating of the motor and damage to the drive.
- g) During operation, the system shall be capable of developing sufficient torque under all load conditions to respond to a 20% alteration in speed set point within a time limit up to 60 seconds.
- h) The integrator action of the speed set point alteration shall be independently adjustable for both an upward and a downward alteration. The minimum time interval between set point adjustments by the distributed control system shall be considered as 10 seconds.
- i) The drive shall trip in case the speed exceeds 105% of the maximum operational speed or reduces to 95 % of the minimum operational speed for more than 10 seconds.
- j) Maximum noise level of motor shall be measured as per relevant IS standard.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[4]	25.09.2014

- k) Variable frequency drive shall be arranged so that it can be operated in an open circuit mode, disconnected from the motor for startup adjustments and troubleshooting/ maintenance.
- l) Voltage at motor neutral shall be maintained at ground potential for the total operating condition.

The drive system shall ensure following:

- i. VFD induced torque pulsation are limited to maximum 1% (even at low speed) so there is minimal stress to the equipment
- ii. Motor is protected from dv/dt stresses.
- iii. No appreciable increase in motor audible noise.

1.3.2 Control requirement:

- a) The VFD and motor characteristics shall be suitable for load specific torque-speed characteristics.
- b) Short time voltage dips up to 20% of nominal voltage (e.g. in case of a large motor start up connected to the same bus as VFD) shall not cause the control system to stop functioning and shall not trip the drive system.
- c) The system shall also be equipped with a facility which shall restart the system in case of voltage dip over 20% or power interruptions for less than 2 seconds, with recovery of the voltage to its nominal value. The drive shall have the facility to block this feature, if required by the operator. Upon restart the converter shall be capable of synchronizing on to a rotating motor and develop full acceleration torque within 10 seconds.
- d) The power controller shall be controlled to always start the motor in the forward direction. Logic shall be provided to prevent the motor from being started in the reverse direction.
- e) The drive motor shall be speed controlled corresponding to 4-20 mA reference input signal unless otherwise specified upon complete loss of the user's speed reference signal, the drive shall automatically run at constant speed at the last speed reference available prior to the loss of signal.
- f) It shall be possible to vary the speed of the drive in either manual or auto mode. Auto/manual selection shall be from VFD panel unless otherwise specified.
 - i. With the selector switch in "manual" mode, the operator shall be able to set the speed through keypad, mounted on front of the drive panel or from speed increase/decrease push buttons from the field. Motor operated potentiometer shall be provided as a speed set point device.
 - ii. With the selector switch in "auto" mode, speed of the motor shall be controlled from a 4-20 mA signal, from owner's DCS (Process Control) system. Necessary equipment required for interfacing with DCS shall also be provided in the drive panel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[5]	25.09.2014

- g) The required provision for the interface with remote I/O (*as per requirement*) shall be through hardwired connection (with potential free contacts and transducers)
- h) Drive system shall have provision for interface with upper level automation such as electrical control system.
- i) The closed loop control feedback for the drive system having output transformer shall be tapped from the secondary side of the output transformer.
- j) Bypass Feature
 - i. Bypass breaker / contactor-HRC fuse complete with protection, annunciation and metering shall be provided.
 - ii. All Variable frequency drives (VFD) having bypass feature shall have motor protection relay along with necessary control and metering etc. Switching scheme shall be such that in case of drive mal-operation, the motor could be taken on bypass control manually, while the drive could be attended by opening its isolation devices.
 - iii. Safety interlock between inverter and bypass breaker/contactors shall be provided such that closing of healthy device is inhibited in case of external fault.

1.4 Specific Requirements

1.4.1 Constructional Requirements

- a) Panel Construction
 - i. The panel shall include suitable semi conducting power devices (Diodes / IGBT) modules with protective devices, reactors (if required), filters (if required), control circuit, control accessories, indication and annunciation etc. The construction of the panel shall provide effective protection against electromagnetic emissions and shall meet the design requirement of integrated standards.
 - ii. Upstream breaker include suitable semi conducting power devices (Diodes / IGBT) modules will be provided on the front door.
 - iii. Safety Interlock shall be provided so that power cabinet cannot be opened unless the upstream breaker is disconnected, safety-grounding switch is closed and DC link capacitor is discharged. Power source breaker can only be closed once the earthing switch is open and panel door is closed with lock defeat facility.
 - iv. The drive shall be suitably housed in sheet steel panels fabricated with 2 mm thick cold rolled sheet steel. The panel shall be suitable for indoor installation, if not otherwise specified. The panel shall be free standing with degree of enclosure protection as IP-31. The maximum and minimum operating height shall be 1800 mm and 400 mm respectively.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[6]	25.09.2014

- v. Bolted un-drilled gland plate shall be provided at bottom. Clamp type terminals shall be used for connection of all wires up to 10 mm² and terminal for higher sizes shall be bolted type suitable for cable lugs. Minimum space for power cable termination shall be 600 mm clear from bottom of the cable gland plate.
- vi. Bus bars shall be of electrolytic copper, color coded separately for AC and DC system. All the live parts shall be sleeved / shrouded to ensure complete safety to personnel intending to carry out routine inspection by opening the panel doors. All the equipment inside the panel and on the doors shall be provided with suitable nameplate.
- vii. All the switches component and accessories which are essential for normal and emergency operation shall be mounted on the door and shall be operable externally. Digital meters shall be preferred. Analogue instruments, where provided, shall be switchboard type, back connected, 72x72mm. Scale shall have red mark indicating maximum permissible operating rating.
- viii. All panels shall be of same height so as to form a uniform line-up, to give good aesthetic appearance.
- ix. All the control wiring shall be enclosed in plastic/ metal channel. Each wire shall be identified at both ends by self-sticking wire marker tapes or PVC ferrules. Power and control wiring inside the panel shall be done with PVC insulated, fire retardant, copper conductor wire. 1.5 mm² size wire shall be used for control circuits, 2.5 sq.mm for CT/PT circuits and 0.75 mm² for electronic circuits. The control fuse rating is 10 Amps or less and 2.5mm² size for control fuse rating above 16A for electrical circuits and 0.7 mm² for electronic circuits. All wires shall be ferruled and terminals shall be properly numbered. Minimum 20% spare terminals shall be provided.
- x. All electronic modules and components shall be accessible from front of panel only. Modular assemblies for both the system control electronic equipment and power electronic equipments shall be used.
- xi. All low voltage compartment and cabling shall be electrically and physically separated from the high voltage compartment.
- xii. DC link capacitor and pre charging and discharging circuit shall be preferably mounted in the rear of the panel. Suitable removable type hooks shall be provided for lifting the panel.
- xiii. Drive keypad, operator control panel required for control, monitoring and measurements shall be supplied and installed outside the panel on the front door. It shall be accessible for operation without opening the front door and shall be non-removable type.
- xiv. All equipment shall be complete with double compression glands, lugs etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[7]	25.09.2014

b) Cooling

- i. The drive panel shall be naturally cooled or water cooled type as per manufacturer's standards. However it is preferred to have natural air cooled system. If unavoidable, forced type-cooling system shall be provided. Cooling system shall include well-dimensioned panel, adequate cooling airflow path, module cooling fan and if necessary, panel cooling fan or water-cooling system shall be considered. Bidder shall ensure that the panel dimensions and flow paths have been designed for continuous running at the specified ambient without overheating. For fan cooled drives, redundant ventilating fans (N + 1) shall be provided.
- ii. Necessary starters shall be provided within the VFD panels for the ventilation fans, any other auxiliary motor etc.
- iii. The system provided shall be interfaced with drive starting and shut down such that safety interlocks such as start permit from cooling system to drive and trip signal from cooling system to drive in case of cooling system failure etc., shall be incorporated in the overall sequence logic.
- iv. MCB for motor space heater, auxiliary power supply if required for local panel, drive panel space heater etc. shall be included and mounted in easily accessible location.

1.4.2 Motor

The motor shall be designed, constructed and tested in accordance with the Specification for high Voltage Induction / Synchronous Motor, in addition to the following requirements:

- a) The motor shall be suitable for VFD control.
- b) The motor shall be suitable for the current waveforms produced by the power supply including the harmonics generated by the drive.
- c) The motor shall be designed to operate continuously at any speed in the operating range for the driven equipment (ie; ID fan / Coal feeder).
- d) The permitted voltage variation shall take into account the voltage drop across the AC drive and all other system components upstream the motor.
- e) Motors required to be transferred to DOL by-pass mode shall be rated for specified variations in system line voltage and frequency. Starting current of motor in DOL bypass mode shall be limited to value specified in motor specifications.
- f) The motor shall be constructed to withstand torque pulsations resulting from harmonics generated by the solid-state power supply.
- g) The motor insulation shall be designed to accept the applied voltage waveform, within the Vpeak and dv/dt limits as per IEC-61800-4.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[8]	25.09.2014

- h) The drive manufacturer shall be solely responsible for proper selection of the motor for the given load application and the output characteristics of the drive.

1.4.3 Static Power Converter

- a) The static power converter shall consist of a line side converter for operation as a rectifier and a load side power converter for operation as a fully controller inverter. Power converter shall be fast switching, most efficient and low loss type.
- b) The converter shall be co-ordinated with the transformers. The converter shall be able to withstand a three phase short circuit current until interrupted by normal breaker operation.
- c) Adequate short circuit and over voltage protection shall be provided for the converter and inverter system.
- d) All power converter devices shall include protective devices, snubber networks and dv/dt networks as required.
- e) The current rating of the converters semi-conductor components shall not be less than 120% of the nominal current flowing through the elements at full load of the VFD through the whole speed range. If the parallel connection of semi conductor is applied, the above current rating shall not be less than 140% of the above values.
- f) All power diodes shall be of silicon type with minimum V_{BO} rating at 2.5 times the rated operating voltage.
- g) The power converter circuit shall be designed so that motor can be powered at its full nameplate rating continuously without exceeding its rated temperature rise nor reducing its service factor due to harmonic currents generated by the inverter operation.
- h) The conversion devices and associated heat sinks shall be assembled such that individual devices can be replaced without requiring the use of any special precautions / tools.
- i) The cooling system of the electronic components, if provided, shall be monitored and necessary alarms shall be provided to prevent any consequential damage to the power control devices.

1.4.4 Converter Transformer

- a) The converter transformer, if provided, shall be copper wound dry type. Insulation class of dry type transformer shall be H with temperature rise of body limited to 75°C. Dry type transformer shall preferably be mounted inside the drive system panel. The impedances of converter input transformers with more than one secondary winding for minimum 18 pulse systems shall be selected to ensure equal load / current sharing

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[9]	25.09.2014

between the secondary windings, the converters and the motor windings under all operational conditions including starting and restarting.

- b) The transformation ratio, impedances, taps and secondary voltage shall be chosen by the drive vendor to optimize system performance.

1.4.5 DC link reactor

- a) Smoothing reactors for the DC link shall be designed to sufficiently decouple the rectifier and inverter portion of the converter and to limit fault currents in this circuit.
- b) Unless otherwise specified, the reactor shall be dry type, air cored, air-cooled or fan cooled type located within the panel.
- c) Reactor shall be suitable for withstanding earth fault continuously and for operation with the non-sinusoidal current wave shapes and DC components under all operational conditions of the system without exceeding its temperature limits.
- d) Noise level shall not exceed value specified in NEMA TR-1

1.4.6 Output filter

- a) VFD output current waveform should be inherently sinusoidal at all speeds, with harmonic limits as specified in this specification. Output filter shall be provided if required. Output filter capacitors shall be provided with discharge circuits to ensure that all residual stored charge is reduced to less than 50 V DC within 300 seconds after a loss of AC voltage. All capacitor shall be maintenance free and self-healing type.
- b) The VFD system shall inherently protect motor from high voltage dv/dt stress, independent of cable length to motor. Output filter shall be an integral part of the VFD system and included within the VFD enclosure.

1.4.7 Protection, Control, Metering, Indication and Annunciation

- a) The Bidder shall provide all the necessary system control, protection, alarm equipment and metering for the entire drive system and its auxiliary equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[10]	25.09.2014

- b) Automatic sequence control shall include start-up of cooling system, auxiliary system of the motor, interlock checking, automatic start and run-up of drive, planned and emergency shutdown. The same shall be processed through microprocessor-based system.
- c) Protective Relays:
For details on protective relays used, refer to Technical Specifications on MV Switchgear
- d) Operator Control Panel
- i. Each drive shall be equipped with a front mounted operator control panel consisting of a backlit alphanumeric display and a keypad with keys for parameterization and adjusting parameter which shall not be limited to start/Stop, Local/Remote, auto/manual, Increase/Decrease, menu navigation and protection and measurement parameter selection, etc.
 - ii. All parameter names, fault messages, warnings and other information shall be displayed in complete English words or standard English abbreviations to allow the user to understand what is being displayed without the use of a manual or cross-reference table. This shall also be used for the modification of all electrical values, configuration parameters, drive menu parameters, application and activity function access, faults, local control, adjustment storage, self test and diagnostics. Keypad shall be operable with password for changing the protection setting, safety interlock etc. However the parameters such as measurements, setting, mode of drive etc. shall be allowed to be viewed without any password.
 - iii. Operator console shall have facility /port to connect external hardware such as Lap-Top etc. Console shall have facility for upload and download of all parameter settings from one drive to another identical drive for start up and operation.
 - iv. Drive system control shall also have facility to receive tripping signal from upstream breaker for tripping and also provision for closing up stream breaker after all required process parameters are achieved.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[11]	25.09.2014

- v. User-friendly software for operation and fault diagnostic shall be loaded in the drive system panel before commissioning.
 - vi. Suitable interface with DCS to be provided for control and status signals of VFD.
- e) Local Motor Control Station
- i. The local motor control station shall be installed near the motor. Components and accessories that are required in the local motor control station may be mounted on the local field mounted panel envisaged for the driven equipment.
 - ii. Meters in the local control station shall be suitable for 4-20mA transducer outputs and shall be calibrated for the actual motor current. Further, for drives with bypass facility, the meters shall be capable of reading bypass full load and starting currents, as well as the drive current.
 - iii. Requirement of controls and indications required in the Local Control Station shall be as specified in the data sheet.
- f) Protective Features:
- The system offered shall incorporate adequate protective features, properly coordinated for the drive control and for motor but not limited to the following:
- i. Incoming line surge protection
 - ii. Under / Over voltage protection
 - iii. Phase loss, phase reversal protection.
 - iv. Programmable Over current protection and under load protection.
 - v. Motor differential protection for motor rated above 1000 kW
 - vi. Inverter Fault.
 - vii. Over frequency operation.
 - viii. Ventilation loss,
 - ix. Over temperature of equipment.
 - x. Over speed of motor.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[12]	25.09.2014

- xi. Specific motor protection, including motor winding, bearing temperatures, over-current, overload, negative phase sequence, locked rotor and earth fault protections etc.
- xii. System Earth fault protection.
- xiii. Excitation system protection for synchronous motor
- xiv. Over and under frequency, rotor earth fault, field failure protection for synchronous motor
- xv. Additional protection for drive system

g) Control features

The following controls shall be provided as a part of the Operator Control Panel or through separate switches.

- i. Start/Stop
- ii. Speed control (Raise/lower)
- iii. Forward/Reverse(if Specified)
- iv. Auto/Manual /test mode
- v. Local/remote
- vi. Emergency stop
- vii. Start/stop for by pass starter (where specified)
- viii. Trip-Remote Breaker
- ix. Excitation control system for synchronous motors
- x. Sequential switching of filters

h) Metering

Digital display of the following parameters shall be as a part of the Operator Control Panel, selectable by the operator.

- i. Input AC Current
- ii. Input AC voltage
- iii. Input AC frequency
- iv. Output voltage
- v. Output current VFD / Bypass
- vi. Output frequency
- vii. Motor thermal state

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[13]	25.09.2014

- viii. Drive thermal state
- ix. Motor speed
- x. Motor energy meter
- xi. DC Link voltage
- xii. Hour Run
- xiii. Voltage and current meter for excitation system for synchronous motor.
- xiv. KVAR, power factor meter for synchronous motors
- xv. Necessary transducer shall be provided with 4-20mA output for indicating motor speed and motor current in DCS unless otherwise specified for other parameters.

i) Indications

Bidder shall provide indications as required for normal operation and for easy maintenance, which shall not be limited to the following indications both at local and at plant DCS.

- i. Motor running
- ii. Motor stopped
- iii. VFD System Fault
- iv. System ready to start
- v. AC mains ON
- vi. Motor over speed
- vii. Rectifier output 'ON'
- viii. Motor zero speed
- ix. Remote breaker trip
- x. Excitation system healthy for synchronous motors

Above indications may be provided as a part of the operator control panel, i.e., door mounted keypad or through hardwired indicating lamps/LEDS.

Potential free contacts of items i- iv shall be wired separately for remote indications in DCS.

j) Audio-visual annunciations

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[14]	25.09.2014

- i. The system shall incorporate audio-visual annunciations for protection, for various fault conditions, for the Drive motor, Supply cables, DC Reactor and the Converter, output transformer etc.
- ii. Alarms shall also be included for the failure of various auxiliaries together with identification of the failing unit, loss of cooling system, various protection devices provided for converter transformer etc.
- iii. Audio-visual window annunciations shall be provided on the front of the panel All annunciations as required for normal and satisfactorily operation of the drive system shall be included as per Bidder standards. These annunciations can be part of operator console panel or separately mounted type.
- iv. Bidder shall include audio-visual alarm as required for normal operation and maintenance of the system but not be limited to the following,
 - Rectifier fuse failure
 - Main AC failure
 - Inverter fuse failure
 - Inverter overload
 - Inverter high temperature
 - Cooling system failure
 - Motor failed to start
 - Transformer failure
 - Excitation system failure for synchronous motor
 - Battery monitoring healthiness
 - Communication and measurement system un healthy
 - Motor temperature high
 - Harmonic filters monitoring
- i. Common potential free contacts shall be provided for above annunciations and these shall be wired up to terminals of DCS I/O panels for remote alarm and monitoring.

k) Fault Diagnostic

Fault diagnostic shall be built into the system to supervise the operation and failure of the system. The information regarding failure of any of the system including shut down of the system shall be available for a period of minimum 4 days (96 hours) after a shut down even though no supply

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[15]	25.09.2014

would be available to the system. The system may be totally de-energized for maintenance or otherwise. It shall be possible to retrieve the record of events prior to tripping of the system or de-energisation. Auxiliary supply to the system components or to the electronics (firmware) for the diagnostics / display shall be taken care by the manufacturer for this purpose.

1.4.8 External Power supply for auxiliary and Control Circuit

Auxiliary power supply for devices external to VFD module, space heater supply for Motor, VFD panel space heater, auxiliary power supply for transformers, cubicle lamps (CFL) etc. shall operate on 240 volts single phase AC.

All control circuit shall operate at voltage of 110V AC or 220V DC.

Bidder shall include supply of all control transformers, protective devices, required accessories etc. and any other control supply voltage as required for the system.

1.4.9 Maintenance features

The controller design shall incorporate the following maintenance features:

- a) Modular construction
- b) All components shall be easily accessible.
- c) Standard diagnostics to aid maintenance personnel. These shall include LED or alphanumeric displays, test or measurement points.

1.4.10 Painting

- a) All metal surfaces shall be thoroughly cleaned and de-greased to remove mill scale, rust, grease and dirt. Fabricated structures shall be pickled and then rinsed to remove any trace of acid. The under-surface shall be prepared by applying a coat of phosphate paint and a coat of yellow zinc chromate primer. The under-surface shall be made free from all imperfections before undertaking the finishing coat.
- b) After preparation of the under surface, the panel shall be provided with epoxy based powder coating. The color shade of the final paint shall be as per manufacturer's standard, unless otherwise specified. Panel finish shall be free from imperfections like pinholes, orange peels, runoff paint, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[16]	25.09.2014

- c) All unpainted steel parts shall be zinc passivated, cadmium plated or suitably treated to prevent rust and corrosion. If these parts are moving elements, then these shall be greased.

Final paint shade shall be light gray and dove gray 631 and 632 as per IS-5 for indoor and outdoor equipment respectively unless otherwise specified

1.5 Tests

The Routine and Type Tests to be performed on the drive system in the presence of the purchaser or consultant shall be as follows:

1.5.1 Type Tests

For each rating and type of VFD, the Bidder shall submit for Owner's approval, the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

All type tests shall be conducted as per relevant standards and test certificates of similar panels conducted within last 5 years shall be furnished.

1.5.2 Routine tests

- a) Visual Inspection
- b) It involves checking of the various equipments/components fault diagnostic unit, Wiring, Terminals, earthing ratings etc. in line with the approved drawings and visual inspection shall not be limited to the following:
- c) Insulation Test
- d) Light Load and Functional Test
- e) Load characteristics test
- f) Load duty test
- g) Checking of Auxiliary Devices
- h) Checking the properties of the control equipment

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-B, Annexure-E13	[17]	25.09.2014

- i) Checking the Protective Devices
- j) Checking of control and functional requirements
- k) High voltage test
- l) Leakage and pressure test for cooling water system where provided
- m) Shaft current/bearing insulation
- n) Automatic restart/re-acceleration

Additional tests on switchgears and dry type transformers shall be carried out based on the requirement defined in the technical specification.

1.5.3 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

1.5.4 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings, Data and Manuals

The engineering services scope and the documentation to be issued with the bid are described hereafter. The list shows the minimum requirements for the documentation, so that any additional documentation considered as necessary will be added to this.

- a) Engineering, manufacturing, delivering and test schedule
- b) Sub-Supplier lists.
- c) General arrangement drawings(plan, elevation, section view) with dimensions
- d) Foundation drawing including loading data.

Document Number	Rev No.	Description	Page No.	Date of Issue

- e) Technical Data sheets.
- f) Electrical and control wiring diagram.
- g) Terminal arrangement drawing, interconnection wiring diagram.
- h) Cross sectional drawing.
- i) Inspection and test plan.
- j) Manufacturing Quality Plan.

1.7 Ratings and requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

Table 2.0

1 GENERAL

This specification is intended to provide the technical guidelines for the fully coordinated Control & Instrumentation (C & I) system for the Coal Handling C&I and its Auxiliaries of [210/215/220/250] MW, Coal fired Subcritical Thermal Power Plant.

The technical specification shall serve as the guide specification for the proprietary controls of coal Handling System and its Auxiliaries, equipments as also various stand alone system controls included as part of sub-packages, as in case of system auxiliaries.

The requirements enumerated in this specification are based on typical configuration of the plant. It shall be responsibility of bidder to offer the control and instrumentation system to meet the actual functional requirements of the coal handling system offered by bidder.

It is to be noted that where equipment or system for the Coal Handling system and its auxiliaries are described, it shall be understood that the quantities described are per unit basis, i.e., identical sets to be furnished for each of the units (If plant have multiple units). Where equipment or systems for common facilities are described, it will be understood that the quantities described are the total quantities required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[1]	25.09.2014

2 SYSTEM DESCRIPTION

I&C system of coal handling system shall consist of all local instruments Viz. Pressure Gauge, Temperature Gauge, limit switch, Pull cord switch, Belt Sway switch, Electronic Zero speed / Under speed switch, Bunker level switch/ indicator, other field sensors, Local panel & push button station, CHP Local control room equipment, as required erection hardware & interconnecting cables required for the control & monitoring of the entire Coal handling Plant along with control of track hopper & Stacker-Reclaimer as turnkey basis.

The Control and Instrumentation system for the Coal Handling System shall be designed to ensure safe, efficient and reliable operation of the plant under all regimes of operation namely start up, shutdown, normal operation and under emergency conditions.

The following equipments of the coal handling system shall be operated and controlled from CHP control room:

- Conveyers, flap gates, scoop type fluid couplings, crushers and screens.
- Stacker cum Reclaimer
- Complete Dust Suppression System
- Ventilation System (group/individual control as required)
- Inline magnetic separators (ON/OFF control with indications)
- Metal Detectors (ON/OFF control with indication)
- In line Belt Weigh Scale (ON/OFF control with indication)
- Vibration Monitoring System (VMS) For HT Drives

A PLC based control system shall be provided for operation, control, interlocking, tripping of the entire Coal Handling Plant and all associated equipment whenever required under specified abnormal conditions.

All 6.6 KV drives shall be provided with fluid coupling temperature/ bearing Temperatures measurement & shall be measured with Duplex RTD. Temperature Measurement sensor shall be provided for all bearing temperature measurement. Stator winding temperature measurement element shall be duplex type and all temperature measuring points shall be connected to PLC. Winding temperature high alarm will be generated in the PLC system. 6.6 KV drives shall also be provided with vibration monitoring devices and shall be connected with PLC.

2.1 General Requirements

1. The control and instrumentation system for Coal handling Plant shall be designed and constructed to meet all the specification requirements. All

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[2]	25.09.2014

instruments/ equipments offered shall be capable of satisfactory operation for prolonged period of time and shall perform accurately and safely under the environmental & operating conditions described in the specification.

2. All equipment, and accessories furnished under the specification shall be from the latest proven control and instrumentation product range of qualified manufacturers whose successful performance has been established by a considerable record of satisfactory operation in power stations. C&I devices & systems shall employ latest state-of-the art technology to guard against any obsolescence. In any case, it shall be required to ensure supply of spare parts for lifetime of the plant.
3. Each item included in this specification shall be inspected and tested by the Bidder in his works for full compliance with specification requirements, completeness, proper assembly, satisfactory operation, cleanliness and state of physical condition as applicable.
4. Full details regarding all equipment and systems including complete Bill of Materials, drawings, data, information, technical literature and other details required to fully establish the capability and performance of the equipment and systems offered shall be provided as a part of the contract.
5. To ensure smooth and optimal maintenance, easy interchange ability and efficient spare parts management of various C&I items, it shall be ensured that each C&I item is of same make, series and from same family of hardware (as far as practicable).
6. All plants and equipments which needs regular operation and monitoring shall be provided with remote operation/ monitoring facilities, at respective control rooms/centers. Automatic control facilities to be incorporated wherever applicable.
7. Operation & Control Philosophy: The operation and control shall be through the PLC based system for the entire Coal Handling Plant (CHP) covering the total functional requirement of sequence control, interlock & protection, monitoring, alarm, data logging.
8. The design of the control system and related equipment shall adhere to the principle of fail safe operation of all system levels i.e, the failure of signal, failure of power or failure of any component should not cause a hazardous condition and at the same time prevent occurrence of false trips and provide reliable and efficient operation of the plant under dynamic condition.
9. The PLC system shall be an integrated control and data acquisition system for providing control & monitoring of coal handling plant equipment from CHP Control Room. The control room operator shall be provided with colour

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[3]	25.09.2014

graphic displays of the Coal Handling Plant and with sufficient details to allow proper control & monitoring of the plant functions.

10. All plant and equipments which needs regular operation and monitoring shall be provided with remote operation/ monitoring facilities, at respective control rooms/centers. Automatic control facilities to be incorporated wherever applicable.
11. Belt Weigher, ILMS, Dust suppression, Dust extraction, Ventilation system, will have local control panels mounted near the equipment. Redundant remote I/O cables shall be provided from local control room to CHP control room for interfacing with CHP PLC.
12. Local start/stop facility for conveyors/ travelling trippers/ Paddle feeders other equipment shall also be provided for maintenance requirements for those which are remote operated.

2.2 PLC system

PLC system shall be redundant with respect to Power Supply, Processor and Communication. Redundant Input card shall be used for measurement of Critical points related to protection of the equipment. All output commands to MCC/ SWGR shall be provided through interposing relay .The control panel shall be IP 55 protection class.

The control system shall have hooter with required hardware and driven from PLC output. Test, Accept and Reset Push Button shall be connected to the PLC system and programmed for alarm annunciator.

A table top mounted PC loaded with editable programming software and HMI shall be provided and placed on a table located on the side of the control panel. There shall be facility of operation from LCD based Operator's station.

2.3 Interfacing With Plant DCS

Facility of interface shall be provided for interface requirements with plant DCS. CHP PLC shall be linked with plant DCS through redundant Unidirectional OPC link in addition to some hardware interface signals. Any device/ software required for the same shall be included. Proper co-ordination shall be maintained with the DCS vendor in achieving the successful & complete interface.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[4]	25.09.2014

3 DESIGN PHILOSOPHY

This section covers the design philosophy which shall be used for all control & instrumentation system for Coal Handling System & its auxiliaries.

1. Control System for coal handling plant shall be Programmable Logic Controller (PLC) based or shall be implemented through micro-processor based distributed control system (DCS) covering total functional requirements of sequence control, interlock & protection, monitoring, alarm and data logging. Remote I/O cabinets shall be provided wherever required depending upon distance/location.
2. It shall be possible to select any coal flow path from the Operator's work station located in the CHP control room viz.
 - Wagon tippler/ track hopper to coal bunkers
 - Wagon tippler/ track hopper to crushed coal storage via stacker cum reclaimer
 - Wagon tippler/ track hopper – one stream to crushed coal stockpile and other stream to coal bunkers
 - From crushed coal stockpile to coal bunkers via stacker cum reclaimer
 - From crushed coal stockpile to coal bunkers via emergency reclaim hoppers
3. Entire CHP shall be controlled from following points:
 - CHP control room consisting of Operator Work Station (OWS) and Large Video Screen (LVS) for the control of entire CHP. Some I/O may be located remotely in Wagon tippler MCC room and on bunker floor.
 - OWS/LCP for the control of stacker cum reclaimer.
 - OWS/LCP for the control of wagon tipplers/track hoppers.
 - Dust extraction/suppression system shall be operated from the respective control panel provided locally with the equipment/system. Dust extraction/suppression system shall operate when the coal conveying system is in operation and bunker ventilation systems shall operate round the clock. DE / Dust suppression system shall be provided with remote operation from main CHP control room except for Bunker floor DE operation which will be local.
 - Control system for stacker cum reclaimer, wagon tipplers, dust extraction /suppression system shall be interfaced to the CHP control room.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[5]	25.09.2014

- Local start/stop push button stations, de-interlock switches to be mounted near each equipment for start/stop during maintenance of the system through Local/remote selection from respective SWGR/MCC.
4. The flow stream path is then selected by positioning different flap gates/shuttle feeders at the desired position from monitor to select the conveyors. After the selected path is in operation the movement of the path selector shall not have any effect on the system. The system shall be in operation with a time delay and with a hooter sound. If selection is wrong, PLC shall generate an audio-visual warning.
 5. The control system shall be designed for "Auto" & "Manual" operation of the conveyors in the selected path. Auto/Manual selection shall be done from faceplate in HMI.
 6. Auto Mode: In the "Auto" mode, the conveyors and related equipment shall start sequentially when the "System Start" is activated. During stopping, when the "System Stop" is activated, all conveyors shall stop sequentially (in the reverse sequence) allowing time delays for clearing the materials on conveyor.
 7. Manual Mode: In Manual Mode, the operator shall start the conveyor system in the same sequence as in Auto mode by pressing individual "Start" buttons on OWS/LCD. The operator shall also stop the conveyor system, by pressing "System stop" or individual "Stop" buttons in the reverse sequence.
 8. During 'sequence start' in both auto and manual modes, first the required number of hooters shall be energized simultaneously for a preset time of 1 minute or so (adjustable) as per the program. After the preset time, the hooters shall stop and a preset time of two minutes (adjustable) shall be allowed for the movement of the personnel and for the permissive of the conveyor system operation. This condition shall be indicated on the HMI as 'SEQUENCE START'. The starting permissive shall be available for a period of 5 minutes. In the event the last conveyor /equipment is not started within this preset time of 5 minutes, the start command for equipment not activated shall be withdrawn. The system shall not be started again unless the 'sequence start' command is again provided and the hooters sound again, as described before. Those conveyors and equipment, which have already started, shall continue to run.
 9. After a conveyor / equipment are started, the status indications against that conveyor / equipment on HMI shall change to steady glow indicating that it is running.
 10. Graphic display status indicators associated with a particular motor /equipment shall flicker fast in case of fault / trip.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[6]	25.09.2014

11. In addition, emergency stop push button for immediate shut down of complete plant shall be provided in the control desk.
12. Vibration monitoring shall be provided for all HT drives such as crusher.
13. Crusher vibration limit shall be as per ISO 2392. r.m.s. velocity limit shall be 4.5 mm/sec.
14. The degree of protection for the motor enclosure shall be IP-55. The terminal boxes shall be provided with at least IP-55 degree of protection. For single core cable termination, gland plates shall be of non-magnetic material. All motors located in hazardous area shall have flame proof design.
15. All MV/HV motors shall be provided with vibration pads for mounting vibration detectors.
16. For 415V motors, maximum double amplitude vibrations upto 1500 rpm shall be 40 microns and 15 microns upto 3000 rpm.
17. Maximum noise level measured at a distance of 1.0 meter from the outer surface of the motor shall not exceed 85 db (A).
18. Pressure indicators shall be used wherever indicating type Pressure transmitters are not envisaged. The applications include:
 - a) Suction and discharge lines of pumps, including header section, if two or more pumps are employed for the same service.
 - b) All input and output lines of process equipments.
19. Pressure Switches shall be avoided as far as possible and in place, smart pressure transmitters with soft limit value monitoring in control system shall be used. The applications shall include the following:
 - a) On all process lines / Equipments where parameter abnormality / status including pre trips alarms to be communicated to the operator in control room.
 - b) For all permissive and protection conditions governed by safety operation of the equipments. e.g. pressure adequate, pressure very high / very low conditions.
 - c) For all interlock conditions, governing starting of standby equipment or subsequent equipments for safety operation of the system.
 - d) Inlet and outlet of filters / strainers.
20. Temperature Elements: RTDs shall be used for casing metal temperature monitoring and bearing temperature monitoring of HT drives/motors.
 - a) Six nos. (2 nos. per phase) Resistance temperature detectors (RTD's) shall be used for all HT motors, for winding temperature monitoring. Each

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[7]	25.09.2014

element shall be 3-wire type, duplex with thermowell assembly. RTDs shall be terminated in the external terminal box, for connection to coal Handling Control system.

- b) 1 no. duplex PRT-100 type RTD shall be used for each bearing of HT equipment and its driving equipment (motor).
 - c) All RTDs shall be PRT-100 type with each element being 3-wire type, duplex with thermowell assembly. RTDs shall be terminated in the external terminal box, for connection to Coal Handling Control system.
 - d) Temperature measurement shall have upscale / down scale protection features not to cause major process upset in case of sensor failure.
21. Level gauges shall be used on all tanks and the maximum length of one gauge glass shall not exceed 1 meter. The gauge glasses shall be stacked to cover the complete height of the tanks including over flow level. There shall be an overlap of minimum 100mm, when more than one level gauge is required.
22. Level switches: The instrument shall be used for the following applications:
- a) On all equipments (storage vessel) where parameter abnormality/status has to be communicated to the operator in the control room.
 - b) All permissive, interlock and protection conditions governed by the safe operation of the equipment.
 - c) The instrument shall be external cage type with SW connection with isolation facility for surface mounted tanks and top mounted with still pipe for all sumps. Still pipes shall be used with adequate supports.
 - d) Radar type level switches shall be used for bulk material bunkers/hoppers.
23. Level Transmitters Stubs with impulse pipes, root valves for mounting Level transmitters shall be used on process equipments where continuous remote monitoring and/or control of level is envisaged. Wherever necessary standpipes or float chambers and also makeup line shall be used for filling up the constant level vessel.
- a) The instrument shall be differential pressure type or torque tube type for other applications.
 - b) Radar type level transmitter shall be used for bulk material bunkers/hoppers.
 - c) Admittance or Radar type shall be for sludge and slurry applications.
24. Solenoid Valves shall be used for all pneumatic control valves hooked up with process interlock requirements and where direct tripping is involved. All

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[8]	25.09.2014

solenoid valves shall be uniformly rated for 24V DC or 220V DC. The number of ways for solenoid valve shall be used as indicated below:

- a) On line two (2) way solenoid valves shall be used, where process line of less than 2 inch with low pressure & temperature application is involved.
- b) Three (3) way solenoid valves shall be used commonly, where the pressure is admitted or exhausted from a diaphragm valve or single acting cylinder. E.g.: Pneumatic operated spray water block valve.
- c) Four (4) way solenoid valves shall be used for operating double acting cylinders (If applicable). E.g.: Pneumatically operated on-off type dampers.
- d) Dual coil, latch, unlatch type Solenoid valves shall be supplied for equipment trips/critical applications.

25. Electro-Pneumatic positioners shall be used for all pneumatically operated control valves, power cylinders etc., for converting controller output of 4-20 mA to appropriate pneumatic signal

26. Air Filter Regulators along with gauges shall be used in each of the:

- a) Air supply line to valve positioner/power cylinders
- b) Air supply line to pneumatic interlocked block valves

27. Interposing relay for interface to the following:

- a) Solenoid valve (if output module cannot directly drive SOV) - Relays with contact rating of minimum 2 Amps.
- b) DC Starter (if output module cannot directly drive) - Relays with contact rating of minimum 0.2 Amps.
- c) Hardwired signal exchange – as required.

28. For all HT rotating equipment bearings provision for mounting vibration probes shall be used.

29. Junction Boxes/Field termination cabinet: All JBs /FTCs shall be FRP. Junction Boxes shall be used for:

- a) Termination of all sensors located equipment wise.
- b) Termination of Duplex RTDS
- c) Termination of limit switch, torque switch, position transmitter and control demand, independently for each valve/device.
- d) Area wise or Elevation wise bunching of cables.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[9]	25.09.2014

30. Instrumentation & control cables and Prefabricated Cables with Anti-Rodent treatment shall be used to:

- a) Connect field instruments to field junction boxes/Local Panels. For switches, both the SPDT contacts of switches shall be wired up to the J.B.
- b) Connect limit switches, torque switches and position transmitters to their respective field junction boxes.
- c) Compensating cable shall be supplied for connection between the element and the respective junction boxes / system cabinets as per guidelines.
- d) Prefabricated cable for connecting between system cabinets, marshalling cabinet to system cabinet, system cabinet to Relay Rack, system cabinets to engineering work stations etc.
- e) Entire C&I cable within the battery limits.

31. All field instruments including electronics located outside control room areas shall be tropicalized and shall be designed to work in site specific atmosphere/climatic conditions and enclosed in dust tight, waterproof and weatherproof enclosures. In general, transmitters and switches installed at outdoor location shall be mounted in closed type transmitter enclosure. For other areas (indoor), open type racks may be used for installation of transmitters and process switches.

32. All alarm shall be displayed in the control system HMI/LCD. However where local panels are used for local operation/monitoring, PLC driven alarm annunciation system with LED type lamps for local panel shall be used.

33. Spring-loaded/ Cage clamp type terminals shall be used for termination of instrumentation cables at field JBs, FTCs and local panels.

34. Signal Exchange Between Coal Handling Equipments/System and control System

- a) All the signals required for interlock/alarm/SER purpose (to be implemented in the control System) shall be hardwired.
- b) All binary outputs provided to local panels/sensors for connection from control System shall be potential free contacts with a rating of 0.2 amps at 220 V DC or 2 amps at 24 V DC or 5 amps at 240 V AC. All check backs to control System shall only be potential free contacts.
- c) All analog outputs provided to local panels/sensors for connection from control System shall be isolated 4-20 mA DC.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[10]	25.09.2014

- d) Command outputs from control System to motorized valve actuator shall be logic level signal (24 V DC) and necessary interposing relays suitable to accept 24 V DC logic level command signal shall be used in MCC module for MOV actuator.

35. All indication lamps shall be LED type.

36. All interposing relays shall be Plug in type with screw type base & LED for status indication. Relay modules/boards etc. are not acceptable.

37. All Limit Switch shall be Non-Contact type. If there is constraints because of process conditions/space, mechanical lever actuated Limit switch may be used.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[11]	25.09.2014

4 DESIGN CRITERIA

This section covers the general design criteria to be adopted in designing the Control & Instrumentation system for the Coal Handling System Package.

4.1 General Requirements

Ambient Conditions

Instruments, devices and equipment for location in outdoor / indoor / air-conditioned areas shall be designed to suit the environmental conditions indicated below and shall be suitable for continuous operation in the operating environment of a coal fired Power plant and also during periods of air conditioning failure without any loss of function, or departure from the specification requirements covered under this specification.

Table 4.1
Protection Class Requirement

Ambient Temperature (outside temperature)	Pressure	Relative Humidity	Atmosphere	Required Protection class of panels /cabinets /desks
Outdoor Location				
55 °C max	Atmosphere	100%Max	Air (dirty)	IP 65
4 °C min	Atmosphere	5% Min	Air (dirty)	IP 65
Indoor Location				
55 °C max	Atmosphere	95% Max	Air	IP 54
4 °C min.	Atmosphere	5% Min	Air	IP 54
Air-conditioned Area				
24 +/- 2 °C normal	Atmosphere	95% Max	Air	IP 44
50 °C Max.	Atmosphere	5 % Min	Air	IP 44

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[12]	25.09.2014

Ambient Temperature (outside temperature)	Pressure	Relative Humidity	Atmosphere	Required Protection class of panels /cabinets /desks
<p>a) For Ventilated enclosures, protection class shall be IP 42.</p> <p>b) For hazardous areas the protection class shall be in accordance with the requirements of the relevant NEC code for the location.</p> <p>c) For PCs, OWS, EWS, Servers, Printers and other peripherals, maximum temperature limit shall be 35 °C, For LCD the same shall be 25 °C & for UPS the same shall be 40 °C</p>				

4.2 Codes & Standards

All equipment, system and service covered under this specification shall comply with the requirements of the latest statutes regulations and safety codes as applicable in the locality where the equipment/systems shall be installed.

The equipment, systems and services furnished as per this specification shall conform to the codes and standards mentioned in this section. However in the event of any conflict between the requirements of two standards or between the requirements of any standard and this specification, all equipments under this specification shall be given tropical treatment for the climatic conditions prevailing at site as described under project data. Tropical protection shall conform to IS-3202 or any other applicable international standard for protection of Electrical power equipments against climatic conditions.

Reference Codes and Standards

The design, manufacture, inspection, testing, site calibration and installation of all equipment and systems covered under this specification shall conform to the latest editions of codes and standards mentioned below and all other applicable ANSI, ASME, IEEE, NEC, NEMA, ISA, DIN, VDE and Indian Standards and their equivalents.

Temperature Measurement

- Instrument and apparatus for temperature measurement ASME PTC 19.3(1974)
- Temperature measurement by electrical resistance thermometers – IS: 2806.
- Thermometer-element-platinum resistance-IS-2848 / DIN 43760/ IEC 751

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[13]	25.09.2014

Pressure Measurement

- Instrument and apparatus for pressure measurement - ASME PTC 19.2 (1964)
- Bourdon tube pressure and vacuum gauges - IS 3624 – 1966

Flow Measurement

- Instrument and apparatus for Flow measurement – ASME PTC 19.5 (1972) Interim supplement, Part-II
- Measurements of Fluid flow in closed conduit – BS 1042 / ISO 5167.

Electronic measuring Instruments & Control hardware

- Automatic null balancing electrical measuring instruments - ANSI C 39.4 (Rev. 1973)
- Safety requirements for electrical and electronic measuring and controlling instrumentation - ANSI C 39.5 - 1974.
- Compatibility of analog signals for electronic industrial process instruments - ISA-S 50.1: ANSI MC 12.1 - 1975.
- Dynamic response testing of process control instrumentation - ANSI MC 4.1 (1975): ISA-S26 (1968).
- Surge withstand capability (SWC) tests - ANSI C 37.90a (1974) IEEE Std. 472 (1974). IEC - 254.1.
- Printed circuit boards - IPC TM-650, IEC 326 C
- General requirements and tests for printed wiring boards - IS 7405 (Part-I) - 1973
- Edge socket connectors - IEC 130-11.
- Requirements and methods of testing of wire wrap terminations DIN 41611 Part-2.
- Dimensions of attachment plugs & receptacles ANSI C73-1973.
- Direct acting Electrical Indicating Instruments: IS-1248-1968.

Electronic Cards, Subassemblies & Components

1. Unpackaged

- Vibration IEC 68.2.26
- Shock IEC 68.2.27
- Drop & Topple IEC 68.2.31

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[14]	25.09.2014

2. Packaged

- Vibration, Drop & Static Compression – NSTA

3. Electromagnetic Compatibility

- Electrical Fast Transient – IEC 801.4
- Surge Withstand – IEC 255.4
- Radiated Electromagnetic Field – IEC 801.3
- Electrostatic Discharge – IEC 801.2
- Electromagnetic Emissions – VDE 0871, Class B

Instrument Switches and Contacts

- Contact rating - AC services NEMA ICS Part-2 125, A600
- Contact rating - DC services NEMA ICS Part-2-125, N600.

Enclosures

- Types of enclosures - NEMA Std. ICS-6-110.15 through 110.22 (Type 4 to 13).
- Racks, panels, and associated equipment - EIA: RS-310-B (ANSI C83.9 - 1972)
- Protection Class for Enclosure, Cabinets, Control Panels and Desks - IS-13947, 1993 & IEC 529.

Apparatus, enclosures and installation practices in hazardous areas

- Classification of hazardous area - NFPA Art. 500, Vol.70-1984.

- Surges withstand capability tests - ANSI C.37.90a - 1974 and IEEE Std. 472 - 1974.
- General requirements & tests for switching devices for control and auxiliary circuits including contactor relays - IS-6875 (Part-I) 1973.
- Boiler safety interlocks - NFPA Section 85B, 85D, 85E, 85F, 85G.

Control Valves

- Flow Equation for Sizing Control Valves – ISA S39.2, 1972
- Control Valve Seat Leakage – ANSI / FCI 70.2
- Face to face Dimensions of Control Valves – ANSI B16.10, ISA – S75.03 & ISA – S75.16
- Steel Pipe, Flanges & Flanged Fittings – ANSI B16.34
- Control Valve Capacity Test Procedure – ISA – S75.02
- Industrial Process Control Valves - IEC 534

Process Connection and Piping

- Codes for pressure piping power piping ANSI B31.1
- Seamless carbon steel pipe ASTM A-106.
- Forged and Rolled Alloy steel pipe flanges, forged fittings, valves and parts - ASTM A-182.
- Material for socket welded fittings - ASTM A-105.
- Seamless Ferritic alloy steel pipe - ASTM A-335.
- Pipe fittings of wrought carbon steel and alloy steel - ASTM A-234.
- Composition bronze or metal castings - ASTM B-62.
- Seamless copper tube, bright annealed ASTM B-168.
- Seamless copper tube - ASTM B-75.
- Dimensions of fittings - ANSI B-16.11
- Valves flanged and butt welding ends - ANSI B16.34.
- Nomenclature for Instrument tube fittings ISA-RP-42.1 - 1982.

Cables

- Colour coding of single or multi-pair cables - ICEA S-61- 402. (Third edition) NEMA WCS-1979.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[16]	25.09.2014

- Guide for design and installation of cable systems in power generating stations (insulation, jacket materials) - IEEE Std. 422 - 1977.
- Requirements of vertical tray flame test - IEEE 383 - 1974.
- Standard specification for tinned soft or annealed copper wire for electrical purpose - ASTM B-33 - 81.
- Oxygen index and temperature index test - ASTM D-2863.
- Smoke generation test - ASTM D-2843 and ASTM E-662.
- Acid gas generation test - IEC-754-1.
- Swedish chimney test - SEN - 4241475 (F3)
- Instrumentation cables and internal wiring IS-1554 (Part-I, 1976) and IS: 5831(1984).
- Mono-mode Fibre – ITU-T G.652 for Optical Fibre Cable
- IEEE 1138, 1994 / IEC 1089 / EIA-455 B for Optical Fibre Cable

Cable Trays, Conduits

- Guide for the design and installation of cable systems in power generating station (cable trays, support systems, conduits) - IEEE Std. 422, NFPA-70-1984.
- Guide for the design and installation of cable systems in power generating station (Cable trays, support systems, conduits) Test Standards, NEMA VE-1 - 1979.
- Galvanizing of Carbon steel cable trays - ASTM A-386-78.

4.3

Power Supply

All instruments and control devices shall be designed to operate on power supplies as follows:

- Electric:
- 230 volts AC, 50 hertz, single-phase for low torque drives with guaranteed satisfactory operation when equipment is continuously energized at any voltage from 216VAC to 264VAC.
- 24V DC for PLC.
- 24 VDC, 110VAC or 230 VAC for Field Instruments.
- Pneumatic: Clean, dry, and oil free instrument air at 4.2 to 8.6 bars gauge.

4.4

Standard Ranges of Analog Signals

The ranges of analog signals shall normally be as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[17]	25.09.2014

- (a) Electric -- 4 to 20 mA dc.
- (b) Pneumatic -- 0.2 to 1.0 kg/cm².

The use of any signal range other than the above shall not be acceptable.

4.5 Contact Ratings

The ratings of all instrument contacts used for alarms and interlocks shall be as follows:

Table 4.2
Contact Ratings

	Voltage Rating (volts)	Continuous Rating	Switching Rating (break)
a)	240 AC	480 volt-amperes	1200 volt-amperes
b)	220 DC	60 watts	200 watts
c)	24 DC	12 watts	25 watts

The ratings of all microprocessor-based controller or programmable controller output contacts shall be as required by the controlled devices. Where necessary for higher current ratings or isolation, interposing relays shall be used.

4.6 Reliability and Availability

- (a) Each component and system shall be of established reliability. The minimum target reliability of each piece of equipment like each electronic module/card, power supply, peripheral etc. shall be established by considering its failure rate/mean time between failures (MTBF), meantime to repair (MTTR), such that the availability of the complete C&I system is assured for 99.7%.
- (b) Detailed reliability calculations shall be used for each system/ equipment (with the help of a schematic of various sub-system connected in series or in parallel as the case may be and MTBF & MTTR values for the various equipments). Availability calculation shall be as per IEEE Standard-P1046 or equivalent.
- (c) When more than one device uses the same measurement or control signal, the transmitter and other components/ module shall be fully equipped to provide all signal requirements. The system shall be arranged so that the failure of any monitoring device or control components or spurious intermediate grounding in the signal path shall not open the signal loop nor cause the loss or malfunction of signal to other devices using the same signal.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[18]	25.09.2014

- (d) To ensure availability, adequate redundancy in system design shall be used at hardware, software and sensor level to satisfy the availability criteria. For the protection system, independent sensing device shall be used to ensure adequate safety of plant equipment.

4.7 Standardization & Uniformity of Hardware

To ensure smooth and optimal maintenance, easy interchange ability efficient spare parts management of various C&I instruments, ensure that all instruments/devices (Processor modules, input/output modules, power supply modules etc.) are of the same family of hardware. For example, all 4-20 mA electronic transducers, control hardware, control valves, actuators instruments/ local devices etc. being furnished shall be manufacturer specific.

4.8 Redundancy

1. Reliability of the Control System shall be established by judicious incorporation of redundancy. In general all critical parts shall have hot standby feature to render the system immune to any single failure.
2. Measurement system (MS), Closed Loop Control System (CLCS) and Open Loop Control System (OLCS) shall all be configured with redundancy at processor modules, communication modules, data bus and power supply modules.
3. Both CLCS & OLCS shall be configured with I/O channels redundancy for each sensor/signals. Where redundant sensors are provided redundant I/O channels shall be used for each sensors/signals.
4. Two out of three measurements philosophy shall be adopted for the control of all closed and critical open loop variables for reliability of operation. The control system shall select the median value for the normal control purpose.

4.9 Operability & Maintainability

1. The design of the control systems and related equipments shall adhere to the principle of 'Fail Safe' operation wherever safety of personnel / plant equipment is involved. 'Fail Safe' operation signifies that the loss of signal or failure of any component shall not cause a hazardous condition. However, it shall also be ensured that occurrence of false trips are avoided / minimized.
2. The types of failure which shall be taken into account for ensuring operability of the plant shall include but not be limited to:
 - Failure of sensor or transmitter,
 - Failure of main and/or redundant controller/other modules,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[19]	25.09.2014

- Loss of motive power to final control element,
 - Loss of control power.
 - Loss of instrument air
3. The choice of hardware shall also take into account sound maintainability principles and techniques. The same shall include but shall not be limited to the following:
- Standardization of parts.
 - Grouping of functions.
 - Interchangeability.
 - Malfunction identification facility/self surveillance facility.
 - Easy modular replacement.
 - Fool proof design providing proper identification and other features to preclude improper mounting and installation.
 - Appropriate derating of electronic components and parts.

4.10 Metering Bases of Units

The following system of units shall be followed throughout the specification unless otherwise mentioned.

Table 4.3
Metering Bases of Units

S.No	Parameter	Unit
1	Pressure	Kg/sq. cm
2	Differential pressure	mm of H ₂ O column or Kg/sq. cm
3	Draught	mm of H ₂ O column
4	Vacuum	mm of Hg
5	Temperature	Degree Celsius
6	Flow	Tonnes / hr or Kg/hr
7	Flow (Air / Gas)	Tonnes / hr or N. Cu. M /hr
8	Density	gm / c.cm
9	Level	mm or M

4.11 Grounding System

All panels, desks, cabinets shall be used with a continuous bare copper ground bus. The ground bus shall be bolted to the panel structure on bottom on both sides. The bolts shall face inside of panels.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[20]	25.09.2014

The system ground shall be isolated from the panel ground with suitable isolators. All internal component grounds or common shall be connected to the system ground, which shall be fabricated of copper flat (size 25 mm x 6 mm min, length as applicable).

Shield on instrumentation cables shall be grounded on panel side. When shielding termination is required in cabinets furnished under this specification, suitable terminals shall be furnished on copper flat forming system ground. System and shield ground shall be connected to earthing strip at 0.0 meter level using suitable size of cable.

4.12 Drive Control Philosophy

The Drive control & measurement philosophy for the project is detailed in this section.

1. Bi-directional drives (inching or open/close)
 - (a) All bi-directional drives shall be operable from Remote i.e. from CR.
 - (b) Remote manual operation of all drives shall be carried out from OWS.
 - (c) Remote Open/Close commands, generated in control system shall be issued to MCC module through interposing relays located in respective MCC module in the MCC room. Latching of commands shall be used in control system logic which shall be reset by Limit/Torque switch feedback. The Limit/Torque switch feedback from drive shall be directly wired to Control System.
 - (d) Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
 - (e) Following signal exchange shall be envisaged between Drive & Control system:
 - Open Limit Switch (Both NO & NC contacts)
 - Close Limit Switch (Both NO & NC contacts)
 - Open Torque Actuation
 - Close Torque Actuation
 - Position feedback (4-20 mA, two wire electronic type) for inching drive
 - (f) Following signal exchange shall be envisaged between MCC & Control system (Remote I/O cabinet of control system located in/near MCC room):
 - Switchgear available
 - Switchgear disturbance
 - Open Command
 - Close Command

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[21]	25.09.2014

2. Unidirectional LT drives

- (a) Unidirectional LT drives shall be operable only from Remote i.e. from CR. In addition, Local pushbutton shall be used only for emergency stopping of drive. Local start operation of the drive is not envisaged.
- (b) Remote manual operation of all drives shall be carried out from OWS.
- (c) Remote Start/Stop commands shall be generated in Control system & shall be issued to MCC module through interposing relays.
- (d) Emergency stop of the drive shall be envisaged from the local pushbutton provided near the drive. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to MCC.
- (e) Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
- (f) Current transducer with 4-20 mA type outputs shall be used in the MCC for monitoring the current in Control System for all Drives greater than 90 KW. Auxiliary power supply to these transducers shall be from the control supply of the respective MCC modules.
- (g) Following signal exchange shall be envisaged between MCC & Control system (Remote I/O cabinet of control system located in MCC room):
 - Switchgear available
 - Switchgear disturbance
 - On Feedback
 - Off Feedback
 - Start Command
 - Stop Command
- (h) All Numerical relays/Intelligent controllers for LT drives shall be interfaced to Control System through IEC 61850 protocol.

3. Solenoid Operated drives

- (a) Solenoid operated drives shall be operable only from Remote i.e. from CR.
- (b) Remote manual operation of all drives shall be carried out from OWS.
- (c) Remote Open/Close commands shall be generated in Control system & shall be issued to the Solenoid through interposing relays.
- (d) Necessary process interlocks shall be realized in Control system.
- (e) Following signal exchange shall be envisaged between solenoid drive & Control system:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[22]	25.09.2014

- Open Limit Position
- Close Limit Position
- Open Command
- Close Command

4.13 HT drives

1. HT drives shall be operable only from Remote i.e. from CR. In addition, Local pushbutton shall be used only for emergency stopping of drive. Local start operation of the drive is not envisaged.
2. Remote manual operation of all drives shall be carried out from OWS.
3. Remote Start/Stop commands shall be generated in Control system & shall be issued to MCC module through interposing relays.
4. Emergency stop of the drive shall be envisaged from the local pushbutton provided near the drive. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to MCC.
5. Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
6. Current transducer with 4-20 mA type outputs shall be used in the MCC for monitoring the current in Control System for all Drives. Auxiliary power supply to these transducers shall be from the control supply of the respective MCC modules
7. Following signal exchange shall be envisaged between MCC & Control system (Remote I/O cabinet of control system located in MCC room):
 - Switchgear available
 - Switchgear disturbance
 - Master Trip relay Operated
 - On Feedback
 - Off Feedback
 - Trip Feedback
 - Emergency stop feedback
 - Start Command
 - Stop Command

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[23]	25.09.2014

- Current Feedback
8. All Numerical relays/Intelligent Controllers for HT drives shall be interfaced to Control System through IEC 61850 protocol.

4.14 Variable Frequency Drives (VFD)

1. VFD shall be operable from Remote i.e. from CCR/LCR & from VFD Local Display unit. In addition, Local pushbutton shall be used only for emergency stopping of drive.
2. Remote manual operation of VFD shall be carried out from OWS.
3. Remote Start/Stop commands shall be generated in Control system & shall be issued to VFD Panel through interposing relays located in VFD Panel.
4. Emergency stop of the drive shall be envisaged from the local pushbutton provided in the field. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to VFD panel.
5. Necessary Electrical protections shall be realized at VFD module whereas process interlocks & protections shall be realized in Control system.
6. Following signal exchange shall be envisaged between VFD & Control system:
 - Switchgear available
 - Switchgear disturbance
 - On Feedback
 - Off Feedback
 - Trip Feedback
 - Emergency stop feedback
 - Start Command
 - Stop Command
 - Current Feedback
 - Speed feedback
 - Speed Setpoint
7. The VFD shall also be interfaced with control system via Modbus soft link.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[24]	25.09.2014

5 COAL HANDLING CONTROL SYSTEM

5.1 General

The instrumentation and control system shall cater to the requirements of coal handling system (CHS) consisting of the following major systems:

- Coal Unloading System
- Stacker Cum Reclaimer (SCR) System
- Coal Transport/Storage/Reclaim System
- Dust Control System
- Electrical Controls Related to Coal Handling System (For Details Refer Electrical Section)
- Vibration Monitoring System for HT Drives

The coal handling system instrumentation shall include the bunker level monitoring system, PLC based control system along with UPS, complete I&C cabling, etc. All necessary field instruments such as Pull Chord Switches, Belt Sway Switches, Zero Speed Switches, RTDs, Ultrasonic level instruments (switches, indicators or transmitters), pressure switches etc and instruments required for auxiliary systems like Compressed Air System, Dust Suppression system etc shall be included.

The design of the control system and related equipment shall adhere to the principle of "fail safe" operation at all system levels (i.e.) loss of signal, loss of power or failure of any component should not cause a hazardous condition; and at the same time prevent occurrence of false trips and provide reliable and efficient operation of the plant under dynamic conditions and attainment of maximum station availability.

For operation and control of the Coal Handling Plant, Bidder shall provide Microprocessor based Programmable Logic Controller based control and instrumentation system which shall cover the total functional requirements of the plant which includes sequence control, interlock & protection, monitoring, alarm, data logging, fault analysis etc. The bidder shall provide all the integral instrumentation for monitoring, Protection and smooth operation of all the Plant and machineries.

5.2 Coal Unloading Control System

5.2.1 Wagon Tippler (wherever applicable)

Coal unloading operation of Wagon Tripler hopper shall be operated/ managed from "Wagon Tripler Control Room" located adjacent to the Wagon Tripler. Wagon tippler control room shall have MMI of the PLC, mimic panel etc shall be air conditioned. Wagon tippler shall be operated and controlled from the Remote IO of CHP PLC located in Wagon tippler control cabin. An

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[25]	25.09.2014

OWS shall be provided in wagon tippler control cabin for operation of wagon tippler.

5.2.2 Apron Feeder & Dribble Feeder (wherever applicable)

Apron Feeder & Dribble Feeder shall be operated and controlled from Remote IO of CHP PLC located in Wagon Tippler Control cabin.

5.2.3 Paddle Feeder (wherever applicable)

Local Control Panel shall be provided for paddle feeder control. However running status of paddle feeder along with stop facilities shall be available from CHP PLC. Suitable indication of paddle wheel rpm shall be provided on the paddle feeder local control panel and flow rate indicator of belt weigh scale shall also be duplicated on local control panel of paddle feeder. Paddle feeder shall be equipped with end travel switch.

5.2.4 Travelling Tripper

Local Control Panel shall be provided for travelling tripper control. However running status of travelling tripper shall be available in CHP PLC. Travelling tripper shall be equipped with end limit switch.

5.2.5 In Motion weigh bridge system

1. One (1) no. In motion pit less type Weigh Bridge complete with Weigh Bridge Platform with Load Cells, Digital Weight Indicator & Totalizer for measurement of gross weight and tare weight shall be provided. Weighbridge shall have its 22" LCD HMI; printer etc. with built in diagnostics and suitable weight management software. Weigh bridge terminal shall be located in the wagon tippler control room or any other location found suitable by the bidder. The weigh bridge control room shall be air conditioned. All cabling shall be armoured with braided stainless steel to protect against corrosion and rodents. The railway track shall be straight and levelled up to at least 100 meters upstream and downstream of each weighbridge. The weighbridge shall be designed to operate in dusty environment.
2. The Accuracy and Least Count of the Weigh Bridge shall be as below:
 - Overall system accuracy : $\pm 0.02\%$ of F.S.
 - Least Count : 10 kg
 - 7 segment LED, self checking, for weight display in tonnes/kgs, with 16 to 20 mm high characters.
 - Continuous self test with selectable automatic analog test and automatic check of components during warm-up.
 - Automatic Zero tracking calibration circuits and zero lock facility as anti fraud measure.
 - Communication ports for interfacing with main computer of plant to enable further processing of data, as and when required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[26]	25.09.2014

- Micro controller based System
- Standard RS232 serial interface for PC & Printer
- Standard RS422 / RS485 port
- Ethernet Connectivity
- Customized & user-friendly Windows based Software for generating reports / slips with parameters like date, time, vehicle no., supplier, material, net and gross weights etc. The relevant file can be printed on a printer.
- High Stability, Accuracy and Repeatability
- Automatic zero maintenance and asymmetric load compensation.
- Auto zero maintenance feature, eliminating the need of frequent zero setting.
- Built in high degree of protection against all forms of electromagnetic & radio frequency interference.
- Diagnostic test facility.
- Multilevel password protection to maintain data security.
- Surge protection - Surge protection for protection of weighing system should be built in (system electronics, PC, load cell etc.) against electrical surges.
- In-built Lightning Protection System
- Self check features for cable breakage etc.

5.3 Stackers Cum Reclaimer (SCR) System

The SCR shall be provided with following minimum instruments for operational interlocks & equipment protections:

1. Radar type level devices to detect stockpile height
2. RF switches for the detection of stockpile surface to protect equipment.
3. Limit switches with backup switches shall operate before device travel limits are exceeded to prevent movement beyond zone of normal operation. The backup switches shall be arranged to directly disconnect power to travel drive motors.
4. Zero speed switches for conveyor under speed detection protection.
5. RF switch for blocked chute detection on each feed chute
6. Audible alarms/sirens to operate before starting of any long travel, luffing, slewing or conveying shall be provided.
7. Anemometer for Wind speed measurement with trip contact for high wind speed.
8. Position measurement for Luffing & slewing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[27]	25.09.2014

9. CCRD for hardwired interlocks with CHP PLC.

5.4 Coal Handling System (Storage/Transport/Reclaim System)

5.4.1 Metal Detector

1. It shall be possible to start the conveyors only after energizing the metal detector and metal detector is in 'reset' condition. Once the metal is detected, the corresponding conveyor shall trip. It shall be possible to restart the conveyors, after local resetting of metal detector & putting back the marker bag in position. Metal detector ON/OFF facilities shall be provided in the OWS.
2. In case of tripping of conveyor system, metal detector shall de energize after a time lag.
3. Following individual indications shall be provided on Local Control panel:
 - Metal Detector 'ON'
 - Metal Detected
 - Metal Detector 'reset'
 - Metal Detector Faulty

5.4.2 In Line Magnetic Separator

1. It shall be possible to start the conveyor only after energizing the magnet of ILMS. Further, if conveyor system trips magnetic separators shall de-energize after a time lag. Also if drive motor of cleated belt of ILMS trips, Magnetic separator shall not get de-energized, but conveyor system shall trip and audio-visual annunciation shall appear at CHP control room.
2. Following individual indications are provided on Local control panel
 - Magnetic separator ON.
 - Incoming supply ON
 - Under current relay operated.
 - Cleated belt motor ON/OFF/TRIP.
 - Oil temperature high

5.4.3 Conveyor System

1. The starting sequence of the conveyors shall follow a direction opposite to that of flow of material.
2. Interlocking of yard conveyor with stacker & reclaimer's boom conveyor shall be provided.
3. Once a conveyor trip, flap gate directing Coal from this conveyor shall change over its position with a time delay and shall come back to the original position again, to prevent jamming of gate.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[28]	25.09.2014

4. Any individual equipment (belt conveyor etc.) should not be allowed to start unless the equipment immediately following the same in the direction of flow of Coal is already in operation.
5. Stop / tripping of any equipment from running condition shall trip all preceding equipment in the system, but shall not effect succeeding ones which shall continue to operate except crushers. Interlocking of various conveyors shall be achieved with limit switches and zero speed switches.
6. Adequate no. of Pull cord switches at 30m intervals shall be provided along the length of each belt conveyor, which shall enable the respective conveyor to be stopped immediately. Belt Protection switches, Pull Chord Switch & Belt Sway Switch, shall be identified/addressed by a specific number in the Control Room.
7. Means shall be provided to pre-warn personnel working nearby when starting any conveyor /Stacker/ Reclaimer by providing Sirens.
8. Interlocking of various conveyors shall be achieved with Flap gate & Flow Dividers via Limit switches & Zero speed switches.
9. Crushers shall be provided with fluid coupling oil temperature, speed and vibration monitoring instruments. Crushers shall trip in case fluid coupling oil temperature/ speed / vibration are going beyond set limits of design.
10. Wherever Scoop type coupling provided for HT motors, the coasting time of respective conveyor, thruster brake, actuator selection and the chute size shall be so selected such that there is no spillage of Coal from any downstream conveyors during next start.
11. For maintenance purpose local operation of the conveyor shall be provided through LPBS located near the Drive. The interlock/de-interlock selector switch shall be provided for enabling the local operation. The required status indication shall also be provided.

5.4.4 Flap gates/Flow Dividers

All flap gates / Flow Dividers / Diverter gates shall be motorized and remote controlled from the control room. Their position shall be indicated on the OWS/LCD of control room. Once a conveyor trips, flap gate directing coal from the conveyor shall change over its position with a time delay and shall come back to the original position again to prevent jamming of gate.

5.4.5 Coal Sampling Unit

1. Coal sampling unit shall be controlled through standalone PLC based Local Control Panel. Control & interlocks for complete sampling system including sampler, crusher, belt feeders & sample collector system shall be implemented in PLC.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[29]	25.09.2014

2. Only one start/stop push button for coal sampling system shall be provided for automatic operation of complete coal sampling system. Local push button stations shall be provided for all individual equipment of coal sampling system near the equipment.
3. The necessary controls for automatic control of coal sampling system shall be designed in accordance with the requirements of ASTM-D-2234.
4. All local instruments like limit switches, proximity switches, emergency stop PB, Belt sway switches, zero speed switches etc. required for the CSU shall be provided.

5.4.6 Bunker Level Measurement

1. Radar type or ultrasonic type level transmitter shall be provided for each Coal bunker. Level of coal in the bunkers shall be indicated in a local panel mounted on the bunker floor of each unit. High & Low level audio-visual alarms shall be provided as a minimum requirement for local operation.
2. Local display and annunciation shall be provided for High and Low level signals on the instrument and level reading shall be available for operator at Control Room by means of 4-20mA.
3. In case of level high in bunker level, the feeding conveyor shall be stopped. Bunker level shall be continuously displayed with low, lowlow, high and high-high indications on the HMI.

5.4.7 Bunker filling system

1. Bunker filling shall be interlocked with bunker level through bunker level transmitter. However for manual Operation of Tripper Level Indicators Shall be provided.
2. The shuttle feeder/Tripper shall be provided with optical encoders for positioning on bunkers.
3. Required Proximity type & mechanical limit switches for over travel protection shall be provided. The over travel limit switch shall be wired directly to MCC.
4. The bunker filling operation shall be provided with manual as well as automatic mode. In automatic mode the bunker filling sequence shall be decided based on the level of bunkers. In addition to this the facility shall be available on OWS for selecting the sequence of bunker filling.
5. Local control panel shall be provided for local operation with status indications & annunciation windows.

5.5 Dust Control System

5.5.1 Dust Suppression System

1. The DSS shall be started or stopped automatically from the coal handling system PLC. The DSS shall be tripped automatically when the main conveyor

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[30]	25.09.2014

/ equipment in that particular Junction Tower is not operating in order to prevent flooding of discharge chutes/conveyors. Necessary flow activation station with local push buttons for maintenance purpose and pressure regulating units with start, stop PBs, indication lamps, control wiring, interlocks, contactors, instrumentation etc. shall be provided.

2. The Coal stockyard DSS water supply pumps located in the coal handling system pump house shall supply water for stockyard DSS only, when stacking and / or reclaiming is taking place. Hence when either stacking or reclaiming or both are taking place in a preselected section of a particular stock pile and or a different stock pile, these pumps shall automatically start supplying water to a set of sprinklers located on either side of the particular stock pile and or a pre-selected section of a particular pile. When stacking and/or reclaiming shifts to another section or to another stockpile, water supply shall also get shifted automatically to those particular set of sprinklers located in the new areas. In the section(s) of the stockpile where stacking and/or reclaiming was taking place earlier, water supply shall be cut off automatically.
3. The fixed nozzles spraying water on to Coal at the discharge of various conveyors, shall be energised only when the respective conveyors are operating.

5.5.2 Dust Suppression System Pumps

1. The DS System pumps shall be operated from CHP control room.
2. Following individual inputs shall be provided to PLC for alarms / indications:
 - Motor On, Off & Trip
 - Discharge water pressure low
 - Water level is low in tank
 - Water level is high in tank
3. Pressure switch shall be provided in the delivery line to maintain the minimum set pressure during the operation. If the pressure falls down below the set pressure the standby pumps shall start automatically after time delay. Even after the pressure is not healthy inside the system the pump shall trip automatically after certain predetermined set time.
4. The control logic should be designed to meet the following minimum interlocks.
 - Both pumps cannot run together. Only one at a time in any mode.
 - Pumps should not be started when the water level is lowest in the tank.
 - Low contact of Level switch to be interlocked.
 - After starting the pump if the pressure is not built within the specified time the running pump should be stopped and other pump shall be tried.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[31]	25.09.2014

If it is the same case with other pump too then the system should stop and announce the alarm.

- Differential pressure switch in the duplex strainer shall give the filter clogged signal. This No contact shall be used for "FILTER CLOGGED" alarm.
- Along with the above interlocks regular motor protection shall be used in the logic.

5.5.3 DS System Compressors

1. The DS air system shall be provided with microprocessor-based control system for each compressor and shall be fully automated, using the manufacturer's standard control package, with single button system start/stop from the CHP Control room and with status/alarm information provided to the operator via the CHP PLC.
2. Local control units with display shall be provided for the compressors to allow local operation & monitoring. All common logics for compressors such as selection, auto change over, duty cycle etc. shall be implemented.
3. The control equipment shall be interfaced with the CHP PLC through Modbus/suitable communication, such that the operator can monitor the operation of the compressors and be aware of problems as and when they occur.
4. The control scheme shall be suitable for operating the compressors such that all the compressors shall be equally loaded and ensures power consumption is also optimized.
5. Any of the compressors may be selectable for "shut down ", "working " or "standby" duty.
6. An electrically operated automatic valve shall be provided on cooling water supply line of each compressor (if applicable) which shall automatically shut of the cooling water supply, in case any of the compressor is not running for more then set time duration. Suitable interlock shall also be provided for opening the valve before starting of any of the compressor.
7. All necessary instrumentation and field sensors for control and operation shall be provided which shall include:
 - Indication of suction pressure after suction air filters for each compressor.
 - Indication of temperature of compressed air after intercooler & after after-cooler.
 - Indication of pressure of lube oil after oil filter.
 - Indication of differential pressure across lube oil filter.
 - Oil Level of Indication of lube oil sump.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[32]	25.09.2014

- Indication of cooling water pressure to compressor cooling circuit.
 - Indication of Flow measurement at the common discharge airline
 - Indication of Air pressure of individual compressor discharge header and on each air receiver.
8. The dual type control system shall permit operation of each compressor in either of the following way :
 - Continuous Variable Load/unload regulation
 - Automatic Start/Stop control.
 9. The compressed air system shall be provided with automatic data logging system-integrated with/through CHP PLC, automatically furnishing and recording the following important parameters.
 - Compressor status like Ready, Run, Stop, Trip, Remote, Alarm, Fault etc
 - Number of hours of operation of compressor.
 - Energy consumption, pressure, and any other related parameters.

5.5.4 Coal Stockyard Spray water system

1. Sprinkler type dust suppression system envisaged for Coal stockpiles.
2. The operation of the sprinklers for stock piles shall be automated by CHP PLC.
3. Two solenoids of opposite side sprinklers shall be made as pair and they should get ON together. Bidder to decide the no. of sprinklers required to be switched ON together depending on the site requirement.
4. There shall be two modes of operation for spray water system:

Manual Mode:

Solenoid pairs shall be switched ON/OFF by using Push Buttons at the Solenoid box. Any sprinkler switched ON in manual mode shall continue in ON status till it is switched off/mode is changed. The indicator shall glow in the panel when any solenoid is ON.

Auto Mode:

In auto mode control of the sprinklers shall be through relay panel. Switching the first relay shall energise Solenoid 1 and 2. Similarly each relay energization shall energise the other solenoids in pairs, covering the entire length of the stockpile. The relay contact shall be latched & till the relays are energised solenoids should remain in energised state. Sprinkler ON time and sequence shall be programmed as per the site requirement. The no. of relays to be energised at a time.

5. The sequence logic & pumps control/interlocks shall be implemented in CHP PLC & operation shall be monitored through OWS/LCD.
6. The failure of sequence or tripping of pumps etc. shall be alarmed at the CHP control room.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[33]	25.09.2014

5.5.5 Dust Extraction System

1. The following sequence shall be followed for starting the DE system:
 - Start Screw conveyors of bag filter & cyclone outlet
 - Start RAV of Cyclone & bag Filter
 - Power to sequential controller
 - Start Centrifugal Fan Motor
 - Open motorized damper of fan inlet
2. The equipments shall be interlocked with following instruments for normal operation of DE system:
 - DPS shall energize at pre set pressure and shall issue command to sequential controller for solenoid valve energization.
 - After air purging in sequence of solenoid valves through sequential controller with pre set pause and on time the DPS shall be de-energized at fixed differential set pressure.
 - Sequential controller shall stop output to solenoid valve if air pressure at compressed air line falls below the set pressure. In that case the whole system shall shut down immediately.
3. ZSS shall be provided for detecting rotation of rotating part of the RAV during running Condition. If any RAV of cyclone, Bag filter fail to run then the whole system shall shut down immediately.

5.6 Vibration Monitoring System

5.6.1 General

Bidder shall supply a programmable on-line Vibration Monitoring System (VMS) that shall automatically acquire data related to the mechanical health of rotating equipment such as crushers. The VMS shall exchange data with the PLC of CHP system for viewing, trending, alarming of machine parameters.

The system shall be complete including transducers, transmitters, monitors, relay modules, networking hardware, power supplies, special cables etc. for measurements, protective alarm and trip etc. The system shall have inherent feature to suppress false alarm / tripping due to defective transducers, power supply failure etc.

No failure of a single component shall lead to the trip of the machine. Critical alarm and trip relay output shall be configured in as required for the machine criticality. All the alarm and trip relay contact shall be hardwired to the respective control system. Potential free wired contact shall be available for the same.

The system shall have the following sub systems:

- Field Transducers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[34]	25.09.2014

- Process data Interface sub system
- PLC interface

Vibration level of equipments at bearings shall not exceed the following limits for different equipment. Vibration levels shall conform to the limits specified below and shall be measured as per VDI 2056 / BS 4675. Equipment Peak to peak limit:

Table 5.1
Vibration Limits

S.N	Description	Vibration Limits
1	At the bearing of drive pulley, motor and gear box for the following equipment:	
	i) Boom conveyor of stacker/ Reclaimer:	115 microns
	ii) All other equipment/ : Conveyors/feeders etc.	75 microns
2	On the floors and columns of junction towers, Crusher house and conveyor, Gallery walkways	200 microns
3	Crusher	160 microns for speed of 750 rpm

For rating ≥ 6.6 KV motors, vibration sensors/ transmitters in X,Y direction with both raw and 4-20mA outputs for motor and gear box shall be provided by the bidder. For raw signals cabling upto junction box & 4-20 mA signal shall be taken to CHP PLC.

5.6.2 System Requirement of VMS

1. The system shall comprise of Instrument rack, dual power supply modules, monitoring modules, relay modules, interface modules, communication modules and necessary software to convert and process raw transducer signal.
2. Failure of single power supply shall not affect system functioning.
3. Monitoring modules shall allow "hot" insertion or removal. All dynamic monitoring modules shall have each channel's buffered transducer signal available on the front of the monitor through BNC connectors. This will enable the buffered output to be used for connecting portable test and diagnostic equipment.
4. Vibration monitors shall have four channel input capability and be fully software configurable for the radial vibration measurement; the monitor should return direct, gap, 1X amplitude and phase, and 2 X amplitude and phase, not 1 X, and Smax data.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[35]	25.09.2014

5. Removal and replacement of module shall be possible to be carried out in system power on condition.
6. Process variable monitors shall have the capability to receive 4-20 mA DC process data in addition to machine transducer data.
7. Relay modules shall be programmable or hardwire connected to perform Boolean operation.
8. The system shall be supplied with necessary configuration and HMI software for configuring.
9. Racks shall be connected in a network. Networking shall be made through OFC / Ethernet data highway cable.
10. Input supply to the system shall only be taken from the UPS system in the nearby area.
11. System shall be capable of operating from 0 to 50 °C and at 95% non-condensing moisture.
12. The monitoring / protection system should be compliant to API 670.

5.7 Operation and Control Philosophy

1. The operation and control of the Coal Handling Plant (CHP) and associated systems shall be performed from it's own dedicated PLC located in the Coal Handling Plant Local Control Room through two nos. (2) Operator Stations and one (1) number Engineering/Operator Work Station. The two (2) Nos. 52" LCD shall be configured to display alarm and also serve normal operation.
2. One (1) no. A3 size dot matrix printer shall be provided which shall be connected to the data highway and One (1) no. A4 size Colour Laser jet printer shall be provided which shall be connected directly to the engineering work station. The required furniture such as operator desk, chairs, etc shall be provided by the bidder. The CHP PLC shall be interfaced to DCS through redundant OPC link by fibre optic cable as well as some signals shall be hardwired to DCS for monitoring purposes.
3. The Stacker & Reclaimers shall be controlled through Dedicated PLC.
4. SCR local PLC shall be interfaced with the CHP PLC over the redundant radio communication network. Wireless Ethernet modem with necessary transmitter-receivers shall be used. Necessary process graphics, alarms, status shall be provided on the CHP PLC for monitoring. Failure of the communication links shall be annunciated in the HMI.
5. The frequency spectrum shall be as per statutory norms. The frequency shall be high to avoid interruption / interference due to building and trees. Necessary structures shall be provided for mounting of the antenna tower. The telemetry license shall be in bidder's scope.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[36]	25.09.2014

6. The SCR PLC shall be programmed for various operating modes as:
 - Local/Auto – manual mode: for operations from SCR cabin
 - Local/Maintenance mode: for maintenance purpose
 - Remote mode: for operation from CHP control room through Telemetry (only in case of emergency)
7. The operator interface for the SCR control desk shall have a HMI directly mounted on to the panel with fully shielded industrial key-board and mouse. In addition to this the control desk shall be provided with push buttons and joy sticks for operator control.
8. Minimum information shall be made available in the local control room as given below:
 - Flow diagram of coal handling system
 - Position of flap gates
 - Operating / non operating equipment indication.
 - Position of flow dividers – 0 to 100% from the reference.
 - Quantity of coal flow in each chute from each position of FD
 - Belt weigh scale capacity in TPH – quantity of coal conveyed on the conveyor in one hour, one shift, one day, one week, one month and one year
 - Fault annunciation of each equipment
 - Down time of each equipment, reasons for break down. Total down time of each equipment in a day, week, month & year.
 - Availability of each equipment % - availability in a year.
 - No. of hours of operation of each equipment in a shift, day, week, month and year.
 - Loading pattern of each conveyor – graphical representation
 - Healthiness of each belt weigh scale, calibration date previous and next due date
 - Major parameters of each equipment
 - Position of each tripper
 - Level of coal in each bunker % fill and height (signal to be taken from the level monitoring system supplied by coal handling vendor)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[37]	25.09.2014

- Alarm for normal / high level of coal in bunker, low level and low low level shall be derived from the level indicators.
- Local / remote selection facility for operation of tripper.
- Current drawn by motors
- Power consumed by equipment
- All electrical faults
- Vibration and temperature alarms for HT motor and gear boxes.

5.7.1 Interlock & Protection

Safety interlocks to be taken care for conveyors and other equipment as a minimum are:

A. Conveyors

- Pull chord switch – not operated
- Belt Sway switch – not operated
- Motor protection - not tripped.
- Local stop PB – reset.
- Chute Block switch – not operated.
- Brakes for conveyor - not operated.
- Trip circuit – healthy.
- Temp of fluid coupling oil - not high
- Zero speed switch – closed at 90% of belt conveyor speed

B. Magnetic Separators / Metal Detectors/Suspended Magnets

- O/L / fault relay - not tripped
- Local Stop PB - reset
- Metal detector - reset

C. Vibrating Screens/Grizzly Feeders

- Motor O/L - not tripped
- Local stop PB – reset
- Respective Crusher – on
- Respective Belt Feeder – on

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[38]	25.09.2014

D. Crusher

- Zero Speed – not operated
- Motor Protection – not tripped
- Vibration level –not high
- Temp of fluid coupling oil – not high
- Local stop PB – reset

E. Flap Gates/ Rack & Pinion Gates

- End of travel limit switches - reset
- Torque limit switches - reset
- Local stop – reset

F. Paddle Feeders (wherever applicable)

- Paddle Feeder Down conveyor - running.
- Local Stop - reset.
- Stop PB in main CHP control room - reset.
- All limit switches - reset.
- Motor O/L - not tripped.

G. Travelling Tripper

- Bunker Conveyor - running.
- Local Stop - reset.
- Motor O/L - not tripped.
- Limit switches – reset.
- Bunker Level Low

H. Apron Feeder (wherever applicable)

- VFD - healthy.
- Trip conditions - healthy.
- Local stop PB – reset.
- Any of the succeeding conveyors - running.
- Dribble Feeder - on.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[39]	25.09.2014

I. Dribble Feeder (wherever applicable)

- Trip conditions - healthy.
- Local stop - reset.
- Pull cord switch - not operated.
- Any of the succeeding conveyors - running.

H.T. motors shall continue to run on no load by disengaging the fluid coupling in the event of failure of any process interlock. The H.T. motors shall however be tripped in the event of any motor fault like O/L, high motor winding temperature etc.

All conveyors and equipment shall have local push buttons. Belt scale shall be started when relevant conveyors are started. The dust suppression systems shall be energized as soon as the conveyors at the transfer points are energized.

5.7.2 Annunciation Requirements

1. Each of the Coal handling system equipment shall have status and alarm indicated in HMI. Operating stop and trip condition of each of the equipment shall be indicated as per the approved color code. Similarly energized, de-energized and trip conditions of magnetic separators shall be indicated on the HMI. The trip indication shall be flashing under trip conditions until accept button is pressed.
2. Individual point Annunciation shall be provided for each of the following in HMI as a minimum:
 - Annunciation for trip of individual belt conveyors
 - Annunciation for Fault in individual conveyor Hydraulic drives / crusher motor, screen motor trip on O/L / fault of HT motors.
 - Annunciation shall be provided for all belt conveyors except trunk conveyors of Stacker cum Reclaimer and belt feeders including shuttle feeders, to annunciate the tripping due to each of the following conditions separately.
 - Pull cord switch operated.
 - Belt sway switch actuated.
 - Zero speed switches actuated.
 - Emergency Switch operated.
 - Thrust Brake Fault in HT Drives
 - Chute Position disturbed.
 - Chute Jam detector
 - Any other causes

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[40]	25.09.2014

- Annunciation for trip of individual crusher, screen and feeder.
- Crusher Vibration Monitor Alarm (for each)
- Annunciation for trip of feeder / conveyor Hydraulic drive due to overload / fault on LT motors / core balance relay /under voltage relay / bi-metal relay
- Annunciation for motor trip due to high bearing temperature and winding temperature.
- Annunciation for operation of low speed switch of crushers, screens.
- Wagon Rack arrived.
- Annunciation for trip of conveyor due to metal detection by metal detector.
- Stacker Reclaimer Tripped - for each.
- Wagon Tippler Tripped - for each (wherever applicable).
- Apron Feeder tripped (wherever applicable).
- Annunciation for Paddle Feeder (wherever applicable)
- Annunciation for Travelling Tripper
- Individual annunciation for each Conveyor for the tripping due to following:
 - Belt sway switch actuated
 - Pull chord switch operated
 - Zero speed switch actuated
 - Emergency switch operated
- Individual annunciation for the following conditions of the electrical power system:
 - Main DC supply feeder failure.
 - Switchgear Incomer and Bus coupler auto trip.
 - 415V switchgear / MCC trouble.
 - Transformer Alarm and Trip.
 - Motors bearing, winding temperature high alarm.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[41]	25.09.2014

6. PROGRAMMABLE LOGIC CONTROL (PLC)

6.1 General Technical & Design Requirements

Programmable Logic Controller (PLC) shall be microprocessor-based system. The PLC shall be versatile, expandable, user friendly and latest state of art technology. The system shall be envisaged for the purpose of sequential operation, protection and interlock, data acquisition system, alarm functions, closed loop control and data archiving for fully automatic operation. Logic controller shall be used with adequate and reliable protection safeguard for various equipments and to assist the operator for easy safe and efficient starting and stopping of various drives in the process. The system shall be designed by selecting high-grade components of proven quality and proper design of system electronics. The system shall be able to operate satisfactorily with reference to the specified environmental conditions as indicated in the specification.

1. The system shall be modular in construction and expandable in future by adding additional electronic modules, which shall be easily accessible for maintenance and repair. The modules shall preferably be Rack/Rail mounted. The types of modules shall be kept to minimum possible in order to have interchangeability and spares inventory.
2. The system shall have extensive self-diagnostic hardware and software features for easy and fast maintenance of the PLC. Safety barriers shall be used for intrinsically safe input / output circuits.
3. The PLC shall have very high noise immunity in order to ensure safe and reliable operation when subjected to electrical radio frequency interference and electromagnetic disturbances expected in a power plant.
4. The system shall be programmed as per the logic requirements required for the functioning of the systems and equipment.
5. Operation of the PLC shall be completely unaffected by a momentary power loss of the order of 20 milliseconds.
6. On-line replacement of any module shall be possible in such a way that the removal and addition of the module shall be possible without de-energizing the system or causing any interruption in the system while replacing a faulty module except for the inputs /outputs which are being handled by that module. However, in case of triple modular redundant or dual PLC configurations, there shall not be any process upset while replacement.
7. PLC shall be used with 20% hard wired installed spare I/O Channels.
8. The system shall be capable of handling the long-term storage of data for 15 days and retrieval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[42]	25.09.2014

9. The system shall be used with programming. PLC shall be used with one no. Laptop of latest configuration with programming software & communication cable.

6.2 PLC System Configuration

The Coal Handling System shall be operated, monitored and controlled through a centralized and dedicated PLC, located in the Coal Handling Plant control room.

The PLC shall be redundant and operated through PC based station (OWS, EWS). A large video display (LCD type) is also shall be envisaged. PLC with work station and the large display shall be located in the control room of CHP. Additionally an OWS (per unit) is envisaged to be installed in the Central Control Room for monitoring. Operation and control shall also be possible from this OWS under predetermined conditions.

Remote Input-Outputs (RIO) concept shall be envisaged. RIO shall be located at different geographical locations and shall communicate to the CHP PLC located in the CHP control room, through dual redundant fibre optic cable links.

PLC shall be networked with the Plant DCS by dual redundant communication link –based on Ethernet TCP/IP using bidirectional OPC connectivity, on fibre optic cable. The data network shall be extended using redundant link on fibre optic cable up to central control room for installation of one operator workstation at the central control room.

6.3 Input/output Sub system

1. I/O subsystem shall be suitable for accepting discrete inputs, BCD inputs and analog inputs. The I/O modules shall be mounted in the I/O racks.
2. Each I/O shall be electrically isolated from external control circuit by suitable means. The minimum isolation level between I/O and logic circuit shall be 1000 V DC.
3. Each module shall have LED for each digital I/O channel to indicate the status of each input / output. Redundancy in I/O level shall be maintained as per the process requirement.
4. PLC inputs shall be used with potential free dry contacts. All the inputs shall be double ended i.e., two wires per input and not common return for all inputs. The contact interrogation voltage for input contacts shall be 24V DC minimum. Each input channel shall be protected by separate fuse.
5. Output contacts from the PLC shall be potential free dry contacts. Each output shall be short-circuit proof and protected by fuse.
6. Visual indication of fuse blown must be provided for each input and output channel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[43]	25.09.2014

7. There shall be at least 20% spare capacity available on input & output modules, over and above the system requirement.
8. All input/output cards shall have quick disconnect terminations allowing for card replacement without disconnection of external wiring and without switching of power supply.
9. PLC shall have the following monitoring features:
 - Power supply monitoring.
 - Contact Bounce filtering.
 - Optical isolation between input and output signals with the internal circuits.
 - In case of power supply failure or hardware fault, the critical outputs shall be automatically switched to the fail-safe mode.
 - Further, keying-in of individual wire connectors shall be used to ensure that only the correct card is plugged on the I/O module. It shall be possible to remove I/O module without disconnecting wiring from field inputs or outputs.

6.4 Processor Sub system

1. The processor sub system shall include CPU, memory, power supply, communication interface etc.
2. Dedicated PLC's shall be envisaged for each Auxiliary system. The processor shall have capability to implement all the control functions required. The processor shall have sufficient memory for storage of the program instructions as applicable to the logic requirements. CPU shall be of 32/64 bit or upgraded version of microprocessor.
3. Memory shall be non-volatile, preferably EEPROM type. However, in case volatile memory is provided, battery backup shall be used for a minimum of three months to keep the stored program intact. A battery drain indication shall be used at least one week before the battery gets drained. Memory shall be used with adequate capacity with 40% spare capacity under worst loading condition.
4. The healthiness of processor hardware and software shall be continuously monitored by watchdog timer.
5. PLC's shall be used as a minimum with dual redundant processor subsystem including CPU, memory and power supply. Redundancy shall be used such that, in case of failure of the main processor, the standby processor shall take over automatically and vice - versa. The changeover shall be bumpless and shall not result any process or system upset.
6. In case of failure of complete processor system i.e., both processors, outputs shall take fail safe state automatically.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[44]	25.09.2014

7. The scan time of programmable controller shall be of the order of 100 milliseconds or better. Scan time of PLC is defined as the cycle time taken by the system to read input, process input executing logic and update control output for all the logics configured within the system. Other activities like diagnostic routines, output / dump of data to peripherals, or any other activity which consume processor time shall also be accounted while computing scan time.

6.5 Communication Sub system

1. The communication subsystem shall provide reliable and high speed data transfer between the processor subsystem, I/O subsystem, PLC console and other devices connected to the system.
2. Redundancy in communication subsystem shall be used, such that on the failure of the active device, communication link or bus, the redundant device communication link or bus shall take-over automatically without interrupting the system operation. The communication bus shall be of coaxial / Fiber optic type.
3. Information about the failed device shall be displayed locally as well as on the PLC console. It shall be possible to manually switch-over the communication from main bus device to redundant bus device without interrupting the PLC functions.
4. The PLC shall have provisions of communication interface facility with Plant DCS system in order to make the entire system operational from CCR. Bi-directional, Redundant soft links shall be used in the PLC for the connectivity with the Plant DCS.
5. Following shall also included in the system:
 - Cables required for interfacing with DCS.
 - Implementation of Tags and establishing the Link.
 - Any other software/hardware required.

6.6 System Power Supply

1. For PLC system, redundant 24 V DC power supply shall be used. The required power supply cable shall be used from the UPS DCDB & ACDB for Coal Handling control system
2. For separately mounted I/O racks, separate power supplies shall be used. Power supply module shall be of ample capacity to supply all modules. In addition 20% spare capacity for future shall be used. All the drives shall be switched ON/OFF through 24V DC coupling relays to be provided in HT/LT SWGR panels.
3. For the Operator Stations and Engineering Station the power supply shall be from the 230 VAC UPS system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[45]	25.09.2014

6.7 PLC Console

1. PLC Console or operating panel/display panel shall be used as operator Interface station for control and monitoring of the plant. This shall be done through dynamic mimic displays and control displays.
2. PLC console shall also be used for program storage, display, fault diagnostic and alarm monitoring. It shall be possible to modify, add or delete the application program on-line without affecting the outputs. It should be possible to modify or create new displays from PLC Console.
3. Isolation shall be used between programming terminal and related subsystems, if there is any possibility of high voltage from TFT being transmitted to other subsystems.
4. The PLC system shall have provision to shift the Operator Station/ Engineering Station to the CCR in future with third party interactive communication facility.

6.8 Displays

The system shall be capable of reading the status of equipments, acquiring the analog signals, displaying the status in the form of mimic diagram, video trend, bar graph, periodic display, alarm display, alarm overview display, logs such as hourly/shift/daily logs, alarm logs etc.

Displays include plant mimic diagrams, which shall include the complete auxiliary plant system indicating each major components of the system and the operating status of individual equipment and devices

6.9 Alarms

1. The system shall display history of alarms in chronological order of occurrence on the Operator Station LCD. At least three (3) levels of alarm priority shall be available which shall be displayed in different color. It should be possible to display and print alarms. System shall have all alarm related functional keys like acknowledge, reset etc. Other design features like set point / dead band adjustment, alarm priority, manual and automatic inhibition based on predefined logic etc. shall be used.
2. The alarm display shall be built bottom up with the most recent alarm at the top of the list. When a point returns to normal, the associated alarm line shall change color suitably and on acknowledgement, the line shall be blanked out.
3. The alarms below the blank lines shall move upward to fill the empty lines. If the capacity of the OWS display page is exceeded, alarm history shall be stored in memory to accept the over- flow. This alarm history shall be displayed upon operator demand.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[46]	25.09.2014

4. When a point goes into an alarm state and appears on the alarm screen, the time of alarm shall flash until acknowledged by the operator. Acknowledgement by the operator shall cause the time to stop flashing. All alarm initiations and return to normal, shall be logged on a printer.

6.10 System Software

1. Complete licensed software for PLC based system including the communication software system shall be supplied and implemented to meet completely the specification requirements.
2. Application software shall be built based on approved logic diagram, graphics etc and shall include controls, graphics, logs, trends, history, report generation etc.
3. The system software shall include all programs for the PLC and PLC console which are required to perform all the PLC functions including communication and self-diagnostics.
4. Diagnostic software shall have the capability to provide information about the failed module / system either in the form of a system configuration display or provide information in the form of a statement.
5. The software's shall not be machine specific. All software licenses shall be valid for the continuous service life of the plant and equipment.
6. Password security shall be used in order to ensure security level to the plant operation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[47]	25.09.2014

7. UNINTERRUPTED POWER SUPPLY (UPS)

Redundant, 230 VAC Uninterrupted Power Supply (UPS) System for CHP control system consisting of 2x 100% capacity static inverters, 2 x 100% capacity static switches, Manual by-pass switch, 1x 100% capacity float-cum-boost chargers, Battery with accessories, Step-down transformer, Voltage Stabilizer, AC Power Distribution Boards etc. shall be provided. UPS shall be provided with all interconnecting cable between UPS equipment and battery, UPS system cabinets and enclosures etc.

UPS shall be provided with all equipment and accessories required for completeness of the system including any feeder distribution as required for protecting UPS equipment and connected inputs and outputs shall be furnished in line with the specification.

7.1 Technical requirements

1. The equipment furnished under this subsection of the specification shall meet the requirements of all applicable codes and standards including ANSI, NEMA, IEEE, NEC and IS.
2. The UPS equipment and the complete system shall have Surge Withstanding Capability (SWC) to meet the requirements of ANSI C 37.90a - IEEE Standard 472-1974.
3. The UPS shall be provided to cater to all the loads for systems, equipment and instruments supplied by the Bidder requiring UPS supply. Spare feeders of at least 10% of the total number of feeders shall be built in.
4. The selection and selective coordination of all the protecting devices including fuse free circuit breakers/ fuses shall conform to the requirements of National Electric Code NEC –1984 and other applicable codes and standards. The selectivity ratios of the fuses shall be such that there is a sufficient margin between the total electric energy of the upstream fuse. The selectivity ratio shall not be less than 2:1 in any case.
5. The following general requirements shall be met for ensuring proper branch and circuit protection.
6. The feeder fuse ampere rating and feeder conductor ampacity must be at least 100% of the non continuous load plus 125% of the continuous load as calculated per Article 220 (220-10 G) of NEC Code- 1984. The feeder conductor must be protected by a fuse not greater than the conductor ampacity.
7. Each ungrounded service entrance conductor shall have a fuse in series with a rating not higher than the ampacity of the conductor.
8. If secondary fuses are sized not greater than 125% of transformer secondary current, individual transformer fuses are not required in the primary,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[48]	25.09.2014

provided, the primary feeder fuses are not larger than 250% of the transformer rate primary current.

9. The UPS system shall be suitable for operation at ambient conditions indicated in the specification.

7.2 Functional requirements

1. The Uninterrupted Power Supply (UPS) system of continuous duty shall supply regulated, filtered and uninterrupted 230V, 50 Hz, single-phase power, within specified tolerances. Each of the UPS loads shall receive one feeder each from the AC Distribution Board of Inverter A& B. However, each inverter shall supply only 50% loads under normal conditions.
2. Each UPS System component shall be compatible for satisfactory and well coordinated operation with other related components as well as with the input and output systems. The Bidder shall be responsible for fully meeting this requirement by proper design and co-ordination of UPS system with other related input/output systems and by furnishing all required equipment for interface and completeness as applicable.
3. The KVA rating of the UPS shall be guaranteed at 230VAC, 50 Hz, single phase output at 50 deg C ambient temperature and load factor of 0.8 lagging. In case, the Bidder's standard UPS rating are applicable at an ambient temperature lower than 50 deg C, the Bidder shall consider derating factor of at least 1.5 % / deg C. The Bidder shall demonstrate the above stated capacity at 500 Deg C during shop testing.

7.3 Normal Operation

1. During normal operation, UPS loads shall be supplied by both 100% capacity inverters each working at 50% load. The inverters shall receive power from DC source (Charger/Battery) and their static switches shall be in the respective "Inverter" position. In this mode the two inverters shall act as hot standby for each other.
2. Necessary paralleling networks shall be included to ensure equal load sharing by both inverters. The rating of the paralleling device / circuit shall be such that it does not act as a limiting factor on the fault clearing capability of the inverters individually and when working in parallel. Load sharing network details shall be provided to establish all functionalities including fuse clearance.
3. One inverter shall act as "Master", working on its internal oscillator and the other inverter shall follow by using the synchronising signal from master inverter for automatic control of its output frequency.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[49]	25.09.2014

7.4 Emergency operation

In case of failure of any inverter, the static switch shall automatically transfer the UPS loads of faulty inverter (say Inverter-"A") to the healthy Inverter-"B" which shall start working at 100% capacity. Thus the feeding of UPS power is continued automatically to all loads connected to both inverters despite the failure of one inverter and the quality power supply to all UPS loads connected to both inverters shall be maintained without interruption. Isolation of faulty inverter shall be automatic and achieved in less than 4 mille seconds.

On inverter failure, the plant AC source is automatically brought in as the standby source to healthy Inverter working at 100% capacity. In this mode, the healthy Inverter shall get the synchronizing signal from the standby AC source.

Operation on internal oscillator and transfer/retransfer to standby source shall be as follows :

1. The output frequency of the healthy inverter shall be automatically synchronised with the plant stand-by AC source supplied through step down transformer and voltage stabliser using synchronising signal from the standby source. If the frequency of the standby source is beyond these limits, the inverter frequency control shall be automatically disconnected from stand-by synchronising signal and the inverter shall maintain the output frequency at 50 Hz within + 0.1 percent under all conditions of load and input voltage by working on its own internal oscillators.
2. During operation on its own internal oscillator, the inverters shall continuously monitor the frequency of standby source. Upon restoration of proper frequency conditions of stand-by source, the inverter shall automatically start using stand-by source frequency as the synchronising signal for inverter output frequency control.
3. During the operation of any inverter on its internal oscillator due to synchronising frequency being beyond the specified limits, the transfer of static switch from "Inverter" to "Standby source" shall be inhibited.
4. While one of the inverters (healthy) is feeding 100% load and the AC source is acting as standby, and in case this invertor also fails, the 100% load shall be automatically transferred from invertor to standby AC source through static switch, provided the standby source is synchronised to the invertor (synchronous transfer). However, such transfers shall be inhibited during operation of invertor on its internal oscillator due to standby AC source frequency being beyond the synchronisation limits. Asynchronous transfer of invertor loads to standby AC source with a beak, on invertor failure will have to be provided by the Bidder.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[50]	25.09.2014

5. Retransfer of loads from standby AC source to inverter shall be automatic or manual as pre selected by the operator and shall be accomplished only after synchronism of the inverter output with the standby source has been automatically accomplished.
6. The manual bypass switch shall have the provision for fully by-passing the UPS system and connecting all UPS loads to the standby AC source.

7.5 Static inverters and auxiliary equipment

The static inverters shall be solid state type employing silicon controlled rectifiers or power transistors and other solid state devices to convert direct current power to essentially sinusoidal alternating current power as per this specification. Ferro resonant type inverters shall not be acceptable. The inverter equipment shall include all necessary circuitry and devices to conform to requirements like voltage regulation, current limiting, wave shaping, transient recovery, surge suppression network, automatic synchronisation etc. as specified herein. Inverter shall be of continuous duty. Natural convection or forced cooling using redundant fans shall be used. Equipment shall be designed for operation with full load even with cooling fans failure / non-availability.

7.5.1 Inverter Capacity

Each static inverter shall have the following minimum capabilities.

Continuous full load rating: meeting specification stipulations

Over load capacity: 125% of full load rating for 10 minutes and 200% for 10 seconds minimum and 300% for 4ms minimum for all specified input voltages.

The inverter shall have sufficient I²t capability to clear a slow acting HRC fuse having a continuous current rating equal to at least 20% of the continuous full load current rating of the inverter, while feeding 100% rated loads of the inverter.

Voltage regulation: $\pm 1\%$ for 0-100% load at all input voltage and all power factors.

Step load pick up: Upon transfer of full load, the inverter output voltage shall not drop below 85% of nominal voltage during the first half cycle after transfer and 90% of nominal voltage in the next half cycle. The recovery to within $\pm 1\%$ of voltage shall be in less than 50 milliseconds.

7.5.2 Input / Output Voltage

The inverters shall be fed from Battery and chargers which do not feed any other loads. Input voltage shall be nominal DC output voltage of battery and charger of range from final voltage after discharge of battery to maximum

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[51]	25.09.2014

DC bus voltage during equalize charging of battery. The inverter shall also be capable of working satisfactorily meeting all specification requirements with only the chargers connected to its input without battery in circuit. Filtering on the input of the inverters shall be furnished as required to operate with the output ripple of the chargers furnished by the Bidder. Each inverter shall include equipment necessary to protect itself from damage resulting from excursions, loss or restoration of DC input voltage and synchronizing voltage. The inverter output voltage shall be 230V AC, 50 hz, single phase. Total harmonic content shall be 4% (max) and harmonic content of any single harmonic shall not exceed 3%. The inverter efficiency at 100% load and 0.8 pf shall be minimum 85% and at 50% load and 0.8 pf shall be minimum 80%.

7.5.3 Over loads, Short Circuits and Load loss

1. The inverters shall be provided with suitable fuses at the input and output which shall permit proper co-ordination with other protective devices and at the same time protect the inverter against damage due to internal faults. All necessary equipment shall be provided to protect the inverters against over loads, short circuits and 100% loss of load. The inverter shall be self protecting against damage if energized with full load connected. All the fuses used in inverter power & control circuits shall be fast acting type, operating in less than 5 ms.
2. The inverter shall be provided with current limiting circuitry which shall limit the output current to a value which will not damage the inverter or blow its fuses.
3. The inverter shall have sufficient I^2t capability to prevent damage to itself until short circuit conditions on the output are cleared.
4. Each inverter shall be capable of operation with non linear loads. Bidder shall furnish details of non linearity for the loads. Output waveform of the inverters) shall remain within specified limits when operating with non linear loads at 100 percent rated load.
5. The inverters shall be self protecting against all AC and DC transients, voltage surges and steady state abnormal voltages and current likely to be encountered in utility power station.

7.5.4 Automatic Synchronization

1. Inverter equipment shall include stable solid state oscillator devices designed to automatically maintain the inverter output in phase and in synchronism with the standby AC source. The frequency regulation shall be automatic within $\pm 0.1\%$ for all conditions of inputs, loads and temperature occurring simultaneously or in any combination.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[52]	25.09.2014

2. Facility shall be provided for automatic transfer to internal oscillator operation when the standby source frequency is not within the synchronisation limits.
3. Provision shall be made for step less adjustment of synch disconnect frequency range from 50 Hz +/- 0.5 Hz to 50 Hz +/- 2 Hz.
4. Automatic adjustment of phase relationship between inverter output and standby AC source shall be gradual, at a controlled slew rate which shall not exceed one Hz per second.
5. The inverter shall normally work on the internal oscillator with either of the two invertors as master synchronizer and the other following it. Suitable selector facility shall be provided to select the master. When any one inverter fails the healthy inverter gets the synchronizing signal from the standby A.C. source.

The DC input current shall never exceed the full load current except for a short circuit within the inverter. This limitation applies to transient as well as steady state currents and includes inrush currents upon initial energisation of the UPS, load energisation, short circuits external to the inverter etc. For any value of the load and load power factor drawn by the equipment served, the inverter shall not impose on DC source any voltage oscillations in excess of 5 volts (RMS total, all frequencies) or any current oscillations in excess of 3 percent (RMS total, all frequencies) of the DC current at full load.

7.5.5 Static inverter auxiliary equipment

In addition to the inverter equipment specified above, auxiliary equipment shall be furnished with each static inverter as follows:

1. Output ammeter, Output voltmeter, Output KVA meter, Input voltmeter, Frequency meter, Power factor meter, Inverter ON-OFF switch, Alarm Reset Push Button etc. of one number each shall be provided on the front panel of the inverter enclosures.
2. Indicating lights shall be furnished on front of the UPS panels. For those abnormal conditions which could be of a momentary nature, the indicating lights shall remain energized and the contact remain closed until cleared by a reset push button on the panel.
3. The following indications shall be provided as a minimum i.e. DC voltage to the Inverter Low/ High, Loss of DC input to the inverter, Inverter output voltage High/ low, Inverter failure, Standby AC source failure, Inverter synchronized with standby AC source in case of failure of the other inverter, Inverter feeding 100% UPS load, Standby AC source feeding 100% UPS loads, Fan failure and temperature high etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[53]	25.09.2014

4. In addition to the above indications, the Bidder shall furnish electrically independent, potential free contacts for each of the above conditions. These contacts shall be rated for 0.5 Amps, 220 Volts DC and shall be wired to the terminal blocks.
5. The Bidder shall furnish 4-20 m A signals for Inverter A & B output voltages, output currents, output frequency etc.

7.5.6 Static transfer switches and auxiliary equipment

The static transfer switches shall be provided to perform the following functions

1. To transfer the load automatically between the Inverter to the standby inverter as described under automatic synchronisation.
2. To transfer UPS load under manual control from standby AC source to inverter when placing the UPS System in service and from inverter to standby AC source when taking the UPS out of service.
3. The static transfer switches shall have two modes of operation namely automatic and manual.
4. The static transfer switches shall use silicon controlled rectifiers and other static devices required for automatic transfer of load from Inverter" to Standby" source and vice versa.
5. The static switches shall be provided with the requirements specified herein including the following:

- | | | |
|----|-----------------------------|---|
| a) | Capacity(continuous) | Continuous full load capacity of the inverter. |
| b) | Capacity (overload) | As per overload capacity of inverter indicated in the specification |
| c) | Capacity (Peak) | 1000% of continuous rating for 5 cycles. |
| d) | Transfer Time | 1/4 cycle maximum. (The transition shall be "make before break". Voltage failure shall be sensed at the output of static switch |
| e) | Voltage Rating (Nominal) | 230 Volts, 50 Hz, single phase. |
| f) | Transient Voltage Tolerance | 340 Volts peak above the normal line voltage. |
| g) | Ambient temperature | 50 deg C max. |
| h) | Cooling | Natural or forced circulation, using redundant fans. |
| i) | Duty | Continuous |

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[54]	25.09.2014

6. The transfer of static switch from normal "Inverter" position to "Stand-by" position shall be initiated by Inverter failure and UPS system trouble, Static switch output voltage failure, over current or manual push button operation.

The UPS bus shall be monitored by two voltage detectors. One fast acting circuit shall be used for detecting a complete and instantaneous voltage loss while the other slower acting averaging circuit with adjustable trip level shall be employed to detect voltage deviation beyond selected limits. Both voltage detector circuits shall automatically initiate operation of static transfer switch.

UPS bus current shall be continuously monitored by a current monitoring detector. This detector shall operate the static transfer switch when the load current exceeds the overload rating of any inverter. The detector shall rest when the load current falls below the rated current of the inverter resulting in retransfer of static switch with inverter position.

The static switch shall automatically transfer the load from inverter to stand-by AC source when the maximum I_{2t} capability of the inverter is reached or when the inverter output voltage drops below 90%.

Over current transfer limit shall be continuously adjustable from inverter continuous rating to inverter current limit rating.

7. Transfer Inhibit of static switch shall be under the following conditions:

Automatic or manual synchronous transfer of load from inverter to stand-by AC source or vice versa, shall be inhibited when the inverter frequency is not synchronized to the alternate source. However, asynchronous transfer facility under such condition shall be provided.

Transfer resulting from overload shall be inhibited when the standby AC source is not available. In this case the load fed by the inverter shall be automatically disconnected.

8. Static transfer switches shall be provided with necessary protective devices (circuit breakers) both in "Normal" as well as "Stand by" position.

9. The static switches shall be furnished with contacts to alarm failure of the alternate source or opening of any fuse protecting the static switches.

10. Auxiliary equipment for static transfer switch

11. Following auxiliary equipment shall be furnished with each static transfer switch a minimum:

- Red indicating Light to indicate switch in "Normal" position, Green indicating Light to indicate switch in "Standby" position, White indicating Light to indicate "Normal" and "Standby", power sources in synchronism, Push-button to simulate normal AC UPS power failure (sensed at static switch output) to test the satisfactory working of static switch, transfer labeled "Transfer Test", Push-button for manual retransfer of static switch to "Normal" position, Push-button for manual transfer from normal to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[55]	25.09.2014

alternate source, Light to indicate standby AC source voltage deviation high, Light to indicate voltage transfer enabled, Light to indicate voltage transfer disabled etc shall be provided on the front of the enclosure.

- Two (2) number each of NO contact for static switch transfer to "Standby" position and standby source voltage deviation $> \pm 2\%$ from normal shall be provided within the static transfer switch enclosure.

A. Manual by-pass switch

- The manual by-pass switch shall be used to isolate any static switch from its load and stand-by power supply and to take the static switch out of service without power interruption to the load. In doing so, the manual by-pass switch shall connect both load buses to a single inverter. The manual bypass switch shall provide the facility for by passing the entire UPS system during the operation of the UPS in the option of the operator.
- The manual bypass switch shall have "make before break" contacts to ensure continuous supply to UPS loads during the operation of the same.
- The manual bypass switch shall be rated for 600 Volts, 50 Hz, single phase operation. It shall have continuous load carrying capacity equal to full load inverter current and necessary short term load carrying and interrupting capacity to meet the requirements of the UPS system.
- An other bypass and disconnect devices shall be provided, as required for orderly start up, shut down and maintenance of UPS system and system components.
- The manual by-pass switch and required disconnect devices shall be furnished duly mounted and wired in enclosure.

B. Float-cum-boost chargers and auxiliary equipment

- Two 100% capacity chargers shall be furnished for the UPS system. Each charger shall confirm to the following requirements.
- Each charger furnished for UPS system shall be adequately rated to ensure that any one shall meet full DC load of UPS system operating at 100 % rating plus recharge the fully discharged UPS batteries within 8 hours.
- The chargers shall be served from a 415 volt, 50 Hz, 3 phase system. The chargers shall maintain the output voltage within plus and minus 0.5 % from no load to full load, with an input power supply deviation in voltage level of $\pm 10\%$ and input power supply deviation in frequency of $\pm 5\%$ and with both deviations present in any combination.
- In addition to supplying DC power for inverters, the chargers shall be designed to charge a fully discharged battery without over loading or causing over voltage or without causing interrupting operation of AC or DC circuit breakers for the entire range of intended operating regimes. Suitable solid state

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[56]	25.09.2014

electronic circuits shall be provided to ensure that the charging current is voltage regulated and current limited. After the battery is recharged the charger shall maintain the battery at full charge until the next emergency operation when the UPS battery is again required to provide DC power.

- e) In addition to supplying DC power for inverters, the chargers shall be designed to charge a fully discharged battery without over loading or causing over voltage or without causing interrupting operation of AC or DC circuit breakers for the entire range of intended operating regimes. Suitable solid state electronic circuits shall be provided to ensure that the charging current is voltage regulated and current limited. After the battery is recharged the charger shall maintain the battery at full charge until the next emergency operation when the UPS battery is again required to provide DC power..
- f) Float and equalising controls shall have an adjustment range of +/- 5% continuous (without steps).
- g) The chargers shall be self-regulating, solid state, silicon controlled, full-wave rectifier type designed for single and parallel operation with the battery specified. The chargers shall be designed for automatic load sharing during parallel operation.
- h) The charger shall be current limited at 125% of full load to reduce output voltage for charger circuit protection and for protection of battery from overcharge. The current limit shall be continuously adjustable from 80% to 125%.
- i) All necessary equipment and devices shall be provided to protect the charger from short circuits, transient voltages, surges, load and supply fluctuations including sudden loss of input or load.
- j) The charger shall have a slow walk-in circuit which shall prevent application of full load DC current in less than 10 seconds after AC power is energised.
- k) The minimum full load efficiency at nominal input and float output shall be 90% or better. The output regulation, ripple content and power factor shall meet the requirements of UPS system offered.

7.5.7 Battery Charger Auxiliary Equipment

Following auxiliary equipment shall be furnished for battery charger a minimum:

AC Voltmeter, DC Voltmeter, AC Ammeter, DC Ammeter, Charger On-Off push buttons, Potentiometers (one "Float Voltage Adjust" and one "Equalising Voltage Adjust", both with manual adjustment knobs, the settings of these knobs, shall be independent of each other), Selector Switch for float charge / Equalising charge, Charging rate setter, Selector switch and lights for ground fault detector, Indicating lights with proper actuating

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[57]	25.09.2014

devices, Circuitry and legend etc shall be furnished on the front of the panel of the charger enclosure.

Indications such as Failure of input AC supply, Charger failure, System on battery operation, Battery equalise timer 'on', Low battery voltage, DC ground fault, Redundant fan failure and temperature high (if provided), Charger fuse failure, Low DC output voltage, High DC output voltage etc.

One set of independent potential free contacts rated for 0.5 amps, 220 volt DC shall be furnished for the alarms above and wired to terminal block for use of alarm annunciation system.

7.5.8 Ground Detector System

Each charger shall be furnished with a ground detector system consisting of a relay and a centre tapped resistor. The resistor shall be connected between the positive bus and the negative bus. The relay coil shall be connected to resistor and ground. The relay shall be furnished with one normally open and one normally closed contact wired to terminal blocks for connection to external circuits.

Two indicating lights and one three position spring return to centre selector switch mounted on front of charger cabinet shall be provided for each ground detector system.

7.5.9 UPS Battery

1. The battery shall be heavy duty Nickel-cadmium type and shall have sufficient Amp-hour capacity to supply 100% full load current of UPS for 30 min. The Ni-cd battery shall conform to IS: 10918 and shall be sized according to IEEE Std. 1115.
2. The battery shall be high discharge performance type to withstand discharge/charge cycles throughout life without loss of capacity. In battery sizing calculation, Bidder shall also take into account a minimum voltage drop of 2.5 volts from battery room to the inverter input.
3. Bidder shall furnish battery sizing calculations, supporting curves/data etc. with the proposal to demonstrate that the proposed battery capacity meets the above specification. Bidder shall take into account various correction factors such as capacity factor, temperature derating factor (at a minimum electrolyte temperature of 4°C), design margin as per data given below:
 - a. Temperature derating factor (At : (Td)
an electrolyte temperature of :
40C)
 - b. Design margin : 20% = 1.2
 - c. Capacity factor (KT) (For : AH capacity of chosen cell
discharge duration of 1 hr. & /(discharge current in amp for

LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[58]	25.09.2014

- end cell voltage of 1.1 volts) chosen cell Corresponding to 1 hour) x Float correction factor.
- d. The UPS battery shall be furnished as specified herein and shall meet following requirements.
- i) iNominal Voltage : As per the requirement of nominal DC voltage level at the input of the inverters.
- ii) Ambient temperature : 50 ° C max.
- iii) Specific gravity, full charge : 1.19 ± 0.01
- iv) Voltage per cell
- Nominal : 1.2 V
- Floating : 1.40 V to 1.42V
- Boost : 1.53 V to 1.67V
- End cell voltage : 1.1 Volts

7.5.10 Battery Accessories:

2 nos of Hydrometer along with syringes suitable for vent holes in different cells, Thermometers, Specific gravity correction chart, Wall mounted type holder made of teak wood for hydrometer & thermometer, Cell testing voltmeter (3-0-3V), Acid/Alkali mixing jar 2 nos, Rubber apron, Rubber gloves, Set of spanners, Goggles (industrial) Instruction Card, Variable metallic resistor & shunt, Inter cell connectors, Suitable terminal lugs for cables, Two tier teakwood battery rack, Jack for lifting the cells etc shall be provided as accessories and fittings of the Batteries and auxiliaries.

7.5.11 Step-down transformer & voltage stabiliser

One 415 Volt, 3 phase to 240 Volt, single phase transformer along with associated voltage stabilizer shall be furnished.

This transformer and stabilizer combination shall convert 415 Volt +/- 10% plant auxiliary AC supply to 230V, +/- 2% single phase standby AC Power, which shall serve as UPS system back up supply source.

The transformer and stabilizer shall be sized for 100 % UPS load and shall co-ordinate with the largest branch circuit protection device for feeder short circuit current without sacrificing voltage regulation. The voltage stabilizer shall employ silicon solid state circuitry and shall maintain a stabilized voltage for 0 -100% load with input voltage variations as indicated above.

The stabilizer shall meet the following characteristics as a minimum. Fast rate of correction - within 5 cycle; Output distortion - less than 5% under worst conditions; Efficiency shall be better than 94%; No load losses less than 5%.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[59]	25.09.2014

7.5.12 AC Distribution Boards

Panel boards for distribution of continuous AC power to essential loads shall be dead-front type panel boards rated for 600 V, AC service. Sheet steel thickness shall be 3 mm for load bearing member and 1.6 mm for other members. The hinged panel board front shall cover the fuses and wiring gutter but not the switch handles. The hinged front and switch handles shall be covered by the enclosure-door.

Each panel board shall be constructed for 2 wire, single phase distribution with solid neutral bar. Phase and neutral bars shall be of copper. Rating of the main lugs shall be equal to the rated continuous full load current of each inverter. Type of enclosure shall be IP 42 as a minimum.

Each panel board shall have one fused disconnect switch of adequate rating for incoming feeder for AC Bus and requisite single pole, suitably rated disconnect switch branch circuit devices. Fused switches shall be equipped with arc quenchers, visible blades and quick-make quick-break operating mechanisms. The number of feeders and rating of each feeder shall be to suit the individual load requirements.

The AC distribution board and components thereof shall be from the latest proven product range of a qualified. However, 25% spare feeders with fuses of each rating shall be provided.

Wiring and interconnections

All interconnections required from input to output terminals or outgoing inverter, transfer switches and distribution board equipment shall be provided within the enclosures in accordance with the manufacturer's proven practice, applicable international standards and good engineering practice. Internal wiring in factory pre-wired electronic systems cabinets may be installed according to the Bidder's standard as to wire size, insulation and method of termination on internal equipment. Wiring for external circuits including all alarm contacts shall be brought to grouped terminal blocks located for convenient connection for external circuits entering from top or bottom.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[60]	25.09.2014

8. FIELD INSTRUMENTS & FINAL CONTROL ELEMENTS

8.1 Belt Weigher

1. The electronic belt weigher for measurement of Coal flow rate and quantity shall be provided at specified locations.
2. The belt weighers shall be complete with load cell type sensing element, weigh idler & suspension system, digital speed sensor, local panel with rate of flow indicator and digital totalizer, remote transmission, special cables, etc. The electronic belt weigher shall be designed for continuous automatic weighing.
3. The frame of Weigh Bridge shall house pivot & link mechanism, weigh idler and all other required items. This shall be made of structural steel. This shall be made of structural steel through angles, self gauging pivots, self aligning bearings and lateral checking by flexure plates, such that entire arrangement is floating.
4. The weigh section shall be fully temperature compensated, and protected against dust, shock and vibration. The load cells shall be suitable for working in the dusty environment prevailing in the CHP area.
5. Min. weighing accuracy shall be $\pm 0.25\%$ and on instantaneous capacity for the full range of 20% to 120% of conveyor design capacity. The weigher shall have 250% overload protection for the structure.
6. All necessary facilities for calibration like weigh-chain, chain reeling drum etc. to be provided along with the belt weigher. Provision for auto-calibration also to be provided.
7. Suitable provision shall be made for indication of the following to the Operator at CHP control room.
 - Daily & cumulative Coal conveyed to crusher house.
 - Daily & cumulative Coal sent to stockpile
 - Daily & cumulative Coal sent to boiler bunker.
 - Amount of Coal available in the stock pile
8. Fully automatic zero and span calibration facility shall be provided.
9. Test chain shall be two (2) idlers longer than the weighing length of the weighers, and shall be complete with chain reset equipment with weight adding reels of adequate size.
10. Provision shall be provided in local panel to retain the totalizer reading during power failure. All necessary battery back-up shall be provided.

Table 8.1
Specifications for Belt Weigher System

S.NO	Features	Minimum Requirements
1	Type	Microprocessor based.
2	Accuracy	+/-0.25 % of Full Scale
3	Weigh Span	4 idler length
4	Belt width	
5	Belt speed	
6	Capacity	
7	Load cell	7 Load cell
a)	Construction	SS encapsulated
b)	Protection	IP-67 or better
c)	Sensitivity	4mV/V or better
d)	Overload	150% of rated capacity/ Ultimate 300% of Rated Capacity
e)	Type	S-type
f)	Rating	weatherproof
g)	Capacity	As per system requirement
8	Belt speed sensor	
a)	Type	Digital
b)	Mounting	Bracket mounting on Return belt
c)	Pulse frequency	200 Hz or more for nominal belt speed
d)	Housing	SS 316
e)	Protection Class	IP-65 or better
9	Power supply	230 V, 50 Hz
10	Communication port	Modbus RS 485
11	Output	4-20 mA for Flow Rate & Pulses for Totalizer
12	Calibration	Automatic Zero & Span Calibration
13	Display	16 digit two line LCD display for Flow Rate & Total Flow.

8.2 Pull chord Switch

Pull chord type (manually reset type) emergency stop switches shall be located on both sides of belt conveyors along the walkways for the entire length of conveyors for emergency stopping of conveyor at spacing of 30 Meters. The location of switches shall start from 4.0 meters from drive pulley / tail pulley. It shall have a separate terminal box with a separate

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[62]	25.09.2014

hinged cover which shall be totally sealed from main box containing actuating mechanism / limit switch etc. Local pull chord actuation shall be provided by means of mechanical flap. Each switch shall have two NO and two NC contacts, which shall be wired out to the terminal block. One contact of the switch shall be used in BMU & other contact shall be serially wired to PLC. The trip contact of the BMU shall be wired directly to switchgear. The terminal block shall have facilities of cable looping. Adequate length of rope and all accessories shall be furnished.

Table 8.2**Specifications for Pull Chord Switch**

S.No	Features	Minimum Requirements
1	Type	Heavy-duty, addressable type
2	Design	Dust & vermin proof design
3	Sensor module	To be housed inside
4	Protection	Conforming to IP-65 or better class of enclosure
5	No. of Contacts	2 N.O. + 2 N.C contacts
6	Contact rating	5 A at 230V A.C
7	Terminals	Suitable to receive 2.5 Sq. mm wires
8	Enclosure material	Aluminium alloy LM6 or cast iron
9	Operation	Bi-directional with two ropes fitted to it from opposite directions terminating with a spring at the anchor points. The spring shall operate the switch in the event of rope breakage.
10	Reset	Manual

8.3**Belt Sway Switch**

Belt sway switches of self resetting type shall be furnished one pair at 50 meter intervals on both sides of conveyor along the conveyor and at the head end, tail end, horizontal bends/ curvature, either side of horizontal bends / curvature etc. to limit belt sway to permissible extent. The location of switches shall start from 15 meters from drive pulley / tail pulley. It shall have a separate terminal box with a separate hinged cover totally sealed from the main box containing actuating mechanism/ limit switch etc. Each switch shall have two NO and two NC contacts, which shall be wired out to the terminal block. One contact of the switch shall be used in BMU & other contact shall be serially wired to PLC. The terminal block shall have facilities for cable looping. The contacts of the switches shall be rated for at least 5 Amps. breaking at 230 VAC.

Specifications for Belts Way Switch

S.N	Features	Minimum Requirements
1	Type	Heavy-duty, addressable type
2	Design	Dust & vermin proof design
3	Sensor module	To be housed inside
4	Protection	Conforming to IP-65 or better class of enclosure
5	No. of Contacts	2 N.O. + 2 N.C contacts
6	Contact rating	5 A at 230V A.C
7	Terminals	Suitable to receive 2.5 Sq. mm wires
8	Enclosure material	Aluminium alloy LM6 or cast iron
9	Cable Entry	4 Nos. ½ " NPT conduit threaded to accept Flameproof cable glands rope breakage.
10	Reset	Self

8.4

Belt Monitoring Unit (BMU)

- One number Belt monitoring unit shall be provided for each Conveyor to give a trip signal in case any of the conveyor switches is actuated and for identifying the switch which has acted.
- Switches of different conveyors shall not be combined in one monitoring unit.
- The addressable sensor module of all pull cord switches of one conveyor shall be connected in series to the BMU. Similarly the addressable sensor module of all belt sway switches of one conveyor shall be connected in series to the BMU.
- If the numbers of switches of one conveyor are more than the identifying capability of one BMU, the switches shall be divided into further groups.
- It shall be possible to identify whether PCS or BSS has acted and which switch has acted and shall be displayed on the BMU / local panel.
- The trip contact of the BMU shall be independent for PCS and BSS and shall be instantaneous without any delay.
- An additional serial output shall be provided by the BMU for connecting to PLC for indication of the type of switch and number of the switch which has acted.
- The trip contact of the BMU for PCS shall be wired directly to switchgear.
- The supply for the BMU shall be from UPS.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[64]	25.09.2014

8.5 Zero Speed Switch

Zero speed switch shall be non-contact (proximity) type electronic switch. Mounting arrangement/ location shall be such that operation, effective sensing distance, sensitivity etc. shall not be effected by accumulation of dust on rotating part or surface of probe. Adequate mechanical protection by means of non-metallic shields shall be provided on top of the switch to prevent any damage due to falling coal / metallic pieces etc. In built initial start up delay and nuisance, tripping delay through timers shall be provided. Each switch shall have two NO and two NC contacts wired out to the terminal blocks. A separate terminal box with a separate cover, which shall be totally sealed from main box, shall be provided. Terminal blocks shall be suitable for terminating 1.5 mm sq. standard copper cable.

Table 8.4
Specifications for Zero Speed Switch

S.N	Features	Minimum Requirements
Sensor Probe		
1	Type	Proximity, 2 wire, NAMUR type, cylindrical
2	Supply	8.5 V DC (approx.)
3	Effective sensing distance	10 mm (min)
4	Protection	IP 65 or better
5	Material of enclosure	SS
6	Sensor cable	2 metres (min)
Monitoring Electronic Unit		
1	Type	Microprocessor-based, programmable
2	Supply	230 V AC
3	Output contacts	2 Change-over / 2 NO + 2NC
4	Contact rating	2 A at 240 V AC
5	Speed range	Configurable
6	Switching Hysteresis	+/- 5% or better or configurable
7	Speed setting	Configurable, with push buttons / key pad
8	Time delay	Configurable from 1 to 20 seconds
9	Protection	IP 65 or IP 20 if mounted inside IP 65 JB/Panel

8.6 Under belt switch

These switches shall be installed under the belt for detecting the presence of material on the belt whose contacts shall in turn be used for operating

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[65]	25.09.2014

solenoid valves of dust suppression system. The switch and its operating arrangement shall be suitable for working in dusty areas. The minimum degree of protection of switch shall be IP-65. The switch shall be capable of detecting three events simultaneously as follows:

- Belt loaded
- Belt running at more than preset speed.
- Preset initial start delay.

8.7

Chute Blockage Switch

One no. chute blockage switch of proven type. Chute blockage switch shall trip the feeding conveyor in case of Chute blockage and protect the feeding conveyor and shall be provided at a suitable height on each leg of the conveyors equipment.

The switch and its operating arrangement shall be suitable for working in dusty areas. Local indication of chute blockage switch actuation shall also be provided. Location of chute block switch shall be such that washing/cleaning of chute by pipe / rod does not affect it.

Table 8.5
Specifications for Chute Blockage Switch

S.N	Features	Minimum Requirements
1	Type	RF Type
	Sensing Probe	
1	Material	SS 316
2	Mounting	Flange type
3	Enclosure Housing	Cast Aluminium or better
4	Enclosure Protection	IP-65 or better
5	Temperature	200 Deg C
	Electronic Controller	
1	Relay output	2 Nos. of potential free change-over
2	Supply	230 V AC
3	Contact Rating	5 A at 230 VAC
4	Local Indication	LEDs for Normal, Alarm levels, Probe
5	Enclosure Housing	Cast Aluminium
6	Enclosure Protection	IP 65 or better
7	Accessories	RF signal cable from sensing probe to

8.8 Electromechanical Type Limit Switch

Table 8.6

Specifications for Electromechanical Type Limit Switch

S.N	Features	Minimum Requirements
1	Sensor / Lever	Heavy duty, high impact operation with robust construction and capable of withstanding repetitive operations
2	Protection	Weatherproof
3	Contacts	Making and breaking arrangements shall be reliable and having high mechanical endurance
4	No. of contacts	Minimum 2 NO + 2 NC adequately rated for handling inductive currents in the circuit
5	Housing	Aluminium alloy LM6 of robust construction
6	Enclosure	IP 65 or better
7	Roller / Lever	High grade, wear resistant material with provision for roller lever to be adjustable and mounted in steps.

8.9 Proximity Type Limit Switch

The normal travel end / intermediate position limit switches shall be 2-wire proximity type. The Proximity switches shall be suitable for detecting the metals without contact and indicate their presence by providing a switched signal.

Table 8.7

Specifications for Proximity Type Limit Switch

S.N	Features	Minimum Requirements
1	Type	2 wire, Inductive type
2	Shape	Rectangular (preferred)
3	Sensing range	15 to 30 mm
4	Control supply	24 V DC
5	Output Logic	NO / NC (selectable)
6	Switching frequency	100 Hz max.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[67]	25.09.2014

S.N	Features	Minimum Requirements
7	Mounting position	suitable for operating in any mounting position
8	Design	Suitable for operating under high mechanical and ambient stress (i.e. high temperature, dust etc.) conditions
9	Ambient Temperature	50 Deg C
10	Indication	LED for indication of operating status
11	Terminal box / Enclosure	IP-65 or better
12	Cable Entry	½ " NPT (F)
13	Terminals	Suitable for 1.5 Sq. mm wire connection

8.10

Resistance Temperature Detector (RTD)

Table 8.8
Specifications for RTD

S.N	Features	Minimum Requirements
1	Type	3 / 4 wire , Pt-100 (100 ohm at 0 deg C) (as per DIN 43760)
2	No. of Element	Duplex
3	Housing/Head	IP-65/Diecast Aluminium. Plug in connectors are to be provided for external signal cable connection
4	Sheathing of RTD	Metal sheathed , mineral insulated, ceramic packed
5	Calibration and accuracy	As per DIN-43670 Class-A for RTD
6	Stability	Zero & span drift within 0.1% of span for a 6 month period.
7	Characteristic	Linear with respect to temp, within $\pm 1/2$ percent of top range value
8	Standard	As per DIN-43670 for RTD & ASME PTC-19.3 for Thermowell
9	Accessories	a) Adjustable Nipple-Union-Nipple with thermo well connection / plug in connectors
		b) Compression fittings / unions
		c) Flanges etc.
		d) Thermowell as per requirement

- RTDs shall be of duplex, platinum three / four wire type with a nominal resistance of 100 ohms at 0°C and conform to DIN 43760 / BS 1904.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[68]	25.09.2014

2. Stability of RTD over full range shall be better than 0.05 ohms and the repeatability figure shall be better than 0.02 ohms. Accuracy shall be of the order of 0.15% or better and response time shall be less than 20 seconds with thermo well.
3. The protective-sheath material shall be SS 316, seamless tubes using compacted magnesium oxide packing for insulation. The insulation resistance at 540°C shall not be less than 5 mega-ohms.

8.11

Temperature Gauge

Table 8.9
Specification for Temperature Gauge

S.N	Feature	Minimum Requirement
1	Type	Mercury filled
2	Sensing Element material	Bourdon AISI 316 SS
3	Movement Materials	AISI 304 SS
4	Case Material/Protection class	SS / IP65
5	Capillary Armouring	SS Flexible
6	Capillary	SS 316 (5 mtr. Length for Local & 15 metre for panel Mounting)
7	Bulb/Stem Diameter	12 mm
8	Dial Size	150 mm
9	Window	Shatterproof glass
10	Scale	Black lettering on white background in 270 °C arc
11	Adjustment	Micrometer screw for zero adjustment. Internal micrometer screw for range adjustment.
12	Pointer	Externally Adjustable
13	Range Selection	Normal Process Temperature – approximately two third of Temperature range.
14	Stop at Max. Reading	Shall be used
15	Over range Protection	150% of FSD
16	Instrument Connection	Bottom connection for local mounting, back connection for panel mounting.
17	Process Connection	½ " NPT with Thermowell
18	Performance :-	
a	Accuracy	+/-1.0% of full scale or better
b	Repeatability	Less than 0.5% of full range
c	Response Time	30 seconds (max.) with Thermowell and 15 seconds Bare.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[69]	25.09.2014

S.N	Feature	Minimum Requirement
15	Operating Ambient Temperature	50 °C (Max. continuous)
16	Accessories	Mounting brackets, Bolts, Nuts, Gaskets / SS Tag plate, SS Thermowell etc.

1. Temperature gauges shall be dial thermometers (liquid spring / metal expansion thermometer), either rigid stem or capillary tube depending upon application; if this is not possible for design reasons, industry type liquid – in – glass thermometers shall be used.
2. Case shall have back or bottom connection with adjustable gland to permit adjustment of thermometer into the thermo well.
3. Thermometer stem adjustable gland with union connection and bushing shall be suitable for ½ inch NPT connection.
4. Bi-metallic type dial thermometer, if used, shall be hermetically sealed, back or bottom connection type, with 150 mm dial.
5. The gauges shall be used with automatic ambient temperature compensation.
6. Scale ranges shall be selected so that normal process temperature in middle two – third of full scale range

8.12

Pressure/ Differential Pressure Switch

Table 8.10

Specification for Pressure/DP Switch

S.N	Feature	Minimum Requirement
1	Type	Piston for high pressure application Bellow/Diaphragm for low pressure application
2	Sensing Element material	AISI 316 SS
3	Wetted Parts material	AISI 316 SS
4	Case Material	Epoxy coated Die Cast Aluminium
5	Setter Scale	Black graduation on white linear scale. Graduation 0 – 100% with red pointer for set points.
6	Over range for Pressure / Vacuum Switch	150% of maximum pressure
7	Set Point	Adjustable throughout switch operating range.
8	Static Pressure for Differential Pressure Switch	Maximum Line Pressure or Static Pressure on either side without permanent deformation or loss of accuracy.
9	Adjustments	Internal – set point

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[70]	25.09.2014

S.N	Feature	Minimum Requirement
		Differential adjustable feature
10	Process Connection	½ " NPT(M) bottom connected
11	Switch Configuration	2 SPDT / 1 DPDT
12	Switch Rating	230 V, 5A AC / 220 V, 0.25 A DC/24 V, 2A DC
13	Switch Type	Snap acting, shock and vibration-proof
14	Cable Connection	½ " ET conduit connections or compression gland
15	Enclosure Class	Weather proof as per IP 65 with corrosion resistance coating.
16	Accuracy	1% of span up to 3Kg/cm2 0.5% of span for more than 3 Kg/cm2.
17	Repeatability	0.5% of span
18	Accessories	
a)		Snubber for pulsating fluid application.
b)		Tag Number, service engraved in SS tag plate
c)		Teflon back-up sheath protection, as required.
d)		i) Remote diaphragm seal with SS 316 armored capillary for typical application. MOC of seal material shall be as per process fluid requirement. ii) Silver coated diaphragm for corrosive services like chlorinated water.
e)		Retention ring and screws for surface mounting.
f)		3-way Gauge Cock (SS 316) for PS / 5-Valve Manifold (SS 316) for DPS.
g)		mp for 2 " pipe, bolt & nut.

1. The pressure switches shall have sensing elements made of copper alloy or stainless steel sealed diaphragm and piston actuated for high pressure service and bellows for low pressure / vacuum service.
2. Low differential pressure switches for low static pressure ranges shall be diaphragm type with snap action switch elements.
3. Low differential pressure switches for high static pressure shall be elbows and torque tube type and snap – action switch elements and metric scale dial indicators.
4. For corrosive, viscous process fluids diaphragm sealed with completely filled inert liquid shall be used. Material of diaphragm and wetted parts shall be selected considering the nature of process fluid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[71]	25.09.2014

5. The sensing elements shall be properly aged and factory tested to remove all residual stresses. They shall be able to withstand at least 150 % the full scale pressure without any damage or permanent deformation.
6. Actuation set point, dead band shall be internally adjustable throughout the range with tamper proof facilities.
7. Electrical connection for the switch devices shall be suitable for plug in type connection.
8. Process connection shall be ½ inch NPT. Process piping connections shall include necessary union, nut, nipple, tail pipe, isolation valve and test connection to permit servicing, testing, calibration and removal of the instrument device.
9. Pressure switches shall be tested as per BS – 6134.

8.13

Guided Wave Radar Type Level Transmitter

Table 8.11

Specification for Guided Wave Radar Type Transmitter

S.N	Feature	Minimum Requirement
1	Application	Level measurement of vessel under vacuum or low pressure application
3	Type	Guided wave radar
4	Principle	TDR (Time domain reflectometry)
5	Probe Material	SS 316
6	Accuracy	5 mm or better
7	Resolution	+/- 0.1 % of range or better
8	Signal Output	4 – 20 mA DC with 600 ohms load with HART compatibility
9	Power Supply	24 V DC + / - 10 %
10	Display	Integral
11	Mounting	External cage type
12	Transmitter housing Protection Class	IP-65 with corrosion resistance coating
13	Accessories	a) All weather canopies for protection from direct sunlight and direct rain.
		b) For hazardous areas, explosion proof enclosure as per NEC article 500 shall be used.
		c) All mounting hardware and accessories required for erection and commissioning. Mounting fittings material shall be SS 316.

8.14 RF Type Level Switch

Table 8.12

Specification for RF Type Level Switch

S.N	Feature	Minimum Requirement
1	Application	Solids
2	Particle size	Fine dust to 400 mm
3	Process Temperature	0 – 100°C
4	Vessel pressure	up to 60 bar
5	Insertion length	As required
7	Mounting	Side or top or top vertical at $\pm 15^\circ$
8	Process connection	40 NB thread or flanged
9	Protection Class	IP 67
10	Electronics	Remote
11	Cable connection	½ "NPT cable gland Plug-in cable connector

8.15 Speed Probe

Table 8.13

Specification for Speed Probe

S.N	Feature	Minimum Requirement
1	Type	Proximity type (inductive / NAMUR)
2	Frequency Response	0-10 KHz
3	Housing	SS 316/ Polyurethane tip
4	Sensing distance	10 mm minimum (2mm for embedded type)
5	Enclosure class	IP67
6	Power supply	24 V DC/8 V DC (for NAMUR)
7	Cable	Integral Cable 6 mtr.
8	Mounting	Flush with check nut
9	Accessories	Flexible conduit, Non-conductive mounting plates etc.

8.16 Speed Transmitter

Table 8.14

Specification for Speed Transmitter

S.N	Feature	Minimum Requirement
1	Type	Microprocessor based Programmable
2	Enclosure Protection	IP-67
3	Accuracy	+/- 1 RPM

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[73]	25.09.2014

S.N	Feature	Minimum Requirement
4	Power Supply	24 V DC
5	Range	Programmable
6	Resolution	0.1 RPM
7	Output	4-20 mA
8	Input signal	Pulse Input from Proximity Probe
9	Display	LCD display

8.17

Solenoid Valves

Table 8.15

Specification for Solenoid Valves

S.N	Feature	Minimum Requirement
1	Operating Principle	Electromagnetic (noiseless), Pilot operated
2	Coil Voltage Rating	24 V DC (in general)/220 V DC/230 V AC/ 110 V AC as required
3	Ways	3 ways in general others as required
4	Port size	¼ " NPT all ports
5	Body	SS Bar stock/Brass
6	Trim	AISI 316 SS
7	Manual Operation	In built
8	Duty	Suitable for continuous Energisation
9	Sealing	Airtight & leak proof
10	Coil Enclosure	SS 316/Moulded type
11	Insulation class	Class H
12	Coil Casing	IP-67
13	Mounting	Suitable for mounting On pipe or in panel
14	Cable connection	½ " NPT Cable gland
15	Accessories	Mounting Bracket, nuts, bolts etc.
16	Other Features	LED Indication

8.18

Vibration Monitor

Table 8.16

Specification for Vibration Monitor

S.N	Features	Minimum Requirements
1	Sensitivity	100 mV/mil or better
2	Frequency Response	User Programmable
3	Accuracy	+/- 5% of full scale

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[74]	25.09.2014

4	Transducer Supply	24 V DC (typical) Voltage
5	Alarm Adjustment	Digitally Adjustable over full scale to alert danger set points
6	Power Supply	240V AC, 50 Hz

8.19

Vibration Sensor

Table 8.17

Specification for Vibration Sensors

S.N	Features	Minimum Requirements
1	Type	Seismic type(Piezoelectric accelerometer)
2	Mounting	The Probe shall be mounted Outside the machine case using protective housing with adjustable sleeves (stingers) that shall be extended to the shaft surface.
3	Frequency Response	0-10 KHz
4	Linear Range	Begins at 10 mils from probe face.
5	Linearity	within ± 1 mil of a straight line
6	Sensitivity	100Mv/mil +/- 10% or better
7	Temperature Sensitivity	3% of span for 600C change or better
8	Ambient Temperature	0-80 deg C
9	Relative Humidity	95% non-condensing
10	Case Material	SS 316
11	Enclosure Class	IP-65
12	Power Supply	24 VDC from monitoring units
13	Accessories	i. Non conductive mounting plates for housing. ii. Extension cables (S.S armored) iii. Suitable junction boxes etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[75]	25.09.2014

9. INSTRUMENTATION CABLES & ACCESSORIES

9.1 Specifications of Instrumentation Cables

a) Common Requirements

Table 9.1

Specification of Instrumentation Cables- Common Requirement

S.N	Property	Requirement
1	Voltage grade	600 V (Peak Value)
2	Codes and Standard	All instrumentation cables shall comply with VDE 0815, VDE 0207, Part 4, Part 5, Part 6 , VDE 0816, VDE 0472, SEN 4241475, ANSI MC 96.1, IS-8784, IS-10810 (latest editions) and their amendments read along with this specification
3	Continuous operation suitability	At 70 deg. C for all types of cables, while 205 deg C for Type-C cables
4	Progressive automatic on-line sequential marking of length in meters.	To be provided at every one meter on outer sheath.
5	Marking to read 'FRLS'	To be provided at every 5 meters on outer sheath except for type-C cable.
6	Allowable Tolerance on overall diameter	+ /- 2 mm (maximum) over the declared value in data sheet.
7	Variation in diameter	Not more than 1.0 mm throughout the length of cable.
8	Ovality at any cross-section	Not more than 1.0 mm

b) Specific Requirements

Table 9.2

Specification of Instrumentation Cables- Specific Requirement

S.N	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
A.	Conductors				
i.	Cross section area				
ii.	Conductor material	ANSI type KX	ANSI type SX	High conductivity annealed tin coated copper	ANSI type KX
iii.	Colour code	Yellow-red	Black-Red	As per VDE-0815	Yellow-red
iv.	Conductor Grade	As per ANSI MC 96.1		Electrolytic	As per ANSI MC 96.1
v.	No. & dia. of strands	7x0.3 Sq. mm (nom)			

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[76]	25.09.2014

S.N	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
vi.	No. of Pairs	2, 6	2	4, 8, 12, 16, 24, 48,	2
vii.	Max. conductor resistance per Km (in ohm) at 20 deg. C	As per ANSI MC 96.1		73.4 (loop)	As per ANSI MC 96.1
viii.	Reference Standard	As per ANSI MC 96.1		VDE 0815	As per ANSI MC 96.1
B.	Insulation				
i.	Material	PVC type YI 3 with FRLS properties			Teflon (i.e. extruded FEP)
ii.	Thickness in mm (Min/Nom/Max)	0.25 / 0.3 / 0.35			0.4 / 0.50
iii.	Volume Receptivity (Min) in ohm-cm	1x10 ¹⁴ at 20 deg. C & 1x 10 ¹¹ at 70 deg.			---
iv.	Voltage rating	1100 V peak operating voltage			
v.	Reference Standard	VDE 0207 Part 4			VDE 0207 part 6 & ASTM D 2116.
vi.	Core diameter above insulation	Suitable for cage clamp connector			
C.	Pairing & Twisting				
i.	Max. lay of pairs (mm)	50			
ii.	Single layer of numbered binder tape on each pair provided	Yes			
iii.	Unit formation of four pairs with printing of no. of Unit provided	NA		Yes	NA
iv.	Conductor / pair identification as per VDE0815	NA		To be provided	NA
D.	Shielding				
i.	Type of shielding	Al-Mylar tape			
ii.	Individual pair shielding	No		To be provided for Type-F cable	No
iii.	Minimum thickness of individual pair shielding	No		28 micron	No
iv.	Overall cable assembly shielding	To be provided			
v.	Minimum thickness of overall cable assembly shielding	55 micron			
vi.	Shielding coverage	100% with at least 20% overlap			
vii.	Drain wire provided for individual shield	NA		Yes (for F-type) 7 -strand	NA

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[77]	25.09.2014

S.N	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
				20 AWG (0.51 mm ²) annealed Tin coated copper	
viii.	Drain wire provided for overall shield	Yes (for F-type) 7 -strand 20 AWG (0.51 mm ²) annealed Tin coated copper			
E.	Fillers				
i.	Non-hygroscopic, flame retardant	To be provided			
F.	Outer Sheath				
i.	Material	Extruded PVC compound YM1 with FRLS properties			Teflon (i.e. extruded FRP)
ii.	Minimum thickness at any point	1.8mm			0.4 mm
iii.	Nominal Thickness at any point	> 1.8mm			0.5mm
iv.	Color	Blue			
v.	Resistant to water, fungus, termite & rodent attack	Required			
vi.	Oxygen index as per ASTM D-2863	Not less than 29%			NA
vii.	Temperature index as per ASTM D-2863	Not less than 250 deg. C			NA
viii.	Acid gas generation by weight as per IEC-60754-1	Maximum 20 %			NA
ix.	Smoke Density rating as per ASTM D-2843	Maximum 60% (defined as the average area under the curve when the results of smoke density test plotted on a curve indicating light absorption vs. time as ASTM D-2843)			NA
x.	Reference Standard	VDE 207 part 5			VDE 207 Part 6 & ASTM D 2116
xi.	Armour	Galvanised steel wire armoured type conforming to IS-3975			
G.	Electrical Parameters				
i.	Mutual capacitance between Conductors. At 0.8KHz (Max.)	200 nF / Km		120 nF / Km for F type 1000 nF / Km for G-type	200 nF / Km
ii.	Insulation resistance (Min.)	100 M ohm / Km			
iii.	Cross talk Figure (min.) at 0.8 KHz	60 dB		60 dB	NA
iv.	Characteristics impedance (Max) At 1 KHz	NA		320 ohm for F type 340 ohm for G type	NA
v.	Attenuation Figure at 1 KHz	NA		1.2 dB / Km	NA

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[78]	25.09.2014

S.N	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
H.	Complete Cable				
i.	Complete Cable assembly	Shall pass Swedish chimney test as per SEN-SS 4241475 class F3.			NA
ii.	Flammability	Shall pass flammability test as per IEEE-383 read in conjunction to this specification			NA
I.	Accessories				
i.	Cable accessories of flame retardant quality	Yes. (Accessories such as harnessing components, markers, bedding, cable jointer, binding tape etc.)			
J.	Cable Drum				
i.	Type	Non-returnable wooden drum (wooden drum to be constructed from seasoned wood free from defects with wood preservative applied to the entire drum) or steel drum.			
ii.	Outermost layer covered with waterproof paper	Yes			
iii.	Painting	Entire surface to be painted			
iv.	Length	1000m + 5% for up to & including 12 pairs 500m + 5% for above 12 pairs			

c) Type Test

Table 9.3
Type Test Requirement for Cables

S.N	Item	Test Requirement	Standard
1	Conductor	Resistance Test Diameter test Tin coating test (drain wire)	VDE – 0815 IS – 10801
2	Insulation	Loss of mass Ageing in air ovens Tensile strength & elongation test before & after ageing Heat shock Hot deformation Shrinkage Bleeding & Blooming	VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 IS – 5831
3	Inner sheath	Loss of mass Heat shock Hot deformation Shrinkage Cold bend / Cold impact test	VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 IS – 5831
4	Outer sheath	Loss of mass Ageing in air ovens Tensile strength & elongation	VDE – 0472 VDE – 0472 VDE – 0472

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[79]	25.09.2014

S.N	Item	Test Requirement	Standard
		test before & after ageing Heat shock Hot deformation Shrinkage Bleeding & Blooming Colour fastness to water Cold bend / Cold impact test Oxygen Index test Smoke Density test Acid gas generation test	VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 IS – 5831 IS – 5831 IS – 5831 ASTM D – 2863 ASTM D – 2843 IEC – 754 – I
5	Filters	Oxygen Index test Smoke Density test Acid gas generation test	ASTM D – 2863 ASTM D – 2843 IEC – 754 – 1
6	AL-MYLAR Shield	Continuity test Shield thickness Overlap test Noise interference	
7	Overall cable	Flammability	IEEE 383 & IEC – 332
8		Noise interference Dimensional checks Cross talk Mutual capacitance HV test Drain wire continuity	IS – 10810 VDE – 0472 VDE – 0472

d) Routine Test

To be carried out by supplier during various stages of manufacture.

1. Insulation & jackets: All tests as per IS – 5831 except insulation resistance, voltage & spark test shall be as per BS – 5308, Part II (1986)
2. Armor test as per IS – 3975
3. Conductor resistance
4. Cable capacitance and L/R ratio.

e) Acceptance Test

These following tests shall be carried out as acceptance test:

1. Continuity test
2. Voltage test as per BS – 5308 Part II (1986)
3. Conductor resistance and drain wire resistance

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[80]	25.09.2014

4. Cable capacitance and L/R ratio test.
5. Tests for uniformity of galvanization of armor as per IS – 2633
6. Oxygen and temperature index test as per ASTM D – 2863
7. Dimensional checks for overall diameter and under armour / over armour diameter.
8. Checking of drum length & overall length tolerances.

Immediately after completion of electrical tests, the ends of the cable shall be sealed to prevent ingress of moisture with suitable PVC / Rubber caps

9.2 Specifications of Optical Fibre Cables (OFC)

1. OFC shall be installed on cable tray, duct bank, cable trench installation as necessary. For outdoor applications the cable shall be armoured with Poly Ethylene sheathing. In all cases cable shall be routed through suitable grade HDPE permanently lubricated protection pipe as per IS-4984, IS-12235 & TEC.G/CDS-08/01 of suitable size @ 53% fill factor.
2. The optical fibre core shall be of ultrapure fused silica glass coated with UV cured acrylate suitable to withstand temperature of about 80 deg. Centigrade continuously.
3. OFC shall be 4 / 8 / 12 core, galvanized corrugated steel taped armored, fully water blocked with dielectric central member for outdoor / indoor application so as to prevent any physical damage. The cable shall have multiple single-mode or multi-mode fibres on as required basis so as to avoid the usage of any repeaters. The outer sheath shall have Flame Retardant, UV resistant properties & to be identified with the manufacturer's name, year of manufacture, progressive automatic sequential on-line marking of length in meters at every meter on outer sheath.
4. The cable core shall have suitable characteristics and strengthening for prevention of damage during pulling viz. steel central member, Loose buffer tube design, 4 fibres per buffer tube (minimum), Interstices and buffer tubes duly filled with Thixotropic jelly or better material etc. The cable shall be suitable for maximum tensile force of 2000 N during installation, and once installed, a tensile 1000 N minimum. The compressive strength of cable shall be 3000N minimum & crush resistance 4000 N minimum. The operating temperature shall be -20 DegC to 70 DegC.
5. The splicing loss of any two fibres in any case shall not exceed 0.10 db/splice.
6. The total additional attenuation above the nominal attenuation due to regular splices, repair splices, connectors, temperature variation, ageing etc. shall be indicated.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[81]	25.09.2014

7. Fibre coloring shall conform to EIA/TIA-598. The color-coding shall be permanent thus withstanding normal handling; e.g., during termination, testing, or cable relocation. Refer to EIA – 359 for color identification and coding.
8. Cables shall be designed & tested in accordance with ISO 11801, TIA-568 & ICEA 596 and Performance specifications shall be measured in accordance with the Fibre Optic test procedures(EIA/TIA -455 documents) test procedures of IEC-60793 & IEC-60794
9. The OFC shall generally conform to the following specifications

Table 9.4A
Specifications for Single Mode Optical Fibre

S.N	Feature		Minimum Requirement
1	Maximum Uncabled Attenuation Coefficient	@1310 nm	0.4 dB/km
		@1550 nm	0.3 dB/km
2	Mode field Diameter	@1310 nm	9.2 ± 0.4 µm
		@1550 nm	10.4 ± 0.8 µm
3	Maximum Cable Cut-off Wavelength		1260 nm
4	Maximum Zero Dispersion Wavelength		1321.5 nm
5	Minimum Zero Dispersion Wavelength		1301.5 nm
6	Maximum Zero Dispersion Slope		0.092 ps/nm ² ·km
7	Maximum Polarization Mode Dispersion		0.2 ps/√km
8	Gigabit Ethernet Length 1000BASE-LX		2-5000 mtrs.
9	Ten Gigabit Ethernet Length	10GBASE-LX	2-10000 mtrs.
		10GBASE-LX4	2-10000 mtrs.
10	Maximum Core/cladding Concentricity Error		0.5 µm
11	Cladding Diameter		125.0 ± 1.0 µm
12	Cladding Non-circularity		1 %
13	Coating Diameter		245 ± 5 µm
14	Maximum Coating Concentricity Error		12.5 µm
15	Temperature Dependence (-60 to + 85C)		0.05 dB/km
16	Temperature & Humidity Cycling (-10 to + 85C, 4 to 90% RH)		0.05 dB/km
17	Minimum Proof Test		100 kpsi

11. Test on Fibre optic cable:

Table 9.4C
Type Test Requirement for Fibre Optic Cables

S.N	Test Requirement	Standard
A	Optical Characteristics of Fibres	
1	Attenuation	IEEE Std. 1138 IEEE STD. P1222 (EIA/TIA – 455-61,78A) (IEC 793-1-C1A,B,C)
2	Cut off wavelength	IEEE STD. 1138 IEEE STD P1222 (EIA-455-80, 170) (IEC-793-1-C7A,B)
3	Fibre Dispersion	IEEE STD. 1138 IEEE STD. P1222 (EIA/TIA-455-168A,169A,175A) (IEC-793-1-C5A,B,C)
4	Frequency Response	IEC-793-1-C2B
5	Mode Field Diameter	IEEE STD. 1138 IEEE STD. P1222 (EIA/TIA-455-164A,165A,167A) (EIA-455-174) (IEC 793-1-C9A,B,C,D)
6	Temperature Cycling	IEEE STD. 1138 IEEE STD. P1222 (EIA/TIA-455-69A) (IEC 793-1-D1)
B	Mechanical Characteristics of Fibres	
1	Abrasion	IEC 793-1-B4
2	Core Concentricity	IEC 793-1-A3
3	Macro Bending	EIA/TIA-455-62A (IEC 793-1-C11)
4	Micro Bending	IEC-793-1-C3
C	Proof Test	IEC-793-1-B1
D	Strippability	IEC 793-1-B6
E	Visual Examination	EIA/TIA-455-13 (IEC 793-1-B5)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[84]	25.09.2014

9.3 Instrumentation Cable Interconnection & Termination Philosophy

The cable interconnection philosophy to be adopted shall be such that expensive grouping of signals by large scale use of field mounted Group Junction Boxes (JBs) at strategic locations. (Where large concentrations of signals are available, e.g. valves limit and torque switches, switchgear) is done and consequently cable with higher number of pairs are extensively used. The details of termination to be followed are mentioned in the following Table:

Table 9.5
Instrumentation Cable Interconnection
& Termination Philosophy

S.N	Application		Type of Termination		Type of Cables
	From (A)	To (B)	End A	End B	
1.	Limit, Torque switches of valves / dampers / drives (integral junction box)	Marshalling cubicle / Marshalling cum Termination Cubicle / Local group JB	Plug-in connector	Posts mount cage clamp type	G
2.	Transmitters, process actuated switches mounted in LIE / LIR	Integral junction box of LIE / LIR	Plug-in connector	Cage clamp (rail mount)	F, G
3.	RTD heads	Local junction Box	Plug-in connector	Cage clamp (Rail mount) type	F
5.	Other Field Mounted Instrument	Local JB / Group JB	Plug in connector	Screwed, Cage clamp (Rail mount) type	F (For analog signals) G (For Binary Signals)
7.	Local junction box, Instrument Junction box of LIE / LIR / Group JB / MCC / SWGR	Group JB	Cage clamp (Rail mount) type	Cage clamp (Rail mount) type	F, G
8.	Local junction box, Instrument Junction box of LIE / LIR / Group JB / MCC / SWGR	Marshalling Cubical / Marshalling cum termination Cabinet	Cage clamp (Rail mount) type	Posts mount cage clamp type	F, G
9.	Marshalling Cubical / Termination Cabinet	Electronic system cabinet	Cage clamp post mounted type	Plug-in connector / Other System as per manufacturer's Standard	Internal Wiring

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[85]	25.09.2014

Notes:

1. Normally 10% spare cores shall be used when the numbers of pairs of cables are more than four pairs.
2. For analog signals, individual pair shielding & overall shielding & for binary signals only overall shielding of instrumentation cables shall be used.
3. * For high temperature applications only.
4. Instrument Cabling for instruments / equipment of specialized / proprietary Control System shall be as per manufacturer's standard.

9.4

Terminal Blocks

1. All terminal blocks shall be rail mounted/post mounted, cage clamp type with high quality non-flammable insulating material of melamine suitable for working temperature of 105 deg. C. The terminal blocks in field mounted junction boxes, temperature transmitters, instrument enclosures/racks, etc. shall be suitable for cage clamp connections. The terminal blocks in Control Equipment Room logic / termination / marshalling cubicles shall be suitable for the post mounted cage clamp connection at the field input end. The terminal blocks for Coal Handling control system Input/ Output connections from/to SWGR/MCC, shall be used with built in test and disconnect facilities complete with plug, slide clamp, test socket etc.
2. All the terminal blocks shall be used complete with all required accessories including assembly rail, locking pin and section, end brackets, partitions, small partitions, test plug bolts and test plug (as specified above for SWGR connections), transparent covers, support brackets, distance sleeves, warning label, marking , etc.
3. The marking on terminal strips shall correspond to the terminal numbering on wiring diagrams. At least 20% spare unused terminals shall be used everywhere including local junction boxes, termination/marshalling cabinets, etc. All terminal blocks shall be numbered for identification and grouped according to the function. Engraved labels shall be used on the terminal blocks.
4. The terminal blocks shall be arranged with at least 100 mm clearance between two sets of terminal blocks and between terminal blocks and junction box walls.
5. Internal wiring in factory pre-wired electronic equipment cabinets may be installed according to the applicable standards as to wire size and method of termination or internal equipment. Terminal blocks for connection of external circuits into factory pre-wired electronic equipment cabinets shall meet all the requirements as specified above.

LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[86]	25.09.2014

9.5 Internal Panels, Cabinets, System Cabinet Wiring Philosophy

1. Internal panel/cabinet wiring shall be of multi-stranded copper conductor with FRLS PVC insulation without shield and outer sheath meeting the requirements of VDE 0815.
2. Wiring to door mounted devices shall be done by 19 strand copper wire provided with adequate loop lengths of hinge wire so that multiple door opening shall not cause fatigue breaking of the conductor.
3. All internal wires shall be used with Tag identification of printed type (partex labels) at both ends. All wire directly connected to trip devices shall be distinguished by one additional red color.
4. All external connection shall be made with one wire per termination point. Wires shall not be tapped or spliced between terminal points.
5. All floor slots of desk/Panels/cabinets used for cable entrance shall be used with removable gasketed gland plates and sealing material. Split type grommets shall be used for prefabricated cables.
6. All the special tools as may be required for solder less connection.
7. Tag identification for internal wires shall be printed (partex labels)
8. Wire sizes to be utilized for internal wiring shall be as per following table.

Table 9.6
Wire Size for Internal Wiring

S.N	Application	Wire Size
1	Current (4-20mA), low voltage signals (48 V)	0.5 Sq. mm
2	Ammeter/ Voltmeter circuit, control switches etc. for electrical system.	1.5 Sq. mm
3	Power supply and internal illumination.	2.5 Sq. mm minimum (shall be as per load requirement)

9.6 Cable Installation & Routing

1. All cable assigned to a particular duct/conduit shall be grouped and pulled in simultaneously using cable grips and suitable lubricants. Cables removed from one duct/conduit shall not be reused.
2. Cables shall be segregated as per IEEE Std. 422. In vertically stacked trays, the higher voltage cable shall not be in higher position and instrumentation cable shall be in bottom tier of the tray stack. The distance between instrumentation cables and those of other system shall be as follows:
 - From 11KV/6.6KV/3.3KV tray system - 900 mm
 - From 415KV tray system - 600 mm
 - From control cable tray system - 300 mm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[87]	25.09.2014

3. Cables shall terminate in the enclosures through cables glands. All cable glands shall be properly gasketed. Fire proof sealing (to prevent ingress of dust entry and propagation of fire) shall be used for all floor slots used for cable entrance. Compression cable glands (double for armored and single for other cables) shall be used.
4. All cables shall be identified by Tag. Nos. provided in approved format at both the ends as well as at an interval of 5 meters.
5. Line voltage drop due to high resistance splices, terminal contacts, insulation resistance at terminal block, very long transmission line etc. shall be reduced as far as practicable.
6. The cables emanating from redundant equipment/devices shall be routed through different paths. The above segregation of cables & wiring for redundant equipment / devices shall be in accordance with IEEE-Std-422

9.7

Cable Laying

1. Cable shall be laid strictly in line with cable schedule. In general, the cable routing from the local instrument to JB shall be such that the cable go away from the hot zone.
2. Identification tags for cables.
Indelible tags to be provided at all terminations, on both sides of wall or floor crossing, on each conduit/duct/pipe entry/exit, and every 20 m in cable trench / tray.
3. Cable tray numbering and marking.
To be provided at every 10m and at each end of cables way & branch connection.
4. Joints for less than 250 Meters runs of cable shall not be permitted.
5. Buried cable protection
With concrete slabs; Route markers at every 20 meters along the route & at every bend.
6. Road Crossings
Cables to pass through buried high density PE pipes encased in PCC. At least 300 mm clearance shall be used between.
 - HT power & LT power cables,
 - LT power & LT control cables,
 - LT control & instrumentation cables,
 Spacing between cables of same voltage grade shall be in accordance with the derating criteria adopted for cable sizing.
7. Segregation (physical isolation to prevent fire jumping)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[88]	25.09.2014

- a) All cable associated with the unit shall be segregated from cables of other Units.
- b) Interplant cables of station auxiliaries and unit critical drives shall be segregated in such a way that not more than half of the drives are lost in case of single incident of fire.

8. Cable clamping

All cables laid on trays shall be neatly dressed up & suitably clamped/tied to the tray. For cables in trefoil formation, trefoil clamps shall be used.

9. Optical fibre cables inside conduits shall be laid on cable trays wherever available and feasible. In areas where the same are required to be buried, the same shall be buried in separate trench approx. 1.6 meter depth, to be laid in 2" GI/rodent proof HDPE conduits covered with sand, brick and soil along the pipe line route.

10. While crossing roads- to be laid in GI/rodent proof HDPE conduits with sand filling at bottom and sand, soil filling at top with cement concrete;

While crossing canals/river- to be laid in GI/rodent proof HDPE conduits within Hume pipe.

9.8

Cable Accessories

1. Cables, which terminate in cabinets of draw out sections, shall have sufficient cable coils in the bottom of the cabinet to permit full withdrawal of draw out sections without disconnecting the cables. When prefabricated cables with factory connectors on both ends are longer than required, the excess cable shall be coiled in the bottom of one or both termination cabinets.
2. No splices shall be made in conductors for instrument and control circuits except where required at connections to devices equipped with factory installed pigtails. Such splices shall be made only in approved splicing boxes of fitting with removable cover. The splices shall be made with sufficient slack left in the wire to permit withdrawal of the splice from the splicing boxes for ease of future disconnection of the splices. All exposed conductor or connector surfaces shall be covered with a minimum of three half-lapped layers of all weather vinyl plastic electrical tape. Taping shall extend a minimum of two cable diameters over the cable jacket and a similar distance over the other insulation or connections requiring insulation.
3. Proper grounding of all equipments shall be done. Further, proper termination of cable shield shall be verified and the grounding of the same shall be coordinated so as to achieve grounding of all instrumentation cable shields at same potential. This shall be completed prior to system tests.
4. Take full care while laying/installing cables as recommended by cable manufacturers regarding pulling tensions and cable bends.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[89]	25.09.2014

9.9 Cable Conduits

1. Conduits shall be generally used for interconnecting cables from field instruments to Local JB's. All unarmoured cables shall be installed in conduit. All rigid conduits, couplings and elbows shall be hot dipped galvanized rigid mild steel in accordance with IS: 9537 Part-I (1980) and Part-II (1981). The conduit interior and exterior surfaces shall have continuous zinc coating with an overcoat of transparent enamel lacquer or zinc chromate. Flexible metal conduit shall be heat resistant lead coated steel, water leak, fire and rust proof. The temperature rating of flexible conduit shall be suitable for actual applications. The flexible metal conduit shall be constructed with interlocked corrosion resistant steel & manufactured in accordance with UL1 & NEC Article 348.
2. All grounding bushings within all enclosures shall be wired together and connected internally to the enclosure grounding lug or grounding bus with 8 AWG bare copper conductors. Conduit runs to individually mounted equipment shall be grounded to the cable tray grounding conductor with 12 AWG bare copper conductors.
3. All rigid conduit fittings shall conform to the requirements of IS: 2667, 1976. Galvanized steel fitting shall be used with steel conduit. All flexible conduit fittings shall be liquid tight, galvanized steel. The end fittings shall be compatible with the flexible conduit supplied.
4. All individually mounted equipment and devices shall be connected to the supply conduit, using not more than one meter of flexible conduit adjacent to the equipment or device. Flexible conduit shall be installed in all conduit runs, which are supported by both building steel and structures subject to vibration or thermal expansion.
5. Special areas, such as Control Rooms in which external noise is to be minimized, shall have flexible conduit in conduit runs where the runs cross from the main building framing to the Control Room framing.
6. Conduit supports shall be furnished and installed in accordance with these specifications. Support material shall comply with the requirements.
 - a) Hanger rods shall be 12 mm diameter galvanized threaded steel rods.
 - b) Single conduit support shall be one-hole cast straps and clamp backs. Multiple conduit bank supports shall be constructed of special galvanized support channels with associated conduit clips.
7. Conduit sealing, explosion proof, dust proof and other types of special fittings shall be used as required by these specifications and shall be consistent with the area and equipment with which they are installed. Fittings installed outdoors and in damp locations shall be sealed and gasketed. Hazardous area fittings and conduits sealing shall conform to NEC requirements for the area classification.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[90]	25.09.2014

8. Double locknuts on all conduit terminations shall be used. Water tight conduit unions and rain tight conduit hubs shall be utilized for all the application which shall be exposed to weather. Moistures pockets shall be eliminated from conduits.
9. Conduits shall be securely fastened to all boxes and cabinets.

9.10 Cable Sub Trays & Support

1. The cable sub-trays and the supporting system, to be generally used between Local/Group JBs and the main cable trays. It is the assembly of section and associated fitting forming a rigid structural system used to support the cable from the equipment or instruction enclosure up to the main cable trays (trunk route). The material of cable tray shall be GI.
2. The covers on the cable sub-trays shall be used for protection of cables in areas where damage may occur from falling objects, welding spark, corrosive environment, etc. & shall be electrically continuous and solidly grounded. The cable trays shall not have sharp edges, burrs or projections injurious to the insulation or outer sheath of the cables.
3. The supporting arrangement of cable tray system shall be able to withstand the weight of the cable and cable tray system. The supporting interval shall not be more than the recommended span for the above loading for the type of cable tray selected. The tray shall not overhang by more than one meter from the support at the dead end. As far as practicable the cable sub-tray system shall be supported from one side only, in order to facilitate installation and maintenance of cables.
4. Install the estimated quantities and size of sub trays / troughs including all required fittings and adaptors on as required basis.

Table 9.7
Specifications for Cable Tray

S.N	Feature	Minimum Requirement
1	Material	Mild Steel as per IS-2062
2	Thickness	Not Less than 2 mm
3	Finish	Hot Dip galvanised as per IS-2629, 2633 & Zinc Coating as per IS-4579
4	Length	2.5 Mtr. +/- 10 mm
5	Width	W +/- 3mm
6	Inward Bend	25 mm
7	Coupler Plate	Thickness 2 mm, length 100 mm, Width 50 mm
8	Coupler plate material	MS with Hot dip galvanised
9	Nuts, Bolts, washer etc.	As required/ Hot dip galvanised

[Logo of Utility]

S.N	Feature	Minimum Requirement
10	Cover	Dome Fixed type, Thickness 1.2 mm (Minimum)
11	Cover Material	Hot dip galvanised MS sheet

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[92]	25.09.2014

10. SYSTEM CABINETS, PANELS & JUNCTION BOX

10.1 General Requirements

1. All control panels, system cabinets, local panels and local instrument enclosures, racks shall be furnished fully wired with necessary provision for convenience outlets, internal lighting, grounding, ventilation, space heating, anti-vibration pads and accessories as per IS:5039-1969 as required for completeness of the system.
2. All panels & cabinets shall be free standing type and have bottom entry for cables unless otherwise specified. The bottom of panels, cabinets, enclosures shall be sealed with bottom plate, compression cable glands and fire proof sealing material to prevent ingress of dust and propagation of fire. The Cabinets shall be designed for front & back access to components, terminals and wiring.
3. The cabinets shall be used with bottom glanding plate which shall be removable from inside and shall be used with sufficient no. of knockouts. All knockouts shall be used with pluggable grommets.
4. The cabinets shall be of max. 2200mm height including base channel. The base channel shall be of 100 ISMC. All cabinets shall be of same height. Construction shall be modular.
5. System & non-system cabinets shall have "look alike" appearance.
6. All electronic system cabinets shall be designed for 50 deg C operating under maximum ambient temperature without air conditioning system in service. Further cabinets, panels shall be so designed that temperature rise due to heat load does not exceed 10 deg. C above ambient temperature under all operating conditions. Necessary louvers, fans, limited packing density, adequate spacing between instruments, devices etc. shall be used to maintain temperature rise within permissible limits.
7. Panels, cabinets enclosures wiring shall be arranged to enable the removal of modules/instruments and devices without unduly disturbing them.
8. All panels, cabinets, enclosures interiors shall be illuminated with rapid start fluorescent strip fixtures with door actuated switches. Door switch terminals shall be shrouded. All illuminated lights shall be used with isolation switch in addition to door switch for maintenance & switching off when not required. Illumination light shall be used on both front & back sides if both sides are provided with equipments/instruments/terminal blocks requiring maintenance.
9. Sufficient number of power receptacles with disconnect switches shall be installed within panels, enclosure and racks.
10. The local instrument enclosures/racks shall be used locally for mounting of electronic transmitters and switches, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[93]	25.09.2014

11. Exterior steel surface shall be sand blasted, ground smooth, filed, primed, sanded and smooth enamel painted to give a good finish subject to minimum paint thickness of 65-75 microns for sheet thickness of 3 mm and 50 microns for sheet thickness of 2mm. Minimum 2 coats of primer and two sprays of final finish colour shall be applied to all surfaces.
12. The colour of the panel's interior shall be brilliant white. External colour of the panels will be as RAL 7032 for LIE/ LIR and RAL 7035 for control room system cabinets.
13. All panels, enclosures, system cabinets, marshalling cabinets shall be used with a minimum of 20% spare terminations and system cabinets shall be used with spare space for 20% additional modules fully wired with connectors etc. in excess of the total requirement of the system design when the cabinets are delivered. The spare space capacity shall be distributed evenly throughout the cabinets.

10.2

System Cabinets

Table 10.1
Specifications for System Cabinets

S.N	Features	Minimum Requirements
1	Application	For housing Signal conditioning cards, input/output cards, processor cards, power supply units etc.
2	Location	Indoor
3	Type	Free standing Vertical type
4	Protection class	IP-44
5	Material & Thickness	CRCA steel/ min. 2mm for panel sides & 3mm for gland plates
6	Doors	Double door with neoprene gasket, Lockable,
7	Cable entry	Bottom with fire proof compound thickness 50 mm for sealing
8	Anti vibration pad	Required, 15mm
9	Painting	Interior- Brilliant White Exterior- RAL 7035
10	Cabinet Dimension	As per Standard Practice
11	Grounding	M6 earthing stud shall be used
12	Ventilation	Fans & louvers with brass mesh required
13	Lighting	rapid start fluorescent strip fixtures with door actuated switches required
14	Lifting arrangement	Removable lifting eyebolts shall be used

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[94]	25.09.2014

1. Beacon Lamps shall be used in each cabinet to indicate panel having fault condition.
2. The racks in system cabinets shall have provision along with plug in sockets/back plane to house accommodate the spare slots/modules as specified elsewhere.
3. The system cabinets, racks in system cabinets, slots in the racks & the terminals shall have identification numbers. A stainless steel metal tag (plate) shall be fixed to the inside of the door & the layout of the racks, slots & details of the card type/service shall be inscribed on this metal tag.
4. Each cabinet shall be used with one each 3 pin receptacles for 230 V, 1P, 50 Hz and receptacles for 24V DC.
5. One of the doors shall be used with folder to keep the relevant engineering document of the cabinet.
6. All cabinets shall have common key for locks.
7. Door shall have concealed type of hinges with 120 degree swing.
8. Door latches shall be of the three-point type to ensure tight closing.
9. Separate Power & shield earthing bus shall be used at the front & rear side of the cabinets. The earthing bus shall be isolated from panel body by suitable insulation material.

10.3 Marshalling Cabinets

Table 10.2
Specifications for Marshalling Cabinets

S.N	Features	Minimum Requirements
1	Application	For termination of all cables originating from field.
2	Location	Indoor
3	Type	Free standing Vertical type
4	Protection class	IP-44
5	Material & Thickness	CRCA steel/ min. 2mm for panel sides & 3mm for gland plates
6	Doors	Double door with neoprene gasket, Lockable,
7	Cable entry	Bottom with fire proof compound thickness 50 mm for sealing
8	Terminal Blocks	Rail mounted cage-clamp suitable for conductor size up to 2.5 mm ² & fused type with LED indication for power supply (24 VDC, 230 V AC, 110 V AC etc.) for instruments & equipments.
9	Anti vibration pad	Required, 15mm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[95]	25.09.2014

S.N	Features	Minimum Requirements
10	Painting	Interior- Brilliant White Exterior- RAL 7035
11	Cabinet Dimension	As per Standard Practice
12	Grounding	M6 earthing stud shall be used
13	Ventilation	Fans & louvers with brass mesh required
14	Lighting	rapid start fluorescent strip fixtures with door actuated switches required
15	Lifting arrangement	Removable lifting eyebolts shall be used

1. Separate Marshalling cabinets for the system shall be supplied for terminating all cables originating from the field and for distributing the signals to different functional panels and cubicles.
2. The terminal blocks shall be cage clamp type. Fused terminal blocks hinged at one end to facilitate easy isolation shall be used wherever necessary. All cabinets shall be used with spare terminals for the spare inputs/outputs as specified elsewhere in the specification. The type of terminals for terminations from cabinets/panels shall match with the pre fabricated cables and pins supplied.
3. The terminals for field cables shall be arranged in a logical order of equipment/system wise.
4. The marshalling cabinets, the terminal blocks, the terminals and the electronic hardware if any, shall have identification numbers.
5. Each cabinet shall be used with one each 3 pin receptacles for 230 V, 1P, 50 Hz and receptacles for 24V DC.
6. One of the doors shall be used with folder to keep the relevant engineering document of the cabinet.
7. All cabinets shall have common key for locks.
8. Door shall have concealed type of hinges with 120 degree swing.
9. Door latches shall be of the three-point type to ensure tight closing.
10. Separate Power & shield earthing bus shall be used at the front & rear side of the cabinets. The earthing bus shall be isolated from panel body by suitable insulation material.

10.4

Local Junction Box

Table 10.3
Specifications for Junction Box

S.N	Features	Minimum Requirements
1	No. of Ways	32 (2X16) with 20% spares terminals

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-C	[96]	25.09.2014

S.N	Features	Minimum Requirements
2	Material & Thickness	3 mm thick FRP
3	Protection class	IP-65 for outdoor/ IP 55 for Indoor
4	Cable entry	Bottom
5	Mounting	Suitable for Wall/column/structures mounting
6	Terminal Blocks	Rail mounted cage-clamp type suitable for conductor size up to 2.5 mm ²
7	Grounding	M6 earthing stud shall be used
8	Gland plate	Removable type
9	Door	Single Lockable door with gasket, able to open sideways, turnable hinge based, latch type lock without handle with common key.
10	Accessories	Tag plate, clamps, fixtures, bolts (SS), nuts (SS), Gasket (Neoprene), cable glands (SS), Lugs (Brass), Fire proof compound for sealing.

1. All JB's for outdoor application shall be used with individual canopies to prevent ingress of water.
2. All JB' shall have provision to add 10% additional TB's.
3. The marking on terminal strips shall correspond to the terminal numbering on wiring diagrams.
4. Separate Terminal blocks shall be used for Analog & Digital Signals & also for signals with different voltage levels.
5. The terminal blocks shall be arranged with at least 100 mm clearance between two sets of terminal blocks and between terminal blocks and junction box walls.
6. Separate shield bus shall be used with screw connection for terminating cable shields.
7. All spare cable entries shall be used with plugs.
8. All wires in JB shall be neatly dressed & ferruled.
9. Double deck type terminal block shall not be used.

1 CIVIL, STRUCTURAL & ARCHITECTURAL WORKS

1.1 Introduction

This specification covers the design, preparation of general arrangement, construction as well as fabrication drawings, supply of all labour as well as materials and construction of all civil, structural as well as architectural work on EPC basis for Renovation and Modernisation of Coal handling Plant and associated structures for the existing [Name of project...] Thermal Power Project of [210/215/220/250] MW capacity. Description of various items of work under this specification and nature of work in detail are given hereinafter. The complete work under this scope shall be as per Volume-II, Section-I, CIVIL SCOPE OF WORK.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[1]	25.09.2014

2 [BUILDINGS & STRUCTURES]

Design and construction of new buildings, structures, foundations etc. as well as repairing / retrofitting of existing buildings, structures, foundations shall take into account requirement for operation and maintenance of all equipments and its users. The buildings will have good architectural features. The surrounding areas shall be properly micro levelled and graded. The architectural design concept of buildings structure shall be evolved considering the functional, technological and other requirements for efficient operation ensuring comfortable working environment for personnel, satisfying the aesthetic requirements. Special care shall be taken to provide elegance and aesthetics, with effective use of appropriate treatment, materials fittings and finishes.

- *Due consideration shall be given for adequate natural lighting and ventilation for both plant and non-plant buildings.*
- *Retrofitting / repair works / new constructions shall not cause damage to the existing structures. The temporary supports shall not be allowed on the existing structures for any of these works unless the loads are minor and may not cause any damage to any existing structure. However in such a case Bidder shall take approval from the Owner/Consultant prior to initiating the work.*
- *Internal finishes shall be provided with latest available materials approved by Owner/Consultant with due consideration of the functional aspect of the area.*
- *External finishes shall be provided with latest materials approved by Owner/Consultant for improving the aesthetics.*
- *The orientation of the important buildings shall be in line with the existing site condition and function as such.*
- *Each building shall have its own identity. However, a total homogeneity shall be maintained in the design of all buildings.*
- *Adequate frontage shall be provided to all important buildings to create a better visual impact.*
- *All other civil and structural buildings shall be developed in conjunction with the above aspects.*

All Civil, Structural and Architectural works of the following systems shall be covered under this package.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[2]	25.09.2014

- a) *Track Hopper*
- b) *Wagon Tippler*
- c) *Stockpile*
- d) *Stacker cum Reclaimer foundations*
- e) *Conveyor Galleries and Trestles*
- f) *Screen cum Crusher Houses- (Primary and Secondary Crusher)*
- g) *Junction Houses*
- h) *Reclaimer Hopper Pits and Shed*
- i) *Compressor cum pump house*
- j) *Tunnels, Pent houses and Transfer Houses*
- k) *CHP Switch Gear cum Control Room Building*
- l) *Dust Suppression, Dust Extraction and Ventilation System Structures*
- m) *Any building inadvertently left out in the above list, however required for proper functioning of the power plant as per system requirement stipulated under Mechanical & Electrical section of this specification shall also be included.]*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[3]	25.09.2014

3 DESIGN REQUIREMENTS

3.1 Location

Geographical location of the plant site is approximately between [...]°[...]′[...]″ N] to [...]°[...]′[...]″ N], Latitude and [...]°[...]′[...]″ E] to [...]°[...]′[...]″ E], Longitude.

3.2 Ground Condition

Subsurface condition: The natural ground surface level approximately varies from [...] m to [...] m] from MSL.

[The soil profile in the plant area can be broadly classified into 3 layers namely laterite, cemented sand and cemented silt in general as per detail soil investigation report. Top soil upto a depth ranging from 0.4 m to 0.75 m is entirely non-uniform. The underlying layer is laterite whose depth varies from 4.0 m to 5.5 m followed by deep layers of cemented silt and cemented sand].

The ground water table (GWT) at finished ground level shall be considered for foundation design purposes.

The detailed soil investigation report conducted for plant shall be made available to Bidder for required replacement / refurbishment / retrofitting of Foundations, if any.

Bidder is advised to carefully study the content of detailed Soil investigation report for the existing type of foundations and design of new ones.

The type, size, depth of the foundation shall be based on the detail soil investigation report provided by OWNER.

3.3 Climatic Condition

a) Temperature

Maximum : [...] °C

Minimum : [...] °C

For design purpose, maximum temperature to be considered: [...] °C

minimum temperature to be considered: [...] °C

b) Rain fall

Minimum : [...] mm in May]

Maximum : [...] mm in October]

Peak hourly rain fall: [...]mm] (corresponding to 50 years return period)

[Note: Maximum per day rainfall as per weather report has been considered conservatively as peak hourly rain fall which will be used for drainage system design etc.]

Annual average: [...] mm to [...] mm & average [...] mm]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[4]	25.09.2014

3.4 Seismic Zone

The site is located in [Zone III] as per IS: 1893-2002. Zone factor shall be [0.10]. Importance factor shall be considered as [1.75].

3.5 Wind Zone

The site is located in wind speed zone [50 m/s] as per IS: 875 (Part 3)-1987.

3.6 Loads and Load Combinations

All new structures shall be designed and old structures requiring modification shall be checked for the most critical combinations of dead loads, imposed loads, equipment loads, wind loads, seismic loads, temperature loads, forces developed due to differential settlement and any other loading conditions which can occur during the design life of the facility.

(a) Dead Loads

Dead loads consist of the weights of the complete structure with finishes, fixtures, partitions, wall panels and all existing / modified / replaced equipments of semi-permanent nature including storage structures partitions, roofing, piping, cable trays, bus ducts etc. The content of storage structures etc. shall be measured at full capacity for this purpose.

The piping loads (for empty, operating and test conditions), cable tray loads and the contents of the storage structures shall be listed separately so that they can be excluded from dead load when dead loads are acting as stabilizing load for uplift.

The following unit weight of material shall be considered for computation of loads. Loads given in IS: 875 (part-I) shall be made use of for material not listed below.

Table 2.1
Weights of Material

Material	Unit weight (kN/m ³)
Plain cement concrete	24.0
Reinforced cement concrete	25.0
Structural steel	78.5
Brick work	19.0
Cement plaster	21.0
Floor Finish	24.0
[Coal]	11.0

(b) Superimposed Live Load (SILL)

Listed below is the minimum SILL for the areas involved. Floors and supporting members subjected to heavy equipment live loads shall be designed on the basis

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[5]	25.09.2014

of the equipment loads specified by vendor or specifically defined SILL whichever is greater.

The specific minimum floor SILL is listed below:

**Table 2.2
Superimposed Live Load (SILL).**

S.No	Description	SILL Value
a)	Roof	
	Flat accessible roof	1.5 kN/m ²
	Flat accessible roof with HVAC equipments, etc.	5 kN/m ²
	Flat inaccessible roof	0.75 kN/m ²
	Sloped Roof	As per code IS: 875 (Part-2)
b)	All building floors & Stairs	5 kN/m ²
c)	Walkways of Conveyor Galleries	5 kN/m ² or Concentrated Load of 3 kN at centre which ever is critical
d)	M.C.C. Floor	10 kN/m ²
e)	Equipment Load	As applicable
f)	Culverts & its allied structures including Concrete pipes	Class "A" / Class "70R" as per IRC standard whichever is higher / load due to bull dozers
g)	Underground basement,	Surcharge of 10 KN/m ²
h)	Vehicular traffic	Surcharge of 20 KN/m ²
i)	Covers for Channels	Surcharge of 10 KN/m ²
j)	Pump Houses	
	Operating Floor Slab	15 KN/sqm or as required by equipment supplier whichever higher
	Workshop	10 kN/m ²
k)	Other areas:	
	• RCC floors (Offices, laboratories, conference rooms and general floors)	5 kN/m ²
	• Balconies	5 kN/m ²
	• Chequered plate / gratings	5 kN/m ²
	• Walkways	3 kN/m ²
	• Toilets	2 kN/m ²

- In addition to LL, Hung loads for electrical, ventilation & air conditioning minimum of 0.5 kN/m² shall be considered.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[6]	25.09.2014

- Load of 1 kN/m² shall be considered as hung load for piping unless otherwise mentioned. However, the actual loads will be as furnished by the supplier. The stringent most will be followed.
- For other areas LL shall be considered as per IS: 875 (Part-2).

(c) Seismic Load

The proposed plant is located in Seismic [Zone-I] as per IS: 1893, Seismic force on the structures will be considered accordingly.

(d) Wind Load

The proposed plant is located in Wind Speed Zone of [50 m/s] as per IS: 875 (Part 3). The wind force on the structures will be considered as follows:

Table 2.3
Wind Speeds

Description	Wind Speed
Basic Wind Speed V _b (at 10m above mean ground level)	[50 m/sec]
Risk coefficient K ₁ (for 100 years)	[1.07]
Category of terrain	[Category 1]
Factor K ₂	As per IS: 875
Topography factor K ₃	As per IS: 875

For the design of structures, wind force on Equipment, supported on frame including all fixtures, piping, staircase, ladder, etc, shall be considered.

Design of structures shall be checked for the condition of wind load with gust factor.

(e) Earth Pressure Loads

For earth pressure the worst condition with dry / submerged and active, passive or at rest shall be considered. The pressure coefficient shall be adopted as recommended in Soil Report or for the backfill material used.

(f) Temperature Loads

The total temperature variation shall be considered as 2/3rd of the average maximum annual variation in temperature. The average maximum annual variation in temperature for this purpose shall be taken as the average between the mean of the daily minimum ambient temperature during the coldest month of the year and mean of daily maximum ambient temperature during the hottest month of the year. The structure shall be designed to withstand stresses due to 50 % of the total considered temperature variation with temperature load applied with positive and negative sense.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[7]	25.09.2014

For design purpose average maximum annual variation shall be taken as $[+50^{\circ}\text{C}]$ to $+5^{\circ}\text{C}$.

Coefficient of thermal expansion of steel shall be taken as per IS: 800 where the value is given as $12 \times 10^{-6}/^{\circ}\text{C}$. Coefficient for thermal expansion for concrete shall be taken as per IS: 456.

(g) Thermal Loads (during operating condition)

When thermal loads (such as produced by temperature changes in piping, equipment and structures) results in friction between equipment and supports (exchangers) or piping and supports, the friction force will be taken as the operating load on the support multiplied by the applicable friction coefficient given below:

Table 2.4
Thermal Loads

Description	Value
Surfaces	Friction coefficient
Rolling supports	0.05
Steel to steel	0.30 (longitudinal) and 0.10 (lateral)
Concrete to steel	0.30

(h) Equipment Loads

Static and dynamic loads of major existing / modified / replaced equipments shall be based on the manufacturer's data of the specified equipments and shall be considered in design in addition to the live load.

Equipments to be tested for hydraulic test, tanks and piping design loading shall include hydraulic test loading. Weight of equipments, ducts, tanks, pipes, conduits, etc. supported by structure shall include maximum possible loading conditions i.e. flooded conditions and associated impacts, test loading, anchorages and constraint effects.

Air and gas duct loads shall include weight of insulation, duct attachments, dust accumulation loads, seismic, wind and other loads applicable.

(i) Cranes, Hoists, Monorail and Elevator loads

All lifting beams and monorails shall have their design loads increased for impact factor. Loads for overhead cranes, hoists, monorails and elevators shall be taken as per IS: 875.

100 % of the lifted load including elevator live load plus the cab weight shall be considered for the elevator support beam design. Pedestals in elevator pits shall be designed assuming impact factor as per IS codes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[8]	25.09.2014

(j) Vibration and Noise

The design shall ensure that vibrations from any moving machinery transmitted from its immediate foundations to adjacent buildings or areas of the same building shall be suppressed in accordance with the recommendations of relevant codes of practice.

(k) Other Loads

- Stresses imparted to structures due to differential settlements, variation of water table, erection and maintenance loads, creep and shrinkage shall also be considered in design of all structures.

- Dust loads

All buildings / structures shall be designed for a dust load of 1 kN/m² for flat roof and 0.5 kN/m² for sloped roof.

- Construction /Erection/Maintenance Loads

The integrity of the structures shall be maintained without use of temporary framing struts or ties and cable bracing as far as possible. However, construction or access considerations may dictate the use of temporary structural systems. Special studies shall be made and documented to ensure the stability and integrity of the structures during any periods involving use of temporary bracing systems.

- Future Loads

Loads from future expansion shall be considered when so directed by the Owner/Consultant. Future loads may include any of the loads listed above.

- Surge Loads

Surge loads may occur in some vessels or equipment. In such cases, the magnitude and direction of the load shall be given by the equipment supplier.

(l) Basic Load Cases

Following basic loads shall be considered for analysis and design:

Dead load	:	DL
Superimposed dead load	:	SIDL
Self weight of permanent equipment	:	EL
Steam piping (Static & Dynamic) & other piping loads	:	PL
Cable loads	:	CL
Live load on floor / walkway	:	LL
Superimposed live load	:	SILL
Live load on roof	:	LLR
Seismic load	:	SL

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[9]	25.09.2014

Wind load	:	WL
Load due to soil pressure	:	SP
Load due to surcharge	:	SCL
Load due to hydrostatic pressure	:	HP
Load due to temperature	:	TL
Hoist, monorail loads	:	MR1
Crane Loads	:	CRL
Special loads	:	SPL

(m) Load Combinations

The individual members of the frame shall be designed for worst combination of forces such as bending moment, axial force, shear force and torsion. Permissible stresses for different load combinations shall be taken as per IS: 456, IS: 800 & IS: 875 (all parts) and other relevant IS codes.

Wind and seismic forces shall not be considered to act simultaneously.

Criticality of erection / maintenance loads shall also be checked separately in combination with other simultaneously occurring loads for possible design loading.

(n) Load Combinations for underground structures

- For the design of sub structure only liquid pressure from inside and no earth pressure and ground water Pressure and surcharge pressure from outside (applicable only to the Structures which are liable to be filled with water or any other liquid) shall be checked.
- For the design of sub structure combination of earth pressure, surcharge pressure and ground water pressure from outside and no water pressure from inside shall be applied.

(o) Coal Handling System (CHS)

In addition to the loads specified in (b) above, following additional loads shall be considered for design of various structures of CHS.

Flat roof	:	
Accessible	:	0.50KN/sq. m dust load
Non accessible	:	1.25 KN/sq. m dust load
Inclined roof	:	0.50KN/sq. m dust load
Building floors	:	5KN/sqm or equipment load whichever is high + 1KN/sqm spillage load (Where

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[10]	25.09.2014

equipment is located)

Load due to material on belt : 1.6 times design weight of the material on belt

Spillage load

Gallery walk way : 1KN/sq. m

Seal plate : 1KN/sq. m

Belt tension for twin conveyors : One belt at starting condition and one in running condition

Impact factor for drive machines : 1.50

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[11]	25.09.2014

4 EARTHWORK AND ROCKWORK

4.1 General

This section applies to all earth and rockwork required for the replacement / refurbishment / retrofitting of existing foundations or construction of new buildings foundations (if any), any types of structure and burying service lines in the ground.

The Bidder shall satisfy himself as to the ground conditions on the site including the nature of the strata to be excavated, obstructions, possibilities of flooding and such like and shall allow for all provisions necessary to carry out the work in the most suitable manner when submitting his tender.

Generally, all buildings and structures must be founded on bearing strata which means that all excavation work for foundations shall meet the requirements of structural analysis based on the results obtained from the detailed soil investigation and of the available information and instruction given in writing by the Owner/Consultant.

Excavation shall be done to the required dimensions and shall be finished according to the specified lines and slopes, in a way acceptable to the Owner/Consultant. All necessary precautions shall be taken to cause the minimum possible alteration or disturbance to the other existing foundations, material lying under and adjacent to the excavation final lines.

4.2 Fill Materials

The fill materials used and source are to be examined and approved. Excavation materials can be used if they fulfil the requirements.

a) Select fill shall have the following properties:

Well graded (uniformity index not less than 5), non-cohesive and nearly silt free (silt content not greater than 5%; up to 10% tolerated, except below footings of structures), salt free (content less than 3%), soils free of organic matter (limit 2%). Decomposing or compressible materials shall not be used.

All materials shall be of such nature and character that it can be compacted to the specified densities in a reasonable length of time. It shall be free of highly plastic clays, of all materials subject to decay, decomposition or dissolution, and of cinders or other materials, which will corrode piping or other metal.

The intention is to use select fill below plinth, floors, roads, parking areas etc.

b) Ordinary fill shall have the following properties:

- Natural inorganic soils: salt content not greater than 5%, organic matter less than 3%. For other properties see under 'Select fill'.
- The intention is to use ordinary fill for non-built areas.

c) Special fill:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[12]	25.09.2014

- Special fill material shall be gravel or crushed rock (for other properties see under 'Select fill'). The intention is to use special fill e.g. as sub-base material for tanks.

4.3 Excavation

The works shall be excavated either by hand or by use of excavating plant and tools acceptable to the Owner/Consultant.

Last 300 mm shall be excavated by hand tools only to ensure that natural conditions of soil at foundation level should not be disturbed. In case if over excavation has been done, the depth of soil over excavated shall be filled with M10 Grade concrete and no earth filling shall be allowed to fill over excavated earth.

Also excavation by hand may be required close to existing installations, existing foundations and/or underground services, but subject to special instruction of the Owner/Consultant.

The Bidder shall carry out all kind of earth and rockwork for the following particular works as defined hereafter (where applicable):-

- i) Clearing and grubbing
- ii) Excavation of topsoil
- iii) Open cut excavation
- iv) Backfilling
- v) Safety precaution during earthwork
- vi) Mining or underground excavation (if required)
- vii) Grading
- viii) Replacement of material
- ix) Trench excavation for service lines
- x) Embankments
- xi) Archaeological findings

4.4 Safety Precautions

The Bidder shall be responsible for all necessary safety measures.

Proper strutting, sheeting and bracing, including re-arrangement of the installations when necessary, stabilization and protection of slopes, methods of excavation to reduce risks of slides etc shall be to the Bidder's debit. The additional moving of soil resulting from such damages will not be paid for.

4.5 Over Excavation

Bidder shall ensure that no excavation work is carried out beyond the founding level of existing nearby building/equipment. Any damage to adjoining structure/ foundation shall be rectified by the Bidder without any extra cost to Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[13]	25.09.2014

4.6 Stockpiles and Disposal

Excavated material from the works selected by the Owner/Consultant for re-use shall be placed immediately in its final position, if possible, or otherwise may be stockpiled or deposited on site as directed by the Owner/Consultant.

The Bidder shall not have the right either to additional payment or to claim because of work involved in stockpiling materials, re-use of for carting to the waste disposal areas. Soil unfit for re-use shall be removed to sites approved by the Owner and shall not be permanently deposited elsewhere. The Bidder shall trim and form the edges of spoil to profiles and levels as directed by the Owner/Consultant.

Distance of stockpiling of excavated material from the pit edge shall be minimum 1.5 meters or half of the depth of the pit whichever is higher.

The placing of materials within the waste disposal areas shall be made in layers not exceeding 0.50 m in thickness in order to obtain an appreciable degree of compaction by means of transportation equipment and/or if required by appropriate compaction equipment.

All traffic to or from the waste disposal areas shall run over the surface of such areas in order to achieve compaction.

4.7 Preparation of Foundation

All earth surface against which concrete is to be poured, shall be clean and free of any detrimental impurities, organic matter or unsuitable material. Immediately after excavation, all such surfaces shall be moistened and treated as directed by the Owner/Consultant and then protected by means of a lean concrete layer, 7.5 cm or PCC thickness as shown in the design drawings, whichever is greater. No concrete is to be poured until formation is inspected and approved by the Owner/Consultant. No structural concrete shall be poured against earth surface. Shuttering shall be used at sides and PCC shall be provided below foundations.

4.8 Backfilling

Foundations and structures shall be backfilled with approved material compacted in layers not exceeding 150 mm by suitable equipment upto the required designed levels.. Compacting shall be carried out with special care by means of pneumatic or mechanical rollers or other compactors of a type previously approved by the Owner/Consultant.

Density requirements as per standard Proctor Test shall be in accordance with relevant parts of IS: 2720 and all tests shall be made by/on under the supervision of Owner/Consultant at Bidder's own expenses, at optimum moisture content:

- a) Backfilling of foundations and under grade slabs - 98%
- b) Under roadways and parking areas - 98%
- c) Embankment - 95%

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[14]	25.09.2014

The thickness of fill layers, number of passes and type of equipment to be used shall be proposed to the Owner/Consultant after compaction tests have been made.

Surfaces receiving fill layers shall, if smooth, be previously scarified to obtain a good key between the new fill layer and the sub-grade.

Backfilling of foundation work with approved materials shall be carried out only after foundations have been inspected by the Owner/Consultant.

4.9 Soil Replacement

The material to be used for replacement of soil shall not contain soluble or swelling components such as clays, or organic matters. Sand gravel mixtures of favourable grain size distribution shall be used in exchange. The suitability of soil for its use for filling shall be as per provisions of Indian Standards.

Prior to the commencement of work, three samples shall be taken from the anticipated borrow area and tested in respect of IS: 2720 or Proctor density, optimum moisture content, grain size distribution and content of soluble matters.

These three samples shall cover the approximate variation of materials to be expected within the borrow area.

The fill material shall be placed in horizontal layers of not more than 15 cm in compacted thickness. The fill moisture content shall be controlled and adjusted in order to achieve a maximum of compaction. Fresh water shall be used for watering of soils.

The fill material shall be compacted by vibratory roller (min. weight 20T.). However for small compaction works such as small patches etc., comparatively low weight compactors or other compaction methods may be used after taking approval from Owner / Consultant. The minimum required degree of compaction should be as defined under "Tests and Properties". One Proctor and three density tests shall be made at every fourth fill layer prior to continuation of filling work. The testing location will be indicated by the Owner/Consultant. Bidder shall make suitable arrangements for carrying out all the necessary quality tests or he shall co-operate with an experienced soil testing laboratory, subject to the approval of the Owner/Consultant.

Filling work may be continued in case all tests performed show satisfactory results.

4.10 Protection of Existing Utilities and Services

During modification/rehabilitation of existing structures or construction of new structures, the Bidder shall provide all protection for existing utilities and services as may be required by his modification and construction operations. Permanent protection of certain items shall be as included under other sections or as instructed by the Owner/Consultant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[15]	25.09.2014

In addition to the requirements as specified, herein the Bidder shall comply with the following requirements:

- a) Use all necessary precautionary and protective measures required to maintain existing structures, utilities, services and appurtenances that must be kept in operation. In particular, the Bidder shall take adequate measures to prevent undermining of existing structures and utilities/services presently in service.
- b) Protect existing or new utilities and services where required by the Bidder's operations and/or as directed by the Owner/Consultant. The Bidder shall be responsible for bracing and supporting existing structures, utilities and services to prevent settlement, displacement or damage.

4.11 Dust Control

The Bidder shall use all means necessary to control dust on roads, dismantling/demolition and modification areas, construction areas and borrow pits.

Surfaces shall be regularly watered to prevent dust becoming a nuisance for the public and interfering with the proper execution of the works.

4.12 Dewatering during Construction

This division applies to the methods and techniques of ground water control. Prior to the decision for the method and technique to be applied, a comprehensive knowledge of the soil and ground water conditions have to be obtained from the results of the detail soil investigation and/or information given in writing by the Owner/Consultant.

Ground water control for keeping the construction pits dry shall be included in the Bidder's scope of work.

The method and technique shall be based on the IS: 3764.

The scope of supply includes removal of all equipment, plants, pipes, machinery, etc for modification /rehabilitation of existing foundations and re-installation of all equipment, plants, pipes, machinery, etc and its removal after completion including operation & maintenance of the equipment during the construction period.

Where necessary, cofferdams, sheet piles, pump sumps, equipment and channels, troughs, inlet gutters, pipes and any other works required for the water control and discharge shall be part of the scope of supply. The dewatering system shall be designed and installed in such a way that alterations and extensions can be made at any time throughout the operating time, if necessary. Reserve units shall be kept ready for service when failure of any of the installed units occurs.

The Bidder has to consider the possibility of a temporary failure of any pump, diesel engine and/or the electric power service and shall install emergency

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[16]	25.09.2014

power units with sufficient capacity to feed the necessary power to the installed unit at the moment of failure. The Bidder shall submit to the Owner/Consultant, the detailed method of the envisaged pumping system for dewatering, the pump capacity and the standby reserve units. The Bidder shall adjust the system if required by the Owner/Consultant.

The Bidder must ensure that any dewatering works will not cause any interference to his own work and to those of other Bidders working elsewhere on site. Any damage occurring during the above mentioned period should then be made good by the Bidder at his own expense.

During the foundation works, the excavated areas, foundation levels, and pits are to be kept free of water down to at least *[0.50]* m below the foundation level.

4.13 Equipments

All equipments, instruments, machineries, tools, pipelines, etc required for execution of the water control shall be kept in good working condition throughout the operation period.

4.14 Execution

The Bidder shall keep records of all data of importance occurring during operation of the water control system. The records shall be submitted to the Owner/Consultant for information and checking every working day. For that purpose, the lowering of the water table shall be controlled by piezometers. The numbers and position of them shall be submitted to the Owner/Consultant's approval. The Bidder shall provide and maintain these piezometers at his own expenses during the dewatering works or as long as the Owner/Consultant requires it.

Pump operations shall not be stopped nor pipes, channels and equipment for dewatering and water control removed or altered in any way, except with the express permission of the Owner/Consultant. The Owner/Consultant will stipulate the time of removal. Until then, the pumps and water drainage facilities shall be kept in proper working order without extra payment being granted.

Pump sumps and channels:

Provision of pump sumps and channels of the dimensions required for each particular case shall include all necessary excavation of any kind of soil above and under water, backfill and consolidation, sheeting, bracing, stiffening, sealing, scaffolding accesses, as well as the disposal of water and all auxiliary works.

Routing of channels or pipes for discharge water shall be such as not to impede or obstruct any of the other works and/or operations.

The same shall be applicable for pump sumps. Prior to the determination of any arrangement of pump sumps, the Owner/Consultant's approval shall be obtained.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[17]	25.09.2014

Routing and location of water discharge lines shall be submitted to the relevant authorities and to the Owner/Consultant's approval.

Difficulties during dewatering:

The Bidder shall consider all difficulties and additional work due to the presence of unexpected ground water during subsequent construction work. Where it is possible to keep off or divert such water without special dewatering arrangements or where work can be carried out normally under or in water, such a method may only be applied after approval from Owner/Consultant has been obtained.

Ready for service condition:

The Bidder shall maintain ready for service and regularly clean all dewatering equipment and accessories and shall keep all access clear so that they can safely be used without risk of accident. Any recommendations made by the Owner/Consultant in this matter shall be carried out immediately.

Leakage:

Blockouts and pipe connections through structures and their closure, proper grouting of joints, etc or repairs in the event of leakage shall be the responsibility of the Bidder.

Piezometers:

The ground water lowering effect is to be checked by piezometers in unfavourable positions (e.g. in the middle of the building pit) before starting the excavation. The piezometers are to be installed at unfavourable positions or in more permeable layers (in stratified sub-soil) below the bottom of the excavation. They serve to check whether or not the water pressure (head) has been sufficiently reduced in those layers below the bottom of the excavation, which are more permeable. Security against hydrostatic uplift is to be demonstrated by calculation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[18]	25.09.2014

5 REINFORCED CONCRETE STRUCTURES AND FOUNDATIONS

5.1 General

All structures, building foundations, machines / equipment foundation, water retaining structures, trenches, pits, etc. shall be checked / designed as per latest relevant IS codes in general. Construction in general shall follow provisions of IS: 456 and IS: 3370 for normal and water retaining structures respectively.

5.2 Design Methodology

a) General

All designs of RCC structures shall be carried out by limit state method as per IS: 456 unless use of working stress method is specifically mentioned. Design strength of materials and design loads shall be calculated using appropriate partial safety factors over characteristic strength and characteristic loads as per IS: 456.

IS: 11384 shall be followed for design of steel concrete composite beam.

For reinforcement detailing IS: 5525 and SP: 34 shall be followed.

The walls shall be provided with reinforcement on both faces for sections 150 mm or more, even if not required from design consideration.

b) Foundation and Underground Structures

Type of foundation system, i.e. isolated, strip, raft shall be decided based on the loading arrangement, load intensity and soil strata. Design of foundations at various levels shall be dependent upon the soil bearing capacity at that level.

Foundation system adopted shall ensure that settlement / relative settlement is as per provision of IS: 1904 and other Indian Standards. However, the settlement shall be restricted to a lower value, if necessary as per the system requirement.

All foundation including machine / equipment foundations shall be of RCC construction. All foundations shall be designed in accordance with relevant parts of the latest revisions of Indian standards IS: 2974 and IS: 456. Raft foundations shall be designed as per IS: 2950.

All foundations shall be treated as per the guidelines prescribed in IS 456: 2000 against sulphate/other aggressive chemicals if found present in soil or as per the requirements of detail Geotechnical Investigation Report.

For design of underground structures, subsoil water level shall be assumed at Finished Ground level. All underground pits, tunnels, basements, cable and pipe trenches, etc. shall be designed as leak proof RCC structure, where depth of ground water table so warrants. In case of leakage in the above structures injection grouting method shall be applied to repair the structure according to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[19]	25.09.2014

the requirement of IS: 6494. Effects of uplift and reduction in bearing capacity due to underground water table shall also be considered.

For Subsoil conditions, Average ground water table, Foundation system, Earth Pressure Coefficient, refer to detail geo-technical investigation report of the site.

The soil conditions met during the foundation works especially in the foundation level are to be checked by the Bidder's soil Engineer, recorded and compared with previous known or investigated results. If essential differences occur, which could be detrimental to the structures, the Bidder has to inform the Owner/Consultant and to propose further measures. Foundation works in such areas are to be continued only after approval of such measures by the Owner/Consultant

If there is any doubt about the soil quality or if discrepancies appear with regard to the previous decisions or investigations stated by the Owner/Consultant, then additional measures are to be taken after consulting the Owner/Consultant (e.g. additional excavation and lean concrete fill)

Allowable settlements, elastic plus consolidation, shall be limited as follows: -

- i) Total settlement : 38 mm
- ii) Differential settlement : 6 mm

Foundations for equipment shall be designed to meet the total and differential settlement established by the equipment manufacturer if they are more stringent than the allowable settlements listed above. Foundations for buildings shall be designed to meet the total and differential settlement as required for the building function if they are more stringent than the allowable settlements listed above.

c) Movement and Expansion Joints

Joints are to be arranged in such a way that stresses and strains caused by settlements, temperature, differential settlement, etc do not adversely affect the structures. This primarily applies to differently loaded areas and structures having different foundations or foundations of different depths. The settlement joints shall run through the complete structure down to foundation level, the expansion joints however shall stop on the top level of foundations.

The joint width is to be at least 2 cm is to be planned considering all relevant factors (settlements, tilting, movements, aspects etc.).

Settlements of all relevant structures shall be measured, recorded and shown in diagrams according to IS: 8009 – "Code of Practice for calculation of settlement of foundation".

d) Foundations at Different Depths

Foundations at different levels should be based beyond a load-spread angle of 30° (against the horizontal). Otherwise, the load influence (e.g. earth pressure) of the higher-level structures on the lower ones must be taken into consideration.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[20]	25.09.2014

e) Replacement

If unsuitable soils are encountered below the grade slabs or basement floor, they are to be replaced by suitable layer wise compacted material down to the good bearing soil.

Materials and compaction method as well as quality control are described in clause 'Earth and Rockworks' of this section. Selected fill is to be employed below all grade paving and basement floors.

f) [Liquid Retaining Structures]

RCC water retaining structure like storage tanks shall be leak proof and designed as un-cracked section in accordance with IS: 3370 (Part 1 to IV) by working stress method. However the parts of such structures not coming in contact with liquid may be designed according to IS: 456.

Water channels and substructure of pump houses shall be designed as cracked section with steel stresses as per IS: 3370 (Part 1 to IV) by working stress method and limiting crack width to 0.2 mm.

All water retaining / storage structures shall be designed assuming liquid upto the height of wall irrespective of provision of any over flow arrangement. No pressure relieving devices shall be permitted in underground structures.

In all liquid retaining structures, PVC water bar shall be provided at each construction / expansion joint. The sequence of construction shall also be specified on drawings showing construction joints.

The walls shall be designed for a surcharge load of 2000 Kg/m² or actual whichever is higher.

Liquid Retaining Structure shall be checked for two loading conditions. With water inside up to operating level and no earth fill outside or water in one compartment and no water in the other compartment (where two compartments are provided).

Base slab / raft of all liquid retaining structure shall be designed to withstand the uplift pressure.]

g) Modification of the existing foundation (as required) for the new equipment supplied

The new equipment shall be supported on an RCC deck which in turn shall be supported over steel helical springs and viscous dampers. The steel helical springs and viscous dampers shall be supported over structural steel beams which in turn shall rest over columns. The columns shall be supported over foundation. The modification of existing foundation may involve partial to full dismantling and reconstruction of new foundation as per design & constraints of space.

Precautions shall be taken not to disturb the basic building structure & other foundation and it shall be ensured that no excavation work is carried out beyond the founding level of existing nearby building/equipment. Any damage to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[21]	25.09.2014

adjoining structure/ foundation shall be rectified by the Bidder without any extra cost to Owner.

The contractor shall be responsible for maintaining all safety norms including the stability of existing structures. Any propping, shoring and under pinning required to this effect shall be put in place before the dismantling work is undertaken.

Wherever any existing concrete member is required to be partially dismantled, a coat of epoxy paint shall be applied to the exposed reinforcement and the cut surface of concrete shall be built up by providing 40 mm thick concrete with wire mesh.

h) Machine Foundations

General

Design of equipment foundation for block type machine foundation (if any) shall be done for the actual equipment loading data. The foundation arrangement shall be decided keeping in mind the existing structural arrangement and space limitation.

The design of machine / equipment foundation shall be as per IS: 456 and IS: 2974. The provisions of DIN 4024 shall also be followed for machine foundations. All machine / equipment foundations and structures subject to vibrations shall be suitably proportioned so that amplitude and frequency of the foundation / structures are within permissible limits.

Dynamic analysis shall be carried out to calculate natural frequencies in all modes including coupled modes and to calculate vibration amplitudes. Frequency and amplitude criteria as laid down by the relevant codes or machine manufacturers shall be satisfied. Minimum reinforcement shall be governed by IS: 2974 and IS: 456.

For the foundations supporting minor equipment weighing less than one ton or if the mass of the rotating parts is less than one hundredth of the mass of the foundation, no dynamic analysis is necessary. However, if such minor equipment is to be supported on building structures, floors, etc. suitable vibration isolation shall be provided by means of springs, neoprene pads, etc. and such vibration isolation system shall be designed suitably. All such foundation shall be separated from adjoining part of building and other foundations. Joints at floor/ slab shall be suitably sealed. All appendages to such foundations shall be reinforced suitable to ensure integral action.

The extent of foundation shall be based on the general arrangement of the equipment and the design requirement. However minimum width of any foundation shall not be less than one meter. Water table has to be considered at finished ground level for design of all foundations.

Suitable arrangement shall be made for prevention of transmission of vibration from the proposed foundation to the nearby structure/ foundation/ paving slab.

All design calculations and drawings shall be submitted to Owner for approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[22]	25.09.2014

In case any modification to any existing nearby structural steel bracing/support system/ concrete work is required, the contractor shall check the adequacy of the design of the existing structures for the new loads. Suitable modification to the existing structure as required shall be carried out by the contractor.

Loose pockets if any found below the foundation shall be removed and filled up with PCC of grade M10.

Loads

All static and dynamic forces / loads which equipment supplier considers applicable shall be considered for analysis and design of machine foundations.

Foundation Sizing

The outline plan dimensions of foundations as given by the machine supplier will be adopted. The height of foundation will be selected after taking into consideration soil strata and operating level of the machine. The eccentricity of common CG of machine and foundation with respect to the centroid of base area should not exceed 5 % of the corresponding base dimensions of foundation. Partial contact between the foundation and soil strata shall be considered wherever applicable. The footing will be checked for minimum contact area of 80 % and maximum bearing pressure will be calculated for the actual contact area only.

Analysis and Design

The minimum grade of reinforced cement concrete shall be M25, unless specified otherwise.

The analysis and design of machine foundations will be carried out to ensure the following:

- Compliance with the manufacturer's requirements and relevant standards
- No resonance phenomenon of a disturbing nature to machine operation should exist at the normal running speed
- Calculations to be performed for dynamic as well as static cases for reinforced concrete block type pedestal
- Soil bearing capacities
- Deep foundation capacities
- Lateral earth pressures
- Allowable settlements
- Structure, equipment and environmental loadings
- Equipment performance criteria
- Access and maintenance requirements
- Temporary construction loadings

The foundation will be designed for the most critical combinations of forces and moments, resulting from all possible combinations of the various loading from the equipment system. The foundation sections will be sized and reinforced adequately for bending moments and shear stresses and uplift.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[23]	25.09.2014

The foundation shall be checked for overturning, sliding and uplift as per relevant IS Codes. The foundation will be checked for overturning with minimum and maximum vertical loads.

For analysis of machine foundation following data will be furnished by the equipment manufacturer:

- Loading diagram showing static and dynamic loads and points of application of loads
- Operating speed of machine
- Weight of rotating parts, maximum eccentricity of rotating mass from the geometric axis of rotation
- Location of C.G. of machines in all three axis
- Mass moment of inertia
- Allowable amplitude / velocity of vibration at machine bearing points
- Temperatures at various areas during operation

While designing following aspects shall also be taken care of:

- All dynamic foundations shall be isolated from building foundations. The isolation gap shall be of minimum 25 mm.
- Natural frequencies of structures and components shall be away from running speed of equipment by at least 20 % generally but for important ones it shall be away by at least 30 %.
- For design of foundation of large fans etc., provision shall be kept in the foundation for addition of mass / area for retaining of the foundations if required at a later date
- However following minimum factor of safety shall be followed:
- Factor of safety against overturning due to wind, seismic or other lateral loads shall be 1.5
- Factor of safety against sliding shall be 1.5
- Factor of safety against uplift due to hydrostatic forces shall be 1.2 and due to any other loads shall be 1.5. Uplift check shall be carried out during construction stage also.

Specific requirements for machine foundations

- Crusher Foundation

The crusher shall be supported on M30 grade RCC deck slab mounted on vibration isolation system comprising springs and viscous dampers, which in turn will be supported on RCC beams. The vibration isolation shall be done by providing inertia block with anti vibration pads. These pads shall be suitably procured with respect to crusher manufacturer's specifications.

Alternatively crushers shall be mounted independently on ground-supported RCC frame structure. The crusher foundation shall be made isolated from building & this should suit to process requirements. Crusher foundations shall be kept isolated by providing 75 to 100 mm gap all around at crusher floor level as per process requirements.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[24]	25.09.2014

Detailed dynamic analysis shall be done for top deck of coal crusher together with springs & dampers and natural frequencies & amplitudes of vibration shall be determined. A mathematical model of top deck shall be formulated with three dimensional beams, plate, and finite elements for the purpose of analysis with the spring idealized with vertical and horizontal stiffness. The mass of the machine together with that of the top deck shall be considered for the analysis. Natural frequencies up to at least 10% above the operating speed shall be determined and three frequencies shall be checked against the design criteria. Forced response dynamic analysis shall be carried out for the unbalance forces generated during operating condition using a sinusoidal forcing function. Unbalanced forces as given by the manufacturer shall be used for this purpose.

Ultrasonic pulse velocity (UPV) test shall be carried out for crusher foundation to ascertain the homogeneity and integrity of concrete. Testing shall be done as per IS: 1331 (Part-1). The defects shall be rectified by using cement / epoxy grout etc.

- **Miscellaneous Machine Foundation**

For miscellaneous machines, most suitable type of foundation shall be provided. Foundation for pumps, and minor rotating equipment etc., are usually in the form of solid block foundations, resting on the ground or on a floor of the building. At such machine supports, floor may be thickened and extra reinforcement may be provided. Also the machines, which are almost vibration free, light to moderately heavy, may be supported in the above manner. Rubber or neoprene pads under some of these machines to reduce transmission of vibrations to the supporting floor will be provided if required.

All block foundations resting on soil shall be designed using the elastic half space theory. The mass of the RCC block shall not be less than three times mass of the machine. Dynamic analysis shall be carried out to calculate natural frequencies in all modes including coupled modes and to calculate vibration amplitudes. Frequency and amplitude criteria as laid down by the relevant codes or machine manufacturers shall be satisfied. Minimum reinforcement shall be governed by IS: 2974 and IS: 456. Suitable vibration isolation shall be provided by means of springs, neoprene pads, etc. and such vibration isolation system shall be designed suitably. All such foundation shall be separated from adjoining foundations.

Temperature Control of Concrete

The temperature of fresh concrete shall not exceed 25°C when placed. For maintaining the temperature of 25°C in the top decks of machine foundations, crushed ice shall be used in mixing water.

Non-Shrink Grout for Equipment Foundations

Special non-shrinking grout of approved make shall be provided in strict accordance with the manufacturer's instructions / specifications. Ready mix

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[25]	25.09.2014

non-shrink grout of GP2 brand or equivalent, of approved make shall be used for base grouting of major rotating equipments.

i) Increase in Stresses

Where stresses due to wind (or seismic) and temperature are combined with those due to other loads, the allowable stresses in concrete and reinforcement steel shall be increased by 33.33% in case of working stress design.

Bearing capacity of the soil shall be allowed to be increased by 25 % under seismic/ wind load condition.

j) Elevated Foundations

Design of all equipment foundations shall be done for the actual equipment loading data. The foundation arrangement shall be decided keeping in view the existing structural arrangement and space limitation. Adequacy of the design of the existing structures, for the new loads shall be, checked by the contractor. Suitable modification as required shall be carried out by the Contractor and complete design for the same shall be furnished to owner for approval. Where ever new columns/foundation is required the same shall be designed and constructed by the contractor as per relevant Indian Standard Code.

For the foundations of the all equipments details static and dynamic analysis shall be done. The static analysis shall include all operating condition, load cases and abnormal loads like short circuit, loss of blades & unbalance and seismic forces as per IS:1893. The dynamic analysis shall consist of free vibration analysis and forced vibration analysis. Design of RCC foundations/as well as structures, checking of design of existing structure shall be carried out by working stress method. A fatigue factor of 2.0 shall be considered for dynamic forces.

The foundation general arrangement shall be such that the spring units are placed over the structural steel beams. The isolation efficiency for steel helical springs and viscous dampers shall be at least 90%. The vibration amplitudes at the bearing locations shall not exceed the limits as per VDI 2060 or limits specified by the machine supplier whichever is more stringent. The ratio of actual spring supported weight to the nominal spring capacity shall not exceed 0.80. At least 3% to 5% of critical damping shall be provided in the form of viscous dampers.

The grade of concrete for the top deck shall be M35.

k) Steel Helical Springs and Viscous Dampers

The supporting structural beam and columns shall be designed for the loads transferred through springs and all other loads such as piping loads, seismic loads as per IS:1893. The stiffness of the beams supporting the springs shall be at least 10 times the stiffness of the springs supported over it along both vertical and horizontal direction.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[26]	25.09.2014

The scope of work shall be deemed to include all activities which may not have been explicitly mentioned but are reasonably implied for the successful completion of the work for which these specifications are intended.

Scope of work of the bidder shall include manufacturing, testing, supply, transport to site, pre-stressing, erection, supervision of erection, release of pre-stress, alignment, commissioning etc of Steel helical springs and viscous dampers:

- Steel helical spring units and viscous dampers along with viscous liquid including associated auxiliaries for installation of the spring units and dampers like steel shims, adhesive pads, etc.
- Frames for pre-stressing of spring elements.
- Suitable hydraulic jack system including electric pumps, high- pressure tubes etc. required for the installation, alignment etc, of the spring units. One set of extra hydraulic jacks, and hand operated pumps shall also be provided.
- Any other items which may be required for the complete installation and satisfactory commissioning of the spring system.

Supervision of complete erection and commissioning of the steel helical springs and viscous dampers including pre-stressing of elements, placing of elements in position, checking clearances on the shuttering of the RCC top deck, releasing of pre-stress in spring elements and making final adjustments and alignments after machine installation etc.

The steel helical springs and viscous dampers supplied should be of proven make. The bidder or his sub-contractor should have designed spring supported machine foundations, manufactured, supplied and installed steel helical springs and viscous dampers (conforming to DIN 2096 & DIN2089) and viscous dampers (providing damping resistance in all three planes) for not less than 2 (two) machine foundations of heavy rotating machine systems.

The damper units or spring-cum-damper units should be of viscous type offering velocity proportional damping. The damper units should be suitable for temperatures ranging from 0 to 50°C. The damping resistance of individual damper units should be such that the designed damping can be provided using reasonable number of units.

All design calculations and drawings shall be submitted to Owner for approval.

5.3 Stability of Structures

Design shall be checked against buoyancy due to the ground water during construction and maintenance stages for structures like underground storage tanks, pits, trenches, basements, etc. Minimum factor of safety of 1.2 against buoyancy shall be ensured considering empty condition inside and ignoring the superimposed loading. For the purpose of calculating downward load due to any

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[27]	25.09.2014

overburden, only the mass located vertically above the projected area of the base slab shall be taken in to consideration.

All building sub-structures including pump houses shall be checked for sliding and overturning stability during both construction and operating conditions for various combination of loads. Factor of safety for these cases shall be taken as mentioned in IS: 456 and other latest relevant IS codes. However following minimum factor of safety shall be followed:

- Factor of safety against overturning due to wind, seismic or other lateral load shall be 1.5 minimum
- Factor of safety against sliding shall be 1.5 minimum
- Factor of safety against uplift due to hydrostatic forces shall be 1.2 and due to any other loads shall be 1.5

Stability of the structure shall also be investigated for loading conditions during construction, repair or other temporary measures. Lower factor of safety may be used for such loading conditions as per relevant IS codes.

In cases where dead load provides the restoring force, only 0.90 times characteristic dead load shall be considered. Imposed loads shall not be considered as restoring force.

5.4 Minimum Thickness of Concrete Structural Elements

The following minimum thickness shall be followed:

Table 2.5
Minimum Thickness of Concrete

S.No	Description	Thickness, mm
a)	Suspended floor / slab / walkways /canopy slabs, etc.	125
b)	Ground floor slab (non-suspended)	150
c)	Water Retaining slabs / walls	200
d)	Cable/pipe trenches/underground pits/Laundry walls and base slab	125
e)	All footings (including raft foundations)	300
f)	Parapets	125
g)	Sunshades	75 at edge

i)	Precast trench cover slabs / floor slabs / louvers	75
j)	Paving	100
k)	Basement walls and base slab	200
l)	Bin walls	150
m)	Underground tank: Below ground water table	200

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[28]	25.09.2014

S.No	Description	Thickness, mm
	Above ground water table	150

From fire resistance point of view minimum cover to reinforced concrete members shall be as per Table 16A of IS: 456.

5.5 Minimum Heights for Pedestal of Steel Columns

Pedestals to Steel Columns for building structures:

Top of RCC foundations (pedestals) shall normally be kept at a minimum *[250 mm]* above finished floor level (FFL) unless specified otherwise. Foundation levels for columns shall be decided to accommodate underground services, pits, trenches, etc.

Stair and ladder pedestal shall be kept *[200 mm]* above the finished floor level.

Pedestals to Steel Columns for Equipment structures:

a) Equipment in open area : as required *[(300 mm min)]*

b) Equipment in covered area : as required *[(150 mm min)]*

c) Structures and equipment

Supplied by vendor : as per vendor's data subject to minimum as specified above.

5.6 Minimum heights for encasement of steel columns

In case the top of pedestal is kept at a lower level so that the column base plate together with gussets and stiffeners remain below finished floor level (FFL) the column bases as well as the column sections shall be encased in concrete above FFL as per following:

a) Open area : *[300 mm]* above paved level

b) Covered area : *[150 mm]* above FFL

5.7 Concrete Works

i) General Description, Proportions and Mixing

Mix Design

At the commencement of the contract the Bidder shall make preliminary tests to determine the proportions by weight of cement, fine aggregates, coarse aggregates and water necessary to produce required grades of concrete. The mix proportions shall be selected to ensure that workability of the fresh concrete is suitable for the conditions of handling and placing and when concrete hardens, it shall have the required strength, durability and surface finish. The Bidder shall get approval of Owner/Consultant to such proportions before he starts concreting. However, such approval shall not relieve the Bidder of his

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[29]	25.09.2014

responsibility to produce concrete having compressive strengths as laid down in the foregoing Table.

No departure from the approved proportions will be permitted during the works unless and until the Owner/Consultant gives written authorisation for any change in proportion. The Owner/Consultant shall have authority at any time to check whether the mixing of concrete is being carried out according to the approved proportions.

For the all major and important R.C. works and for all special works, the design of mixes shall be made by the Bidder at his own cost, for each grade of concrete as well as for various workability. The design of mixes shall be made according to I.S. 10262 or any other approved standard methods.

The concrete made by designing the mix is termed hereinafter as "Design Mix Concrete".

The cement content for various grades of concrete shall be based on design mix. However, irrespective of requirement of cement found out from design mix, cement content of concrete shall not be reduced below the quantities specified as under.

Grade of concrete	Minimum cement content per Cu.m finished concrete
M-15	290 kg
M-20	320 kg
M-25	380 kg
M-30	not less than 400 kg
M-35	not less than 400 kg

Water Cement Ratio

Where a particular water cement ratio is stipulated in the design or drawing along with the characteristic grade of concrete the design of mix shall be carried out by adjusting the other variable factors to obtain the characteristic strength of concrete with stipulated water cement ratio.

In the structures where the impermeability and shrinkage of concrete have an important bearing on the durability and serviceability of the structures, such as water retaining structures, basements, underground premises, tunnels, pump houses, pre-stressed structure, thin precast members etc. the water cement ratio shall be kept low and preferably not exceeding 0.45.

The water cement ratio, as achieved in the Mix Design, or as specified in the drawings shall be adhered to strictly and shall not be varied without the permission of the Owner/Consultant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[30]	25.09.2014

Workability

The workability of fresh concrete shall be such that the concrete is just suitable for the conditions of handling & placing so that after compaction it becomes completely consistent and homogeneously surrounds all the reinforcement and completely fills the formwork.

The workability of fresh concrete at the place of batching/mixing shall be measured by compacting factor test and at the place of disposition by means of slump test. During the finalisation of Trial Mixes, the relationship between compacting factor and slump test shall be established for each grade of concrete as well as for various levels of workability. The workability tests shall be carried out in accordance with IS: 1199.

Normally, in the condition of low water cement ratio as well as for medium/high workability, the workability shall be achieved by increasing the cement content, in consistent with added water.

In cases where the cement content is to be limited to reduce the heat of hydration, and the water/cement ratio is also to be kept low to reduce the permeability or due to other requirements the desired workability may be achieved with use of limited doses of plasticiser or air entraining agent. In such cases the method of mixing and dosage of the plasticiser/air entraining agent shall be according to the manufacturer's specification and with the approval of the Owner/Consultant.

The usual limits of consistency for various types of structures are given below:

Limits of consistency

Degree of Workability	Slump in mm with Standard - Cone		Use for which concrete is suitable as per IS : 1199
	Minimum	Maximum	
Very low	0.0	25.0	Large mass concrete structure with heavy compaction equipment, roads and the like.
Low	25.0	50.0	Uncongested wide and shallow R.C.C structures
Medium	25.0	75.0	Deep but wide R.C.C structures with congestion of reinforcement and inserts
High	75.0	125.0	Very narrow and deep R.C.C structures with congestion due to reinforcement and Inserts

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[31]	25.09.2014

Durability

The durability of concrete, depending on the exposure condition, is to be taken into account while designing the mix. For given aggregates, the cement content should be sufficient to make sufficiently low water cement ratio and Appendix A of IS: 456 shall be taken as guideline for durability considerations.

Minimum fire rating of 2 hours shall be considered where fire hazard is expected and accordingly minimum cover shall be taken as per Table 16 A of IS: 456. For structures below ground level which are exposed to sulphate attack, requirement of cement shall be as per Table 5 of IS: 456. Intermixing of different grades of concrete in the same structure shall not be allowed in a particular element.

Mix design concrete shall be used for all areas other than plain concrete work used for lean concrete, screeds and backfill.

The following minimum grades of concrete as per IS: 456 shall generally be used for the type of structures noted against each grade.

Table 2.6
Grades of Concrete

Concrete mix/Grade	Type of structure
1:5:10	Fill concrete
1:4:8	Blinding layer below foundations, trenches and underground structures, foundation below brick wall, etc. Minimum thickness of layer shall be 75 mm
M15	Plinth protection work around buildings
M25	Base plate encasement, encasement of structural steel work, all RCC paving work, ground floor slabs, cable and pipe trenches, precast concrete work etc.
M30	All RCC structures and equipment foundations, super structure, grade beams, columns, roof slabs and all underground RCC structures, cable and pipe rack foundation, pedestals etc.

Inter mixing of different grade of concrete in the same structure shall not be allowed normally.

ii) Trial Mixes

- Before concreting commences, the Bidder shall, at his own expense, make trial mixes to determine the mix proportions required to produce the strengths specified for each class of concrete and for each degree of workability required to allow placing, transporting and compacting of the concrete with the equipment he proposes to use in any particular situation. Only materials which the Bidder intends to use for concreting (including all admixtures) shall be used in the trial mixes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[32]	25.09.2014

- Test cubes from trial mixes shall be made and tested in accordance with IS: 516.
- As per IS: 456 and IS: 516, three separate batches of concrete should be made, workability of each batch determined and three test cubes shall be made from each batch for each age (e.g. for 7 and 28 days) at which tests are required. The strength shall conform to target mean strength as per IS: 456 – Requirements for design mixes.
- The appropriate strength requirements may be considered to be satisfied if none of the strengths of the cubes is below the required characteristic strength and if the average strength of the nine cubes is not less than recommended by IS: 456 and IS: 516, trial mixes.

iii) Quality and Testing

Not more than 5% of the test results may fall below the 28 days specified strength. Making and curing of test specimens shall be in accordance with relevant IS: 456, IS: 516 and IS: 1199.

All mixes can only be placed following approval by the Owner/Consultant. The mean strength shall exceed the characteristic strength by a margin of 1.65 times the standards deviation expected from the batching plant. However, no standard deviation less than 3.5 N/mm² shall be used as a basis for designing a mix.

iv) Trial Mixes and Field Tests

Sufficient laboratory trial mixes shall be prepared to show that concrete complies fully with the specified performance criteria. The following tests are to be included:

- Air content < 1%
- Slump: Piles 170 + 25 mm, regular work 80 + 20 mm as per IS: 1199
- Fresh and hardened concrete densities
- Field trial mixes shall be carried out under full-scale site conditions as per IS: 4925 (for structural concrete only).
- Where directed by the Owner/Consultant, concrete incorporating reinforcement details shall be cored to assess stratification of mixes. Cores of 150 x 200 mm (diameter and length) shall be used.
- Each trial mix shall have 9 x (150 x 150 x 150 mm) cubes taken to measure 24 hours/7 days and 28 day compressive strengths. These trials shall be run for three consecutive days (for structural concrete only).
- At least 3 x sets of field trials shall be tested according to the provisions laid down in laboratory testing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[33]	25.09.2014

- The average 28 day characteristic strength for trial mixes shall be as per IS: 456.. Failure to comply shall result in the mix having to be re-designed.
- All test results shall have to be complied before approval can be given.

v) Consistency of Concrete

The amount of water used in the concrete shall be adjusted as required to ensure such a consistency that it can be readily transported, placed and compacted without segregation of the materials or bleeding of free water at the surface. Addition of water to compensate for stiffening of the concrete before placing shall not be permitted. Consistency of the concrete shall be checked by slump tests measured in accordance with IS: 1199 and shall not exceed the values given in clause 7.1 of IS: 456-2000.

vi) Mixing of Concrete

- The cement and aggregate shall be thoroughly mixed in a batch-type pull mill mixer. The capacity of the mixer shall not be less than 1 (one) cubic meter and the total capacity of the batching mixing plant shall be such to accommodate the various concrete quantities to be cast in a continuous way and shall comply with the requirements of IS: 456, IS: 1791 and IS: 12119.
- The water shall not be added until all the aggregate and cement are in the drum. Mixing shall continue until the concrete is uniform in colour and for not less than 2 (two) minutes after all the materials and water are in the drum.
- Partly set or excessively wet concrete shall not be used. No concrete shall be mixed by hand.

Bidder shall make suitable arrangements for carrying out all the necessary quality tests and ensure that testing work shall be carried out in compliance with the standards.

5.8 Strength of Concrete

i) Testing of fresh concrete by means of test cubes

- a) All test cubes shall be made and tested for compressive strength in accordance with IS: 456, IS: 516 and IS: 1199.
- b) The minimum required strength for different classes of concrete shall be as shown in clause "General description and proportions and mixing" here above.
- c) The grade of concrete required will depend partly on the particular use and the characteristic strength needed to provide the structure with adequate ultimate strength and partly on the exposure conditions and the cover provided to any reinforcement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[34]	25.09.2014

- d) A minimum of four test samples (of six test cubes each) shall be taken on each concreting day (from the same mix) and for at least each 40 m³ of concrete mixed. At least one sample shall be taken for each shift.
- e) For columns, beams and cantilevers seven (7) cubes for every 15 m³ of concrete poured shall be taken. The concrete for test samples shall be taken directly from the concrete mixer and shall be handled (vibrated etc) under similar conditions to those prevailing during the construction. The moulds for the test cubes shall be made of steel. Tests shall be carried out in an approved laboratory.
- f) The strength level of each type and each strength concrete will be evaluated separately and the concrete strength will be considered satisfactory if:
 - Compressive strength: The concrete shall be deemed to comply with the strength requirements when both the following conditions are met:-
 - The mean strength determined from any group of four consecutive test results complies with the appropriate limits in column 2 of table 11 of IS: 456.
 - Any individual test result complies with the appropriate limits in column 3 of table 11 of IS: 456.
 - Flexural strength: When both the following conditions are met, the concrete complies with the specified flexural strength:-
 - The mean strength determined from any group of four consecutive test results exceeds the specified characteristic strength by at least 0.3 N/mm².
 - The strength determined from any test result is not less than the specified characteristic strength less 0.3 N/mm².
- g) If the results are less than those specified, the Owner must suspend all concreting work and order further tests. Any concrete found not to comply with the specification shall be broken out and replaced to the satisfaction of the owner.
- h) The Bidder shall pay all costs incurred in making, curing, delivering and testing of concrete cubes.

ii) Testing of concrete in structures

- a) The types of tests described hereinafter are applicable to the finished parts of the structures. They may be used in routine inspection and for quality control.
- b) Type of tests:
 - Cutting cores: The procedure used shall comply with the requirements of IS: 516 or an approved equivalent standard.
 - Gamma radiography: The testing shall be carried out in accordance with the requirement of IS: 13311, part 1 or equivalent.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[35]	25.09.2014

- Ultrasonic test: Such tests may be used to obtain approximate indications of the strength of the concrete in the structures (IS: 13311, part 1).
 - Electromagnetic cover measuring devices: Such tests may be used to verify the position of the reinforcement and shall be in accordance with the requirements of design (IS: 13311, part 1).
 - Rebound hammer test: Such tests may be used to obtain approximate indications of the strength of the concrete (Ref. IS: 13311, part 2).
 - Load tests of structures or parts of structures: If the results of the above mentioned check tests show that the quality of the materials is inadequate or if other defects are revealed, the owner may require a loading test to be made.
- c) For the purpose of testing floors, roofs and similar structures and their supports, the test load shall be equivalent to the sum of the characteristic dead load and one-and-a quarter times (1.25 times) the characteristic imposed load for a period of 24 hours which the works or part thereof to be tested have been designed.
- d) Wherever certain procedures for testing of parts in structures are required by standards or codes of practice, these are to be followed. All tests must be conducted in the presence of the Owner/Consultant.
- e) If within 24 hours of removal of the imposed load, the structure does not recover at least 75% of the deflection under superimposed load, the test may be repeated after a lapse of 72 hours. If the recovery is less than 80%, the structure shall be deemed to be unacceptable.
- f) If the result of the test is not satisfactory, the Owner/Consultant shall instruct that the part of the works concerned be taken down or cut and reconstructed to comply with this specification. The Bidder shall at his own cost take down or cut out and reconstruct the defective work.
- g) The Owner/Consultant may require other tests to be made. Number of samples, tests and types will be as per Owner requirements.
- h) All the costs for the above mentioned tests shall be borne by the Bidder.

5.9 Materials

a) Storage of materials

All materials shall be stored and handled in a manner that will prevent contamination and/or deterioration. Storage of materials shall conform to IS-4082 "Recommendation on stacking and storage of construction materials and components at site". Deteriorated and/or contaminated material shall not be used for the concrete and shall be removed from the site at the expense of the Bidder.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[36]	25.09.2014

b) Cement

OPC/PPC Cement of reputed make conforming to relevant codes, shall be used for all Concreting works and the certificate of manufacturer shall be furnished with each batch. Cement used shall be ordinary Portland cement unless the chemical nature of the soil warrants special cement for structures below ground level.

Sampling and Testing of Cement

- All deliveries of cement to the concrete supplier shall be accompanied by a certified mill test report and shall include all of the physical and chemical properties as required by relevant IS: 8112 for grade 43 and IS-12330 for sulphate resistant cement.
- The manufacturer's test certificate will normally be accepted as proof of compliance with the specification, but the Owner may order further tests of a character specified in the appropriate Indian standards. The confirmatory tests are to be conducted by a recognized quality control organization. The Bidder shall bear all expenses required for the preparation, dispatch, and tests of the samples. In case the results of such tests show any sample to be inferior to specifications, the whole consignment from which the sample was taken shall not be used and shall be immediately removed from the site.

Delivery and Storage of Cement

- The following information shall be provided for all cement shipments (either whole or part) which are intended for delivery to site: date of manufacture, date of original loading, destinations en-route, date of unloading, intended date of delivery to site.
- The Bidder shall obtain and provide to the owner the manufacturer's average test certificate for each consignment of cement to the works.
- The certificates shall be provided before the consignments are required for use and shall show the chemical composition and physical properties determined in accordance with the relevant standard.
- Samples shall be taken from each consignment of cement and tested as directed by the owner in an approved independent laboratory.
- Consignments shall be used in the order in which they were delivered.
- Bagged cement shall be stored in a weatherproof building having dense impervious bituminous or concrete floors which shall be kept swept clean at all times. The storage arrangements shall be fully completed and approved by the owner before any cement is delivered to site.
- Each consignment of cement shall be separately stored for ease of access, identification, inspection and sampling. Sufficient stocks shall be maintained on site to ensure the proper progress of the works and the stock holdings shall be to the approval of the owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[37]	25.09.2014

- No cement from any consignment shall be used in permanent works without the approval of the owner.
- Cement which contains air-set or hardened lumps, re-powdered air-set material, foreign matter or which has been contaminated or is otherwise unsatisfactory in the opinion of the Owner/Consultant will be rejected and shall be removed from site without delay.
- The Bidder shall be responsible for satisfying himself that the performance characteristics of cement are not such as to necessitate excessive cement content or be likely to cause or accentuate any undesirable properties in the fresh or hardened concrete notwithstanding apparent compliance with this specification.

c) Reinforcing steel

General

Reinforcing steel used in reinforced concrete shall comply with the following standards:-

Deformed bars shall be of grade Fe500 and conform to IS: 1786.

Mild steel shall conform to IS: 432.

Mesh reinforcement shall conform to IS: 1566.

Binding wire

Binding wire for general use shall be annealed wire 16/18/20 BWG conforming to IS 280. The number of strands shall be as per IS specification.

Reinforcement supports

- Reinforcement supports shall include all spacers, chairs, ties, slab bolster, clips, chair bars, and other devices for properly assembling, placing, spacing; supporting, and fastening the reinforcement.
- Spacers shall be cast from concrete of the same quality as that in which they will be embedded.
- Concrete block spacers shall be cast in metal moulds with an approved means of separating blocks and of ensuring that the blocks are of the proper size.
- Binding wire shall be incorporated into the blocks to enable them to be securely attached to vertical or horizontal bars and the Bidder shall demonstrate both that the blocks are of the requisite strength and that the means of attachment to the reinforcement are adequate.

Certificates

Each consignment of steel reinforcement shall be accompanied by a test certificate from the manufacturer showing that the steel has been tested and analyzed and the date of such tests and analyses and that such tests and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[38]	25.09.2014

analyses comply in all respects with the standards. The following tests shall be carried out on reinforcement:-

- Cast analysis
- Carbon equivalent value
- Tensile strength, yield stress, elongation
- Bend test
- Bond classification
- Chemical analysis

Stock of reinforcing steel

In order to ensure due progress of the works, the Bidder shall at all times maintain on the site a stock of reinforcing steel sufficient for the following month's work. No reinforcing steel shall be used upon the works until it has been accepted as satisfactory by the Owner/Consultant.

Rejection

The owner at his discretion may order random testing of the reinforcement steel and in the event of any failed test reject the entire lot notwithstanding the manufacturer's or coating applicator's certificates.

The Bidder shall remove all rejected reinforcing steel from the site without delay at his own expense.

Storage

All bars for reinforcement and steel fabric reinforcement shall be stored on the site under cover on timber or concrete supports suitably spaced and of sufficient height to keep the steel not less than 150 mm clear of the ground.

Bar-bending Schedules

The Bidder shall prepare bar bending schedules based on the detailed reinforcement drawings. These shall be presented to the Owner/Consultant for review. The Bidder is fully responsible for their completeness and correctness in every way nor shall any claim for extra cost or time be allowed on the grounds of errors or discrepancies which may arise between drawings and schedules.

d) Water

Water used for mixing and curing shall be clean and free from injurious amounts of oils, acids, alkalis, salts, sugar, organic materials or other substances that may be deleterious to concrete or steel. pH value of water shall not be less than 6.

Only potable water shall be used. Tests and quality of water shall be in accordance with IS: 456 or equivalent.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[39]	25.09.2014

e) Aggregates

General

The aggregates for concrete shall be crushed natural rock subject to Owner's approval.

The aggregate to be used in the work shall be supplied from an established pit or quarry.

The concrete supplier shall obtain from the aggregate producer, or otherwise provide current test, examination, and inspection reports performed and certified by an approved laboratory for submittal to the Owner/Consultant.

As a minimum, this information shall include the following items:-

- **Item 1**

A comprehensive description, with current photographs of the pit or quarry, including but not limited to, identification by name and location, type of deposit, age, potential reserves, primary products by size including average gradation based on previous six (6) months production and the range for each sieve size; mining methods, process equipment, quality control organization and laboratory; the primary and alternate means of product transportation; listing of primary and secondary users of the product.

- **Item 2**

Petrographic examination in accordance with IS: 2386 (Part-8) and ASTM C-295 performed by a qualified concrete aggregate petrographer. This report shall be based on material produced and examined within the previous six (6) months and must be representative of the current production.

- **Item 3**

Coarse aggregate shall be sampled from current production in accordance with IS: 2386 (Part 1 to 8). Three [20 mm, 10 mm & 5 mm] nominal maximum size (NMS) aggregates shall be sampled and tested as follows:

IS 2386(Part 1): Methods of test for aggregates for cement: Part 1
Particle size and shape (Amendments 3)

IS 2386(Part 2): Methods of test for aggregates for concrete: Part 2
Estimation of deleterious materials and organic impurities (Amendment 1)

IS 2386(Part 3): Methods of test for aggregates for concrete: Part 3
Specific gravity, density, voids, absorption and bulking

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[40]	25.09.2014

- IS 2386(Part 4): Methods of test for aggregates for concrete: Part 4 Mechanical properties (Amendments 3)
- IS 2386(Part 5): Methods of test for aggregates for concrete: Part 5 Soundness
- IS 2386(Part 6): Methods of test for aggregates for concrete: Part 6 Measuring mortar making properties of fine aggregates (Amendments 2)
- IS 2386(Part 7): Methods of test for aggregates for concrete: Part 7 Alkali aggregate reactivity
- IS 2386(Part 8): Methods of test for aggregates for concrete: Part 8 Petrographic examination
- ASTM C-295 Standard guide for petrographic examination of aggregates for concrete

Aggregates when subjected to the tests defined in items above, unless otherwise approved by the Owner/Consultant shall meet the requirements of IS: 383 and IS: 456.

Testing is to be carried out at the following intervals:

Table 2.7
Grades of Concrete

Type	Coarse Agg.	Fine Agg.
Grading	Daily	Daily
Specific Gravity	7 days	7 days
Magn Sulphate soundness	30 days	-
Clay, Silt and dust content	Daily	Daily
Shape (elongation and flakiness)	3.5 days	-
Los Angeles Abrasion	Initial stage only	Initial stage only
Moisture content	2 days	Daily
Drying shrinkage	Initial only	Initial only
Organic impurities	30 days	30 days
10% fines value for concrete	7 days	-

Combined grading shall also be done on a daily basis.

Storage and handling of aggregates

- Aggregate stockpiles shall be arranged and used in a manner to avoid segregation and to prevent contamination with other materials or with other sizes of like aggregates. Aggregate delivery trucks shall be covered to prevent wind blown contamination. Aggregate stockpiles shall be located relative to prevailing winds to mitigate the accumulation of wind-borne dust.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[41]	25.09.2014

- Adequate storage shall be provided for each aggregate. The aggregate storage area shall be on concrete pavement sloped to drain excessive moisture. The aggregate storage area shall provide bulkheads to separate piles and protect against wind blown contaminants. Provision shall be made to shade and sprinkle the aggregates with potable water.
- Aggregate stockpiles shall be built in successive horizontal layers not exceeding 1 m in thickness, with each layer being completed before the next is started. No vehicles shall be allowed to operate on top of the stockpiles.
- Rescreening Coarse Aggregate: Rescreening and washing of coarse aggregates is required, if necessary, to reduce total chloride and/or sulphate contents to a level less than the maximum allowed by the specifications. If rescreening is required, the screening and washing shall be just prior to transferring aggregate to batch plant bins. Aggregates shall be dewatered over a screen to remove excess water before being stored in the batch plant bins.
- Natural or manufactured sand shall be allowed to drain until it has reached somewhat uniform moisture content before it is used.

Fine Aggregate

Fine aggregate source shall be manufactured crushed stone or river sand, excluding fines, which are by products/rejects of coarse aggregate production. The crushed stone sand shall be graded from fine to coarse with the coarse sizes predominating to give maximum density.

The amount of fine particles as ascertained by the laboratory sedimentation method shall not exceed 10% for crushed stone nor 4% for natural sand.

The amount of material passing a 75 micron sieve (IS test sieve) shall not exceed the following limits:-

Crushed Stone Sand

- i) Concrete subject to abrasion 1% by weight
- ii) All other concrete 3% by weight

There shall be no clay or fine silt present.

The amount of hollow shells like to form voids or remain partially unfilled and present in material retained on an IS 2.36 mm sieve, determined by direct visual separation, shall not exceed 3% by weight of the entire sample.

Tests are to be executed in accordance with IS: 2386. The grading of fine aggregate for concrete work shall comply with the requirements of IS: 383.

The grading of the aggregates should be such as to produce a concrete of the specified proportions, which will work readily into position without segregation and without the use of excessive water content. The grading should be controlled throughout the work so that it conforms closely to that used for the preliminary tests.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[42]	25.09.2014

A check on the moisture content of sand should be made at least once a day before concreting. The amount of water to be added to the concrete mix should be adjusted accordingly. Any washing, screening, classifying and other operations on the fine aggregate required to meet this specification shall be done by the Bidder. Washing is required if the content of silt adhering to the aggregate is found to be unacceptably high.

Coarse Aggregate

Coarse aggregate shall be crushed rock and shall be free from decomposed stone, clay, earth or other deleterious substances. The unit weight of the coarse aggregate shall not be less than 2.5 t/m³. Aggregate of crushed natural stone is deemed adequate if the stone reveals a crushing strength of 1000 kg/cm² when tested. Friable, flaky and laminated pieces, mica and shale shall only be present in such quantities as not to affect the strength and durability of the concrete.

The grading of coarse aggregate for concrete shall comply with the requirements of IS: 383.

Samples of aggregates shall be submitted to the Owner/Consultant, together with sieve analysis showing the proportion by weight passing sieves. When aggregates which are satisfactory to the Owner/Consultant have been selected, the Bidder shall secure his entire supply of each material from the same source so as to maintain the same quality and grading throughout the work. Should it become necessary to change the source or characteristics of the material supplied this shall only be done after additional tests.

f) Concrete additives

Use of Concrete Additives

Concrete additives approved by the Owner/Consultant shall be used to improve consistency, workability, quality and strength of the concrete.

Chemical admixtures manufacturer shall provide certified test reports from qualified independent laboratories showing actual test results indicating material that complies in all respects with the applicable specification.

Admixtures used in concrete shall conform to the appropriate specification and requirements as indicated below:-

- Air entraining admixtures shall conform to IS: 9103.
- Water reducing and retarding admixtures shall conform to IS: 9103. Accelerating admixtures shall not be used.

High range water reducers shall be naphthalene-sulfonated polymer based material. No admixtures containing chlorides shall be used.

- Chemical admixture suppliers shall provide certified test reports with each shipment indicating compliance with the appropriate specification. The test reports shall include the chloride content of the admixture, specific gravity and solids content.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[43]	25.09.2014

- Fibers: Polypropylene fibers shall be collated, fibrillated polypropylene fiber of approved manufacture.
- Admixtures used in production of concrete shall be the same as used in establishing the required concrete mix and shall be used in accordance with the manufacturer's directions.
- Liquid admixtures shall be stored in such a manner to avoid contamination, evaporation and segregation in accordance with the manufacturers' recommendations

Accelerating and Retarding Additives

Such additives shall only be used in case of necessity and after obtaining the written approval of the Owner/Consultant.

Plasticizers and Air entraining Additives

Plasticizers and air entrainers are intended to reduce bleeding of free water at the surface. It shall only be used after the written approval of the Owner/Consultant and in accordance with the manufacturer's instructions.

5.10 Dismantling/Demolishing and Modification in PCC&RCC

- The dismantling implies, carefully taking up or down and removing without damage. This shall consist of dismantling one or more parts of a structure. This includes chipping work, cutting of reinforcement, making holes/opening etc. in concrete members, according to the required shape, size and profile at all elevations.
- The term demolition implies, taking up or down or breaking up of a structure/member, in part or full, as specified or shown in the drawings or as directed by Engineer.
- In a structural member, both dismantling and demolishing work may be involved. In such case, the portion of work treated as demolishing shall be as shown on the drawing or as directed by the Engineer.
- All material obtained from the demolition/dismantling work shall be property of the Owner, unless otherwise specified.
- All serviceable materials obtained, shall be separated out and stacked properly upto a lead of [500 meter] or shall be returned to OWNER's stores and all unserviceable materials, rubbish etc., shall be disposed off as directed by the Engineer, upto a lead of [2kms].
- The dismantling / demolishing operations shall be carried out in proper sequence so that the serviceable material can be salvaged, without being damaged during the process or work.
- Necessary propping, shoring and under pinning shall be provided for safety of adjoining work or property which is to be left intact, before dismantling/demolishing work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[44]	25.09.2014

- All demolition work shall be carried out in conformity with the local safety regulations, extreme caution being exercised to avoid damage to the work and the equipment, which are to be left intact. Necessary precautions shall be taken to keep the dust nuisance down. Safety requirements stipulated in IS: 4130 shall also be followed.
- As and where necessary, the dismantled/demolished materials shall be lowered to the ground and not thrown and then properly stacked as directed by the Engineer. Wherever required, temporary enclosures shall be erected to minimize the dust or moisture infiltration.
- Wherever fresh concrete is laid over old concrete, to ensure proper bond between old concrete and fresh concrete, the surface of old concrete shall be thoroughly cleared by removing all loose particles and coat of epoxy paint shall be applied.

5.11 Minimum Cover to Foundation Bolts

Minimum distance from the centre line of foundation / anchor bolt to edge of pedestal shall be the maximum of the following:

Clear distance from the edge of base plate / base frames to the outer edge of the pedestal shall be minimum 50 mm

Clear distance from the face of pocket to the outer edge of pedestal shall be 75 mm

Clear distance from the edge of sleeve or anchor plate to the edge of pedestal shall be 75 mm

5.12 Miscellaneous Requirements

Fillets at the junction of roof and vertical walls shall be provided with cast in-situ cement concrete 1:2:4 (nominal mix) followed by 12 mm thick 1:4 cement mortar.

A screed layer not less than 100 mm thick of cast in-situ concrete of nominal mix 1:3:6 shall be provided below all water retaining structures. A sliding layer of craft paper or bitumen paper shall be provided over the screed layer to destroy the bond between screed and base slab.

Plywood formwork shall be used for all water retaining / conveying structures and for all over ground concrete works. For other areas steel/ plywood formwork shall be used.

Unless specified 20 mm and down graded aggregates shall be used for all structural concrete works. However 40 mm and down graded aggregates may also be used under special conditions for foundation.

Tolerance for formed and concrete dimension shall be as per IS: 456.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[45]	25.09.2014

5.13 Major Equipment Foundation

Special requirements for concreting of major equipment foundations shall be as given below:

Coarse Aggregates

Sound and durable crushed stone aggregates shall be used. All aggregates shall be tested for alkali aggregate reaction. Materials, which contain high percentage of reactive silica, shall not be used. In exceptional cases of high percentage of reactive silica content, aggregate may be allowed where low alkali cement shall be used. Lime stone aggregate shall not generally be used for foundations, which are subjected to high temperature and repeated temperature cycles (like in the case of all machine foundations).

Temperature Control of Concrete

The temperature of fresh concrete shall not exceed 25° C when placed. For maintaining the temperature of 25° C in the top deck of machine foundations, crushed ice shall be used in mixing water.

Admixture

Plasticizer cum retarder/accelerating type admixture shall generally be added to the concrete for promoting workability in addition to retarding / accelerating setting time for mass concreting work. The Bidder shall submit the mixing proportion/report after conducting the design mix as per the relevant codes and standards. The slump of concrete shall generally be in the range given below:

Block foundation	: 100mm to 150mm
Column	: 100mm to 150mm

Formwork

Plywood formwork shall be used for the top deck of all machine foundations. Any other type of formwork required to be used may be permitted subject to prior approval of the OWNER/CONSULTANT after submission of the required data.

Scheme for Concreting

Batching plants shall be mobilized for all RCC works. Concrete pump shall be mobilized for all foundations. Arrangements for stand-by Plant and Equipments shall also be made.

Placing of Concrete

Base mat as well as top deck of machine Foundations shall be cast in a single pour. However the BIDDER shall submit method statements for various structures and shall get the prior approval from the OWNER/CONSULTANT before placing the concrete.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[46]	25.09.2014

Ultrasonic Testing

Ultrasonic pulse velocity test shall be carried out for the top deck of all machine foundations to ascertain the homogeneity and integrity of concrete. In addition, additional cubes (at the rate of one cube per 150 cum of concrete subject to a minimum of six cubes) shall be taken to carry out Ultrasonic Pulse velocity (UPV) testing on the cubes to serve as reference UPV values. Testing shall be done as per IS: 13311 (Part-1). In case of any defects, the BIDDER shall rectify the defects suitably using cement / epoxy grout etc.

5.14 Transport of Concrete

Immediately after mixing, the concrete shall be conveyed to the place of use as rapidly as possible using methods, which will prevent the segregation, loss or contamination of materials. The concrete shall be placed and compacted within 90 minutes of the addition of water to the mix. Any concrete left unplaced after this time shall be rejected and removed from the site.

The Concrete shall be transported by transit mixers of adequate capacity. Before using concrete pumps, placer pipelines, chutes or spouts it is necessary to have the written approval of the Owner/Consultant.

The Bidder shall obtain permission well in advance of any concrete pour.

5.15 Concreting Operations

Inspection prior to Concreting

All concreting methods shall be subject to the approval of the Owner/Consultant.

Concrete placing shall not be started until the Owner/Consultant has approved all preparation of forms, reinforcement, joints and all mixing, conveying, spreading, curing, finishing and protection equipment.

Placing of Concrete

Concrete shall be placed in the forms as close as possible to its final position in a single operation to the full thickness of slabs and beams and shall be placed in horizontal layers, not exceeding 2.5 m height in a single pour in walls, columns and similar members.

The Bidder shall organize the pouring of concrete in such a manner that once concreting of a section has started the operation shall be continuous and each operation shall be completed prior to a stoppage.

The temperature of concrete shall not exceed 40°C measured at discharge into the works.

The maximum allowable temperature of any point within any cast element is 60°C. The maximum allowable differential temperature between any two points in the same element is 15°C. Additional temperature control measures during

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[47]	25.09.2014

construction (such as the use of insulated formwork) will be required. Bidder to prepare a process control chart and method statement verifying measures to achieve these requirements.

Temperature monitoring of concrete work is required where:

The minimum dimension of any casting is 0.8 metres or more, or otherwise instructed by the Owner/Consultant.

Where specified on the drawings, construction, expansion or contraction joints shall be provided and the concrete shall be poured continuously between two adjacent joints. No other joints than shown on the drawings shall be permitted. Stoppage (cold) joints formed between two concreting operations separated by more than 6 hours time shall be subject to the same treatment as the construction joints.

Concrete shall not be dropped into place from a height exceeding 1.5 metres. Trunking and chutes to Owner/Consultant's approval shall be used for any concrete to be deposited from a height exceeding 1.5 m.

Concrete which has partially hardened shall not be exposed to injurious vibration or shock, except for controlled re-vibration where specified. When concreting of a certain large structural element is specified strictly as to be poured continuously, then the concreting operations shall be organized for day and night working, in long shifts, as necessary.

5.16 Compaction and mechanical vibration of concrete

As concrete is being placed it shall be compacted by mechanical vibrators complying with IS: 2505, IS: 2506, IS: 2514 & IS: 4656, to obtain a dense material free from honeycombing, free from water and air holes.

The Bidder shall ensure that the vibrators are used in such a manner that the reinforcement is not displaced, the formwork not damaged and no segregation/bleeding caused, but complete compaction of the concrete is achieved.

5.17 Finish of concrete

The concrete face shall have the finishes indicated on the drawings or in the present specification. The finished surface of the concrete shall be sound, solid and free from honeycombing, protuberances, air holes or exposed aggregate. No plastering, cement wash, mortar or paint shall be applied to cover defective concrete surfaces.

5.18 Construction, expansion and contraction joints

Construction joints

The number of construction joints should be kept as low as possible consistent with reasonable precautions against shrinkage. Concreting should be carried out continuously up to construction joints.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[48]	25.09.2014

Where it is necessary to introduce construction joints, careful consideration should be given to their exact location, which should be indicated on the drawings. Alternatively, the location of joints should be subject to agreement between the Owner/Consultant and the Bidder before any work commences. Construction joints should be at right angles to the general direction of the member and should take due account of shear and other stresses.

Concrete should not be allowed to run to a featheredge and vertical joints should be formed against a stop board.

The top surface of a layer of concrete should be level and reasonably flat unless design considerations make this undesirable. Joint lines should be so arranged that they coincide with features of the finished work.

If a kicker (i.e. a starter stub) is used it should be at least 70 mm high and carefully constructed. The kicker must be incorporated with the previous concrete. Where possible, the formwork should be designed to facilitate the preparation of the joint surface, as the optimum time for treatment is usually two to four hours after placing.

The maximum horizontal length of wall to be poured in one operation in any one direction is 7.5 metres. A period of 7 days to be allowed between adjacent pours except where water stops are provided when this can be reduced with Owner/Consultant's approval. Alternatively a gap of 600 mm width shall be left between adjacent pours and filled after 7 days from the date of formation subject to Owner/Consultant's approval.

Immediately prior to recommencement of concreting on a joint, the surface of the concrete against which new concrete will be cast should be free from laitance and should be roughened to the extent that the largest aggregate is exposed but not disturbed. Care should be taken that the joint surface is clean immediately before the fresh concrete is placed against it.

Particular care should be taken in the placing of the new concrete close to the joint. This concrete should be particularly well compacted and if possible a vibrator should be used.

Where the Owner/Consultant considers that special preparation is necessary, i.e. for an in-situ structural connection, preparation should be carried out preferably when the concrete has set but not hardened, by spraying with a fine spray of water or brushing with a stiff brush, which is sufficient to remove the outer mortar skin and expose the larger aggregate. Where this treatment is impracticable, sand blasting or a needle gun should be used to remove the surface skin and laitance. Hacking of hardened surfaces should be avoided.

A record shall be kept on site of the time and date of placing the concrete in each section of the work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[49]	25.09.2014

Expansion and contraction joints

The expansion joints, contraction joints and other permanent structure joints shall be provided in positions as shown in the drawings.

Joints shall be straight and vertical, except where otherwise specified, and concrete surfaces on both sides of the joint shall be flush. Where necessary, water stoppers of a type approved by the Owner/Consultant shall be embedded in the concrete. The water stopper should be made of high quality material, which must obtain its resilience through the service life of the structure for the double function of movement and sealing. The surface of water stoppers should be carefully rounded to ensure tightness of the joint even under heavy water pressure. To ensure a good tightness with or without movement of the joints the water stopper should be provided with anchor parts. The cross-section of the water stoppers should be determined in accordance with the presumed maximum water pressure and joint movements. The complete works of fixed and welded connections must be carried out strictly in accordance with the manufacturer's instructions.

All joints between structural steel and concrete parts shall be sealed by a suitable permanent flexible compound.

5.19 Concreting at night

When approval is given to carry out concreting operations (under control of the Owner/Consultant) at night or in places where daylight is excluded, the Bidder has to provide adequate lighting at all points of mixing, transportation and placing of concrete.

5.20 Protective measures for concrete

In general, the cover of rebars shall be as per IS: 456 taking into account the site conditions. However, the minimum concrete cover shall not be less than:

Concrete parts above ground (external surface)	: 40 mm
Concrete exposed to underground & groundwater	: 50 mm
Isolated footings	: 50 mm
Raft	: 75 mm
Slabs	: 25 mm
Beams	: 25 mm
Columns	: 40 mm

Immediately after the compaction of the concrete has been finished, the Bidder shall ensure adequate protection from the weather. Excessive drying can lead to crack formation as a result of plastic contraction. The concrete surface shall be covered with a layer of sacking, canvas, straw mats or similar absorbent material, special protection sprays kept constant moist for at least 7 days.

Curing compounds or other methods of preventing evaporation may be used if approved by the Owner/Consultant. Where formwork cannot be removed within

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[50]	25.09.2014

24 hours after placing the concrete, the formwork shall be kept shaded from the direct rays of the sun and shall be sprayed with water.

Owner/Consultant's approval to the use of a particular curing compound and to the method of application will only be given after the Bidder has completed satisfactory site trials and a sample panel has stood for at least 28 days.

Where large sections of concrete are poured, special precautions to the approval of the Owner/Consultant shall be taken to reduce and dissipate the heat generated by the setting and hardening of the concrete.

The minimum amount of reinforcement shall be present to prevent shrinking cracks.

No load of any kind, however light, shall be allowed on concrete which has not properly set and the Bidder shall prevent any load to be imposed on the concrete structures until it has been declared by the Owner/Consultant to be ready to carry loads.

5.21 Concrete with Special Properties

General requirements

The pre-condition for obtaining concrete with special properties is that it should be made with the appropriate composition, that it is placed in such a way that segregation does not occur and further that it is fully compacted and given appropriate curing.

Waterproof concrete

This concrete must meet the provisions of IS: 3370. Waterproof concrete must be sufficiently dense (impermeable).

Waterproofing and protection of underground concrete structures

Water aggressive to concrete should be kept away from the fresh concrete.

Concrete, which is exposed for a prolonged period to "very severe" chemical attack, must be protected against direct access of the aggressive substances.

The protection, which is to be laid as protection to all concrete surfaces in contact with the ground, shall consist of an approved waterproofing membrane. The membrane shall adhere to all concrete surfaces, including undersides of structures and other surfaces where concrete is cast in contact with the membrane.

Such membranes shall be PVC sheets of minimum 0.35 mm thickness with knobs of Maxlock.

The waterproof membranes shall be installed in strict accordance with manufacturer's instructions.

The membranes shall extend 15 cm above ground level.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[51]	25.09.2014

When setting forms and reinforcing steel caution shall be exercised to avoid damage to the impervious membrane. The surface of the impervious membrane extending outside the forms shall be protected during subsequent operations.

Any puncture or damaged areas shall be cleaned and patched according to manufacturer's instructions.

Concrete with high wearing resistance

Concrete which is exposed to severe mechanical action, e.g., due to intensive traffic, sliding of bulk materials, frequent impact blows or movements of heavy objects, or due to fast-flowing water carrying solids, or other causes, should possess high wearing resistance and correspond at least to grade M30.

The aggregate upto 4 mm size should consist predominantly of quartz or materials of at least equal hardness; the coarser particles should consist of stone or artificial materials possessing high abrasion resistance. In the case of particularly severe mechanical action, it will be necessary to use special hard materials. The particles of all types of aggregate should have a moderately rough surface and be of compact shape. The combined aggregate should be as coarsely graded as possible.

Furthermore, the concrete should be as stiff as possible, in order that there will be no concentration of cement slurry or water in the top layer. The concrete should be kept moist for at least 7 days after placing.

Finishing of formed surfaces

Fins and other surface projections shall be removed from all formed surfaces except exterior surfaces that shall be covered with earth backfill. Exterior surfaces that shall be exposed above grade and all interior surfaces, except those not usually exposed to view shall be cleaned and rubbed. Rubbing shall produce a smooth, uniform surface free of marks, voids, surface glaze, and discolorations.

Rubbing shall be done by hand with a carborundum stone using only the mortar produced by the rubbing action and the application of water.

Projecting ends of all form ties shall be removed. The resulting recesses shall be cleaned, wetted, and filled with patching mortar. Patches on rubbed surfaces shall match the texture of the adjacent concrete.

Finishing of unformed surfaces

No surface treatment shall be required for buried or permanently submerged concrete. As a minimum, unformed surfaces shall be finished by screeding and floating. Surfaces requiring a trowelled finish shall be finished by screeding, floating, and trowelling.

Float finished and screeded surfaces shall be finished to provide a flat profile within a 6 mm deviation as measured from a 3 m straightedge. Trowel finished

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[52]	25.09.2014

surfaces shall be finished to form a flat plane. The surface profile shall not deviate more than 3 mm when measured from a 3 m straightedge.

Screeding

Screeding shall provide a concrete surface conforming to the designated elevations and contours with all aggregates completely embedded in adjacent mortar. Surface irregularities in screeded surfaces shall be limited to the tolerances specified.

Floating

The surfaces shall be screeded and given an initial float finish as soon as the concrete has stiffened sufficiently to work. Coarse aggregate disturbed by the float or causing a surface irregularity shall be removed and replaced with mortar. Initial floating shall produce a surface of uniform texture and appearance.

Initial floating shall be followed by a second floating at the time of initial set. The second floating shall produce a smooth float finish of uniform texture and colour.

Floating shall be performed with hand floats or suitable mechanical compactor floats.

Trowelling

The exposed portions of the tops of equipment bases, tops of interior curbs, and the surfaces of interior slabs not receiving a separate finish shall receive a steel trowel finish. Trowelling shall be performed after the second floating when the surface has hardened sufficiently to prevent excess cement from being drawn to the surface. Trowelling shall produce a dense, smooth, uniform surface free from blemishes and trowel marks.

Surfaces to be covered with neoprene-hypalon coatings shall be lightly trowelled but not burnished.

Brooming

Brooming shall follow the float finish for exterior surfaces where a nonslip surface is required. Brooming shall be done with an acceptable steel or fiber broom not less than 450 mm wide. Brooming ridges shall be transverse to the normal traffic direction and shall be between 1.5 mm and 3 mm deep. Adjacent strokes of the broom shall overlap slightly. Broomed surfaces shall be free of porous spots, irregularities, depressions, and small pockets or rough spots.

Aggregate Exposure

Surface mortar shall be removed and the aggregate exposed from surfaces that shall be covered with mortar, concrete, or grout at a later time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[53]	25.09.2014

Edging

Unless specified otherwise, exposed edges of floated or troweled surfaces shall be edged with a tool having a 6 mm corner radius.

Finishing mortar

Finishing mortar shall be added if there is not sufficient mortar available from the concrete mix. The proportions for this finishing mortar shall be 102 kilograms of concrete sand to one sack of Portland cement, mixed with enough water for proper application. Slump for finishing mortar shall not exceed 50 mm.

Separate finishes

Certain slabs surfaces shall be finished with a separate concrete finish or floor covering.

Base slab surfaces shall be ground or filled until each surface is within the specified tolerances. Low areas shall be filled. High spots shall be ground slightly lower than required and then filled and smoothed to the proper elevation and surface.

Surfaces that receive epoxy set quarry tile and resilient tile shall be flat with a profile that shall not deviate more than 3 mm from a 3 m straightedge placed on any part of the surface. These surfaces shall be either trowel finished concrete at the elevation indicated on the drawings or a float finished surface set 3 mm low and levelled with trowel finished fill material.

Surfaces that receive a mortar set quarry tile, ceramic tile, or vitrified finish shall be given a smooth, tight, and uniform float finish with a profile tolerance of 6 mm as measured from a 3 m straightedge.

5.22 Formwork

Design and construction

For stability and type of formwork and support framing used, IS: 14687 is to be observed.

The formwork and the supporting structure are to be so dimensioned as to be able to withstand all vertical and horizontal forces safely.

Supporting structures shall be sufficiently rigid to maintain the forms in their correct position and to be true to shape and dimensions so that the final concrete is within the limits of the dimensional tolerances specified in section) "Dimensional Tolerances".

The Bidder shall submit in sufficient time in advance for the approval of the Owner/Consultant the calculations, designs and details of the methods adopted and materials proposed for the formwork.

Particular attention must be paid to the formwork supports and braces to avoid any slip when the concrete is poured.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[54]	25.09.2014

Materials for formwork

Forms shall be constructed from steel or from sound timber well seasoned and free from shakes. Plywood lining for forms shall be of timber, which is resin-bonded and water repellent.

Formwork surfaces in contact with concrete shall be free from adhering grout, projecting nails, splits or other defects.

Joints shall be sufficiently tight to prevent the leakage of cement grout. Connections shall be constructed to permit easy removal of the shuttering and shall be either nailed, screwed, bolted, or otherwise secured so as to be strong enough to retain the correct shape during consolidation of the concrete. Where a slope exceeds 1 V: 2 ½ H, formwork shall be provided for the top of the concrete faces and anchored to prevent flotation.

The details of fair-faced concrete facades have to be to the satisfaction of the Owner/Consultant. The concrete surface for facades has to be absolutely stainless and all efforts have to be taken to achieve this. All the proposed formwork shall be properly designed before its usage.

Grading of formwork and of finished concrete surfaces

Quality of formwork, materials to be used and treatments of surface are graded according to the finish of the concrete surface as given in IS: 14687.

The type and treatment of the formwork lining (plywood, metal, plastics, etc) should be appropriate to the grade of concrete finish required.

Preparation and inspection of formwork

Before concrete is placed, all formwork shall be inspected to see if it is built according to the approved plans and to see if it has been cleaned and is free from sawdust, shavings, dust, mud, earth or other contamination and properly oiled. Contact surfaces of panels shall be treated with a suitable release agent (e.g. non-staining mineral oil) where applicable. Surfaces, which are not oiled, shall be wetted thoroughly to prevent warping.

Erection and placing of formwork

All formwork shall be erected and placed in accordance with the construction drawings approved by the Owner/Consultant. Shuttering shall be true to line and braced and struttred to prevent deformation under weight and pressure of the wet concrete, live loads, wind and other forces. The deflections shall not exceed 3 mm.

The formwork for beams and slabs shall be erected so that the form on the sides of the beams and of the soffits of slabs can be removed without disturbing the beam soffit.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[55]	25.09.2014

If the formwork for columns is erected to the full height of the columns, one side shall be provided with openings for concreting in order to guarantee a proper compaction of the poured concrete.

Formwork for walls and elsewhere shall be arranged for a maximum concreting height of 2.5 m in a single pour. Wherever necessary, panel openings are to be provided in the forms for cleaning, inspection, access of vibrators, etc.

Before placing of concrete, bolts, ties and fixings shall be positioned and all devices used for forming openings, holes, pockets, chases, recesses, etc shall be fixed to the formwork carefully.

Panels shall be put together to ensure a perfect fit at the joint and fixed in both directions.

Where concrete surfaces will be exposed to view (permanently exposed surfaces) the formwork shall be such as to produce a completely true, smooth surface, free from perceptible irregularities or to show clearly the desired texture. Such formwork shall be marked on the drawings as "Fair-faced Formwork".

Where concrete surfaces are covered (non-exposed surfaces), the formwork shall be referred to and marked as "Sawn Formwork".

Internal spacers and ties, if any, shall be so arranged that after removing of the forms no holes shall extend through the concrete, in the case of watertight concrete or to be closed by plastic plugs and epoxy mortar in all other cases.

All formwork will be inspected and approved by the Owner/Consultant before concrete placing commences but this shall not relieve the Bidder of any of his responsibilities under the contract.

Striking of formwork

Formwork shall not be removed until the concrete has sufficient strength to carry its own weight plus any constructional or designed loads likely to be applied with a normal factor of safety. It shall be removed in such a manner that no shock or injury shall result to the concrete.

Before removal of the formwork, the concrete shall be examined and removal shall proceed only on the instructions and under the supervision of a competent person.

In accordance with IS: 456 clause 11.3.1, the striking period for cast in-situ concrete under certain conditions may be taken as follows: -

**Table 2.8
Formwork**

Type of Formwork	Minimum period before striking formwork
Vertical formwork to columns, walls, beams	16 to 24 hours
Soffit formwork to slabs (props to be refixed)	3 days

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[56]	25.09.2014

Type of Formwork	Minimum period before striking formwork
immediately after removal of formwork)	
Soffit formwork to beams (props to be refixed immediately after removal of formwork)	7 days
Props to slabs:	
1) Spanning upto 4.5 m	7 days
2) Spanning over 4.5 m	14 days
Props to beams and arches:	
1) Spanning upto 6 m	14 days
2) Spanning over 6 m	21 days

Special care is necessary in the case of components, which have to carry nearly the full-calculated load as soon as the formwork is struck.

Columns, piers and walls are to be struck before the beams and slabs supported by them. Scaffolds, formwork supports and self-supporting floor formwork are to be carefully lowered by releasing the devices.

Extreme care shall be taken to avoid chipping of corners during removal of formwork.

To keep deflections through creep and shrinkage to a small amount, auxiliary supports should be left in place or immediately repositioned after striking.

5.23 Water stoppers

Water stoppers shall be of PVC or equivalent and shall be eye-letted with a minimum 25 cm width. Type and manufacturer shall be submitted to the Owner/Consultant's approval.

All intersection pieces shall be prefabricated by the manufacturer and only welding of butt-joints in running lengths will be allowed to be carried out on the site.

The site welding of butt-joints shall be executed by using the manufacturer's purpose-made electrically heated jig and work shall be done by competent and trained personnel only. The manufacturer's instructions shall be carefully observed.

The wings of the water stoppers shall be formed with corrugations or bulbs to achieve a good bond. Moreover, the water stoppers shall conform to the following requirements:-

- The tensile strength not less than 10 N/sq.mm when tested.
- The ultimate elongation shall not be less than 22% when tested.
- The tear resistance shall not be less than 2 N/sq.mm when tested.
- The material shall not crack when tested.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[57]	25.09.2014

- Under accelerated elongation, the tensile strength shall not be less than 8 N/sq.mm and the ultimate elongation shall not be less than 200%.

The water stoppers shall be installed so that they are securely held in position during the placing of concrete, which shall be fully and properly compacted around the water stoppers to prevent voids or porous areas. Adequate clearance between the reinforcement and all the water stoppers shall be kept to permit proper compaction of concrete.

No holes or nailing shall be made through any water stopper for fixing purposes. Jointing by lapping two pieces of water stoppers shall not be permitted.

The free edges of water stoppers shall at all times be protected from direct sunlight.

5.24 Curing

Concrete shall be protected from loss of moisture for not less than 7 days after the concrete is placed and if required the concrete may be protected for few more days as per the design mix / approved methodology.

Trowelled surfaces except those that receive a separate finish or coating, shall be cured with a membrane curing compound. Float finished surfaces, except those that receive a separate finish, may be cured with either a membrane-curing compound or with water. Only water curing shall be used if the surface receives a separate finish.

Water curing

Water saturation of concrete surfaces shall begin as quickly as possible after initial set of the concrete. Water curing shall begin within 12 hours in dry weather and within 24 hours in damp weather. The rate of water application shall be regulated to provide complete surface coverage with a minimum of runoff. The application of water may be interrupted for surface rubbing. The concrete surface shall not be permitted to dry.

After the rubbing has been completed, rubbed surfaces shall be covered with burlap and kept saturated for the remainder of the curing period.

Membrane curing

Membrane curing compound shall be applied within 30 minutes after final finishing of the surface or as soon as possible after finishing without causing damage to the surface. Membrane curing compound shall be spray applied at coverage of not more than 7.4 sqm/litre. Membrane curing shall not be used on surfaces that shall be covered at a later date with mortar, concrete, damp proofing, tile, or any coating. Membrane curing shall not be used on cast-in-place concrete bases for field-erected tanks. Membrane curing will be permitted only after prior approval of the OWNER/CONSULTANT.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[58]	25.09.2014

Floor sealer

All concrete floors shall be given two coats of clear floor sealer in addition to that applied as membrane curing compound. The first coat shall be applied at the end of the curing period before any traffic is permitted on the floor. The second coat shall be applied after the floor has been cleaned in preparation for the final inspection. Floor sealer shall be applied in strict accordance with the manufacturer's recommendations.

5.25 Waterproofing/Damp proofing

A waterproofing seal shall be provided for all below grade structures where applicable by external tanking with PVC sheets of 1.0 mm thickness with knobs for membrane type waterproofing. In addition, joints in deep underground structures shall be provided with structural waterproofing.

Damp-proof course 40 mm thick, consisting of cement concrete 1:2:4, with admixture of approved water-proofing compound shall be laid at plinth level for walls of all buildings for protection of super-structure against moisture and dampness.

5.26 Repair of damaged and defective concrete

Concrete after its final setting shall be inspected by the Owner/Consultant and any cracks, honeycomb areas, segregations, etc shall be marked. No repairs shall be carried out until directed by the Owner/Consultant.

Surface defects in formed concrete shall be repaired to the satisfaction of the Construction Manager within 24 hours. Concrete that is porous, honeycombed, or otherwise defective to a depth in excess of 25 mm shall be cut out and removed to sound concrete. Edges shall be square cut to avoid feathering. Cut surfaces shall be coated with epoxy bonding compound before the concrete is placed.

Defective concrete shall be replaced within 48 hours after the forms have been removed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[59]	25.09.2014

6 PRESSURE GROUTING

The work shall consist of drilling grout holes, exploratory holes and check holes, pressure testing, pressure washing, and injecting suspension grout under pressure, and shall include furnishing of all materials, labor, and equipment as described and specified.

6.1 Materials

a) Cement

Portland cement shall be contains less than 0.6 percent alkali.

b) Aggregate

Aggregate shall be non reactive and shall be washed before use. When sources of aggregate are changed, test reports shall be provided for the material from the new source prior to commencing grout work. Fine aggregate shall be sand or crushed stone.

c) Admixtures

Admixtures shall be compatible with the grout and shall comply with the manufacturer's recommendations. Admixtures shall be added to the grout mix separately.

Water Reducing Retarder: Water reducing retarder shall comply with relevant Indian standard or as approved by Owner.

Lubricant: Lubricant additive for cement pressure grouting shall be Intrusion Prepakt Intrusion Aid, Sika Intraplast N, or as approved by Owner.

d) Water

Waste for washing aggregate, for mixing and for curing shall be potable, shall not contain more than 1000 mg/l of chlorides as Cl, nor more than 1300 mg/l of sulfates as SO₄, and shall not contain impurities which may change the setting time by more than 25 percent or a reduction of more than 5 percent of the compressive strength of the grout at 14 days when compared to the results for grout made with distilled water.

e) Grout

Drypack Grout

Drypack grout shall be a mixture of approximately one part cement, 1.5 parts sand, water reducing retarder and sufficient water to make a stiff workable mix, branded Dry Pack or approved equal.

Cement Grout

Cement grout shall be a mixture of one part cement, two parts sand proportioned by volume admixtures for pressure grouting and sufficient water to form a workable mix.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[60]	25.09.2014

Nonshrink Grout:

- Non-shrink expansive flowable grout shall be used for under pinning work below base plate of columns. Non-shrink cum plasticiser admixture shall be added in the grout. For grouting of base of machine foundation high strength ready mixed non-shrink flowable grout shall be used.
- Type and grade of grouting for structural columns and equipment bases shall be as indicated. Crushing strength of the grout shall generally be one grade higher than the base concrete. Minimum grade of grout shall be M 30.
- Nominal thickness of grouting shall be at least 50 mm for building columns and pedestals of major equipment. For secondary posts, stair and ladder base, etc. grouting shall not be less than 25 mm thick.

Special grout, where specified on the drawings, shall be provided in strict accordance with the manufacturer's instructions/specifications. Pre-mixed Grout Conbextra GP-2 of 'FOSROC' make or equivalent of crushing strength 650 kg/cm² for major equipment foundations and Conbextra GP-1 or equivalent having crushing strength of 450 kg/cm² for other foundations where concrete grade M30 or higher is provided

- Forms and shims used to obtain adequate clearance shall not be removed and the anchor bolts shall not be tightened for at least three days after placing the grout. After the removal of forms and shims, area occupied by shims shall be filled and the area between the base and edge of the foundation shall be finished smooth to allow drainage away from the base. Attachment of interconnecting piping of machinery and complete load transfer of machinery shall not be done before the bolts are tightened. During this period, grouting work shall be properly cured using rags/gunny bags.

In view of extremely small proportion (about 0.01% by weight of cement) of the aluminium powder required, it is necessary to take all precautions to ensure thorough mixing. It is advisable to mix the blend of aluminium powder thoroughly with sand and cement before water is added because aluminium powder has a tendency to float on water.

- Proprietary material of approved manufacture used as an admixture to obtain non-shrinking grout shall be mixed in the proportion of 1:1:1 (1 cement: 1 admixture: 1 sand), or as per manufacturer's instructions.

Pre-mixed non-shrinking grout shall be used as per manufacturer's instructions and without any additional materials/admixtures such as cement, sand and aggregates etc.

Epoxy Grout for Crack Repair and Dowel Anchorage

Except for applications involving pressure grouting or crack injection, epoxy shall be a high modulus, moisture insensitive, two components, 100 percent solids, thermosetting modified polyamid epoxy compound. The material shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[61]	25.09.2014

equal which is capable of not sagging in horizontal or overhead anchoring applications.

Epoxy for applications involving pressure grouting or crack injection, shall be a high modulus, moisture insensitive, two components, injection grade, 100 percent solids blend of epoxy resin compounds. The material shall equal which is capable of achieving complete penetration of hairline and larger cracks.

Polymer Concrete for Resurfacing and Patching

Polymer concrete shall consist of a liquid binder and dry aggregate mixed together to make a flowable mortar. The liquid binder shall be a chemical and oil resistant, stress relieved, low modulus, moisture insensitive, two component epoxy resin compound. The binder material shall equal with a consistency similar to light weight oil for proper mixing with the aggregate. The aggregate shall be oven dry, kept in sealed packages until the time of mixing and be of size and consistency compatible with recommendations of the manufacturer of the liquid binder for the intended application.

Adhesive Resin for Dowel Anchorage:

Pneumatically operated caulk gun and automatically mixed at nozzle. Subject to compliance with one of the following: HIT RE500-SD Adhesive Anchoring System, Hilti, Inc. (ICC ESR-2322), HIT-HY 150 MAX-SD Adhesive Anchoring System, Hilti, Inc. (ICC ESR-3013), SET-XP Adhesive Anchoring Systems, Simpson Strong-Tie Co. (ICC ESR-2508).

6.2 Pressure Grouting Equipment

Pressure grouting equipment shall include a mixer and holdover agitator tanks designed to place grout at pressures up to 0.345N/mm^2 (50 psi). Gauges indicating grouting pressure shall be provided and the mixer shall be equipped with a meter capable of indicating to within 0.003 m^3 the volume of grout placed.

6.3 Execution

Bonding compounds for use with grout is to be provided and installed per the manufacturer's recommendations.

a) Drypack Grout

Drypack grout is to be used for built-up surfaces, setting miscellaneous metal items and minor repairs.

Surfaces required to be built-up with drypack grout are to be roughened by brushing, cleaned and coated with the bonding compound before application of grout. The grout is to be applied to the required thickness.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[62]	25.09.2014

b) Cement Grout

Cement grout is to be used for filling nonbearing portions of equipment pads and pressure grouting.

Except for the specialized requirements for pressure grouting, grout is to be mixed and placed in the same manner as cast-in-place concrete. Grout is to be mixed for at least one minute and diluted grout is to agitated until placed.

c) Non-shrink Grout

Nonshrink, nonmetallic aggregate grout is to be used under equipment, bearing plates and column base plates. Nonshrink, metallic aggregate grout is to be used under rotating equipment where high strength and fatigue are of concern, to grout anchor bolts and to grout reinforcing steel. Grout is to be placed and cured in accordance with the manufacturer's recommendations.

Holes required for grouting shall be blown clean with compressed air and are to be free of dust or standing water. Horizontal holes for grouting are to be drilled at a slight downward angle and with the inserted dowel or bolt bent to match.

d) Epoxy Grout

Epoxy grout shall be used for repairing cracks by pressure grouting or gravity, repairing structural concrete and may be used for setting dowels or bolts in holes. Concrete is to be primed in accordance with the grout manufacturer's recommendations.

The use of epoxy grout must comply with the following restrictions:

- Limited to areas where exposure, on an intermittent or continuous basis, to acid, chlorine gas or to machine or diesel oils, is extremely unlikely.
- Limited to applications where exposure to fire or to concrete temperatures above the product heat deflection temperature or 120 deg F (40 deg C)(whichever is less) is extremely unlikely. Overhead applications are not allowed.
- Holes for the anchors shall be drilled (not cored), shall be blown clean with compressed air and shall be free of dust or standing water.
- The anchor type, size and embedment depth shall be as shown on the drawings and the anchor must be installed in accordance with the manufacturer's recommendations.
- The anchor must not be loaded until after the full curing period has elapsed.

e) Pressure Grouting

Prior to grouting, cracks and holes to be grouted shall be washed clean. Washing is not required for grouting soil voids. Once started, grouting shall be continuous until completed. In case of a mechanical failure or other stoppage of the work, the grout equipment shall be washed out sufficiently to ensure that fresh only grout is pumped when the work is restarted.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[63]	25.09.2014

After grouting is completed, the Contractor shall remove the grouting plant and all related parts, equipment, and supplies from the site, including unused materials and waste.

6.4 Field Quality Control

- Bidder shall make suitable arrangements for carrying out all the necessary quality tests and ensure that testing work shall be carried out in compliance with the standards.
- Testing of grout mixes for conformance to manufacturer's specified strength: The independent testing laboratory shall take four test samples of each day's grout mix and test grout mix samples at 7 and 28 days. Test reports shall be submitted to the Owner for review.
- Test 25 % of reinforcing steel dowels installed with adhesive resin on a given day in tension using pullout procedure. Test to 80% of specified yield strength of the dowel with special inspection. Dowels specifically noted on the drawings as "No test required" do not require tension testing.
- If the failure rate of dowels exceeds 10 percent, testing will be increased to 100 percent of that day's installation of similar anchors or dowels. Testing will be reduced to 25 % of that day's installation when the failure rate is reduced to 10 percent or less. Failed dowels will be replaced at no additional cost to the Owner. The Contractor will produce daily reports of all testing activities; copies of daily reports will be submitted to the Owner in a timely manner.

6.5 Submittal

- Manufacturer's data shall be provided for bonding compounds, dry pack, non-shrink, pressure grout, retardants, epoxy grout, polymer concrete.
- Test reports, accompanied by a manufacturer's statement that previously tested material is of similar type, quality, and manufacture as that which is proposed for use on this projects, shall be submitted for Cement, Aggregates, Retardants, Bonding compounds and Epoxy resin
- The testing laboratory shall provide evidence of correction of deficiencies noted in the inspection report before materials specified in this section are delivered to the job site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[64]	25.09.2014

7 RETROFITTING WORKS

7.1 General

- a) The Work shall, in general, conform to other works/items specified in this Specification.
 - If the specifications for any item are not available in in this Specification cited above, relevant BIS Specifications should be followed.
 - In case BIS Specifications are also not available, the decision of Engineer-in-Charge given in writing based on acceptable sound engineering practice and local usage shall be final and binding on the contractor.
- b) The work will be carried out in accordance with the architectural and structural drawings to be approved by Owner. The structural and architectural drawings shall have to be properly correlated before executing the work.
- c) For items where so desired, samples shall be prepared before starting the particular items of work for prior approval of the Owner and nothing extra shall be payable on this account.
- d) Materials brought at site of work shall not be used in the work before getting satisfactory Mandatory test results.
 - Equivalents for the various materials and the materials of approved make shall be got approved from the Owner in writing before using them on the work.
- e) The contractor shall submit the required documents regarding the genuineness of materials used such as manufacturer's certification that the firm has manufactured the supplied materials.
- f) The contractor shall get approved from the Owner the storage space for epoxy/polymer/patented/other manufacture of materials to ensure that the storage temperature is maintained between 5° C and 38° C unless recommended otherwise by the manufacturer.
- g) Contractor shall comply with manufacturer recommendations so as to comply with environmental conditions under which the repair materials may be applied.
- h) The contractor shall employ Principal Technical Representative & skilled site workers who shall have adequate qualifications and experience for the proper execution of such works and already performed works of this kind with success.
- i) Contractor shall advise all workers working with epoxies to avoid contact with eyes and skin, inhalation of vapours, and ingestion. Necessary protective and safety equipments in the form of hand gloves, welders' goggles, shall be provided by the contractor and used on site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[65]	25.09.2014

- j) Care shall be taken to ensure that vibrations are well within acceptable limits for structural safety and users of the building.
- k) For the execution of protection and repair works, properly maintained plant and equipment permitting adequate treatment of the concrete substrate, proper execution of the work and determination of the required properties of the construction materials and construction measures must be present on the construction site.
- l) To ensure efficient and effective functioning, all plant and equipment must be checked on-site and at field material testing laboratory prior to first use and at appropriate intervals thereafter.

7.2 Chipping of Unsound/Weak Concrete Material

a) Purpose

To remove weak, loose or carbonated concrete over an area from its surface with pneumatically operated or power driven tools by chiselling, chipping etc.

b) Materials and Tools & Plants (T&P)

Power or pneumatically driven chisel, chipping tools complete with accessories, hand-tools like chisels, hammer, pH indicator (0.2% phenolphthalein solution) with pH range at least up to 10.5 and clinical injection syringe.

c) Safety

Safety shall be ensured in accordance with contract conditions and specifications.

d) Procedure

Step-1: Prop and support to relieve the structural member of stress and strains.

Step-2: Scaffolding, if necessary for the exterior members, shall be done for working upon the area.

Step-3: Working Platforms for interior members, if necessary, shall be erected suitably or provided as mobile.

Step-4: Provide Protective Screen, if necessary.

Step-5: Mark off the area to be repaired using straight lines between corners. The marked area shall have 90° corners with the sides parallel or normal to the direction of the reinforcement. The marked boundaries for the repair area should be a minimum of 50 mm outside the perimeter of the spall. For a single spall, the repair area should have a minimum width of 100mm in any direction. If a number of spalls are closely located to each other, these spalls should be included in a single area marked for repair.

Step-6: Cut shall be made along the marked boundary, normal-to-the surface. It should be made with a diamond cutter blade. However, when diamond cutting is not practical, the normal cut can be made with a power driven chisel. Minimum depth of cut shall be 10 mm. In situations where the diamond saw could cut

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[66]	25.09.2014

into the reinforcing steel due to inadequate concrete cover, the boundary edge should be formed manually by means of chisel and impact hammers. A cover meter could be used to estimate the depth of cover.

Step-7: Chipping to remove all the unsound and weak concrete material shall be done carefully from the damaged portions of structural members by adopting mechanical or manual means up to the required depth to produce sound concrete surface to a near uniform depth for the repair area.

e) **Tolerance**

The chipping tolerances shall be ± 5 mm.

f) **Chiselling**

Hand Tools are typically applicable for concrete removal for smaller, moderate and areas of limited access. Removal should begin at the interior of the repair area and progress toward the boundaries, using suitable hammer. Power Driven Chisels/Hammers are normally applicable for chiselling smaller thicknesses up to about 50 mm. Pneumatic Hammers are normally applicable for chiselling larger thicknesses in excess of 50 mm Mechanical Milling (single drum, rotary cutter head with Tungsten-carbide bits) is applicable for large areas where the concrete cover is to be removed. Care must be taken to avoid contact with the reinforcing steel as both the reinforcement and the cutter drum could be damaged. Rounded And Feathered Edges should be hand cut to form normal-to-the-surface boundaries. All the edges and cavities shall be square shouldered.

Step-8: Test for carbonation shall be carried out at embedded or exposed reinforcement locations, by spraying phenolphthalein indicator on concrete in contact and in the immediate vicinity of reinforcement soon after its chipping. As otherwise, chipped concrete surface in contact with air is likely to get carbonated soon after its coming in contact with atmospheric carbon dioxide.

Step-9: A full-depth chiselling and removal of concrete all round reinforcement shall be carried out, in case the concrete in contact and in immediate vicinity of the reinforcement is carbonated.

Step-10: Inspection and soundness testing, after concrete removal & cleaning, for weaknesses and delamination of exposed surfaces shall be visually carried out. If required, additional removal will be done.

Step-11: Cleaning of debris and dust shall be carried out from within the chiselled/ chipped area and its disposal as per direction of the Engineer-in-Charge.

7.3 Removing concrete all around reinforcement including from its behind

a) **Purpose**

To create an average clear air gap equal to nominal size of coarse aggregate plus 5 mm all around embedded reinforcement, in contact with carbonated concrete for rust removal & passivating its surface with fresh alkaline passivating coat and concrete/ mortar.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[67]	25.09.2014

b) **Materials and T&P**

Power or pneumatically driven chiselling, abrading, chipping tools complete with accessories, hand-tools like chisels, hammer, pH indicator i.e. 0.2% solution of phenolphthalein indicator for pH range preferably up to 11.5 or at least up to 10.5, clinical injection syringe.

c) **Safety**

Safety shall be ensured in accordance with contract conditions and specifications.

d) **Procedure**

Step-1: Prop and support, if not done already, to relieve the structural member of stress and strains.

Step-2: Scaffolding & working platforms for the exterior members, if not already done and if necessary, shall be erected for working upon the area.

Step-3: Working Platforms for interior members, if not already done and if necessary, shall be erected suitably or provided as mobile.

Step-4: Provide Protective Screen, if not already done and if necessary.

Step-5: Test for carbonation shall be carried out at embedded or exposed reinforcement locations, by spraying phenolphthalein indicator on freshly chipped concrete in contact and in the immediate vicinity of reinforcement.

Step-6: A full-depth chiselling and removal of concrete all round reinforcement shall be carried out, if the concrete in contact and in immediate vicinity of the reinforcement is carbonated. The concrete around reinforcement shall be removed so as to have a near uniform air gap of about 5 mm plus the nominal size of coarse aggregate to be used in repair concrete/mortar. However, the air gap shall not be less than 15 mm in any case. Power/pneumatic driven tools/chisels shall be used for such portions of carbonated concrete around reinforcement, which could not be removed manually, to achieve a near uniform required air gap all around including behind the reinforcement. Power Driven Chisels/Hammers are normally applicable for chiselling smaller depths up to about 50 mm. Pneumatic Hammers are normally applicable for chiselling larger depth in excess of 50 mm.

Step-7: Cleaning of debris and dust shall be carried out from within the chiselled /chipped area and its disposal as per direction of the Engineer-in-Charge.

7.4 Rust cleaning from reinforcement Steel

a) **Materials and T&P**

Chiselling, abrading, chipping, hammering, wire brushes, paint brush, abrading cloth, etc hand tools complete with accessories, tested and approved chemical rust remover.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[68]	25.09.2014

b) **Safety**

Safety shall be ensured in accordance with contract conditions and specifications.

c) **Procedure**

Step-1: Cleaning by manual method-

Remove the rust manually from all round the surface along the length of reinforcement, using hand tools like chisels, hammers, wire brushes, abrading cloth/paper, etc. This shall be continued manually along the length of the rusted reinforcement till such time that the steel surface is cleared of all rust that could be removed manually.

Step-2: Cleaning by chemicals –

Remove the Rust by using tested chemicals, if directed by Engineer-in-Charge, due to unsatisfactory results of manual rust removal. Chemical rust remover shall be brush applied over the reinforcement surface thoroughly all around the circumference and along the full length of rusted reinforcement. After 24 hours (or as prescribed by manufacturer) of its application, the surface shall be cleaned with wire brush and all loose particles removed. It shall be washed with water thoroughly and allowed to dry.

7.5 Cleaning Reinforcement and exposed concrete surface of loose and foreign material by means of sand blasting

a) **Purpose**

Clean the prepared concrete surface of all-loose, lightly sticking materials including the foreign materials, loose concrete, aggregates etc to provide a good bond with the applied repair material and clean the reinforcement surface of any minor rust remaining after manual and chemical cleaning to achieve shining bright metal.

b) **Materials and T&P**

Coarse sand conforming to Zone I or II as per IS: 383, Air compressor of a minimum 35 Kilowatt capacity, spray gun for sand, all related accessories for sand blasting, hand tools like wire brushes, chisels, etc

c) **Testing of Materials and T&P**

The sand shall be tested to conform to the specification.

The air compressor shall be tested to perform to the required standards as laid down in specifications of shotcreting.

d) **Safety**

Safety shall be ensured in accordance with contract conditions and specifications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[69]	25.09.2014

e) Procedure

Step-1: Specified tested coarse sand shall be collected at site in required quantity for sand blasting.

Step-2: Make available mechanical power driven air compressor in working condition at site with all required accessories for carrying out sand blasting as well as air blasting operations.

Step-3: Coarse sand shall be sprayed under pressure over the exposed surface so as remove all loose and foreign material and to cause an intense abrading of the reinforcement and removal of rust from entire surface of reinforcement to achieve shining bright surface. The sand blasted surface shall be subsequently cleaned with oil free air blast.

7.6 Providing drilling and inserting nipples along crack lines

a) Purpose

To fix injection nipples and seal the remaining portion of honey combed or cracked concrete /masonry for grout injection.

b) Materials and T&P

12 mm diameter approved PVC/aluminium /Galvanised Iron nipples, Chisel, hammer, power driven tool for chase cutting & drilling, hand operated blow out pump, sealing putty of polyester/epoxy/polymer modified mortar etc. and all related accessories and materials.

c) Testing

The sealing putty and the nipples shall be tested to conform to the manufacturers specifications. The power driven tools shall be test driven and their drill/cutting bits shall be tested for effectiveness before taking up the repair operation.

d) Procedure

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Personnel, Supervision, Product delivery, Storage and Handling etc.

Step-2: Identify the Cracks and mark the area for injection grouting.

Step-3: Prop & support the structural member, if required, to relieve it of stress and strains.

Step-4: Open up cracked surface by making 'V' notch or groove of size 12 mm x 12mm.

Step-5: Remove plaster, if required, to identify and mark the honey combed area.

Step-6: Drill holes at least 25 mm diameter and 40mm deep along crack lines at spacing of 300 mm or thickness of the structural member, whichever is less. In

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[70]	25.09.2014

honey combed area @ 9 nos per sqm. as directed by Engineer-in-Charge and up to 30 mm to 40 mm depth.

Step-7: Remove coarse debris and dust in opened up cracks and drilled holes by blowing oil free compressed air, if available with air compressor, otherwise with hand operated blow out pump. Concrete surfaces required to be grouted shall be free from all loose and unsound materials by means of mechanical abrasion using stiff wire brushes, after removing all loose areas with chisel and hammer. Area shall be made free from any deleterious materials, such as oil dust dirt etc. by means of oil free jet of compressed air. All prepared concrete surfaces shall be thoroughly inspected and got approved by the contractor.

Step-8: Insert 12mm dia specified injection nipples in holes drilled along crack lines and fix them by sealing only its sides with epoxy or polymer modified mortar.

Step-9: Seal the crack or the honey combed surface between the nipples by polymer modified mortar as may be approved by Engineer-in charge. The polymer used shall be of approved grade and applied as per specifications mentioned separately elsewhere. The polymer-modified mortar shall be moist cured for 1-3 days and allowed to gain strength before actual grouting commences.

7.7 Sealing of cracks by injection of advance grout

a) Purpose

To inject the specified grout into honeycombed or cracked concrete/ masonry

b) Materials and T&P:

Cement, sand. Water and admixture for cementitious grout shall be as per clause 5 of this specification.

Polymer: It shall be as specified and shall conform to ASTM-C-1059.

Hand/power operated grouting pressure pump/gun with pressure gauge. The grouting equipment shall be capable of supplying, mixing, stirring and pumping grout to the satisfaction of the Owner. The equipment shall have the capacity to inject grout at a pressure upto 7 kg per square centimeter measured at the grout connections. It shall be capable of mixing and pumping of cement sand grout 1:2 with water cement ratio ranging from 0.5 to 1.

Air compressor with all related accessories for carrying compressed air to the required location. Hand operated blow out pump may be allowed by Owner for small crack depths/areas.

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions), Mechanical blender for mixing, Spray equipment/brush for application of polymer modified/ bonding cement slurry

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[71]	25.09.2014

c) Execution:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured material (e.g. specified resin, hardener, polymer, cement, etc as may be required) shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the storage period shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3: If directed by Owner, collect random samples of materials for test and send to approved laboratories so as to ensure that they satisfy the physical and mechanical properties. The grout pump and the pressure gauge shall be tested before taking up the repair operation.

Step-4: Identify the Cracks and mark the area for injection grouting.

Step-5: Surface Preparation: The appropriate propping/supporting, surface preparation and crack sealing as per site requirements shall be completed, which may sequentially cover one or more of the following items of work:

- Prop & support the structural member to relieve it of stress and strains.
- Provide grouting nipples.

Step-6: Blow the compressed air followed by washing with water through nipples located at the highest level and downwards to ensure removal of even fine dust particles from the cracked surface, which could obstruct the free flow of grout material and impede its bonding with cracked surface (and drying with air blast wherever epoxy injection grout is to be used).

Step-7: Saturate the cracked surface in the vicinity of crack/honeycombed concrete/ masonry with water (but without excess water), only if the cementitious grout is to be injected. Otherwise, this step may be skipped.

Step-8: Prepare the injection grout as specified under clause 5 of this specification.

Step-9: Inject the approved & specified grout into the cracks by means of suitable gun or pump at a pressure of 1- 2 kg./cm² for epoxy grout and 4-7 kg./cm² for cementitious grout. In case of vertical cracks injection shall be started at the lowest nipple and continued until the injected grout begins to flow out at the next higher nipple. Whereas in other cases of horizontal locations, the injection shall be started from one nipple and continued until the injected grout begins to flow out at the other nipple.

The first nipple shall then be closed off and injection continued at the second until the grout flows out at the third. The process shall be repeated until the whole of the crack has been sealed. As soon as the system is cured, the nipples shall be cut.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[72]	25.09.2014

In case of Honeycombed Area, each grout hole shall be grouted individually. Grouting pressures to be used in the work will vary with the conditions encountered and different areas and the pressure used shall be between 1 to 4 kg/cm². The sequence of injection shall be as per the direction of Engineer-in-Charge.

7.8 Providing and inserting shear key bars

a) Purpose

Shear key bars are used for providing a structural connection of the applied repair material with the substrate/parent surface for transfer of forces occurring at the interface.

b) Materials and T&P:

Epoxy cartridges and specified lengths and diameter of steel reinforcement.

Standard Power driven drilling/hammering equipment, Hand operated blow out pump, brushes, epoxy dispenser, epoxy cartridge holder, disposable PVC mixing nozzle for epoxy, and any other incidental accessories and T&P items.

c) Procedure

Step 1: Mark the locations of shear keys and get the same approved for structural connection from the Owner.

Step 2: Drill holes to specified depth and diameter in concrete at marked locations for the specified dia of shear key bars.

Step 3: The drilled hole in dry state shall be cleaned with round brushes and by blowing air through a tube inserted in the hole and connected to hand operated blow out pump.

Step 4: Inject epoxy from the foil pack with the help of epoxy dispenser, epoxy cartridge holder and disposable PVC mixing nozzle inserted inside the drilled hole to fill it from bottom of the hole and upwards.

Step 5: Insert the reinforcing bar and allow the epoxy adhesive to cure.

7.9 Reinforcement for RCC works etc.

a) Purpose

To provide reinforcement in repair concrete for structural purposes, controlling effects of thermal variation or holding shotcrete/gunite material in position. The reinforcement material may comprise specified grade and quality with or without zinc coating.

b) Material & T&P:

Specified reinforcing material, necessary hand or power driven tools for cutting, bending, binding, transportation, handling and placement etc. Reinforcement bars if used shall conform to I.S. 432 (Part-I) or I.S. 1786. Welded wire fabric where used shall conform to I.S. 1566.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[73]	25.09.2014

c) Procedure

The general requirements, placing in position, measurement etc. shall be generally followed as in clause 4 of this specifications excepting those specifications provided in the following clauses.

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Testing of Material: The requisite number of test specimens of specified reinforcing material shall be collected from each batch of manufacture or supply received (whichever is less) for these to be tested for conformance to the specified requirements before use on the work.

Step-3: Execution:

The required reinforcement as per approved detailed drawings in the form of round bars or welded wire fabric in such a way so as to cause the least interference with placement of repair material.

d) Overlaps:

Lapped reinforcing bars shall not be tied together. They shall be separated by at least 50 mm wherever possible. Wire mesh shall be lapped by 1-1/2 squares in all direction. Minimum requirement of lap length of bars shall be as specified in I.S. 456.

e) Clearance around reinforcement:

Sufficient clearance shall be provided around the existing exposed and additional reinforcement to permit complete encasement with sound repair material.

f) Cover:

Minimum cover to reinforcement shall be as specified under clause 4 or as per I.S. 456. As far as possible the bars shall be arranged so as to permit shooting from opposite side.

g) Fixing:

Reinforcement shall be fixed to existing shear key bars and depth gauges driven into the concrete with wires and secured rigidly so that the vibration resulting from the deposition of repair material shall not impair or displace them.

h) Where Gunite /shotcrete to be done in more than one layer

In such cases, the additional reinforcement should be so fixed that it is encased in succeeding layer. No additional reinforcement is required to be fixed in first layer of gunite.

Mesh reinforcement shall be fixed in the manner so that it is firmly held at least 12 mm away from the parent concrete surface as well as from the final finished surface. It shall be ensured that it is stiffened enough and cannot belly out during the guniting / jacketing / concrete overlays with consequent lack of cover. It shall be done by tying with parent concrete surface through shear key

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[74]	25.09.2014

bars or depth gauges. GI-wire mesh fabric will add sacrificial "Zinc" coating & shall reduce corrosion process in the reinforcement. The wire mesh spacing shall be as specified in the drawings.

7.10 Alkaline Passivating bond coat over Reinforcement

a) Purpose

To protect steel reinforcement with a passivating alkaline layer provided all around its circumference along the length with strong adhesive to bond with applied repair concrete or mortar.

b) Materials and T&P:

Specified alkaline passivating & bonding materials e.g. CPCC material, epoxy, epoxy phenolic IPN-RB or specified polymer and cement, mixing water, necessary T&P for mixing and applying bond coat e.g. brush, mechanical mixer, mechanical stirrer, etc.

Epoxy Adhesives shall conform to ASTM C-882.

Polymer Latex shall conform to ASTM C-1059.

Cement shall be ordinary Portland cement conforming to IS: 269.

Patented materials e.g. CPCC or epoxy-phenolic IPN-RB as per licensee's specifications

c) Execution:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured repair materials shall be received at site in factory sealed containers with labels legible and intact, if the shelf life so permits. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3: Prepare the surface for treatment.

Step-4: Thoroughly inspect all the concrete surfaces prior to applications of passivating/ bond coat and get approved from the Engineer-in-Charge.

Step-5: Test the materials by taking random samples and testing in approved laboratories so as to check whether they satisfy the physical and mechanical properties.

Step-6: Make available at site all necessary mechanical equipment as under:

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions),

Mechanical blender for mixing

Brush for application of specified and approved passivating/bond coat.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[75]	25.09.2014

Step-7: Material Mixing: Components of the passivating/ bond coat mix shall be weigh batched and mixed in specified proportions in a clear container free from harmful residue or foreign particles. The components shall be thoroughly blended with a mechanical mixer to a uniform and homogeneous mixture. Small batches (upto 1 litre) may however be allowed by manual mixing using spatulas, palette, knives etc.

Step-8: Material Application: The alkaline passivating & bonding material shall be applied to prepared reinforcement substrate after tying in new reinforcement wherever specified in the form of bars or welded wire fabric. It shall be applied to reinforcement surfaces by stiff nylon bristle brush. The coating material shall be worked well all round the periphery and along its exposed length using a stiff brush ensuring that no pinholes are remaining. The second coat, if required, the same shall be applied as per manufacturer's recommendation after the first coat is touch dry.

7.11 Bonding coat for hardened concrete with repair concrete/shotcrete/cement mortar

a) Purpose

To provide adequately strong adhesion of parent concrete with applied repair concrete or mortar.

b) Materials and T&P

Specified bonding materials e.g. epoxy or polymer and cement, mixing water, necessary T&P for mixing and applying bond coat e.g. brush, spray gun, mixer, mechanical stirrer, etc.

Epoxy Adhesives shall conform to ASTM C-882

Polymer Latex shall conform to ASTM C-1059.

Cement shall be ordinary Portland cement conforming to IS: 269.

c) Execution

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured repair materials shall be received at site in factory sealed containers with labels legible and intact, if the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer- in-Charge Full quantity shall be worked out as theoretically required for consumption in the whole work

Step-3: Prepare the surface for treatment.

Step-4: Saturate the surface with water but shall be free of excess surface water, debris and dust, where cementitious bond coat is to be applied. Otherwise, surface to remain dry and clean of debris and dust.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[76]	25.09.2014

Step-5: Thoroughly inspect all the concrete surfaces prior to applications of adhesive and get approved from the Engineer-in-Charge.

Step-6: Test the materials by taking random samples and testing in approved laboratories so as to check whether they satisfy the physical and mechanical properties.

Step-7: Make available at site all necessary mechanical equipment as under:

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions), Mechanical blender for mixing Spray equipment, brush for application of epoxy, polymer modified, bonding cement slurry.

Step-8 Bond Coat Mixing: Components of the bonding coat mix shall be weigh batched and mixed in specified proportions in a clear container free from harmful residue or foreign particles. The components shall be thoroughly blended with a mechanical mixer to a uniform and homogeneous mixture. Small batches (upto 1 litre) may however be allowed by manual mixing using spatulas, palette, knives etc.

Step-9 Bond coat application for jacket concrete/ shotcrete/ Mortar placement: The specified adhesive shall be applied to concrete surface at atmospheric temperatures below 40°C for epoxy adhesive and below 30°C for polymer modified cement or cement-sand slurry adhesive. Bonding coat shall be applied by spray equipment or stiff nylon bristle brush as approved by Engineer-in-Charge. The bonding material shall be worked well into the surface of the parent body ensuring that no pinholes are visible.

Polymer modified bonding cement slurry shall be applied to a thickness not in excess of 2 mm.

If necessary, a second coat shall be applied at right angles to the first to ensure complete coverage and absence of pin holes.

All concrete surface shall be well protected beyond limits of surface receiving adhesive against spillage.

Step-10 Repair Material Application: Fresh plastic concrete/ shotcrete/ mortar shall be applied while adhesive is still tacky and well within the pot-life/ setting period. If adhesive cures to the extent of losing its tack or has set before plastic concrete/shotcrete/mortar is placed, the same shall be removed or slightly abraded and second coat of adhesive applied. Freshly placed plastic concrete shall be thoroughly consolidated to ensure full bonding of new concrete with the substrate.

d) Bond of repair with parent concrete:

Evaluate bonding of fresh concrete/ shotcrete/ mortar to existing concrete after the fresh material has cured for not less than 7 days by sounding and tapping fresh concrete with a blunt metal instrument to the satisfaction of Engineer-in-charge. Suspect inadequate bonding, if a hollow sound is detected in any area.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[77]	25.09.2014

In case of conflicted location contractor shall extract one core from the repaired surface area at the end of 28 days.

Conduct one core test at random for checking the bond, for every 100 square metre or part thereof. The contractor shall core each area after 28 days of application of concreting/ shotcreting/ repair mortar application for determination of bonding adequacy.

Core drilling shall be done through applied repair material and into the existing concrete. Core diameter shall be not less than three times the nominal size of the coarse aggregate used in repair material or as required by the Engineer-in-Charge. Length of cylindrical cores shall preferably be twice the core diameter or twice the thickness of applied repair material or as instructed by Engineer-in-Charge but in any case not less than the dia of the core.

Cores shall be visually inspected by Engineer-in-Charge for evidence of poor workmanship.

Cores shall be tested in tension to evaluate the quality of bond between new concrete/shotcrete/mortar and the parent concrete. If the failure is in the parent concrete the bond of new repair material shall be deemed to be satisfactory.

Failure at the bond line or in the repair material shall be concluded as lack of proper bond or inadequate strength of repair mortar

Dismantle such areas of work failed in bond or repair material and re-prepare the surface after chipping off new concrete/mortar work and abrading the epoxy/polymer/cement slurry interface. Nothing for testing concrete for bond between old and new concrete shall be paid separately.

7.12 Curing of RCC Surfaces etc

a) Purpose

To ensure satisfactory hydration of cement by retaining or replenishing the mixing water lost due to natural drying and evaporation process for a specified period through exposed cementitious surfaces of the freshly placed cement mortar/ concrete.

b) General

Importance of wet curing to all items of work involving use of cement can not be over emphasised. Any surface experiencing discontinuity of dampness of surface with any patch having dried out during the specified period of curing, it shall be prominently marked with lime or other suitable prominent colour.

c) Materials and T&P:

Curing compound, brush or hand operated spraying gun and all other related accessories for application on Concrete/Plastered Surface.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[78]	25.09.2014

d) Procedure:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of specified manufactured material shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out theoretically for consumption in the whole work.

Step-3

- **Moist Curing:**

Cover all exposed surface of concrete, when the concrete begins to harden i.e. two to three hours after compaction with moist gunny bags or any other material approved by the Owner.

Keep the exposed surfaces continuously damp after its final setting (i.e. after a maximum of 8 hours of concreting) by ponding with a sheet of water or by covering with a layer of sacks, canvass, hessian or similar water absorbent materials constantly kept wet by water sprinkling for at least 7 days, where ordinary portland cement is used and 10 days, where portland pozzolana cement is used from the date of placing of concrete. For concrete work with other types of cement, curing period shall be as per manufacturer's recommendations or as directed by the Owner.

- **Using Curing compound:**

Testing of Materials:

It must be ensured that curing compound should neither affect the strength nor the surface of concrete. It shall not leave any undesirable stains on surface to affect the bond of plaster or other finishes to be applied later. It should be soluble in water, so that it can be removed by splashing or washing with water without scrubbing the surface.

Test for Efficacy:

The testing of curing compounds shall be done from each lot of curing compound received at site by casting two sets of 15 cm cubes with each set having 6 cubes. One set shall be moist cured by covering with damp gunny bags and subsequently by immersing under water and the other set by applying curing compound on top after 2 to 3 hours of casting and subsequently on de-moulding apply on the remaining faces all around. The cubes shall be kept in an environment similar to which the actual structure is exposed for a period of 7 days after its casting. Three concrete cubes each from both sets shall be tested after 7 days for their crushing strength as per standard test procedure. The average crushing strength of cubes cured with curing compound shall be not less than 95% of the crushing strength of cubes cured under damp or immersion curing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[79]	25.09.2014

Test for Staining:

The set of three sample cubes applied with curing compound, remaining after 7-day cube crushing strength test, shall be washed with water with soft brush scrubbing with nylon bristles and allowed to dry for a period of seven days in an atmosphere with relative humidity not exceeding 40% at ambient temperature. The other set of three cubes cured for seven days under damp or immersion conditions shall also be kept for another seven days under identical humidity and temperature conditions. The surface of the two sets of such cubes shall be compared by closely observing for any visible stain and texture that may detrimentally affect its bond with subsequently applied plain plaster or aesthetic appearance. Such observations shall be recorded in three categories as no effect, slight effect and moderate effect. The curing compound shall be considered as acceptable in the 'no effect' category and unacceptable in the 'moderate' category. The decision of Engineer-in-Charge, which shall be final and binding, based on the likely use of finished surface of concrete/plaster shall determine the acceptability of the 'slight effect' category.

Concrete curing compounds, after testing satisfactorily for efficacy, may be used in lieu of moist curing with the permission of the Engineer-in-Charge. Such compounds shall be applied to all exposed surfaces of the concrete by spraying or brushing within two to three hours of casting and well within an hour of removal of formwork.

7.13 Engineered Steel Tubular double Scaffolding System

a) Purpose

To provide a scaffolding system with adjustable working platforms on the exterior of the building for the workmen to work upon any part of the area to be accessed safely and with ease for surface preparation, application of repairs and construction activity.

b) Materials

The standard proprietary tubular double scaffolding system of repute with all accessories, working platforms etc.

c) Design

It shall be designed for all the incidental dead, live and wind loads as per IS: 875 in steel tubular sections as per general design considerations governed by IS:800. The design of the scaffolding system shall cater to the safety features for the workmen.

d) Fabrication and Erection

Fabrication and erection shall be done as per the design brief and installation instructions of the proprietary firm. It shall be maintained in functional condition for the work duration.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[80]	25.09.2014

7.14 Temporary barricading using angle iron verticals and sheet panels

a) Purpose

To provide a barricading on ground to physically define the boundaries of the site of construction/repair activity for restricted entry of only those involved with the construction work.

b) Materials

Available Corrugated G.I. Sheet minimum 24 G thick; Framing structural material at least MS Angle iron of size [40x40x5mm] or equivalent.

c) Fabrication & Erection

Size of framing panel shall be decided depending upon site conditions and these could be approximately 2.0 metres long with height as 1.8 metre.

It shall be made up at least of two verticals, each with additional length of about 600 mm for fixing in to ground firmly and two horizontals equal to the length of panel.

It shall be made up by cutting the structural sections to size, shear punching holes in verticals and horizontals for nuts and bolts or making other suitable provision for receiving CGI sheet or other specified panelling material and connection of panel with adjoining panels.

Fabrication of frame of an individual panel shall be by welding at corners, welding MS plate at base of verticals or any other acceptable practice approved by Engineer-in-charge.

G. I sheet or other specified panelling material shall be suitably fixed. It shall preferably be done by means of nuts and bolts at its ends spaced at about 300 mm c/c transversely and at about 600 c/c longitudinally along corrugations. The corrugations of CGI sheet shall run along the shorter span of the panel.

In case of newly fabricated panels, these shall be painted with red oxide zinc chromate primer on steel work and approved primer on other material and at least one coat of paint of approved shade. In case of used panels, one coat of paint of approved shade shall be applied over the existing paint. The portion of verticals to be embedded in ground shall be suitably protected against rusting by painting it with bitumen or other suitable paint.

The fabricated panels shall be suitably fixed vertically and firmly in to the ground to the satisfaction of Engineer-in charge by maintaining a uniform height of about 1.8 metres above GL and connecting each panel with the adjoining panels with nut and bolts or other suitable means.

Suitable provision of frame/posts in the openings provided in barricading shall be made for receiving door shutter at locations as approved by Engineer-in-Charge.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[81]	25.09.2014

7.15 Temporary protective fabric screens

a) Purpose

To protect passersby from falling debris and also to protect the workmen and structure being repaired against direct exposure to sun.

b) Materials:

For screening purpose jute cloth, woven PVC cloth, geo-textile or wire-mesh as specified and approved by Engineer-in-Charge shall be used, which shall conform to their relevant BIS Code. Screen materials shall be fixed by suitable means comprising of M.S.Flats/ J-bolts /nails/clamps, etc with washer or any other suitable means on frames of existing scaffolding etc.

c) Procedure

Scaffolding, if required, comprising of verticals, horizontals and diagonal bracings of steel tubes shall be fixed over ground which is payable separately.

One end of the screening material, brought to site in looms/rolls, shall be properly fixed over top horizontal member with suitable means and suspended so as to cover the required area.

The vertical fall of screen shall be suitably fixed/firmed up at intermediate levels so as to keep it in position during the work duration.

Next strip of the screening material shall be fixed with its sides stitched or suitably jointed or lapped with the previous ones as approved by Engineer-in-charge.

Spacing of frame member of scaffolding shall be so selected that the sagging of screen shall not hinder the repair process.

The contractor shall maintain the protective screens in acceptable conditions for the entire work duration as required by the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[82]	25.09.2014

8 CONCRETE RETROFITTING METHODS

In selecting the retrofitting method, the current status of the existing concrete structure as determined through inspection, the performance of the structure, the performance required of the structure after retrofitting, the conditions for retrofitting construction work, the ease of maintenance, economy and other factors shall be considered.

At the stage of selecting the retrofitting method, the current status of the existing structure and its performance shall be obtained, and the performance required for the structure after retrofitting and the conditions for retrofitting work shall be determined. Factors that should be considered in selecting the method include the effectiveness of the various retrofitting methods with respect to the required performance improvements, the viability of execution of the retrofitting work, the impact of the retrofitting work on the surrounding environment, the ease of maintenance after retrofitting, economy and other factors.

Various retrofitting methods listed below shall be used for retrofitting objective:

8.1 Retrofitting of concrete members

a) **Continuous fiber reinforced plate bonding construction method:**

Bonding continuous fiber reinforced plates to the surface of the existing structure to restore or improve load-carrying capacity

b) **Continuous fiber reinforced plate jacketing construction method:**

Jacketing with continuous fiber reinforced plates around the periphery of the existing structure to restore or improve load-carrying capacity and deformation characteristics

c) **Prestressed concrete jacketing construction method:**

Placing pre-stressing wires and pre-stressing stranded steel wires in place of lateral ties around the periphery of existing member sections and using mortar and concrete to bond them in order to reinforce the structure. To increase the restraining effect of the inner concrete, the pre-stressing steel is generally stressed during placement.

d) **Pre-stressing introduction (internal cable) construction method:**

Using internal cables for the existing concrete members to provide pre-stressing and restore or improve the load-carrying capacity of the members.

e) **Repaving method:**

Replacing some or all of the existing concrete members with new members through the use of precast members or concreting on site to restore or improve load-carrying capacity.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[83]	25.09.2014

8.2 Retrofitting as a structural body

a) Beam (girder) addition method:

Adding beams between the main girders of the existing reinforced concrete deck to reduce the deck span and restore or improve the load-carrying capacity of the reinforced concrete deck.

b) Seismic wall addition method:

Placing new reinforced concrete walls between existing reinforced concrete rigid-frame bridge piers and bonding them to form a continuous unit in order to restore or improve the load-carrying capacity as a structural body.

c) Support point addition method:

Supporting the intermediate sections of the beams and other existing concrete members with new members to reduce the span of the members in order to restore or improve the load-carrying capacity as a structure.

d) Seismic isolation method:

Using seismic isolation bearings and the like to reduce the seismic energy applied to the structure in order to improve its various performance values during an earthquake.

8.3 Foundation retrofitting

a) Underground wall (beam) addition method:

Connecting the foundations with cast-in-site diaphragm walls and underground connecting beams to distribute stress and ensure the stability of the entire system.

b) Pile/footing addition construction method:

When pile foundations are damaged or there is residual displacement, adding piles or footings to increase the load-carrying capacity of the foundation.

c) Foundation improvement method:

Improving the ground around the foundation with cement improvement materials to improve the ground bearing capacity and horizontal foundation resistance. Also prevents excessive pore water pressure and liquefaction.

d) Steel sheet-pile coffering construction method:

Placing sheet-piles around the periphery of the footings and bonding them to the footings to improve bearing capacity and horizontal resistance.

e) Foundation compacting method:

When insufficient foundation bearing capacity is a concern due to scouring or the like, using concrete or the like to compact the ground around the foundation in order to restore bearing capacity.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[84]	25.09.2014

8.4 Repair of cracks and missing sections

a) **Cracks fill method:**

Forcing low viscosity resin and ultra-fine cement into the cracks in existing concrete members to seal the cracks.

b) **Fill method:**

Filling cracks, rock pockets, cavities, peeling and other small-scale missing sections in existing concrete members with resin and mortar to repair sections.

c) **Section repair method:**

Removing deteriorated or damaged portions of existing concrete members and then restoring these members to their original sectional status using materials with excellent bonding to existing concrete.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[85]	25.09.2014

9 SHORING AND UNDERPINNING

9.1 Material and Equipment

- a) The contractor shall furnish all materials, tools, equipment, facilities and services as required for providing the necessary shoring and underpinning work and facilities. Jack and jacking equipment shall be more than adequate for the imposed loads and shall be provided with calibrated gauges.
- b) Shoring and bracing materials
Provide heavy timber posts, beams, planks, boards, pipe struts, pin piles, and accessories as required.
- c) Lagging and sheeting material
Provide heavy timber boards, planking or sheeting as required. Lagging board shall be secured in place by steel H-piles, with boards inserted between the H-flanges.
- d) Underpinning Pier
An excavation pit, provided generally by manual excavation, which is carried to a pre-selected bearing surface and then filled with concrete to provide supplementary foundation support for the underpinning structure.
- e) Concrete
Refer clause 4 of this specification for concrete requirements.
- f) Grout
Refer to Clause 5 of this specification for Non-Shrink Grout requirements.
- g) Structural Steel
Refer to Clause 9 of this specification for Structural steel requirements

9.2 Execution

- a) Detection of Movement
 - For each existing structure that may be affected by the work, install settlement markers on each footing, building corners, wall or surrounding improvements to be monitored. Settlement markers shall be capable of being read to an accuracy of 1.52mm.
 - Take and record readings not less than once per week during performance of the work until the permanent structures is complete to the ground level.
 - Stop work; notify the Engineer, and take immediate remedial action if movement of the existing structure occurs during performance of the work.
 - Upon completion of the work, take weekly readings of the measurement points for a period of 4 weeks or longer if movement persists, and report the results to the Engineer.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[86]	25.09.2014

- The detection of movement shall be performed by a qualified licensed land surveyor or civil engineer.

9.3 Shoring and Underpinning

- Existing footings, foundations, pile caps, grade beams, retaining walls, or pavement which may be affected by excavation operations shall be shored or underpinned adequately or otherwise protected against settlement and shall be protected against lateral movement.
- Provide soldier piling, lagging and sheeting, tie-backs, slurry diaphragm wall, and cementitious grouting, as required, to hold back earth at excavations and as required to prevent cave-ins and earth sloughs.
- Footings, foundations, pile caps, grade beams, retaining walls, or pavements which have been undermined by earthwork and pile-driving operations shall be filled and supported with concrete extended to undisturbed bearing earth or bedrock.
- Concrete may be placed as a stiff mix of minimum slump (dry pack), or concrete may be pneumatically placed (shotcrete), or concrete may be placed by conventional methods with concrete formed to hold it in proper position.

9.4 Concrete Piers, Walls and Pile caps

- Install concrete underpinning piers, walls, and pile caps as indicated, with the bottom at the indicated or bearing elevation and the top approximately three inches below the structure to be underpinned. Dry pack the space within three days after concrete placement is completed.
- Where earth forms are indicated, install waterproof building paper or board between the earth and concrete to prevent water loss from the fresh concrete.
- Do not remove support of existing structure until concrete piers, walls, or pile caps have attained design strength.

9.5 Piles and Caissons

- Install pipe pile shells or drilled shafts at locations indicated, and extend from underside of existing footings to indicated elevations, plus additional penetration if required to develop the design working load of the pile or caisson.
- Distribute jacking reactions over the existing structure in a manner that will not overstress or deflect the existing structure.
- Weld splices where indicated. Provide watertight welds capable of developing the full strength of the pile or caisson. Align splices to ensure the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[87]	25.09.2014

straightness of the pile from top to tip. Use outside sleeves and backup rings as necessary.

- Where the pile tip is below the ground-water table, maintain the elevation of the water inside the shell at approximately the elevation of the ground-water table during installation of the shell.
- After installation of the shell, apply the full design-working load to the empty pile shell and maintain until there is no measurable settlement over a one hour period.
- Maintain the excavation within the pile shell approximately 12 inches above the tip during driving, and dewater pile shells prior to filling with concrete in a manner which will prevent loss of earth or soil at the tip. An earth plug may be left in the pile tip or a concrete plug may be placed and cured prior to dewatering pile shells.
- After load testing to the design load, dewatering, and inspection of the shell by the Engineer, fill accepted pile shells with concrete in the presence of the Engineer. Keep an accurate record of the volume of concrete deposited in each pile. Deficiencies revealed by comparing the volume of the inside of the pile with the volume of placed concrete will be cause for rejection of the pile or correction of the deficiency.
- Securely wedge in place with steel wedges those piles that have satisfied the load-testing requirements. Weld and encase in concrete all wedges, plates, wedging struts and piles, as indicated or required.
- Following completion of load transfer of underpinned structures, fill the underpinning pits with concrete as indicated. Provide reinforcement, shear keys, dowels, and water stops as indicated or required. Place concrete to within 3 inches of the underside of the existing foundation. After three days, dry pack the space between the foundation and concrete.

9.6 Load testing of piles and acceptance criteria

- After the concrete within the pile or shaft has set for at least 24 hours, test each pile or pier by jacking to a load equal to 150 percent of the design-working load of the pile. Maintain the load until there is no measurable settlement of the pile over a one-hour period.
- Load-test piles in sequences and groupings that will minimize or eliminate eccentric loadings on the existing foundation and piles.
- Piles will be rejected and shall be retested if, in the opinion of the Engineer, there is a danger of unequal loading.
- Should the existing structure fail to furnish sufficient reaction to installed underpinning piles to the test loads specified, provide additional reaction to prevent damage to, and movement of, the structure during installation of piles, and to obtain specified underpinning test loads. The additional reaction shall not detrimentally affect the structure.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[88]	25.09.2014

- Maximum out-of-plumb tolerance for installed piles: two percent.
- Maximum offset of top of pile from the design center: 3 inches.

9.7 Fill and backfill

Provide engineered fill and backfill in accordance with Clause 3 of this specification, after acceptance of the underpinning by the Owner.

9.8 Temporary Supports

Install temporary supports where necessary to support structures to be underpinned and those that will be affected by underpinning and restoration work.

9.9 Restoration

Restore existing structures to conditions equivalent to those existing prior to the start of shoring and underpinning work, including repair of any settlement-related damage.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[89]	25.09.2014

10 STRUCTURAL STEEL WORK

Design of structural steel work shall include generally but not be limited to the steel constructions listed below:

- Steel building structure and open structures including beams, columns, bracings, supporting structures for floors, roof slabs, cladding etc.
- Hoist & monorail supporting beams etc.
- Coal conveyor galleries, trestles, transfer house, pent house, crusher house, wagon Tippler, Track hopper etc.
- Platforms and walkways
- Ladders, staircases, handrails, etc.

10.1 Design

(a) General

Concrete floors shall be considered to provide continuous lateral support to the top (compression) flange of the support beams. However where large cut outs are to be provided in the floor slabs horizontal floor bracing shall be provided. Grating / Chequered plate floor shall neither be considered to provide lateral support to the top flange of supporting beams nor to provide a shear diaphragm. Adequate lateral support and horizontal bracing shall be provided as required in such cases.

Floors for vibrating machines of all kind together with supporting framework shall be adequately braced in both horizontal and vertical planes. Floors or structure supporting mechanical equipment shall be designed to minimize vibration, avoid resonance and maintain alignment and level.

(b) Design of structure

The Design of steel structures shall be done by Working stress or Limit state method, in accordance with the provisions of IS: 800 and other relevant IS codes as applicable to specific structures. Basic consideration for structural framing shall be stability, rigidity, building usage, ease of fabrication / erection and overall economy. Additional bracings / moment connections shall be used to assure stability of structures. Structure shall be designed such that the surfaces of all parts shall be accessible for inspection, cleaning, painting and maintenance. Most of steel superstructure shall be designed as simple space frame structures. Simple space frame design utilizes single-span beam systems, vertical diagonal bracing at main column lines and horizontal bracing at the roof and major floor levels.

Large span built-up girders shall be single web plate girders of welded construction with bearing and intermediate stiffeners. For lifting / monorails beams ISMB sections shall be preferred and the bottom flange of all beams shall be checked separately for distortion and reinforced suitably if required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[90]	25.09.2014

Columns shall be designed to support the load combination which results in maximum interaction ratio. Exterior columns shall be designed to resist moments due to wind & seismic. Columns shall also be designed to resist moments caused by discontinuous vertical bracing or non-concentric bracing work points. Column base can be fixed or pinned. Lateral forces shall be resisted by rigid jointed moment connections in rigid frame design. For design which requires the use of the minimum column load (such as, uplift on anchor bolts, column axial tension, etc.) use 90 % of the column dead load and no live load. Uplift forces from vertical bracing and Wind uplift on the roof shall be included where applicable.

Permissible stresses for different members shall not be allowed to exceed by 33.33 % under wind and seismic conditions. However, members who shall be designed primarily to resist wind load such as bracing members, no increase in permissible stresses will be permitted. However, permissible stresses in bolts and welds shall be allowed to exceed up to 25 % only.

Base plates shall be placed on foundation pedestal with grouting. For large base plates necessary grout holes shall be provided. All anchor bolts for fastening steel columns on foundation shall be embedded in foundation during concreting itself. No anchor pockets in foundation shall be allowed. Design of base plates shall be based on design pressure on foundation which shall not exceed the following:

Pedestal in concrete grade M30 7.50 N/mm²

The total horizontal shear force at the base of column is transferred to the column pedestals through friction between the base plate and the grout. A coefficient of friction of 0.30 shall be used in conjunction with the minimum column load. If the horizontal shear force exceeds the frictional resistance force or if the column is subjected to a net uplift load, the total force shall then be transmitted through shear bars / shear keys welded to the base plate. Anchor bolts are not assumed to resist any horizontal shear force. Necessary recesses shall be kept in the foundation concrete for shear lugs.

Static analysis of overhead conveyor galleries upto a span of 24 m is allowed. However dynamic analysis shall be carried out for overhead conveyor galleries exceeding 24 m span.

For equipments, the bolt shall be either embedded or placed inside the pedestal and grouted with non-shrink grout.

The following criteria shall be followed for posting loads on the design drawings. For vertical beam reactions, the load shall be posted whenever the value exceeds the maximum allowable uniform distributed load. For axial loads in floor beams, the actual horizontal load which the beam end connection must resist shall be posted for each end of the beam. Note that this value may be different for opposite end of the same beam. For truss members, only one member force shall be noted for each member.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[91]	25.09.2014

(c) Permissible deflections

The permissible deflections of various steel members under normal loading conditions shall be as specified below. For calculation of deflections in structures and individual members dynamic effects shall not be considered, unless specified otherwise. Also, no increase in deflection limits shall be allowed when wind or seismic loads are acting concurrent with normal loading conditions.

• **Vertical deflection**

a) For beams supporting dynamic equipment	Span / 500
b) For beams supporting floors / masonry	Span / 325
c) For beams supporting pipes (pipe racks)	Span / 400
d) For roofing and cladding components	Span / 250
e) For gratings and chequered plates	Span / 200 subject to a maximum of 6 mm
f) Coal conveyor gallery bridges	Span / 450

For crane gantries or any member subjected to working loads, the maximum deflection under dead load and live load excluding impact shall not exceed the following values:

For manually operated cranes and monorails : Span / 500

For electric overhead cranes

- i) Up to 50 t capacity : Span / 750
- ii) Over 50 t capacity : Span / 1000

• **Horizontal deflections**

The permissible horizontal deflections shall be as per following unless specified otherwise:

a)	Single storey building (without crane load)	Height / 325
b)	Multistoried building (without crane load)	Height / 500
c)	Pipe rack columns	Height / 200
d)	Open Structures	Height / 200
e)	Crane gantry girder due to surge	Span / 2000 limited to maximum of 15 mm
f)	Building main columns at crane rail due to action of crane surge load only	Height / 2500 limited to level maximum of 10 mm
g)	Open gantry columns at crane rail level due to action of crane surge load only	Height / 4000 limited to maximum of 10 mm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[92]	25.09.2014

h)	Coal handling trestles	Height/1000
----	------------------------	-------------

Provisions of IS: 800 and relevant latest IS Codes shall be followed for limiting deflections of structural elements not listed above.

(d) Minimum thickness and size of steel elements

• **Minimum Thickness**

The minimum thickness of various components of a structure and hot rolled sections shall be as follows. The minimum thickness of rolled shapes shall mean flange thickness regardless of web thickness. Structural steel members exposed to significantly corrosive environment shall be increased suitably in thickness or suitably protected otherwise as per good practice and sound engineering judgement in each instance.

Trusses, purlins, girts and bracing	6 mm
Columns and beams	8 mm
Gussets	8 mm
Stiffeners	8 mm
Base plate	10 mm
Chequered plates	6 mm o/p
Grating flats	5 mm

Minimum thickness of structural members other than gratings and chequered plate directly exposed to weather and inaccessible for painting and maintenance shall be 8 mm.

Chequered plate shall conform to IS: 3502 (latest) and minimum thickness of chequered plate for floorings, covers etc shall be 6 mm.

• **Minimum Sizes**

The flange width of purlins supporting light weight concrete slab shall not be less than 65 mm and for those supporting roof sheeting and wall cladding it shall not be less than 50 mm. Width of steel rolled section connected to other member shall be at least 50 mm. The depth of beams for platform of all structures shall not be less than 125 mm.

(e) Slenderness and depth ratios

The slenderness ratio of main members in tension, compression or bending shall be in accordance with IS: 800.

The following limiting ratios of depth to span shall be considered as a general guide.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[93]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

Truss	1 / 10
Rolled beams and girders for Ordinary floors and rafters	1 / 24
Supporting floor beams for vibrating Machines / equipments	1 / 15
Roof purlins and girts	1 / 45
Gable columns	1 / 30

(f) Design of Connections

Welding will be done in accordance with the recommendations of IS: 816 and IS: 9595.

Shear connections will be designed for 75 % of section strength for rolled sections and 80 % of section strength for built up section or rolled section with cover plates. Designed shear force shall be more than actual shear. Moment connections between beam and column will be designed for 100 % of moment capacity of the beam section.

All butt welds will be full penetration butt welds.

Size of fillet weld for flange to web connection for built up section will be as follows:

- i) Able to take full shear capacity or actual shear whichever is more for box section
- ii) Able to take 80 % of full shear capacity or actual shear (if indicated in drawings) or shall be 0.5 times of the web thickness whichever is more. For I-section Weld will be double fillet
- iii) All welds will be continuous. The minimum size of the fillet weld will be 6 mm as per relevant IS code

Connection of vertical bracings with connecting members will be designed for full tensile capacity of the bracings. The connection between top flange & web of built-up girder will be full penetration butt weld & for bottom flange, connection may be fillet weld.

Connection of base plate & gusset members with the columns will be done considering that total load gets transferred through weld.

Splicing

All splicing work will be full strength. Field splicing will be done with web / flange cover plates. For, exceptional cases the field splicing will be designed for 50 % of load carried by the cover plates and remaining 50 % load through full penetration butt weld. Shop splicing for all sections other than rolled will be carried out by full penetration butt welds with no cover plates. Splicing for all rolled sections will be carried out using web and flange cover plate. For design efficiency of site weld shall be considered as 80 %.

Insert plates

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[94]	25.09.2014

Insert plates shall be designed / checked for shear and bending moment. All lugs shall be checked for tension. Bond strength of concrete shall also be checked. Lugs using steel bars shall preferably be fillet welded to the plate to transfer full strength of the lug.

10.2 Fabrication

(a) General

Fabrication drawings shall be prepared according to the provision of IS: 800, IS: 813, IS: 816, IS: 9595, IS: 1367 and IS: 9178.

The work to be provided by the Bidder, unless otherwise specified elsewhere in the contract, shall include, but not be limited to the following:

- i) Preparation of complete detailed fabrication drawings and erection marking drawings required for all the structures covered under the scope of the contract based on design drawings submitted by the Bidder and approved by the Owner/Consultant.
- ii) To submit revised design with calculations and detailed fabrication (drawings in case any substitution of the designed sections are to be made.
- iii) To submit design calculations for joints and connections developed by the Bidder along with detailed fabrication drawings.
- iv) Furnish all materials, labour, tools and plant and all consumables required for fabrication and supply, all necessary bolts, nuts, washers, tie rods and welding \ electrodes for field connections. The field connection materials supplied by the Bidder shall be to the extent of actual requirement plus 10 % (ten percent).
- v) Furnish shop painting of all fabricated steelwork as per requirements of this Specification.
- vi) Suitably mark, bundle and pack for transport all fabricated materials.
- vii) Prepare and furnish detailed Bill of Materials, Drawing Office Dispatch lists, Bolt List and any other list of bought out items required in connection with the fabrication and erection of the structural steelwork.

(b) Conformity with Design

Except where the standard connection details are furnished, the Bidder shall design all connections, supply and fabricate all steelwork and furnish all connection materials, Shear connectors / shear lugs on the beams in accordance with the approved drawings and / or as instructed by the Owner/Consultant Keeping in view the maximum utilization of the available sizes and sections of steel materials. The methods of painting, marking, packing and delivery of all fabricated materials shall be in accordance with the provisions of the contract and / or as approved by the Owner/Consultant. Provision of all relevant Indian Standard Specifications and Codes of Practice shall be followed unless otherwise specified in the contract.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[95]	25.09.2014

(c) Quality control

The Bidder shall establish and maintain quality control procedures for different items of work and materials to the extent he deems necessary to ensure that all work shall be performed in accordance with this specification. In addition to the Bidder's quality control procedures, materials and workmanship at all times shall be subjected to inspection by the Owner/Consultant. As far as possible, all inspection by the Owner/Consultant shall be made at the Bidder's fabrication shop whether located at Site or elsewhere. The Bidder shall co-operate with the Owner/Consultant in permitting access for inspection to all places where work shall be done and in providing free of cost all necessary help in respect of tools and plants, instrument, labour and materials required to carry out the inspection. The inspection shall be so scheduled as to provide the minimum interruption to the work of the Bidder.

Materials or workmanship not in reasonable conformance with the provisions of this Specification may be rejected at any time during the progress of the work.

The quality control procedure shall cover but not be limited to the following items of work

- a) Steel Quality, manufacturer's test certificates, test reports of representative samples of materials from unidentified stocks if permitted to be used.
- b) Bolts, Nuts Manufacturer's certificate, dimension & Washers checks, material testing.
- c) Electrodes Manufacturer's certificate, thickness and quality of flux coating.
- d) Welders .Qualifying Tests
- e) Welding sets Performance Tests
- f) Welds Inspection, X-ray, Ultrasonic tests
- g) Paints Manufacturer's certificate, physical Inspection reports
- h) Galvanizing Tests in accordance with IS: 2633 and IS: 4759.

(d) Materials

If desired by the Owner/Consultant, Test Certificates of materials supplied by the Bidder in respect of each consignment shall be submitted in triplicate. Whenever the materials are required to be used from unidentified stocks, if permitted by the Owner/Consultant, a random sample shall be tested at an approved laboratory from each lot of 50 tonnes or less of any particular section.

Materials for main and secondary members shall be selected in line with good engineering practice and shall be arranged within any structure with due regard for maintenance of the structure and Plant and Equipment supported or sheltered by the Structure and also with regard to corrosion.

All steel materials shall be free from all imperfections, mill scales, slag intrusions, laminations, pitting, rusts, etc. that may impair their strength, durability and appearance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[96]	25.09.2014

All rolled steel shall conform to the requirements of the Indian Standards.

- i) Structural Steel will conform to IS: 2062 Grade-A for rolled steel members or plates up to 20 mm thickness.
- ii) For plates above 20 mm thickness and welded construction, steel conforming to IS: 2062 Grade-B will be used.

(e) Workmanship

All workmanship shall be equal to the best practice in modern structural shops, and shall conform to the provisions of IS: 800 and other relevant Indian Standards or equivalent.

Straightening Material

Rollled materials before being laid off or worked, must be clean, free from sharp kinks, bends or twists and straight within the tolerances allowed as per IS:1852. If straightening is necessary, it may be done by mechanical means or by the application of a limited amount of localized heat. The temperature of heated areas, as measured by approved methods, shall not exceed 600°C.

Cutting

Cutting shall be affected by shearing, cropping or sawing. Use of a mechanically controlled gas cutting torch may be permitted for mild steel only. Gas cutting of high tensile steel may also be permitted provided special care is taken to leave sufficient metal to be removed by machining, so that all metal that has been hardened by flame is removed. Gas cutting without a mechanically controlled torch may be permitted if special care is taken and done under expert hand, subject to the approval of the Owner/Consultant.

To determine the effective size of members cut by gas, 3 mm shall be deducted from each cut edge. Gas cut edges, which will be subjected to substantial stress or which are to have weld metal deposited on them, shall be reasonably free from gouges. Occasional notches or gauges not more than 4 mm deep will be permitted. Gouges greater than 4 mm that remain from cutting shall be removed by grinding. All re-entrant corners shall be shaped notch-free to a radius of at least 12 mm. Shearing, cropping and gas cutting shall be clean, reasonably square and free from any distortion.

Planning of Edges

Planning or finishing of sheared or cropped edges of plates or shapes or of edges gas-cut with a mechanically controlled torch shall not be required, unless specifically required by design and called for on the drawings, included in a stipulation for edge preparation for welding or as may be required after the inspection of the cut surface. Surface cut with hand-flame shall generally be ground, unless specifically instructed otherwise by the Owner/Consultant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[97]	25.09.2014

Clearances

The erection clearance for cleated ends of members connecting steel to steel shall preferably be not greater than 2 mm at each end. The erection clearance at ends of beams without web cleats shall be not more than 3 mm at each end, but where, for practical reasons, greater clearance is necessary, suitably designed cleatings shall be provided.

Bolted construction

All bolts and nuts shall conform to the requirements of IS: 1367.

Field connections shall preferably be bolted connections unless specified otherwise. Weld connections at site shall be avoided.

High strength friction grip bolts shall be of property class 8.8 and shall conform to IS: 3757 and shall not be less than 20 mm in diameter unless designated otherwise. High strength bolts shall be installed as bearing type joint except where loads are reversible. Bearing Type connection (H.T. bolts Grade 8.8) shall be used for all removable type connections. Bolts will be tightened to develop the required pre-tension during their installation.

All erection bolts shall be of minimum 16 mm diameter of property class 4.6 conforming to IS: 1367 unless specified otherwise.

Holes for bolts shall not be more than 1.5 mm for bolt of diameter equal or lesser than 25 mm and shall not be more than 2 mm for bolt of diameter greater than 25 mm.

Holes through more than one thickness of material for members, such as compound stanchions and girder flanges, shall be drilled after the members are assembled and tightly clamped or bolted together. Punching may be permitted before assembly, if the thickness of the material is not greater than the nominal diameter of bolt plus 3 mm subject to a maximum thickness of 16 mm provided that the holes are punched 3 mm less in diameter than the required size and reamed after assembly to the full diameter.

Holes for turned and fitted bolts shall be drilled to a diameter equal to the nominal diameter of the shank or barrel subject to a tolerance grade of H8 as specified in IS: 919. Parts to be connected shall be firmly held together by tacking welds or clamps and the holes drilled through all the thicknesses in one operation and subsequently reamed to size. Holes not drilled through all thickness in one operation shall be drilled to a smaller size and reamed out after assembly.

Holes for bolts shall not be formed by gas cutting process.

Assembly

Drifting to enlarge un-matching holes shall not generally be permitted. In case drifting is permitted to a slight extent during assembly, it shall not distort the metal or enlarge the holes. Holes that must be enlarged to admit the bolts shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[98]	25.09.2014

be reamed. Poor matching of holes shall be cause for rejection. The component parts shall be so assembled that they are neither twisted nor damaged and shall be so prepared that the specified cambers, if any, are maintained.

Bolted construction shall be permitted only in case of field connections if called for on the Drawings and is subjected to the limitation of particular connections as may be specified. In special cases, however, shop bolt connections may be allowed if directed by the Owner/Consultant.

Washers shall be tapered or otherwise suitably shaped, where necessary, to give the heads and nuts of bolts a satisfactory bearing. The threaded portion of each bolt shall project out through the nut at least one thread. In all cases the bolt shall be provided with a washer of sufficient thickness under the nut to avoid any threaded portion of the bolt being within the thickness of the parts bolted together. In addition to the normal washer, one spring washer or locknut shall be provided for each bolt for connections subjected to vibrating forces or otherwise as may be specified on the Drawings.

Welded Construction

Welding shall be in accordance with relevant Indian Standards. Welding shall be done by experienced and good welders who have been qualified by tests in accordance with IS: 817. All shop connections shall be welded type.

Preparation of Material

Surface to be welded shall be free from loose scale, slag, rust, grease, paint and any other foreign material except that mill scale which withstands vigorous wire brushing may remain. Joint surfaces shall be free from fins and tears, Preparation of edges by gas-cutting shall, wherever practicable, be done by a mechanically guided torch.

Parts to be fillet welded shall be brought in as close contact as practicable and in no event shall be separated by more than 4 mm. If the separation is 1.5 mm or greater, the size of the fillet welds shall be increased by the amount of the separation. The fit of joints at contact surfaces which are not completely sealed by welds, shall be close enough to exclude water after painting. Abutting parts to be butt-welded shall be carefully aligned. Misalignments greater than 3 mm shall be corrected and in making the correction the parts shall not be drawn into a sharper slope than 20C.

The work shall be positioned for flat welding whenever practicable.

In assembling and joining parts of a structure or of built-up members, the procedure and sequence of welding shall be such as will avoid needless distortion and minimize shrinkage stresses. Where it is impossible to avoid high residual stresses in the closing welds of a rigid assembly, such closing welds shall be made in compression elements.

In the fabrication of cover-plated beams and built-up members, all shop splices in each component part shall be made before such component part is welded to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[99]	25.09.2014

other parts of the member. Long girders or girder sections may be made by shop splicing not more than three sub-sections, each made in accordance with this paragraph.

When required by the Owner/Consultant, welded assemblies shall be stress relieved by heat treating in accordance with the provisions of the relevant Indian Standard or any other Standard approved by the Owner/Consultant.

All complete penetration groove welds made by manual welding, except when produced with the aid of backing material not more than 8 mm thick with root opening not less than one-half the thickness of the thinner part joined, shall have the root of the initial layer gouged out on the back side before welding shall be started from that side, and shall be so welded as to secure sound metal and complete fusion throughout the entire cross-section. Groove welds made with the use of the backing of the same material as the base metal shall have the weld metal thoroughly fused with the backing material. Backing strips need not be removed. If required, they may be removed by gouging or gas cutting after welding is completed, provided no injury is done to the base metal and weld metal and the weld metal surface is left flush or slightly convex with full throat thickness.

Groove welds shall be terminated at the ends of a joint in a manner that will ensure their soundness. Where possible, this should be done by use of extension bars or run-off plates. Extension bars or run-off plates need not be removed upon completion of the weld unless otherwise specified elsewhere in the Contract.

To get the best and consistent quality of welding, automatic submerged arc process shall be preferred. The technique of welding employed, the appearance and quality of welds made, and the methods of correcting defective work shall all conform to the relevant Indian Standards.

No welding shall normally be done on parent material at a temperature below (-) 50C. However, if welding is to be undertaken at low temperature, adequate precautions as recommended in relevant Indian Standard shall be taken. When the parent material is less than 40 mm thick and the temperature is between (-) 50C and 00C, the surface around the joint to a distance of 100 mm or 4 times the thickness of the material, whichever is greater, shall be preheated till it is hand warm. When the parent material is more than 40 mm thick, the temperature of the area mentioned above shall be in no case be less than 200C. All requirements regarding preheating of the parent material shall be in accordance with the relevant Indian Standard.

Submerged arc welding process shall be used for welding longitudinal fillet welds (connecting flanges with web) and longitudinal / transverse butt joints for fabrication of columns, framing beams and all other built up members unless manual arc welding is specifically required. All electrodes, flux, bare wire etc will be procured from approved manufacturers. All butt welds in beams, girders & columns will be of full penetration. All butt welds will be radio-graphically or ultrasonically tested as per relevant IS codes and standard practice. The base

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[100]	25.09.2014

wire electrodes for submerged arc welding will conform to IS: 7280. The combination of wire and flux will satisfy requirements of IS: 3613.

Peening

Where required, intermediate layers of multiple-layer welds may be peened with light blows from a power hammer, using a round-nose tool. Peening shall be done after the weld has cooled to a temperature warm to the hand. Care shall be exercised to prevent scaling or flaking of weld and base metal from over peening.

Equipment

These shall be capable of producing proper current so that the operator may produce satisfactory welds. The welding machine shall be of a type and capacity as recommended by the manufacturers of electrodes or as may be approved by the Owner/Consultant.

Finish

Column splices and butt joints of compression members depending on contact for stress transmission shall be accurately machined and close-buttressed over the whole section with a clearance not exceeding 0.2 mm locally at any place. In column caps and bases, the ends of shafts together with the attached gussets, angles, channels etc., after welding together, should be accurately machined so that the parts connected butt over the entire surfaces of contact. Care should be taken that those connecting angles or channels are fixed with such accuracy that they are not reduced in thickness by machining by more than 2 mm.

Slab bases and caps

Bases and caps fabricated out of steel slabs, except when cut from material with true surface, shall be accurately machined over the bearing surface and shall be in effective contact with the end of the stanchion. A bearing face which is to be grouted direct to a foundation need not be machined if such face is true and parallel to the upper face.

Miscellaneous

- Lacing bars

The ends of lacing bars shall be neat and free from burrs.

- Separators

Rolled section or built-up steel separators or diaphragms shall be required for all double beams except where encased in concrete, in which case, pipe separators shall be used.

- Bearing Plates

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[101]	25.09.2014

Provision shall be made for all necessary steel bearing plates to take up reaction of beams and columns and the required stiffeners and gussets whether or not specified in Drawings.

- Architectural Clearances

Bearing plates and stiffener connections shall not be permitted to encroach on the designed architectural clearances.

- Shop Connections
 - i) All shop connections shall be welded as specified on the Drawings.
 - ii) Certain connections, specified to be shop connections, may be changed to field connections if desired by the Owner/Consultant for convenience of erection and the Bidder will have to make the desired changes at no extra cost to the Owner.
- Shop Erection

The steelwork shall be temporarily shop-erected complete or as directed by the Owner/Consultant so that accuracy of fit may be checked before despatch. The parts shall be shop-erected with a sufficient number of parallel drifts to bring and keep the parts in place. In case of parts drilled or punched using steel jigs to make all similar parts interchangeable, the steelwork shall be shop erected in such a way as will facilitate the check of interchange ability.

(f) Shop Painting

All fabricated steel material, except those galvanized or to be embedded in concrete, shall receive paint coatings as specified below. All paints shall be of approved brand and shade as per the Owner's requirement.

Steel surface, which is to paint, shall thoroughly be cleaned of all loose mill scale, rust, grease, dirt and other foreign matter by wire brush & if required by sand blasting prior to actual surface preparation. The surface shall be cleaned to grade ST-2.5 as per SIS05-5900 or as per IS: 1477 (Part -I).

All steel structures shall receive two primer coats and two finish coats of painting. After fabrication the first coat of primer shall be immediately given over the prepared steel surface. The second coat of primer shall be applied over the dried first primer coat. Two finish coats shall be applied over the primer coats before dispatch of structure at site.

Primer paint shall be red oxide zinc chromate conforming to IS: 2074. Dry film thickness of each coat shall be 50 microns. Adequate care should be taken such that the surface does not possess a slick finish to which paint may not adhere properly. Top coat shall consist of two coats of HB Synthetic enamel of approved shade and colour with glossy finish and DFT as 75 microns (total). Thus the total DFT of painting including that of primer coats shall not be less than 175 microns.

Following care shall be taken while painting:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[102]	25.09.2014

- i) Joints to be site welded shall have no paint applied within 100 mm of welding zone. Similarly where friction grip fasteners are to be used no painting shall be provided. On completion of the joint the surfaces shall receive the paint as specified.
- ii) Surfaces inaccessible after assembly shall receive two coats of primer prior to assembling.
- iii) Surfaces inaccessible after erection, including top surfaces of floor beams supporting gratings or chequered plate, shall receive one additional coat of finish paint over and above number of coats specified above before erection.
- iv) Portion of steel member embedded / to be encased in concrete shall not be painted.
- v) Areas / Surfaces subjected to chemical attacks shall be painted with acid resistant paint.
- vi) Machine finished surfaces shall be protected against corrosion by a rust inhibiting coating that can be easily removed prior to erection or which has characteristics that make removal unnecessary prior to erection.

(g) Inspection, testing and acceptance criteria

Unless specified otherwise, inspection to all work shall be made by the Owner/Consultant at the place of manufacture prior to delivery. The Owner / Consultant shall have free access at all reasonable times to those parts of the manufacturer's works which are concerned with the fabrication of the steelwork under this Contract and he shall be afforded all reasonable facilities for satisfying himself that the fabrication is being done in accordance with the provisions of this Specification. The Bidder shall provide free of charge, such labour, materials, electricity, fuel, water, stores, tools and plant, apparatus and instruments as may be required by the Owner/Consultant to carry out inspection and / or tests in accordance with the Contract.

The Bidder shall guarantee compliance with the provisions of this Specification.

The Bidder shall carry out sampling and testing in accordance with the relevant Indian Standards and as supplemented herein for the following items at his own cost, unless otherwise specified in the Contract. The Bidder shall get the specimens tested in a laboratory approved by the Owner/Consultant and submit to the Owner/Consultant the test results in triplicate within 3 (three) days after completion of the test.

Steel

All steel supplied by the Bidder shall conform to the relevant Indian Standards, except otherwise mentioned in the Contract, only tested quality steel having mill test reports shall be used. In case unidentified steel materials are permitted to be used by the Owner/Consultant, random samples of materials will be taken from each unidentified lot of 50 ton or less of any particular section for tests to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[103]	25.09.2014

conform to relevant Indian Standards. Cost of all tests shall be borne by the Bidder.

All material shall be free from all imperfections like mill scales, slag intrusions, laminations, pittings, rusts etc. that may impair their strength, durability and appearance.

All raw steel plate of thickness more than 20 mm supplied by the Bidder shall be checked against lamination before procurement & prior to commencement of fabrication work in the following ways as directed by the Owner/Consultant:

- i) Ultrasonic testing along the edge of specified points of the plates shall be carried out to delete lamination in the plates, if any.
- ii) If the results of the tests in (i) are not satisfactory, the whole area of the plates shall be checked by ultrasonic testing at specified nodal points formed at equidistant grid locations. The spacing of the grids shall be determined from tests in (i) or as directed by the Owner/Consultant.

If the results of the above tests are not satisfactory, the plates shall not be taken up for fabrication work. Even after fabrication at shop, if the Owner/Consultant requires any ultrasonic testing to detect lamination of plates, the same shall be carried out by the Bidder. If the plates in the fabricated item are found to be laminated, the component will be rejected.

Welding

All electrodes shall be procured from reliable manufacturers with test certificates. The correct grade and size of electrode which has not deteriorated in storage shall be used. The inspection and testing of welding shall be performed in accordance with the provisions of the relevant Indian Standards or other equivalents. For every 50 tonnes of welded fabrication, the Owner may ask for at least one test-destructive or non-destructive including X-ray, ultrasonic test or similar, the cost of which shall be borne by the Bidder. In the event of further tests as may be desired by the Owner. The cost of such test shall be borne by the Bidder if the results are found to be unsatisfactory; and if the test shows no defect, the cost shall be borne by the Owner. In cases of the test results showing deficiency, the Owner / Consultant shall have option to reject or instruct any remedial measures to be taken free of charge to the Owner.

Bolts, nuts and washers

All bolts, nuts and washers shall be procured from reputed manufacturer approved by the Owner/Consultant and shall conform to the relevant Indian Standards. If desired by the Owner/Consultant, representative samples of these materials may have

- i) Name of the Bidder
- ii) Number and date of the Contract

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[104]	25.09.2014

- iii) Name of the office placing the contract
- iv) Nomenclature of stores
- v) A schedule of parts or pieces, giving the parts or piece number with
- vi) Tolerance

The tolerance on the dimension of the individual rolled steel components shall be as specified in IS: 1852. The tolerances on straightness, length etc. of various fabricated components (such as beams, girders, columns, etc) of the steel structures (other than steel railway and road bridges structure) subjected to dynamic loading (like wind, seismic etc.) and thin walled constructions (like box girders) shall be as specified in IS: 7215.

10.3 Erection

(a) General

The work to be provided for by the Bidder, unless otherwise specified in the Bid, shall include but not be limited to the following:

- i) The Bidder shall provide all transport equipment, lifting equipment, tools, tackle, consumables, materials, labour and supervision required for the erection of the structural steelwork.
- ii) Receiving, unloading, checking and moving to storage yard at Site including prompt attendance to all insurance matters as necessary for all fabricated steel materials arriving at Site. The Bidder shall pay all demurrage and / or wharfage charges etc. on account of default on his part.
- iii) Transportation of all fabricated structural steel materials from Site storage yard, handling, rigging, assembling, bolting, welding and satisfactory installation of all fabricated structural steel materials in proper location according to approved erection drawings and / or as directed by the Owner/Consultant. If necessary, suitable temporary approach roads to be built for transportation of fabricated steel structures.
- iv) Checking centre lines, levels of all foundation blocks including checking line, level, position and plumb of all bolts and pockets. Any defect observed in the foundation shall be brought to the notice of the Owner/Consultant. The Bidder shall fully satisfy himself regarding the correctness of the foundations before installing the fabricated steel structures on the foundation blocks.
- v) Aligning, plumbing, levelling, bolting, welding and securely fixing the fabricated steel structures in accordance with the Drawings or as directed by the Owner/Consultant.
- vi) Touch up paintings, making good any damaged shop painting and completing any unfinished portion of the shop coat shall be carried out by the Bidder free of cost to the Owner.
- vii) All minor modifications of the fabricated steel structures as directed by the Owner/Consultant including but not limited to the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[105]	25.09.2014

- Removal of bends, kinks, twists etc. for parts damaged during transport and handling.
- Cutting, chipping, filling, grinding etc. if required for preparation and finishing of site connections.
- Reaming of holes for use of higher size bolt if required.
- Welding of connections in place of bolting for which holes are either not drilled at all or wrongly drilled during fabrication. Welding in place of bolting will be permitted only at the discretion of the Owner/Consultant.
- Re-fabrication of parts damaged beyond repair during transport and handling or re-fabrication of parts which are incorrectly fabricated.
- Fabrication of parts omitted during fabrication by error, or subsequently found necessary.
- Drilling of holes which are either not drilled at all or are drilled in incorrect location during fabrication.
- Carry out tests in accordance with this Specification if directed.

(b) Conformity with design

The Bidder will erect the entire fabricated steel structure, align all the members, complete all field connections and grout the foundations all as per the provisions of this specification and the design criteria detailed in the approved erection drawings and / or other stated document. All work shall conform to the provisions of the relevant Indian Standard Specifications and / or the instructions of the Owner/Consultant. The testing and acceptance of the erected structures shall be in accordance with the provisions of this Specification and / or the instructions of the Owner/Consultant.

(c) Storage of materials

All material shall be so stored as to prevent deterioration and to ensure the preservation of their quality and fitness for use in the works. Any material which has been deteriorated or damaged beyond repairs and has become unfit for use shall be removed immediately from the site.

(d) Yard

The Bidder will have to establish a suitable yard in an approved location at site for storing the fabricated steel structures and other materials which will be delivered to him by the Owner according to the Contract. The yard shall have proper facilities like, drainage, lighting, suitable access, trailers and other heavy equipments. The yard shall be fenced all round with security / arrangement and shall be of sufficiently large area to permit systematic storage of the fabricated steel structures without overcrowding and with suitable access, trailers and other equipment for use in erection work in proper sequence in accordance with the approved programme of work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[106]	25.09.2014

The Bidder should visit the site prior to submission of his Tender to acquaint himself with the availability of land and the development necessary by way of filling, drainage, access roads, fences, sheds etc. All of which shall be carried out by the Bidder at his own cost as directed by the Owner.

(e) Covered Store

All field connection materials, paints, etc. shall be stored on well designed racks and platforms off the ground in a properly covered store building to be built at the cost of the Bidder.

(f) Workmanship

Erection Plant and equipment

The suitability and adequacy of all erection tools and plant and equipment proposed to be used shall be efficient, dependable, in good working condition and shall have the approval of the Owner/Consultant.

Method and sequence of erection

The method and sequence of erection shall have the prior approval of the Owner/Consultant. The Erection shall arrange for most economical method and sequence available to him consistent with the Drawings and Specifications and such information as may be furnished to him prior to the execution of the Contract.

Temporary bracing

Unless adequate bracing is included as a part of the permanent framing, the erector during erection shall install, free of cost to the Owner, temporary guys and bracings where needed to secure the framing against loads such as wind or seismic forces comparable in intensity to that for which the structure has been designed, acting upon exposed framing as well as loads due to erection equipment and erection operations.

If additional temporary guys are required to resist wind or seismic forces acting upon components of the finished structure Installed by others during the course of the erection of the steel framing, arrangement for their installation by the erector shall be made free of cost to the Owner.

The responsibility of the Bidder in respect of temporary bracings and guys shall cease when the structural steel is once located plumbed levelled, aligned and grouted within the tolerances permitted under the specification and guyed and braced to the satisfaction of the Owner/Consultant.

The temporary guys, braces, false work and cribbing shall be removed immediately upon completion of the steel erection and shall return to the Owner's store in good condition if the materials are supplied by the Owner otherwise permission shall be given to Bidder to take out the materials from 'the project site. The Owner may remove and return the materials in good condition to the Bidder without any charge if they have been left in place under other agreed arrangement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[107]	25.09.2014

Temporary floors for buildings

It shall be the responsibility of the Bidder to provide free of cost planking and to cover such floors during the work in progress as may be required by any Act of Parliament and / or by-laws of state, Municipal or other local authorities.

Setting out

Positioning and levelling of all steelwork, plumbing of stanchions and placing of every part of the structure with accuracy shall be in accordance with the approved Drawings and to the satisfaction of the Owner/Consultant. Concrete foundations, where required, shall be made by other agencies. Anchor bolts and other anchor steel shall be embedded by other agencies. The Bidder shall check the positions and levels of the anchor bolts, etc. before concreting and get them properly secured against disturbance during pouring operations.

He shall remain responsible for correct positioning. For heavy columns, etc. the Bidder shall set proper screed bars if desired by the Owner/Consultant, to maintain proper level. No extra payment shall be made for this.

Each tier of column shall be plumbed and maintained in a true vertical position subject to the limits of tolerance allowable under this Specification.

No permanent field connections by bolting or welding shall be carried out until proper alignment and plumbing has been attained.

Field bolting

All relevant portions in respect of bolted construction of the Specification for Fabrication of Structural Steelwork applicable to the Project shall also be applicable for field bolting in addition to the following:

Bolts shall be inserted in such a way so that they may remain in position under gravity even before fixing the nut. Bolted parts shall fit solidly together when assembled and shall not be separated by gaskets or any other interposed compressible materials. When assembled, all joint surfaces, including those adjacent to the washers shall be free of scales except tight mill scales. They shall be free of dirt, loose scales, burns, and other defects that would prevent solid seating of the parts. Contact surfaces within friction-type joints shall be free of oil, paint, lacquer, or galvanizing.

Drifting

Correction of minor misfits of bolts will be considered as permissible. For this, light drifting may be used to draw holes together and drills shall be used to enlarge holes as necessary to make connections. Reaming, that weakens the member or makes it impossible to fill the holes properly or to adjust accurately after reaming shall not be allowed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[108]	25.09.2014

(g) Testing and Acceptance Criteria

General

Loading tests shall be carried out on erected structures, if required by the Owner/Consultant, to check adequacy of fabrication and / or erection. Any structure or a part thereof found to be unsuitable for acceptance as a result of the test shall have to be dismantled and replaced with suitable member as per the Contract of either fabrication or erection of steelwork whoever is responsible for it and no payment towards the cost of the dismantled portion and any connected work shall be made to the Bidder, unless it is proved that the deficiency is due to reasons beyond the Bidder's scope. If any damage is done to any other parts of the structure or to any fixtures, the same shall be made good free of cost by the Bidder responsible, to the satisfaction of the Owner/Consultant. The cost of the tests specified hereinafter shall be borne by the Owner. Any extra claim due to loss of time, idle labour, etc. arising out of these testing operations shall not be entertained, however, only reasonable and appropriate time extensions will be allowed. The structure or structural member under consideration shall be loaded with its actual dead load for as long a time as possible before testing and the tests shall be conducted as indicated below. The method of testing and application of loading shall be as approved by the Owner/Consultant.

Stiffness Test

In this test, the structure or member shall be subjected, in addition to its actual dead load, to a test load equal to 1.5 times the specified superimposed load, and this loading shall be maintained for 24 hours. The maximum deflection attained during the test shall be within the permissible limit. If, after removal of the test load, the member or structure does not show a recovery of at least 80 % of the maximum strain or deflection shown during 24 hours under load, the test shall be repeated. The structure or member shall be considered to have sufficient stiffness, provided that the recovery after this second test is not less than 90 % of the maximum increase in strain or deflection recorded during the second test.

Strength Test

The structure or structural member under consideration shall be subjected, in addition to its actual dead load, to a test load equal to the sum of the dead load and twice the specified superimposed load, and this load shall be maintained for 24 hours. In the case of wind load, a load corresponding to twice the specified wind load shall be applied and maintained for 24 hours, either with or without the vertical test load for more severe condition in the member under consideration or the structure as a whole. Complete tests under both conditions may be necessary to verify the strength of the structure. The structure shall be deemed to have adequate strength if, during the test, no part fails and if on removal of the test load, the structure shows a recovery of at least 20 per cent of the maximum deflection or strain recorded during the 24 hours under load.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[109]	25.09.2014

Structure of same design

Where several structures are built to the same design and it is considered unnecessary to test all of them, one structure, as a prototype, shall be fully tested, as described in previous sub-clauses, but in addition, during the first application of the test load, particular note shall be taken of the strain or deflection when the test load 1.5 times the specified superimposed load has been maintained for 24 hours. This information is required as a basis of comparison in any check test carried out on samples of the structure when a structure of the same type is selected for a check test, it shall be subjected, in addition to its actual dead load, to a superimposed test load, equal to 1.5 time the specified live load, in a manner and to an extent prescribed by the Owner/Consultant. This load shall be maintained for 24 hours, during which time, the maximum deflection shall be recorded. The check test shall be considered satisfactory, provided that the maximum strain or deflection recorded in the check test does not exceed by more than 20 % of the maximum strain or deflection recorded at similar load in the test on the prototype.

Repair after inspection tests

An actual structure which has passed the "Strength Test" as specified above herein before and is subsequently to be erected for use, shall be considered satisfactory for use after it has been strengthened by replacing any distorted members and has subsequently satisfied the 'Stiffness Test' above.

10.4 Requirement for specific structures

Coal Handling System Structures

Toe guards shall be provided on sides of conveyor gallery, toe guard shall have a minimum size of 65 x 6 mm.

In case the inclination of the conveyor is more than 10°, walkway shall be given with steps.

For the design of conveyor gallery, load due to cables, light fittings and pipes as well as effect of gravity take up loads shall also be considered, in addition to dead load, wind load and imposed load.

Lattice girders supporting the conveyor shall be suitably braced at top and bottom chord levels to transmit the wind load to the end portals connected to trestles. Roof purlins and walkway runners shall also be suitably braced at both ends.

In the case of galleries, temperature expansion joint shall be introduced at intervals less than 180 m to divide the galleries into temperature block. In each block at least one four legged rigid support guaranteeing stability of structure in the longitudinal direction shall be provided. This shall also to take care of all longitudinal forces in the given block. Effect of wind load acting on 2-legged trestle shall also be considered while designing the 4-legged trestle.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[110]	25.09.2014

Base plates for trestles shall be designed as gusseted base with shear lugs to transfer horizontal forces. Anchor bolts shall be designed only for uplift forces.

Conveyor galleries and trestles having two conveyors belt shall be designed for both conveyors working together.

Chute loads on floors of houses shall be considered plugged with material for the entire height of the chute.

In case chequered plates are used as floor covering the thickness of plate o/p shall be 8 mm. Suitable plan bracings shall be provided 75 mm from top of steel to transfer all the horizontal forces.

Anchor fasteners shall not be used for supporting equipment imparting dynamic forces.

Bracing patterns and locations shall be so planned such that they do not hinder movement of personnel and movement of equipment during maintenance. When floor beam forms part of vertical bracing system, additional loads from the floor beams transferred to the bracing shall be taken into account.

Angle section shall not be used as flexural members except for purlins, side girts and walkway runners. Minimum angle size used shall be L50x50x6.

All foundation bolts shall be provided with double nuts.

End connection for rolled beams and channels shall be designed for a minimum of 60% of their shear capacity and built up beams for 80% of their shear capacity in addition to axial load.

Dynamic analysis shall be carried out for beams supporting screens, vibrating feeder, rotating equipment and conveyor supporting beam in conveyor gallery.

To admit proper light into the conveyor gallery perspex sheet shall be provided at the rate of one square metre per metre length of gallery on the roof and 0.2m² per metre length of gallery per side on the sides of conveyor gallery.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[111]	25.09.2014

11 ARCHITECTURAL WORKS

The architectural design concept of buildings shall be evolved considering the functional, technical and other requirements for efficient operation, ensuring comfortable working environment for personnel, satisfying the aesthetic requirements. Special care shall be taken to provide elegance and aesthetics, with effective use of appropriate treatment, materials, fittings and finishes. To achieve above objective Bidder shall employ a qualified architect / architectural firm to carry out all designs and hold all other architectural responsibilities for the project.

The Bidder shall obtain and be conversant with all laws, by-laws and regulations of local and Statutory Bodies as applicable to the project. The architectural concept evolved should also take care of these requirements. The Bidder shall provide the drawings and documents for such statutory approvals.

11.1 General

The architectural services shall cover finishing work of new buildings and modernised existing buildings/structures, included under the specification starting from masonry work, partition walls, cladding walls, roof protection, finishing of walls, floors and ceilings, false ceiling as required potable water system, sanitation etc.

During execution of the contract, the Bidder shall take approval from the Owner, for all building materials and finish items (e.g. floor tiles, doors, and windows, paints etc.) to be used for the contract by submitting samples and/or product literature as appropriate.

Finishing works including material used for renovation/modernisation work shall be matched with the finishing of existing structures to make similarity in architectural view of new and existing structures.

11.2 Finishes

All exposed surfaces shall be clean and smooth and members shall be sized to give a pleasing appearance. The Finishes for all Structures and Buildings shall meet the functional requirements and shall be as per the approved Finishing Schedule. However, the finishing schedule shall be pre-approved by the Owner/Consultant.

11.3 Design Requirements

(a) Architectural Concepts

- All buildings and structures shall be architecturally treated in such a way so as to be in complete harmony with the surrounding structures and environment. Local architectural characters may be judiciously imbibed. The building shall be designed initiating an architectural control common to all

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[112]	25.09.2014

buildings. The architectural control shall be clearly spelt out in terms of scale, man & form.

- Overall colour scheme of the plant and other buildings shall be designed judiciously and in a comprehensive manner taking into account the mass and void of buildings, its facade, equipments, exposed structural elements, piping, trestles, bus ducts and other service elements.
- Overall emphasis shall be on developing an eco-friendly architecture, merging with the nature with its own sustainable energy management systems.
- The scheme shall be conceptually finalized in totality including that of equipments so that the proper co-ordination with other agencies can be taken up at appropriate time.

(b) Architectural Design

- Natural light shall be used to the maximum extent. For adequate light and ventilation, National Building Code recommendation shall be followed.
- Entrance canopies, chajjas (projections, recesses) over openable windows and door openings on exterior facades shall be provided.
- All the buildings shall be architecturally designed to meet the National Building Code.
- Architectural design and detailing aspects of all the buildings shall be rendered through professional services of an Architect Statutory requirement and any clearances from local authority may be required to be met with, wherever essential. The Architect Consultant shall be of national - International repute having experience in similar kind of works. The consultant shall evolve the design philosophy and shall present it in the form of presentation drawings, prospective views, 3-D Models & detail drawings.
- A comprehensive interior design scheme shall be conceived with the intention of projecting a definite theme and aesthetic appearance to inside working environment. It shall take into account the multidisciplinary engineering activities involving plant technology and architectural & civil engineering for a smooth control hierarchy and man machine interface.

The Bidder shall develop the architectural layout of all the buildings listed in this document as per the final approved equipment disposition and other layout considerations indicated elsewhere in this specification. These drawings shall need the approval of the Owner/Consultant before construction. The Bidder shall also have to submit perspective views if so desired by the Owner/Consultant at no expenditure to the Owner. Approval from statutory authorities, e.g. Factories Inspector, Explosives Inspector, Loss Prevention Association of India / Tariff

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[113]	25.09.2014

Advisory Committee etc. shall be the responsibility of the Bidder without any obligation of the Owner.

The entire complex shall have an architectural character and style of its own and shall be visually and functionally integrated with the existing landscape. The Bidder must visit the site and have a feel of the overall environment, so that a harmonious as well as integrated architectural concept of the proposed phase of development is achieved. Special care must be taken to enhance the visual and technological quality of development by adopting updated technology, materials, finish etc.

11.4 Guideline for Architectural Works

11.4.1 Roof Insulation and Ventilation

Wherever required the roof of buildings shall be insulated with foam concrete. For ventilation requirements relevant section of the specification shall be referred.

11.4.2 Roof Waterproofing

All roofs of buildings shall be provided with 3 layers, first being elastomeric membrane water proofing treatment, secondly screed concrete shall be laid and finally the wearing course. Elastomeric membrane shall be laid as per manufacturer's specifications which shall adhere to specifications as given in IS 2645. Run off gradient shall be given a minimum of 1 in 100. Gradient shall comprise screed concrete 1:2:4 using 12.5 mm or below coarse aggregate. Over the screed concrete waterproofing treatment shall be provided as below:

A wearing course shall consist of pressed clay tiles of size 230x230x18 mm laid in water proofing compound mixed cement mortar (1:3) and sealing of joints using sealing compound.

11.4.3 Brick/stone masonry and parapet wall

All masonry works shall be designed in accordance with IS: 1597, IS: 1905, IS: 2212, IS: 4326 and other relevant IS codes as applicable. Structural design of load bearing and non-load bearing walls constructed with solid or perforated burnt clay bricks or concrete blocks shall be in accordance with criteria specified by National Building Code of India.

All walls shall be non-load bearing infill panel walls. External walls of all buildings shall be at least one brick thick. All internal walls shall be at least one brick thick except for internal partition walls for office area, canteen, change rooms, first aid rooms and toilets, which may be half brick thick.

Minimum 50 kg/sq.cm compressive strength brick shall be used for non-load bearing super structure brickwork. Cement sand mortar 1:6 for one brick thick wall and 1:4 for half brick thick wall shall be used. For half brick walls, RCC transoms and mullions shall be provided to reinforce the wall where required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[114]	25.09.2014

All brickwork shall be plastered as per specification.

Even where metal cladding is specified, for initial [3 m] height from the ground level, minimum one brick thick masonry wall shall be provided.

All up stands and parapet walls on roof shall be of RCC construction, minimum height of parapet walls shall be [1050 mm] and a minimum thickness of [125 mm].

11.4.4 Cement based polymer modified mortar

a) Purpose

To carry out structural repairs to prepared patches of spalled concrete with an alkaline impervious repair material comprised of polymer admixed cement-sand mortar.

b) Materials and T&P

Polymers in emulsion or powder forms as may be specified conforming to ASTM C1059, Ordinary Portland Cement of 43 grade conforming to relevant BIS code, Sand conforming to Zone-II or Zone-III grade of IS: 383, Mixing water conforming to IS: 456-2000, mortar mixer with mechanical water dozer, spatulas, trowels, etc.

c) Procedure:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of specified polymers shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3 Testing of Material: The requisite number of test specimens of mortar shall be cast from each batch of manufactured or supplied materials received (whichever is less). These are to be tested for conformance to the specified requirements before use on the work. Polymer modified cement mortar with cement: sand proportion by weight as (1:3) shall have the following properties

Minimum compressive strength -20N/sq.mm after 28 days at 27oC

Step-4: Identify and mark the area for Polymer modified mortar repair.

Step-5 Surface Preparation: The appropriate propping/supporting, surface preparation and crack sealing as per site requirements shall be completed, which may sequentially cover one or more of the following items of work:

Prop & support the structural member to relieve it of stress and strains.

Removal of existing surface plaster/treatment shall be done.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[115]	25.09.2014

Chipping unsound/weak concrete material shall be done.

Removing concrete all around embedded rusted reinforcement shall be done.

Removing and cleaning reinforcement of rust from its surface to give it a shining bright metal shall be done.

Sealing the cracked or honeycombed concrete with injection grouting shall be done.

Providing and inserting mild steel shear key bars shall be done with minimum 3 nos per square meter of surface area of substrate, which may also be used as depth measuring gauge.

Additional fresh reinforcement, if required, shall be tied with required overlaps or welded.

The rust, if any, persisting over the existing exposed reinforcement or the new reinforcement shall be removed mechanically or chemically.

Cleaning of lightly sticking materials and foreign matter from the exposed concrete surface and steel reinforcement by suitable means shall be done.

Step-6: Clean the dust and saturate the prepared surface of concrete and reinforcement with a clean oil free air blast and water fit for construction.

Step-7: Inspection of concrete surface prior to adhesive application shall be thoroughly inspected and got approved by the Engineer-in-Charge. Surfaces shall be ensured to be free from any deleterious materials such as oil, dust, dirt etc. using oil free air blast.

Step-8: Alignment & thickness Control- Ground wires shall be fixed at reference points to measure and control the thickness of overlay. Shear keys fixed earlier could also function as depth gauges. Adequate ground wires shall be installed to establish thickness and surface planes of the overlay build up. Ground wires shall be tight and true to line and placed in such a manner that they may be further tightened.

Step-9: Apply Passivating & bonding coat over the cleaned existing and new reinforcement.

Step-10: Apply bond coat on the cleaned concrete substrate.

Step-11: Mix and Prepare Polymer Modified Mortar to have a uniform consistency and texture by adding cement sand and polymer as weigh batched ingredients of the design mix, a specified proportion of water through water dozer.

Use of prepacked ready to use components supplied by manufacturers in containers may be allowed subject to approval of Owner. In case where prepacked ready to use materials are to be used, the contractor shall submit the manufacturer's certificate verifying conformance to material specification as specified, manufacturer's mixing and application procedure for approval by Engineer-in-charge.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[116]	25.09.2014

Plastering with cement based polymer modified mortar shall be done immediately after applying the bonding slurry to the prepared surfaces, preferably in coats of approximately 10mm thickness as greater thickness may lead to delamination/collapse. However, coats shall be applied in fairly rapid successions within 15 to 30 minutes. After applications of mortar the surface shall be finished using a wooden float.

Step-12: Moist cure the polymer modified mortar surface for 1-3 days followed by air curing at ambient temperature or as per manufacturer's specification, if specified otherwise. Use of flowing water or ponding of water shall not be done for curing. Steam curing shall not be permitted.

Step-13: Test the Surface of 7-day cured concrete overlay for soundness by tapping or sounding with hard blunt surface.

d) Inspection & Quality control

The mortar application work shall be continuously inspected by a qualified supervisor who shall check materials, application of mortar, curing stoppage of work during low temperatures (minimum working temperature being 8°C in most of the polymer modified mortar or as per manufacturer direction) and high winds etc. Each completed work of mortar shall be systematically sounded with a hammer to check for drummy areas after hardening.

In suspect areas or whenever directed by Engineer-in-Charge, the contractor shall drill the cores from the finished work and in to the host concrete after 28 days of mortar application. The cores shall be examined for evidence of poor workmanship by the Owner, and if he is satisfied that either the bonding work or the subsequent layer of mortar are not of the required workmanship, the contractor at the instruction of Engineer-in-Charge shall dismantle such areas of work as required by the Owner and re-do the same after re-preparing the surface by chipping off mortar work and abrading the bonding slurry interface.

11.4.5 Partition Wall

All intermediate walls shall be full brick thick wall in 1:6 cement sand mortar. Half brick thick wall in 1:4 cement: sand mortar with [2 nos. 6 mm] diameter rod in every fourth layer shall be provided. For long walls intermediate RCC pillars and RCC horizontal tie shall be provided. Full glazed partition in anodized aluminium frame shall be provided for operator's cubicles for clear view of the operating equipment and in Control room area.

11.4.6 Metal cladding

a) Permanent colour coated sandwiched insulated metal cladding system

Trough zinc-aluminium alloy coated (both sides) M.S. sheet having 0.6 mm minimum thickness (or high tensile steel sheet of 0.5 mm minimum thickness) shall be used on external face (outer face) of cladding system. Weight of coating shall not be less than 180 gm / sq.m. The outer side (exposed face) shall be permanently colour coated with Polyfluro Vinyl Coating (PVF2) of Dry Film

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[117]	25.09.2014

Thickness (DFT) 20 microns (minimum) over primer. Inner side of external sheet shall be provided with suitable pre-coating of minimum 7 microns.

Galvanised M.S. sheets of minimum 0.6 mm thickness shall be used as inner liner (internal face) of cladding system. The exposed face shall be permanently colour coated with silicon modified polyester paint of DFT 20 microns (minimum) over primer. Inner face of external sheet shall be provided with suitable pre-coating of minimum 7 microns. The rate of galvanising shall not be less than 180 gm / sq. m.

The permanent colour coated sheet shall meet the general requirements of IS: 14246 and shall conform to class 3 for the durability.

Inner sheet shall fixed directly to side runners and Z spacers made of at least 2 mm thick galvanised steel sheet of grade 375 as per IS: 277. Inner sheet shall be fixed at the rate not more than 0.75 m centre to centre to hold the insulation and external sheeting.

The insulation shall be of bonded mineral wool of minimum thickness 50 mm conforming to IS: 8183, having a density of 32 kg / cu. m for glass wool & 48 kg / cu. m for rock wool.

b) Permanent colour coated (non-insulated) metal cladding system

Trough zinc-aluminium alloy coated not less than 180 gm/sq.m M.S. sheets having 0.6 mm minimum thickness (or High tensile steel sheet of 0.5 mm minimum thickness) shall be used for the cladding system. The outer side (exposed face) shall be permanently colour coated with PVF2 paint of minimum DFT 20 microns over primer and the inner side (internal face) shall be coated with same paint of minimum DFT 12 microns over primer. These shall be fixed directly to runners. The sheets shall meet the general requirement of IS: 14246 and shall conform to class 3 for the durability.

c) Flashings, Cap, Trim Closures etc.

All flashings, trim closures, caps etc. required for the metal cladding system shall be made out of plain sheets having same material and coating specification as mentioned above for the outer face of the sandwiched metal cladding.

11.4.7 Plastering

On the exterior wall & rough side of interior brick wall [18 mm] thick minimum with cement-sand mortar in two layers shall be applied. Where external finish will require rich plastering for special finish plaster shall be of 1:4/1:3.

Interior wall: [12 mm] thick with 1:4 cement-sand mortars

Ceiling: [6 mm] thick with 1:3 cement-sand mortar shall be provided to all exposed ceilings.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[118]	25.09.2014

11.4.8 Removal of plaster manually from masonry or concrete surface using chisel and hammer and disposal of debris etc

a) Purpose

For removal of all type of loose /delaminated /damaged/weak cement plaster from surface of masonry or concrete.

b) Procedure

Step-1: Safety shall be ensured in accordance with contract conditions and specifications.

Step-2: Provide double scaffolding, protective screens etc.

Step-3: Existing plaster to be identified for removal by tapping all areas and its boundary shall be marked with a colour marking (in an optimal rectangular shape), which shall be approved by Engineer-in-Charge.

Step-4: Make a cut normal to the surface all along the boundaries with power driven cutters. The depth of cut shall not exceed the thickness of plaster.

Step-5: Remove the plaster manually with the help of chisel and hammers to completely expose the parent masonry or concrete surface, so as not to have any traces of such plaster left behind.

11.4.9 False ceiling and under deck insulation

All air conditioned areas shall be provided with the suspended false ceiling system. Under deck insulation system shall be provided on the under side of the roof / floor slab of the air-conditioned areas based on the functional requirement. Aluminium false ceiling system shall comprise of [84 mm] wide [12.5 mm] deep closed type plain panels of approved colour, roll formed out of [0.5 mm] thick corrosion resistant aluminium alloy AA 5050 fixed on roll formed carriers. Additional hangers and height adjustment clips shall be provided for return air grills, supply air diffusers, light fixtures, AC ducts etc. Suitable M.S channel (minimum ISMC100) grid shall be provided above false ceiling for movement of personnel to facilitate maintenance of lighting fixtures, AC ducts etc.

Bidder shall prepare a layout of the false ceiling system incorporating light fixtures, supply air diffuser, return air grills, fire detectors, fire protection sprinklers etc. such that the ceiling looks aesthetically pleasing. Work shall commence only after the Owner approves the layout. Under deck insulation shall comprise of [50 mm] thick resin bonded mineral wool insulation mat conforming to IS:8183. This mat shall be backed with [0.05 mm] thick aluminium foil and [24 Gx25 mm] wire mesh netting. These shall be fixed to ceiling or wall as the case may be with [100x50x6 mm] slotted mild steel plate welded to M.S. plate inserts embedded at the soffit of the slab at [600 mm c/c and 14 G] steel wire drawn through slots and fixed to wire netting.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[119]	25.09.2014

11.4.10 Doors

- Generally hollow metal (steel) flush doors with pressed steel frame shall be provided for plant and utility areas.
- Solid core factory made wooden flush doors in hard wood frame shall be used in interior office areas. Aluminium doors shall be provided in at entrances and important areas.
- Special areas like control rooms and other special area shall be provided with minimum 15 micron pre-coated Le. colour anodised aluminium glazed partitions with air lock facilities having two sets of doors.
- Fire rated doors with panic bar shall be provided in cable spreader rooms and other areas having fire hazard and also to all fire exists as per TAC requirement.
- Doors shall be provided at appropriate location to prevent dust ingress from outside.
- FRP Doors with FRP Frames shall be provided for all the toilet doors.
- Weather stripping shall be provided to all outside doors as well as air-conditioned areas and all other doors where dust-free environment is required.

11.4.11 Rolling shutters

Rolling steel shutters conforming to IS: 6248 will be used for large openings where frequent use is not envisaged. Unless noted otherwise, main entry doors of width and height to suit the requirements. Rolling shutters with area up to 8 m² shall be pull and push type hand operated, while above 8 m² shall be pull and push type with ball bearings (Electrically operated) as per IS specification.

11.4.12 Windows & Ventilators

In all buildings, full glazed windows and ventilators in minimum [15 micron] colour anodized aluminium window frame shall be provided with [4 to 6 mm] thick (depending on the size of panel) clear float glass and [6 mm] thick clear wired/laminated glass where required from safety point of view. Structural glazing may be considered as an important facade element.

The window area shall be so decided as to allow adequate natural ventilation and light.

Note: Glass thickness and member sizes of Aluminium Glazed doors and windows shall be designed by the manufacturer and to be submitted for approval by the Bidder before execution.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[120]	25.09.2014

11.4.13 Plywood Covering Panels to Cover Windows etc. During repairs

a) Purpose

To protect the finished items against their spoiling/damage to finishes during the process of carrying out repairs in a building. The items could include finished windows, doors, glass curtain wall or other such items.

b) Materials:

Wooden Battens of size 50mm X 50mm (approximately) or as approved by Engineer-in-charge, free from warping, cracks etc. made from locally available timber.

Plywood of suitable thickness preferably 6 mm thick as approved by Engineer-in-Charge.

Nails, screws etc. as per requirement.

c) Fabrication:

Size of covering panels shall be more than the size of windows etc. to be shielded/ protected, enough to be fixed to the walls without damaging the windows etc.

Wooden battens shall be cut approximately to the size of panels of windows etc. to be protected. The joints of the wooden framework shall be lap joint or as approved by Engineer-in-Charge.

Where the panel size is more than 2 square metres or as specified by the Engineer-in-Charge, the stiffening shall be done with batten backing to impart stiffness enough to provide rigidity against undue deflection due to impact of falling debris, self load, etc.

Plywood shall be fixed with nails/screws over the batten frames. The spacing of nails/screws shall be about 300mm c/c or as may be required at site.

d) Fixing:

The plywood covering panel shall be suitably fixed without damaging the windows etc. being protected by such panels with nails/screws fixed in walls strong enough to resist the forces likely to be imparted during repair work. It shall be done in such a manner that it can be removed with ease without damaging the covered windows etc. after completion of repairs.

e) Removal:

After completion of work, the covering panels shall be removed carefully, so as not to cause any damage to windows etc. covered. The damages, if any, shall be made good.

11.4.14 Facilities in Buildings

Adequate toilet and drinking water facilities shall be provided for personnel working in each building. Each building shall have toilet facilities both for Gents

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[121]	25.09.2014

and Ladies. Number of toilet fixtures shall be adequate for the occupancy as per National Building Code.

However minimum 1 Water Closet, 1 washbasin, 1 urinal shall be provided in each toilet.

Each floor shall have drinking water facility connected through water purification system like Aquaguard or similar approved make.

11.4.15 Glazing & Glazed Partition

- Glazing in Control room between AC. and non-AC. areas shall be insulating glass consisting of [two 6 mm] thick toughened float glass sheet hermetically sealed and separated by [12 mm] gap for thermal insulation. Clear glass shall be provided where clear view is required. In other areas tinted glass may be provided.
- [4 mm] thick ground glass shall be provided for toilets.
- Glazing between two AC. areas shall be with 6 mm thick clear float glass.
- All glazing shall be in aluminium frame.
- [6mm] thick Wired / laminated glass shall be used for windows / ventilators at higher level for safety.
- [24mm] thick insulated double glazing having 6mm thick tinted heat-reflecting type float glass on outer side and 6mm thick clear float glass on inner side with [12mm] air gap & hermetically sealed shall be mounted on [15 micron] coloured anodised aluminium frame suitable for structural glazing system.

11.4.16 Sealant

Silicon sealant or polyurethane sealant shall be used in all expansion joints exposed to weather. All joints around exterior doors, windows, and expansion joints, etc. shall be sealed for proper water-lightness.

11.4.17 Damp Proof Course

[40 mm thick 1:1.5:3] concrete with waterproofing admixture. Water proofing compound shall be of Zydex, SIKa, or similar approved.

11.4.18 Plinth Protection

Minimum [1000 mm] wide and minimum [100 mm] thick M 15-grade concrete plinth protection along building periphery shall be provided with surface drain of required size and slope, to suit storm water quantity, shall be provided. The plinth protection shall be laid over prepared sub-grade and base formed with locally available broken laterite stone to thickness of [150 mm].

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[122]	25.09.2014

11.4.19 Painting

- Exterior Masonry Surface : Buildings shall be finished with [Acrylic Emulsion pain] as per IS specification with approved colour and scheme.
- Exterior Steel Work : Anti-corrosive synthetic enamel paint over [anti corrosive primer].
- All Woodwork: [Synthetic paint over a coat of primer].
- All Internal Steel Work : [Synthetic enamel over a coat of primer].
- Interior Office Spaces Rooms, All AC Areas : Acrylic emulsion paint over [2 mm] control thick plaster of paris punning.
- Balance areas: As indicated in finish schedule in this document.
- Fire Door: Post Office red shade shall be provided.

11.4.20 Flooring

Unless and otherwise specified, the nominal total thickness of floor finish shall be [50 mm] including under bed and topping. The flooring shall be laid on already matured concrete base. The under bed for floors shall consist of minimum grade of M 15 with stone chips [12.5 mm] downgraded as coarse aggregates. The under bed shall be provided appropriate slope towards catch pit for floor drainage.

- **False Flooring System**

Removable type false flooring system shall be provided wherever required (computer rooms etc.). RCC floor slab will be sunk to a depth [800 mm], which shall be height of the false floor system. The flooring shall consist of fire resistant phenol formaldehyde bonded particle board panels [600x600x35 mm] size, mounted on steel pedestals of adjustable height and supporting steel grid system to provide under floor space. [2 mm] thick flexible anti-static PVC topping on top and PVC strip edging on sides of each panel shall be provided.

- **PVC Floor Finish**

Two mm thick PVC as per IS: 3462 and laid as per IS: 5318 over concrete under bed of [48 mm] shall be provided in electronic cubicle rooms, conference room, etc. PVC tiles shall ensure anti static surface.

- **Vitrified ceramic Tiles**

Heavy duty vitrified ceramic tiles of appropriate thickness and of minimum size [600 mm x 600 mm] of approved shade & colour shall be provided for control room as per relevant code and manufacturer's specification over concrete bedding to result in an overall thickness of [50 mm].

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[123]	25.09.2014

- **IPS Flooring**

IPS (cement concrete flooring) with metallic floor hardener topping [12 mm] thick with a total thickness of [50 mm] shall be provided in maintenance and unloading area, ground floors, floor of pump house, permanent stores and other plant building areas where heavy duty flooring is required.

IPS flooring with non-metallic floor hardener shall be provided in all MCC and switchgear rooms, which are not air-conditioned.

IPS flooring shall also be provided in areas, which are not provided with any special finish. Areas which are likely to be subjected to oil spillage shall be provided with two coats of oil resistant painting over IPS floor finish. If required, Bidder has to use floor hardeners at appropriate locations.

- **Heavy Duty Ceramic Tiles**

Heavy duty vitrified ceramic tiles with suitable finish shall be used in toilets, pantry, dining hall of canteen, locker rooms etc. The tiles shall be minimum of [300 x 300 x 7 mm] of approved shade, brand and colour.

- **Acid / Alkali Resisting Tiles**

Battery rooms and other areas coming into contact with acid / alkali vapours or fumes shall be given acid / alkali resistant tiles [25 mm] thick, jointed with acid / alkali resistant cement slurry. Bedding shall comprise of potassium silicate mortar conforming to IS: 4832 (Part-I) and resin based mortar like epoxy for jointing. Total thickness of flooring shall be [50 mm]. Ceramic unglazed vitreous tiles conforming to IS: 4457 with minimum thickness of 20 mm may also be used as acid / alkali resistant tile.

- **Integral Floor Finish**

For cable vaults floor finish integral to the concrete base shall be provided as per IS: 2571.

- **Cast-in-situ Terrazzo**

Risers and treads of staircases shall be provided with cast in-situ terrazzo. This shall be laid as per IS: 2114, using white cement or cement with colouring pigment. Chequered finish shall be provided for treads. Total thickness of the finish shall be 25 mm.

11.4.21 Miscellaneous

PVC nosing shall be provided for edge protection of R.C.C. stair treads.

Angles [50x50x6 mm] (minimum) with lugs shall be provided for edge protection of cutouts / openings in floor slabs, edge of drains covering gratings, edge of R.C.C cable / pipe trenches of any other place where breakage of edges / corners is expected.

Floors of switchgear rooms shall have embedded steel channel suitable for easy movement of breaker panel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[124]	25.09.2014

11.4.22 Skirting/DADO

- [150] mm skirting matching with floor finish shall be provided in all areas unless specified otherwise elsewhere.
- Toilets and locker rooms shall be provided with dado of [2100] mm high with glazed tiles of minimum [5] mm thickness generally as per IS: 777.
- For Control room and control equipment room minimum 5 mm thick decorative coloured ceramic tiles shall be provided upto false ceiling level.
- For battery room and other areas coming in contact with acid / alkali spillage / fume, dado of acid / alkali resistant tiling as per IS: 4457 shall be provided to a height of [2100] mm set in potassium silicate mortar and joints pointed with resin bonded mortar
- Staircase wall shall be given dado of cast in-situ terrazzo to a height of [2100] mm or as per approved drawings.
- Before wall surfaces are covered with tiles, flags or mosaic to be set in normal mortar bedding, a sprayed coating of cement mortar shall be applied to the base unless otherwise specified. Where no adequately even surface is available for work involving thin beddings, special provisions shall be made to compensate for this, e.g., rendering coat, screed. The concrete surface to which tiles, flags, terrazzo, screed, etc are to be placed, shall be cleaned by wet sandblasting and washed with water under pressure, so as to produce the specified surface condition.
- The exterior brickwork walls shall consist of load bearing and non-load bearing type construction. Exterior surfaces shall be treated with approved chemical waterproofing over cement plaster. Bricks of minimum 75 kg/cm² crushing strength shall be provided. Brickwork shall be carried out in cement sand mortar conforming to IS: 1077. Cement sand mortar shall conform to IS: 2250.

11.4.23 Roof access

All roofs shall be provided with access thorough a staircase / cage ladder. Minimum [1000 mm] wide access path shall be provided with suitable tiles to approach equipment on roof.

11.4.24 Roof Drains

Roof drains design criteria

Minimum diameter of the pipe shall be [150 mm]. The roof drains shall be sized for the roof area runoff for a maximum rainfall per hour at site.

Detailed specification is mentioned elsewhere in this specification.

Roof Drainage and Water Proofing

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[125]	25.09.2014

All roofs of buildings shall be provided with 3 layers, first being elastomeric membrane water proofing treatment, secondly screed concrete shall be laid and finally the wearing course. Elastomeric membrane shall be laid as per manufacturer's specifications which shall adhere to specifications as given in IS 2645. Run off gradient shall be given a minimum of 1 in 100. Gradient shall comprise screed concrete 1:2:4 using 12.5 mm or below coarse aggregate. Over the screed concrete waterproofing treatment shall be provided as below:

A wearing course shall consist of pressed clay tiles of size [230x230x18 mm] laid in water proofing compound mixed cement mortar (1:3) and sealing of joints using sealing compound.

LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[126]	25.09.2014

12 GENERAL REQUIREMENTS

12.1 Roof

All the buildings having R.C.C slabs over structural steel framing are provided with troughed metal sheet decking which acts as permanent shuttering. These sheets shall meet the general requirements of IS: 14246 and shall conform to class 3 for durability. The sheeting shall be permanently colour coated galvanised M.S. troughed metal sheet decking of approved profile with minimum base metal thickness of 0.8 mm and minimum trough depth of 38 mm. Silicon modified polyester painting shall be used for permanent coating over galvanised surface with minimum rate of galvanising of 180 gm of zinc per sq. m. Dry film thickness of colour coating shall be at least 20 micron.

Roof of all buildings having R.C.C. framework shall have cast in-situ R.C.C. slab with conventional shuttering.

Structural steel roofing wherever required shall be of permanently colour coated galvanised M.S troughed metal sheet of approved profile. Minimum base metal thickness shall be 0.8 mm. The rate of zinc consumption for galvanising shall be 275 gm/sq. m. The external face shall have permanent colour coating of PVF 2 paint of minimum DFT of 20 microns and inner surface shall be coated with silicon modified polyester paint with DFT of 20 microns

12.2 Platforms and walkways

Platforms shall be provided to all major equipment, not directly accessible from the floors, for maintenance. Platforms and connecting walkways shall have a minimum width of 750 mm. Platforms in front of the entry shall be at least 900 mm wide. Platforms located close to each other shall be connected with walkways.

All steel platforms above grade level shall be constructed with kick plates at edge of the platform to prevent tools or materials from falling off. It shall consist of 8 mm thick steel plate projecting 100 mm above the platform surface. Kick plate shall be painted with the same type of coating as the material to which it is attached. Approach to EOT crane shall be ensured by Cage ladder or staircase.

12.3 Stairs and ladders

Steel Stairs

All steel staircases shall normally have minimum clear width (back to back of stringer) of 1000 mm and maximum inclination with horizontal of 35.75°. However, in case of space restriction, minimum clear width up to 750 mm and slope up to 45° may be provided. The vertical height between successive landings shall not exceed 5 m. Channels (minimum MC 200) shall be provided as stair stringers. Treads shall be minimum 250 mm wide of chequered

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[127]	25.09.2014

plate/grating, with suitable nosing, and spaced equally so as to restrict the rise to maximum 180 mm (200 mm in exceptional cases).

Steel Ladders

Ladders shall be provided to platforms, walkways, instruments and equipments, which do not require frequent access. Ladders shall preferably be vertical and its angle with vertical shall not exceed 50. Ladders shall be of minimum 450 mm clear width with 20 mm diameter MS rungs spaced at 300 mm (maximum).

Ladders shall be provided with a safety cage of minimum 750 mm diameter clear when the top of ladder is more than 4.5 m above the landing level. However safety cages shall start at 2.5 m above the lower landing level.

RCC Stairs

All stairs shall have maximum riser of 180 mm and a minimum tread of 250 mm. However, for public buildings riser shall be limited to 150 mm and tread width of 300 mm. Minimum width of stairs shall be 1200 mm generally. All stairs normally shall not have more than 15 risers in one flight. Aluminium angle nosing with minimum 50X25X3 angle or PVC nosing shall be provided for edge protection of RCC stairs.

12.4 Handrails

Handrails shall be provided at appropriate places to ensure safety e.g. around all floors/roof openings, projections / balconies, walkways, platforms, steel stairs etc.

All handrails shall be of 32 mm nominal bore MS pipes (medium class) as per IS: 1161 galvanised using 900 gm/sq. m of zinc. Handrails for platforms, walkways and projections shall be a two-rail system with the top rail 1000 mm above the walkway surface and the intermediate rail 450 mm below the top rail. Handrail post spacing shall be limited to 1500 mm as far as possible but can be proportioned to the length of the protected horizontal opening. In such a case spacing shall not exceed 1850 mm centre to centre of posts. Handrails shall be shop fabricated for specific locations and field welded or bolted to the erected structural steel. For platforms at elevation more than 30 m, three rail system with top rail at 1500 mm shall be adopted.

For RCC stairs, handrails with 20 mm square MS bar balustrade with suitable MS flat & aluminium / Teakwood handrail shall be provided, unless specifically mentioned otherwise. All hand rails except stairways shall be provided with toe guard plate of 100x8mm thick.

12.5 Edge protection

Wherever possible around floor openings an RCC kerb of 100 mm wide 150 mm high shall be provided. All concrete edges, where breakage of concrete corner is expected, shall be provided with angles at least L 50x50x6 with lugs for edge protection e.g. all round the cut-outs/openings in floor slab, edges of drains supporting grating covers, edges of RCC cable/pipe trenches supporting covers,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[128]	25.09.2014

edges of manholes supporting covers and supporting edges of precast covers etc.

12.6 Vertical Headroom

All accessible areas shall be provided with minimum clear headroom as follows, unless otherwise specified:

Table 2.9

Headroom

Description	Headroom, mm
Finished floors to ceiling (buildings)	3000
Doors, Walkways, Platforms, Stairs etc.	2100
False ceiling of office areas	3000
False ceiling walkway	1000
Safety cage for ladders	2500
Access for forklift trucks	2800
Main roads/Railway crossings & crane access	7000
Other plant roads and truck access	5000
Cable & Pipe rack (except road/rail crossings)	3000

12.7 Waterproofing of underground structures

All underground structures like basements, pump houses, water retaining structures etc. shall have plasticiser cum waterproofing cement additives conforming to IS: 9103. In addition, limits on permeability as given in IS: 6494 shall also be met with. The concrete surface of these structures in contact with soil shall be provided with minimum two coats of bituminous painting of grade 85/25 conforming to IS: 702 @ 1.7 kg/sq.m (minimum) for water/ damp proofing. Also provision shall be made on the inner surface of walls and base slab, so that waterproofing grouting can be injected later in case of leakage.

12.8 Anti-termite treatment/Anti-weed treatment

Pre-constructional anti termite treatment shall be given to all buildings as per IS: 6313 and other relevant Indian Standards.

Reservoirs shall be given an anti-weed treatment of approved quality and quantity as per the manufacturer's specification. Anti weed treatment shall be carried out before carrying out the lining work.

12.9 Plinth Level

The finished floor levels of CHP, transfer towers, crusher house shall be 800 mm higher than the external finished ground level. Finished ground floor level (plinth level) of all buildings and pump houses shall be minimum 500 mm above the formation level/grade level.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[129]	25.09.2014

All cable vaults shall be located above ground level i.e. cable vaults shall not be provided as basements in the buildings.

12.10 Statutory Requirements

All the applicable statutory rules pertaining to Indian Factories act, Factory rules of state government, Fire safety rules of Tariff Advisory Committee, Water act of Pollution Control Boards, Explosives act etc. and stipulations of other relevant statutory authorities shall be taken into consideration at the time of design.

Provisions of safety, health and welfare according to Factories act shall be complied with design stage. These shall include provision of continuous walkway (minimum 500 mm wide) along crane-girder at crane girder level on both sides of the building, comfortable approach to EOT crane cabin, railings, fire escape, locker room for workmen, pantry, toilets, rest room etc.

Adequate number of fire escapes shall be provided in a building. Fireproof doors, number of staircases, fire separation walls, lath plastering on structural steel member (in fire prone areas) shall be made according to the recommendation of TAC. For fire safety requirements of buildings IS: 1641 and IS: 1642 shall be followed in addition to TAC requirements. All masonry firewalls shall be minimum 345 mm thick and RCC firewall shall be minimum 200 mm thick.

12.11 Waterproofing of underground structures

All underground structures like basements, pump houses, water retaining structures etc. shall have plasticiser cum waterproofing cement additives conforming to IS: 9103. In addition, limits on permeability as given in IS: 6494 shall also be met with. The concrete surface of these structures in contact with soil shall be provided with minimum two coats of bituminous painting of grade 85/25 conforming to IS: 702 @ 1.7 kg/sq.m (minimum) for water/ damp proofing. Also provision shall be made on the inner surface of walls and base slab, so that waterproofing grouting can be injected later in case of leakage.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[130]	25.09.2014

13 GENERAL CIVIL WORKS AND CONSTRUCTION TOLERANCES

13.1 Basic requirements for all civil works

Design requirements

The design of all structures under this contract shall be such that differential and total settlements or other movements shall not exceed acceptable limits and full provision shall be made for all expansion and other joints. The design shall be to the approval of the Owner/Consultant.

- Structural members subjected to flexure shall be designed to have adequate stiffness to limit deflections or any deformations that affect strength or serviceability of a structure adversely. The maximum allowable deflections of structural members shall be in accordance with the relevant design standards and/or the limits prescribed by the machinery manufacturers (whichever is less).
- The superstructures and foundations subjected to vibrations (the primary source of these vibrations being the unbalanced forces generated by rotating or reciprocating equipment) shall be designed such that vibrations will be neither intolerable nor troublesome to personnel and will not cause damage to the machine or structure.
- The natural frequency of the whole of the superstructures and foundations or parts thereof and all structures adjacent thereto shall not coincide with the operating frequency of the vibrating plant.
- The differences between frequencies and the dynamic analysis of the superstructures and foundations shall be in accordance with the relevant design standard.
- The dimensions of all the buildings shall be such as to provide adequate space for the safe installation and proper operation, maintenance and repair of all plant and equipment.
- Throughout the works all floor slabs above rooms containing electrical equipment shall be watertight. No drainpipes or water pipes are permitted to pass through these rooms.
- All materials used in the works shall be of the best quality of their respective kinds as specified herein, obtained from sources and suppliers approved by the Owner/Consultant and shall comply strictly with the tests prescribed hereinafter or, where tests are not laid down in this specification, with the requirements of the latest issue of the relevant Indian, American, British, German Standards or other Standards approved by the Owner/Consultant.
- Samples of all materials proposed to be used in the works may be called for at any time by the Owner/Consultant.
- The work shall be carried out by competent personnel skilled in their various trades.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[131]	25.09.2014

- Before commencing the works, the Bidder shall ascertain the locations and nature of all existing underground services and shall take every possible precaution against any damage occurring to them or interference therewith, during the execution of the works.
- Suitable access to the roofs of the buildings by means of steel stairs shall be provided for maintenance and repair of any installation.
- All rooms with fire hazard shall be provided with suitable emergency exits.
- Proper access roads with footpaths shall be provided to bring in all the equipment and to take it out in case of maintenance. These access roads shall be suitable for the vehicles, which will be used (cars, forklifts, trucks/trailers etc) to reach up to the point of unloading of the equipment.
- Safe, convenient and straight forward accesses and means are to be provided to take equipment in and out of all rooms, at all levels using suitable stair wells and suitable electric hoists. The dimensions of rooms, stairwells, doors, etc shall be designed to suit the a.m. transport concept.
- Before starting of design works, the Bidder shall submit to the Owner/Consultant for approval the project design manual containing the design data and the detailed design criteria for all civil works. Design works shall commence only after approval of the project design manual by the Owner/Consultant.

13.2 Basic requirements during construction

Basic Cleaning

Basic cleaning includes all floors, walls, ceilings, built-in fittings and equipment, including the furnishings. The basic cleaning operation must result in a degree of cleanness, which permits the fully equipped buildings and rooms and associated outdoor installations and secured surfaces to be taken over without complaint.

Advertising boards and stickers, temporary protective coatings and claddings, remains and splashes of paint, must be removed with water or suitable solvents.

Dust and other dirt must be completely removed from all wall and floor surfaces, as well as from all furniture.

Windows and mirrors must be cleaned so that they are completely clear and without streaks.

Perlator gauges, showerheads, odour traps and floor drains of the sanitary installations must be cleaned and the fittings and bright pipe work must be spotlessly polished.

Petrol and oil separators must be emptied, cleaned and refilled if necessary during basic cleaning.

Lamps, including dishes, lighting units and tubes, switches and sockets as well as bases and skirting boards, doors with frames and glazing, windows, window

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[132]	25.09.2014

seats and other furniture and fittings must be included in the basic cleaning operation.

Initial Equipment

The specification is drawn up on the assumption that the scope of the initial equipment and consumption materials is to be provided complete in every respect; everything required for the use and care of the installations must be supplied, even if this is not expressly specified in the documentation.

Bidder shall ensure that during excavation ground water level shall be lowered by at least 0.50 m below the founding level adopting appropriate method of dewatering. Lean concrete below foundation shall be laid soon after excavation with minimum loss of time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[133]	25.09.2014

14 STANDARDS, CODES AND REFERENCES

14.1 General

The Design of the Steel Structural Works shall be prepared and presented in accordance with IS codes. In absence of guidelines of specific items in the IS codes, International codes viz., American, BS, DIN or Australian code shall be used. All the Indian Standards referred to shall be the latest revision (including all amendments issued thereto) on the date of opening of the price bid. The Standards adopted shall be clearly stated in the calculations.

The Design shall comply with the current Local Authority Building Regulations (National Building Code) where appropriate. Subject to the agreement of the Owner, other International / Foreign National Standards, and, International / Foreign National Standard Codes of Practice, may be used.

To the extent that the Design shall include materials, methods or workmanship to be incorporated into the works, they shall be selected and incorporated into the design in accordance with the recommendations and requirements of the following (as appropriate in order of precedence but not mutually exclusive):

Statutory requirements

The Contract provisions

Bureau of Indian Standard Codes of Practice

International / Foreign National Standards

Agreement Certification for Materials

Manufacturer's recommendations for materials

Competent Trade Association recommendation

Engineering judgment

In case of any deviation / conflict between provisions of IS codes and the design criteria, the provisions that are more stringent shall be followed unless specifically directed otherwise.

Reference to only some of the codes in this document and various clauses of design criteria shall not limit or restrict the scope or applicability of other relevant codes. It shall be ensured that all other codes relevant to a specific job, in addition to those already mentioned, are followed wherever applicable.

Where British / American / DIN or other codes and standards are referred to in this document, equivalent Indian Standards may be substituted if available.

Materials supplied from India shall follow the Indian Standard Specifications.

Field and laboratory testing procedures for materials follow Indian Standard Specifications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-II, Section-II, Part-D	[134]	25.09.2014

14.2 Codes for Loads

- IS: 875 : Code of Practice for design loads (other than earthquake) for Buildings and structures (All parts)
- IS: 1911 : Schedule of unit weights of building materials
- IS: 1893 (Part 1) : Criteria for earthquake resistant design of structure – General provisions and buildings
- IS: 1893 (Part 4) : Criteria for earthquake resistant design of structure – Industrial structures including stack-like structures

14.3 Codes for RCC

- IS: 456 : Plain and reinforced concrete - Code of Practice
- IS: 2974 : Code of Practice for design and construction of machine foundations
- IS: 2911 : Code of Practice for design and construction of pile foundation
- IS: 4326 : Code of Practice for earthquake resistant design and construction of buildings
- IS: 4995 : Criteria for design of reinforced concrete bins for storage of granular (all parts) and powdery materials
- IS: 4998 : Criteria for design of reinforced concrete chimneys: (All parts)
- IS: 5525 : Recommendation for detailing of reinforced concrete works
- IS: 1786 : Specification for high strength deformed steel bars and wires for concrete reinforcement
- IS: 11384 : Code of Practice for composite construction in structural steel and concrete
- IS: 11504 : Criteria for structural design of Reinforced concrete Natural Draft Cooling Tower
- IS: 11682 : Criteria for design of RCC staging for overhead water tanks
- IS: 13920 : Code of Practice for ductile detailing of reinforced concrete structures subjected to seismic forces

14.4 Codes for Structural Steel

- IS: 800 : Code of Practice for general construction in steel
- IS: 801 : Code of practice for use of cold-formed light gauge steel structural members in general building construction
- IS: 806 : Code of Practice for use of steel tubes in general building construction
- IS: 808 : Dimensions for hot rolled steel beam, column channel and angle section

LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[v]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No	Detail	Unit	Bidder to Indicate
1.0	COAL HANDLING PLANT		
1.1	Coal Bunkers		
	a) Bunker capacity at BMCR condition	h	
	b) Bunker capacity at BMCR condition	m ³	
	c) Shape		
	d) Material and thickness		
	e) Lining and thickness		
	f) Coal density considered for bunker volume calculation	kg/m ³	
	g) Coal density considered for structure design calculation	kg/m ³	
	h) Level sensing arrangement		
	i) Air blasting arrangement		
	j) Bunker drawing to be enclosed		
1.2	Belt Conveyors (Furnish information for each belt conveyor-wise)		
1.2.1	a) Guaranteed capacity b) Design Capacity	TPH TPH	
1.2.1.1	Maximum lump size of coal handled	mm	
1.2.2	Belt width x speed x Troughing angle	mm x ms ⁻¹ x deg.	
1.2.2.1	Belt Position i. Length between centers ii. Maximum angle of inclination iii. Total lift	m Degree m	
1.2.3	Type & Make of belt and standard adopted	...	
1.2.4	Belt rating	kN/m	
1.2.5	Top cover thickness x Bottom cover thickness	mm x mm	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[1]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No	Detail	Unit	Bidder to Indicate
1.2.6	Cover Grade		
1.2.6.1	Weight of belt/meter length	kg	
1.2.6.2	Length of belt required for replacement including jointing allowance	m	
1.2.7	Idlers:		
	i. Standard adopted: for tube x idler set		
	ii. Tube material x outside diameter (OD) x thickness	(mm x mm)	
	iii. Type & Make of bearings		
	iv. Idler spindle material (include impact)		
	v. Bearing size (exclude impact)	mm	
	vi. Bearing size (for other idlers)	mm	
	vii. Troughing idler spacing x self-aligning troughing idler spacing	m x m	
	viii. V-type (2-Roll) return idler spacing x self-aligning return idler spacing	m x m	
	ix. Impact idler spacing x Nos. per loading point	mm	
	x. Impact idler OD steel x tube thickness x OD rubber ring	mm x mm x mm	
	xi. Min. bearing life in working hours	h	
	xii. Motor name plate rating and RPM		
1.2.8	Pulleys:		
1.2.8.1	Head Pulleys (including traveling tripper's head pulley):		
	i. OD x bearing cold rolled steel (CRS) x shell thickness x end disk thickness	mm x mm x mm x mm	
	ii. Shaft diameter @ bearing x shaft material	mm	
	iii. Shaft deflection		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[2]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No	Detail	Unit	Bidder to Indicate
	iv. Type x thickness x lagging material x shore hardness	_ x mm x _ x Shore A	
1.2.8.2	Drive Pulleys (for dual drive and where drive unit is not at head end):		
	i. OD x bearing CRS x shell thickness x end disc thickness	mm x mm x mm x mm	
	ii. Shaft diameter @ bearing x shaft material	mm x _ mm	
	iii. Shaft deflection	min.	
	iv. Type x Thickness x Lagging material x Shore hardness	_ x mm x _ x Shore A	
1.2.8.3	Tail + Take-up + Bend Pulleys (including tripper bend pulley):		
	i. OD x bearing CRS x shell thickness x end disc thickness	mm x mm x mm x mm	
	ii. Shaft diameter @ bearing x shaft material	mm x _ mm	
	iii. Shaft deflection	min.	
	iv. Lagging thickness x material x shore hardness	mm x _ x Shore A	
1.2.8.4	Snub Pulleys		
	i. OD x Bearing CRS x Shell thickness x End disc thickness	mm x mm x mm x mm	
	ii. Shaft diameter x Shaft material	mm	
	iii. Shaft deflection	min.	
	iv. Lagging thickness x material x Shore hardness	mm x _ x Shore A	
1.2.8.5	Deflector Rollers		
	i. OD x Shell thickness x bearing CRS	mm x mm x mm	
	ii. Shaft diameter @ bearing x type of bearing	mm x _	
	iii. Lagging thickness x material	mm x _	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[3]	25.09.2014

S.No	Detail	Unit	Bidder to Indicate
	iv. Quantity provided per conveyor	Nos.	
1.2.8.6	Holding down Pulleys (on concave portion of belt):		
	i. Pulley OD x shaft diameter x bearing CRS		
	ii. Lagging thickness x material		
1.2.8.7	Pulleys (General)		
	i. Min. bearing life in working hours	h	
	ii. Type & Make bearing used		
	iii. Type & Make of Plummer block		
	iv. Material of construction of Plummer block		
1.2.8.7.1	v. Standard adopted (pulleys) Take-up i) Type ii) Estimated weight of carriage & pulley	kg	
1.2.8.8	Drive Units		
	i. Type of drive unit		
	ii. Wrap angle	Deg.	
	iii. Actual power consumption at motor shaft	kW	
	iv. Motor power installed	kW	
	v. Type; make of fluid coupling (HS side)		
	vi. kW rating of fluid coupling	kW	
	vii. Gearbox type & Make and size		
	viii. Service factor used (for gearbox selection) on motor rating		
	ix. Input kW rating x thermal rating	kW x kW	
	x. Type, size & make of low speed coupling		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[4]	25.09.2014

S.No	Detail	Unit	Bidder to Indicate
	xi. Type, Size & Make of Holdback provided (where applicable)		
	xii. Service factor used to select holdback		
	xiii. Torque rating of holdback	Nm	
	xiv. Type, size & make of brake provided		
	xv. Service factor used to select brake		
	xvi. Torque rating of brake		
1.2.9	Gearbox		
	• Conveyors Nos.		
	• Manufacturer & Model no.		
	• Type		
	• Reduction Ratio (Nominal & Exact)		
	• Maximum allowable rating (Mechanical/Thermal)	KW	
	• Mechanical efficiency	%	
	• Type of Enclosure		
	• Bearing type & life		
	• Method of lubrication		
	• Type of primary coupling		
	• Type of secondary coupling		
	• Hold back provided		Yes/No
	• Details of Hold back		
	• Drive base frame provided		Yes/No
	• Materials of construction		
	• Casing		
	• Shaft		
	• Gear, pinion, worm etc.		
	• Gears & pinions hardened and ground		Yes/No
	• Duty conditions		
	• No. of working hour per day

S.No	Detail	Unit	Bidder to Indicate
1.4.13	Limit switches, Rail clamp, end stops, brakes, etc for smooth & safe operation of tripper travel provided		
1.4.14	Type of last bunker feeding		
1.5	Ventilation System		
1.5.1	Type of ventilation system as per spec provided		
1.5.2	Unitary type pressure ventilation in areas as per spec provided		
1.5.3	Unitary type pressure ventilation system		
	i. Guaranteed number of air changes per hour (area wise)		
	ii. +/- ve pressure (minimum) maintained in the area (guaranteed)	mmwc	
	iii. Type & make of fan		
	iv. Louvers / filter / water spray system / ducting/grills etc as per spec provided		
	Filter type offered, size, Rating, Filter media, Efficiency, whether Cleanable?, fresh air velocity through filter.		
	Air velocity limits kept as per specification.		
	v. Ducting material of construction & PL thickness		
	vi. Air velocity through ducting & Grills.		
	vii. Fan capacity, speed, Efficiency, Impeller material, Shaft kw		
1.5.4	Ventilation System: (Furnish Air changes considered per hour for the following areas):		

Document Number	Rev No.	Description	Page No.	Date of Issue

S.No	Detail	Unit	Bidder to Indicate
1.6.12	Furnish details of air compressor such as capacity (free air), type & make, air receiver capacity & kW rating of motor		
1.6.13	Dust emission level in clean air discharged from the stack (guaranteed)	mg/Nm ³	
1.6.14	Dust Suppression System		
a)	Type and location		
b)	Method of Working and Detailed Description Furnished?		
c)	Spray nozzles		
d)	Area Covered by Each Spray Nozzle		
e)	Spacing		
f)	Material of Nozzle Tips and Housing		
g)	Details of Pumps		
h)	Make		
i)	Liquid handled		
j)	Capacity		
k)	Number included (operating + standby)		
l)	Location		
m)	Motor rating		
n)	Tanks		
o)	Number		
p)	Material of Construction		
q)	Capacity		
r)	Are Overflow and Drain Connections with Valves Included?		
s)	Are Level Controls Included?		
t)	Are all necessary valves, piping and fittings included?		
u)	Is schematic/water balance flow diagram for complete dust suppression system covered under the scope of supply

	Details of bearings		
	Type & life of bearing		
	Noise level at a distance of 1 m & 1.5 m above floor level :	DB	
	Equipment weight		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[38]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No	Detail	Unit	Bidder to Indicate
	Is the equipment suitable for operating satisfactorily during monsoon		
	Whether drawing enclosed with offer		Yes/No
	Working principle of operation		
	Whether catalogue/leaflet/ write-up enclosed with offer		Yes/No
1.22.3	Paddle Feeders		
	Type		
	Make		
	Location		
	Capacity Maximum Minimum		
	Quantity		
	Type of Material Handled		
	Lump Size (MAX)		
	Bulk Density (T/Cu.M)		
	Range of Travel (M)		
	Suitable for continuous to and fro operation		Yes/No
	Pre-limit Switches for traverse direction reversal provided		Yes/No
	Blade diameter		
	Capacity variation range		
	Method of Capacity Variation		
	Material of blade		
	Material of blade liner		
	Drive system Detail & Location of Panels		
	Maxm. & minm. speed	m/sec.	
	Paddle wheel drive type & KW Rating	kW	
	Detail of variation of paddle wheel speed		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[39]	25.09.2014

S.No	Detail	Unit	Bidder to Indicate
	Whether automatic reversal possible		Yes/No
	Carriage Rail		
	Size		
	Length	m	
	Centre to Centre Distance	mm	
	End stops provided		Yes/No
	Type of carriage drive		
	KW rating of carriage drive motor	kW	
	Speed of carriage		
	Range of variation of speed		
	Type/No. of over travel switches per feeder		
	Type of drive for carriage with KW rating	kW	
	Suitable Trailing Cable for Feeder Drive Motor provided		
	Length of Cable	m	
	Detail of Cable suspension arrangement		
	Liner on paddle feeder table		
	Type & Details of dust control system		
	Detail of dust sealing of track hopper slot openings		
	Type of lubrication		
	All necessary electrical control & safety facilities provided		Yes/No
	Furnish detail		
	Hours of operation per day		
	Whether equipment suitable for specified conveyor data and conditions		
	Equipment weight	kg	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[40]	25.09.2014

S.No	Detail	Unit	Bidder to Indicate
	Whether equipment complete with all standard parts, safety accessories etc. for smooth operation		Yes/No
	Leaflet/Catalogue furnished		Yes/No
1.22.4	Belt Feeders		
	No. of Belt Feeder provided		
	Name of Manufacturer		
	Application & Feeder Nos.		
	Capacity	TPH	
	Whether due consideration given in design for material shear effect below surge hopper		Yes/No
	Length of Belt Feeder	c/c	
	Width of Belt Feeder		
	Speed of Belt Feeder		
	Troughing Angle	deg.	
	Skirt Height	mm	
	Drive Details – <ul style="list-style-type: none"> •Type of Drive •Belt Power •Motor rating at 50 deg.C •Type of Gear Box for Drive •Type of Input Coupling •Type of Output Coupling •Type of Brake 		
	Belt Details <ul style="list-style-type: none"> •Belt Width •Belt Designation •Whether Belt Specification conform to NIT •Belt cover grade •Belt cover thickness •Cover thickness provided considering loading cycle 		Yes/No Yes/No
	Details of Idlers provided		Yes/No
	Details of pulleys provided		Yes/No

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[41]	25.09.2014

S.No	Detail	Unit	Bidder to Indicate
	Weather pull cord & zero speed switches provided		Yes/No
	Type & travel of take-up		
1.23	Electronic Belt Weighing System		
	a. Number	Nos.	
	b. Make		
	c. Capacity (Rated/ Design)	TPH	
	d. Range of length and weight of wagons which can be weighed on the weigh bridge		
	e. Type of weigh bridge		
	f. Type of sensing device		
	g. Type of recording devices		
	h. Length of live rail		
	i. Accuracy of weighing		
	j. Static		
	k. Dynamic		
	l. Capacity of each load cell		
	m. Indicate whether PC, printer with all accessories as per the requirement		
	n. Type of MIS reports generated		
	o. Approval by weights and measures authority		
	p. Method of calibration		
1.24	Inline Magnetic Separator		
	Type and Make		
	Number and Location		
	Size and Thickness of Tramp Iron Chute		
	Max. and Minimum Size and Weight of Tramp Iron that can be Lifted	mm	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[42]	25.09.2014

S.No	Detail	Unit	Bidder to Indicate
	Operating Height of Magnet	mm	
	Flux Density of Magnet at Surface of Magnet and at Operating Distance from Magnetic Separator under hot stabilized condition	Gauss	
	Speed of Inline magnetic separator		
	All Accessories as per specification included		
	Rectifier Type		
	Force Index		
	Whether Wear Plates of SS is provided for inline Magnetic below the magnet		
	Size of magnet		
	Required Power Supply	V	
	Magnetic Core and Coil Material		
	Maximum Operating Temperature of Coil	°C	
	Power Consumption under hot stabilized condition		
	Type of belt		
	Type of drive		
1.25	Metal Detectors		
	Type and Make		
	Location		
	Number		
	Detecting Capacity		
	Annunciation/Hooter provided		
	Audible Range of Hooter		
	Indicator Dropped on Detection of Metal provided	m	
	Indicator Type		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-A	[43]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]

1.0 MOTOR

SL. NO.	DESCRIPTION	UNIT	DATA
1.	Manufacturer		
2.	Type and frame size		
3.	Nos. required		
4.	Application		
5.	Specification & Codes		
6.	Capacity for specified climatic conditions [50°C]		
7.	Location for installation		
8.	Type of enclosure & ventilation		
9.	Degree of protection		
10.	Type of duty		
11.	No. of phases, frequency & voltage		
12.	Permissible variations in		
a)	Voltage		
b)	Frequency		
c)	Combined		
13.	At rated voltage & frequency		
a)	Full load current		
b)	Full load speed		
c)	No load current		
14.	Minimum permissible voltage during starting :		
15.	Maximum permissible time at minimum permissible voltage during running at full load.		
16.	Maximum permissible time at 75% of rated voltage during running at full load.		
17.	Whether motor stalls at 70% of rated voltage Efficiency & power factor.		
18.	Stator winding		
	Type & nos. of terminals Brought out		
	Resistance between terminals at 20°C		
	Resistance per phase at 20°C		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-004	01	Tender Document for Selection of R&M Contractors – Coal Handling Plant Volume-III, Part-B	[2]	25.09.2014

Technical Specification For R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

SL. NO.	DESCRIPTION	UNIT	DATA
	Inductance per phase		
	Capacitance per phase		
	Starting current as % of full load current		
19.	Torque at full load in Kgm.		
a)	Break away torque in % of full load torque		
b)	Pull up torque in % of full load torque		
c)	Pull out torque in % of full load torque		
20.	Starting time in sec.		
a)	Without mechanism coupled		
b)	Mechanism coupled through hydraulic coupling when it may be presumed that load is transferred to motor shaft only after attaining almost full speed.		
	i. with rated voltage		
	ii. with 80% of rated voltage		
	iii. with 110% of rated voltage		
21.	Starting time in sec. With mechanism coupled through flexible coupling		
a)	with rated voltage		
b)	with 80% of rated voltage		
c)	with 110% of rated voltage		
22.	Safe stall time (hot motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
23.	Safe stall time (Cold motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
24.	Limiting motor temperature to determine safe stall time		
25.	Permissible maximum accelerating time (hot motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		

Document Number	Rev No.	Description	Page No.	Date of Issue

Technical Specification For R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

SL. NO.	DESCRIPTION	UNIT	DATA
26.	Permissible maximum accelerating time (cold motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
27.	Class of Insulation And Material		
28.	Whether insulation is suitable for 415 V, 6.6kV system		
29.	Temperature rise under normal conditions over 50°C ambient temperature		
30.	By resistance method --- °C over cooling water temp. for CACW motors.		
31.	Degree centigrade over cooling air temp. for CACA motor.		
32.	By Thermometer method ---- Degree centigrade over cooling water temp. for CACW motor.		
33.	Degree centigrade over cooling air temp. for CACA motor.		
34.	Method of starting :		
35.	Permissible starting duty cycles :		
36.	Stator thermal time constant :		
37.	Method of cooling (If applicable)		
	Details of water cooling system		
a)	No. of cooler		
b)	Water requirement per cooler		
c)	Losses removed by cooler		
d)	Max. permissible temperature of cooling water at inlet		
e)	Max. permissible temperature of cooling water at outlet		
f)	Maximum permissible pressure at water outlet		
g)	Water pressure drop through the cooler		
h)	Temp. of cold air coming out & entering the machine For permissible cooling water temperature of [31°C]		
i)	Temp. rise of air passing through machine at full load.		
j)	Air pressure drop through The cooler		
k)	Temp. rise of water through cooler		
l)	Protection against leakage of water :		

Document Number	Rev No.	Description	Page No.	Date of Issue

SL. NO.	DESCRIPTION	UNIT	DATA
m)	Arrangement to ensure the water flow		
38.	Bearings		
a)	Number :		
b)	Type :		
c)	Lubrication system :		
d)	Quantity of lubricant reqd. For both the bearings. Life in hours at rated speed :		
e)	Recommended lubricant :		
f)	Bearing end play :		
g)	Inlet oil pressure :		
h)	Temp. rise of oil :		
i)	Max. permissible temp. of bearing :		
j)	Max. Permissible temp. of Oil		
k)	Permissible running time without forced oil at full load & full speed :		
39.	Whether bearings are provided with 4 wire, platinum RTD having 100-ohm resistance at 0°C for remote temp. Indication.		
a)	Whether bearings are provided with local temperature indicator having two adjustable contacts rated for 5A at 240V AC or 0.5A at 220V DC. : Yes/No		
b)	If forced lube oil system provided :Yes / No		
c)	Qty of lubricant required for initial filling.		
d)	Recommended period after which lubricant should be replaced		
e)	Bearing cooling water requirement		
f)	Max. Permissible bearing cooling water inlet temp. (permissible)		
g)	Max. Permissible bearing cooling water outlet temp.		
h)	Terminal designation corresponds to direction of rotation (Facing driving end).		
i)	Terminal boxes with accessories separate terminal boxes provided.		
40.	Winding temp. detectors		
41.	Bearing temp. detectors

1 PROGRAMMABLE LOGIC CONTROLLER (PLC)

Table 1.1
Data Sheet for PLC

S.N	Feature	To be Filled by Bidder
1	Type of the system offered and Model No.	
2	Make	
3	Year of launching of the system	
4	Is the system offered, the latest system available/ being marketed in the international market by the vendor	
5	Place of Manufacturing	
6	Is the offered system confirms to the Specification provided in the tender document with regard to Spare Capacity, Expandability, Redundancy,	
7	Is the System offered is with open system architecture to enable integration of third party hardware/ software applications	
8	Support direct connectivity to Ethernet based LAN	
9	Deterministic and secure architecture	
10	On-line removal/replacement of I/O modules/ drive control modules possible without switching off power supply to the corresponding rack & without affecting controller operation	
11	Total I/O handling capacity of Controller	
12	No. of Tags handling capacity of Controller	
13	Total Power requirement for the offered system	
14	Total Heat Load of all cabinets	
15	Scanning rate for	
a	Analog Signal	
b	T/C Signal	
c	RTD Signal	
d	Binary Signal	
16	Loop Execution Time for

S.N	Feature	To be Filled by Bidder
a	Interlocks	
b	Close loops	
17	Auto switchover to backup redundancy Level	
a	Controller Level	
b	Power supply Level	
c	Communication Level	
18	Output Status on Controller Failure	
19	Battery back-up duration for control processor	
20	Non-volatile memory capacity to store programs, standard software to perform control, DAS & Diagnostic functions	
21	Maximum no. of Channels for	
a	Analog Input module	
b	T/C Input module	
c	RTD Input module	
d	Analog Output module	
e	Binary Input Module	
f	Binary Output module	
22	Optical Isolation for Binary Input/Output provided.	
23	Galvanic isolation for Analog Input/Output provided	
24	Can the analog and binary controls be implemented at different execution speeds, in the multi-function controllers.	
25	Simulation of Analog/Digital Input/Output possible.	
26	Data Transmission speed for	
a	Ethernet LAN	
b	Data Highway	
c	I/O Bus

S.N	Feature	To be Filled by Bidder
10	Maximum Core/cladding Concentricity Error	
11	Cladding Diameter	
12	Cladding Non-circularity	
13	Coating Diameter	
14	Maximum Coating Concentricity Error	
15	Temperature Dependence (-60 to +85C)	
16	Temperature & Humidity Cycling (-10 to +85C, 4 to 90% RH)	
17	Minimum Proof Test	
18	Bending Induced Attenuation (100 turns, 75mm diameter)	

Table 4.4
Data Sheet for Fibre Optic Cable (Multi Mode)

S.N	Feature	To be Filled by Bidder
1	Maximum Uncabled Attenuation Coefficient	@850 nm
		@1300 nm
2	Overfilled Launch Bandwidth	@850 nm
		@1300 nm
3	Gigabit Ethernet Length	1000BASE-SX
		1000BASE-LX
4	Ten Gigabit Ethernet Length	10GBASE-SR
		10GBASE-LX4
5	Numerical Aperture	
6	Core Diameter	
7	Maximum Core Non-circularity	
8	Maximum Core/cladding Concentricity Error	
9	Cladding Diameter	
10	Cladding Non-circularity

TABLE OF CONTENTS

1.0 INVITATION FOR BID	1
1.1 Introduction.....	1
1.2 Invitation.....	1
1.3 Brief Scope of Work.....	1
1.4 Tender Details	1
1.5 Time Schedule.....	2
1.6 Bid Submission.....	2
2 INSTRUCTIONS TO BIDDERS.....	3
2.1 Introduction.....	3
2.2 Address and Contact Details of Owner	3
2.3 General Project Information	3
2.4 Owner's Consultant	3
2.5 Sources of Fund	3
2.6 Cost of Bidding	3
2.7 Non-Transferability of Bid document.....	3
2.8 Scope of Work & Single Bidder Responsibility	3
2.9 Time Schedule.....	4
2.10 Tender Documents	4
2.11 Preparation of Bids	6
2.11.1 Language of Bid	6
2.11.2 Bidding Procedure.....	6
2.11.3 Bid Submission	6
2.11.4 Bid Guarantee	7
2.11.5 Bid Opening	8
2.12 Composition of Techno Commercial Bid (Part-1 Bid)	9
2.13 Composition of Price Bid (Part-II Bid)	9
2.14 Bid Prices	10
2.15 Signature of Bids	10
2.16 Clarifications/Corrigendum/ Amendment of Tender Specifications	11
2.17 Modification of Bids	11
2.18 Information to be Furnished with the Bid.....	11
2.19 Policy of Bids under Consideration	12
2.20 Validity of Bid.....	12
2.21 Understanding & Clarification on Documents & Specifications.....	12
2.22 Latest Hour for Receipt of Bids	13
2.23 Single Bidder Responsibility	13
2.24 No Claim for Compensation for Submission of Bid	13
2.25 Deputation of Representatives for Discussion.....	13
2.26 Evaluation of Bid.....	13
2.27 Local Conditions	14
2.28 Deviations.....	15
2.29 Blacklisting/Debarring	16
2.30 Award of Contract.....	16

2 INSTRUCTIONS TO BIDDERS

2.1 Introduction

[Name of Utility], the Owner, intends to carry out the Renovation & Modernization of [Unit no.-XX ----- of the XXXX Power Plant].

Under the subject Tender, [Utility] invites bid for Renovation & Modernization of Ash Handling System of the said Renovation & Modernization work to be carried out as per the accompanying Technical Specifications. The Bidder shall submit the offer for complete scope of work indicated in the Technical Specification.

2.2 Address and Contact Details of Owner

[Designation, Address and Contact details

-----]

2.3 General Project Information

General information about the plant and R&M project is indicated in section 3.0 on General Project Information.

2.4 Owner's Consultant

[-----], hereinafter referred to as "Consultant" is the Consulting Engineer for the project, appointed by the Owner, [-----], to provide project consultancy services.

2.5 Sources of Fund

[Utility] intends to finance the subject Package of the said renovation & modernization work, through Internal and other sources & External/ Domestic Commercial/ Borrowing from international development funding agencies. [Utility] has tied up the required fund for this package.

2.6 Cost of Bidding

The Bidder shall bear all costs associated with the preparation and submission of its bid, and the Owner will in no case be responsible or liable for these costs, regardless of the conduct or outcome of the bidding process.

2.7 Non-Transferability of Bid document

Transfer of Bid documents issued to one intending bidder to another is not permissible.

2.8 Scope of Work & Single Bidder Responsibility

The scope of the work shall be on the basis of single Bidder responsibility, covering the complete scope of work specified under these specifications and documents. It shall include the following:

- (a) Disassembly of existing equipment/ systems as required.
- (b) Detailed design of the systems/equipment covering all Mechanical, Electrical, Control & Instrumentation, Civil and Structural works.
- (c) Complete manufacture, including shop inspection and testing.
- (d) Providing engineering drawings, data, operational & maintenance manuals, etc., for the Owner's review/ approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-3-	25.09.2014

- (e) Packing, forwarding and transportation including insurance from the manufacturer's works to plant site and transportation from storage yard to erection site.
- (f) Receipt, storage, preservation and conservation of system/equipment at site including construction of storage facility viz. covered, semi-covered, air-conditioned, open yard at the space allocated at site by Owner including storage-cum-erection and all other specified & statutorily required insurance.
- (g) Pre-assembly, if any, erection, testing, commissioning, completion of plant and equipment/ system, conducting trial operation, performance guarantee test and handing over of all the plant and equipment/ system covered under this specification.
- (h) Carrying out all related civil and structural works at site including construction of foundations, buildings, structures etc. Including supply of cement and steel and all other required materials.
- (i) Supply of mandatory spares and tools & tackles.
- (j) Training of Owner's personnel.

Detailed scope is provided in Volume-II of the Technical Specifications.

Bids not covering the entire scope mentioned hereinabove may be treated as incomplete and hence are liable for rejection.

2.9 Time Schedule

The completion Time Schedule for Completion of R&M work and Performance Guarantee Tests shall be as given in the SCC.

2.10 Tender Documents

The scope of contract, technical specification, bidding procedures and contract terms are prescribed in the Tender Documents. The Tender Documents comprise, inter alia, the following volumes:

Volume – I	:	Commercial
Volume – I Chapter-1	:	Invitation for Bid
Volume – I Chapter-2	:	Instructions To Bidders
Volume – I Chapter-3	:	General Project Information
Volume – I Chapter-4	:	General Condition of Contract (GCC)
Volume – I Chapter-5	:	Special Condition of Contract (SCC)
Volume – I Chapter-6	:	Forms & Schedules
Volume – II	:	Technical Specifications
Volume – II Section-I	:	Project Technical Specification
Volume – II	:	Detailed Technical Specification-Mechanical

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-4-	25.09.2014

Section-II, Part-A		
Volume – II Section-II, Part-B	:	Detailed Technical Specification-Electrical
Volume – II Section-II, Part-C	:	Detailed Technical Specification-I&C
Volume – II Section-II, Part-D	:	Detailed Technical Specification-Civil

Volume – III, Part-A	:	Technical Schedule-Mechanical
Volume – III, Part-B	:	Technical Schedule-Electrical
Volume – III, Part-C	:	Technical Schedule-I&C

The Bidder is expected to examine all instructions, forms, terms and specifications in the Tender Documents including clarifications/corrigendum/amendments for completeness and obtain clarifications, if any, from the Owner.

The Bidder is expected to examine all instructions, forms, terms, conditions, specifications and other information in the bidding documents. Failure to furnish all information required as per the bidding documents or submission of a bid not substantially responsive to the bidding documents in every respect will be at the Bidder's risk and may result in rejection of its bid.

A prospective Bidder requiring any clarification to the Tender Documents may notify the Owner in writing by post or by e-mail followed by postal confirmation at the Owner's address indicated in ITB. The Owner will respond in writing by post or by e-mail followed by post confirmation to any request for clarification or modification of the bidding documents that it receives not later than twenty-one (21) days prior to the deadline for submission of bids prescribed by the Owner. Owner's response will be sent to all prospective Bidders that have been issued the Bidding Documents.

The Bidder is advised to visit the plant and obtain on its own responsibility all information that may be necessary for preparing the bid. The Owner will facilitate the bidder to collect such information about the plant in the manner that does not interface with plant operation and does not in any way adversely impact the interest of the Owner. The costs of visiting the site including engaging any third party consultant by Bidder, if required as per the assessment of Bidder, shall be borne by the bidder fully.

The Bidder, its personnel and agents will release and indemnify the Owner and its personnel and agents from and against all liability during such information collection and will be responsible for death or personal injury, loss of or damage to property and any other loss, damage, costs and expenses incurred as a result of the inspection.

At any time prior to the deadline for submission of bids, the Owner may, for any reason, whether at its own initiative, or in response to a clarification requested by a prospective Bidder, amend the bidding documents.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-5-	25.09.2014

The amendment will be notified in writing by post or by e-mail followed by post confirmation to all prospective Bidders that have received the bidding documents and will be binding on them.

At any time prior to the deadline for submission of bids, the Owner, at its discretion may extend the deadline for submission of the bids.

2.11 Preparation of Bids

2.11.1 Language of Bid

The bid prepared by the Bidder and all correspondence and documents related to the bid shall be in English language, provided that any printed literature furnished by the Bidder may be written in another language, as long as such literature is accompanied by a translation of its pertinent passages in English language in which case, for purposes of interpretation of the bid, the translation shall govern.

2.11.2 Bidding Procedure

Single Stage Two Part Bidding Procedure will be followed for this package.

The bidders are required to submit, the bids for the Renovation and Modernization work in two parts. Both the parts are to be submitted together before the indicated Bid submission Time & Dates.

The Part-I Bid comprises the techno-commercial bid without prices. The main components of the Techno-Commercial Bid are Bid Guarantee, Scope of Work & Terminal Points, Technical descriptions/details, Technical Data Sheets, List of Tools & Tackles, Deviations to Technical and Commercial Specifications/Conditions, Overall Completion Time Period & L-1 Network Schedule, Resource Deployment Schedule, Detail of Sub-Contractors/Sub-Suppliers/Sub-Vendors, Spares list, Quality Assurance Programme, Details of the present commitments & details of contracts in hand, Indices and Coefficients for Price Variation etc. Part-II Bid will comprise Quoted Price and Quoted Performance Guarantee Parameters. Initially, only the Part-I Bid will be opened and Part-II Bid is kept in safe custody.

After evaluation of the Techno-Commercial (Part-I) Bids, each Bidder who has submitted a broadly responsive Part-I Bid, will be invited for Techno-Commercial Discussion, during which, all the required amendments, additions, deletions and other adjustments are noted and recorded in a memorandum. Part-II Bid (Price Bid) of only those Bidders will be opened, whose Part-I Bid is found to be responsive to Tender Specifications and Conditions. The date & time for opening of Price Bid will be intimated separately.

Techno-Commercial Bid should not contain any price data.

Price Bid should not contain any matter in respect of Technical and / or Commercial aspects other than the details specifically sought by the Owner.

2.11.3 Bid Submission

- (1) Bid proposals shall be accepted from only those eligible bidders who are found qualified during the pre-qualification process & are issued Tender Documents. Unsolicited bids shall not be taken into cognizance.
- (2) All Bid proposals shall be prepared and submitted in two parts, part-wise in separate sealed covers, with all pages serially numbered. All bids shall be prepared in the English language only, by typing or printing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-6-	25.09.2014

- (3) *[One original and 9 (nine) identical copies of the original]* with all enclosures shall be submitted by each Bidder for Part-I and Part-II, clearly indicating the original and the number of the copy (i.e., “Original”, “Copy No. 1”, “Copy No. 2” etc.).
- (4) All these covers shall be individually sealed and put in an outer cover which also shall be sealed and super scribed as in other covers.
- (5) The covers should be pasted properly before applying the wax seal. Failure to do so may result in rejection of such bids.
- (6) The Bidder’s Bid and the documents attached thereto shall be considered as forming part of the Contract documents.
- (7) In the event of discrepancy between “Original” and any copy of the bids, the hard copy of Original shall prevail.
- (8) The Bid shall be submitted to [-----]. Bid submitted to any other office of Owner is liable for rejection. Bids submitted by Telefax or e-mail will be rejected
- (9) Owner will receive Bids in respect of all the equipment/systems and scope of work as set forth in the accompanying Technical Specifications. All bids shall be prepared and submitted in accordance with the Tender Documents.
- (10) Failure to furnish all information required in the Tender Documents or submission of a Bid not substantially responsive to the Tender Conditions and Technical Specifications in every respect or bids received in incomplete shape shall be liable for rejection. A bid shall be determined as substantially responsive in every respect, if it conforms to all the terms, conditions and specifications specified in Tender Documents without material deviations, objections, conditionality or reservations.
- (11) A material deviation, objection, conditionality or reservation is one:
 - (i). That affects in any substantial way the scope, quality or performance of the contract;
 - (ii). That limits in any substantial way, inconsistent with the Tender Documents, the Owner’s rights or the successful Bidder’s obligations under the contract.
- (12) Deviation(s) to vital clauses listed under the Tender Documents shall be considered to be material deviation(s).
- (13) Notwithstanding any information and data, which may be contained in these Tender Documents, the Bidder has to make independent inquiries and generally obtain his own information on all matters that may in any way affect prices, risks and obligations of the Contractor under the Contract.
- (14) Either the agent or the Principal manufacturer directly could bid in a tender, but not both. In case both submit the tenders, the tender of the manufacture will alone be considered.
- (15) An agent representing one manufacturer in a tender will not be allowed to quote on behalf of another manufacturer along with previous manufacturer in a subsequent / parallel tender for the same item.

2.11.4 Bid Guarantee

- (1) The Bid shall be accompanied by Bid Guarantee either in the form of Bank Guarantee valid for [---] days from the scheduled date of opening of the Bids (Part-I) or Demand Draft of equivalent amount drawn in favour of “[-----]” payable at “[-----]”.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-7-	25.09.2014

- (2) The Bank Guarantee shall be from any scheduled commercial Bank in India authorized by Reserve Bank of India,, to issue such Bank Guarantee on a non-judicial stamp paper of value not less than Rs. [---]/-.The stamp paper shall be purchased in the name of the Bank.
- (3) Unless otherwise expressly stated,
 - a) The Bid Guarantee shall be executed only on behalf of the Bidder in whose name the Tender Documents have been issued.
 - b) The Bid and other documents shall be submitted only by the Bidder in whose name the Tender Documents have been issued.
 - c) The Bid Guarantee shall be executed only as per the format prescribed by Owner at ([-----]). In the event of any deviation in this regard, the decision of Owner as to whether the same could be accepted or not, will be final and binding on the Bidder.
- (4) The Bidder shall arrange for extension of validity of Bid and that of the Bid Guarantee upon request from the Owner.
- (5) No interest shall be paid on Bid Guarantee amount. The offer without Bid Guarantee or with short Bid Guarantee or Bid Guarantee in the form other than that specified herein above or from banks not specified hereinabove will be liable for rejection.
- (6) Any Bid not accompanied by the Bid Guarantee shall be rejected and the Bidder shall not be permitted to participate in the tender.
- (7) The Bid Guarantee shall be forfeited if the Bidder withdraws / modifies / changes / impairs / derogates the bid proposal on its own after the Bids are opened or submits forged/bogus certificates or fails to accept the Letter of Award issued by Owner or fails to submit Contract Performance Guarantee.
- (8) The Bid Guarantee of all unsuccessful Bidders shall be returned after price cover opening and price evaluation. The Bid Guarantee of the successful Bidder shall be returned after furnishing of the Contract Performance Bank Guarantee to the Owner and acceptance thereof.

2.11.5 Bid Opening

1. This is a single stage two part tender. On the specified date and time of opening, Part– I Bid containing Bid Guarantee and Technical and Commercial Proposal without Prices will be opened. At the time of opening of Part–I of the bids, the names of the bidders who submitted their bids shall be read out and other such details as Owner, at its discretion, may consider appropriate, shall be read out. The Part – II (Price Bid) will be lodged and opening date of the same will be intimated separately to those Bidders whose Part-I Bid will be determined to be substantially responsive to Tender Conditions and Technical specifications in all respects.
2. If the Bidder desires to be present at the time of opening of Part-I of bids, it shall depute its representatives (not more than two persons) in time with due authorization for participating in the Bid opening.
3. Owner takes no responsibility for delays, loss or non-receipt of Bid documents or any letters sent by post/courier either way and also reserve the right to reject any Bid in part or full without assigning any reasons thereof.

2.12 Composition of Techno Commercial Bid (Part-1 Bid)

This part shall, inter alia, include the following in the same order as listed below. One original and 9 (nine) identical copies shall be submitted.

- (i). Duly filled in "Form of Bid" (As per Annexure-B of this Volume).
- (ii). Power of Attorney/Authorization with the seal of the company in favour of the person signing the Bid.
- (iii). Deleted
- (iv). Bid Guarantee- as per Annexure A.
- (v). Schedule of Prices as per Schedule – F1 (Table 1 to Table-7) with the word "Quoted" in lieu of Price data and all other details except price data.
- (vi). Mandatory spares as per Technical Specifications (with the word "Quoted" in lieu of Price data)
- (vii). Recommended spares (with the word "Quoted" in lieu of Price data)
- (viii). Tools & Tackles as per Technical Specifications (with the word "Quoted" in lieu of Price data)
- (ix). Schedule of Performance Guarantees- as per Schedule – F1 (Table-8) with the word "Quoted" in lieu of Performance Guarantee parameters
- (x). Signed copy of all the corrigendum's/amendments/clarifications, if any issued for the tender
- (xi). Overall Time Schedule as per Schedule – F2 and Bar chart/PERT Network schedule to achieve the time schedule
- (xii). Deviations to the Commercial specification, if any, as per Schedule – F3.
- (xiii). Deviations to Technical Specifications, if any, as per Schedule – F4.
- (xiv). Requirements of the Contractor at site, as per Schedule – F5.
- (xv). Resource deployment schedule as per Schedule – F6
- (xvi). Details of the present commitments of the Bidder, details of contracts in hand
- (xvii). Details of Sub-Contractors/Sub-Suppliers/Sub-Vendors, if any
- (xviii). Quality Assurance Programme
- (xix). Technical Details to be furnished with the Bid as called for in the Technical Specification Vol-II and Technical Bid Data Sheet Vol-III.
- (xx). Schedule of weights and dimensions
- (xxi). Coefficients and indices for price variation formula

The Part-I Bid shall not contain any Price data.

2.13 Composition of Price Bid (Part-II Bid)

The Bidders are requested to quote the Prices and the Performance Guarantee parameters only in the specified format. Price given in Part-II should cover the entire scope of work as given in Part-I of the offer including list of mandatory spares and Tools & tackles with itemized price and should be as per Schedule of Price enclosed. **[One original and 9 (Nine) identical]** copies shall be submitted.

1. The Price Bid shall contain the following :

- (i). Duly filled in Form of bid as per Annexure-C
- (ii). Completely filled in Schedule of Prices Schedule – F1 (Table 1 to Table-7)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-9-	25.09.2014

- (iii). Completely filled in Schedule of Performance Guarantees Schedule – F1 (Table-8).
2. The Bidder shall quote his price against each item of the schedules as indicated in the enclosed formats. The Bidder shall quote the prices only once after considering all the pros and cons, risks and contingencies. Rebate percentage etc., if any, should be spelt out by the Bidder in the first Bid itself.
 3. The amount shall be quoted both in figures and words clearly and legibly. No overwriting is allowed. All scoring and cancellations should be countersigned by the Bidder. In case of illegibility, the interpretation of the Owner shall be final. All entries shall be in English language only.
 4. The Bid may be made in Indian Rupees as well as in Foreign Currencies (maximum three foreign currencies) and all payments for the entire scope will be made in Indian Rupees as well as in the quoted Foreign Currencies.
 5. Prices in Indian supply shall be quoted on Ex-works supply of plant & equipment basis including Packing & forwarding. Inland transportation, Insurance charges, etc. shall be indicated separately.
 6. Excise Duty, Central sales tax (CST), service tax, Value Added Tax (VAT), VAT on Works Contract, other applicable taxes, duties and Cess shall be clearly indicated by the bidder in the price schedules and these taxes shall be considered for bid evaluation.

2.14 Bid Prices

Bidders shall quote for the entire scope of work on single responsibility basis & the total bid price covers all the Contractor's obligations mentioned in tender document specification or to be reasonably inferred from the tender documents/ specification in respect of the disassembly/ dismantling of existing equipment facility as specified, design, manufacture, including procurement and subcontracting (if any), delivery, construction, installation, commissioning, completion of the facilities and conductance of Performance Guarantee tests for the facilities including supply of mandatory spares, recommended spare & tools/ tackles (if any). This includes all requirements under the Contractor's responsibilities for testing, pre-commissioning and commissioning of the facilities, conducting Guarantee tests and, where so required by the tender documents, the acquisition of all permits, approvals and licenses, etc.; the operation, maintenance and training services and such other items and services as may be specified in the tender documents, all in accordance with the requirements of the Conditions of Contract and Technical Specifications.

Bidders are required to quote the price for the commercial, contractual and technical obligations outlined in the tender documents.

Prices quoted by the Bidder shall be subject to adjustment during performance of the Contract to reflect changes in the cost of labour, material, etc. A bid submitted with a fixed price quotation will not be rejected, but the price adjustment will be treated as zero. The price adjustment provision will not be taken into consideration in bid evaluation.

2.15 Signature of Bids

Each page of the Bid must be signed and stamped by the Bidder with his usual signature. The names of all persons signing should also be typed or printed below the signature. Satisfactory evidences of authority of a person signing on behalf of the Bidder shall be furnished with the Bid. Erasures or corrections in the Bid documents if

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-10-	25.09.2014

any shall be signed by the person signing the Bid. Printed literature, it enclosed need not be signed. Bids not conforming to the above requirements are liable to be treated as non-responsive.

2.16 Clarifications/Corrigendum/ Amendment of Tender Specifications

1. At any time prior to the deadline for submission of Bids, the Owner may, for any reason, whether at his own initiative or in response to clarification(s) requested by a prospective Bidder, modify the Tender Specifications by amendment.
2. Clarifications/Corrigendum/Amendment shall be construed to be an integral part of the Tender Specifications, which will be notified. Amendments will be hosted in Owner's website. Bidders are requested to visit Owner's website and note amendments, if any, before submission of bid. Owner shall not be responsible if any bidder fails to notice any amendment.
3. Amendment shall be numbered serially. Signed copies of amendments & clarifications shall be enclosed in Part-I of bid by bidder.

2.17 Modification of Bids

The Bidder is not permitted to modify his Bid suo-moto after the Bid submission.

2.18 Information to be Furnished with the Bid

1. The Bid (Part-I) must clearly indicate the name of the manufacturer, the type or model of each principal item of equipment proposed to be supplied and erected. The Bid should also contain drawings and descriptive materials indicating general dimensions, material from which the parts are manufactured, principles of operation and the extent of pre-assembly involved, major erection equipment required to be deployed, method of erection and the proposed erection Organization structure.
2. The above information shall be provided by the Bidder in the form of separate sheets, drawings, catalogues, etc.
3. Any Bid not containing sufficient descriptive material to describe accurately the system / equipment proposed may be treated as incomplete and hence rejected. Such descriptive materials and drawings submitted by the Bidder will be retained by the Owner. Any major departure from these 'drawings and descriptive material submitted will not be permitted during the execution of the Contract' without specific written permission of the Owner.
4. Oral statements made by the Bidder at any time regarding quality, quantity or arrangement of the equipment or any other matter will not be considered.
5. Standard catalogue pages and other documents of the Bidder may be used in the Bid to provide additional information and data as deemed necessary by the Bidder.
6. In addition to the hard copy of Part-I Bid, the Bidder shall submit soft copy of all data sheets, Schedule, List of Mandatory spares, tools & tackles and Bar Chart/PERT as well as deviation tables in a compact disk (CD). However, hard copy alone will be considered as authentic for evaluation. Bidder shall submit all the filled in datasheet also in soft copy. Bidder shall also furnish soft copies and hard copies of Data Sheet with filled in details wherever details are required to be indicated by the Bidder.

2.19 Policy of Bids under Consideration

Bids shall be deemed to be under consideration immediately after they are opened. While the Bids are under consideration, Bidder's and/or their representatives or other interested parties are advised to refrain from contacting by any means, the Owner and/or his employees/ representatives on matters related to the Bids under consideration. The Owner, if necessary will obtain clarifications on the Bids by requesting for such information from any or all the Bidders, in writing as may be necessary.

2.20 Validity of Bid

1. The Bid shall be kept valid for acceptance for **[180 days]** from the schedule date of opening of the Part-I Bid.
2. The Bidder will not be permitted to change the substance of the Bid suo-moto, after Bid has been opened.
3. Unilateral revision or withdrawal of offer by the Bidder within the subsistence of the validity period of offer shall not be permitted. Violation of this condition shall result in rejection of the Bid without notice, besides forfeiture of Bid Guarantee. The Bidder shall also be debarred either permanently or for a fixed period, at the discretion of Owner from participating in any of the Owner's tenders.

2.21 Understanding & Clarification on Documents & Specifications

1. The Bidder is required to carefully examine the specifications and documents and fully informs himself as to all the conditions and matters which may in any way affect the 'Renovation and Modernization work to be carried out or the cost thereof. Bidders are required to visit the plant to get familiarized with local conditions. However, the Bidders' visit to site shall be at their cost and risk, without any liability on part of the Owner.
2. Bidders may seek clarifications to the prescribed clauses and / or different part of the Tender Specifications. Such a request for clarifications, if any, should reach the Owner at least **[7 (seven) days]** before the date stipulated for pre-bid meeting. The Owner then will issue interpretations and clarifications as it may think fit in during the pre-bid meeting. After pre-Bid meeting, Bidder may seek further clarification till **[21 days]** prior to schedule opening date of Part-I Bid. After receipt of such clarifications, the Bidder may submit its Bid but within the time and date as specified in the Invitation for Bid or as amended by the Owner. All such clarifications and the relevant exchange of correspondence between the parties shall be construed to form part of the tender specifications.
3. Pre-Bid Conference will be organized and outcomes of the pre-bid conference is binding on all the Bidders. Outcome of the Pre-Bid Conference will be intimated by the Owner to all the Bidders.
4. A copy of such clarifications duly signed and stamped shall be enclosed with the Bid (Part-I). In case any queries remain un-replied, it shall be construed that in respect of those queries, the respective stipulations of the Tender Specifications/Conditions shall continue to apply and/or no new stipulations are made with respect to those queries.
5. No extension of time for submission of Bid will be granted on account of Bidders' request for interpretation/clarifications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-12-	25.09.2014

2.22 Latest Hour for Receipt of Bids

Bids must reach the designated Office of Owner not later than [-----] Hrs, Indian Standard Time (IST) on the date fixed for receipt of the Bid as indicated in the Invitation for Bid. Bids delivered / received after the time and date fixed for the receipt of the bids shall be liable for rejection.

2.23 Single Bidder Responsibility

1. The scope of supply and services shall be under single Bidder responsibility.
2. The successful Bidder should not sub contract the entire work on back to back basis or otherwise.

2.24 No Claim for Compensation for Submission of Bid

1. The submission of any Bid connected with these documents and specifications shall constitute an agreement that the Bidder shall have no cause of action or claim against the Owner for rejection of his Bid.
2. Regardless of the conduct or outcome of the bidding process, Bidder shall not be entitled to claim any costs, charges and expenses incidental to or incurred by him through or in connection with his submission of Bid or its consideration by the Owner, even though the Owner may elect to modify/withdraw the Invitation for Bid or does not accept the Bid(s).

2.25 Deputation of Representatives for Discussion

After opening of the Bid, if the Owner desires to have techno-commercial discussion on the Bid, the Bidder shall be in a position to depute his competent representatives of various disciplines at short notice with full authority for finalising technical parameters as well as Commercial Terms and Conditions of the Tender.

2.26 Evaluation of Bid

1. For evaluation and comparison of price bid, the prices indicated at [-----] summary of Prices as per Schedule [-----] will be considered. The Bids received will be evaluated by the Owner to ascertain the lowest evaluated substantially responsive Bid vis-à-vis the Tender Specifications. The Bidder has to satisfy himself that full information is furnished as required in the specifications. Lack of particulars or incomplete information furnished will run the risk of rejection of the bid. The following major procedures would be followed for evaluation of bids.
2. All the Bidders would be brought on par with reference to Technical Specification, Commercial Condition, Instructions to Bidders and subsequent techno-commercial discussions/ clarifications.
3. Commercial loading would be done for non-compliance of commercial terms and conditions of the Tender Specifications other than the vital clauses, as the case may be.
4. After the evaluation of Part-I bids (techno-commercial bids) and before opening of Part-II bids (Price Bids), in case the bidders are asked to make changes to their techno commercial offer that may have price implications, Owner may give the bidders opportunity to submit addendum to price bid covering the price implication only against such changes before the opening of Part-II bids (Price Bids). All the bidders will be notified, at least 15 days before the Price Bid opening date, about such changes against which they can submit addendum to Price Bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-13-	25.09.2014

5. To facilitate evaluation and comparison, the Owner will convert all bid prices expressed in foreign currencies into Indian Rupee at State Bank of India Bills Selling exchange rates prevailing on the date of opening of the price bid.
6. The Bidder is eligible for a price variation as per Tender Condition. However Price variation shall not be considered for Bid evaluation.
7. Technical loading will be done for omission of price data in respect of equipment/facilities, spares, tools & tackles, etc. The highest quoted corresponding price will be loaded against such omission. If no quoted price is available, the loading will be done as per the corresponding price as estimated by the Owner.
8. The quoted values for Performance Guaranteed Parameters given in Table below would be evaluated using evaluation factors specified. The evaluation factors shall be applicable to the differential values calculated from among the Bidders of corresponding item with appropriate highest or lowest value (i.e., the best quoted value) as the base. The evaluation will be based on the guarantee parameters inclusive of all tolerance furnished at the Guaranteed Condition. Bidders to note that the values indicated in the Schedule of Performance Guarantees shall be inclusive of all tolerances including measurement uncertainty.

Table-Bid Evaluation Factors

Sl. No.	Functional Performance Parameter	Evaluation Factor Rate
1.	Auxiliary Power	[-----] INR per kW

The evaluation factors rate shall be prorated for any fractions of the specified value.

- (1). Arithmetical errors will be rectified on the following basis:
 - If there is any discrepancy between the unit price and the total price that is obtained by multiplying the unit price and the quantity, the unit price shall prevail and the total price will be corrected.
 - If there is a discrepancy between the total Bid Price and the sum of total prices, the sum of the total prices shall prevail and the total Bid Price will be corrected.
 - If there is discrepancy between the rates in figures and in words, the rates expressed in words shall only prevail and shall be adopted.
- (2). All the Sl. Nos. and columns in the 'Schedules of Prices' shall be quoted. If no prices are envisaged for any of the entries, 'Nil' shall be mentioned. In this context "Nil" mentioned against any item shall construe that the Bidder shall not charge any amount separately for that item from the Owner. If the terms, such as 'not applicable' "-----" or blank are mentioned against any Sl. Nos./columns, the highest amount quoted for the concerned entry among all Bidders will be loaded for purposes of evaluating the Price Bids.

2.27 Local Conditions

1. The Bidder shall inspect the site and shall satisfy himself of the site conditions and shall apprise himself of the procedure for engagement of agencies/labour and shall collect any other information, which may be required before submitting the Bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors-Ash Handling System Volume-I	-14-	25.09.2014

2. Wages not less than Minimum wages for Contract labour shall be paid as applicable in this region from time to time. Claims and objections due to ignorance of site conditions will not be considered after submission of Bid.
 - (i). The Bidder is required to carefully examine the Technical & General Specification, commercial Terms and Conditions, drawings and other details relating to work given in the Tender Specification and get fully acquainted as to all conditions and matters which may in any way affect the work or the cost thereof.
 - (ii). The Bidder shall be deemed to have exhaustively examined the Tender Specifications including the Form of Contract, to have obtained all information and clarifications on all matters whatsoever that might affect the carrying out of the work and to have satisfied himself as to the adequacy of his Bid. He is deemed to have known the scope, nature and magnitude of the work and the requirements of materials and labour involved etc. and as to all work he has to complete in accordance with the Contract for the adequacy of his Bid.
 - (iii). The Bidder shall be deemed to have visited and carefully examined the plant/ site and surroundings, to have satisfied himself about the nature and details of all existing structures, if any, and also as to the nature and conditions of the railways, roads, bridges and culverts, means of transport and communications, whether by land, water or air and as to possible interruptions thereto and the access to and from the site, to have made independent enquiries, examined and satisfied himself as to the sources for obtaining earth, gravel, sand, stones, bricks and all other construction materials, the site for disposal of surplus earth and debris, the available accommodation, underground existing services, sub-soil water conditions, storms, prevailing winds, climatic conditions and all other similar matters which may affect the work.
 - (iv). The Bidder shall be deemed to have acquainted himself with the Indian Income tax Act, 1961, Indian Companies Act, 1956, Indian Customs Act, 1962, Indian Central Excise Act, Value Added Tax, Indian Sales Tax Act, Indian Electricity Act, Central Electricity Authority Regulations Indian Boiler Regulations, Factories Act, Pollution Control Regulations and other related Acts & Laws prevalent in the State of [-----] and in India and as amended from time to time. The Owner shall not entertain any request for clarifications from the Bidders regarding such local conditions.
 - (v). Any neglect or omission or failure on the part of the bidder in obtaining necessary and reliable information as stated above or on any other matter affecting the Bidder shall not relieve him from any risk or liabilities or the entire responsibility for completion of the work in accordance with the Tender Specifications.

2.28 Deviations

1. Normally, deviations are not permitted in commercial terms & conditions and technical specification. Nevertheless, if the Bidder takes any deviation, it shall be clearly indicated in the deviation schedule (Schedule – [-----] and Schedule- [-----] with a soft copy in MS-Word format in compact disc, with “Original” of Part-I of the Bid). Deviation listed elsewhere in the Bid shall be summarily rejected and ignored. Separate printed standard terms and conditions of the Bidder shall not be taken into cognizance and shall be totally rejected.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-15-	25.09.2014

2. No alterations or disfigurement, other than filling in particulars wherever called for in the formats of the Tender Specifications shall be made in the Bid. Any changes/modifications made by the Bidder in Bid documents itself shall not be taken into consideration.
3. If at any later date, it is found that documents, information, averments and data submitted by the bidder in the Bid, based on which the Bidder has been considered eligible or successful or has been awarded the Contract is incorrect or false to the extent that had the correct or true information been made available to the Owner at time of tender evaluation, the Bid would have been declared ineligible or unsuccessful, the Bidder shall be forthwith disqualified or, as the case may be, the Contract awarded based on such incorrect or false information shall be cancelled and the Bid Guarantee / contract performance Guarantees deposited shall be appropriated by the Owner towards Owner's cost, loss and damage to Owner.

2.29 Blacklisting/Debarring

In case, certificates submitted by the Bidders are found to be a forged/untrue, the Bidder will not only be disqualified for this tender but also would be black listed/debarred by the Owner.

2.30 Award of Contract

1. Award Criteria
 - The Owner will award the contract to the successful Bidder whose Techno-commercial bid has been determined to be substantially responsive and Price Bid to be the lowest evaluated bid, provided that the Bidder is determined to be qualified to perform the contract satisfactorily.
 - The Owner reserves the right to vary the quantity of any of the Items / Spares and / or delete any Item / Spares altogether at the time of Award of Contract.
2. Owner's Right to Accept Any Bid and to Reject Any or All Bids

The Owner reserves the right to accept or reject any bid, for any reasons including National defense and security consideration and to annul the bidding process and to reject all bids at any time prior to award of contract, without thereby incurring any liability to the affected Bidder or bidders or any obligation to inform the affected Bidder or bidders of the grounds for the Owner's action.
3. Notification of Award

Prior to the expiration of the period of bid validity, the Owner will notify the successful Bidder in writing by registered letter (Letter of Award or LOA) or by email to be confirmed in writing by registered letter, that its bid has been accepted. The notification of award will constitute the formation of the contract.

Upon the successful Bidder's furnishing of the performance securities the Owner will promptly notify each unsuccessful Bidder and will discharge its bid security.
4. Signing the Contract Agreement

At the same time as the Owner notifies the successful Bidder that its bid has been accepted, the Owner will send to the Bidder the Contract Agreement provided in the bidding documents, incorporating all agreements between the parties.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-16-	25.09.2014

Within *[twenty-eight (28)]* days of receipt of the Contract Agreement, the successful Bidder shall sign and date the Contract Agreement and return it to the Owner.

5. Corrupt or Fraudulent Practices

The Owner requires that Bidders, Contractors and Suppliers observe the highest standard of ethics during the procurement and execution of the contracts. In pursuance of this policy, *[Name of Utility]* requires that Bidders, Contractors and Suppliers observe the highest standard of ethics during the procurement and execution of the contracts. The Employer may reject a Bid Proposal of a successful Bidder if it emerges that the Bidder recommended for award has engaged in Corrupt or Fraudulent practices in competing for the subject contract. The Employer may declare a Bidding firm ineligible for participation in future tenders of the Employer, either indefinitely or for a stated period of time, if it at any time it emerges that the firm has engaged in Corrupt or Fraudulent practices in competing for or in executing a contract of the Owner. Corrupt Practice means the offering, giving, receiving or soliciting of anything of value to influence the procurement process or contract execution. Fraudulent practice means a misrepresentation of facts in order to influence a procurement process or the execution of a contract to the detriment of the Owner and includes collusive practice among Bidders designed to establish bid prices at artificial non-competitive levels and to deprive the Employer of the benefits of free and open competition.

2.31 Agency Commission

No Agency commission shall be payable under the Contract.

2.32 Contract Performance Bank Guarantee (CPBG)

As a Contract security, the successful Bidder, to whom the work is awarded, shall be required to furnish a Contract Performance Bank Guarantee (CPBG) in the Format attached as Annexure- G, in favour of the Owner within 30 days from the date of issue of Letter of Award (LOA). The guarantee amount shall be equal to ten percent (10%) of the 'Contract Price' and it shall guarantee the faithful performance of the 'Contract' in accordance with the terms and conditions specified in these documents and specifications. The CPG shall be valid till the end of 'Warranty Period' plus Ninety (90) days grace period. If the contract price is in more than one currency, CPBG shall be 10% of respective currency.

2.33 Contract Quality Assurance

1. The Bidder shall include in his Bid a detailed Quality Assurance Programme containing the overall quality, management and procedures which he proposes to follow in the performance of the 'Works' during various phases.
2. After Letter of Award (LOA) the detailed Quality Assurance Programme to be followed for the execution of the 'Contract' will be mutually discussed and agreed to and such agreed Programme shall form a part of the 'Contract'.

2.34 Codes & Standards

Specifications give reference to Indian or internationally accepted Standards. However, equipment or materials meeting other recognized National or International Standards, which ensure an equal or superior quality than Standards specified, will also be accepted. For details of codes and standards refer Technical specification, Volume-II.

2.35 Vital Clauses

The following clauses in the Tender Specification & Draft Contract are vital. Bidder is advised not to take deviations to these clauses. If deviations are taken from the stipulations of these clauses, such Bids would be liable for rejection:

- Scope of Work
- Time Schedule
- Price Basis
- Contract Performance Guarantee
- Warranty
- Liquidated Damages
- Force Majeure
- Arbitration
- Taxes & Duties
- Bid Guarantee
- Patents, Indemnity
- Validity of Bids

4 GENERAL CONDITIONS OF CONTRACT (GCC)

4.1 Definitions

- i. **"Applicable Laws"** means the laws of any national, state, local or municipal legislature in India, or of any other Competent Authority, including all laws, acts, judgments, statutes, rules, regulations, ordinances, orders, decrees, injunctions, governmental authorizations, requirements of Applicable Permits and any agreements, decisions, acts, instructions, requirements, directions and notifications of any competent or other Competent Authority or court or tribunal or arbitrator having jurisdiction over the matter in question, including those related to taxes, assessments, expropriation and duties, or authoritative interpretation, as amended, modified, enacted, reinterpreted or revised from time to time hereafter.
- ii. **"Applicable Permits"** means all permits, licenses, authorizations, consents, decrees, waivers, privileges, acknowledgements, concessions, approvals, rulings, decisions and visas from, filings with or applications submitted to, any Competent Authority or court or tribunal of competent jurisdiction necessary from time to time for or in relation to the performance of the Works, including as detailed in this GCC.
- iii. **"Agreement"** means the Contract Agreement (entitled "Contract Agreement") executed by the parties to which these Conditions are annexed and also includes supplements & amendments to the Contract.
- iv. **"Contract"** means the Agreement entered into between Owner and Contractor as per the 'Contract Agreement' signed by the parties, including contract documents, all attachments and appendices thereto and all documents incorporated by reference therein.
- v. **"Contract Documents"** means the complete documents, which are the basis of finalization of the contract, including correspondence exchanged from issue of tender till date of signing the contract. All such documents shall be listed in the Contract Agreement.
- vi. **"Contractor's Equipment"** means all plant, facilities, equipment, machinery, tools, apparatus, appliances or things of every kind required in or for installation, completion and maintenance of Facilities that are to be provided by the Contractor, but does not include Plant and Equipment, or other things intended to form or forming part of the Facilities.
- vii. **"Contractor"** means the person(s), Firm or a Company whose bid to perform the Contract has been accepted by the Owner and shall be named as such in the Contract Agreement, and includes the legal successors or permitted assigns of the Contractor.
- viii. **"Contract Price"** means any sum or sums finally accepted by the Owner for the execution of this contract, subject to such additions and adjustments thereto or deductions there from, as may be made pursuant to the Contract.
- ix. **"Contractor's Representative"** means any person nominated by the Contractor & approved by the Owner hereof to perform the duties delegated by the Contractor.
- x. **"Consulting Engineer"** means Owner's Engineer appointed by the Owner. Also refers to any other firm(s) or person(s) as may be appointed by the Owner from time to time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-20-	25.09.2014

- xi. **“Commissioning”** means the construction of plant and equipment for operation of the Facility at rated capacity are complete and the plant and equipment achieves the designated full load/full capacity, at designated fuel/input.
- xii. **“Completion”** means that the Facilities (or a specific part thereof where specific parts are agreed) have been completed operationally and structurally and put in a tight and clean condition, and that all work in respect of pre-commissioning of the Facilities or such specific part thereof has been completed and commissioning has been attained as per Technical Specifications.
- xiii. **“Competent Authority”** means any agency, authority, department, inspectorate, ministry or statutory person (whether autonomous or not) of GOI, [Name of the State], Ministry of Environment and Forests (MoEF) any other State of the Republic of India or any local authority.
- xiv. **“Day”** means calendar day of the Gregorian calendar.
- xv. **“Defect Liability Period”** means the period of validity of the warranties given by the Contractor, commencing at completion of the Facilities or a part thereof, during which the Contractor is responsible for defects with respect to the Facilities.
- xvi. **“Effective Date”** means the date from which the Time for Completion of the facilities and other milestones for execution of the Renovation & Modernization work as per the scope of work under this tender by the Contractor shall be determined.
- xvii. **“Erection Services”** means those entire services ancillary to the supply of the plant and equipment for the Facilities, to be provided by the Contractor under the Contract. e.g. transportation and provision of marine or other similar insurance, inspection, expediting, site preparation works (including the provision and use of Contractor's Equipment and the supply of all construction materials required), installation, testing, Pre-commissioning, commissioning, operations, maintenance, the provision of operations and maintenance manuals, training of Employer's Personnel etc.
- xviii. **“Facilities”** means the plant and equipment to be supplied and installed, as well as all the Erection Services to be carried out by the Contractor under the Contract.
- xix. **“Force Majeure”** means mean any event beyond the reasonable control of the Owner or of the Contractor, as the case may be, and which is unavoidable notwithstanding the reasonable care of the party affected.
- xx. **“GCC”** means the General Conditions of Contract hereof.
- xxi. **“Good Industry Practice”** means the exercise of that degree of skill, diligence and prudence which would reasonably and ordinarily be expected from a skilled and experienced Contractor, equipment manufacturer or operator applying the standards generally adopted by global Contractors, global equipment manufacturers and operators in the construction or operation of power generation facilities or the manufacture of equipment therefore, except in so far as inconsistent with any applicable Indian law or directive.
- xxii. **“Guarantee Test(s)”** means the test(s) specified in the Technical Specifications to be carried out to ascertain whether the Facilities or a

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-21-	25.09.2014

- specified part thereof is able to attain the Functional/Performance Guarantees specified in the Technical.
- xxiii. **"Incoterms"** means International rules for interpreting trade terms published by the International Chamber of Commerce (latest edition), Paris (France). Unless inconsistent with any provisions of the contract, the meaning of any trade term and the rights and obligations of the parties there under shall be as prescribed by Incoterms.
 - xxiv. **"Inspector/Inspecting Engineer"** means the Owner or any person nominated by the Owner from time to time, to inspect the equipment of works under the contract and/or the duly authorized representative of the Owner.
 - xxv. **"Latent Defect"** means the defects inherent in the material or arising out of design deficiency which does not manifest itself during the Warranty Period/Defect Liability Period, as described in this GCC.
 - xxvi. **"Letter of Intent (LOI)/Letter of Award (LOA)"** means the official letter issued by the Owner notifying the Contractor that its Bid Proposal has been accepted.
 - xxvii. **"Month"** means calendar month of the Gregorian calendar.
 - xxviii. **"Manufacturer's Works" or "Contractor's Works"** means the place used by the Contractor, its manufacturer, supplier, collaborators or sub-contractors/vendors/sub-vendors for the performance of the works.
 - xxix. **"Operational Acceptance"** means the acceptance by the Owner of the Facilities (or any part of the Facilities where the Contract provides for acceptance of the Facilities in parts), which certifies the Contractor's fulfillment of the Contract in respect of performance guarantees of the Facilities.
 - xxx. **"Owner" or "Purchaser"** shall mean the [Name of the Utility], , and includes its legal successors or permitted assignees.
 - xxxi. **"Person"** means any natural person, firm, corporation, company, voluntary association, partnership, joint venture, trust, and incorporated organization, unincorporated organization, Competent Authority or other entity.
 - xxxii. **"Pre-commissioning"** means the testing, checking and other requirements specified in the Technical specifications that are to be carried out by the Contractor in preparation for commissioning.
 - xxxiii. **"Project"** means the Owner's [-----] in respect of which the Contract has been signed.
 - xxxiv. **"Project Consultant" or "Owner's Consultant"** means the engineering firm or person(s) appointed by the Owner to render engineering project consultancy services for the project.
 - xxxv. **"Project Manager"** means the person appointed by the Owner thereof and named as such, to perform the duties delegated by the Owner.
 - xxxvi. **"Plant and Equipment"** means permanent plant, equipment, systems, machinery, apparatus, articles and things of all kinds to be provided and incorporated in the Facilities by the Contractor under the Contract (including the spare parts to be supplied by the Contractor under the Contract Agreement), but does not include Contractor's Equipment.
 - xxxvii. **"SCC"** means the Special Conditions of Contract hereof.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-22-	25.09.2014

- xxxviii. **“Site”** means the land and other places upon which the Facilities are to be installed, and such other lands or places as may be specified in the Contract as forming part of the Site.
- xxxix. **“Sub Contractor”, including “Vendors/Sub-Vendors”**, means any firm or person to whom execution of any part of the Facilities, including preparation of any design or supply of any plant and equipment is subcontracted directly or indirectly by the Contractor, and includes its legal successors or permitted assignees.
- xl. **“Technical Specification / “Tender Documents”** means the document, setting out a description and specification of the Works and statement of the technical and other standards to which the Works are to be performed including any modifications thereto made in accordance with the Conditions. This includes the technical & commercial specifications and other Tender Documents forming a part of the Contract and such other Schedules and drawings as may be mutually agreed upon.
- xli. **“Tenderer”/“Bidder”** means the Person(s), Firm/Company who has submitted its Bid Proposal in response to the bid invitation by the Owner, for the Project.
- xl. **“Time for Completion”** means the time within which completion of the Facilities as a whole (or of a part of the Facilities where a separate time for completion of such part has been specified) is to be attained in accordance with the stipulations and provisions of the Contract.
- xl. **“Warranty Period” or “Defect Liability Period”** means the period during which the Contractor shall remain liable for repair or replacement of any defective part of the works performed under the contract, free of cost.
- xl. **“Work(s)”** means and includes the tasks of furnishing of equipment, labour & services, transport, handling, unloading and storage at site, civil construction and complete erection, testing, commissioning putting into satisfactory operation and completion of successful performance tests, reliability tests and any other guaranteed parameters as defined in the Contract, replacement, modification, repair of defective parts or equipment during warranty period and rectification of latent defects during latent defect period.
- xl. **“Writing” or “Written”** shall include any manuscript, type-written or printed statement, under or over signature and/or seal as the case may be.

When the words "Approved", "Subject to Approval", "Satisfactory", "Equal to", "Proper", "Requested", "As Directed", "Where Directed", "When Directed", "Determined by", "Accepted", "Permitted", or words and phrases of similar importance are used, the approval, judgment, direction, etc., is understood to be a function of the Owner. Words implying persons or the gender neutral pronoun 'it', shall include firms, companies, corporation, associations or body of individuals whether incorporated or not. Words implying masculine gender or singular number shall also include the feminine gender and plural number and vice-versa where the context so requires or permits.

Terms and expressions not herein defined shall have the same meaning as are assigned to them in the Indian Sale of Goods Act (1930), failing that in the Indian Contract Act (1872) and failing that in the General Clauses Act (1897) including amendments thereof, if any.

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-23-	25.09.2014

4.2 Contract Documents

- a) All documents forming part of the Contract (and all parts thereof) are intended to be correlative, complementary and mutually explanatory. The Contract shall be read as a whole.
- b) The Contract will be signed in three originals and the Contractor shall be provided with one signed original and the rest will be retained by the Owner.

4.3 Order of Precedence of Contract Documents

In case there is any ambiguity of conflict between different contract documents, the order of precedence shall be as follows:-

- i. The signed Contract Agreement & the annexure/ appendices thereto (highest precedence)
- ii. Notification of award.
- iii. Special Condition of Contract
- iv. General Condition of Contract
- v. Technical specification & Tender Drawing.
- vi. The bid & schedules/ attachment submitted by the contractor

4.4 Interpretation

All Contract Documents, all correspondence and communications to be given, and all other documentation to be prepared and supplied under the Contract shall be written in English, and the Contract shall be construed and interpreted in accordance with English language.

The singular shall include the plural and the plural the singular, except where the context requires otherwise.

Unless inconsistent with any provision of the Contract, the meaning of any trade term and the rights and obligations of parties there under shall be as prescribed by Incoterms. Incoterms means latest edition of International Rules for Interpreting Trade Terms published by the International Chamber of Commerce Paris, France.

4.5 Construction of the Contract

The Contracts to be entered between the Owner and the Contractor shall be as under:

First Contract: For Ex-Works Supply of all Plant & Equipment including Mandatory Spares and technological and miscellaneous structures with all accessories.

Second Contract : For providing all services i.e. Inland Transportation for Delivery at Site, Inland Transit Insurance, Unloading, Storage, Handling at Site, Erection, Insurance Covers other than inland transit insurance, Testing, Commissioning and Conducting Guarantee Tests in respect of all the Equipment supplied under the First Contract, Civil works including supplies such as cement & reinforcement steel and all other services as specified in the Contract Documents.

The above two Contracts will contain a cross-fall breach clause specifying that breach of one Contract will constitute breach of the other Contracts which will confer a right on the Owner to terminate the other Contract also at the risk and the cost of the Contractor.

The award of the separate Contracts shall not in any way dilute the responsibility of the Contractor for the successful completion of the Facilities as per Contract Documents and a breach in one Contract shall automatically be construed as a breach of the other Contract which will confer a right on the Owner to terminate the other Contract also at the risk and the cost of the Contractor.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-24-	25.09.2014

4.6 Independent Contractor

The Contractor shall be an independent contractor performing the Contract. The Contract does not create any agency, partnership, joint venture or other joint relationship between the parties hereto.

Subject to the provisions of the Contract, the Contractor shall be solely responsible for the manner in which the Contract is performed. All employees, representatives or Subcontractors engaged by the Contractor in connection with the performance of the Contract shall be under the complete control of the Contractor and shall not be deemed to be employees of the Owner, and nothing contained in the Contract or in any subcontract awarded by the Contractor shall be construed to create any contractual relationship between any such employees, representatives or Subcontractors and the Owner.

4.7 Joint Venture or Consortium

Not Used.

4.8 Non-Waiver

No relaxation, forbearance, delay or indulgence by either party in enforcing any of the terms and conditions of the Contract or the granting of time by either party to the other shall prejudice, affect or restrict the rights of that party under the Contract, nor shall any waiver by either party of any breach of Contract operate as waiver of any subsequent or continuing breach of Contract. Any waiver of a party's rights, powers or remedies under the Contract must be in writing, must be dated and signed by an authorized representative of the party granting such waiver, and must specify the right and the extent to which it is being waived.

4.9 Severability

If any provision or condition of the Contract is prohibited or rendered invalid or unenforceable, such prohibition, invalidity or unenforceability shall not affect the validity or enforceability of any other provisions and conditions of the Contract.

4.10 Origin

"Origin" means the place where the materials, Equipment and other supplies for the Facilities are mined, grown, produced or manufactured, and from which the services are provided.

4.11 Notices

All notices to be given under the Contract shall be in writing, and shall be sent by personal delivery, or post, or special courier, or telefax, or E-mail to the address of the relevant party indicated in the Contract.

Either party may change its postal address, telefax number, or E-mail ID or addressee for receipt of such notices by ten (10) days' notice to the other party in writing.

Notices shall be deemed to include any approvals, consents, instructions, orders and certificates to be given under the Contract.

4.12 Governing Laws

The Contract shall be governed by and interpreted in accordance with laws in force in India. The Courts of [.....] shall have exclusive jurisdiction in all matters arising under the Contract.

Document Number	Rev No.	Description	Page No.	Date of Issue

4.13 Settlement of Disputes

a) Mutual Consultation

If any differences/ dispute arises between the Owner and the Contractor in connection with or arising out of the Contract, before or after the termination, abandonment or breach of the Contract—the Owner & Contractor shall seek to resolve any such dispute or difference by mutual consultation. If the parties fail to resolve such a dispute or difference by mutual consultation, then the dispute shall be referred in writing by either party to the Arbitrator, with a copy to the other party.

b) Arbitration

Either Owner or the Contractor may, of its intention to commence arbitration, as to the matter in dispute, and no arbitration may be commenced unless such notice is given.

Any dispute, in respect of which a notice of intention to commence arbitration has been given, as above shall be finally settled by arbitration. Arbitration may be commenced prior to or after completion of the Facilities.

Any dispute submitted by a party to arbitration shall be heard by an arbitration panel composed of three arbitrators, in accordance with the provisions set forth below.

The Owner and the Contractor shall each appoint one arbitrator, and these two arbitrators shall jointly appoint a third arbitrator, who shall chair the arbitration panel. If the two arbitrators do not succeed in appointing a third arbitrator within *[twenty eight (28)]* days after the latter of the two arbitrators has been appointed, the third arbitrator shall, at the request of either party, be appointed by the Appointing Authority for arbitrator is given below.

Appointing Authority for Arbitrator:

- President, Institution of Engineers in case of an Indian Contractor.

If one party fails to appoint its arbitrator within *[forty-two (42)]* days after the other party has named its arbitrator, the party which has named an arbitrator may request the Appointing Authority to appoint the second arbitrator.

If for any reason an arbitrator is unable to perform its function, the mandate of the Arbitrator shall terminate in accordance with the provisions of applicable laws and a substitute shall be appointed in the same manner as the original arbitrator.

Arbitration proceedings as follows:-

- In case of an Indian Contractor Adjudication/Arbitration proceedings shall be conducted in accordance with Indian Arbitration and Conciliation Act 1996.

The Place for Arbitration shall be: *[New Delhi]*, India.

The language of arbitration shall be English.

The decision of a majority of the arbitrators (or of the third arbitrator chairing the arbitration, if there is no such majority) shall be final and binding and shall be enforceable in any court of competent jurisdiction as decree of the court. The parties thereby waive any objections to or claims of immunity from such enforcement.

Notwithstanding any reference to the arbitration,

- The parties shall continue to perform their respective obligations under the Contract unless they otherwise agree.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-26-	25.09.2014

- The Owner shall pay the Contractor consideration due to the Contractor.

4.14 Scope of Facilities

- Unless otherwise expressly limited in the Technical Specifications, Facilities the Contractor's obligations cover the provision of all Plant and Equipment including spares and the performance of all Services required for design, manufacture (including procurement, quality assurance, construction, installation, associated civil works, Structural and others construction works, precommissioning and delivery) of the Plant and Equipment and the installation, commissioning, completion of facilities and performance testing of the Facilities in accordance with the plans, procedures, specifications, drawings, codes and any other documents as specified in the Technical Specifications. Such specifications include, but are not limited to, the provision of supervision and engineering services; the supply of labour, materials, equipment, spare parts and accessories; Contractor's Equipment; construction utilities and supplies; temporary materials, structures and facilities; transportation loading & unloading.
- The Contractor shall, unless specifically excluded in the Contract, perform all such work and/or supply all such items and materials not specifically mentioned in the Contract but that can be reasonably inferred from the Contract as being required for attaining Completion of the Facilities.

4.15 Time for Commencement and Completion

- The Contractor shall commence work on the scope of work under this Tender from the date of Letter of Award. Contractor shall thereafter proceed with the Facilities in accordance with the time schedule specified in SCC & detailed network schedule agreed & appended to the contract.
- The Contractor shall attain Completion of the Facilities (or of a part where a separate time for Completion of such part is specified in the Contract) within the time stated in the SCC subject to time extensions, the contractor is entitled under the contract conditions or time extension expressly grouted by the Owner.

4.16 Spare Parts

In addition to the supply of Mandatory Spare Parts included in the Contract, the Contractor agrees to supply other spare parts (recommended spares) required for the operation and maintenance of the Facilities for 3 years. However, the identity, specifications and quantities of such spare parts and the terms and conditions relating to the supply thereof are to be agreed between the Owner and the Contractor, and the price of such spare parts shall be that given in Price Schedule for recommended spares. The price of such spare parts shall include the purchase price thereof and other costs and expenses (including the Contractor's fees) relating to the supply of spare parts. The prices of recommended spares covered in price schedule shall be valid for a period of six months after the date of Notification of Award of Main Equipment and Mandatory Spares.

- The Contractor shall supply the recommended spares at the same terms and conditions as are otherwise applicable to this Contract.
- All the spares for the equipment under the Contract will strictly conform to the Specification and other relevant documents and will be identical to the corresponding main equipment/components supplied under the Contract and shall be fully interchangeable.
- All the Mandatory Spares covered under the Contract shall be manufactured along with the main Equipment as a continuous operation and the delivery of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-27-	25.09.2014

the spares will be affected along with the main Equipment in a phased manner and the delivery would be completed by the respective dates for the various categories of equipment as per the agreed schedule. If order for the Recommended Spares has been placed with the Contractor prior to commencement of manufacture of the main equipment this shall be applicable for manufacturer of recommended spares as well.

- The Contractor will provide the Owner with the manufacturing drawings, catalogues, assembly drawings and any other document required by the Owner for the recommended spares. Such details will be furnished to the Owner as soon as they are prepared but in any case not later than six months prior to commencement of manufacture of the corresponding main equipment.
- In addition to the spares recommended by the Contractor, if the Owner further identifies certain particular items of spares, the Contractor will submit the prices and delivery quotation for such spares within [30] days of receipt of such request with a validity period of 6 months for consideration by the Owner and placement of order for additional spares, if the Owner so desires.
- The quality plan and the inspection requirement finalised for the main equipment will also be applicable to the corresponding spares.
- The Contractor will provide the Owner with all the addresses and particulars of his sub-suppliers while placing the order on vendors for items/components/equipment covered under the Contract and will further ensure with his vendors that the Owner, if so desires, will have the right to place order for spares directly on them on mutually agreed terms based on offers of such vendors.
- The Contractor shall guarantee the long term availability of spares to the Owner for the full life of the equipment covered under the Contract. The same provision will also be applicable to spares supplied by Sub-contractors.
- For the first 6 years from the schedule date of completion of facilities the prices will be derived from the corresponding Ex-Works Price at which the order for such spares have been placed by Owner as a part of Mandatory Spares or Recommended Spares, or from the rates of Mandatory Spares or Recommended Spares as quoted by/negotiated with the Contractor. Ex-Works order price of future spares shall be computed in accordance with the price adjustment provisions covered under the main Contract excepting that the base indices will be counted from the scheduled date of Commissioning of the last equipment under the main project. The Contractor will indicate in advance the delivery period of the items of spares, which the Owner may procure in accordance with this clause. In case of emergent requirements of spares, the Contractor would make every effort to expedite the manufacture and delivery of such spares on the basis of mutually agreed time schedule.
- In case the Contractor fails to supply the mandatory or recommended spares in the terms stipulated above, the Owner shall be entitled to purchase the same from the alternate sources at the risk and the cost of the Contractor and recover from the Contractor, the excess amount paid by the Owner over the rates worked on the above basis. In the event of such risk purchase by the Owner, the purchases will be as per the Works and Procurement Policy of the Owner prevalent at the time of such purchases and the Owner at his option may include a representative from the Contractor in finalising the purchases.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-28-	25.09.2014

- It is expressly understood that the final settlement between the parties in terms of relevant clauses of the Contract Documents shall not relieve the Contractor of any of his obligations under the provision of long term availability of spares and such provisions shall continue to be enforced till the expiry of 6 years period reckoned from the scheduled date of Commissioning of the Plant and Equipment unless otherwise discharged expressly in writing by the Owner.
- The Contractor shall warrant that all spares supplied will be new and in accordance with the Contract Documents and will be free from defects in design, material and workmanship. The defects liability period for spares shall be 12 months from the date it is put to use. In case of failure of any spare part due to fault in design material or workmanship the same part will be replaced by the contractor without any extra cost of the Owner.

In case of any failure in the original component/equipment due to faulty designs, materials and workmanship, the corresponding spare parts, if any, supplied will be replaced without any extra cost to the Owner unless a joint examination and analysis by the Owner and the Contractor of such spare parts prove that the defect found in the original part that failed, can safely be assumed not to be present in spare parts. Any replaced spare parts will have the Defects Liability period of 12 months from the date it is put in use. The discarded spare parts will become the property of the Contractor as soon as they have been replaced by the Contractor. In any case the defect liability of spares will expire at the end of 48 months from the date of their receipt at site

The Defects Liability of spares that are not used within 18 months from the respective date of the delivery at Site will, be subject to condition that all such spares are stored in accordance with Contractor's standard recommended practice, if any, and the same has been furnished to the Owner.

4.17 Contractor's Responsibilities

- a) The Contractor shall design, manufacture (including associated purchases and/or subcontracting), disassemble/dismantle wherever required, install, commission and complete the Facilities and carryout the Guarantee tests with due care and diligence in accordance with the Contract.
- b) Before entering into this contract the Contractor is responsible to have examined the data relating to the Facilities provided by the Owner, and on the basis of information that the Contractor could have obtained from a visual inspection of the Site and of other data readily available to it relating to the Facilities as at one month days prior to bid submission. Any failure to acquaint itself with all such data and information shall not relieve contractor of its responsibility for properly estimating the difficulty or cost of successfully performing its scope of work under this contract.
- c) The Contractor shall acquire in its name all permits, approvals and/or licenses from all local, state or national government authorities or public service undertakings in the country where the Site is located that are necessary for the performance of the Contract, including, without limitation, visas for the Contractor's and Subcontractor's personnel and entry permits for all imported Contractor's Equipment.
- d) The Contractor shall comply with all laws in force in India and the place where the facility is located out. The laws will include all national, provincial, municipal or other laws that affect the performance of the Contract and bind upon the Contractor. The Contractor shall indemnify and hold harmless the Owner from and against any and all liabilities, damages, claims, fines, penalties and expenses of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-29-	25.09.2014

whatever nature arising or resulting from the violation of such laws by the Contractor.

4.18 Owner's Responsibilities

- a) The Owner shall be responsible for acquiring and providing legal and physical possession of the Site and access thereto, and for providing possession of and access to all other areas reasonably required for the proper execution of the Contract, including all requisite rights of way.
- b) The Owner shall acquire and pay for all permits, approvals and/or licenses from all local, state or national government authorities or public service undertakings, which such authorities or undertakings require the Owner to obtain them in the Owner's name, are necessary for the execution of the Contract.
- c) If requested by the Contractor, the Owner shall use its best endeavours to assist the Contractor in obtaining in a timely and expeditious manner all permits, approvals and/or licenses necessary for the execution of the Contract from all local, state or national government authorities or public service undertakings that such authorities or undertakings require the Contractor or Subcontractors or the personnel of the Contractor or Subcontractors, as the case may be, to obtain.
- d) The Owner shall be responsible for the continued operation of the Facilities after Completion.

4.19 Taxes & Duties

- a) Excise Duty, Central sales tax (CST), service tax, Value Added Tax (VAT), VAT on Works Contract, other applicable taxes, duties and Cess shall be clearly indicated by the bidder in the price schedules and these taxes shall be considered for bid evaluation. The reimbursement of these taxes shall be on actual subject to the quoted value of these taxes as ceiling corresponding to the base price. Additional liability of taxes and duties arising out of price variation shall be reimbursed against documentary evidence over and above the ceiling (quoted value). Statutory variation in Indian taxes and duties will be dealt with as per the relevant stipulations of the specification.
- b) Except as otherwise specifically provided in the Contract, the Contractor shall bear and pay all Taxes, Duties, Levies and Charges including Entry Tax, Service Tax, if applicable in connection with the Facilities in India and outside India. All taxes, duties & levies on works contract, if any, shall be to the Contractor's account and no separate claim in this regard will be entertained by the Owner.
- c) All taxes, duties and levies including entry tax/octroi (if any) in respect of all components, Equipment and material to be dispatched directly from the sub-vendor's works to site shall be to the Contractor's account and no separate claim in this regard will be entertained by the Owner.
- d) In case there is introduction of GST or any other tax in lieu of existing Excise Duty/Service Tax and VAT/ Sales Tax, the contract price will be adjusted for the impact of any differential tax liability subject to documentary evidence. This will be restricted to direct transaction between the owner and contractor, and bought out items directly dispatched from sub-vendor's works to project site.
- e) Further all taxes, duties and levies including sales tax on works contract, Entry Tax, if any, in respect of civil construction works, erection & commissioning if any and custom duty/sales tax as applicable on the materials used for such construction works shall be to the contractor's account and no separate claim in this regard will be entertained by the Owner. Incidence of Service Tax & cess on any component

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-30-	25.09.2014

of the Bid Price shall be to the Contractor's account and bidders shall include Service Tax as applicable at the date seven (7) days prior to the date of bid submission in the bid price. The Contract Price will be adjusted for impact of any change in the rate of service tax or cess on service tax subsequent to this date for direct transactions between the Owner and the Contractor.

- f) If any tax exemptions, reductions, allowances or privileges may be available to the Contractor, the Owner shall use its best endeavours to enable the Contractor to benefit from any such tax savings to the maximum allowable extent.

4.20 Intellectual Property

The copyright in all drawings, documents and other materials containing data and information furnished to the Owner by the Contractor herein shall remain vested in the Contractor or, if they are furnished to the Owner directly or through the Contractor by any third party, including suppliers of materials, the copyright in such materials shall remain vested in such third party. The Owner shall however be free to reproduce all drawings, documents and other material furnished to the Owner for the purpose of the contract including, if required, for operation and maintenance.

4.21 Confidential Information

- a) The Owner and the Contractor shall keep confidential and shall not, without the written consent of the other party hereto, divulge to any third party any documents, data or other information furnished directly or indirectly by the other party hereto in connection with the Contract, whether such information has been furnished prior to, during or following termination of the Contract. Notwithstanding the above, the Contractor may furnish to its Subcontractor(s) such documents, data and other information it receives from the Owner to the extent required for the Subcontractor(s) to perform its work under the Contract, in which event the Contractor shall obtain from such Subcontractor(s) an undertaking of confidentiality similar to that imposed on the Contractor.
- b) The Owner shall not use such documents, data and other information received from the Contractor for any purpose other than the operation and maintenance of the Facilities. Similarly, the Contractor shall not use such documents, data and other information received from the Owner for any purpose other than the design, procurement of Plant and Equipment, construction or such other work and services as are required for the performance of the Contract.
- c) The obligation of a party, shall not apply to that information which
- now or hereafter enters the public domain through no fault of that party
 - can be proven to have been possessed by that party at the time of disclosure and which was not previously obtained, directly or indirectly, from the other party hereto
 - Otherwise lawfully becomes available to that party from a third party that has no obligation of confidentiality.

4.22 Representatives

- a) Project Manager

If the Project Manager is not named in the Contract, then within fourteen (14) days of the Effective Date, the Owner shall appoint and notify the Contractor in writing of the name of the Project Manager. The Owner may from time to time appoint some other person as the Project Manager in place of the person previously so appointed, and shall give a notice of the name of such other person to the Contractor without delay.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-31-	25.09.2014

The Owner shall take reasonable care to see that no such appointment is made at such a time or in such a manner as to impede the progress of work on the Facilities. The Project Manager shall represent and act for the Owner at all times during the currency of the Contract. All notices, instructions, orders, certificates, approvals and all other communications under the Contract shall be given by the Project Manager, except as herein otherwise provided.

All notices, instructions, information and other communications given by the Contractor to the Owner under the Contract shall be given to the Project Manager, except as herein otherwise provided.

b) Contractor's Representative & Construction Manager

- If the Contractor's Representative is not named in the Contract, then within *[fourteen (14) days]* of the Effective Date, the Contractor shall appoint the Contractor's Representative and shall request the Owner in writing to approve the person so appointed. If the Owner makes no objection to the appointment within *[fourteen (14)]* days, the Contractor's Representative shall be deemed to have been approved. If the Owner objects to the appointment within *[fourteen (14)]* days giving the reason there for, then the Contractor shall appoint a replacement within *[fourteen (14) days]* of such objection.
- The Contractor's Representative shall represent and act for the Contractor at all times during the currency of the Contract and shall give to the Project Manager all the Contractor's notices, instructions, information and all other communications under the Contract. All notices, instructions, information and all other communications given by the Owner or the Project Manager to the Contractor under the Contract shall be given to the Contractor's Representative or, in its absence, its deputy, except as herein otherwise provided. The Contractor shall not revoke the appointment of the Contractor's Representative without the Owner's prior written consent, which shall not be unreasonably withheld. If the Owner consents thereto, the Contractor shall appoint some other person as the Contractor's Representative.
- The Contractor's Representative may, subject to the approval of the Owner (which shall not be unreasonably withheld), at any time delegate to any person any of the powers, functions and authorities vested in him or her. Any such delegation may be revoked at any time. Any such delegation or revocation shall be subject to a prior notice signed by the Contractor's Representative, and shall specify the powers, functions and authorities thereby delegated or revoked. No such delegation or revocation shall take effect unless and until a copy thereof has been delivered to the Owner and the Project Manager.
- From the commencement of installation of the Facilities at the Site until Operational Acceptance, the Contractor's Representative shall appoint a suitable person as the construction manager (hereinafter referred to as "the Construction Manager"). The Construction Manager shall supervise all work done at the Site by the Contractor and shall be present at the Site throughout normal working hours except when on leave, sick or absent for reasons connected with the proper performance of the Contract. Whenever the Construction Manager is absent from the Site, a suitable person shall be appointed to act as his or her deputy.
- The Owner may by notice to the Contractor object to any representative or person employed by the Contractor in the execution of the Contract who, in the reasonable opinion of the Owner, may behave inappropriately, may be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-32-	25.09.2014

incompetent or negligent, or may commit a serious breach of the Site regulations.

- If any representative or person employed by the Contractor is removed.

4.23 Work Program

a) Contractor's Organization

The Contractor shall supply to the Owner and the Project Manager a chart showing the proposed organization to be established by the Contractor for carrying out work on the Facilities. The chart shall include the identities of the key personnel together with the curricula vitae of such key personnel to be employed within *[twenty one (21)]* days of the Effective Date. The Contractor shall promptly inform the Owner and the Project Manager in writing of any revision or alteration of such an organization chart.

b) Program of Performance

Within *[twenty-eight (28)]* days after the date of Notification of Award of Contract, the Contractor shall prepare and submit to the Project Manager a detailed Program of Performance of the Contract, made in the form specified in the SCC and showing the sequence in which it proposes to design, supply, transport, assemble, install and precommissioning the Facilities, as well as the date by which the Contractor reasonably requires that the Owner shall have fulfilled its obligations under the Contract so as to enable the Contractor to execute the Contract in accordance with the program and to achieve Completion and Acceptance of the Facilities in accordance with the Contract. The program so submitted by the Contractor shall accord with the Time Schedule included in Contract Schedule 3 (Time Schedule) to the Form of Contract Agreement and any other dates and periods specified in the Contract. The Contractor shall update and revise the program as and when appropriate or when required by the Project Manager, but without modification in the Times for Completion.

c) Progress Report

The Progress Report shall be in a form acceptable to the Project Manager and shall indicate: (a) percentage completion achieved compared with the planned percentage completion for each activity; and (b) where any activity is behind the program, giving comments and likely consequences and stating the corrective action being taken.

d) Progress of Performance

If at any time the Contractor's actual progress falls behind the program, or it becomes apparent that it will so fall behind, the Contractor shall, at the request of the Owner or the Project Manager, prepare and submit to the Project Manager a revised program, taking into account the prevailing circumstances, and shall notify the Project Manager of the steps being taken to expedite progress so as to attain Completion of the Facilities within the Time for Completion.

e) Work Procedures

The Contract shall be executed in accordance with the Contract Documents and the procedures given in the section on Forms and Procedures of the Contract Documents.

If agreed between the Owner and the Contractor, the Contractor may execute the Contract in accordance with its own standard project execution plans and procedures to the extent that they do not conflict with the provisions contained in the Contract.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-33-	25.09.2014

4.24 Subcontractors and Subvendors

- a) The Contract Agreement specifies major items of supply or services and a list of approved Subcontractors against each item, including vendors. Insofar as no Subcontractors are listed against any such item, the Contractor shall prepare a list of Subcontractors for such item for inclusion in such list. The Contractor may from time to time propose any addition to or deletion from any such list. The Contractor shall submit any such list or any modification thereto to the Owner for its approval in sufficient time so as not to impede the progress of work on the Facilities. Such approval by the Owner for any of the Subcontractors shall not relieve the Contractor from any of its obligations, duties or responsibilities under the Contract.
- b) The Contractor shall select and employ its Subcontractors/Subvendors for such major items from those listed.

4.25 Design and Engineering

- a) Specifications and Drawings

The Contractor shall execute the basic and detailed design and the engineering work in compliance with the provisions of the Contract, or where not so specified, in accordance with good engineering practice. The Contractor shall be responsible for any discrepancies, errors or omissions in the specifications, drawings and other technical documents that it has prepared, whether such specifications, drawings and other documents have been approved by the Project Manager or not, provided that such discrepancies, errors or omissions are not because of inaccurate information furnished in writing to the Contractor by or on behalf of the Owner.

- b) Codes and Standards

Wherever references are made in the Contract to codes and standards in accordance with which the Contract shall be executed, the edition or the revised version of such codes and standards current at the date *[twenty eight (28)]* days prior to date of bid submission shall apply unless otherwise specified. During Contract execution, any changes in such codes and standards shall be applied after approval by the Owner.

- c) Approval/Review of Technical Documents by Project Manager

The Contractor shall prepare (or cause its Subcontractors to prepare) and furnish to the Project Manager the documents for its approval Any part of the Facilities covered by or related to the documents to be approved by the Project Manager shall be executed only after the Project Manager's approval thereof.

Project Manager shall either return one copy thereof to the Contractor with its approval endorsed thereon or shall notify the Contractor in writing of its disapproval thereof and the reasons there for and the modifications that the Project Manager proposes. The Project Manager shall not disapprove any document, except on the grounds that the document does not comply with some specified provision of the Contract or that it is contrary to good engineering practice. The procedure for submission of the documents by the Contractor and their approval by the Project Manager shall be discussed and finalised with the Contractor.

If any dispute or difference occurs between the Owner and the Contractor in connection with or arising out of the disapproval by the Project Manager of any document and/or any modification(s) thereto that cannot be settled between the parties within a reasonable period, then such dispute or difference may be referred to an Adjudicator. If such dispute or difference is referred to an Adjudicator, the Project Manager shall give instructions as to whether and if so, how, performance of the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-34-	25.09.2014

Contract is to proceed. The Contractor shall proceed with the Contract in accordance with the Project Manager's instructions, provided that if the Adjudicator upholds the Contractor's view on the dispute, then the Contractor shall be reimbursed by the Owner for any additional costs incurred by reason of such instructions and shall be relieved of such responsibility or liability in connection with the dispute and the execution of the instructions as the Adjudicator shall decide, and the Time for Completion shall be extended accordingly.

The Project Manager's approval, with or without modification of the document furnished by the Contractor, shall not relieve the Contractor of any responsibility or liability imposed upon it by any provisions of the Contract except to the extent that any subsequent failure results from modifications required by the Project Manager.

4.26 Procurement

a) Plant and Equipment

The Contractor shall manufacture or procure and transport all the Plant and Equipment in an expeditious and orderly manner to the Site.

b) Transportation

The Contractor shall at its own risk and expense transport all the Plant and Equipment and the Contractor's Equipment to the Site by the mode of transport that the Contractor judges most suitable under all the circumstances. Unless otherwise provided in the Contract, the Contractor shall be entitled to select any safe mode of transport operated by any person to carry the Plant and Equipment and the Contractor's Equipment. Upon dispatch of each shipment of the Plant and Equipment and the Contractor's Equipment, the Contractor shall notify the Owner by telex, cable, telefax, facsimile or Electronic Data Interchange (EDI) of the description of the Plant and Equipment and of the Contractor's Equipment, the point and means of dispatch, and the estimated time and point of arrival in the country where the Site is located, if applicable, and at the Site. The Contractor shall furnish the Owner with relevant shipping documents to be agreed upon between the parties.

The Contractor shall be responsible for obtaining, if necessary, approvals from the authorities for transportation of the Plant and Equipment and the Contractor's Equipment to the Site. The Owner shall use its best endeavours in a timely and expeditious manner to assist the Contractor in obtaining such approvals, if requested by the Contractor. The Contractor shall indemnify and hold harmless the Owner from and against any claim for damage to roads, bridges or any other traffic facilities that may be caused by the transport of the Plant and Equipment and the Contractor's Equipment to the Site.

4.27 Installation

a) Setting Out/Supervision/Labour

Bench Mark: The Contractor shall be responsible for the true and proper setting-out of the Facilities in relation to bench marks, reference marks and lines provided to it in writing by or on behalf of the Owner.

If, at any time during the progress of installation of the Facilities, any error shall appear in the position, level or alignment of the Facilities, the Contractor shall forthwith notify the Project Manager of such error and, at its own expense, immediately rectify such error to the reasonable satisfaction of the Project Manager. If such error is based on incorrect data provided in writing by or on behalf of the Owner, the expense of rectifying the same shall be borne by the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-35-	25.09.2014

Contractor's Supervision: The Contractor shall give or provide all necessary superintendence during the installation of the Facilities, and the Construction Manager or its deputy shall be constantly on the Site to provide full time superintendence of the installation. The Contractor shall provide and employ only technical personnel who are skilled and experienced in their respective callings and supervisory staff who are competent to adequately supervise the work at hand.

The Contractor shall provide and employ on the Site in the installation of the Facilities such skilled, semi-skilled and unskilled labour as is necessary for the proper and timely execution of the Contract. The Contractor is encouraged to use local labour that has the necessary skills. Unless otherwise provided in the Contract, the Contractor shall be responsible for the recruitment, transportation, accommodation and catering of all labour, local or expatriate, required for the execution of the Contract and for all payments in connection therewith.

The Contractor shall at its own expense provide the means of repatriation to all of its and its Subcontractor's personnel employed on the Contract at the Site to their various home countries. It shall also provide suitable temporary maintenance of all such persons from the cessation of their employment on the Contract to the date programmed for their departure. In the event that the Contractor defaults in providing such means of transportation and temporary maintenance, the Owner may provide the same to such personnel and recover the cost of doing so from the Contractor.

The Contractor shall, in all dealings with its labour and the labour of its Subcontractors currently employed on or connected with the Contract, pay due regard to all recognized festivals, official holidays, religious or other customs and all local laws and regulations pertaining to the employment of labour.

b) Contractor's Equipment

All Contractors' Equipment brought by the Contractor onto the Site shall be deemed to be intended to be used exclusively for the execution of the Contract. The Contractor shall not remove the same from the Site without the Project Manager's consent that such Contractor's Equipment are no longer required for the execution of the Contract. Unless otherwise specified in the Contract, upon completion of the Facilities, the Contractor shall remove from the Site all Equipment brought by the Contractor onto the Site and any surplus materials remaining thereon.

The Owner will, if requested, use its best endeavours to assist the Contractor in obtaining any local, state or national government permission required by the Contractor for the export of the Contractor's Equipment imported by the Contractor for use in the execution of the Contract that is no longer required for the execution of the Contract.

c) Site Regulations and Safety

The Owner and the Contractor shall establish Site regulations setting out the rules to be observed in the execution of the Contract at the Site and shall comply therewith. The Contractor shall prepare and submit to the Owner, with a copy to the Project Manager, proposed Site regulations for the Owner's approval, which approval shall not be unreasonably withheld.

Such Site regulations shall include, but shall not be limited to, rules in respect of security, safety of the Facilities, gate control, sanitation, medical care, and fire prevention.

d) Opportunities for Other Contractors

The Contractor shall, upon written request from the Owner or the Project Manager, give all reasonable opportunities for carrying out the work to any other contractors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors-Ash Handling System Volume-I	-36-	25.09.2014

employed by the Owner on or near the Site. If the Contractor, upon written request from the Owner or the Project Manager, makes available to other contractors any roads or ways the maintenance for which the Contractor is responsible, permits the use by such other contractors of the Contractor's Equipment, or provides any other service of whatsoever nature for such other contractors, the Owner shall fully compensate the Contractor for any loss or damage caused or occasioned by such other contractors in respect of any such use or service, and shall pay to the Contractor reasonable remuneration for the use of such Equipment or the provision of such services.

The Contractor shall also so arrange to perform its work as to minimize, to the extent possible, interference with the work of other contractors. The Project Manager shall determine the resolution of any difference or conflict that may arise between the Contractor and other contractors and the workers of the Owner in regard to their work.

The Contractor shall notify the Project Manager promptly of any defects in the other Contractors' work that come to its notice, and that could affect the Contractor's work. The Project Manager shall determine the corrective measures, if any, required to rectify the situation after inspection of the Facilities. Decisions made by the Project Manager shall be binding on the Contractor.

e) Emergency Work

If, by reason of an emergency arising in connection with and during the execution of the Contract, any protective or remedial work is necessary as a matter of urgency to prevent damage to the Facilities, the Contractor shall immediately carry out such work.

If the Contractor is unable or unwilling to do such work immediately, the Owner may do or cause such work to be done as the Owner may determine is necessary in order to prevent damage to the Facilities. In such event the Owner shall, as soon as practicable after the occurrence of any such emergency, notify the Contractor in writing of such emergency, the work done and the reasons there for. If the work done or caused to be done by the Owner is work that the Contractor was liable to do at its own expense under the Contract, the reasonable costs incurred by the Owner in connection therewith shall be paid by the Contractor to the Owner. Otherwise, the cost of such remedial work shall be borne by the Owner.

f) Site Clearance

Site Clearance in Course of Performance: In the course of carrying out the Contract, the Contractor shall keep the Site reasonably free from all unnecessary obstruction, store or remove any surplus materials, clear away any wreckage, rubbish or temporary works from the Site, and remove any Contractor's Equipment no longer required for execution of the Contract. **Clearance of Site after Completion:** After Completion of all parts of the Facilities, the Contractor shall clear away and remove all wreckage, rubbish and debris of any kind from the Site, and shall leave the Site and Facilities clean and safe.

g) Watching and Lighting

The Contractor shall provide and maintain at its own expense all lighting, fencing, and watching when and where necessary for the proper execution and the protection of the Facilities, or for the safety of the owners and occupiers of adjacent property and for the safety of the public as per specification.

Document Number	Rev No.	Description	Page No.	Date of Issue

4.28 Testing & Inspections

- a) The Contractor shall at its own expense carry out at the place of manufacture and/or on the Site all such tests and/or inspections of the Plant and Equipment and any part of the Facilities as are specified in the Contract.
- b) The Owner and the Project Manager or their designated representatives shall be entitled to attend the aforesaid test and/ or inspection, provided that the Owner shall bear all costs and expenses incurred in connection with such attendance including, but not limited to, all travelling and board and lodging expenses.
- c) Whenever the Contractor is ready to carry out any such test and/or inspection, the Contractor shall give a reasonable advance notice of such test and/or inspection and of the place and time thereof to the Project Manager. The Contractor shall obtain from any relevant third party or manufacturer any necessary permission or consent to enable the Owner and the Project Manager (or their designated representatives) to attend the test and/or inspection.
- d) The Contractor shall provide the Project Manager with a certified report of the results of any such test and/or inspection. If the Owner or Project Manager (or their designated representatives) fails to attend the test and/or inspection, or if it is agreed between the parties that such persons shall not do so, then the Contractor may proceed with the test and/or inspection in the absence of such persons, and may provide the Project Manager with a certified report of the results thereof.
- e) The Project Manager may require the Contractor to carry out any test and/or inspection not required by the Contract, provided that the Contractor's reasonable costs and expenses incurred in the carrying out of such test and/or inspection shall be added to the Contract Price. Further, if such test and/or inspection impede the progress of work on the Facilities and/or the Contractor's performance of its other obligations under the Contract, due allowance will be made in respect of the Time for Completion and the other obligations so affected.
- f) If any Plant and Equipment or any part of the Facilities fails to pass any test and/or inspection, the Contractor shall either rectify or replace such Plant and Equipment or part of the Facilities and shall repeat the test and/or inspection upon giving a notice.
- g) If any dispute or difference of opinion shall arise between the parties in connection with or arising out of the test and/or inspection of the Plant and Equipment or part of the Facilities that cannot be settled between the parties within a reasonable period of time, it may be referred to the Adjudicator.
- h) The Contractor shall afford the Owner and the Project Manager, at the Owner's expense, access at any reasonable time to any place where the Plant and Equipment are being manufactured or the Facilities are being installed, in order to inspect the progress and the manner of manufacture or installation, provided that the Project Manager shall give the Contractor a reasonable prior notice.
- i) The Contractor agrees that neither the execution of a test and/ or inspection of Plant and Equipment or any part of the Facilities, nor the witnessing of any test by the Owner, nor the issuance of any test certificate shall relieve the Contractor of any obligation under this Contract.
- j) No part of the Facilities or foundations shall be covered up on the Site without the Contractor carrying out any test and/or inspection required under the Contract. The Contractor shall give a reasonable notice to the Project Manager whenever any such part of the Facilities or foundations is ready or about to be ready for test and/or inspection; such test and/or inspection and notice thereof shall be subject to the requirements of the Contract.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-38-	25.09.2014

- k) The Contractor shall uncover any part of the Facilities or foundations, or shall make openings in or through the same as the Project Manager may from time to time require at the Site, and shall reinstate and make good such part or parts.

4.29 Completion of the Facilities

- a) As soon as the Facilities or any part thereof has, in the opinion of the Contractor, been completed operationally and structurally and put in a tight and clean condition as specified in the Technical Specifications, excluding minor items not materially affecting the operation or safety of the Facilities, the Contractor shall so notify the Owner in writing.
- b) The Owner shall supply the operating and maintenance personnel as specified in the Form of Contract Agreement for Pre-commissioning of the Facilities or any part thereof.
- c) As soon as all works in respect of Pre-commissioning are completed and, in the opinion of the Contractor, the Facilities or any part thereof is ready for Commissioning, the Contractor shall commence Commissioning as per procedures stipulated in Technical Specifications, and as soon as Commissioning is satisfactorily completed, the Contractor shall so notify the Project Manager in writing.
- d) If the Project Manager notifies the Contractor of any defects and/ or deficiencies, the Contractor shall then correct such defects and/or deficiencies.
If the Project Manager is satisfied that the Facilities or that part thereof have reached Completion, the Project Manager shall, within **[seven (7)]** days after receipt of the Contractor's notice, issue a Completion Certificate stating that the Facilities or that part thereof have reached Completion as at the date of the Contractor's notice.
If the Project Manager is not so satisfied, then it shall notify the Contractor in writing of any defects and/or deficiencies within **[seven (7)]** days after receipt of the Contractor's repeated notice, and the above procedure shall be repeated.
- e) If the Project Manager fails to issue the Completion Certificate and fails to inform the Contractor of any defects and/or deficiencies within **[seven (7)]** days after receipt of the Contractor's notice, or if the Owner makes use of the Facilities or part thereof, then the Facilities or that part thereof shall be deemed to have reached Completion as of the date of the Contractor's notice, or as of the Owner's use of the Facilities, as the case may be.
- f) As soon as possible after Completion, the Contractor shall complete all outstanding minor items so that the Facilities are fully in accordance with the requirements of the Contract, failing which the Owner will undertake such completion and deduct the costs thereof from any monies owing to the Contractor.
- g) Upon Completion, the Owner shall be responsible for the care and custody of the Facilities or the relevant part thereof, together with the risk of loss or damage thereto, and shall thereafter take over the Facilities or the relevant part thereof.

4.30 Commissioning & Operation Acceptance

- a) Commissioning
Commissioning of the Facilities or any part thereof Acceptance shall be completed by the Contractor as per procedures detailed in the Technical Specifications. The Contractor shall, unless otherwise specified in Contract/ Tender Specifications, supply the utilities, lubricants, chemicals, catalysts, facilities, services and other matters required for Commissioning.
- b) Guarantee Test

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-39-	25.09.2014

The Guarantee Tests (and repeats thereof) shall be conducted by the Contractor after Commissioning of the Facilities or the relevant part thereof to ascertain whether the Facilities or the relevant part can attain the Functional Guarantees specified in the Contract Documents. The Contractor's and Project Manager's advisory personnel shall attend the Guarantee Test. The Owner shall promptly provide the Contractor with such information as the Contractor may reasonably require in relation to the conduct and results of the Guarantee Tests (and any repeats thereof). If for reasons not attributable to the Contractor, the Guarantee Tests of the Facilities or the relevant part thereof cannot be successfully completed within the period from the date of Completion, specified in the SCC or any other period agreed upon by the Owner and the Contractor, the Contractor shall be deemed to have fulfilled its obligations with respect to the Functional Guarantees.

c) **Operational Acceptance**

Operational Acceptance shall occur in respect of the Facilities or any part thereof when

- the Guarantee Tests have been successfully completed and the Functional Guarantees are met; or
- The Guarantee Tests have not been successfully completed or has not been carried out for reasons not attributable to the Contractor within the period from the date of Completion specified in the SCC or any other agreed upon period as specified in GCC.
- The Contractor may give a notice to the Project Manager requesting the issue of an Operational Acceptance in respect of the Facilities or the part thereof specified in such notice as at the date of such notice.
- The Project Manager shall, after consultation with the Owner, and within forty five (45) days after receipt of the Contractor's notice, issue an Operational Acceptance Certificate. If within *[forty five (45)]* days after receipt of the Contractor's notice, the Project Manager fails to issue the Operational Acceptance Certificate or fails to inform the Contractor in writing of the justifiable reasons why the Project Manager has not issued the Operational Acceptance Certificate, the Facilities or the relevant part thereof shall be deemed to have been accepted as at the date of the Contractor's said notice.

d) **Partial Acceptance**

If the Contract specifies that Completion, Commissioning and Guarantee Tests shall be carried out in respect of parts of the Facilities, the provisions relating to Completion and Commissioning including the Guarantee Tests shall apply to each such part of the Facilities individually, and the Operational Acceptance Certificate shall be issued accordingly for each such part of the Facilities. If a part of the Facilities comprises facilities such as buildings, for which no Commissioning or Guarantee Tests are required, then the Project Manager shall issue the Operational Acceptance Certificate for such facility when it attains Completion, provided that the Contractor shall thereafter complete any outstanding minor items that are listed in the Operational Acceptance Certificate.

4.31 Completion Time and Liquidated Damage

a) **Completion Time Period**

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-40-	25.09.2014

The Contractor guarantees that it shall attain Completion of the Facilities (or a part for which a separate time for completion is specified in the SCC) within the Time for Completion specified in the SCC.

- b) If the Contractor fails to attain Completion of the Facilities or any part thereof within the Time for Completion, the Contractor shall pay to the Owner liquidated damages in the amount computed at the rates specified in the SCC. The aggregate amount of such liquidated damages shall in no event exceed the amount specified as "Maximum" in the SCC.

However, the payment of liquidated damages shall not in any way relieve the Contractor from any of its obligations to complete the Facilities or from any other obligations and liabilities of the Contractor under the Contract.

- c) No bonus will be given for earlier completion of the facilities or part thereof.

4.32 Defects Liability

- a) The Contractor warrants that the Facilities or any part thereof shall be free from defects in the design, engineering, materials and workmanship of the Plant and Equipment supplied and of the work executed.
- b) The Defects Liability Period shall be *[eighteen (18)]* months from the date of Completion of the Facilities (or any part thereof) or *[twelve (12)]* months from the date of Operational Acceptance of the Facilities (or any part thereof).

If during the Defects Liability Period any defect should be found in the design, engineering, materials and workmanship of the Plant and Equipment supplied or of the work executed by the Contractor, the Contractor shall promptly, in consultation and agreement with the Owner regarding appropriate remedying of the defects, and at its cost, repair, replace or otherwise make good (as the Contractor shall, at its discretion, determine) such defect as well as any damage to the Facilities caused by such defect. The Contractor shall not be responsible for the repair, replacement or making good of any defect or of any damage to the Facilities arising out of or resulting from any of the following causes:

- improper operation or maintenance of the Facilities by the Owner
 - operation of the Facilities outside specifications provided in the Contract
 - Normal wear and tear.
- c) The Owner shall give the Contractor a notice stating the nature of any such defect together with all available evidence thereof, promptly following the discovery thereof. The Owner shall afford all reasonable opportunity for the Contractor to inspect any such defect.
- d) The Owner shall afford the Contractor all necessary access to the Facilities and the Site to enable the Contractor to perform its obligations.
- e) If the repair, replacement or making good is of such a character that it may affect the efficiency of the Facilities or any part thereof, the Owner may give to the Contractor a notice requiring that tests of the defective part of the Facilities shall be made by the Contractor immediately upon completion of such remedial work, whereupon the Contractor shall carry out such tests.
- f) If the Contractor fails to commence the work necessary to remedy such defect or any damage to the Facilities caused by such defect within a reasonable time (which shall in no event be considered to be less than fifteen (15) days), the Owner may, following notice to the Contractor, proceed to do such work, and the reasonable costs incurred by the Owner in connection therewith shall be paid to the Owner by

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-41-	25.09.2014

the Contractor or may be deducted by the Owner from any monies due to the Contractor or claimed under the Performance Security.

If the Facilities or any part thereof cannot be used by reason of such defect and/or making good of such defect, the Defects Liability Period of the Facilities or such part, as the case may be, shall be extended by a period equal to the period during which the Facilities or such part cannot be used by the Owner because of any of the aforesaid reasons. Upon correction of the defects in the Facilities or any part thereof by repair/replacement, such repair/replacement shall have the Defects Liability Period extended by a period of *[twelve (12) month]* from the time such replacement/repair of the Facilities or any part thereof.

4.33 Functional Guarantees

The Contractor guarantees that during the Guarantee Tests, the Facilities and all parts thereof shall attain the Functional Guarantees as per the Contract. If, for reasons attributable to the Contractor, Functional Guarantees are not met either in whole or in part, the Contractor shall, within a mutually agreed time, at its cost and expense make such changes, modifications and/or additions to the Plant or any part thereof as may be necessary to meet such Guarantees. The Contractor shall notify the Owner upon completion of the necessary changes, modifications and/or additions, and shall seek the Owner's consent to repeat the Guarantee Test. If the specified Functional Guarantees are not established even during the repeat of the Guarantee Tests, the Owner may at its option, either reject the plant and equipment and recover from the Contractor payments already made or Accept the equipment/system/plant after levying Liquidated Damages as specified.

4.34 Patents Indemnity

The Contractor shall indemnify and hold harmless the Owner and its employees and officers from and against any and all suits, actions or administrative proceedings, claims, demands, losses, damages, costs, and expenses of whatsoever nature, including attorney's fees and expenses, which the Owner may suffer as a result of any infringement or alleged infringement of any patent, utility model, registered design, trademark, copyright or other intellectual property right registered or otherwise existing at the date of the Contract by reason of: (a) the installation of the Facilities by the Contractor or the use of the such Facilities.

4.35 Limitation of liability

Except in cases of criminal negligence or wilful misconduct by the Contractor, the aggregate liability of the Contractor to the Owner, whether under the Contract, in tort or otherwise, shall not exceed the total Contract Price, provided that this limitation shall not apply to any obligation of the Contractor to indemnify the Owner with respect to patent infringement.

Except in cases of criminal negligence or wilful misconduct by the Contractor, the Contractor shall not be liable to the Owner, whether in contract, tort, or otherwise, for any indirect or consequential loss or damage, loss of use, loss of production, or loss of profits or interest costs, provided that this exclusion shall not apply to any obligation of the Contractor to pay liquidated damages to the Owner.

4.36 Transfer of Ownership

Ownership of the Plant and Equipment (including spare parts) to be imported into India shall be transferred to the Owner upon loading on to the mode of transport to be used to convey the Plant and Equipment from the country of origin to that country.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-42-	25.09.2014

Ownership of the Plant and Equipment (including spare parts) procured from within India shall be transferred to the Owner when the Plant and Equipment including spares are loaded on to the mode of transport to be used to convey the Plant and Equipment including spares from the works to the site and upon endorsement of the despatch documents in favour of the Owner. Ownership of the Contractor's Equipment used by the Contractor and its Subcontractors in connection with the Contract shall remain with the Contractor or its Subcontractors. Ownership of any Plant and Equipment in excess of the requirements for the Facilities shall revert to the Contractor upon Completion of the Facilities or at such earlier time when the Owner and the Contractor agree that the Plant and Equipment in question are no longer required for the Facilities, provided quantity of any Plant and Equipment specifically stipulated in the Contract shall be the property of the Owner whether or not incorporated in the Facilities. Notwithstanding the transfer of ownership of the Plant and Equipment, the responsibility for care and custody thereof together with the risk of loss or damage shall remain with the Contractor until Completion of the Facilities.

4.37 Care of Facilities

The Contractor shall be responsible for the care and custody of the Facilities or any part thereof until the date of Completion of the Facilities, where the Contract provides for Completion of the Facilities in parts, until the date of Completion of the relevant part, and shall make good at its own cost any loss or damage that may occur to the Facilities or the relevant part thereof from any cause whatsoever during such period. The Contractor shall also be responsible for any loss or damage to the Facilities caused by the Contractor or its Subcontractors in the course of any work carried out.

4.38 Loss of or Damage to Property; Accident or Injury; Indemnification

The Contractor shall indemnify and hold harmless the Owner and its employees and officers from and against any and all suits, actions or administrative proceedings, claims, demands, losses, damages, costs, and expenses of whatsoever nature, including attorney's fees and expenses, in respect of the death or injury of any person or loss of or damage to any property (other than the Facilities whether accepted or not), arising in connection with the supply and installation of the Facilities and by reason of the negligence of the Contractor or its Subcontractors, or their employees, officers or agents, except any injury, death or property damage caused by the negligence of the Owner, its contractors, employees, officers or agents.

4.39 Insurance

- a) The Contractor shall at its expense take out and maintain in effect, or cause to be taken out and maintained in effect, during the performance of the Contract, the insurances set forth below in the sums and with the deductibles and other conditions as specified. The identity of the insurers and the form of the policies shall be subject to the approval of the Owner, who should not unreasonably withhold such approval.
 - Cargo Insurance during Transport:-Covering loss or damage occurring while in transit from the Contractor's or Subcontractor's works or stores until arrival at the Site, to the Plant and Equipment (including spare parts thereof) and to the Contractor's Equipment.
 - Installation All Risks Insurance:-Covering physical loss or damage to the Facilities at the Site, occurring prior to Completion of the Facilities, with an extended maintenance coverage for the Contractor's liability in respect of any loss or damage occurring during the Defects Liability Period while the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors-Ash Handling System Volume-I	-43-	25.09.2014

Contractor is on the Site for the purpose of performing its obligations during the Defects Liability Period.

- Third Party Liability Insurance: - Covering bodily injury or death suffered by third parties (including the Owner's personnel) and loss of or damage to property occurring in connection with the supply and installation of the Facilities.
 - Automobile Liability Insurance:-Covering use of all vehicles used by the Contractor or its Subcontractors (whether or not owned by them) in connection with the execution of the Contract.
 - Workers' Compensation:-In accordance with the statutory requirements applicable in any country where the Contract or any part thereof is executed.
 - Other Insurances Such other insurances as may be specifically agreed upon by the parties.
- b) The Owner shall be named as co-insured under all insurance policies taken out by the Contractor pursuant except for the Third Party Liability, Workers' Compensation and Owner's Liability Insurances, and the Contractor's Subcontractors shall be named as co-insured's under all insurance policies taken out by the Contractor except for the Cargo Insurance During Transport, Workers' Compensation and Owner's Liability Insurances. All insurers' rights of subrogation against such co-insured's for losses or claims arising out of the performance of the Contract shall be waived under such policies.
 - c) The Form of Contract Agreement, deliver to the Owner certificates of insurance (or copies of the insurance policies) as evidence that the required policies are in full force and effect. The certificates shall provide that no less than twenty one (21) days' notice shall be given to the Owner by insurers prior to cancellation or material modification of a policy.
 - d) The Contractor shall ensure that, where applicable, its Subcontractor(s) shall take out and maintain in effect adequate insurance policies for their personnel and vehicles and for work executed by them under the Contract, unless such Subcontractors are covered by the policies taken out by the Contractor.
 - e) The Owner shall at its expense take out and maintain in effect during the performance of the Contract those insurances specified.
 - f) the Owner may take out and maintain in effect any such insurances and may from time to time deduct from any amount due the Contractor under the Contract any premium that the Owner shall have paid to the insurer, or may otherwise recover such amount as a debt due from the Contractor. If the Owner fails to take out and/or maintain in effect the insurances the Contractor may take out and maintain in effect any such insurances and may from time to time deduct from any amount due the Owner under the Contract any premium that the Contractor shall have paid to the insurer, or may otherwise recover such amount as a debt due from the Owner. If the Contractor fails to or is unable to take out and maintain in effect any such insurances, the Contractor shall nevertheless have no liability or responsibility towards the Owner, and the Contractor shall have full recourse against the Owner for any and all liabilities of the Owner herein.
 - g) The Owner shall give to the Contractor all such reasonable assistance as may be required by the Contractor. With respect to insurance claims in which the Owner's interest is involved, the Contractor shall not give any release or make any compromise with the insurer without the prior written consent of the Owner. With respect to insurance claims in which the Contractor's interest is involved, the Owner shall not give any release or make any compromise with the insurer without the prior written consent of the Contractor.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors-Ash Handling System Volume-I	-44-	25.09.2014

- h) Wherever total damages/loss of Equipment/materials, would occur, the Contractor will be entitled to payment of all payments received from the underwriters except the following amounts:
- The amount paid to the Contractor under the Contract in respect of Equipment/materials damaged/lost (excluding the pro-rata initial advance) but including the entire amount of escalation, if any, already paid to the Contractor.
 - Custom Duties and taxes which have already been paid by the Owner.
 - In case of damage to any Equipment/materials during any stage, the Contractor upon rectification of the damaged equipment to the satisfaction of the Owner shall be paid to the extent of full claims settled by the underwriters.
- i) All the Plants & Equipment being supplied by the Owner free of cost for installation of the equipment, cabling, earthing and lightning protection etc. by the Contractor, covered by this specification shall be kept insured by the Contractor against loss, damage, theft, pilferage, fire etc. from the point of unloading at Site up to the time of taking over by the Owner including handling, in plant transportation, storage, installation, testing and commissioning, etc. and the Contractor shall be fully responsible for making good of any loss or damage at his own cost within a reasonable time as mutually agreed upon by the Owner and the Contractor. Any loss/damage shall be brought to the Owner's notice immediately. The premium paid by the Contractor to the Insurance Company for such insurance shall be reimbursed by the Owner to the Contractor at actual against documentary proof to be furnished by the Contractor. The Contractor shall obtain competitive quotation for such insurance and shall take prior approval from the Owner before taking the insurance. The insurable value of the equipment being procured by the Owner will be intimated to the Contractor for the purpose of insurance.
- It will be the responsibility of the Contractor to lodge, pursue and settle all claims with the Insurance Company in case of any damage, loss, theft, pilferage, fire, etc. and the Owner shall be kept informed about it. The losses, if any, will have to be borne by the Contractor, if the claims are not lodged and pursued properly or in the time or if the same are not settled by the Insurance Company.
 -

4.40 Change in Laws & Regulation

- a) If, after the date [seven (7)] days prior to the date of Bid submission, in India, any law, regulation, ordinance, order or by-law having the force of law is enacted, promulgated, abrogated or changed (which shall be deemed to include any change in interpretation or application by the competent authorities) that subsequently affects the costs and expenses of the Contractor and/or the Time for Completion, the Contract Price shall be correspondingly increased or decreased, and/or the Time for Completion shall be reasonably adjusted to the extent that the Contractor has thereby been affected in the performance of any of its obligations under the Contract. However, these adjustments would be restricted to direct transactions between the Owner and the Contractor and not on procurement of raw materials, intermediary components etc. by the Contractor. Notwithstanding the foregoing, such additional or reduced costs shall not be separately paid or credited if the same has already been accounted for in the price adjustment provisions wherever applicable.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-45-	25.09.2014

4.41 Force Majeure

- (a) Force Majeure" shall mean any event beyond the reasonable control of the Owner or of the Contractor, as the case may be, and which is unavoidable notwithstanding the reasonable care of the party affected. Force Majeure events include Acts of God, Acts of Government, war, sabotage, riots, civil commotion, revolution, flood, earthquake, cyclone, fire, epidemic etc.
- (b) If either party is prevented, hindered or delayed from or in performing any of its obligations under the Contract by an event of Force Majeure, then it shall notify the other in writing of the occurrence of such event and the circumstances thereof within **[fourteen (14)]** days after the occurrence of such event.
- (c) The party who has given such notice shall be excused from the performance or punctual performance of its obligations under the Contract for so long as the relevant event of Force Majeure continues and to the extent that such party's performance is prevented, hindered or delayed.
- (d) The party or parties affected by the event of Force Majeure shall use reasonable efforts to mitigate the effect thereof upon its or their performance of the Contract and to fulfil its or their obligations under the Contract, but without prejudice to either party's right.
- (e) No delay or non-performance by either party hereto caused by the occurrence of any event of Force Majeure shall
 - constitute a default or breach of the Contract
 - to any claim for damages or additional cost or expense occasioned thereby
 if and to the extent that such delay or non-performance is caused by the occurrence of an event of Force Majeure.
- (f) If the performance of the Contract is substantially prevented, hindered or delayed for a single period of more than **[sixty (60)]** days or an aggregate period of more than one hundred and **[twenty (120)]** days on account of one or more events of Force Majeure during the currency of the Contract, the parties will attempt to develop a mutually satisfactory solution.
- (g) Force Majeure shall not apply to any obligation of the Owner to make payments to the Contractor herein.
- (a)

4.42 Change in the Facilities

(a) Introducing a Change

- The Owner shall have the right to propose, and subsequently require, the Contractor during the performance of the Contract to make any change, modification, addition or deletion to, in or from the Facilities (hereinafter called "Change"), provided that such Change falls within the general scope of the Facilities and does not constitute unrelated work and that it is technically practicable, taking into account both the state of advancement of the Facilities and the technical compatibility of the Change envisaged with the nature of the Facilities as specified in the Contract.
- The Contractor may from time to time during its performance of the Contract propose to the Owner (with a copy to the Project Manager) any Change that the Contractor considers necessary or desirable to improve the quality, efficiency or safety of the Facilities. This includes any additional scope of work that the contractor thinks is essential for achieving the minimum

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-46-	25.09.2014

performance level specified in the SCC or the Contract. The Owner may at its discretion approve or reject any Change proposed by the Contractor.

- No change made necessary because of any default of the Contractor in the performance of its obligations under the Contract shall be deemed to be a Change, and such change shall not result in any adjustment of the Contract Price or the Time for Completion.

(b) Changes Originating from Owner

- If the Owner proposes a Change, it shall send to the Contractor a "Request for Change Proposal," requiring the Contractor to prepare and furnish to the Project Manager as soon as reasonably practicable a "Change Proposal," which shall include the following:
 - ✓ brief description of the Change
 - ✓ effect on the Time for Completion
 - ✓ estimated Cost of the Change
 - ✓ effect on Functional Guarantees (if any)
 - ✓ effect on any other provisions of the Contract.
- The pricing of any Change shall, as far as practicable, be calculated in accordance with the rates and prices included in the Contract. If the rates and prices of any change are not available in the Contract, the parties thereto shall agree on specific rates for the valuation of the Change.
- If before or during the preparation of the Change Proposal it becomes apparent that the aggregate effect of compliance therewith and with all other Change Orders that have already become binding upon the Contractor to increase or decrease the Contract Price as originally set forth in the Contract Agreement by more than fifteen (15) percent, the Contractor may give a written notice of objection thereto prior to furnishing the Change Proposal as aforesaid. If the Owner accepts the Contractor's objection, the Owner and the Contractor shall agree on specific rates for valuation of the change.
- Upon receipt of the Change Proposal, the Owner and the Contractor shall mutually agree upon all matters therein contained including agreement on rates if such rates are not available in the Contract or if the limit of 15% set forth has been exceeded. Within *fourteen (14)* days after such agreement, the Owner shall, if it intends to proceed with the Change, issue the Contractor with a Change Order.
- If the Owner is unable to reach a decision within *fourteen (14)* days, it shall notify the Contractor with details of when the Contractor can expect a decision.
- If the Owner decides not to proceed with the Change for whatever reason, it shall, within the said period of *fourteen (14)* days, notify the Contractor accordingly.
- If the Owner and the Contractor cannot reach agreement on the price for the Change, an equitable adjustment to the Time for Completion, or any other matters identified in the Change Proposal, the Owner may nevertheless instruct the Contractor to proceed with the Change by issue of a "Pending Agreement Change Order."

Upon receipt of a Pending Agreement Change Order, the Contractor shall immediately proceed with effecting the Changes covered by such Order. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-47-	25.09.2014

parties shall thereafter attempt to reach agreement on the outstanding issues under the Change Proposal.

(c) Changes Originating from Contractor

- The Contractor shall submit to the Project Manager a written “Application for Change Proposal,” giving reasons for the proposed Change and including the information. Upon receipt of the Application for Change Proposal, the parties shall follow the procedures indicated above for “Request for Change Proposal.”

4.43 Extension of Time for Completion

- (a) The Time(s) for Completion specified in the SCC shall be extended if the Contractor is delayed or impeded in the performance of any of its obligations under the Contract by reason of any of the following:
- Any Change in the Facilities or
 - any occurrence of Force Majeure or
 - any suspension order given by the Owner or reduction in the rate of progress or
 - any changes in laws and regulations or
 - any default or breach of the Contract by the Owner, or any activity, act or omission of any other contractors employed by the Owner or
 - any other matter specifically mentioned in the Contract;
- By such period as shall be fair and reasonable in all the circumstances and as shall fairly reflect the delay or impediment sustained by the Contractor.
- (b) Except where otherwise specifically provided in the Contract, the Contractor shall submit to the Project Manager a notice of a claim for an extension of the Time for Completion, together with particulars of the event or circumstance justifying such extension as soon as reasonably practicable after the commencement of such event or circumstance. As soon as reasonably practicable after receipt of such notice and supporting particulars of the claim, the Owner and the Contractor shall agree upon the period of such extension.
- (c) The Contractor shall at all times use its reasonable efforts to minimize any delay in the performance of its obligations under the Contract.

4.44 Suspension

- (a) The Owner/ Project Manager may, by notice to the Contractor, order the Contractor to suspend performance of any or all of its obligations under the Contract. Such notice shall specify the obligation of which performance is to be suspended, the effective date of the suspension and the reasons thereof. The Contractor shall thereupon suspend performance of such obligation (except those obligations necessary for the care or preservation of the Facilities) until ordered in writing to resume such performance by the Project Manager/ Owner.
- If, by virtue of a suspension order given by the Project Manager/ Owner, other than by reason of the Contractor’s default or breach of the Contract, the Contractor’s performance of any of its obligations is suspended for an aggregate period of more than *[ninety (90)]* days, then at any time thereafter and provided that at that time such performance is still suspended, the Contractor may give a notice to the Project Manager requiring that the Owner shall, within *[twenty eight (28)]* days of receipt of the notice, order the resumption of such performance or

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-48-	25.09.2014

request and subsequently order a change, excluding the performance of the suspended obligations from the Contract.

- (b) If the Contractor is unable to carry out any of its obligations under the Contract for any reason attributable to the Owner, including but not limited to the Owner's failure to provide possession of or access to the Site or other areas;

Then the Contractor may by *[fourteen (14)]* days' notice to the Owner suspend performance of all or any of its obligations under the Contract, or reduce the rate of progress. If the Contractor's performance of its obligations is suspended or the rate of progress is reduced, then the Time for Completion shall be extended, and any and all additional costs or expenses incurred by the Contractor as a result of such suspension or reduction shall be paid by the Owner to the Contractor in addition to the Contract Price, except in the case of suspension order or reduction in the rate of progress by reason of the Contractor's default or breach of the Contract.

- (c) During the period of suspension, the Contractor shall not remove from the Site any Plant and Equipment, any part of the Facilities or any Contractor's Equipment, without the prior written consent of the Owner.

4.45 Termination

(a) Termination for Owner's Convenience

The Owner may at any time terminate the Contract for any reason by giving the Contractor a notice of termination. Upon receipt of the notice of termination, the Contractor shall either immediately or upon the date specified in the notice of termination

- (i) cease all further work, except for such work as the Owner may specify in the notice of termination for the sole purpose of protecting that part of the Facilities already executed, or any work required to leave the Site in a clean and safe condition.
- (ii) terminate all subcontracts, except those to be assigned
- (iii) remove all Contractor's Equipment from the Site, repatriate the Contractor's and its Subcontractors' personnel from the Site, remove from the Site any wreckage, rubbish and debris of any kind, and leave the whole of the Site in a clean and safe condition
- (iv) The Contractor, subject to the payment, shall

- ✓ deliver to the Owner the parts of the Facilities executed by the Contractor up to the date of termination
- ✓ to the extent legally possible, assign to the Owner all right, title and benefit of the Contractor to the Facilities and to the Plant and Equipment as at the date of termination, and, as may be required by the Owner, in any subcontracts concluded between the Contractor and its Subcontractors
- ✓ Deliver to the Owner all non-proprietary drawings, specifications and other documents prepared by the Contractor or its Subcontractors as at the date of termination in connection with the Facilities.

In the event of termination of the Contract for Owner's convenience, the Owner shall pay to the Contractor the following amounts

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-49-	25.09.2014

- ✓ the Contract Price, attributable to the parts of the Facilities executed by the Contractor as on the date of termination
- ✓ the costs reasonably incurred by the Contractor in the removal of the Contractor's Equipment from the Site and in the repatriation of the Contractor's and its Subcontractors' personnel
- ✓ any amounts to be paid by the Contractor to its Subcontractors in connection with the termination of any subcontracts, including any cancellation charges
- ✓ costs incurred by the Contractor in protecting the Facilities and leaving the Site in a clean and safe condition
- ✓ the additional cost of satisfying other obligations, commitments and claims that the Contractor may in good faith have undertaken with third parties in connection with the Contract.

(b) Termination for Contractor's Default

- (i) The Owner, without prejudice to any other rights or remedies it may possess, may terminate the Contract forthwith in the following circumstances by giving a notice of termination and its reasons thereof to the Contractor:

If the Contractor becomes bankrupt or insolvent, has a receiving order issued against it, compounds with its creditors, or, if the Contractor is a corporation, a resolution is passed or order is made for its winding up (other than a voluntary liquidation for the purposes of amalgamation or reconstruction), a receiver is appointed over any part of its undertaking or assets, or if the Contractor takes or suffers any other analogous action in consequence of debt

If the Contractor assigns or transfers the Contract or any right or interest therein in violation of the provision.

If the Contractor, in the judgement of the Owner has engaged in corrupt or fraudulent practices in competing for or in executing the Contract.

For the purpose of this Sub Clause:

"corrupt practice" means the offering, giving, receiving or soliciting of anything of value to influence the action of a public official in the procurement process or in contract execution.

"fraudulent practice" means a misrepresentation of facts in order to influence a procurement process or the execution of a contract to the detriment of the Owner and includes collusive practice among Bidders (prior to or after bid submission) designed to establish bid prices at artificial non-competitive levels and to deprive the Owner of the benefits of free and open competition.

- (ii) If the Contractor
- has abandoned or repudiated the Contract
 - has without valid reason failed to commence work on the Facilities promptly the progress of Contract performance for more than *[twenty eight (28)]* days after receiving a written instruction from the Owner to proceed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-50-	25.09.2014

- persistently fails to execute the Contract in accordance with the Contract or persistently neglects to carry out its obligations under the Contract without just cause
- refuses or is unable to provide sufficient materials, services or labor to execute and complete the Facilities in the manner specified in the program at rates of progress that give reasonable assurance to the Owner that the Contractor can attain Completion of the Facilities by the Time for Completion as extended

then the Owner may, without prejudice to any other rights it may possess under the Contract, give a notice to the Contractor stating the nature of the default and requiring the Contractor to remedy the same. If the Contractor fails to remedy or to take steps to remedy the same within *[fourteen (14)]* days of its receipt of such notice, then the Owner may terminate the Contract forthwith by giving a notice of termination to the Contractor.

(iii) The Contractor shall, either immediately or upon such date as is specified in the notice of termination,

- cease all further work, except for such work as the Owner may specify in the notice of termination for the sole purpose of protecting that part of the Facilities already executed, or any work required to leave the Site in a clean and safe condition
- terminate all subcontracts, except those to be assigned to the Owner pursuant to paragraph (d) below
- deliver to the Owner the parts of the Facilities executed by the Contractor up to the date of termination
- to the extent legally possible, assign to the Owner all right, title and benefit of the Contractor to the Works and to the Plant and Equipment as at the date of termination, and, as may be required by the Owner, in any subcontracts concluded between the Contractor and its Subcontractors
- Deliver to the Owner all drawings, specifications and other documents prepared by the Contractor or its Subcontractors as at the date of termination in connection with the Facilities.

(iv) The Owner may enter upon the Site, expel the Contractor, and complete the Facilities itself or by employing any third party. The Owner may, to the exclusion of any right of the Contractor over the same, take over and use with the payment of a fair rental rate to the Contractor, with all the maintenance costs to the account of the Owner and with an indemnification by the Owner for all liability including damage or injury to persons arising out of the Owner's use of such equipment, any Contractor's Equipment owned by the Contractor and on the Site in connection with the Facilities for such reasonable period as the Owner considers expedient for the supply and installation of the Facilities.

Upon completion of the Facilities or at such earlier date as the Owner thinks appropriate, the Owner shall give notice to the Contractor that such Contractor's Equipment will be returned to the Contractor at or near the Site and shall return such Contractor's Equipment to the Contractor in accordance with such notice. The Contractor shall thereafter without delay and at its cost remove or arrange removal of the same from the Site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-51-	25.09.2014

- (v) The Contractor shall be entitled to be paid the Contract Price attributable to the Facilities executed as at the date of termination, the value of any unused or partially used Plant and Equipment on the Site, and the costs, if any, incurred in protecting the Facilities and in leaving the Site in a clean and safe condition. Any sums due to the Owner from the Contractor accruing prior to the date of termination shall be deducted from the amount to be paid to the Contractor under this Contract.
- (vi) If the Owner completes the Facilities, the cost of completing the Facilities by the Owner shall be determined.

If the sum that the Contractor is entitled to be paid, plus the reasonable costs incurred by the Owner in completing the Facilities, exceeds the Contract Price, the Contractor shall be liable for such excess.

The Owner and the Contractor shall agree, in writing, on the computation described above and the manner in which any sums shall be paid.

(c) Termination by Contractor

- i. If
 - the Owner has failed to pay the Contractor any sum due under the Contract within the specified period, has failed to approve any invoice or supporting documents without just cause pursuant to [-----] (Terms and Procedures of Payment) of the Form of Contract Agreement, or commits a substantial breach of the Contract, the Contractor may give a notice to the Owner that requires payment of such sum, requires approval of such invoice or supporting documents, or specifies the breach and requires the Owner to remedy the same, as the case may be. If the Owner fails to pay such sum, fails to approve such invoice or supporting documents or give its reasons for withholding such approval, fails to remedy the breach or take steps to remedy the breach within [fourteen (14) days] after receipt of the Contractor's notice, or
 - the Contractor is unable to carry out any of its obligations under the Contract for any reason attributable to the Owner, including but not limited to the Owner's failure to provide possession of or access to the Site or other areas or failure to obtain any governmental permit necessary for the execution and/or completion of the Facilities which the Owner is required to obtain as per provision of the Contract or as per relevant applicable laws of the country,

then the Contractor may give a notice to the Owner thereof, and if the Owner has failed to pay the outstanding sum, to approve the invoice or supporting documents, to give its reasons for withholding such approval, or to remedy the breach within [twenty eight (28) days] of such notice, or if the Contractor is still unable to carry out any of its obligations under the Contract for any reason attributable to the Owner within [twenty eight (28) days] of the said notice, then the Contractor may terminate the Contract forthwith by giving a notice of termination to the Owner.
- ii. If the Owner becomes bankrupt or insolvent, has a receiving order issued against it, compounds with its creditors, or, being a corporation, if a resolution is passed or order is made for its winding up (other than a voluntary liquidation for the purposes of amalgamation or reconstruction), a

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-52-	25.09.2014

receiver is appointed over any part of its undertaking or assets, or if the Owner takes or suffers any other analogous action in consequence of debt, then the Contractor may terminate the Contract forthwith by giving a notice of termination to the Owner.

- iii. If the Contract is terminated, then the Contractor shall immediately
 - cease all further work, except for such work as may be necessary for the purpose of protecting that part of the Facilities already executed, or any work required to leave the Site in a clean and safe condition
 - terminate all subcontracts, except those to be assigned to the Owner pursuant to paragraph (d)(ii)
 - remove all Contractor's Equipment from the Site and repatriate the Contractor's and its Subcontractor's personnel from the Site.
 - In addition, the Contractor, subject to the payment, shall
 - ✓ deliver to the Owner the parts of the Facilities executed by the Contractor up to the date of termination
 - ✓ to the extent legally possible, assign to the Owner all right, title and benefit of the Contractor to the Facilities and to the Plant and Equipment as of the date of termination, and, as may be required by the Owner, in any subcontracts concluded between the Contractor and its Subcontractors
 - ✓ Deliver to the Owner all drawings, specifications and other documents prepared by the Contractor or its Subcontractors as of the date of termination in connection with the Facilities.
- iv. If the Contract is terminated, the Owner shall pay to the Contractor all payments, and reasonable compensation for all loss or damage sustained by the Contractor arising out of, in connection with or in consequence of such termination.
- (d) The expression "Facilities executed" shall include all work executed, Erection Services provided, any all Plant and Equipment acquired (or subject to a legally binding obligation to purchase) by the Contractor and used or intended to be used for the purpose of the Facilities, up to and including the date of termination.
- (e) In calculating any payment due from the Owner to the Contractor, account shall be taken of any sum previously paid by the Owner to the Contractor under the Contract, including any advance payment paid.

4.46 Assignment

The Contractor shall not, without the express prior written consent of the Owner, assign to any third party the Contract or any part thereof, or any right, benefit, obligation or interest therein or there under, except that the Contractor shall be entitled to assign either absolutely or by way of charge any monies due and payable to it or that may become due and payable to it under the Contract

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors-Ash Handling System Volume-I	-53-	25.09.2014

5 SPECIAL CONDITIONS OF CONTRACT (SCC)

5.1 Contract Details

- **Name of Contract:** Renovation & Modernization of Ash Handling System-AHS) Package for [-----]
- **Bid Document No. :** [-----]
- **The Owner is:**
 - Name of Owner: [-----]
 - Address of Owner: [-----]
 - Telephone No. : [-----]
 - Fax No: [-----]
 - E-Mail: [-----]
- **The Project Manager is:**
 - Name of Project Manager: [-----]
 - Address of Project Manager: [-----]
 - Telephone No. : [-----]
 - Fax No: [-----]
 - E-Mail: [-----]

5.2 Effective Date

The Owner shall inform the successful Bidder of its acceptance of the Tender by a formal Letter of Acceptance. This Letter of Acceptance will be the Effective Date for determining the Time for Completion of the facilities and other milestones for execution of the Renovation & Modernization work as per the scope of work under this tender by the Contractor.

The following three activities will be completed within [two (2)] months from the date of Letter of Acceptance:

- (a) The contract agreement will be executed by the Owner and the Contractor.
- (b) The Contractor will submit to the Owner the Contract Performance Bank Guarantee, and the Advance Payment Bank Guarantee.
- (c) The Owner will pay the Contractor the Advance Payment as per the Terms of Payment.

The Owner will make the advance payment promptly once Contractor has fulfilled the necessary conditions specified in Terms of Payment. If payment of Advance is delayed beyond two months from the date of Letter of acceptance for reasons attributable to the Owner, the date of payment of advance shall be the effective date for determining the time for completion of facilities. However, failure of the contractor to provide all the required Bonds/Guarantees within the prescribed period will cause the Bid Security to be forfeited.

5.3 Time for Commencement and Completion

The Time Schedule for the execution of the scope of work by the Contractor under this tender and commencement of unit shut down by Owner shall be as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors-Ash Handling System Volume-I	-54-	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

1.	Time for completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network	By [.....] months from Effective Date
2.	Time for Commencement (by Owner) of Unit Shut Down. (Note: In case Contractor fails to complete the engineering, supply and mobilization activities as at serial no.1, Owner may, at its discretion, reschedule commencement of unit shut down	By [.....] months from Effective Date
3.	Time for Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender	By [.....] days from start of unit shut down
4.	Performance Guarantee Test (By Contractor)	By [.....] months from the completion of trial operation after completion of R&M activities

5.4 Liquidated Damage for Delay

5.5 Rate of Liquidated Damage for Delay

If the Contractor fails to successfully achieve completion of R&M activities and commissioning of the retrofitted facilities as per the scope of work within the time period specified in SCC, the Contractor shall pay to the Owner amount calculated as per the rates given in the following table as Liquidated Damage and not as penalty.

1.	Delay in completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network	Liquidated Damage payable at the rate Rs.[.....] for each week of delay
2.	Delay in Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender	Liquidated Damage payable at the rate Rs [.....] for each day of delay

The Liquidated Damage for Delay in completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network and Liquidated Damage for Delay in Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender are independent and shall be applied separately.

5.6 Liquidated Damage for Non-fulfillment of Functional Guarantees

If the Contractor fails to successfully achieve the Functional Guarantees during Performance Guarantee Test as per the Tender Specification, the Contractor shall pay

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-55-	25.09.2014

to the Owner amount calculated as per the rates given in the following table as Liquidated Damage and not as penalty.

Sl. No.	Functional Guarantee Parameter	Rate of Liquidated Damage
1	Auxiliary Power	[.....] INR per kW increase

The reference condition for Performance Guarantee Parameters shall be as per Volume-II Technical Specification.

The Liquidated Damage for non-fulfillment of the different Functional Guarantee Parameters are independent of one another and shall be applied separately.

{Note: The rate of LD for any functional guarantee parameter shall be at least 1.5 times the corresponding Bid Evaluation Factor}

5.7 Maximum Leivable Liquidated Damages

The amount of Liquidated Damage for delay shall be limited to a maximum of 10 % of the total contracts price (i.e. sum of Ist, IInd and IIIrd contracts, as applicable) price including price variation as per the provisions of the contract and excluding price of Mandatory Spares. This limit is applicable for the Liquidated Damage for Delay in completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network and Liquidated Damage for Delay in Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender taken together.

The aggregate amount **of Liquidated Damage for non-fulfilment of functional guarantee shall be limited to** a maximum of 10 % of the total contracts price (i.e. sum of Ist and IInd contracts, as applicable) price including price variation as per the provisions of the contract and excluding price of Mandatory Spares.

The limit on maximum leivable Liquidated Damage for Delay and maximum leivable Liquidated Damage for non-fulfillment of functional guarantee are independent of each other and shall apply separately.

5.8 Payment of Liquidated Damages

Contractor shall pay to the owner any Liquidated Damages that are payable as per the provisions of the Contract within thirty (30) days of receipt of Owner's invoice setting forth amount of Liquidated Damages that are then due and payable. If Contractor delays payment of Liquidated Damages that are payable under the provisions of the Contract beyond thirty (30) days, Owner, at its discretion, shall be entitled to recover such amounts by either setting off the relevant unpaid amount against any payment(s) due to the Contractor or by making a demand under Contract Performance Bank Guarantee.

5.9 Contract Price

- The Contract Price shall be as (Contract Price and Terms of Payment) of the Form of Contract Agreement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors–Ash Handling System Volume-I	-56-	25.09.2014

- b) The Contractor shall be deemed to have satisfied itself as to the correctness and sufficiency of the Contract Price, which shall, except as otherwise provided for in the Contract, cover all its obligations under the Contract.

5.10 Terms of Payment

- a) The Contract Price shall be paid as Terms and Procedures of Payment to the Form of Contract Agreement. The procedures to be followed in making application.
- b) No payment made by the Owner herein shall be deemed to constitute acceptance by the Owner of the Facilities or any part(s) thereof.
- c) The currency or currencies in which payments are made to the Contractor under this Contract to the Form of Contract Agreement, subject to the general principle that payments will be made in the currency or currencies in which the Contract Price has been stated in the Contractor's bid.

5.11 Contract Securities (Bank Guarantees)

- a) The Contractor shall provide the Bank Guarantee specified below in favour of the Owner at the times, and in the amount, manner and form specified below.
- b) Advance Payment Bank Guarantee
- The Contractor shall, within *[thirty (30)]* days of the Notification of Contract Award, provide a security for an amount equal to the advance payment, and in the same currency or currencies, with a initial validity of up to *[ninety (90)]* days beyond the date of Completion of Facilities.
 - The security shall be in the form of an Unconditional Bank Guarantee. The Advance payment Bank Guarantee shall be reduced prorata every three (3) months after First Running Account Bill/Stage Payment under the Contract based on the value of equipment/facilities received. The cumulative amount of reduction at any point of time shall not exceed ninety percent (90%) of the advance corresponding to cumulative value of the Facilities supplied and received as per a certificate issued by the Project Manager and the balance of 10% shall be released on Completion of those Facilities. It should be clearly understood that reduction in the value of security for advance shall not in any way dilute the Contractor's responsibility and liabilities under the Contract including in respect of the Facilities for which the reduction in the value of security is allowed.
- c) Performance Bank Guarantee
- The Contractor shall, within *[thirty (30)]* days of the notification of award, provide a Bank Guarantee for the due performance of the Contract for ten percent (10%) of the Contract Price with an initial validity up to *[ninety (90)]* days beyond the Defects Liability Period
- d) The performance Bank Guarantee shall be denominated in the currency or currencies of the Contract, or in a freely convertible currency acceptable to the Owner.

5.12 Sequential Supply

The Contractor is required to supply the material and equipment under the Contract in a sequential manner as per the requirement at site for erection. If Contractor supplies any material/equipment ahead of the requirement as per the agreed Detailed Time Schedule, the Owner, at its discretion, may withhold progressive payment for such material/equipment till the time it is due for supply as per the agreed Detailed Time Schedule.

Form of Contract Agreement

THIS CONTRACT AGREEMENT is made the _____day of _____, 20_____.
 BETWEEN (1) [Name of Employer], a corporation incorporated under the laws of [country of Employer] and having its principal place of business at [address of Employer] (hereinafter called “the Employer”), and (2) [name of Contractor], a corporation incorporated under the laws of [country of Contractor] and having its principal place of business at [address of Contractor] (hereinafter called “the Contractor”)

WHEREAS the Employer desires to engage the Contractor to dismantle/disassemble, design, manufacture, test, deliver, install, complete and commission certain Facilities, viz.

[.....]
 [.....]
 [.....]

(“the Facilities”) and the Contractor have agreed to such engagement upon and subject to the terms and conditions hereinafter appearing.

NOW IT IS HEREBY AGREED as follows:

1.1 Contract Documents

- a) Contract Documents means this signed Contract agreement and its annexure/appendices, and the complete documents, which are the basis of finalization of the contract, including correspondence exchanged from issue of tender till date of signing the contract. The following will constitute the Contract Documents:
 - i. The signed Contract Agreement & the annexure/ appendices thereto (highest precedence)
 - ii. Letter of award.
 - iii. Special Condition of Contract
 - iv. General Condition of Contract
 - v. Technical specification & Tender Drawing.
 - vi. The bid & its schedules/ attachment submitted by the contractor.

- a) All documents forming part of the Contract (and all parts thereof) are intended to be correlative, complementary and mutually explanatory. The Contract shall be read as a whole.

- b) The Contract will be signed in three originals and the Contractor shall be provided with one signed original and the rest will be retained by the Employer.

1.2 Order of Precedence of Contract Documents

In case there is any ambiguity of conflict between different contract documents, the order of precedence shall be as follows:-

- i. The signed Contract Agreement & the annexure/ appendices thereto (highest precedence)
- ii. Letter of award.
- iii. Special Condition of Contract
- iv. General Condition of Contract
- v. Technical specification & Tender.
- vi. The bid & schedules/ attachment Drawing submitted by the contractor.

1.3 Definitions

The Definitions of terms and expressions shall be as per GCC clause 4.1. Terms and expressions not defined in GCC shall have the same meaning as are assigned to them in the Indian Sale of Goods Act (1930), failing that in the Indian Contract Act (1872) and failing that in the General Clauses Act (1897) including amendments thereof, if any.

1.4 Contract Price

The Employer hereby agrees to pay to the Contractor the Contract Price in consideration of the performance by the Contractor of its obligations hereunder:
The Contract Price shall be the aggregate of: [amount of foreign currency in words], [amount in figures], and [amount of local currency in words], [amount in figures], or such other sums as may be determined in accordance with the terms and conditions of the Contract.

1.5 Term of Payment

The terms and procedures of payment according to which the Employer will reimburse the Contractor are given in Contract Schedule 1 (Terms and Procedures of Payment) hereto.

1.6 Time for Commencement and Completion

The Time Schedule for the execution of the scope of work by the Contractor under this tender and commencement of unit shut down by Employer shall be as follows:

1.	Time for completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network	By [.....] months from Effective Date
2.	Time for Commencement (by Employer) of Unit Shut Down. (Note: In case Contractor fails to complete the engineering, supply and mobilization activities as at serial no.1, Employer may, at its discretion, reschedule commencement of unit shut down	By [.....] months from Effective Date
3.	Time for Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender	By [.....] days from start of unit shut down
4.	Performance Guarantee Test (By Contractor)	By [.....] months from the completion of trial operation after completion of R&M activities

The detailed Time Schedule shall be as per Contract Schedule 2.

Contract Schedule-1

Terms of Payment

The Employer shall pay the Contractor in the following manner and at the following times, on the basis of the Price Break down given in the Section on Price Schedules. Payments will be made in the currencies quoted by the Bidder unless otherwise agreed between the parties. Application for payment in respect of part deliveries may be made by the Contractor as work proceeds.

I. Terms of Payment for Supply of Plant and Equipment (excluding Mandatory Spares and Recommended Spares):

1	10% of the total Ex-Works price	Initial Advance on Acceptance of Letter of Award by the Contractor, Signing of Contract Agreement and submission of Contract Performance Bank Guarantee, and Advance Payment Bank Guarantee by Contractor
2	50% of Ex-Works price for each identified equipment as progressive payment	Upon dispatch of the identified equipment after dispatch clearance by employer on raising of Invoice by the Contractor and submission of evidence of shipment
3	15% of Ex-Works price for each identified equipment	On receipt of equipment at site and physical verification and certification by the Employer
4	20% of the total Ex-Works price	On Completion of Facilities
5	5% of the total Ex-Works price	Successful completion of Performance Guarantee Test

II. Terms of Payment for Supply of Mandatory Spares and Recommended Spares

1	70% of the Ex-Works Price of each Spare	Upon dispatch of the identified Spare after dispatch clearance by employer on raising of invoice by the Contractor and submission of evidence of shipment
2	30% of the Ex-Works Price of each Spare from within India	On receipt of Spare at site and physical verification and certification by the Employer

III. Terms of Payment for Local Transportation, Inland Transit Insurance

For Plant & Equipment except Spares		
1	100% of Local Transportation, Inland Transit Insurance pro-rata to value of the equipment	On receipt of Equipment at site and upon raising of Invoice by the Contractor
For Spares

IV. Terms of Payment for Erection of Plant & Equipment

1	10% of Total Price for Erection of Plant & Equipment	Initial Advance on Acceptance of Letter of Award by the Contractor, Signing of Contract Agreement and submission of Contract Performance Bank Guarantee, and Advance Payment Bank Guarantee by Contractor
2	75% of Price for Erection of Plant & Equipment as progressive payment pro-rata to value of plant & equipment erected	On certification by Employer of successful erection of plant & equipment and successfully passing of quality checks
3	10% of Total Price for Erection of Plant & Equipment	On Completion of Facilities
4	5% of Total Price for Erection of Plant & Equipment	Successful completion of Performance Guarantee Test

V. Terms of Payment for Civil Works

1	10% of Total Price for Civil Works	Initial Advance on Acceptance of Letter of Award by the Contractor, Signing of Contract Agreement and submission of Contract Performance Bank Guarantee, and Advance Payment Bank Guarantee by Contractor
2	75% of Price for Civil Works as progressive payment	On certification by Employer regarding value of work completed & successfully passing of quality checks
3	10% of Total Price for Civil Works	On Completion of Facilities
4	5% of Total Price for Civil Works	Successful completion of Performance Guarantee Test

VI. Terms of Payment for Price Adjustment Amount

Any increase in the Price of any component Contract shall be paid as per the Terms of Payment for base price. The initial 10% advance payment pertaining to increase in price shall be paid along with progressive payment of that equipment. Reduction to the Contract Price, if any, due to price adjustment provisions, shall be effected by recovering 100% of the reduction amount (including advance) from any of the Contractor's bills falling immediately due for payment.

VII. Terms of Payment for Taxes & Duties

Any Tax or Duty payable by Employer as per the Terms & Conditions of Contract and is directly payable to Statutory Authorities/Government as per law shall be directly paid to the concerned authority or Government by the Employer. Any other

Contract Schedule-2

PRICE ADJUSTMENT

- (i) The Contract Price shall be subject to price adjustment during performance of the Contract to reflect changes in the cost of labour and material in accordance with the provisions described below.
- (ii) Only following components of the Contract Price will be subject to Price adjustment :
 - (a) Ex-Works (India) price of plant and equipment excluding Mandatory Spares. The price adjustment amounts towards these price components shall be without any ceiling.
 - (b) Erection Services component of the Contract Price. The price adjustment amounts towards this price component shall be without any ceiling.
 - (c) Civil Works component of the Contract Price. The price adjustment amounts towards this price component shall be without any ceiling.
- (iii) Price adjustment amounts towards aforesaid components of Contract Price shall be paid in the respective currencies of Contract.
- (iv) The indices for price adjustment shall necessarily be of India and shall be well established and nationally recognized in India. Preferably Government indices shall be used.
- (v) The price adjustment formula for the components of the Contract Price above shall be as stipulated hereinafter.
- (vi) **Ex-Works price component of Plant and Equipment excluding mandatory spares**

The price component of the equipment for any shipment/ dispatch comprises of a fixed portion (designated as 'F' and the value of which is specified hereunder) and a variable portion linked with the indices for various materials and labour.

The amount of price adjustment towards variable portion payable/recoverable on each shipment/dispatch shall be computed as under :

$$ES = ES_1 - ES_0$$

ES₁ will be computed as follows:

$$ES_1 = ES_0 \left\{ F + a \times \frac{A_1}{A_0} + b \times \frac{B_1}{B_0} + c \times \frac{C_1}{C_0} + Lb \times \frac{L_1}{L_0} \right\}$$

Where

ES = Adjustment to Ex-Works component expressed in the currency of the Contract payable to the contractor for each shipment/dispatch

ES₁ = Adjusted amount of Ex-works price component expressed in the currency of the Contract payable to the Contractor for each shipment/dispatch

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-I, Annexure & Schedules	[8]	25.09.2014

- ES_0 = Ex-works for the plant and equipment in the currency of the Contract, shipment/dispatch wise.
- The fixed portion of the ex-works component of the Contract Price (F) shall be 0.15.
 - a, b, c etc. shall be co-efficient of major materials/items involved in the ex-works component of the Contract Price. The sum of these co-efficient shall be between 0.50 to 0.60.
 - A, B, C etc. shall be published price indices of corresponding major materials/items. Such indices shall necessarily be of India.
 - 'Lb' shall be co-efficient for labour component in the ex-works of the Contract Price which shall be between 0.25 to 0.35.
 - 'L' shall be labour index.
 - Sum of all the material co-efficient and the labour co-efficient shall be 0.85.

For the indices(A, B, C etc.), subscript 'o' refers to indices as on 30 days prior to original scheduled date for opening of Part-I Bid.

Subscript '1' refers to indices/exchange rates as of:

(a) three months prior to the date of shipment/dispatch for labour, and

(b) six months prior to the date of shipment/dispatch for material.

In case of shipments/dispatches which are delayed beyond the schedule date of shipment/dispatch for reasons attributable to the Contractor, the price adjustment provision shall not be applicable for the period of time between the schedule date of shipment/dispatch and the actual date of shipment/dispatch.

(vii) Erection Services Component

The price component for erection services comprises of a fixed portion and a variable portion linked with the index of labour.

$$ER = ER_1 - ER_0$$

ER_1 will be computed as follows:

$$ER_1 = ER_0 \left(0.15 + 0.85 \frac{FL_1}{FL_0} \right)$$

Where:

ER	=	Adjustment to erection services component of contract price payable to the contractor for each billing.
-----------	---	---

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-I, Annexure & Schedules	[9]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

ER ₁	=	Adjusted amount of erection services component of Contract Price payable to the Contractor.
ER ₀	=	Value of the Erection work done in the billing period (month)
FL	=	Indian field labour index namely, All India Consumer Price Index for Industrial Workers (All India Monthly Average) as published by Labour Bureau, Simla, Government of India.

For the indices, subscript 'o' refers to indices as on 30 days prior to date set for opening of Part-I bids. .

For the indices, subscript '1' refers to the indices as applicable for the month of execution of the erection work. For the exchange rates, subscript '1' refers to the exchange rates as applicable on the last day of the month of execution of the erection work.

In case of erection activities which are delayed beyond the schedule date for reasons attributable to the contractor, the price adjustment provision shall not be applicable for the period of time between the schedule date of completion and actual date of completion of the respective erection activity.

(viii) The following components of the contract price shall not be subject to price adjustment and shall remain firm during the execution of the contract :

- (1) Ocean Freight and Marine Insurance for Plant and Equipment, mandatory spares and recommended spares.
- (2) Price for Mandatory spares & Recommended Spares.
- (3) Inland Transportation charges (including Inland Transit Insurance, port clearance, port handling & port charges) for plant & equipment and Spare Parts.

(ix) Civil Works Component

The Price of Civil Works for any month comprises a fixed part designated as 'F' and variable parts linked to indices for labour, steel, cement, other commodities and Fuel & Power. The monthly price adjustment amount for the civil works component of the Contract Price will be computed as per the formula given below:

$$EC = EC_1 - EC_0$$

EC₁ will be computed as follows:

$$EC_1 = EC_0 \left\{ F + a \times \frac{MI_1}{MI_0} + b \times \frac{LI_1}{LI_0} + c \times \frac{FI_1}{FI_0} + d \times \frac{SI_1}{SI_0} + e \times \frac{CI_1}{CI_0} \right\}$$

Where

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-I, Annexure & Schedules	[10]	25.09.2014

- EC = Adjustment to Civil Works price component expressed in the currency of the Contract payable to the contractor for each month
- EC₁ = Adjusted amount of Civil Works price component expressed in the currency of the Contract payable to the Contractor for each month
- EC₀ = Value of Civil Works done expressed in the currency of the Contract for the billing period (month).
- The fixed portion (F) of the Civil Works component of the Contract Price shall be 0.15.
 - 'a' is the coefficient for material cost other than cement and steel involved in the Civil Works component of the Contract Price and it shall be 0.15.
'b' is the coefficient for labour cost involved in the Civil Works component of the Contract Price and it shall be 0.3.
'c' is the coefficient for Fuel & Power cost involved in the Civil Works component of the Contract Price and it shall be 0.05.
'd' is the coefficient for steel cost involved in the Civil Works component of the Contract Price and it shall be 0.25.
'e' is the coefficient for cement cost involved in the Civil Works component of the Contract Price and it shall be 0.10.
 - MI shall be All India Whole Sale Price Index for all commodities as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry.
LI shall be All India Consumer Price Index for industrial labour as published by Labour Bureau, Government of India
FI shall Index Number of Wholesale Price for group Fuel & Power as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry
SI shall Index Number of Wholesale Price for Steel as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry
CI shall Index Number of Wholesale Price for Cement as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry

For the indices(MI, LI,FI, SI and CI), subscript 'o' refers to indices as on 30 days prior to original scheduled date for opening of Part-I Bid. Subscript '1' refers to indices as of one prior to the month for which Civil Works is being billed.

such demand made by the OWNER on the Bank shall be conclusive and binding, absolute and unequivocal notwithstanding any difference between the OWNER and CONTRACTOR or any dispute or disputes raised/ pending before any Court, Tribunal, Arbitrator or any other authority. The Bank agrees that the guarantee herein contained shall continue to be enforceable till this sum due to the OWNER is fully paid and claims satisfied or till the OWNER discharges this Guarantee.

- 3 The Bank further irrevocably guarantees and undertakes to pay any amount due and payable by the CONTRACTOR by reasons of non-fulfilment of any of the following obligations of the Contractor:
 - (a) Successful and satisfactory operation of the plant & equipment supplied and erected under the said Contract as per the Technical Specifications and other Tender/Contract documents.
 - (b) That the equipment installed under the said Contract shall be new and in accordance with Contract Documents and be free from all defects in design, engineering, material workmanship and performance for a period of 12 calendar months after final takeover of the equipment by the OWNER and that upon written notice from the OWNER, the CONTRACTOR shall remedy free of any expense to the OWNER, such defects as noticed and developed under the normal use of the said plant & equipment, within the said guarantee period.
- 4 The OWNER shall have the fullest liberty without affecting in any way the liability of the Bank under this guarantee, from time to time, to extend the time of Performance by the CONTRACTOR. The Bank shall not be released from its liabilities under these presents by any exercise of the OWNER of the liberty with reference to the matter aforesaid.
- 5 The OWNER shall have the fullest liberty, without affecting this guarantee to postpone from time to time the exercise of any powers vested in them or of any right which they might have against the CONTRACTOR and to exercise the same at any time in any manner, and either to enforce or to forbear to enforce any covenants, contained or implied in the CONTRACT between OWNER and the CONTRACTOR or any other course or remedy or security available to the OWNER and the Bank shall not be released of its obligations/liabilities under these presents by any exercise by the OWNER of his liberty with reference to the matters aforesaid or any of them or by reasons of any other act or forbearance or other acts of omission or commission on the part of the OWNER or any other indulgence shown by the OWNER or by any other matter or thing whatsoever which under law would, but for this provision, have the effect of relieving the Bank Guarantee. The Bank further undertakes not to revoke this guarantee during its currency without the previous consent of the OWNER.
- 6 The Bank further agrees that the decision of the OWNER as to the failure on the part of the CONTRACTOR to fulfill their obligations as aforesaid and/or as to the amount payable by the Bank to the OWNER hereunder shall be final, conclusive and binding on the Bank.
- 7 The OWNER shall have the fullest liberty to lodge their claim for encashment of the guaranteed sum either in full or part, in the manner suitable to them. However, payment made for a sum lesser than the guaranteed amount shall not relieve or discharge the bank from their obligations guaranteed under the bank guarantee, till the contractual obligations are fully performed by the Contractor or the Bank Guarantee is discharged by the OWNER, as the case may be and the Bank Guarantee shall continue to be in force till such time.
- 8 The Bank also agrees that the OWNER shall be entitled at his option to enforce this guarantee against the Bank as a Principal Debtor, in the first instance notwithstanding any other security or guarantee that it may have in relation to the CONTRACTOR's liabilities.

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[x]	25.09.2014

1 INTENT OF SPECIFICATION

- 1.1 The intent of this specification is to Renovate and Modernize various equipment & systems of Ash Handling Plant (AHP) including but not limited to [Bottom Ash Handling System, Wet Fly Ash Handling System, Dry Fly Ash Handling System (Vacuum conveying or Pressurized transport system) including all associated Electrical system, Control & Instrumentation systems and Civil & Structural work]. The renovated Ash Handling Plant shall be designed considering the following parameters to evacuate ash from different zones of Boiler and ESP of each of the [210/215/220/250] MW unit:

Description	Units	Design Parameters
Coal Consumption/Unit	TPH	[...]
No. of Units to be catered by the designated AHP	[...]
Ash Content in Coal	%	[...]
Bottom Ash and Economizer ash	%	[...]
Fly Ash and Air Pre-Heater ash	%	[...]
Duration of Bottom Ash and Economizer ash evacuation in a shift of 8 hours	Hours	[...]
Duration of Fly Ash and Air Pre-Heater ash evacuation in a shift of 8 hours	Hours	[...]

- 1.2 The Bidder shall carry out the required replacement / refurbishment / retrofitting of the various equipment/systems of Ash Handling Plant package as per the requirements of his design so as to make the same capable of operating for an extended life of [20/25] years and giving the output specified in the subsequent clauses in this specification in order to be compatible with the requirement of Main Plant package. The scope of replacement / refurbishment / retrofitting shall include but shall not be limited to the scope of work mentioned in clause 4.6 which is based on the recommendation of RLA/CA and EA studies conducted during [.....]. However, any other items/systems which have not been specifically mentioned but are considered necessary by the Bidder for giving the intended performance of various equipment/systems of ASH package, shall also be included in the scope of Bidder and shall be separately highlighted by the Bidder in his proposal.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[1]	25.09.2014

- 1.3 Bidders are required to quote the performance guarantee value for Auxiliary power consumption as per Table 1.2 below:

Table: 1.2

S.No.	Parameter	Performance Guarantee Values
1	Maximum Auxiliary Power Consumption (kW)	[....]

For Auxiliary power consumption, the best quoted value shall be considered as base parameter and other bids shall be cost loaded as per difference between base parameter and respective quoted guaranteed parameter multiplied by evaluation factors specified in the Commercial Volume (Volume-I).

- 1.4 The modified/replaced/retrofitted equipment will conform to the requirement of the specification prescribed in Section-II of Volume-II. The relevant technical details like OEM's Specifications and Drawings for the existing equipment required to be modified / replaced / retrofitted have also been provided in Volume-II, Section-II for the reference of the Bidders.
- 1.5 Bidders are required to carry out necessary modifications / replacement in the existing mechanical / electrical equipment or systems including related civil/structural works as per specification requirement and also based on their own assessment.
- 1.6 The scope of work for R&M shall include designing / re-designing, basic and detailed engineering, re-engineering, refurbishing / retrofitting, supply, inspection and testing at supplier's works, packing, forwarding to site, forwarding from site to Bidder's facilities, unloading and storage at site, pre-assembly, machining if required, site fabrication, erection, replacing of various equipment and systems, application of paints and thermal insulation, carrying out all pre-commissioning checks/ tests and any other work required to complete the system, commissioning and trial operation, performance tests of various equipment and systems covered under this Specification. Bidder's scope shall also include dismantling of the existing equipment/ facilities, including unloading & transportation to designated storage / disposal yard, wherever required as a result of augmentation of existing mechanical, electrical, I&C and civil/structural/ architectural works. The Bidder shall restore the equipment/ facilities, whenever applicable, after carrying out necessary renovations/modifications under the scope of R&M works.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[2]	25.09.2014

All the tools & tackles, labour and other facilities required for dismantling and restoration shall also be in the scope of the Bidder.

Bidder shall also put back into service all the systems/equipment of the units after completion of R&M works, whether any modification is carried out on the same or not. All necessary tools, tackles, labour, instruments, spares, consumables etc. required for putting back into operation shall also be provided by the Bidder.

- 1.7 It is not the intent to specify completely herein all aspects of services and equipment to be provided by the Bidder who in any case shall be responsible for fulfillment of the intent of Specification. Irrespective of whether specifically mentioned or not, the services, equipment and systems to be provided in accordance with this Specification shall also form a part of the scope of work and shall conform in all respects to the highest standard of engineering, design, quality and workmanship so that after completion of R&M work by the Bidder, the plant shall be capable of performing completely in a safe, reliable and sustained manner as acceptable to the Owner.
- 1.8 Unless otherwise specifically clarified by the Owner, interpretation by the Owner in respect of scope of supplies & services and the meaning of the Specifications, drawings, requirements of operation, maintenance, redundancy etc., shall be final and binding on the Bidder. Owner shall have the right to reject or accept any work or material which in his assessment is not technically complete and proven to meet the requirements of this Specifications and/or applicable National and International Codes & Standards mentioned elsewhere in this Specification.
- 1.9 The requirements, conditions, appendices etc, given in various parts/ sections of technical Specifications shall form integral part of this Specification. Bidder is required to carefully examine and understand the Specifications and seek clarifications, if required, to ensure that he has understood the Specifications as intended by the Owner. In the absence of any specific clarifications made to the Owner during Bidding stage, the interpretation of Owner shall be final. The Bidder's offer should not carry any sections like clarifications, interpretations and/or assumptions. All such points are required to be clarified & resolved during Bidding stage.
- 1.10 Any deviation or variation from the scope of supply and services or the intent of the Specification shall be clearly brought out under the schedule of Technical / Commercial deviations, irrespective of the fact that such

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[3]	25.09.2014

deviation / variation may be standard practice or possible interpretation of the Specifications by the Bidder. In case, no clear and specific deviation is taken by the Bidder in the relevant schedule of Bid Proposal Sheet while making his Bid proposal, it will be construed that the Bidder shall comply with the stipulations of the Specification fully with regard to scope of services and supplies to be provided by him to achieve the objective of R&M. Further, unless otherwise specifically clarified by the Owner, the interpretation by the Owner in respect of scope of supplies and services to be performed by the Bidder shall be final and binding.

- 1.11 If the Bidder feels that, in his opinion certain features brought out in his offer are superior to what has been specified, these may be highlighted separately in the Bid. The Bidder at his own discretion may also make Alternate offers, which in his opinion are of superior technology, material etc. to the specified requirements leading to better performance like efficiency / output etc. of the units after renovation. In such case, the Bidder shall carry out a comprehensive study and clearly identify the scope of offer in his alternate proposal. The Bidder shall furnish that detailed study to Owner along with the Bid where the Bidder shall bring out in detail the scope of modifications required to be carried out by him in the various systems and equipment including but not limited to *[Bottom Ash Handling System, Wet Fly Ash Handling System, Dry Fly Ash Handling System (Vacuum conveying or Pressurized transport system) including all associated Electrical system, Control & Instrumentation systems and Civil & Structural work]*.

Such Alternate proposals shall be supplemented with sufficient amount of information like specified design standards and performance requirements, Bidder's experience, operating feedback, provenness, etc. for justifying such proposals. Implications of such Alternate offers on the performance, output, efficiency, auxiliary power consumption, etc. shall be clearly brought out in the Bid to enable the Owner to determine the advantages, superiority and acceptability of the proposals.

However the Bidder's Base offer shall necessarily be in line with the Specification requirements.

The Base offers will be evaluated as per procedure outlined in the Bid documents and the Alternate Offers of the lowest evaluated Bidder will only be considered for acceptance or otherwise. Owner may reject alternative proposals submitted by the Bidder at his sole discretion, without assigning any reason what so ever.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[4]	25.09.2014

- 1.12 In the event of conflict between requirements of any two clauses of the Specification documents or requirements of different Codes/ Standards specified, the more stringent requirement as per the interpretation of the Owner shall apply, unless confirmed otherwise by the Owner in writing.
- 1.13 The General technical conditions pursuant to the Contract, placed separately in this Specification, shall form an integral part of the Specification. These conditions shall supplement all the detailed technical Specification and requirement identified in this Specification.
- 1.14 Out of complete unit comprising of mechanical, electrical, C&I systems and equipment, some components/systems are envisaged to be replaced with new ones having better design features while some of the other components are to be refurbished / upgraded by the Bidder under present R&M Work. It shall be the responsibility of the Bidder to ensure that components/ equipment/ systems being supplied new OR components/ equipment/ systems being refurbished / upgraded by him are fully compatible and integrated with the existing equipment / systems so as to give safe, reliable and sustained operation of the complete unit. Modifications needed on the assembled equipment to ensure complete integration are to be brought out by the Bidder in the Bid and such modifications, if any, after Owner's approval shall be carried out by the Bidder to the satisfaction of the Owner.
- 1.15 The systems shall operate without any restriction over the entire range of operating conditions as envisaged in the subsequent section of the Specification. The Bidder shall ensure that after R&M there are no restrictions/ alterations in modes of operations of the system, as per the original/existing operation philosophy.
- 1.16 As the various equipment/ systems/ components are to be fitted in the existing plant, Bidder is advised to visit the plant site to get fully conversant with the job, site conditions, and constraints, and collect all the information as required and as available before quoting against this Specification.
- 1.17 A brief extract of the existing plant, the original design details/ performance parameters along with plant details, operating history and known problem areas; wherever possible are brought out in the successive section of this Specification. Relevant plant layout drawings and certain key schematic drawings, as available, have also been provided in Annexure-I of this section

2.4 Fuel

At present the power station is sourcing coal from [...] coal mines. The coal is being transported to the project site by [Indian Railways/ MGR system/ cross country conveyor]. Proximity of Railway line to site from [...] Railway Station is about [...] km. The railway link shall also be used for transportation of heavy equipment to site during construction phase and to bring main and secondary fuel to the power plant during operation of plant.

2.4.1 Coal Analysis

Proximate and ultimate analysis of coal (on as received basis)

3 EXISTING PLANT DETAILS

The Power Plant, is of the configuration of [...x...MW]. The Unit no. [...] of the power plant, which is proposed to be taken up for Renovation and Modernization was first commissioned in the year [...]. For the above unit, M/s [...] and M/s [...] are the Original Equipment Manufacturers (OEMs) for the Boiler and Turbo-Generator, respectively. The boiler for the unit is of [PF/CFBC] design. The boiler is provided with [front & rear/ corner/down shot] firing system. LP stage of Turbine is designed with [Bauman] exhaust. Condenser cooling system of the unit is designed on [once through / re-circulation system]. The Ash Handling Plant was supplied by M/s [...] and designed for rated capacity of [...] TPH. Power generated from the unit is being supplied to [...State/Central grid]. Power is being evacuated through [...numbers of 220/400kV Double/Single Circuit lines] to [... substation.] The primary fuel is [domestic/imported/blended] [coal/lignite] fuel being sourced from [...] coal mines. The consumptive water for the power plant is being sourced from [...river /...sea].

3.1 Operational Background

Unit No [...] of [...] Thermal Power Station having a Generating Capacity of [210 MW] was commissioned in the year [...]. The boiler is of [...] design and the turbine is of [LMZ] design. Though the boiler was originally designed for coal with Gross Calorific Value (GCV) of [...kCal/kg], it presently operates on coal supplied with GCV of about [...kCal/kg]. The deterioration experienced over the years in Plant's Average Performance Parameters is shown in Table 3.1.

3.1.1 Average Performance Parameters of AHP over the Life

ix.	Lean slurry Pumps	kW	
x.	Instrument air compressor with air drying plant (ADP)	kW	
xi.	Ash water recirculation pumps	kW	
xii.	Bottom Ash crushers	kW	

3.1.4 Feedback from the Plant Operators

Detailed discussions were held with the Plant operators who provided the feedback about the design and operation related problems of various systems. These are listed in the Table 3.4 below.

Table 3.4
Feedback from the Plant Operators

S. No.	Name of the System/Equipment	Type of Problem	Probable Solution as per the Operators

3.1.6 Maximum Achievable Load due to performance constraint

[Due to performance constraint of various equipment of Ash handling Plant, the maximum generation from the unit is restricted to [...] MW. The operational data at the above maximum load is indicated in the table below.]

Table: 3.6

Nature of constraint	Output (MW)	Aux. Power Consumption (%)	Unit's Gross Efficiency (%)

3.2 Salient Technical Feature of Existing Ash Handling System

{Describe in this sub-section, the Design Parameters and Salient Features of all the important Equipment and Systems of existing Ash Handling Plant as mentioned below}.

3.2.1 Mechanical System

The Ash handling system shall be design for [...] units of [...] MW.

The Ash is generated after burning of coal in boiler. Ash is generated in two forms, one is the bottom ash/ coarse ash and another is fly ash. The ash is being disposed in to the ash pond which is outside the plant boundary.

[The details of the system are mentioned in the table below:]

3.2.2 Electrical System

[Two numbers of 100% rated 6.6 kV feeders are provided by Owner/Utility/Purchaser at 6.6kV Station switchgear for feeding power to the complete Ash handling plant. Required number of adequately rated service Transformers of 6.6/0.433kV near load centres and associated 415V switchgear for feeding the auxiliaries of the complete Ash handling plant and all other associated equipments and system of like Cable Carrier System, Lighting System and Earthing & Lightning system are covered in AHP package.]

{Note: DC battery and Charger is provided by others. However supply and termination of cables from Station DCDB (supplied by others) to DCDB of AHP is in scope of AHP Contractor}

A brief extract of the existing Electrical Equipments and Systems of Ash Handling System package describing the original design details are given below. Relevant plant layout drawings and certain key schematic drawings have also been furnished in Annexure-I of this section of the specification for the purpose of familiarization and modification if required.

A. Service Transformer

[The Service transformer of Oil/Dry type is designed to cater 100% of Ash Handling System LT load with 2 x100% configuration. The design parameters of the Service Transformer are furnished below:]

J. Illumination System

[The illumination system is categorized mainly as Normal & DC lighting. Lighting System of AHP covers AHP Switchgear room, Peripheral Lighting and roads etc which are in the boundary of AHP package. DC lighting is provided at strategic location which gets supply from DCDB. Lighting Distribution Board (LDB) is normally getting supply from 415V PMCC. Each LDB is provided with lighting transformer for isolation of lighting circuit from power circuit and also for limiting short time current rating. Outgoing circuits of LDB feeds Lighting panels which is placed local to fixtures. Separate LDB provided for indoor as well as for outdoor area. The Design parameters of Illumination System and its major components comprising of LDB with transformer, Lighting Panel, Lighting Fixtures, Lighting wires and Lighting Poles are furnished below]:

{Note: Lighting system for Boiler, TG, CHP, Mechanical BOP and eBOP are covered in respective package itself.}

K. Earthing and Lightning System

[The Earthing & Lightning System for Ash Handling package is described as below: Complete Equipment earthing with riser from main grid, peripheral building earthing and connecting to main grid with treated electrode with test link within the battery limit of AHP is covered in AHP package. All above ground earthing for AHP is covered in this package. System Neutrals are earthed through Treated Earth Pit. All areas of power plant are

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[48]	25.09.2014

interconnected to form an integrated single earthing system. Lightning system for AHP battery limit of outdoor and building are covered in AHP package and same is in line with earthing system. The Design parameters of Earthing and Lightning System are furnished below]:

{Peripheral underground earthing as well as main earth grid below ground will be provided by others}.

3.2.3 Control & Instrumentation

[The existing control and instrumentation system generally is an old control system and requires large scale replacement owing to obsolescence of the existing equipment. Existing Ash handling plant control system is envisaged with the relay based hardwired logic which requires replacement with new Control System for ash handling plant which shall be Programmable Logic Controller (PLC) based or shall be implemented through micro-processor based distributed control system (DCS) covering total functional requirements of sequence control, interlock & protection, monitoring, alarm and data logging. Remote I/O cabinets shall be provided wherever required depending upon distance/location Integrated microprocessor based open loop control, sequential control and data acquisition system for Ash Handling System in hierarchical levels with integrated unit monitoring systems in the upper level are therefore to be envisaged for the plant.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[50]	25.09.2014

3.2.4 Civil Works

Bidder shall go through the details of the existing Buildings / Structures / Foundations / Facilities mentioned hereunder (but not limited to) for thorough understanding of conditions of the same. In order to assess the quantum of Civil / Structural / Architectural R&M work within the package, Bidder shall also carry out a brief or detailed survey (as required) of the site to acknowledge and obtain any other information/data about present conditions at site and identification of modification requirements in any other structure or foundation not included here. Conditional details of important buildings / structures / foundations / facilities which require major modifications have been described below:

{Details of the existing buildings / structures and their foundations in the Vacuum Pump House including Switchgear Room, Ash water pump house including ash water tank, switchgear and control room, Ash slurry pump house including make-up water sump, ash slurry sump, switch gear and control room, Bottom Ash Disposal System Structures including Storage hopper, Fly Ash Disposal System Structures including intermediate surge hoppers, Fly ash equipment building, Fly ash silos, Silo utility building, Pipe racks & Cable racks, Ash Pond, AHP Clarifier, Clear Water Tank and Recirculation Pump House and Chemical House for Ash WTP etc. shall be indicated in this section. Also the available GA/Construction Drawing including Load Data shall also be provided.}

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[51]	25.09.2014

4 SCOPE OF SUPPLY & SERVICES

4.1 The scope of supply and services to be provided by the Bidder shall include all such activities as required to meet the target and intent of this specification. The scope for each unit shall generally cover, but will not be limited to the following:

- (i) Replacement of some of the existing components with new components of improved and better design.
- (ii) Incorporation of new systems / components wherever required in line with the Specification.
- (iii) Refurbishing / Retrofitting of some of the components in the existing equipment/system.
- (iv) All types of civil/structural works like modification and strengthening of foundation of existing and upgraded equipment, making new structures or foundations (if applicable), dismantling, restoration, supply and erection of any temporary supports or any other construction work required for implementation of renovation work.

All structural modifications/strengthening of existing structure of building, equipment foundation, etc. including supply, fabrication and erection of any new structure and provision of any additional platform if required for access to new equipment or existing equipment as specified.

Supply of all materials, equipments, machinery and manpower required for civil/structural R&M works.

Site enabling works as per the requirements to support civil/structural R&M works.

- (v) Design, engineering, submission of design calculations for review and approval, manufacturing, inspection and testing at suppliers' works, packing, forwarding to site, unloading, erection, supervision, pre-commissioning, testing and commissioning and performance testing of the equipment / systems and works indicated in clause No. 4.6 of this technical Specification.
- (vi) Mandatory spares, start-up and commissioning spares. The general requirements in respect of various types of spares are given in Clause 9 of this section of Technical Specification.
- (vii) Packing, transportation and transit insurance of all materials required for renovation / replacement work as per this Specification from the supplier's/sub supplier's works to [Name of the Plant], unloading, preservation and storage at site. Packing, transportation, transit insurance, clearance from all concerned agencies etc. of all components/materials

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[52]	25.09.2014

required to be forwarded from [Name of the Plant] to Bidder's facilities and back to [Name of the Plant].

- (viii) Dismantling of the systems, reassembly and re-erection / reinstallation along with associated inspection, testing, commissioning and trial run of equipment individually as well integrated with the overall plant trial operation.
- (ix) Dismantling of the systems, handling and storage of dismantled equipment, reassembly and re-erection / reinstallation along with associated inspection, testing, commissioning and trial run of equipment individually as well integrated with the overall plant trial operation.
- (x) Materials which are removed from the existing machines but are not re-used during the re-assembly of the machines as well as those components which are found to be beyond refurbishment shall be the property of Owner and shall be deposited at Owner's designated stores. Bidder shall prepare a record of all such dismantled material and hand it over to the Owner.
- (xi) Loading, transportation, unloading and disposal of scrap to the designated storage/disposal yard.
- (xii) It shall be the responsibility of the Bidder to obtain on behalf of the Owner the necessary approvals of Inspection Authority as may be required for design and design calculations, manufacturing, erection procedure renovation. Bidder shall also be responsible for obtaining approval from the other statutory authorities in India, as may be required, for other plants and systems supplied by him. All such documentation submitted to statutory authorities shall also be submitted to the Owner for his review.

Handling of materials at site including handling / transportation as required to take equipment components to the workshop for carrying out the modification work and to bring it back for installation. All arrangements for such activities are to be done by the Bidder.
- (xiii) Erection of all material supplied new for renovation (including erection of components, replacing old components). Re-erection of any component / equipment removed for modification so as to make complete unit consisting of ash Handling systems including electrical & control and instrumentation equipment /system ready for commissioning.
- (xiv) All gas cutting / dismantling, edge preparation, welding, bolting etc. and conductance of all NDTs like radiography, ultrasonic testing, MPI, die penetration testing etc. Any new matching pieces, piping, hangers & supports etc. required for assembly of equipment/ systems, as per system requirements shall also be included in the scope of the Bidder.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[53]	25.09.2014

- (xv) All Pre-commissioning activities as may be required such as hydraulic testing, air & gas tightness test, steam blowing for steam piping under fuel oil system, floating of safety valves, oil flushing etc. including erection and dismantling of all temporary systems like piping / tanks etc. and Conductance of all demonstration tests including performance test.
- (xvi) Assisting and coordinating with Owner in tuning various control loops finalizing protection and control requirements of all Systems under Ash Handling package.
- (xvii) Insurance for all items / activities in line with the provisions of General Condition of Contract of Volume-I.
- (xviii) Making arrangement for proper electrical grounding of all systems, supplied by him as required by the system design. All required accessories including grounding cables are also included in Bidder's scope.
- (xix) Installation, Interconnection laying and termination of all Bidder supplied cables, testing and commissioning of all equipment/systems furnished by the Bidder.
- (xx) Civil / Mechanical work (such as grouting, cutting, welding etc.) related to mounting of New Cabinets, CRT / Keyboards, laying & termination of associated Cables.
- (xxi) Supply of all necessary tools, tackles, commissioning spares, test instruments and deputing of experienced personnel for completion of the above erection, testing and commissioning work.
- (xxii) Dismantling of existing C&I cabinets along with associated cabling, for various systems under Ash handling package for retrofitting the new C&I systems, based on requirement as described in clause No. 4.6.
- (xxiii) Providing all site execution and supervision by qualified and experienced engineering personnel during execution of all works under the scope of Bidder. Also providing all facilities and qualified personnel for implementing the approved quality assurance program me.
- (xxiv) Dismantling of the existing Instrumentation Cables and relaying of new cables as may be required.
- (xxv) The Bidder shall conduct all shop and site tests as per the requirements of this Specification and Owner approved "Quality Assurance Program" to be finalized before the award of this Contract. Facilitating inspection, witness of shop and site tests by the representatives of Owner shall be in the scope of the Bidder.
- (xxvi) Performance Guarantee tests after successful completion of initial operation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[54]	25.09.2014

(xxvii) Construction Water

[Construction water shall be made available to Bidder at a single point in a suitable location. The Bidder shall arrange at his own cost the required pumps, distribution pipe line network for further distribution as required to carry out construction work.]

(xxviii) Construction Power

[Construction power shall be made available to bidder at single point at [...] kV level. Further distribution as required to carry out the construction work shall be carried out by Bidder at his own cost.]

(xxix) Providing all other services necessary for meeting the intent and requirement of this Specification. This shall include but not limited to system engineering, furnishing drawings, data, and information for Owner's review, participation in meeting & reviews, System warranty, revision of O&M Manuals etc.

4.2 Tools & Tackles

One (1) set of special tools and tackles required for the maintenance of equipment/systems have to be supplied by the Bidder. These tools and tackles shall be separately packed and brought to site. These shall not be used for erection/commissioning purposes and shall be in an unused and new condition, when they are handed over to the Owner. A list of all such special tools and tackles shall be submitted along with the offer.

For C&I system, Bidder shall supply one set for each unit of special non standard tools, module testing kit, cables, and any other equipment required for erection commissioning, testing, trouble shooting, calibration, maintenance and inspection of all systems / equipment provided. Any tools required to make changes (DIP shunt cutter, soldering irons, tips, wire wrap guns and bit unwrapping tools, strippers, terminal guard, connector repair tool, dies etc.) shall also be supplied.

Bidder's scope shall also include supply of all Cranes, welding sets and NDT testing equipment, scaffolding, special tools and tackles, jigs and fixtures as may be required during modification / erection and commissioning. Those items specifically brought to site solely for erection / modification purpose and if no more needed for regular maintenance of the equipment, can however, be taken back by the Bidder after completion of the work at site, subject to the approval of Owner.

4.3 Safety

The design of the equipment shall incorporate every reasonable precaution and provision for the safety of all personnel and for the safety and security

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[55]	25.09.2014

of all persons and property. The design shall comply with all appropriate statutory regulations relating to safety.

Newly constructed structures and equipment shall be designed and constructed to withstand every foreseeable static and dynamic loading condition, including loading under earthquake conditions, with an adequate margin of safety.

Ready and safe access with clear head room shall be provided to all the newly supplied parts of the plant for operation, inspection, cleaning and maintenance.

- 4.3.1 While carrying out the R&M work as per this Specification, the Bidder may have to modify the existing equipment foundations, or do the excavation work and make new foundations. The Bidder may also have to make new supporting arrangements with / without modified loads for the items/ equipment supplied by him. Under all such conditions Bidder shall be solely responsible for ensuring the safety of the adjacent equipment / foundations and of the existing supporting structures. The R&M work by the Bidder shall be carried out in such a manner that no damage is caused to existing equipment / foundations / structure and all precautions, including strengthening of existing structures, as may be necessary, shall be taken by the Bidder to ensure safety of existing plant / equipment / foundation / structures.

4.4 Training Requirements

Bidder shall include in his offer the training programme for Owner's Operation & Maintenance staff in view of introduction of new systems/ equipment. This training shall be organized before handing over the unit.

- 4.5 In case there is any difference in scope of work and services as described in this section of the Specifications and individual Specification volumes, then more stringent of the Scope of work and services shall prevail.

4.6 Detail Scope of Work:

4.6.1 Ash Handling Plant

{Describe in this chapter, all the equipment/components which need to be replaced/refurbished/retrofitted as finalized in the DPR on the basis of RLA/CA and EA report. Scope with regard to Civil, structural and architectural work as required for the Ash Handling System due to incorporation of new equipment/components shall also be incorporated in this chapter.}

The Bidder shall include in his scope the following works for the R&M of the Unit, which are based on RLA/CA and EA studies. The overall scope of work

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[56]	25.09.2014

shall include but shall not be limited to the scope of work mentioned below. Any other items not specifically mentioned but considered necessary by the Bidder for carrying out the R&M work, shall also be included in his scope so as to meet the intended performance of various equipment & systems.

4.6.2 Miscellaneous

- a. In addition to the above listed works, scope of civil / structural / architectural works and supplies shall be as detailed below.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[78]	25.09.2014

Bidder shall carry out a brief or detailed survey (as required) of the site to acknowledge and obtain any other information/data about present conditions of the buildings, structures, foundations & facilities mentioned in this specification and identification of modification requirements in any other structure or foundation not included here.

Bidder shall be provided with the existing drawings and documents as listed in Annexure-I by the Owner to facilitate the civil / structural / architectural, refurbishment and replacement works.

Subsequently Bidder shall prepare and submit for approval by Owner, a detailed scheme including methods techniques, requirements etc. for carrying out civil/structural/architectural R&M works to executed in the plant.

b. The scope of Civil / Structural / Architectural works to be carried out by the Bidder under this package shall generally cover the following:

- Inspection and checking the design adequacy of the foundations of existing structures like [Vacuum Pump House including Switchgear Room, Ash water pump house, switchgear and control room, Ash slurry pump house, switch gear and control room, Bottom Ash Disposal System Structures, Fly Ash Disposal System Structures, Fly ash equipment building, Fly ash silos, Silo utility building, Pipe racks & Cable racks, Recirculation Pump House and Chemical House for Ash WTP etc.] for all the applicable loads and construction of new foundations / modification of existing, wherever required.
- Inspection and checking for any corrosion / damage of existing structures of [Vacuum Pump House including Switchgear Room, Ash water pump house including ash water tank, switchgear and control room, Ash slurry pump house including make-up water sump, ash slurry sump, switch gear and control room, Bottom Ash Disposal System Structures including Storage hopper, Fly Ash Disposal System Structures including intermediate surge hoppers, Fly ash equipment building, Fly ash silos, Silo utility building, Pipe racks & Cable racks, Ash Pond, AHP Clarifier, Clear Water Tank and Recirculation Pump House and Chemical House for Ash WTP etc.].
- Carrying out all interior / exterior architectural repair and replacement works [such as flooring, painting, plastering, door/windows, roof finishing, water proofing, sheet cladding, roof sheeting, new false ceiling, glass partitions, lighting works replacement or modification of AC duct where ever applicable].
- Any other civil related work required in buildings / structures of the package from aesthetics ambience & ease of operation point of view.

In addition to this any other modification/alteration to existing nearby foundation/structural steel/concrete/underground pipes work if required for

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[79]	25.09.2014

satisfactory execution of intended work covered under this specification shall be carried out by the Bidder. Supply of all material required for the above work is included in Bidder's scope

c. Supplies for Civil/Structural Work

The Bidder shall supply all material needed for completion of all civil, structural and architectural works as per this specification. The Bidder's scope of supply generally includes but is not limited to the following:

- Supply of cement, steel (for reinforcement as well as for any other use), grout, admixture for RCC work, sand and all other construction/ architectural / building materials as may be required for any repair/modification of existing civil works / foundation or for construction of new foundation / civil works.
- Supply of structural steel for all structural erection / modification / strengthening.
- Supply of all foundation bolts, and nuts base plates, embedments with lugs, miscellaneous steel where ever needed
- Supply of steel helical springs and viscous dampers for new equipment (if any).

d. Construction Enabling Works

[The owner shall provide the following facilities to the by Bidder to carry out the construction work.

- *Temporary Stores to store construction material.*
- *Fabrication Yard]*

e. Quality Control Laboratory

- *[To conduct acceptance test on all construction material, weldments, concrete cubes etc laboratory facilities if available in the existing unit shall be used. In case the laboratory facility is not available within the unit, Bidder shall get the testing done at his own cost from a reputed test laboratory approved by the Owner.]*

f. Construction Tools & Materials Supplied By the Bidder. The Bidder shall arrange adequate number and type of machinery and equipment for proper setting out and timely completion of the various works covered under the scope of the work. All arrangements for transporting the equipment to and from the site shall be done by the Bidder at his own expense.

The Bidder shall provide all fuels and lubricants required for the operation and maintenance of construction machinery and equipment as well as his transport vehicles at his own cost. Work Execution and Supervision:

g. Work Execution and Supervision:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[80]	25.09.2014

The Bidder shall have at the site accredited and qualified engineers and foremen / supervisors with adequate number of years of experience in execution of similar works and also operators of machinery and equipment, for satisfactory progress and timely completion of the works.

- h. The Bidder shall be fully responsible for the correctness and accuracy of the tests performed, results obtained / tabulated, interpretation of test results and recommendations made. The work shall be executed in a professional manner with full understanding of the importance of work for a R&M project of this magnitude.
- i. In the event of occurrence of any accidents at / near the site of the work or in connection with execution of the work, a report shall be made immediately to the Owner, giving full details of the accident. He shall also report such accidents to all the competent authorities wherever such reports are required by those authorities.
- j. Owner reserves the right to order in writing, from time to time, during the progress of the work, removal and re-execution of any work which in the opinion of the Owner is not in accordance with the specification / bid document.
- k. During inclement weather, rains etc., the Bidder shall suspend all works for such time as the Owner may direct and shall protect from damage all works already in progress or completed just then. All such temporary protective measures shall be at the Bidder's cost and any damage to works shall be made good by the Bidder at his own expense.
- l. Safety of Adjacent Plant/Equipment and Civil Structure

While carrying out the R&M work as per this specification, the Bidder may have to modify the existing equipment foundations, or do the excavation work and make new foundations. The Bidder may also have to make new supporting arrangements with / without modified loads for the items / equipments supplied by him. Under all such conditions Bidder shall be solely responsible for ensuring the safety of the adjacent equipments / foundations and of the existing supporting structures. The R&M work by the Bidder shall be carried out in such a manner that no damage is caused to existing equipments / foundations / structures and all precautions, including strengthening of existing structures, as may be necessary, shall be taken by the Bidder to ensure safety of existing plant / equipment / foundation / structures.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[81]	25.09.2014

4.6.3 Spares

All spares as specified in Annexure-II of this Specification in accordance with Clause No. 9.

4.6.4 Consumable, Oil & Lubricants

All the first fill and consumables such as greases, oil, lubricants, servo fluids/control fluids, gases and essential chemicals etc. as required up to the complete commissioning of the Ash handling systems, are covered in the scope of Bidder. Suitable standard lubricants as available in India are preferable. Efforts should be made to limit the variety of lubricants to minimum.

4.6.5 Embedded Parts & Fixture

All fixtures, embedded parts, steel embedment including fixing lugs and welding between them, foundation plates, grouting, nuts, bolts etc. for fixing all the equipment, piping on civil works shall be included in scope work of this package. All structures which would be required by the Bidder for supporting the piping shall also be included in scope of work of this package.

4.6.6 Other Services

The scope of Erection, Commissioning and Testing shall include the following:

- a) Complete pre-commissioning work including tests of facilities such as line flushing, hydraulic testing, chemical cleaning of pressure parts etc and all other tests as mutually agreed in the Bidder's quality assurance program me as well as those identified in the Specification.
- b) Supply of all consumables (except coal and fuel oil for firing) like chemicals for chemical cleaning, passivation, inhibition etc., oil for line flushing, any other consumable as required for above pre-commissioning/ commissioning activities.
- c) Necessary arrangement as required for the start up of various equipment & systems of Ash handling package.
- d) Supply of all temporary equipment such as tanks, piping, including supports, valves, pumps and all necessary instrumentation for successful conductance of pre-commissioning and commissioning activities. All temporary equipment and instruments shall be clearly listed out in the Bid.
- e) Providing safety barricades and signage during dismantling, erection and testing etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[82]	25.09.2014

- f) Supply of all labour, skilled/semi skilled supervisors, engineers and any other manpower.
- g) All the erection materials and consumables like shims, welding rods, soldering and brazing alloys, industrial gases, insulating tapes, compounds, chemicals etc. required for the erection and commissioning works.

Note: The temporary equipment specifically brought by the Bidder solely for the pre-commissioning and commissioning work shall, on completion of these activities, remain the property of the Bidder.

The selection of material of all the temporary equipment/instruments shall be compatible with the service conditions expected during pre-commissioning/ commissioning activities.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[83]	25.09.2014

5 TERMINAL POINTS & EXCLUSIONS

5.1 Terminal Points

For all terminal points, scope of this contract shall include supply of matching flanges, gaskets, bolts, nuts etc including any isolation valve. Terminal Points mean Engineering, Procurement and Erection in entirety. The terminal points of the complete package to be supplied shall be as follows.

(a) **Furnace Bottom Ash Hopper**

Furnace Bottom Ash Hopper outlet flange

(b) **Economiser Hopper**

Economiser Hopper outlet flange

(c) **Air Pre Heater Hopper**

Air preheater and ESP Hopper outlet flange

(d) **ESP Hopper**

ESP Hopper outlet flanges

(e) **Ash Slurry Disposal**

Ash Slurry Disposal System – Discharge point of ash slurry disposal pipeline

(f) **Service Water**

One no. Stub connection with isolation valve shall be provided on service water supply header Near [AHP control room at °N, °E].

Bidder has to provide service water lines and valves for all the areas covered under this package.

(g) **Drinking Water**

One no. Stub connection with isolation valve shall be provided on drinking water supply header Near [AHP control room at . °N, °E].

Bidder has to provide drinking water lines and valves for all the areas covered under this package.

(h) **Electrical**

Between equipments which are covered under AHP package, supply and termination at both ends are in the scope of AHP contractor. Between equipment supplied by AHP contractor and others, scope of work is defined is as below.

- **MV cable:** At the terminal of 6.6 kV Station switchgear of Owner. All Power and control cables and termination from the terminals of 6.6kV Station Switchgears are included in the scope of AHP package.
- **DC System:** At the terminal of 220V Station DCDB supplied by others. All Power and Control cables and termination from the terminals of 220V DCDB of others to AHP DCDBs are included in the scope of AHP package.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[84]	25.09.2014

- **Cable Carrier System:** At the point outside of Ash handling Main Switchgear room. Complete Cable carrier system in side AHP battery limit is in the scope of AHP bidder. However Connection to interplant cable carrier system at Main switchgear room will be carried out by Owner.
- **Earthing and Lightning System:** At the terminal of Riser provided by Owner at below ground peripheral earthing of Main AHP switchgear room.

Note:

- Only relay contacts (1 NO/1 NC) shall be provided by the other package contractor. The required auxiliary relays, control cables including their laying & termination shall be in the scope of AHP Bidder. Similarly, necessary contact (1 NO/1 NC) required by other package Contractors shall be provided by AHP Bidder.
- Wherever Power is tapped from Purchaser's board, Bidder's scope starts from the outgoing terminals of the respective board. Bidder has to include all necessary termination materials, cables, trays, conduits, supporting structure, terminations, and necessary earthing accessories in his scope.

(i) Control & Instrumentation

Instrumentation Cabling & interface between CHS PLC and DCS:

Redundant Modbus TCP/IP through FO cable (by BIDDER) shall be provided between AHP PLC and Common Station DCS. All hardware and software requirements at the AHP PLC end to establish Modbus TCP/IP interface with Common Station DCS shall be in BIDDER scope.

5.2 Exclusions

- Ash Dyke
- Open trucks, closed tankers for dry/semi dry fly ash disposal
- 6.6kV Station switchgears.
- DC Battery and Charger.
- Below ground earth mat

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[85]	25.09.2014

6 GENERAL TECHNICAL REQUIREMENTS

6.1 Codes & Standards

- 6.1.1 Apart from some specific application, the proposed R&M equipment shall comply with the appropriate Indian Standard / DIN or equivalent international Standard. Specification as listed below in this section and mentioned in detailed Specifications, each incorporating the latest revisions at the time of tendering.
- 6.1.2 Wherever specified or required the Plant & Equipment shall conform to various statutory regulations such as Indian Electricity Rules/Act, Indian Boiler Regulations, Factories Act, etc.
- 6.1.3 In the event of any conflict between the codes and standards referred above, and the requirements of this Specification, the requirements, which are more stringent, shall govern.
- 6.1.4 In case of any change of code, standards and regulations between the date of purchase order and the date, the Bidder proceeds with manufacturing, the Owner shall have the option to incorporate the changed requirements.
- 6.1.5 List of Reference Codes/Standard
Relevant Standards as specified in Detailed Technical Specification, Section-II of Volume-II shall be followed.

6.2 Name Plates

- 6.2.1 Instruction plates, nameplates or labels shall be permanently attached to each main and auxiliary item of plant in a conspicuous position. These plates shall be engraved with the identifying name, type and manufacturers serial number, together with the loading conditions under which the item of plant has been designed to operate.
- 6.2.2 Items such as valves, which are subject to hand operation, shall be provided with nameplates so constructed as to remain clearly legible throughout the life of the plant giving due consideration to the difficult climatic conditions to be encountered. Nameplates shall be securely mounted where they will not be obscured in service by insulation, cladding, actuators or other equipment. Direction of flow is also to be engraved.
- 6.2.3 All trade nameplates and labels shall be in Bilingual language. All measurements shall be in M.K.S. Units.
- 6.2.4 The size and location of nameplates shall be subject to Approval of the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[86]	25.09.2014

6.3 Guards and Fences

- 6.3.1 Effective guards and fences must be provided to prevent injury to operators.
- 6.3.2 Mesh guards which allow visual inspection of equipment with the guard in place are generally preferable. The guards shall be constructed of mesh attached to a rigid framework of mild steel rod, tube, or angle and the whole galvanized to prevent loss of strength by rusting or corrosion. The guards shall be designed to facilitate removal and replacement during maintenance.
- 6.3.3 Guards for couplings and rotating shafts shall be in accordance with BS 5304-1975 or similar approved standard. All rotating shafts and parts of shafts must be covered.

6.4 Operation, Maintenance & Availability

- 6.4.1 Equipment/works offered shall be designed for high availability, high reliability, low maintenance and ease of operation & maintenance. The Bidder shall specifically state the design features incorporated to achieve high degree of reliability, availability, operability and ease of maintenance. He shall also furnish details of availability records in plants stated in his experience list.
- 6.4.2 Wherever required platforms and walkways with access ladders having hand rails shall be provided to facilitate operation and maintenance.

6.5 Materials

- 6.5.1 In selecting materials of construction of equipment, the Bidder shall pay particular attention to the atmospheric conditions existing at the Site and the nature of material/fluid handled. Wherever deviations are taken in respect of materials specified, the reasons shall be spelt out clearly in the proposal.
- All materials shall be new, and shall be of the quality most suited to the proposed application.
- 6.5.2 As far as possible; materials shall be in accordance with Indian or international standard Specifications. Where such standards are not available, sufficient information shall be provided to allow the Owner to assess the suitability of the material for the particular application.
- All materials used shall have performed lengthy satisfactory service in similar or more arduous conditions to those proposed by the Bidder.
- 6.5.3 All parts which could deteriorate or corrode under the influence of the atmospheric, meteorological or soil conditions at the Site, or under the influence of the working conditions shall be suitably and effectively protected so that such deterioration or corrosion is a minimum over the life of the plant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[87]	25.09.2014

6.6 Lubricants, Chemical and Control Fluids

- 6.6.1 Provision shall be made for suitable efficient lubrication where necessary to ensure smooth operation free from undue wear.
- 6.6.2 Non ferrous capillary tubing shall be used throughout.
- 6.6.3 Oil baths shall be provided with filling and drain plugs, both of adequate size. An approved means of oil indication including level switches and temperature indication shall be provided.
- 6.6.4 Lubrication points shall be conveniently situated for maintenance purposes. It must be possible to carry out lubrication from a gangway or landing and without the removal of guarding or having to insert the hand into it. Where accessibility to a bearing for oiling purposes would be difficult a method of remote lubrication shall be fitted.
- 6.6.5 The Bidder shall provide a detailed and comprehensive Specification for all lubricating oils, greases and control fluids required for the entire plant. A sufficient supply of these shall be provided by the Bidder for initial commissioning, first fill and till handing over of the unit.
- 6.6.6 The Bidder shall supply a detailed schedule giving the lubricant testing, cleaning and replacement procedures. All equipment and facilities necessary for the testing, cleaning and changing of lubricants and control fluids shall be provided. The Bidder shall endeavour to reduce the varieties and grades of required lubricants, chemicals and control fluids to a minimum, matching them where possible to those already in use in the generating station in order to simplify procurement and minimize storage requirements. All lubricants, chemicals and control fluids shall be of internationally recognized standards and shall be easily obtainable from a large number of Indian suppliers. Bidder shall also indicate the equivalent Indian Standard for the above for easy procurement in future.
- 6.6.7 No lubricant or control fluid shall have toxic or other harmful effects on personnel or on the environment.

6.7 Plant Life and Mode of Operation

- 6.7.1 On completion of the R&M project, the plant/equipment and systems individually and collectively shall be possible to operate continuously with routine maintenance and overhauls for an economic service life of not less than [20/25 years] under the prevailing site conditions and for the type of duty intended.
- 6.7.2 After R&M of Ash Handling system and associated auxiliaries, the unit shall be able to operate to its rated capacity continuously and there shall be no restriction of the operation of the supplied system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[88]	25.09.2014

6.8 Packaging & Marking

All the equipment shall be suitably protected, coated, covered or boxed and crated to prevent damage or deterioration during transit, handling and storage at site till the time of erection. While packing all the materials, the limitations from the point of view of availability of railway wagon sizes in India should be taken account of. The details of various wagons normally available with Indian Railways for transportation of heavy equipment shall be considered by the Bidder. The Bidder shall be responsible for all loss or damage during transportation, handling and storage due to improper packing.

The identification marking indicating the name and address of the consignee shall be clearly marked in indelible ink on two opposite sides and top of each of the packages. In addition the Bidder shall include in the marking gross and net weight, outer dimension and cubic measurement. Each package shall be accompanied by a packing note (in weather proof paper) quoting specifically the name of the Bidder, the number and date of Contract and names of the office placing the Contract, nomenclature of contents and Bill of Material.

6.9 Protection

Equipment having antifriction or sleeve bearings shall be protected by weather-tight enclosures. Coated surfaces shall be protected against impact, abrasion, discoloration and other damages. Surfaces that are damaged shall be repainted.

Electrical and C&I equipment shall be protected against moisture and water damages. All external gasket surfaces and flange faces, couplings, rotating equipment shafts, bearings and like items shall be thoroughly cleaned and coated with rust preventive compound as specified above and protected with suitable wood, metal or other substantial type covering to ensure their full protection. All exposed threaded parts shall be greased and protected with metallic or other substantial type protectors.

All piping, tubing and conduit connections on equipment and other equipment openings shall be closed with rough usage covers or plugs. Male threaded openings shall be closed with rough usage covers or plugs. Female threaded openings shall be closed with forged steel plugs. The closures shall be taped to seal the interior of the equipment. Open ends of piping, tubing and conduit shall be sealed and taped.

Returnable containers and special shipping devices shall be returned by the manufacturer's field representative at the Bidder's expense.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[89]	25.09.2014

6.10 Painting

6.10.1 General

All exposed metallic surfaces subject to corrosion shall be protected by shop application of suitable coatings. Surfaces not easily accessible after shop assembly shall be treated before-hand and protected for life of the equipment. Surfaces to be finish painted after installation shall be shop painted with at least two (2) coats of primer. Steel surfaces, which are not to be painted, shall be coated with suitable rust preventive compound subject to the approval of the Owner.

All paints shall be used in accordance with the manufacturer's instructions. No thinners or other substance shall be added to the coating material without the approval of the Owner. The quality and vendor of the paints shall require approval of the Owner.

All paints, when applied in a normal full coat, shall be free from runs, sags, wrinkles, patchiness, brush marks or other defects.

All primers shall be well marked into the surface, particularly in areas where pitting is evident, and the first priming coat shall be applied as soon as possible after cleaning, within four hours maximum. If the drying interval between successive coats, which should not exceed one week, has been so long as to endanger the adhesion of the following coat, the paint already applied shall be lightly rubbed down with fine abrasive paper before putting on the next coat.

Paint spraying on large surfaces shall not normally be done indoors, except with the approval of the Owner. Spray guns shall not be used outdoors in windy weather or near unprotected surfaces of a contrasting colour and under no circumstances shall spray guns be used where spray may be carried into or onto exposed electrical equipment.

Paint containers shall not be opened until required and the paint shall be mechanically mixed thoroughly before use, and agitated occasionally during use.

Electrical equipment shall be shop finished with one or more coats of primer and two coats of high-grade oil resistant enamel. The interior of all panels' cabinets and enclosures shall be finished with gloss white enamel.

The Bidder shall furnish sufficient touch up paint for one complete finish coat on all exterior factory surfaces of each item of equipment. The touch up paint shall be of the same type and colour as the factory applied paint and shall be carefully packed to avoid damage during shipment. Complete painting instructions shall be furnished.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[90]	25.09.2014

Shop primer for steel and iron surfaces which will have a continuous operating temperature below 35 °C shall be selected by the Bidder, in accordance to the relevant standard. Special high temperature primer shall be used on surface exposed to operating temperature above 35 °C.

The colour scheme shall be submitted during execution of Contract for approval by the Owner.

6.10.2 Preparation

Oil and grease shall be removed from the surface by washing with a suitable detergent, rinsing with clean water, and drying.

Surfaces to be shot blasted shall be cleaned to Swedish Standard SA 2.5 or equivalent, and all dust remaining after cleaning shall be removed.

The priming coat shall be applied without delay.

6.10.3 Damaged Paintwork

Any damaged paintwork shall be corrected / modified as follows:

- a) The damaged area, together with an area extending 25 mm around its boundary, shall be cleaned down to bare metal.
- b) A priming coat shall be immediately applied, followed by a full paint finish equal to that originally applied and extending 50mm around the perimeter of the original damage.
- c) The repainted surface shall present a smooth surface. This shall be obtained by carefully chamfering the paint edges before and after priming.

6.10.4 Painting Systems

The requirements for the dry film thickness (DFT) of paint and the materials to be used shall be as stated below, unless otherwise specified elsewhere in this Specification.

a) Surfaces Subject to Weathering

All surfaces shall have a minimum of four coats of paint made up as follows:

Primer coat	:	35 micron DFT
Tie coat	:	35 micron DFT
Finishing coat (2 Nos.)	:	35 micron DFT per coat

The total minimum DFT shall be 140 micron.

b) Surfaces Inside Buildings

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[91]	25.09.2014

All surfaces shall have a minimum of three coats of paint made up as follows:

Primer coat	:	35 micron DFT
Tie coat	:	35 micron DFT
Finishing coat (2 Nos.)	:	25 micron DFT per coat

The total minimum DFT shall be 120 micron.

The type and colour of primer & finish coat shall be selected by the Bidder after approval by the Owner.

6.11 Environment Protection

6.11.1 Environment Protection

The plant & equipment under this R&M project shall be designed for installation and operation in harmony with the surrounding environment and all measures of pollution control shall be ensured by the Bidder to restrict pollution from the liquid effluent and RPM emission within the limits as given below with due consideration of Environment (Protection) Rules.

6.11.2 For Liquid Effluent

During construction activities, Bidder shall maintain the statutory compliance of State Pollution Control Board and MoEF in respect of pollution control and environmental protection within and around plant boundary. Any specific requirement of State Pollution Authorities over and above shall be maintained.

6.11.3 Noise Level Requirement

The plant & equipment under this R&M project will be designed, constructed and provided with suitable acoustic measures to ensure the noise level criteria as per the following stipulations of MoEF & State Pollution Control Board.

- a) Maximum noise level shall not exceed 85 dB (A) when measured at 1.0 m away from the noise emission source.
- b) Maximum noise level from its source within the premises shall not exceed 70 dB (A) as per Environment (Protection) Rules 1986, Schedule-III, 'Ambient Air Quality Standards' in respect of noise.
- c) Any statutory changes in stipulations regarding noise limitation that may occur in future according to State Pollution Control Board or Central pollution Control Board or Ministry of Environment & Forest regulation during tenure of the Contract, the Bidder shall comply with the updated/amended requirement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[92]	25.09.2014

An exception will be made for the plant at startup operations of other big pressure reducing devices operating during emergency periods and for the safety valves.

6.12 Inspection and Testing

6.12.1 Inspection and Tests during Manufacture

- 6.12.1.1 The method and techniques to be used by the Bidder for the control of quality during manufacture of all plant and equipment shall be agreed with the Owner prior to the Award of Contract.
- 6.12.1.2 The Owner's general requirements on quality control and shop tests as mentioned in Section II of Volume-II.
- 6.12.1.3 Owner shall be informed for witnessing the shop tests of any item of the plant or equipment for checking the compliance with the Specification requirement and or related standards prior to leave place of manufacturing.
- 6.12.1.4 Advance notice shall be given to the Owner as agreed in the Contract, prior to the stage of manufacture being reached, and the piece of plant must be held at this stage until the Owner has inspected the piece, or has advised in writing that inspection is waived. If having consulted the Owner and given reasonable notice in writing of the date on which the piece of plant will be available for inspection, the Owner does not attend, the Bidder may proceed with manufacture having forwarded to the Owner duly certified copies of his own inspection and test results.
- 6.12.1.5 The Bidder shall forthwith forward to the Owner the Test Certificates in [...] copies for approval.
- 6.12.1.6 Under no circumstances any repair or welding of castings be carried out without the consent of the Owner. Proof of the effectiveness of each repair by radiographic and/or other non destructive testing technique, shall be provided to the Owner.
- 6.12.1.7 All the individual and assembled rotating parts shall be statically and dynamically balanced in the works.
- 6.12.1.8 Where accurate alignment is necessary for component parts of machinery normally assembled on site, the Bidder shall allow for trial assembly prior to dispatch from place of manufacture.
- 6.12.1.9 All materials used for the manufacture of equipment covered under this Specification shall be of tested quality. Relevant test certificates shall be made available to the Owner. The certificates shall include tests for mechanical properties and chemical analysis of representative material.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[93]	25.09.2014

- 6.12.1.10 All pressure parts connected to pumping main shall be subjected to hydraulic testing at a pressure of 150% of design pressure. The duration of the pressure tests shall be sufficient, as approved by the Owner, to show any leakage paths and to permit a thorough examination of the component whilst under pressure.
- 6.12.1.11 All necessary non destructive examinations shall be performed to meet the applicable code requirements.
- 6.12.1.12 All welding procedures adopted for performing welding work shall be qualified in accordance with the requirements of applicable code. Radiography, magnetic particle examination magnuflux and ultrasonic testing shall be employed wherever necessary/ recommended by the applicable code.
- 6.12.1.13 The Bidder shall furnish the quality procedures to be adopted for assuring quality from the receipt of material at site, during storage, erection, pre-commissioning to tests on completion and commissioning of the complete system/equipment.
- 6.12.2 Performance Tests at Site**
- 6.12.2.1 The full requirements for testing the system shall be agreed between the Owner and the Bidder prior to Award of Contract. The completely erected System shall be tested by the Bidder on site under normal operating conditions. The Bidder shall also ensure the correct performance of the System under abnormal conditions, i.e. the correct working of the various emergency and safety devices, interlocks, etc.
- 6.12.2.2 The Bidder shall provide complete details of his normal procedures for testing, for the quality of erection and for the performance of the erected plant. These tests shall include site pressure test on all erected pipe work to demonstrate the quality of the piping and the adequacy of joints made at site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[94]	25.09.2014

7

LAYOUT CONSIDERATION

{Effort should be made to keep the Layout of the newly equipped system / packages under the R&M project unchanged to the extent possible with respect to existing layout to avoid disturbance to the existing equipment & facilities for which any modification/changes are not envisaged based on RLA/LA and EA assessment. However a general guidelines, which needs to be followed, as required, are given below :}

[The Ash handling equipment has been distributed in following major facilities/buildings.

- a) Ash slurry pump house containing slurry pumps of multiple series. Space shall be provided to install one more stage slurry pump at later stage / date to enable dispose slurry to new ash dump area or rising existing ash pond dyke height and maintenance area.
- b) Ash Water Pump House Containing [...] Nos. HP Water Pumps, [...] Nos. LP Water Pumps, [...] Nos Economizer Pumps and [...] Nos. Seal Water Pumps.
- c) Buffer Hoppers and Collector Tank Tower.
- d) Dry Fly Ash Silos.
- e) Fly ash equipment building containing fluidizing blowers and heaters, instrument air compressor and drier etc.
- f) Compressor House with Vacuum Pumps and Transport Air Compressors with maintenance area.
- g) Ash handling system central control room.
- h) Silo utility building.
- i) Chemical house for recirculation ash water treatment plant.
- j) Ash Water recovery clarifier.
- k) Recovered water pump house.]

[Aeration blower is installed away from the silo in order to ease the maintenance.

Slurry pipe streams for BA slurry or Mixture of BA and FA Slurry should remain 1 meter above the ground level and approach road in order to ease the maintenance.

The associated electrical facilities shall be placed in annexed buildings or as found suitable. The buildings shall be provided with necessary office space, toilet etc as applicable. Adequate maintenance space and lay-down area shall be provided in buildings.

Approach to all equipment, piping, valves shall be provided. Where such facilities are not possible, separate platform, approach ladder etc shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[95]	25.09.2014

provided. A clear space of 1200 mm minimum shall be provided between two equipment / pipe / valve. Headroom of minimum 2500 mm shall be provided wherever human approach is applicable. Head room of 2100 mm over EOT crane rail level walkways shall be maintained. All pipe racks shall have walkways.

In case of two (2) rows of pumps/equipment located in parallel, minimum distance between the equipment shall meet the following criteria.

Clear distance between edges of pedestals/motors of pump located parallel shall be 2000 mm.

In case the space provided is acting as the handling space for the equipment by overhead crane, the space shall be maximum size of equipment being handled plus the clearance of 500 mm minimum on either side with the stationary equipment.

Withdrawal spaces of equipment.

Adequate space provisions shall be kept within the Ash transportation pipe trestle, compressor house & the associated MCC room for further extension, if required.]

- 7.1 The safety requirements as per the Factories Act, Indian Electricity Rules and other applicable codes/standards etc. shall be observed while developing the layout.
- 7.2 The available existing layout details of the plant are indicated in the enclosed drawings as Annexure-I. However, Bidder to suggest his own modified layout arrangement which shall be subject to approval of the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[96]	25.09.2014

8 PERFORMANCE GUARANTEES

The term "Performance Guarantees" wherever appears in this Section shall have the same meaning and shall be synonymous to "Functional Guarantees".

Similarly the term "Performance Tests" wherever appears in this Section shall have the same meaning and shall be synonymous to "Guarantee Test(s)".

8.1 General Requirements

- 8.1.1 The Bidder shall guarantee that the equipment offered shall meet the ratings and performance requirements stipulated for various equipment covered in this technical Specifications.
- 8.1.2 The guaranteed performance parameters furnished by the Bidder in the Bid proposal, shall be without any tolerance values and all margins required for instrument inaccuracies and other uncertainties shall be deemed to have been included in the guaranteed figures.
- 8.1.3 The Bidder shall demonstrate all the guarantees covered herein under Category I, II & III during functional guarantee / acceptance test. The various tests which are to be carried out during performance guarantee/acceptance test are listed elsewhere in this Section. The guarantee tests shall be conducted by the Bidder at site in presence of Owner.
- 8.1.4 All costs associated with the tests including the cost associated with the supply, calibration, installation and removal of test instrumentation shall be included in the price offered by Bidder.
- 8.1.5 At all times during the Performance Tests the emissions as applicable and effluents from the Plant shall not exceed the Guaranteed Emission and Effluent Limits.
- 8.1.6 It shall be the responsibility of the Bidder to make the plant ready for the performance guarantee tests.
- 8.1.7 All instruments required for performance testing shall be of the type and accuracy required by the code and prior to the test, the Bidder shall get these instruments calibrated in an independent test institute approved by the Owner. All test instrumentation required for performance tests shall be supplied by the Bidder and shall be retained by him upon satisfactory completion of all such tests at site. All calibration procedures and standards shall be subjected to the approval of the Owner. The protecting tubes, pressure connections and other test connections required for conducting guarantee test shall conform to the relevant codes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[97]	25.09.2014

- 8.1.8 Tools and tackles, thermowells (both screwed and welded) instruments/devices including flow devices, matching flanges, impulse piping & valves etc. and any special equipment, required for the successful completion of the tests, shall be provided by the Bidder free of cost.
- 8.1.9 The Performance/ Acceptance test shall be carried out as per the agreed procedure. The PG test procedure including demonstration tests shall be submitted within [90 days] of the date of Notification of Award and finalization of the PG test procedure shall be done within [180 days] from the date of Notification of Award. After the conductance of Performance test, the Bidder shall submit the test evaluation report of Performance test results to Owner promptly but not later than one month from the date of conductance of Performance test. However, preliminary test reports shall be submitted to the Owner after completing each test run.
- 8.1.10 The PG test procedures shall be submitted for equipment/ system & subsystem under Bidder's scope for all Guarantees under category I, II & III as mentioned below, as per latest International codes & standard including correction curves, meeting the Specification requirements along with sample calculations & detailed activity plan of preparation (including test instrumentation), conductance and evaluation of Guarantees.
- 8.1.11 The Bidder shall submit for Owner's approval the detailed Performance Test procedure containing the following:
- Objective of the test.
 - Various guaranteed parameters & tests as per Contract.
 - Method of conductance of test and test code.
 - Duration of test, frequency of readings & number of test runs.
 - Method of calculation.
 - Correction curves, as applicable to various system/equipment.
 - Instrument list consisting of range, accuracy, least count, and location of instruments.
 - Scheme showing measurement points.
 - Sample calculation.
 - Acceptance criteria.
 - Any other information required for conducting the test.
- 8.1.12 In case, during performance guarantee tests, it is found that the equipment/systems has failed to meet the guarantees, the Bidder shall carry out all necessary modifications and/or replacements to make the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[98]	25.09.2014

equipment/system comply with the guaranteed requirements at no extra cost to the Owner. However, if the Bidder is not able to demonstrate the guarantees, even after the above modifications/replacements within [ninety (90) days] or a reasonable period allowed by the Owner after the initial performance guarantee tests have been completed, the Owner will have the right to impose the stipulated clauses under Guarantee Category I, II & III as specified in this Specification:

8.1.13 For Category-I Guarantees

Reject the equipment/system/plant and recover from the Contractor payments already made

(OR)

Accept the equipment/system/plant after levying Liquidated Damages (LD) as specified in Clause No. 5.6 of Volume I. The LDs shall be prorated for the fractional parts of the deficiencies.

8.1.14 For Category-II Guarantees

Reject the equipment/plant/system and recover, from the Contractor, the payments already made. Conformance to the performance requirements under Category-II is mandatory.

8.1.15 For Category-III Guarantees

Reject the equipment/system/plant & recover, from the Contractor, the payments already made.

(OR)

Accept the equipment/system after assessing the deficiency in respect of the various ratings, performance parameters and capabilities and recover from the Contract price an amount equivalent to the damages as determined by the Owner. Such damages shall however be limited to the cost of replacement of the equipment/systems replacement of which shall remove the deficiency so as to achieve the guaranteed performance.

8.2 Performance Guarantees under Category-I

The performance guarantees which will attract liquidated damages shall be as follows:

- (i) **Total Auxiliary Power Consumption** – The auxiliary power consumption shall be calculated using the following relationship.

$$P_{au} = \sum P_u$$

P_{au} = Guaranteed Unit Auxiliary Power Consumption.

P_u = Power consumed by each of the continuously running equipment of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[99]	25.09.2014

Ash Handling Plant System under the scope of Bidder.

While guaranteeing the auxiliary power consumption the Bidder shall necessarily include all continuously operating equipment of Ash handling package. Auxiliary power shall be guaranteed stream wise as defined .The auxiliaries to be considered shall include but not be limited to the following:

S.No	Drive	Weightage Factor
1.	Bottom Ash crushers	[0.625]
2.	Bottom Ash H.P. water pumps	[0.625 for jet pump system and 1.0 for submerged scrapper conveyor system]
3.	Bottom Ash L.P. water pumps	[1.0]
4.	Fly Ash water pumps	[0.5]
5.	Bottom ash slurry transportation pumps	[1.0]
6.	Bottom ash slurry disposal pumps	[0.625 for jet pump system and 1.0 for submerged scrapper conveyor system]
7.	Fly ash conveying air compressors with air drying plant (ADP)	[1.0]
	Fly ash conveying vacuum pumps	[1.0]
8.	Transport air compressor with air drying plant (ADP)	[1.0]
9.	Lean slurry Pumps	[1.0]
10.	Instrument air compressor with air drying plant (ADP)	[1.0]
11.	Ash water recirculation pumps	[1.0]

Note:

The Bidder shall furnish a list of equipment for Ash Handling System to be covered under auxiliary power consumption for the approval of Owner.

8.3

Guarantees under Category-II

The Performance Guarantees, conformance to which is mandatory are as follows:

Liquid Effluent: *Liquid Effluent discharge to an outside body, from the plant*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[100]	25.09.2014

battery limit, shall meet statutory requirements State Pollution Control Board.

8.4 Guarantees under Category-III

The performance guarantee tests shall be conducted for *[Seven (7) days]* continuous operation of the boiler at 80% to 100% load. In case of any major breakdown in any of the equipment disrupting the operation of Ash Handling Plant, the breakdown period shall be added to the testing period of *[7 days]*. The performance guarantee test shall be conducted to prove uninterrupted operation of ash handling plant of each unit separately as they are completed and all units simultaneously when they are completed. The ash handling plant shall be operated with its normal auxiliaries, (as applicable commensurate with the number of boiler units in operation) without using standby pumps or any other standby equipment.

The parameters guaranteed shall have no tolerance value whatsoever. The equipment and systems offered shall be guaranteed to meet the following performance.

a) Bottom Ash Handling System

In case of intermittent type bottom ash removal system employing water impounded hopper and jet pumps, the system shall be guaranteed to meet the following performance:

- i) Continuous effective extraction, crushing and conveying of bottom ash generated during various modes of boiler operation to the ash slurry sump and the continuous effective pumping of combined slurry from this sump to the ash slurry dump area.

The extraction of bottom ash shall be done once in every shift of eight (8) hours. The total time for evacuating the eight (8) hour collection of bottom ash corresponding to maximum collection rates specified shall not exceed [...] hours.

b) Economiser and Air Pre-heater Ash Handling System

Economizer ash shall be drained to BA hopper through HP water, from where the same shall be transferred through jet pumps to Ash Slurry Sump.

Air Pre heater Ash shall be extracted through vacuum conveying system to Intermediate surge Hopper along with ESP Fly Ash.

The continuous effective conveying of ash as stated above shall be established by no stagnation of ash or slurry at any point in the complete system and with all interlocks, protections working satisfactorily.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[101]	25.09.2014

c) Fly Ash Handling System

- i) Continuous effective conveying of fly ash from all fly ash collection hoppers i.e. ESP hoppers, generated during various modes of boiler operation up to collecting channel/ buffer hoppers, from buffer hoppers to ash storage silo and from collecting channel to the ash slurry sump and the continuous effective pumping of ash slurry from this sump to dyke area. Total time for evacuating the fly ash collected in each unit in every shift of eight (8) hours corresponding to maximum ash collection rates shall not exceed [...] hours.
- ii) The continuous effective conveying and pumping as stated above shall be established by no stagnation of ash or slurry at any point in the complete system and with all interlocks, protections and sequential operation working satisfactorily.
- iii) Rated capacity at rated discharge pressure of each air compressor/blower/vacuum pump as applicable.

d) Ash water and Seal Water Pumps

- i) Rated capacity at rated head of each ash, seal and flushing water and other water pumps.

e) Ash slurry Disposal Pumps

- i) Rated capacity at rated head of each ash slurry disposal pump.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[102]	25.09.2014

9 SPARE PARTS

The Bidder shall include in his scope of supply all the necessary mandatory spares, start up and commissioning spares and recommended spares and indicate these in the relevant schedules. The general requirements pertaining to the supply of these spares is given below:

9.1 Mandatory Spares

The list of mandatory spares considered essential by the Owner is enclosed in Annexure-II of this Specification. The Bidder shall indicate the prices for each and every item (except for items not applicable to the Bidders design) in the 'Schedule of mandatory spares' whether or not he considers it necessary for the Owner to have such spares. If the Bidder fails to comply with the above, the cost of such spares shall be deemed to be included in the Contract price. The Bidder shall furnish the population per unit of each item in the relevant Schedules. Whenever the quantity is mentioned in "sets" the Bidder has to give the item details and prices of each item.

Whenever the quantity is indicated as a percentage, it shall mean percentage of total population of that item in the R&M Contract unless specified otherwise, and the fraction will be rounded off to the next higher whole number. Wherever the requirement has been specified a 'set' it will include the total requirement of the item for a unit, module or the R&M Contract scope or as specified. Where it is not specified a 'set' would mean the requirement for the single equipment/system as the case may be. Also the 'set' would include all components required to replace the item; for example, a set of bearings shall include all hardware normally required while replacing the bearings.

All mandatory spares shall be delivered at site at least two months before scheduled date of initial operation of the first unit. However, spares shall not be dispatched before dispatch of corresponding main equipment.

Wherever quantity is specified both as a percentage and a value, the Bidder has to supply the higher quantity until and unless specified otherwise. Price of mandatory spare parts will also be evaluated.

9.2 Recommended Spares

In addition to the mandatory spare parts mentioned above, the Bidder shall also provide a list of recommended spares for [five (5)] years of normal operation of the plant and indicate the list and total prices in relevant schedule. The list shall take into consideration the mandatory spares specified and should be independent of the list of the mandatory spares. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[103]	25.09.2014

Owner reserves the right to buy any or all of the recommended spares. The recommended spares shall be delivered at project site at least two months before the scheduled date of initial operation of first unit. However, the spares shall not be dispatched before the dispatch of the main equipment.

Prices of recommended spares will not be used for evaluation of the Bids. The price of these spares will remain valid up to execution of the Contract. However, the Bidder shall be liable to provide necessary justification for the quoted prices for these spares as desired by the Owner.

9.3 Start-up & Commissioning Spares

Start up and commissioning spares are those spares which may be required during the start-up and commissioning of the equipment/system till the handing over of the Plant. The Bidder shall provide all such start up and commissioning spares and keep an adequate stock of the same to be brought by him to the site for the plant erection and commissioning. These must be available at site before the equipment are energized. The unused spares, if any, should be removed from there, only after handing over of the plant. All start up spares which remain unused at the time shall remain the property of the Bidder.

9.4 General Requirements

The Bidder shall indicate the service expectancy period for the spares parts (both mandatory and recommended) under normal operating conditions before replacement is necessary.

All spares supplied under this Contract shall be strictly inter-changeable with the parts for which they are intended for replacements. The spares shall be treated and packed for long storage under the climatic conditions prevailing at the site e.g. small items shall be packed in sealed transparent plastic with desiccators packs as necessary.

All the spares (both mandatory and recommended) shall be manufactured along with the main equipment components as a continuous operation as per same Specification and quality plan.

The Bidder will provide Owner with cross-sectional drawings, catalogues, assembly drawings and other relevant documents so as to enable the Owner to identify and finalize order for recommended spares.

Each spare part shall be clearly marked or labeled on the outside of the packing with its description. When more than one spare part is packed in a single case, a general description of the content shall be shown on the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[104]	25.09.2014

outside of such case and a detailed list enclosed. All cases, containers and other packages must be suitably marked and numbered for the purposes of identification.

All cases, containers or other packages are to be opened for such examination as may be considered necessary by the Owner.

The Bidder will provide the Owner with all the addresses and particulars of his sub-suppliers while placing the order on Vendors for items/ components/ equipment covered under Contract and will further ensure with his Vendors that the Owner, if so desires, will have the right to place order for spares directly on them on mutually agreed terms based on offers of such Vendors.

The Bidder shall warrant that all spares supplied will be new and in accordance with the Contract documents and will be free from defects in design, material and workmanship.

In addition to the recommended spares listed by the Bidder, if the Owner further identifies certain particular items of spares, the Bidder shall submit the prices and delivery quotation for such spares within [30 days] of receipt of such request for consideration by the Owner and placement of order for additional spares if the Owner so desires.

The Bidder shall guarantee the long term availability of spares to the Owner for the full life of the equipment covered in the Contract. The Bidder shall guarantee that before going out of production of spare parts of the equipment covered under the Contract, he shall give the Owner [at least 2 years] advance notice so that the latter may order his bulk requirement of spares, if he so desires. The same provision will also be applicable to Sub-Bidders. Further, in case of discontinuance of manufacture of any spares by the Bidder and/or his sub-Bidders, Bidder will provide the Owner, two years in advance, with full manufacturing drawings, material Specifications and technical information including information on alternative equipment makes required by the Owner for the purpose of manufacture/procurement of such items.

The prices of all future requirements of spares beyond [five (5)] years shall be derived from the corresponding Ex-works price at which the order for such spares have been placed by the Owner as a part of the mandatory spares or recommended spares. Ex-works order price of future spares shall be computed in accordance with the price escalation formula to be furnished by Bidder indicating base price reference variation indices for material, labour

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors - Ash Handling System Volume-II, Section-I	[105]	25.09.2014

etc. Based on the formula and considering escalation indices prevailing at the time of order of spares, order price shall be worked out. The base indices will be counted from the scheduled date of successful completion of trial operation of the last plant/equipment under the project. The above option for procuring future recommended spares by the Owner shall remain valid for the period of fifteen [fifteen (15)] years from the date of successful completion of trial operation of the last plant/equipment. In case the spare parts from the same sub-Vendor are not available due to obsolescence or any other reason, the Bidder shall supply the spares for a period of [fifteen (15)] years from an alternative source.

C. I&C

S.No	Item	Quantity/Unit	Remarks
1	Programmable Logic controller (PLC) for Ash Handling Plant		
1.1	Power Supply Unit/Module for PLC and I/O	10% of each type & Model, minimum 1 no whichever is higher	
1.2	Input/ Output modules	10% of each type & Model, minimum 1 no whichever is higher	
1.3	Central Processor Unit Module	1 no. of each type & Model	
1.4	Communication Module	1 no. of each type & Model	
1.5	Interface Module	1 no. of each type & Model	
1.6	PLC Backplane I/O Bus without modules	1 no. of each type & Model	
1.7	Network adapters/converter, LIU,OLM, Network/ Ethernet Switch and other network hardware used	1 no. of each type & Model	
1.8	Display Units (LCD/LED/TFT)	1 no. of each type & Model	
1.9	Keyboard	2 nos.	
1.10	Mouse	2 nos.	
1.11	Hard Disk Dive Unit (capacity as per requirement)	1 no.	
1.12	CD/DVD Read/Write Drive	1 no.	
1.13	CDs/DVDs	25 Nos.	
1.14	Installation Software (for OWS, EWS, Controllers, Firewall Security and any supporting softwares)	1 no. copy of CD/DVD of each requirement	
1.15	Interconnecting Cables with connectors (within panels)	1 no. of each type	
1.16	Prefab Interconnecting Cables with connector	1 no. of each type & length	
1.17	System Bus Cable With Connector	1 no. of each type & length	
1.18	IO bus cable with connector for remote IO units	1 no. of each type & length	
1.19	Loose Connectors	3 nos. of each type	
1.20	Batteries for RAM battery back-up	1 set for each type and model no. of CPU	
1.21	Printer Paper	3000 sheets of each type	
1.22	Printer Cartridge / Toner/ Ribbon	5 Nos. of each type	
2	UPS for CHP Package)

S.No	Item	Quantity/Unit	Remarks
2.1	Intelligent UPS		
2.2	Silicon Controlled Thyristors, Diodes & Power Transistors	100%	
2.3	Capacitors	1 set	
2.4	CT's, CVT's, VT's, Chokes, AC/DC isolators, Contactors, Timers, Relays	10% of each type and rating	
2.5	Fuses of Each Type & Ratings	100%	
2.6	Fuse Free Circuit Breakers	5%	
2.7	Electronic Modules	10%	
2.8	Lamp Holders With Series Resistors	10%	
2.9	Cooling Fans	1 nos of each type	
2.10	Digital/Analog panel meters/indicators	1 nos of each type	
2.11	Relays of all types including overload relays	10%	
3	Field Instruments for Ash Handling Plant		
3.1	RTD (single/Duplex type), Thermocouple	10% of each type & Range	
3.2	Pressure Gauge, DP Gauge	10% of each type & Range	
3.3	Temperature Gauge	10% of each type & Range	
3.4	Level Gauge	10% of each type & Range	
3.5	Pressure Switch	10% of each type & Range	
3.6	Differential Pressure Switch	10% of each type & Range	
3.7	Level Switch (Capacitance/RF Type/Float/Displacer etc)	10% of each type & Range	
3.8	Level transmitter (Ultrasonic, Radar type)	1 no. in each type and range	
3.9	Pneumatic power Cylinder	1 No. of each type & Range	
3.10	Solenoid Valve with coil	1 No. of each type & Range	
3.11	Accessories for Transmitters & Gauges(valve manifold, snubber, isolation valve, drain valve etc.,)	2 nos. in each type and range	
3.12	Pneumatic Valve Actuator spare kit(including diaphragm, piston, gaskets, O-rings etc.,)	2 sets for each type and size of actuator	
3.13	Position Limit Switch	10% of each type & Range	
3.14	Solenoid Valve with coil	10% of each type & Range

S.No	Item	Quantity/Unit	Remarks
3.15	Pneumatic Valve Actuator spare kit (including diaphragm, piston, gaskets, O-rings etc.,)	2 sets for each type and size of actuator	
3.16	Smart Valve Positioner	10% of each type & model	
3.17	Air Filter Regulator	10% of each type & range	
4	Process connection Piping for Ash Handling Plant		
4.1	2 way, 3 way valves for instruments	10% of each type, size, rating, class, material & model	
4.2	Fittings	10 Nos. of each type, rating, material & size	
4.3	Valve manifolds (2way, 3 way & 5way)	10 % of each type, rating & model	
4.4	Air Filter Regulator	10 % of each type, model & range	
4.5	Impulse piping & tubing	5 nos. of standard Length of each size, rating & material	
5	Instrumentation cables & Accessories For Ash Handling Plant		
5.1	All Instrumentation Field Cables from Instrument to JB and JB to DCS/PLC (including compensating cable)	5% of total installed Length (In running meter) if total installed length < 1000 metres or 1 no. of 1000 metre. Drum if total installed length > 1000 metres, of each type, pair & size	
5.2	Fiber optic cable	1000 metres of each type and size	
5.3	Communication cable from PLC to RIO	1000 meters in each type and size	
5.4	Communication cable from PLC to OWS/EWS	500 meters in each type and size	
6	Cabinets, Panels & Junction Box For Ash Handling Plant		
6.1	Terminal Blocks	5% of each type & rating (for types of total quantity > 100 nos.)	
6.2	MCB	10% of each type & rating	
6.3	Fuse	50% of each type & rating	
6.4	Junction box	1 no. of each size & material	
6.5	LED Indicator	10% of each type, Colour & voltage rating	
6.6	Panel/Cabinet cooling fan	5% of each type & model	
6.7	Panel/Cabinet door switch	5% of each type & model	
6.8	Panel/Cabinet CFL	5% of each type & model

1

GENERAL

The ash handling system shall be complete in all respects with mechanical, civil & structural, architectural, electrical, control & instrumentation systems. The scope shall include bottom ash handling system, coarse ash handling system, fly ash handling system, ash disposal system up to the ash disposal area and water recovery system from ash pond for [210/215/220/250] MW Power Project. The plant shall be designed to cater for [...] % PLF and ash content of worst coal as [...] %.

Design, manufacture, inspection and testing of all the equipment shall comply with all the currently applicable statutory regulations and safety code in the locality where the equipment are to be installed. Other internationally acceptable standards, which ensure equal or higher performance than those specified, shall also be accepted. Nothing in this specification shall be construed to relieve the bidder of the related statutory responsibility. In case of any conflict between standards and this specification, decision of the Owner/Owner's Engineer shall be final and binding.

CODES & STANDARD

List of standards is given below for reference:

Standard No	Description
IS: 1239	Mild Steel ERW tubes, tubular and other wrought steel fittings (Part I & II)
IS: 3589	Electrically Resistance welded steel pipes for water gas and sewage (150 to 2000 mm nominal diameter)
IS: 4736	Hot dip Zinc coating on steel tubes
IS: 5822	Code of practice for laying steel pipes
IS: 9404	Colour code for identification of pipelines in thermal power plants.
BS: 534	Black bolts screws and nuts.
BS: 2633	Specification for Class- I Arc welding of ferritic steel for pipe work carrying fluids.
BS: 4504	Flanges and bolting for pipes, valves, and fitting metric series
ANSI B 16.5	Steel pipe flanges, flanged valves and fittings
ANSI B 16.5	Steel pipe flanges, flanged valves and fittings
ANSI B 16.9	Factory made wrought steel butt welded fittings
ANSI B 16.11	Forged steel fittings (Socket welded and threads)
ANSI B 16.21	Non-metallic gaskets for pipe flanges.
ANSI B16.25	Butt welding ends.
ANSI B16.28	Steel short radius fittings
ANSI B 36.10	Welded and seamless wrought steel pipe
ANSI A 234	Carbon and ferritic alloy steel fittings
API 617/619/672	Centrifugal Compressors
BS:1571 (Part I & II)	Acceptance test for positive displacement compressor and exhausters.
IS: 6206	Guide for selection, installation and maintenance of air Compressor plants with operating pressures up to 10 bars
IS: 5727	Glossary of terms related to compressor exhausters
IS: 5456	Code of practice for testing of positive displacement type air

3 SYSTEM DESCRIPTION

3.1 Bottom Ash Removal System

[The function of ash handling system is to evacuate ash from different zones with its specified evacuation rate/time till its life period with minimum maintenance. Description of the system is as follows: -

- i) Bottom ash resulting from the combustion of coal in the boiler shall fall into the over ground water impounded [double/triple] "V" type hopper with steel construction having [...] number feed gates. Each unit shall be provided with one (1) number refractory lined, water impounded, level maintained, triple section, type steel- fabricated bottom ash hopper having a hold up volume to store bottom ash and Economizer ash generated for a period of eight (8) hours. Under each V Section, there shall be [two (2)] outlets.*
- ii) Each outlet shall be fitted with a Hydraulically operated feed gate, clinker grinder, feed sump, jet pump and a set of piping and valves designed for adequate capacity for removal of the ash in slurry form. The Bottom Ash hopper discharge gates shall be opened once in a shift of eight (8) hours and the stored Ash shall be removed by means of jet pumps and transported in slurry pipe lines to the Ash slurry sump for its further disposal to the Ash pond by means of Ash slurry disposal pumps. Out of [...] outlets, only [...] outlets (... on each V Section) will be operating and other [...] shall be in standby mode.]*
- iii) The slurry formed shall be transported to the common ash slurry sump through pipes (running on pipe racks). Bottom ash system operation will be controlled from bottom ash local panel. Bottom ash and Economizer ash generated in eight (8) hours will be cleared in about [...] hour. Bottom ash and Economizer ash generation per unit will be calculated at 100% PLF considering generation of bottom ash and economizer ash as [30%] of total ash with worst coal.*
- iv) Under different furnace expansion condition necessary sealing to be maintained between furnace and atmosphere through water fill seal trough around bottom ash hopper with a provision of continuous make up and overflow.*

3.2 Coarse Ash Removal System

- i) From economizer hoppers of each unit, coarse ash will flow to respective bottom ash hopper through adequately sized sloping pipe duly assisted by jets (Flushing nozzles) placed at strategic locations on the tank for easy slurry flow.*
- ii) The coarse ash slurry along with bottom ash slurry will be transported to the common ash slurry sump in the same manner as bottom ash Slurry. Effective*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[5]	25.09.2014

sealing and hopper expansions are to be made by means of water trough type expansion joint

3.3 Fly Ash Removal System

- i) Fly ash will be collected in Electrostatic Precipitator (ESP), Air preheater (APH) Hoppers and Stack Hoppers. There will be requisite no. of hoppers in ESP and APH. Owing to highly efficient ESP, ash collection in stack hopper is expected to be negligibly small.*
- ii) Dry Fly Ash Unloading System shall consist of two stages. The first stage shall include extraction of dry Fly Ash from the various ESP and APH hoppers to the intermediate surge hopper by vacuum conveying system and in the second stage, Ash shall be conveyed/ transported from intermediate surge hoppers to the FA storage silos. In first stage, vacuum will be created by mechanical exhausters (vacuum pumps) suitably designed. There will be one cylinder operated fly ash intake valve below each fly ash hopper. On opening of the valve, fly ash will enter a fly ash conveying line by gravity. There will be one air intake / check valve in each branch conveying line, which will allow requisite amount of air to be drawn into the system.*
- iii) Vacuum pump of liquid ring type will create the requisite vacuum in the system. [...] Nos. mechanical exhausters (vacuum pumps) shall be provided. Out of the above, [...] nos. (.W+..S) shall cater for dry FA system and [...] nos. (.W+..S) for wet FA system for [210/215/220/250] MW unit. [...] nos. of bag filters shall be provide for each unit, out of which [...] nos. shall be located on each intermediate surge hopper and [...] nos. on collection tank with effective storage capacity of thirty minutes. The bag filter will be of pneumatic pulse jet type and high pressure instrument air pulsing will be used to dislodge collected fly ash from the bags to the intermediate surge hopper. The air leaving the bag filter will be passing through dedicated vacuum pumps before air is released to atmosphere. Wetting unit shall be envisaged in the air line from bag filters to the vacuum pumps with Dust sensors at the suction of every Vacuum Pump (mechanical exhauster) so as to avoid ingress of any fly ash dust into the mechanical exhausters.*
- iv) In Second stage, fly ash from intermediate surge hopper (ISH) will be transported to the fly ash silos through pressure conveying system which includes [...] nos. Air Compressors (.W+..S) for [210/215/220/250] MW.*
- v) In wet conveying mode, dry fly ash shall be conveyed from ESP and Air preheater Hoppers to Wetting Head and Collecting channel by vacuum conveying method, where it is mixed with water and resultant ash slurry is discharged by HP Water to ash slurry sump through ash slurry through trench or carbon steel pipe over pipe racks. Wetting head should be use for mixing of water and ash before collecting channel.*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[6]	25.09.2014

- vi) In dry Conveying mode, the total fly ash of [210/215/220/250] MW from ESP and Air preheater hoppers shall be conveyed to ISH and then from ISH, ash will be conveyed to FA Silos in pressure conveying mode by means of [...] Nos. parallel streams (..W+..S).*
- vii) There shall be [...] numbers intermediate surge hoppers (ISH) for [210/215/220/250] MW units and each surge hopper shall have a capacity for storage of fly ash from [each unit] over a period of thirty minutes. The Intermediate Surge Hoppers shall be equipped with primary collectors/secondary collectors/target box along with bag filter as applicable to vacuum extraction system. Air blowers for each unit shall be provided to aerate Ash inside the buffer hoppers and ESP hoppers to facilitate free flow of Ash.*
- viii) From each Intermediate Surge Hopper, ash will be transported to any of the ash storage silos (common for [...] units of [210/215/220/250] MW) through the pressure conveying streams.*
- ix) The [...] numbers (..W+..S) fluidizing blowers shall be provided for the units for easy dislodging of ash from all the fly ash hoppers and ISH.*
- x) There will be [...] silos for the collection of fly ash, each of 16 hours storage of fly ash generated.*
- xi) Fly ash generated per shift (8 hours) per unit will be calculated at 100% PLF considering fly ash generation to be 90% of total ash with worst coal. Fly ash generated in eight (08) hours will be cleared in about [...] hours.*
- xii) From Fly ash storage silo, presently, there will be provision for unloading directly on trucks from each silo. Each Fly ash storage silo will be provided with the following:*
 - Two (2) numbers Rotary Drum Conditioners cum Un-loaders for providing necessary water spray for dust suppression during loading of ash on open trucks.*
 - Two (2) numbers telescopic spouts arrangements with scavenger fan complete with suction bag filter shall be provided for unloading of fly ash in closed tanker. Both the outlets for ash handling shall be provided with manual chain wheel operated plate valve and cylinder operated plate valve and feeder with control.*
 - Two (2) additional blanked flanges shall be provided considering probable future requirement for ash transportation directly to Ash Utilization Project. Unloading of dry ash into railway wagon in future is also envisaged, for which rail track under the silo shall also be provided.*
 - Silo fluidizing arrangement comprising [...] blowers for silos and all related accessories. [...] Nos. blowers shall be able to fluidize ash of one (1) silo under full load condition. So, even when, [...] silos operate together, [...] blower will remain stand-by.*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[7]	25.09.2014

- Suitable number of bag filter & vent fan (with 100% stand by) for venting within the stipulated limits of ash emission (less than 50 mg/Nm³).
- Access doors at suitable & strategic locations.
- Ash level detection and Radio frequency type sensing device.
- Relief valve to take care of any positive or negative excursion of pressure within the silo.

3.4 Bottom Ash, Coarse Ash & Fly Ash (Wet) Slurry Transport

- Coarse ash & bottom ash slurry from Bottom Ash hopper through hydraulically operated feed gate, clinker grinder, feed sump & jet pump and fly ash slurry from collecting channel are discharged to ash slurry sump which is common for both the units.
- The Ash slurry sump will be rectangular pyramidal shape suitably compartmentalized and lined with alloy cast iron liners. It will be of over ground construction & slurry pumps located on ground floor should have flooded suction from the Ash slurry sump. The emergency overflow of the Ash slurry sump will lead to the nearest drain sump.
- Each unit will have [...] Nos. slurry piping's for discharging of BA & CA slurry to ash slurry sump. Each slurry pipe shall be dedicated to one (1) outlets, there shall be Two outlets per V Section. Out of total [...] slurry pipes [...] slurry pipe lines (one from each hopper) from each unit will be operating simultaneously for decanting the bottom ash whereas other [...] slurry lines shall be in standby mode.]
- Any type of slurry (BA & CA or Wet FA) of any unit will have the flexibility of being led to any one of two compartments of the slurry sump. There shall be [...] sets of slurry pumps (each set being Single/Double stage depending on final design) common for both the units out of which [...] sets will be working (for [...] units) and [...] set will be common standby. Each pump will be of identical duty conditions.
- Disposal of Sludge produced while water treatment in Clarifier into the Ash slurry sump shall be under bidder scope. All the necessary pumps, piping, fitting's etc. and accessories for the same shall be provided by the bidder. Sludge pumps shall be envisaged as 100% standby.
- At least 1st stage shall have scoop controlled Fluid Couplings to vary the duty point within (-) 45% to (+) 10% of design duty point. Space shall be kept in ash slurry pump house for future one stage in case new ash pond is identified or for future increment of existing ash dyke.
- There shall be [...] slurry pipes running from slurry pump discharge to ash dump area out of which [...] will be working for [...] units and [...] will remain as common standby. The slurry concentration for Fly Ash shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[8]	25.09.2014

around 30% and for Bottom Ash shall be around 25%.

- viii) Considering future rising of Dyke height, the slurry pumps shall be capable of delivering slurry to a dyke height of at least 17m from existing grade level.*
 - ix) All pipe/fittings & supports shall be suitable to take that load area at hydro-test condition.*
 - x) Necessary slurry line flushing arrangement shall be provided.*
- Mechanical ventilation (supply exhaust fans) for different areas in Ash slurry pump house and switchgear rooms.*

3.5 Ash Dump Area - Equipment and Facilities

- i) Ash pond area which is approximately [...] km away from ash slurry sump will be divided in [...] segments to cater for upcoming units. The ash pond will be maintained by filling and cutting alternate segments. The slurry pump head shall be designed to enable discharge at furthest point in the dyke area up to ultimate dyke height ([...] Meter, from present existing earth level).*
- ii) Ash slurry pipes will discharge into the ash pond and ash particles will settle inside the ash pond. An ash water recovery, collection and transfer system is to be provided near ash pond area.*
- iii) Main slurry pond shall gradually get filled up with deposited ash, thus adequate number of discharge points shall be provided along the perimeter of ash disposal area and provisions shall be there to shift the slurry discharge amongst the discharge points from time to time such that an efficient filling of the entire ash pond is ensured. Proper garlanding on the ash dyke shall be made for this purpose.*
- iv) Entire ash slurry will be retained within this Ash Dump. It is also intended to retain the entire precipitation received by the Dyke area within the reservoir itself.*
- v) The recovery water system shall consist of a stilling pond near ash pond area for collection of runoff water from ash slurry, the recovery water pumping system ([...] slurry sump pumps, [...] working for [...] units and one common standby, each pump rated for 80% recovery of ash water [per unit] considering both bottom ash and fly ash are disposed in slurry form) for recycling the entire quantity of decanted water for being consumed back in the plant.*
- vi) The recovery water pumps shall be located on a barge over stilling pond with flexible piping and cables connected to fixed layout.*
- vii) The decanted water will be clarified through adequate capacity clarifier at Dyke end. The clarified water will be stored into clarified water tank and from there it will be pumped back to the main plant/Ash water tank for both the Units.*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[9]	25.09.2014

- viii) *The system shall have provision of chemical dosing system as necessary for coagulation and efficient settlement of ash carryover as well as chemical treatment.*
- ix) *The pipe lines shall be complete with basalt lined bends, specialties, fittings, fixtures, pipe couplings, gaskets, nuts, bolts, clamps, embedments, structural steel supports for piping system and other accessories.*
- x) *Adequately sized motor operated or solenoid operated & pneumatically actuated metal to metal seated knife edge gate valve/100% tight shut off rubber lined knife edge gate valves/plug valves shall be provided at the suction and discharge of combined Ash slurry disposal pumps.*

3.6 Bottom Ash Hopper Overflow System

- i) *Overflow water from Bottom Ash Hopper and seal trough of [each unit], will led to Overflow Transfer Sump with storage capacity of 10 minutes and from there transferred to the ash slurry sump via collecting channel.*
- ii) *[...] numbers Overflow Transfer Pumps will be employed for [each unit] out of which [...] will be working, [...] as working standby. There will be continuous supply of LP water for Bottom Ash water cooling to 60 °C.*

3.7 Common Ash Laden Water Clarification System

- i) *[Ash water clarification plant receives recovery water from the Ash Dump Area and any other drains the Bidder intends to route to this plant.*
- ii) *All effluents originating from the Ash Handling Plant and leading to the station drain shall have to meet all pollution criteria as laid down by IS-2490, Part I and other stipulations State Pollution Control Board.*
- iii) *All sludge produced by this common clarification Plant shall be sent to the common Ash disposal area.]*

3.8 Common Water Supply System

- i) *The total requirement of water for the Ash Handling System shall be met from following sources namely:*
 - *[Cooling Tower Blow down]*
 - *Clarified Water from WTP Clarifier.*
 - *[Decanted recovery water from the ash dump area.]*
 - *[Clear Water from Oily Water Separator.]*
- ii) *Common slurry sump make up will be fed from ash water tank through Ash Water Pumps.*
- iii) *[...] nos. H.P. water pumps shall be provided for both units ([...] workinh + [...] standby). Each pump set will be able to cater to the total requirement of HP water during Bottom Ash & Fly Ash removal of one unit.*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[10]	25.09.2014

- iv) *There shall be [...] LP water pumps for both units ([...] workinh + [...]) standby) to cater various LP water requirements.*
- v) *[...] numbers Economizer Water Pumps shall be provided for both units ([...] working + [...] stand by) to cater to water requirements for removal of Economizer ash to Bottom Ash Hopper in slurry form.*
- vi) *[...] numbers seal water pumps, common for [both units], taking suction from the Ash Water tank shall supply water at different sealing points.*
- vii) *All pumps listed above shall be complete with drive motors, base plates, foundation bolts, inserts, embedment and accessories as specified and as required. Complete Ash water pipe lines, valves, fittings, pipe rack, structural steel supports for piping system and other accessories as specified and as required.*

viii) Consumers Requiring Ash Water

- *Jet pumps for Bottom Ash & Coarse Ash Cleaning*
- *Intermittent demand for de-sludging, line flushing, jetting etc*
- *High pressure requirements at different points of Bottom ash hopper*
- *Continuous make up for seal trough & BA hopper*
- *Intermittent demand for seal trough flushing and Gate Housing Flushing.*
- *Continuous demand for refractory cooling*
- *Slurry sump make up*
- *Spray water at rotary drum conditioner cum unloader.*

All of the above requirements will normally be met by recycled ash water i.e. through HP/LP water/ Economizer pumps fed from Ash Water sump and the deficit will be met by make - up water.

ix) Consumers Requiring Clean & Clarified Water

- *Seal water for clinker grinder required during Bottom ash removal*
- *Cooling Water requirement for Fly Ash Conveying blowers/ compressors and Instrument Air Compressor & Fluid Couplings*
- *Seal water for ash slurry pumps and other different pumps and Mechanical Exhauster.*
- *Water for Wetting heads, air washer, FA Slurry /trench jetting, combined ash slurry make-up, combined ash slurry, sump agitation.*

All of the above requirements will be met from clarified water supply header (for Ash Handling system) & seal water pumps.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[11]	25.09.2014

3.9 Dry Fly Ash Storage Silos

- i) Storage silo for dry fly ash of capacity as per data sheet with adequate margins shall be provided. Storage silo shall be of flat/conical bottom type with the provision of air slides/fluidizing pads at the bottom. Storage silo shall be provided to store precipitator fly ash with adequate air space. This silo shall be used to collect dry fly ash for the purpose of sale. It shall have facilities for dry ash unloading into covered road tankers and conditioned fly ash in open road tankers.
- ii) Each dry fly ash storage silo shall be provided with following arrangement for unloading the fly ash.
 - Two retractable chutes along with rotary feeder for unloading the dry fly ash into closed road tankers at a rate specified in data sheet.
 - Two ash dust conditioner along with feeder for loading the conditioned ash into open road tankers at a rate specified in data sheet. It shall be possible to vary the water supply depending upon ash flow rate. However max moisture content in the ash shall be limited to 20%.
 - Two blanked connections along with isolation valves shall also be provided in the silo for future installation of pneumatic equipment for transportation of a dry ash to third party and for installation of equipment to slurry the dry ash to dispose off it through ash disposal system.
- iii) The storage silo shall be designed to provide clear headroom of 5.5 mt (from paved floor level to Bottom of Silo beam) for a road tanker to come under the silo and receive the ash from the retractable chutes.
To facilitate locating these chutes over the road tanker opening, it shall be possible to move the chute in all directions in the horizontal plane. It may be noted that unloading system from Silo shall be suitable for both closed tanker/open truck unloading as well as unloading on railway wagons. Silo layout and column location shall be suitable for accommodating two vehicles for simultaneous loading of ash. Clear headroom shall be sufficient for unloading of dry fly ash in railway wagon in future.
- iv) Each retractable chute shall include a shut off device at the silo outlet, a level probe to determine the level of ash within the road tanker, de-dusting and vent air systems, and a motor operated winch system to lower/raise the chute. Retractable chute/Dry ash unloader shall be sourced from reputed manufacturer(s), whose bulk loading spouts/retractable chutes have established field proveness. The unloading chute shall have vent fan with bag filter in suction connected to the tanker to take the displaced air and discharge in clean manner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[12]	25.09.2014

- v) Each storage silo shall be provided with a separate and dedicated floor aeration system.
- vi) The silo aeration system shall be supplied by constant volume blowers. Any manifolds employed for air distribution in the aeration system shall be fitted with blank flanges at the manifold ends, to facilitate maintenance requirements.
- vii) Details of the pressure/vacuum relief valves provided in the storage silos shall be furnished along with the bid.
- viii) Vent filters shall be provided on the storage silos for cleaning the aeration and displaced air before venting out. The Bidders should provide either exhaust fans or to consider positive pressure in silo while selecting parameters of compressors to assist venting. Vent filters and fans shall be installed under cover, and the protected from all potential adverse weather conditions.
- ix) The dust loading from the outlet of the Vent filters shall not exceed 50 mg/Nm³ under any operating condition with 10 per cent bags plugged. Bidders shall justify the selected air to cloth ratio of the bag filters. The Bidders shall also supply details on how the air flow into and out of, the storage silos is balanced during different operating conditions.
- x) Gross Face velocity (considering 10% bag plugged condition) for Silo Vent Filter should never exceed 1.5 m/min.
- xi) All Silo Vent Filters shall be supplied complete with automatic pulse jet bag filter cleaning equipment, venting fan with all necessary instrumentation including diff. Pr gauge, diff pr switch, solenoid operated pulse valve.
- xii) Clean air plenum on Silo Vent Filter with clear man height shall be provided for easy access of bags for maintenance. Silo Vent Filter manhole shall have easy access through platform/stair etc.
- xiii) All Vent filters shall be supplied complete with the automatic Vent filter cleaning equipment, details of which shall be included with the tender.
- xiv) Any manifolds employed for air distribution in the aeration system shall be fitted with blank flanges at the manifold ends, to facilitate maintenance requirements.
- xv) Bidders shall ensure the provision of a proven dust collection system in the storage silo that separate out bulk of the ash from the conveying air before the air is extracted through the bag filters.

3.10 Instruments

Each silo shall be provided with following instruments as a minimum:

- i) Silo ash level transmitter 1 No.
- ii) Level switch with the telescopic chutes (meant for unloading into closed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[13]	25.09.2014

tankers): 1 No.

iii) Differential pressure gauge across the Vent filter: 1 No

iv) Differential pressure switch across the Vent filter: 1 No.

The bidder shall include any other instrument required to make the system safe, efficient and reliable.

3.11 Instrument Air Supply System

i) [...] numbers compressor [W+ S] for each units and one (1) common stand-by) , with [...] number of Air Drying Plant [...] working for [...] units, one (1) common stand-by and one (1) maintenance stand-by) will be installed in the Ash Handling Plant for supplying Instrument Air (I.A.) for different valve actuation purpose, bag filter cleaning, etc of the Ash handling system.

Necessary tapping with suitable isolation valve will be provided on this Ash Handling Plant's I.A. header at strategic location so that same can be interconnected with Main Plant I.A. header, if it is feasible to do so. The instrument air supply for remote location e.g. silo shall have suitable air receiver along with moisture separator aided with maintenance free auto drain trap.

3.12 Drain Pumping System

i) Drain Pit Sump Pumps shall be provided in bottom ash hopper area (drain pit located near Bottom Ash Hopper Area of each unit). Total four (4) numbers "Ejector" type pumps located inside individual pits and shall be motivated by HP Ash Water Pumps shall be provided for [...] units (one working and one stand by for each unit). The drain pit pumps shall pump the slurry back to the bottom ash overflow transfer sump of respective units.

ii) Vertical, centrifugal, single stage, semi-open or open and non-clogging type impeller drain pumps shall be provided in Slurry Sump Area, Vacuum Pump House and near ash silo area.

- In ash slurry sump area, total two (2) number drain pumps for [two units] (one working and one stand by) shall be provided.
- In ash silo area, total two no drain pumps for [two units] (one working and one stand by) shall be provided.
- In vacuum pump house area, total four no drain pumps for two units (one working and one stand by for each unit) shall be provided.]

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[14]	25.09.2014

4 DESIGN CRITERIA

a) Overall design criteria for the system

Following aspects are to be given primary consideration in selecting the Ash Handling Plant

- i) Present system to be installed shall have capability of handling entire ash produced in [...] units during BMCR operation considering worst coal firing and with reasonable design margin of 5%.
- ii) Selection of system configurations with minimum consumption of water. Recovery of water to the best possible extent and minimum make up into the system is to be attempted. However, it may be noted that operation of the plant should not be affected in case there is no recovery water from ash dump area
- iii) Quality of effluent outgoing from the plant (if at all) shall conform to latest norms of Environment Pollution Control as detailed later under "Pollution Consideration"
- iv) While laying out the present phase of plant equipment it shall be borne in mind that there shall be provision for space for future extension
- v) Clinker Crusher, jet pump and other pumps & installation etc, if not specified otherwise will be on/above ground level
- vi) Design of the Ash Handling Plant shall be carried out considering 8 hrs shift ,100% PLF and following ash generation rates (% of total ash):
 - i) Bottom Ash and Economizer ash [...]%
 - ii) Fly Ash and Air Pre-Heater ash [...]%
- vii) Bulk Density of ash & other general design guidelines & standard equipment sizing criteria may be considered as follows:

S.No	Detail	Value
A	Density	
i)	Bottom Ash for Volume Sizing	[650] kg/m ³
ii)	Bottom Ash for Strength Computation	[1600] kg/m ³
iii)	Fly Ash for ESP/APH/Economizer hopper volume and hopper outlet area computation as well as volume for intermediate surge hopper.	[750] kg/m ³
iv)	Fly Ash for Silo Volume Computation	[450] kg/m ³

Document Number	Rev No.	Description	Page No.	Date of Issue

S.No	Detail	Value
v)	Fly Ash for Strength Computation	[1600] kg/m ³
B	Ash Concentration	
i)	Concentration of Bottom Ash slurry	[30]% (w/w)
ii)	Concentration of Fly Ash slurry	[30]% (w/w)
iii)	Concentration of Combined Bottom and Fly Ash Slurry	[25]%
C	Velocity Considered in Pipes for Various Duties	
i)	Maximum Velocity in Air & Water Lines shall be as indicated in other relevant BOP packages suiting the service requirement.	[...]
ii)	Minimum/ Maximum Velocity in Bottom Ash Slurry Lines	2.3/2.8 m/sec
iii)	Minimum/ Maximum Velocity in Fly Ash Slurry Lines	1.8/2.8 m/sec.
iv)	Combined Ash Slurry (Minimum/ Maximum)	2.3/ 2.8 m/sec
v)	Tip Speed for Ash Disposal Pump (Max)	1676 m/min
vi)	Ash Disposal Pump Speed to be limited to	1000 rpm
D	Friction factor ' C ' to be considered:	
i)	Friction factor ' C ' for Ash Slurry Lines	140
ii)	Friction factor ' C ' for Sludge Lines	130
iii)	Friction factor ' C ' for Recovery Water Lines	110
iv)	Friction factor ' C ' for Bottom Ash Over Flow Lines	120
v)	Friction factor ' C ' for Water Lines (as per relevant package)	110

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[16]	25.09.2014

S.No	Detail	Value
E	Basis for selection of capacities of various tanks/sumps - (effective maximum pumping capacity)	
i)	Bottom Ash Over Flow Tank	for 10 minutes
ii)	Slurry Sump (each compartment)	for 5 minutes
iii)	Ash Water Tank	for 30 minutes

b) Other Design Considerations

Ash handling plant shall be designed considering ash generated at 100% PLF with worst coal firing with minimum removal rate as specified corresponding sections.

A margin of 10 % shall be built up on the actual pump capacity and head (considering Hazen-William) for selection of all types of pumps parameters.

A margin of 5% to be considered on the actual friction drop for arriving at ash slurry disposal pump head (considering Hazen-William)

A margin of 15% shall be considered on selection of motor rating over and above the maximum requirement of driven equipment in entire operating range if not specified otherwise. For slurry pumps and other variable speed driven equipment motor rating shall be more than equipment power requirement at maximum speed of the speed variation in addition to satisfying the above.

Data to be considered for design of clarifier for bottom ash overflow water and ash recovery water:

- i) Minimum particle size of ash in bottom ash overflow water to settler: 30 microns
- ii) Suspended solids in bottom ash overflow water to settler: Min TSS to be considered 1000 ppm. TSS after settler shall be maximum 100 ppm.

c) Pollution Considerations

- i) Liquid Effluent: For liquid effluent generated (if at all) in the Ash Handling Plant, the provisions of MINAS (Minimum National Standard) - COINDS/21/1986 is followed before discharging water to the recipient environment. In case there is any specific requirement of the state pollution authorities over & above MINAS stipulations, the same shall be taken care of in the Effluent Treatment Plant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[17]	25.09.2014

- ii) Thermal Pollution: The system design is such that a large surface area (provided in the Ash Dump) shall adequately cool the recovery water. Besides, it will be noted that there is, as such, no direct discharge of water to the recipient environment without treatment. Therefore, the stipulations of thermal pollution shall be met.
- iii) Particulate Emission: Vent filters, Air scrubbers shall be provided at logistic locations to arrest any sort of particulate emission in the ambient to restrict the SPM within permissible limit.
- iv) Noise Pollution: Average evaluated sound pressure levels shall be within 85 dB (A) measured at a distance of one (1) meter. from the equipment concerned as per Noise Rating Curve ISO 85.

d) Fly Ash Handling System

It is contemplated to convey the fly ash from respective fly ash hoppers (ESP & Air Pre-heater) up to the Intermediate Surge Hopper (ISH) by pneumatic vacuum system in the first stage conveyance of fly ash. EPC Bidder shall keep the bottom level of ESP hopper adequately high to enable small truck movement for ash collection in emergency.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[18]	25.09.2014

5 EQUIPMENT AND SYSTEM DATA SHEET

5.1 Water Impounded Bottom Ash Hopper & Economizer Ash Tank

S.No	Detail	Description
1	Maximum water level in bottom ash hopper	<i>As per Bottom ash Hopper seal plate assembly</i>
2	Maximum allowable ash level in Bottom ash hopper	<i>600 mm below the maximum water level.</i>
3	Hopper Body	<i>Tested quality mild steel plates of thickness not less than 10mm (IS 2062) except top 1100 mm of hopper including seal trough shall be constructed of 6mm thick SS 316. The entire inner BA Hopper walls shall be lined with monolithic castable refractory of minimum 230 mm thickness.</i>
4	Refractory anchors	<i>Stainless steel, AISI:316</i>
5	Sluicing/Arch Breaking/wash nozzles	<i>Body: SS Nozzle tip: tool steel or SS of hardness not less than 550 BHN or SS with ceramic inserts</i>
6	Refractory Cooling water header inserted in refractory	<i>Stainless steel</i>
7	Seal trough	<i>Stainless steel SS: 316, Seal trough of the bottom ash hopper should be integral construction. It shall be sized to maintain clearance between the seal plate and the trough during any vertical downward, side to side & front to rear expansion of boiler.</i>
8	Refractory	<i>Castable refractory of minimum 230 mm thickness. Protection measures such as embedded impact bars shall be provided to prevent damage to refractory in area of clinker impact.</i>
9	Temp. of Bottom Ash	<i>[...] °C</i>
10	Minimum effective ash storage capacity	<i>8 hours (Bottom Ash + Economizer Ash)</i>

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[19]	25.09.2014

S.No	Detail	Description
11	Minimum angle between hopper wall & horizontal	45 Deg. (Approx.)

- i) No pits in the boiler bottom are allowed to accommodate bottom ash handling equipment.
- ii) Thermal shock of exposed refractory to be prevented. A cooling water distribution header with deflection shield shall be provided all round the top of ash hopper, for cooling the portion of refractory all round the top of ash hopper.
- iii) To assist in the hopper emptying process, flushing nozzles shall be provided in the inclined section of the hopper walls.
- iv) The areas of hopper subjected to severe abrasion & erosion shall be suitably protected by wear plates. The protection is mandatory requirement for outlet opening of BA hopper.
- v) Each hopper section shall include a hinged access door. Circular doors shall have a diameter or not less than 750 mm, rectangular access doors shall have dimensions of at least 900 x 600 mm. Each hopper section shall also be provided with two (2) nos. 150 mm size inspection windows for viewing both the slopes.
- vi) The seal trough shall incorporate an overflow system, make-up system, drainage system and high pressure water nozzles to facilitate complete flushing of the seal trough.

5.2 Bottom Ash Hopper Discharge Gate

S.No	Detail	Description
1	Quantity / Nos.	[...]
2	Opening Size	Minimum [... x ...] mm
3	Drive of Feed Gate	Hydro-pneumatic, to ensure smooth & guided opening / closing to limit friction & wear.
4	Inclination of feed gate	Same as that of BA hopper.
5	Wear protection liners	Shall be provided on gates inside of gate housing & sliding surface coming in contact with gate.
6	Accessories of Ash gate housing	Yes/No

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[20]	25.09.2014

S.No	Detail	Description
7	Access door	600 mm diameter (min)
8	Lancing or Poke Door	Yes/No
9	Venting System	Yes/No
10	Flusing nozzles on either side of feed gate	Yes/No
11	Flushing & drain connections along with valves for sump of ash gate housing.	Yes/No
12	Material of Construction	
	Gates	Cast Iron IS: 210, Gr. FG-260.
	Gate wear liners	6mm thick SS:316/SS:410
	Gate spindle	SS
	Housing wear plates / impingement plates	25 mm thick Alloy Cast Iron IS:210, Gr.FG-260.
	Housing	10 mm thick (min.) Mild Steel IS: 2062.

5.3

Jet Pumps

S.No	Detail	Description
1	Quantity	[...]
2	Rated capacity (M3/hr)	[...]
3	Material of Construction	
	Inlet section, throat & discharge/tail piece	Alloy cast iron as per IS: 4771 type 1(a) min. 4.5% Nickel with min. hardness of 500 BHN or equivalent material with same hardness.
	Nozzle inlet	CI Grade FG-260 as per IS 210
	Nozzle tip	Ceramic lined stainless steel/tungsten carbide. Min 500

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[21]	25.09.2014

S.No	Detail	Description
		BHN

5.4 Clinker Grinder/Ash Crusher

S.No	Detail	Description
1	Function	To reduce bottom ash clinkers to (-) 25mm to facilitate pumping through the proposed slurry pipe lines.
2	Location	[...]
3	Crushing Capacity	[...]
4	Grinder speed	Not to exceed 40 RPM
5	Bearing of clinker grinder	Grease lubricated, heavy duty roller bearings. Clear water sealing to be provided at gland seals
6	Type	Single or double roll: Rolls shall be suitable for auto reverse rotation also in the event of jamming.
7	Drive Arrangement	Electric reversible drive motor, fluid coupling and gear box. Drive motor speed not to exceed 1000 rpm & shall be sized for frequent start stop-reverse-stop & start duty.
8	Wear plates	Wear plates shall be provided on clinker grinder inlet and other wearing surfaces of the grinder chamber.
9	Base Frame	Common steel fabricated base frame for grinder motor and drive shall be furnished.
10	Material of Construction	
	Grinder Chamber	Carbon steel (IS: 2062) min 10mm thick.
	Wear Plates	12-14% Mn. Austenitic steel plates to IS: 276. 10mm thick.
	Grinder Rolls & teeth	Hadfield's Manganese steel (ASTM A128, 12-14% Mn) casting, work hardened to 400 BHN at site/High chromium alloy CI. Grinder teeth shall

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[22]	25.09.2014

S.No	Detail	Description
		be weld able.
	Grinder Shaft	Stainless Steel 304/ EN-24.
	Shaft Sleeve	Hardened stainless steel 410/416.
	Clinker outlet chute/Ejector feed sump	10mm thick mild steel (IS: 2062) lined with wear resistant liners.

5.5 Air / Oil Converter Tank

Shall be designed as per ASME Section-VIII Pressure Vessel Code/Other equivalent standards; this steel pressure vessel shall be galvanized inside & outside along with all protuberances; Corrosion allowance of minimum one (1) mm; fitted with relief valve, drain valve; all air & water/oil pipe works with four way double coil center off type Solenoid Valves, isolation valves, pressure hoses etc. Solenoid valve shall have manual override and entire arrangement shall ensure keeping feed gate at intermediate position if required.

5.6 Bottom Ash Hopper Cooling Water Overflow Tank

S.No	Detail	Description
1	Effective storage capacity	Minimum (10) minutes of bottom ash hopper overflow.
2	Tank	Shall be of self supporting type or underground sump.
3	Material of Construction	Tested quality mild steel plates of thickness not less than 10mm (IS: 2062) and suitably stiffened with rolled steel sections. Or underground RCC sump

5.7 Flushing Boxes

- i) One Flushing Box of suitable capacity for each BA Hopper shall be designed for effectively discharging of the ash
- ii) The flushing boxes shall be provided with jetting nozzles at strategic points.
- iii) The flushing boxes shall be installed under each Economiser hoppers also. The temperature of ash in economizer ash hoppers is 350°C (approx) and BA Hoppers will be 1050°C (approx).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[23]	25.09.2014

- iv) The design shall ensure a water seal against atmospheric air leakage into economizer ash hoppers at the time of ash removal.
- v) The material of construction of various parts shall be as follows:

S.No	Detail	Description
1	Body	10 mm thick M.S to IS:2062
2	Liners	8 mm thick replaceable stainless steel SS-410 liners of hardness 400 BHN on complete base area and impingement area of the wall
3	Nozzles	Body : Cast Iron/Mild Steel Tip: Anti corrosive tool steel/ stainless steel/SS with ceramic inserts hardness not less than 550 BHN
4	No. of nozzles per flushing apparatus	[...]

5.8 Expansion Joints For Economizer Hoppers

- i) The expansion joints shall be of water seal type construction to accommodate the thermal expansions of economizer hoppers
- ii) Approximately 350 mm sealing shall be provided to prevent ingress of air into economizer hoppers
- iii) Necessary make up water and drain connections shall be provided in the expansion joints
- iv) The material of construction of the body of the expansion joint shall be 10 mm thick MS to IS: 2062

5.9 Fly Ash Collection Chute/ Hopper Isolation Valves (Knife Gate)

- i) Body : Cast Iron FG 260 hardened to 180-200 BHN.
- ii) Gate: 10mm thick MS with minimum 35 microns of hard chrome on both sides/ SS with stellite to achieve hardness of 300-350 BHN.
- iii) Seat: Replaceable stainless steel hardened & smooth finished (250 BHN minimum)
- iv) Body & seat hydro-test pressure 6 kg/ sq cm or 2 times the working pressure, whichever is higher

5.10 Fly Ash Intake Valves

- i) The design shall be such that the isolation disc shall be completely out of the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[24]	25.09.2014

path of the high velocity air stream of the conveying system. Valve body should be provided with hand hole & easily removable cover for inspection. Dust seals & renewable bushings are to be provided for the operating shaft of the valve. Valve shall be positive closure type & shall immediately close if there should be a failure of operating air.

- ii) For special fluidizing type ash intake valves (for 1st & 2nd field ESP hoppers) the same shall be fitted with fluidizing arrangements & manual poke rods to assist breaking any possible arch formation. The valve body & seat shall be of alloyed wear resistant material having at least 350 BHN Hardness.

S.No	Detail	Description	
1		Ash Feed Valves	Branch Isolation Valve
2	Type and Quantity	Swing/slide plate type for Vacuum system, Plate type/ butterfly / dome / cone type for Pressure system.	
3	Mode of actuation	Solenoid operated pneumatically actuated with provision of manual override facility.	
4	Body	Alloy Cast Iron to Gr. Fg 260, with hardness of 250 BHN (Min.) & properties equivalent to Gr. FG 260 to IS:210	
5	Plate/Disc	10 mm thick SS with 300-350 BHN hardness for plate	Min 3 mm thick stainless steel with 300-350 BHN hardness
6	Seat	Seat replaceable or SS smooth finish with 250BHN (Min)	

5.11 Vacuum Breaker

- i) Vacuum breaker shall be employed to open automatically at the end of fly ash handling operation, to prevent any residual vacuum prevailing in the ash transport pipeline. In case of emergency line vacuum rising to shut off the vacuum breaker shall be opened beyond a tolerable limit as per control logic. The vacuum breaker shall be mounted on the pneumatic ash transport line.
- ii) The vacuum breaker shall be of slide plate type or popup type with automatic operation by pneumatic cylinder and piston assembly with solenoid valve. The body shall be made of Alloy Cast Iron with a hardness of 250 BHN (min.) and the plate be min. 3 mm thick SS 304/410.

5.12 Air Intake Valves

- i) The air intake valves shall be spring loaded or check type and be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[25]	25.09.2014

provided/mounted on fly ash branch pipe (in case of vacuum extraction system) for air entry as may be required for necessary assistance to ensure the ash extraction.

- ii) The exact number and size shall be as per system requirement. The valve body shall be made of Cast Iron (CI FG220)/Gun Metal/Cast Steel and disc shall be constructed of SS-410 or Gun Metal. All air intake valves shall be provided with suitable rain-hood protection.

5.13 Ash Transporter/Air Lock/Pump Tank

- i) The vessel shall be designed for not more than one lakh cycles of operation annually for the specified ash evacuation rate.
- ii) Ash transporter /air locks/pump tanks shall be provided with necessary inlet and outlet valves of the type specified elsewhere in the specification.
- iii) The ash transporter /air locks/pump tanks vessel shall be constructed with tested quality mild steel plates as per IS:2062. They shall be able to withstand the abrasive action and hot condition of fly ash. The Ash transporter /Air locks/pump tanks shall be supported independently on steel columns or hanger support.
- iv) A full explanation to the air lock/pump tank operation cycle shall be supplied with the tender, listing all operations i.e. loading, fluidizing, and discharging. Calculation justifying size of venting connection is to be provided by Bidder.
- v) Aeration pads, if felt necessary by the bidder to assist the flow of ash through the air-lock valves shall be provided.

S.No	Detail	Description
1	Design pressure	1.5 times the design pressure of associated Air Blower/ Compressor or 2 times the operating pressure whichever is higher. Design calculations shall be submitted for Owner's approval
2	Material of construction	Tested quality IS:2062
3	Nos. provided	One working set and one standby set for each Combination filter Separator cum buffer hopper.
4	Aeration pads	As per requirement (Ceramic tiles/ sintered bronze/woven SS mesh)

5.14 Intermediate Surge Hoppers

- i) Fly ash from the various collection chutes/hoppers shall be conveyed to bag filter cum buffer hopper. Aeration pads shall be provided in the bottom sloping portion of ISH to prevent compaction and to fluidize the fly ash

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[26]	25.09.2014

during discharge from the ISH. ISH are to discharge the fly ash extracted from various fly ash collection chutes to pressure transporter system.

- ii) Each Buffer Hopper should be provided with a Vacuum/pressure relief Valve. Pressure relief to atmosphere from the buffer/surge hoppers shall be through vent filter. Intermediate Surge hopper shall have provision of emergency manual unloading of ash.

S.No	Detail	Description
1	Number	[...]
2	Material of construction	10 mm thick MS plate as per IS 2062 or RCC construction with 20mm thick abrasion resistant alloy C.I or 10mm thick SS liner of 300 – 350 BHN at sloping surface and outlet area.
3	Discharge	[...]
4	Aeration pads	As per requirement (Ceramic tiles/sintered bronze/woven SS mesh)
5	Vent/ equalizing valve	Yes/No
6	Capacity	[...]

5.15 Wetting Heads

- i) Adequately sized wetting head shall be provided above collecting channel for wetting the dry fly ash and separating it from conveying air. The wetting head shall be provided with a water supply of sufficient quantity and pressure for feeding the nozzles that will produce spray of water, ensuring rapid wetting of the incoming ash. Nozzles shall be so directed as to prevent spray from entering the ash discharge pipe.
- ii) The bidder shall provide sufficient length of discharge pipe below the wetting unit to collecting channel to ensure proper mixing of ash with water.
- iii) Wetting head shall be compact in design and provisions shall be made for easy replacement of nozzles. Flanged connections shall be provided for all inlet and outlet connections of the wetting head with suitable hand holes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[27]	25.09.2014

S.No	Detail	Description
1	Purpose	For wetting the dry fly ash using water spray to convert into slurry.
2	Quantity	To match with vacuum extraction stream
3	Fluid to be handled	Ash and water mixture and air
Material of Construction		
4	Casing	2.5% Ni-CI 300 BHN (min.)
5	Nozzle	Replaceable anti-corrosion tool steel or stainless steel 500-550 BHN or of SS with ceramic inserts.
6	Water chamber	CI grade:FG260 to IS:210
7	Tail pipe to collect tank	Alloy CI; 400 BHN
8	Inlet Liner	Alloy CI 450 BHN

5.16 Collecting channels

The collecting channel shall be located below the wetting heads and serve the purpose to separate and vent out air and discharging the ash slurry to the ash disposal sump by HP Water through pipe lines. In case of vacuum system this will also serve the purpose of separating and venting out the entrapped air discharged by wetting head and before discharging the entrapped air into atmosphere, it shall be passed through an air washer to achieve a sustained outlet dust emission of 50 mg/Nm³ (Max.) at exhaustor discharge with the ash handling system operating at designed capacity. The dust emission figure shall be guaranteed.

- The collecting channel shall be located at an elevation which will provide sufficient static head to overcome frictional and other losses in the wet ash flow discharge line up to ash slurry sump and to prevent entry of water upward from seal box.
- For maintenance purposes suitable stair case, maintenance platform, walkway with handrails at necessary levels shall be provided.
- The sizing of collecting channel, inlet/outlet connections etc. shall be corresponding to the maximum anticipated discharge flow requirements. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[28]	25.09.2014

collecting channel shall be complete with drain, overflow and vent pipe connections along with pipes and requisite size and lengths.

S.No	Detail	Description
1	Location	Below wetting head
2	Material of construction	
a.	Tank	Tested quality MS 10mm thick IS:2062, Gr-A
b.	Baffle	Tested quality MS 12mm thick IS:2062, Gr-A
c.	Liners / Impingement plate	Alloy CI (300 – 350 BHN) 20mm thick (min.)Or SAILHARD/TISCRAAL 10 thk 400 BHN
d.	Quantity	To suit no. of vacuum streams

5.17 Air Scrubber (Washer)

These shall be of steel construction and the location of air entry & discharge flanges shall be such that the air receives the nozzle spray thereby eliminating any dry fly ash to escape to the mechanical exhaust inlet. The quenched fly ash in the form of lean slurry shall be led to a seal pot with vacuum leg. The design of air scrubber shall ensure negligible amount of mist and dry ash carryover with the outlet air. The sizing of air scrubber shall be based on particle size of twenty (20) micron & below and for FA Stream Capacity.

The air scrubbers shall be located at a higher level with respect to collecting channel. The seal pots of each unit will be located at an elevation such that a vacuum leg of adequate length is arrived at and simultaneously the seal pot discharge water pipes can be run in an overhead pipe rack and led to the Slurry sump in sloped gravity flow fashion aided by jetting nozzles.

5.18 Bag Filters

- The bag filter units, one at the end of every vacuum conveying FA stream and on each FA silos with 1 working and 1 standby shall be provided.
- Gross Face velocity (considering 10% bag plugged condition) for bag filter should never exceed 1m/min.
- The performance of the bag filter shall not get affected with 10% of the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[29]	25.09.2014

bags plugged. The material of bag shall be capable of continuous exposure of temperature 150°C min and momentary contact 170°C.

- iv) The bag filter unit shall be designed to achieve as sustained outlet dust emission less than 50 mg/Nm³
- v) All bag filters shall be supplied complete with automatic pulse jet bag filter cleaning equipment with all necessary instrumentation including diff. Pr gauge, diff pr switch, solenoid operated pulse valve.
- vi) Clean air plenum on bag filter with clear man height shall be provided for easy access of bags for maintenance. Bag filter manhole shall have easy access through platform/stair etc.

5.19 Drive Motor

- i) Drive motor shall be connected to the Air Compressors directly or through any suitable type of power transmission system.
- ii) The continuous motor rating (at 50°C ambient) shall be at least ten percent (10%) above the maximum load demand of the compressor in the entire operating range to take care of the system frequency variation. Total maximum load demand shall include air compression power plus any power consumed in auxiliaries like cooling fan etc. When the driver is not directly coupled to the compressor, due account shall be made for losses in power transmission in addition to the above 10% extra margin.
- iii) The bidder shall include all instruments required to make the system safe, efficient and reliable.

5.20 Transport Air Compressor

- i) Air compressors shall be designed for continuous operation with high efficiency to satisfy the system requirements. Satisfactory operation in parallel shall be ensured without any uneven load sharing, undue vibration, noise etc.
- ii) The design shall incorporate every reasonable precaution for the safety of all operation and maintenance personnel. Each compressor unit should have all moving parts protected by a guard.
- iii) The scope of supply shall include all the necessary compressed air system complete with compressors, coolers, necessary isolating and non return valves, pressure relief valve, water separators, silencers and vent pipe work.
- iv) In order to have flexibility in operation the compressor discharge shall be interconnected with suitable valve arrangement.

7	Type of lubrication	Oil
8	Type of cooling	Air/water [for water cooling - DM close cycle cooling water system to be employed, Type of water-passivated DM water]
9	Duty	Continuous
10	Type of intake filter	Dry type
11	Dryness of air	Air temperature to be maintained above the dew point throughout the conveying process till silo.

5.21 Fluidizing Air Blowers

- The blowers shall be oil lubricated and preferably air cooled.
- The Blowers shall be constant volume/positive displacement type and each blower shall be provided with suction filters, pressure relief valves with the corresponding vent pipe work, necessary isolating and non-return valves, inlet and/or outlet silencer so that blower unit can comply with the noise

Document Number	Rev No.	Description	Page No.	Date of Issue

5.23 Vacuum Pumps For Fly Ash Extraction

- Vacuum pumps shall be sized to meet evacuation criteria as indicated in accompanying data sheet. A minimum margin of 10% over the above capacity shall be considered for sizing of the vacuum pumps.
- The design shall also take into account the possibility of vacuum pumps sucking in the gas containing SO₂ and SO₃
- Silencers shall be provided so that each vacuum pump complies with the noise level limits stipulated by statutory authority. Moisture Separator shall be provided to separate liquid and air and to reduce noise.

S. No	Detail	Description
1	Type	[...]
2	Total Numbers (Working and standby)	[...]
3	Design condition	Vacuum pump shall be sized for 600°C gas temperature and 340 °C seal water temperature with gas as 100% dry basis. However motor capacity shall be suitable to handle same capacity of air at 200 °C
4	Guaranteed figure	[...]

Document Number	Rev No.	Description	Page No.	Date of Issue

S. No	Detail	Description
5	Sizing of vacuum pumps	To cater to the ash removal rates as specified. A minimum margin of 10% over the above capacity shall be considered for sizing the vacuum pumps. In case the first field of ESP goes out of service, the second field shall collect the ash of first field and so on. The design shall take care of this aspect.
6	Material of Construction	
	Casing with cones/ Port Plates	Ni Cast Iron (min 2.0% Ni)
	Shaft	Carbon Steel EN8
	Impeller	Stainless Steel
	Shaft Sleeves	Stainless Steel
	Type of coupling between Pump & Motor	V Belt drives along with belt-guards.
	Accessories	Necessary moisture separator and silencer, Vibration isolation pad, Vacuum breaker, Acoustic enclosure if applicable.
	Location, Duty	Indoor, Continuous.
	Inlet seal water temperature	34 ° C
	Noise level	85 dB (max) at a distance of 1M from equipment

5.24 Instrument Air Compressors and Drives

- Each compressor unit should have all moving parts protected by a guard.
- The scope of supply shall include all the necessary compressed air plant complete with compressor coolers, necessary isolating and non-return valves, pressure relief valve, water separators, silencers and vent pipe work.
- Water separators shall be complete with automatic drain traps. Each separator shall be rated for twice the individual compressor flow at 1 bar above maximum operation pressure. Each water separator shall have flanged connections.
- The wall thickness of the cylinders shall be sufficient to withstand the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[36]	25.09.2014

maximum cylinder pressure and to permit successive re-boring without hazard.

- v) [Cooling water requirement (for water cooling - DM close cycle cooling water system to be employed, Type of water- passivated DM water) if any, should be furnished by bidder. The cooling water supply shall be given by the Owner at one mutually agreed point only].

S.No	Detail	Description
1	Type of Compressor	Oil Free Screw Compressor
2	Duty	Continuous
3	Location	[....]
4	Qty	[....]
5	Design Ambient Temperature	50 °C, 100% RH
6	Design Requirement	Instrument quality air as per Instrument Society of America Standards 7.34 to meet the requirements of instruments, valves, actuators, bag filter cleaning etc. A 10% margin shall be provided on compressor capacity over and above the maximum flow requirement.
7	Drive	Electric Motor(Six(6) starts per hour)
8	Drive motor rating	The continuous motor rating (at 50°C) shall be at least ten per cent (10%) above the maximum load demand of the compressor in the entire operating range to take care of the system frequency variation. Total maximum load demand shall include air compression power plus any power consumed in auxiliaries like cooling fan etc. When the driver is not directly coupled to the compressor, due account shall be made for losses in power transmission in addition to the above 10% extra margin
9	Annunciation	Local/Remote as required
10	Discharge Pressure	8 Kg/sq.cm or based on detailed calculations (whichever is higher)
TESTING AND INSPECTION		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[37]	25.09.2014

S.No	Detail	Description
	Hydrostatic Tests	Yes
	Spot Radiography of Welds	Yes
	Bend Test for receivers (as per BS-5169)	Yes
	Performance tests at Full load; full discharge pressure; and full RPM as per BS-1571, Part-2 or equivalent.	Yes
	Type test for motor	Yes

5.25 Air Receivers

- i) Air receiver of ample size shall be provided, so that delivered air pressure is kept within $\pm 5\%$ of rated pressure without excessive start/stop operation in the working cycle and shall cater to plant instrument air requirement, in case compressor trips.
- ii) Air receivers shall be located convenient to compressor discharge. The receivers and associated fittings shall comply with BS: 5169 and BS: 1123 or other approved standards. Manufacturing of Air Receiver for Instrument Air Compressor Will Be As Per Class-II.
- iii) The receivers shall each be supplied complete with test certificate, safety relief valve, pressure gauge, flanged inlet and outlet connections, inspection manhole (in accordance with BS: 5169-1975, or similar national/international equivalent), screwed drain connection, automatic drain trap with balance line, drain trap isolating valve, isolating valve and manual drain valve, nameplate, support frame or legs, and a set of suitable foundation bolts.
- iv) As far as possible the design, manufacture and performance of air receivers shall be in accordance with the following latest applicable standards :
 - IS: 2825 - Code for unfired pressure vessels.
 - ASME-Sec. VIII Div.-1 Code for unfired pressure vessels.
 - BS: 487 - Fusion welded steel air receivers.
 - IS: 7938 - Air receivers for compressed air installations. \

5.26 Air Drying Plants (desiccant type)

- i) General Performance Requirements
 - The air drying plants receiving compressed air saturated with moisture shall be capable of operating continuously to provide reliable moisture free compressed air. Dew point of the outlet air shall be as mentioned in the Data Specification Sheet or lower throughout the operation.
 - The delivered compressed air shall not contain any trace of oil, grease or any other impurities and air shall be free from all corrosive

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[38]	25.09.2014

contaminants and hazardous gases, flammable or toxic. Size of particles in the delivered air shall not exceed one (1) Micron. The delivered air shall be 100% oil free.

- For calculating moisture load, relative humidity and dry bulb temperature at air drying plant (ADP) inlet shall be taken as 100% and 50 °C respectively.
- For the capacity and air flow rate through drier, the data specification sheet shall be referred to.
- Air drying plant shall be complete with pre and after filter including all piping, valves, instruments and other, accessories as required for safe and satisfactory operation of the plant.
- Driers shall be suitable for part load operation while maintaining the outlet air dew point as specified above. Necessary instruments and controls shall be provided to ensure that the specified dew point is maintained irrespective of input variations.
- The Bidder shall assume full responsibility in the operation of the air drying plant as a whole.

S.No	Detail	Description
1	General Information	
a)	Installation	Indoor, Skid-mounted
b)	Duty	Continuous
c)	Quantity required	Three (3) Numbers [One with each Instrument Air Compressor]
d)	Type of Drying	Desiccant Type
e)	Service	Instrument Air
f)	Annunciation	Audio Visual
2	Performance Specification	
a)	Capacity	Same as each Instrument Air Compressor
b)	Inlet Air Pressure	To suit compressor rating

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[39]	25.09.2014

S.No	Detail	Description
c)	Outlet dew point at 1 ata	(-) 20 °C
d)	Maximum allowable air pressure drop	0.2 kg/sq.cm
3	Quality of Instrument Air	
a)	Dust Particle size	Less than one (1) micron
b)	Oil Content	100 % oil free

5.27 Ash Transportation Lines

- i) The capacity of transport air compressors shall be decided to match the capacity of extraction system i.e. the capacity of extraction and transportation system shall be similar.
- ii) The bidder shall furnish detailed calculations of compressor sizing along with the bid.
- iii) Each compressor shall have an inlet filter of dry type to protect the compressor. The filter inlet area should be large enough to ensure frequent filter changes are not required.
- iv) Cooling water requirement, if any, should be furnished along with the bids. The cooling water supply shall be given by the Owner at one point only.
- v) Bidder shall include an inlet and/or outlet silencer so that each compressor unit complies with the noise requirements outlined in Specification.

5.28 Pneumatic Ash Conveying Pipe Line

Parameters	Details
Pipe size (I.D.)	As required.
Type of Pipes for vacuum conveying	Class-D cast iron pipes centrifugally cast conforming to IS: 1536 or BS: 1211. Pipes of non standard size without conforming ARE/BS will not be accepted.
Type of Joints	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[40]	25.09.2014

Parameters	Details
Pipe to Pipe, Pipe to Fitting, Pipe to valve & valve to Fitting, Fitting to Fitting,	Flanged/sleeve coupling/bevel
Fittings (Bends, elbows laterals and spool piece etc.)	Ni-hard/chrome-alloy cast iron or equivalent. Minimum hardness 450 BHN and wear back thickness minimum 20 mm. For slurry line MS fittings with 20mm basalt lining is also acceptable. For basalt line fittings a pipe spool of one meter long having basalt lined at discharge end of bend/ elbow shall be provided. For impact bend a short spool of alloy CI shall be provided adjacent to fitting at discharge end.
Sleeve Couplings	
Material of Construction	
Sleeve	9.0 mm thick carbon steel ASTM-36/CI FG 260:IS:210
Flanges/End rings	Carbon steel to ASTM –A-108/Cast IRON FG-260, IS:210
Gasket	To suit ash temperature
Material	Nitrile (NBR) BS:2494 Grade G/Neoprene; silicon rubber/graphite asbestos
Nuts & Bolts	Hot dip galvanized as per IS:4759. Bolts, nuts and washer should be of similar material to those used for coupling housing/sleeves to minimize the possibility of galvanic corrosion.
Inspection and Testing	Yes
Pipes shall be tested hydraulically as per relevant standard.	
Fittings shall be tested hydraulically at twice the operating pressure or 1.5 times the design pressure whichever is higher.	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[41]	25.09.2014

5.29 Fly Ash Silo

Parameters	Details
Numbers provided	[...]
Capacity (each)	[...]
Capacity of Retractable chute	[...]
Capacity of Rotary Un-loader	[...]
Max. water content in unloader	[...]
Fluidizing Pads	Ceramic tiles/Sintered Bronze/ Woven SS Mesh
Particulate emission at vent filter outlet	Below 50 ppm
Unloader hood in silo	Yes /No

5.30 Rotary Drum Unloader cum Dust Conditioner

- The rotary drum un-loaders cum conditioners are located below the silo opening on an intermediate level concrete platform such that trucks can move freely underneath it.
- At the inlet of the rotary unloader there shall be a variable capacity feeder which can be controlled. These feeders accurately control the discharge of the silo into the unloader.
- At the upstream of the orifice feeder there shall be cylinder operated knife gate valves. The unloader inlet section is stationary and provided with a seal between the revolving drum & the inlet section.
- The drum will be provided with suitable guards to ensure operators' safety. Scrapper plate shall be of steel construction lined with special wear resistant alloy. There shall be expansion joint provided on the unloader to eliminate distortion & uncontrolled field variations. There shall be access doors to all parts of the unloader e.g., inlet section of the drum & discharge box.

5.31 Horizontal Centrifugal Pumps

- The ash slurry pumps, HP pumps, LP pumps, Economizer Water Pumps, sludge pumps, seal water pumps shall essentially be horizontal and centrifugal type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[42]	25.09.2014

S.No	Parameters	Description	
i)	Description	Ash slurry disposal pumps, and sludge pumps	HP, LP, Seal water, Economizer Water Pumps and other horizontal water pumps
ii)	Type	Horizontal, single stage centrifugal type(all identical pumps shall be interchangeable)	Horizontal, single or multi stage centrifugal type (all identical pumps shall be interchangeable)
iii)	Duty	Continuous	
iv)	Fluid to be pumped	Highly abrasive slurry. Pump shall be designed to handle maximum ash lump size expected at the outlet of clinker grinder	Raw Water/Clarified
v)	Parameters: -Flow & Head	As per design guidelines contained in accompanying specifications	
vi)	Suction condition	Flooded suction with suction lift of 2m	
vii)	Pump speed (max.)	1,000 rpm	1,500 rpm
viii)	Impeller tip speed	1676 meters / min. (max.)	As per manufacturers standard
ix)	Type of coupling	Variable speed Hydraulic coupling with speed reduction by means of speed reduction gear box in first stage. Speed variation + 10% - 45% with respect to rated design point in case of ash disposal pumps	Directly driven through coupling.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[43]	25.09.2014

S.No	Parameters	Description	
		For the subsequent stage through belt drive.	
x)	Material of Construction		
	Casing	Outer casing shall be of cast steel to ASTM-A216 or spheroidal Graphite Ductile iron to ASTM-A536, 65-45-12. Inner casing (Volute liners) shall be of chrome nickel cast iron (composition to NI hard-IV) of 550 BHN. Or 24% chromium cast iron of 550 BHN. Bottom Ash Overflow Pump : CI FG 260(in case single casing pump)	2-2.5% Ni-Cast Iron to IS: 210, Grade FG-260.
	Impeller	Chrome nickel cast iron (composition to NI-hard IV) of 550 BHN Or 24% chromium cast iron of 550 BHN.	Bronze Gr.I to IS:318/SS
	Wear plate / liners wear rings	- do-	Bronze Gr.I to IS: 318/SS or equivalent.
	Shaft	Carbon steel to AISI - 1040 / EN-8	Carbon steel to AISI K-1040 / EN-8
	Shaft Sleeve	Hardened and ground stainless steel (550-	As per manufacturer standard.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[44]	25.09.2014

S.No	Parameters	Description
		BHN) SS 410 BHN for BA overflow pump
	Base Plate	Steel to IS: 226 up to 20mm thickness and IS:2062 and over 20mm thickness.
xi)	Drive Motor Rating	20% margin over and above the maximum load demand in the entire operating range of pump at 50 Deg. C. 10% for water pump with HT drives & 15% with LT drives.
	Drive Motor Speed	Not exceeding 1500 rpm
xii)	Ash Slurry Pump efficiency	To be selected by Bidder. However for the purpose of evaluation, no credit shall be given for the pump efficiency in excess of 70% with handling of ash slurry for ash slurry disposal pumps, BA slurry transportation pump and BA overflow pump.

Note:-

The ash slurry disposal pumps shall also be required to handle clarifier sludge from the water treatment plant and the same shall be taken into consideration while sizing the pumps

5.32 Vertical Sump Drainage Pumps

	BA overflow Pumps, Sump drainage pumps for Vacuum Pump House Area, Silo Area, Slurry Sump Area
Type	Vertical, Centrifugal, single stage, semi-open or (open non-clogging) type impeller with no bearing inside sump.
Duty	[...]
Fluid to be pumped	[...]
Capacity and total dynamic head (Guaranteed)	[...]
Suction Condition	Submerged

Document Number	Rev No.	Description	Page No.	Date of Issue

Number of pumps	[...]
Pump speed (Max.)	1500 rpm (Max.)
Type of coupling between pump & Motor	Directly driven through flexible or rigid coupling/V-belt driven
Location of pump thrust bearing	In Motor Stool
Material of Construction	
(i) Casing	Alloy Cast Iron (350 BHN) (Min 2.7% Ni; 1% Cr.)
(ii) Impeller	Alloy Cast Iron (350 BHN) (Min 2.7%, Ni, 1% Cr.)
(iii) Impeller shaft	Stainless steel -410
(iv) Line shaft	EN - 8 to BS:970
(v) Column pipe and discharge pipe	Fabricated steel to pipe IS:2026 (Minimum 6 mm Thk)
(vi) Shaft sleeve	Hardened stainless steel to 400 BHN
(vii) Base plate	Steel to IS:2062
Motor details	
Rating	[...]
Speed	1500 rpm(max)

5.33 Valves, Pipings & Fittings

a) Slurry Disposal Line Valves At Dyke Area

- Valve shall be knife gate construction.
- The size of all valves shall be the same as that of parent pipe.
- Material of construction shall be as follows:
 - Plate : MS: IS 2062 Gr A with chrome plating.
 - Body : CI grade FG 260 to IS : 210

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[46]	25.09.2014

Note: Blank/ through spouts arrangement is also acceptable for discharge points at ash pond. This shall be subjected to acceptance during detail engineering.

b) Bottom Ash and Other Ash Slurry Line Valves

Adequately sized pneumatic cylinder operated metal to metal seated knife edge gate valves/plug valves shall be provided at the outlet of Jet pumps handling bottom ash; at the suction and discharge of combined ash slurry disposal pumps and BA over flow water pumps suction/discharge.

The selection of the type of valve shall be done based on the line pressures. It shall be ensured that the metal to metal seated knife edge gate valves strictly meet the testing requirements of MSS-SP 81 code for seat leakages.

Valves shall be provided with a mechanical indicator and limit switches to indicate open or closed position of the valve locally and remotely.

For working pressure up to 10 kg/cm² - Metal to metal seated knife gate valve shall be selected.

For working pressure above 10 kg/cm² – Plug type regular pattern valve or resilient sealed knife gate valves shall be used.

Material of construction shall be as follows:

S.No.	Parameters	Description
i)	Body/Cover	Cast iron FG-260 to IS: 210 (min. 10 mm thickness) with Ni hard deflection cone (minimum 400 BHN hardness) for knife edge gate valves. OR Carbon steels to ASTM - A - 216 Gr. WCB (0.3% carbon max.) for plug valves.
ii)	Gate/Plug	Stainless steel with min. 350-400 BHN Hardness on wear surface for knife edge gate valves (gate edge) OR Carbon steel to STM-A-216 Gr. WCB case hardened to 400-450 (port) and BHN suitably impregnated for low friction.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[47]	25.09.2014

S.No.	Parameters	Description
iii)	Stem	Stainless steel (SS-304) for knife edge gate valves OR IS: 1875 Class C made out of ASTM-A-105 (forged carbon steel) and will be suitably impregnated for low friction or BS:970-709M40.

c) Ash Slurry Sump Isolation Plug Valves, Sump Liners and Agitating Nozzles.

The ash slurry sump shall have isolated compartments. Each compartment shall serve one (1) number stream of ash slurry disposal pumps. The bottom ash slurry shall be led to a common distribution trough at the top of the slurry sumps which will have manually operated plug valves enabling the slurry to flow to the desired compartments (corresponding to the pump steams in operation).

It shall be possible to operate slurry sump isolation valves from platform at top of sump. The valve shall be provided with gear operator if effort required to operate the valve exceeds 25 kgf

Material of construction for slurry sump isolation valves shall be corrosion and abrasion resistant and shall be of quality most suited to proposed application. Suitable measures to protect the bearings from ash ingress shall be provided.

Valves shall be suitable for outdoor duty.

All the slurry distribution troughs and sump compartments shall be provided with abrasion liners in the areas of slurry impingement.

Alloy CI, 350BHN lining for the inner walls of the slurry sump shall be provided by Bidder. The lining should be minimum 20 mm thick, on side walls and 30 mm thick at bottom".

Bidder shall provide adequate number of high velocity water jetting/agitating nozzles in the slurry trenches/sumps to avoid setting of ash particles at the bottom of the trenches/sumps. The material of jetting/agitating nozzles shall be anti corrosion tool steel/or SS-410/416 of hardness 500-550 BHN.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[48]	25.09.2014

d) Water and Air Piping, Fitting and Accessories

All piping shall be provided with vents at the highest points and drains at the lowest points along with vent valves and drain cocks. Vents shall not be less than 15mm in size. Drains shall not be less than 25 mm size. The piping shall be arranged to provide clearance for the removal of equipment requiring maintenance and for easy access to valves and other piping accessories required for operation and maintenance.

Piping shall generally be routed above ground but where specifically indicated/approved by the Engineer the pipes may be arranged in trenches or buried. Bidder shall provide either coal tar or Bitumen tapes on conventional coat and wrap system for corrosion protection of buried piping as per relevant codes and standards.

Overhead piping shall have a normal minimum vertical clearance of 3 meters above walk ways and working areas and 8 meters above roadways unless otherwise approved by the Engineer.

Pipe Size in pump suction side shall be at least one pipe size larger than the corresponding pump discharge connection.

The pipe supports shall be spaced as follows:

Pipe Size (NB)	25	50	80	100	150	200	300	400	500
Spacing in meter	2.1	3.0	3.7	4.3	5.2	5.8	7.0	8.2	9.1
Data Sheet:									
WATER PIPES									
S.No.	Detail	Description							
i)	Type of Pipes	a) Up to & including 150 NB				MS, ERW pipes to IS:1239 Heavy grade			
		b) 200 NB to 450 NB				MS ERW to IS 3589. FE 410 grade.			

Document Number	Rev No.	Description	Page No.	Date of Issue

		c) 500 NB and above	Rolled and welded from MS plate to IS: 226 Dimensional tolerances as per IS: 3589 Or SAIL or Equal make spiral welded pipes.
ii)	Pipe Sizes	As required.	
iii)	Thickness of Pipes	a) Pipe specs. as per IS:1239	Pipe thickness shall be of Heavy grade.
		b) Pipe spec. as per IS:3589 (ERW)	Min 6.35 mm thick for 200 NB to 400 NB size and Min. 7.14 mm thick for 450 NB size.
		c) Pipe spec. as per IS:3589 (ERW) from IS 226 plates/spiral welded	Min. 8mm thick
iv)	Type of Line joints.		
		a) 50 NB and below	Butt welded as per ANSI B 16.25
		b) 65 NB and above.	Butt welded to ANSI: B16.25
v)	Quantity	As required	
vi)	Fittings (Bends)		
		a) For sizes up to & including 65NB	Short radius bends and material same as that of parent pipe.
		b) For sizes 80 NB to 300 NB	SR & LR elbow and material same as that of parent pipe
		c) 350 NB & above.	Miter bends with Miter angle not exceeding 22.5°.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[50]	25.09.2014

		Material shall be same as that of parent pipe and dimensional tolerance shall be as per BS: 534.
vii)	Flanges	Slip on flat face type with drilled and pressure rating as per valve and other specialties. Material of construction shall be as per IS:226 upto 20mm thickness and IS: 2062 for higher thickness.
Air Pipes		
i	Type	ERW pipe as per IS:1239, heavy grade with galvanizing as per IS:4736 for pipes upto and including 150NB. For pipes of sizes above 150 NB it shall be as per CI I (i b) & CI no. I (iii B) above
ii	Pipe Sizes	As required
iii	Pipe Thickness	as per IS:1239, heavy grade for pipes upto and including 150NB. For pipes of sizes above 150 NB it shall be as per as mentioned above for water pipes.
iv	Type of Line joints	65 NB and above : Screwed, 80 NB and above : Sleeve Welded. However valve etc. shall be screwed and with flange.
v	Quantity	As required
vi	Fittings (elbows)	As per ASTM-A-234 Gr. WPB (GI)
vii	Flanges	Raised face type G.I screwed and pressure rating as per valve and other specialties. Material of construction on shall be IS: 226 upto 20 mm thickness and IS: 2062 for higher thickness.

e) Water and Air Line Valves

Water and Air Line Valves and Specialties (As per specification indicated elsewhere suiting the service requirement) for fluidizing air line valves design and construction shall take special consideration for temperature of service fluid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[51]	25.09.2014

f) Gate/Globe/Check/Plug/Butterfly Valve

S. No	For sizes 50 mm and below and working pressure up to 15 kg/cm ² (g)	
i)	Body/Wedge/Disc	Gun Metal
ii)	Trim & Seat	Gun Metal
iii)	Stem	Brass
S. No	For sizes 65 mm and above and working pressure up to 15 kg/cm ² (g).	
i)	Body/Wedge/Disc	C.I. to IS 210 Gr. FG 260
ii)	Trim & Seat	SS/ Gun Metal
iii)	Stem	SS 410
iv)	Hand wheel	C.I. to IS 210 Gr. FG 220
S. No	For all sizes and Working pressure above 15 kg/cm ² (g).	
i)	Body/Wedge/Disc	Cast/Forged carbon steel
ii)	Wedge/Disc/Plug	Cast carbon steel with 13% Cr lined
iii)	Trim and Stem	Stainless steel
iv)	Quantity	As required.

g) Ash Slurry Disposal Pipes

The minimum wall thickness of slurry piping shall be 9.52 mm (minimum)/as per Class D (in case of Cast Iron pipe). Tolerance in pipe thickness shall be as per relevant IS/BS standard.

The bottom ash slurry transportation piping shall continue without bends, branches or merging for a distance of at least 8-10 pipe diameter length from jet pump outlet.

The ash slurry disposal pipelines shall be provided with adequately sized drain connections with blind flanges as per the final layout requirements.

Bidder shall conduct line surge studies for the ash disposal pipelines and submit these to the Engineer for review. Suitable arrangements as required to protect the system based on approved line surge studies shall be included in Bidder's scope.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[52]	25.09.2014

h) Fittings

All fittings (bends, elbows, laterals & spool pieces etc.) used in ash slurry disposal piping up-to ash dyke shall be basalt lined with flanged ends.

These fittings shall be as per good engineering practice and of large radius (Min. 3D) construction.

Alloy C.I. or Basalt lined spool pieces (as the case may be) of minimum 1.5 meters length shall be provided at the discharge of every fitting immediately after slurry pump discharge.

i) Couplings

For ease of rotation and replacement of ash slurry disposal pipes at regular intervals of time for maintenance purpose, sleeve type couplings shall be provided.

Straight length of pipes without any intermediate coupling shall not exceed 30 meters. It shall be possible to replace or rotate (as applicable) any fitting and any particular spool or pipe during maintenance without unduly disturbing neighboring healthy joints and pipe spools. Bidder shall furnish calculation for selection and spacing of couplings taking into account forces due to expansion contraction, deflection, lateral displacement etc.

The coupling shall be capable of taking a minimum of 2° angular deflection and sufficient gap between ends of pipes at couplings shall be provided to take care of expansion in piping.

S.No	Parameters	Description	
i)	Ash slurry disposal pipe	MS ERW steel pipes to SAIL commercial Quality, 9.5 thk (min)/IS:3589	
ii)	Fly ash slurry pipe	MS ERW steel pipes, 9.5 thk (min) as per IS:3589 Gr FE 410	
	I. Pipe Fittings (Bends, Elbows, Laterals And Spool Pieces Etc.)		
	Material and Hardness:	i) Up to Ash dyke ii) Over Ash Dyke	20 mm thick cast basalt lined MS fittings (MS shell of min 6 mm thickness) or Alloy CI, 400 BHN

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[53]	25.09.2014

S.No	Parameters	Description
		iii) Bottom ash slurry and fly ash slurry handling lines Ni-chrome-alloy cast iron or equivalent. Min. hardness 400 BHN. Integral wear back of minimum 20 mm thickness. Or 20 mm thick cast basalt lined MS fittings (MS shell of 6 mm thickness)
	Cast basalt fittings	Hardness : 8 mhos (minimum)
		Bending strength : 300 kg/cm ² (minimum)
		Compressive strength : 4500 kg/cm ² (minimum)
	II.Type of Joints	Sleeve type coupling joint in straight length, flanged joints at fittings, bends, elbows, laterals etc.
	III.Couplings	
	Type:	Sleeve type couplings with minimum 9.0 mm thick sleeve.
	Material of Construction	
	Sleeve:	Carbon Steel to ASTM A-36/CI FG 260: IS 210
	Flanges/ End rings:	Carbon Steel to ASTM A-108 steel / Cast Iron FG – 260
	Nuts & Bolts:	Hot dip galvanized/spray galvanized as per IS: 4759. Bolts, nuts and washers should be of similar material to those used for coupling housings/sleeves to minimize the possibility of galvanic corrosion

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[54]	25.09.2014

6 QUALITY ASSURANCE, INSPECTION & TESTING

The Bidder shall adopt Quality Assurance Programmes as per relevant standards subject to Owner's approval, to ensure that the equipment and services under the scope of work, whether manufactured or performed within the Bidder's works or at his sub-vendor's premises or at the Owner's site or at any other place of work, are in accordance with the specifications. Such programmes shall be outlined by the Bidder and shall be finally accepted by the Owner after discussions before the award of the contract. The QA programme shall be generally in line with IS/ISO-9001. The Quality Assurance Programme of the Bidder shall generally cover the following:

- a) Organization structure for the management and implementation of the proposed Quality Assurance Programme.
- b) Quality System Manual.
- c) Design Control System.
- d) Documentation and Data Control System.
- e) Qualification data for Bidder's key personnel.
- f) The procedure for purchase of materials, parts, components and selection of sub-contractor's services including vendor analysis, source inspection, incoming raw-material inspection, verification of materials purchased etc.
- g) System for shop manufacturing and site erection controls including process, fabrication and assembly.
- h) Control of non-conforming items and system for corrective actions and resolution of deviations.
- i) Inspection and test procedure both for manufacture and field activities.
- j) Control of calibration and testing of measuring testing equipment.
- k) System for Quality Audits.
- l) System for identification and appraisal of inspection status.
- m) System for authorizing release of manufactured product to the Owner.
- n) System for handling, storage and delivery.
- o) System for maintenance of records, and
- p) Quality plans for manufacturing and field activities detailing out the specific quality control procedure adopted for controlling the quality characteristics relevant to each item of equipment/component.

6.1 General Requirements - Quality Assurance

- a) All materials, components and equipment covered under this specification shall be procured, manufactured, erected, commissioned and tested at all the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[55]	25.09.2014

stages, as per a comprehensive Quality Assurance Programme. A programme of inspection/tests to be carried out by the Bidder for some of the major items is given in this technical specification. This is, however, not intended to form a comprehensive programme as it is the Bidder's responsibility to draw up and implement such programme duly approved by the Owner. The detailed Quality Plans for manufacturing and field activities shall be drawn up by the Bidder and will be submitted to Owner for approval.

- b) Manufacturing Quality Plan (MQP) will detail out for all the components and equipment, various tests/inspection, to be carried out as per the requirements of this specification and standards mentioned therein and quality practices and procedures followed by Bidder's/ Sub-vendor's Quality Control Organization, the relevant reference documents and standards, acceptance norms, inspection documents raised etc., during all stages of materials procurement, manufacture, assembly and final testing/performance testing. The Quality Plan shall be submitted to the Owner for review and approval. The format for MQP shall be submitted by the Bidder for the approval of the Owner before the award of Contract.
- c) Field Quality Plans (FQP) will detail out for all the equipment, the quality practices and procedures etc. to be followed by the Bidder's "Site Quality Control Organization", during various stages of site activities starting from receipt of materials/equipment at site. The format for FQP shall be submitted by the Bidder for the approval of the Owner before the award of Contract.
- d) The Bidder indicate in the QP the reference documents/plant standards/acceptance norms/tests and inspection procedure etc., These Quality Plans and reference documents/standards etc. will be subject to Owner's approval without which manufacturer shall not proceed. These approved documents shall form a part of the contract. In these approved Quality Plans, Owner shall identify customer hold points (CHP), i.e. test/checks which shall be carried out in presence of the Owner or his authorized representative and beyond which the work will not proceed without consent of Owner in writing. All deviations to this specification, approved quality plans and applicable standards must be documented and referred to the Owner along with technical justification for approval and dispositioning.
- e) The material shall be dispatched from the manufacturer's works after the same is accepted by the Owner.
- f) All material used for equipment manufacture including casting and forging etc. shall be of tested quality as per relevant codes/standards. Details of results of the tests conducted to determine the mechanical properties; chemical analysis and details of heat treatment procedure recommended and actually followed shall be recorded on certificates and time temperature

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[56]	25.09.2014

chart. Tests shall be carried out as per applicable material standards and/or agreed details.

- g) All welding and brazing shall be carried out as per procedures drawn and qualified in accordance with requirements of ASME Section IX/BS-4870 or other International equivalent standard acceptable to the Owner.
The welding/brazing procedures shall be followed as per Indian/International Standards.
- h) All brazers, welders and welding operators employed on any part of the contract either in Bidder's/sub-vendor works or at site or elsewhere shall be qualified as per ASME Section-IX or BS-4871 or other equivalent International Standards acceptable to the Owner.
- i) Welding procedure qualification & Welder qualification shall be as per Indian/International Standards. However, where required by the Owner, tests shall be conducted in presence of Owner for the site erection. Any other statutory requirements for the equipment/systems shall be complied with.
- j) On all back-gauged welds MPI/LPI shall be carried before seal welding.
- k) Unless otherwise proven and specifically agreed with the Owner, welding of dissimilar materials and high alloy materials shall be carried out at shop only.
- l) No welding shall be carried out on cast iron components for fabrication or repair.
- m) All non-destructive examination shall be performed in accordance with written procedures as per International Standards but qualified operator. NDT shall be recorded in a report, which includes details of methods and equipment used, result/evaluation, job data and identification of personnel employed and details of co-relation of the test report with the job.
- n) All plates of thickness above 40 mm and all bars stock/Forging above 40 mm diameter shall be ultrasonically tested.
- o) The Bidder shall list out all major items/ equipment/ components to be manufactured in house as well as procured from sub-vendors.
- p) For components/equipment procured by the Bidders for the purpose of the contract, after obtaining the written approval of the Owner, the Bidder's purchase specifications and inquiries shall call for quality plans to be submitted by the suppliers. The quality plans called for from the sub-vendor shall set out, during the various stages of manufacture and installation, the quality practices and procedures followed by the vendor's quality control organization, the relevant reference documents/ standards used, acceptance level, inspection of documentation raised, etc. Such quality plans of the successful vendors shall be finalized with the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[57]	25.09.2014

- q) If required, the Owner shall carry out quality audit and quality surveillance of the system and procedures of the Bidder's or their sub-vendor's quality management and control activities. The Bidder shall provide all necessary assistance to enable the Owner carry out such audit and surveillance. The Bidder shall also take requisite corrective measures for restoring/ improving the system in line with the outcome of such quality surveillance and audits.
- r) The Bidder shall carry out an inspection and testing programme during manufacture in his work and that of his sub-vendor's and at site to ensure the mechanical accuracy of components, compliance with drawings, conformance to functional and performance requirements, identity and acceptability of all materials, parts and equipment. Bidder shall carry out all tests/inspection required to establish that the items/equipment conform to requirements of the specification and the relevant codes/standards specified in the specification, in addition to carrying out tests as per the approved quality plan.
- s) Quality audit/surveillance/approval of the results of the tests and inspection will not, however, prejudice the right of the Owner to reject the equipment if it does not comply with the specification when erected or does not give complete satisfaction in service and the above shall in no way limit the liabilities and responsibilities of the Bidder in ensuring complete conformance of the materials/equipment supplied to relevant specification, standard, data sheets, drawings, etc.
- t) For all spares and replacement items, the quality requirements as agreed for the main equipment supply shall be applicable.
- u) Rectification procedures to be adopted to make the job acceptable shall be subject to the approval of the Owner.
- v) In case any deviation is observed with respect to relevant document or good engineering practices, and the same is considered by the Bidder to be acceptable, as it is or with certain rectifications/ modifications, based on his detailed technical analysis, then the Bidder shall refer the same to Owner along with reason for deviation, proposed corrective action, technical justification for suitability of the proposal and preventive measures for avoiding recurrence of similar deviations. Based on his evaluation, the Owner may accept the proposal as it is or with modifications or may reject the same. Such proposals shall be raised in suitable Non-conformity report format (NCR). The NCR can be raised irrespective of the CHP stages in the QP.
- w) Burn in and Elevated Temperature Test Requirement for Electronics Solid State Equipment:
- x) All solid state electronic systems/equipment shall be tested as a complete system/equipment with all devices connected for a minimum of 168 hours (7

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[58]	25.09.2014

Days) continuously under energized conditions prior to shipment from manufacturing works, as per the following cycle.

Elevated Temperature Test Cycle

During the elevated temperature test which shall be for 48 hours of the total 168 hours of testing, the ambient temperature shall be maintained at 50 °C. The equipment shall be interconnected with devices which will cause it to repeatedly perform all operations it is expected to perform in actual service with load on various components being equal to those which will be experienced in actual service.

During the elevated temperature test the cubicle doors shall be closed (or shall be in the position same as they are supposed to be in the field) and inside temperature in the zone of highest heat dissipating components/modules shall be monitored. The temperature rise inside the cubicle should not exceed 10°C above the ambient temp at 50 °C.

Burn in Test Cycle

The 48 hours elevated temperature test shall be followed by 120 hours of burn in test as above except that the temperature shall be reduced to the ambient temperature prevalent at that time.

During the above tests, the process I/O and other load on the system shall be simulated by simulated inputs and in the case of control systems; the process which is to be controlled shall also be simulated. Testing of individual components or modules alone shall not be acceptable.

In case the Bidder/ sub-vendor is having any alternate established procedure of eliminating infant mortality of components, the detail procedures followed by the Bidder/ sub- vendor along with the statistical figures to validate the alternate procedure may be submitted to the Owner for his consideration.

The Bidder/Sub-vendor shall carry out routine test on 100% item at Bidder/sub-vendor's works. The quantum of check/test for routine and acceptance test by Owner shall be generally as per criteria/sampling plan defined in referred standards. Wherever standards have not been mentioned quantum of check/test for routine / acceptance test shall be as agreed during detailed engineering stage.

6.2 QA Documentation Package

The Bidder shall submit the QA Documentation in *[two hard copies and two CD ROMs]*, as identified in respective quality plan with tick (√) mark.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[59]	25.09.2014

Each QA Documentation shall have a project specific Cover Sheet bearing name & identification number of equipment and including an index of its contents with page control on each document.

The QA Documentation file shall be progressively completed by the Bidder/ sub-vendor and the same shall be submitted to the Owner in [2 hard copies and 2 CD-ROMs], within two weeks of dispatch of the equipment.

11.2.1 Typical contents of QA Documentation is as below:-

- a) Approved Quality Plan.
- b) Material mill test reports on components as specified by the specification and approved Quality Plans.
- c) Manufacturer / works test reports/results for testing required as per applicable codes and standard referred in the specification and approved Quality Plans.
- d) Non-destructive examination results /reports including radiography interpretation reports. Sketches/drawings used for indicating the method of traceability of the radiographs to the location on the equipment.
- e) Heat Treatment Certificate/Record, if applicable (Time- temperature Chart).
- f) All the accepted Non-conformance Reports (Major/Minor) / deviation, including complete technical details / repair procedure).
- g) Inspection reports duly signed by the Inspector of the Owner and Bidder for the agreed Customer Hold Points.
- h) Certificate of Conformance (COC) wherever applicable.

Similarly, the Bidder shall be required to submit two sets [(two hard copies and two CD ROMs)], containing QA Documentation pertaining to field activities as per Approved Field Quality Plans and other agreed manuals/ procedures, prior to commissioning of individual system.

6.3 Inspection, Testing and Inspection Certificates

- a) The word 'Inspector' shall mean the Owner's Inspection engineer and/or agency acting on behalf of the Owner to inspect and examine the materials and workmanship of the works during its manufacture or erection.
- b) The Owner's Inspection Engineer and/or agency acting on behalf of the Owner shall have access at all reasonable times to inspect and examine the materials and workmanship of the works during its manufacture or erection and if part of the works is being manufactured or assembled on other premises or works, the Bidder shall obtain for the Owner's Inspection Engineer and/or an outside inspection agency acting on behalf of the Owner, permission to inspect as if the works were manufactured or assembled on the Bidder's own premises or works.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[60]	25.09.2014

- c) The Bidder shall give the Owner [fifteen (15)] days written notice of any material being ready for inspection/testing. Such tests shall be to the Bidder's account except for the expenses of the Inspector's. The Owner's Inspection Engineer and/or an outside inspection agency acting on behalf of the Owner, unless the witnessing of the tests is virtually waived and confirmed in writing, will attend such tests within [fifteen (15)] days of the date on which the equipment is noticed as being ready for test/inspection failing which the Bidder may proceed with test which shall be deemed to have been made in the inspector's presence and he shall forthwith forward to the Owner duly certified copies of test reports in [two (2) copies] for his review and approval.
- d) The Owner's Inspection Engineer and/or Owner's inspection agency acting on behalf of the Owner shall within fifteen [(15) days] from the date of inspection as defined herein give notice in writing to the Bidder, on any objection to any drawings and all or any equipment and workmanship which is in his opinion is not in accordance with the contract. The Bidder shall give due consideration to such objections and shall either make modifications that may be necessary to meet the said objections or shall inform in writing to the Owner, giving reasons therein, that no modifications are necessary to comply with the contract. After due consideration, the Owner may accept or reject the same.
- e) When the factory tests have been completed satisfactorily at the Bidder's or sub-vendor's works, the Owner shall issue a certificate to this effect within [fifteen (15) days] of completion of tests. The completion of these tests or the issue of the certificates shall not bind the Owner to accept the equipment should it, on further tests after erection be found not to comply with the contract.
- f) In all cases where the contract provides for tests whether at the premises or works of the Bidder or any sub-vendor, the Bidder, except where otherwise specified, shall provide free of charge such items as labour, material, electricity, fuel, water, stores, apparatus and instruments as may be reasonably demanded by the Owner, to carry out effectively such tests on the equipment in accordance with the Contract and shall provide the facilities to accomplish testing.
- g) The inspection by the Owner's Inspection Engineer and issue of Inspection Certificate thereon shall in no way limit the liabilities and responsibilities of the Bidder in respect of the contract.
- h) To facilitate advance planning of inspection in addition to giving inspection notice, the Bidder shall furnish quarterly inspection programme indicating schedule dates of inspection at Customer Hold Point and final inspection stages. Updated quarterly inspection plans will be made for each three

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-A	[61]	25.09.2014

consecutive months and shall be furnished before beginning of each calendar month.

- i) All inspection, measuring and test equipment used by Bidder shall be calibrated periodically depending on its use and criticality of the test/measurement to be done. The Bidder shall maintain all the relevant records of periodic calibration and instrument identification. Wherever asked specifically, the Bidder shall re-calibrate the measuring/test equipment in the presence of Owner's Inspection Engineer agency.

6.4 Shop and Site Tests

- a) Shop tests will include all tests to be carried out at Bidder's works, at works of his sub-vendor and at works where raw material supplied for manufacture of equipment is manufactured.
- b) All materials will be of tested quality supported with correlated test certificates.
- c) Shop and Site tests will include electrical, mechanical, performance and hydraulic tests in accordance with relevant IS or any other approved standard or any other tests called for by the Owner under these specifications to ensure that the plant being supplied fulfills the requirements of the specifications. For equipment not covered by any IS or other approved standards, the tests to be carried out will be in accordance with the quality plan to be agreed to between the Bidder and the Owner.

6.5 Site Tests

The successful Bidder will prepare and submit detailed quality plans in the format prescribed by Owner setting out the quality practice and procedures to be adopted by him for assuring quality for each equipment under this specification from the receipt of material at site, during storage, erection, pre-commissioning to final commissioning of the plant. These procedures will necessarily include all checks/tests conducted at site for preservation, assembly, alignment, positioning of the equipment, foundation preparation, welding/bolting, heat treatment, non-destructive examination, hydraulic test, running test, performance test etc. The above will be discussed and finalized by the Bidder with the Owner.

The Bidder will also furnish detailed quality procedure proposed by him for storage, preservation, painting, acid cleaning, alkali boil out, steam blowing, hydraulic test, air/gas tightness test etc. to the Owner. The same will be discussed and finalized by the Bidder with the Owner.

6.6 System Checking / Reliability Trials:

- a) Successful Bidder will carry out tests at site to prove to the Owner that each equipment of the supply complies with requirements stipulated and is erected in accordance with requirements specified. Before the plant is put

into trial operation the Successful Bidder will be required to conduct tests to demonstrate to the Owner that each item of the plant is capable of correctly performing the functions for which it was specified and its performance, parameters etc. are as per the specified/approved values. These tests may be conducted concurrently with those required under commissioning sequence.

1.1 General

This specification is intended to cover the [design, engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning] of Ash Handling Plant complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] Of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 List of Attachments

The following List of attachments is enclosed along with this specification.

[Note: List of attachments is depends on specific project scope of work. R & M consultant may attach the attachments as per project specific scope of work. For reference all attachments are considered in this package as per scope of work considered]

ANNEXURES-E1

1.0 MOTOR

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Electric Motor complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes & Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

IS : 325	:	Specification for three phase induction motor.
IS : 900	:	Code of Practice for installation and maintenance of induction motors
IS : 996	:	Single phase AC motors
IS : 1231	:	Dimensions of three-phase foot-mounted induction motors
IS : 1271	:	Thermal evaluation and classification of electrical insulation.
IS : 2223	:	Dimensions of flange mounted ac induction motors.
IS : 2254	:	Dimensions of vertical shaft motors for pumps
IS : 3177	:	Crane duty motors
IS : 4029	:	Guide for testing three phase induction motors.
IS : 4691	:	Degree of protection for enclosures of rotating electrical machinery.
IS : 4722	:	Specification for rotating electrical machinery.

NEMA, MG-1	:	Motors and Generators
ISO : 1940-1	:	Mechanical vibration – Determination of permissible residual unbalance

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E1	[2]	25.09.2014

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All motors shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The motors shall be suitable for operation in a highly polluted environment.
- b. AC Motors shall be of [constant speed, squirrel cage, three/ single phase, induction type.] Motors shall be rated for [continuous duty/intermittent duty]. They shall also be suitable for long period of inactivity. They shall also be suitable for direct online starting (DOL starting).
- c. DC motors provided for emergency service shall be shunt / compound wound type. Motor shall be sized for operation with fixed resistance starter for maximum reliability.
- d. Power supply for AC motors shall be as follows:

Table: 2.0

1.	[Below 0.22 kW]	:	240V, 1 Phase, 50Hz
2.	[From 0.22 kW up to & including 160 kW]	:	415V, 3 Phase, 50Hz
3.	[Above 160 kW]	:	6.6kV, 3 Phase, 50Hz

- e. All AC motors shall be suited for the following range of frequency and voltage variations:

- i. Voltage Variation : +/-10%
- ii. Frequency Variation : 50Hz (+)3% to (-)5%
- iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency

- f. DC motors shall be rated for 220V DC supply with voltage variation of -15% to +10%.
- g. The motor characteristics shall match the requirements of the driven equipment so that adequate starting, accelerating, pull up, break down and full load torques are available for the intended service.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E1	[3]	25.09.2014

- h. Moreover, motors shall be so designed that maximum inrush currents and locked rotor and pullout torque developed by them at extreme voltage and frequency variations do not endanger the motor and driven equipment.
- i. Motors shall be capable of developing the rated full load torque even if the supply drops to 70% of the rated voltage.
- j. For 6.6kV motors, locked rotor current not to exceed [600%] of full load current, including positive tolerance, except for BFP. For BFP the starting current shall be [450%] of FLC. For 415 V motors Locked rotor current not to exceed [600%] of full load current with IS tolerance.]
- k. For DC motors, the starters shall be provided to limit the starting current to [2] times of the full load current.
- l. Maximum continuous motor ratings shall be at least [10%] above the maximum load demand of the driven equipment under entire operating range including voltage and frequency variations.
- m. Accelerating torque at any speed with the lowest permissible starting voltage shall be at least [10%] motor full load torque. Pull out torque at rated voltage shall not be less than 205% of full load torque. It shall be 275% for crane duty motors.
- n. The motors shall be suitable for bus transfer schemes provided on the 6.6kV and 415V systems without any injurious effect on its life. If motors are connected to an automatic bus transfer system, they may be subjected to 150% of the nominal voltage during changeover of buses due to the phase difference between the incoming voltage and motor residual voltage. In such cases, motors shall be capable of restarting under full load after momentary loss of voltage.
- o. Motors shall be of [energy efficient of type Eff-2] as per IS: 12615/equivalent IEC/ International Standards.
- p. Motor shall be designed to keep torsional and rotational natural frequencies of vibration of the motor and driven equipment at least 25% above the motor operating speed range.

1.3.1 System Grounding

Table: 3.0

(a)	6.6 kV	:	Low Resistance Grounded to limit the earth fault current to [300 Amps]

b)	Paint Thickness	:	[Within 100 to 150 micron.]
c)	Paint Shade	:	[RAL5012 BLUE]

1.4 Specific Requirements

1.4.1 Locked Rotor Withstand Time

- The starting time of the motor shall be at the minimum permissible voltage.
- For motors with starting time up to 20 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E1	[6]	25.09.2014

condition at highest voltage limit shall be at least 2.5 second more than starting time.

- c) For motors with starting time more than 20 second and up to 45 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot condition at highest voltage limit shall be at least 5 second more than starting time.
- d) For motors with starting time more than 45 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot condition at highest voltage limit shall be more than starting time by at least 10% of the starting time.
- e) Speed switches mounted on the motor shaft shall be provided in cases where above requirements are not met.

1.4.2 Starting Voltage Requirement

I.	All motors (except mill motors):
a)	[85% of rated voltage for motors up to 4000 kW]
b)	[75% of voltage for motors above 4000 kW]

II.	For mill motors:
a)	[85% of rated voltage for motors above 1000 kW]
b)	[90% of rated voltage for motors below 1000 kW]

The motor shall be capable of withstanding the stresses imposed if started at 110% rated voltage.

Pump motor subject to reverse rotation shall be designed to withstand the stresses encountered when starting with non-energized shaft rotating at [125%] rated speed in reverse direction.

The motor may be subjected to sudden application of 150% rated voltage during bus transfer, due to the phase difference between the incoming voltage and motor residual voltage.

1.4.3 Winding and Insulation

a)	6.6 kV AC motors	:	Winding material shall be of copper. Insulation shall be of [Class F with winding temperature rise limited to Class B]. They shall withstand 1.2/50 microsecond switching surges of "4U + 5 KV" (U= Line voltage in KV). The coil inter-turn insulation shall be suitable for 0.3/3 micro second surge of 32 / 12 KV followed by 1 min
----	------------------	---	--

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E1	[7]	25.09.2014

			power frequency high voltage test of appropriate voltage on inter turn insulation.
b)	415V AC & 220V DC motors	:	Winding material shall be of copper. Insulation shall be of [Class B with temperature rise limited to Class B.]
c)	Conveyor motors		Short circuit rings of conveyor motors shall be either joint less or welded type. Brazed joint is not acceptable.

1.4.4 Motor Control

a) For HV Motors

- i. Motors of rating above [160 kW] shall be suitable for 6.6 KV voltage
- ii. Frequent starting motors of rating above [160 kW] shall be suitable to be controlled by vacuum contactors

(b) For LV Motors

- i. Motors of rating less than [132 kW] shall be operated by Contactor from respective MCCs. Motors of rating up to [18.5 kW] shall be provided with MPCBs and Electronic overload relays. Motors of rating above [18.5 kW] and below [45 kW] shall be provided with MCCBs and Electronic overload relays. Motors of rating [45 kW] and above but less than [132 kW] shall be provided with MCCBs and CT operated Electronic over load relays.
- ii. Motors of rating [132 kW] and up to [160 kW] shall be suitable to be controlled by Air circuit breakers from switchgear, PMCCs and shall be provided with comprehensive numerical motor protection relays.
- iii. Only for firefighting system, motor rated [upto 200kW] shall be fed from 415V switch board.

1.4.5 Starting duty

Motors shall be suitable for [3 nos. consecutive Cold starts ups and 2 nos. consecutive Hot starts ups.] Motors shall be suitable for three equally spread starts per hour when the motor is under normal service condition.

1.4.6 Bearings

- a) Anti-friction type radial and thrust bearings (ball, roller) and sleeve bearing shall be rated for minimum standard life of 40,000 hours taking bearing and driven equipment loads (in case the drive is not having

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E1	[8]	25.09.2014

separate thrust bearing) into account. If bearings are lubricated, loss of grease shall be scarce and it shall not creep along shaft into motor housing. Facility of removal of excess grease shall also be provided for grease lubricated bearings.

- b) Vertical shaft motors shall be provided with thrust and guide bearings. Thrust bearing of tilting pad type is preferred. However, if Anti-friction bearings can take vertical thrust, thrust & guide bearings are not required.
- c) Bearing shall be effectively sealed against dust ingress and shall be pressure grease gun lubricated. The bearing and housing shall be so designed that greasing shall be possible while the motor is running, without removal of covers.
- d) Where bearing supports are attached to the motor casing, adequate bracing shall be provided on these supports to reduce vibrations and ensure life of bearings.
- e) If the bearings are oil lubricated, a drain plug shall be provided for draining residual oil and oil level gauge shall be provided to show precisely oil level required under standstill and running conditions.
- f) Unless otherwise approved, bearing lubricating system shall be such that no external forced oil or water is necessary to maintain required oil supply to keep bearing temperature within design limits.
- g) Lubricants shall be selected for prolonged storage and normal use of motors in tropical climate and shall contain corrosion and oxidation inhibitors. Greases shall have suitable bleeding characteristics to minimize setting. The selected lubricants shall be indigenously available.
- h) Motors rated above 1000 kW shall have insulated bearings to prevent flow of shaft currents.

1.4.7 Temperature Rise

- a) For Air Cooled Motors, temperature rise of insulation should be limited to [70 °C] over ambient temperature by resistance method.
- b) For Water Cooled Motors, temperature rise of insulation should be limited to [80 °C] over inlet cooling water temperature mentioned elsewhere, by resistance method.

1.4.8 Cooling

[All motors shall be either Totally Enclosed Fan Cooled (TEFC) or Totally Enclosed Tube Ventilated (TETV) or Closed Air Circuit Air Cooled (CACA) type. However, motors rated 3000 kW or above can be Closed Air Circuit Water Cooled (CACW)]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E1	[9]	25.09.2014

1.4.9 Enclosure

- a) All motor enclosures shall conform to the degree of protection of [IP54] for indoor and IPW-55 for outdoor installation unless otherwise specified. Motor for outdoor or semi outdoor service shall be of weather proof construction. Motors of large output rating located indoor could have screen protected drip proof (SPDP) enclosure conforming to [IP-23.]
- b) For motors located in outdoor & corrosive locations, FRP canopy shall be provided. In case steel canopy is provided, the same shall be epoxy painted to meet the surrounding atmosphere. Motors located in hazardous areas such as Hydrogen plant shall have flame proof enclosures of Group – IIB conforming to IS: 2148.
- c) For hazardous locations such as fuel oil facilities area, the enclosure of motor shall have flame proof construction conforming to IS 2148.

1.4.10 Noise Level and Vibration

Noise level shall be limited to 85 dB (A) at 1.5 meters from the motor. However the same shall be as per IS: 12065 unless otherwise specified. The peak amplitude of vibration shall be within the specified limits laid down in IS: 12075. Motors shall withstand vibrations produced by driven equipment. HV motor bearing housings shall have flats in both X and Y directions suitable for mounting 80mmX80mm vibration pads. Vibration pads with screwed holes for mounting vibration probes shall be provided at both DE and NDE.

1.4.11 Temperature Monitoring

[In HV motors, at least four numbers simplex/ two numbers duplex platinum resistance type temperature detectors shall be provided for each phase of stator winding]. Each bearing shall be provided with dial type thermometer with adjustable alarm contact and two numbers duplex Platinum resistance type temperature detector (3 wire, 100 ohm at zero °C). In case of CACA and CACW motors dial type temperature indicator shall be provided (one each for hot and cold air temperature monitoring for CACA and CACW and one each for inlet and outlet water temperature monitoring for CACW). If alarm and trip are required for cooling air temperature, temperature switch shall be provided. The contact rating shall be minimum 0.5A at 220V DC and 5A at 240V AC. Flow switches shall be provided for monitoring cooling water flow of CACW motor and oil flow of forced lubrication bearing. Low voltage motors rated 100 kW and above shall be provided with two PT100 RTDs per phase of winding.

1.4.12 Earthing

Motor body shall have two earthing points on opposite sides. Motor terminal boxes shall also have separate grounding terminals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E1	[10]	25.09.2014

1.4.13 Termination

- a) HV motors can be offered with either Elastimold termination or dust tight phase segregated double walled (metallic as well as with insulated barrier) cable boxes. In case Elastimold terminations are offered, then protective cover and trifurcating sleeves shall also be provided. Removable gland plates of thickness 3 mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material for single core cables) shall be provided in case of cable boxes. The main cable box / terminal box shall withstand [a fault current up to 40 kA for 0.25 seconds for HV motors and 50 kA for 0.25 seconds for LV motors]. Separate terminal boxes shall be provided for space heaters and RTDs and NCT (if applicable).
- b) [All terminal boxes shall be capable of being turned through 360 degrees in steps of 90 degrees unless otherwise specified.]
- c) For HV motors the distance between gland plate and the terminal studs shall not be less than 500 mm.

1.4.14 Differential Protection

For motors rated 6.6kV, [2000 KW & above,] neutral current transformers of PS class shall be provided on each phase in a separate neutral terminal box for differential protection.

1.4.15 Tropical Protection

- (a) All motors shall have fungus protection involving special treatment of insulation and metal against fungus, insects and corrosion.
- (b) All fittings and hardware shall be corrosion resistant.
- (c) Space Heater
- (d) Suitable single phase space heaters operated at 240V, 50Hz, 1Phase AC supply shall be provided on motors rated for 30KW and above to maintain windings in dry condition when motor is standstill. Separate terminal box for space heaters & RTDs shall be provided.
- (e) The space heater shall be sized to maintain the motor internal temperature above dew point when the motor is in idle condition.

1.4.16 Rating Plate

Motor shall have Stainless steel nameplate(s) showing diagram of connections, all particulars as per IS: 325 / NEMA-MG-1 and following additional information:

- (a) Type of bearing and recommended lubricants along with location of insulated bearing.
- (b) Temperature rise under normal/abnormal conditions.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E1	[11]	25.09.2014

(c) In addition to above, an arrow block shall be screwed on to the body of motor on the non-driving end to indicate normal direction of rotation of motor.

(d) Year of Manufacture

1.4.17 Drain Plug

Motor shall have drain plugs so located that they shall drain the water, resulting from the condensation or other causes from all pockets of the motor casing.

1.4.18 Dowel Pins

Motor shall be designed to permit easy access for drilling holes through motor feet or mounting flange for installation of dowel pins after assembling the motor and driven equipment.

1.4.19 Painting

The complete motor assembly including fan shall be painted with corrosion proof paints of approved class.

1.4.20 Lifting provision

Motor weighing 25 Kg or more shall be provided with eyebolt or other adequate provision of lifting.

1.4.21 Local Push Button Station (LPBS)

- a) Each motor shall be provided with push button station as per process requirement i.e. Start/Stop or Emergency Stop.
- b) The degree of protection of LPBs shall be IPW 55 for outdoor and IP 54 for indoor applications.
- c) All Push Buttons shall be push to actuate type and stop Push Button shall be lockable in off position as per the scheme requirement.
- d) The Emergency local stop push button of Stay put type shall be provided with Press to lock & turn to release keyless mechanism.
- e) All PBs shall be provided with 2 numbers NO and 2 numbers NC contacts for various interlocking purposes. One contact of stop PB shall be directly wired to switchgear module for direct tripping and another contact to control system.
- f) Terminals to be suitable for 2 cores of 2.5 Sq.mm. cable with 20% spare terminals.
- g) All LPBS shall be of Poly Carbonate /FRP / Die Cast Aluminium material.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E1	[12]	25.09.2014

I) TestsType Test

For each type & rating of HV and LV motors of rating above [50 kW], the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last[five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The following shall constitute the type tests:

- (a) Visual and dimensional check
- (b) Winding resistance measurement
- (c) No load test
- (d) Mechanical vibration
- (e) Direction of rotation versus phase sequence
- (f) Insulation resistance measurement
- (g) High potential test
- (h) Locked rotor test
- (i) Speed/torque test
- (j) Over speed test
- (k) Temperature rise test
- (l) Determination of characteristic
- (m) Degree of protection test for the enclosure.
- (n) Noise level
- (o) Shaft current and bearing insulation test (Applicable for HV motors)

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E1	[13]	25.09.2014

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.5 Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

Dimensional General Arrangement drawing

- a) [Motor sizing calculation
- b) Foundation Plan & Loading
- c) Cable end box details
- d) Space requirement for rotor removal
- e) Thermal withstand curves hot & cold
- f) Starting and speed torque characteristics at 80% & 100% voltage
- g) Complete motor data
- h) Erection & Maintenance Manual
- i) Test reports
- j) QAP]

1.6 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

S. No.	Technical Particulars	Unit	Parameters	Remarks
1	Motor application		[As per requirement]	
2	Rated Output, kW	kW	[As per requirement]

1.0 MOTORIZED ACTUATORS

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Motor Operated Actuator complete with all accessories for efficient and trouble-free operation of valves, dampers and gates for R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes & Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

CEA	CEA Regulations
CEA	Standard Technical Specifications For Main Plant Package
IEC: 60034-1	Rotating electrical machines.
NEMA, MG-1	Motors and Generators

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- All motor operated actuators shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%.
- Depending on the required type of services, the rating of motor operated actuators shall be selected. For isolating service, the actuator shall be [rated for three successive open-close operations of the valve/ damper or 15 minutes continuous operation whichever is higher.] Whereas for regulating service, the actuator shall be suitably [time rated for required number of duty cycle or 150 start per hour whichever is higher].
- The actuator shall be accompanied with constant speed, squirrel cage, three/ single phase, induction motor. The motor shall be designed for high

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E2	[2]	25.09.2014

torque and reversing service. They shall also be suitable for direct online starting (DOL starting).

- d. Motors of actuators shall be suited for the following range of frequency and voltage variations:

- i. Voltage Variation : +/-10%
- ii. Frequency Variation : 50Hz (+)3% to (-)5%
- iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency

- e. The motor operated actuator shall be sized for performing open / close operation at rated speed against designed differential pressure at [90%] of rated voltage. The motor shall have [10%] design margin on the shaft design power.

The actuator shall meet the following performance requirements:

- i. Open & Close the valve completely and make leak tight valve closure without jamming.
- ii. Attain full speed of operation before valve load is encountered and impart an unseating blow to start the valve in motion (hammer blow effect).
- iii. The motor reduction gearing shall be sufficient to lock the shaft when the motor gets de energized and prevent drift from torque switch spring pressure.
- iv. The entire mechanism shall withstand shock resulting from closing with improper setting of limit switches or from lodging of foreign matter under the valve seat.
- v. The actuator shall be designed for mounting in any position without any lubricant leakage or operating difficulty.

1.4 Specific Requirements

1.4.1 Construction

- a) The actuator shall essentially comprise of drive motor, limit switches, gear train, clutch, hand wheel, position indicator/ transmitter, space heater and internal wiring.
- b) The actuator enclosure shall be totally enclosed, dust tight, weather proof with [IPW 55] degree of protection.
- c) All electrical equipment, accessories and wiring shall be provided with tropical finish to prevent fungus growth.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E2	[3]	25.09.2014

- d) Gear train shall be made of metal (fiber gears are not acceptable). Self locking feature shall be provided to prevent drift under torque switch (wherever applicable) spring pressure when motor is de energized.
- e) Manual wheel shall disengage automatically during motor operation.

1.4.2 Type

- a) The actuators shall have integral starters along with overload relays with built-in single phase preventer.
- b) A 415 V, 3 phase, 3 wire, 50 Hz power supply will be provided from power plant 415 V switchgear through MCCB. Control voltage of the starter circuit shall be 110 V AC or depending on manufacturer's practice. But the same shall be derived from incoming 415 V, 3 phase, 3 wire supply.

1.4.3 Motors

- a) Type: The drive motor shall be three phase, squirrel cage induction motor suitable for direct on line starting with starting current limited to six times the rated current
- b) Enclosure: The motor shall be totally enclosed, self ventilated with [IPW 65] degree of protection.
- c) Insulation: The motor winding shall be insulated with [Class – B] insulation having temperature rise limited to [Class – B].
- d) Bearing: The motor bearing shall be [double shielded, grease lubricated and antifriction type].
- e) Earthing: At least two earthing terminals shall be provided for the motor body. Separate earthing terminal should be provided for terminal box.
- f) Protection: The following electrical protections should be provided for the motor:
 - i. Single Phasing Protection
 - ii. Overload Protection
 - iii. Overheating Protection through thermostat
 - iv. Wrong Phase Sequence Protection
- g) Limit Switches: Each actuator shall be accompanied with following switches:
 - i. Four nos. positional limit switches (2 for open & 2 for close), each adjustable at any position from fully open to fully closed positions of the valve / damper.
 - ii. Two torque limit switches, one for each direction of travel, self blocking & adjustable torque type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E2	[4]	25.09.2014

- iii. Four nos. end travel limit switches, two for each direction of travel.
 - iv. A single shaft shall actuate all contacts of limit switches at each position.
- h) Interface: Open/close command termination logic with position and torque limit switches, positioned circuit shall be suitably built in the PCB inside the actuator.
- i. For binary drive, open/close command and status thereof and disturbance monitoring signal (common contact for overload, thermostat, control supply failure, L/R selector switch at local, other protections operated) shall be provided. Interface with the control system shall be through hardwired signal only. Interposing relays provided (with coil burden 2.5 VA) in the DCS shall be energized to initiate opening and closing, by 24V DC signal from the external control system. Potential free contact provided by the IPR shall be utilized in the control circuit of the contactor of motorized actuators.
 - ii. For modulating drive, the command to actuator shall be in form of 4- 20mA signal. The necessary positioning circuit and motor protection shall be provided.
 - iii. Open/close command termination logic shall be suitably built inside actuator.
- i) Hand Wheel: Each actuator shall be provided with a hand wheel for emergency manual operation. The hand wheel shall disengage automatically when the motor is energized.
- j) Position Indicator / Transmitter: The actuator shall have
- i. One built in local position indicator for 0 – 100% travel.
 - ii. One position transmitter of modulating / inching type for remote indication suitable to stabilize 4-20mA signal and operated with [24V DC].
- k) Space Heater: Space heater of suitable rating shall be provided. The power supply shall be derived from main power supply available in the actuator.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E2	[5]	25.09.2014

- l) Wiring: All electrical devices shall be wired up to and terminated in a terminal box. The internal wiring shall be done with [2.5 sqmm] copper wires. All wiring shall be well identified at both ends with ferrules.
- m) Terminal Box:
- i. The terminal box shall be weather proof with removable front cover and cable glands suitable for cable connection. The terminals shall be suitable for connection of [2.5 sq.mm copper conductor].
 - ii. Necessary double compression cable glands with nickel coating and tinned copper lugs for cables shall be provided.
 - iii. The terminal block shall be suitable for 650V grade power cable.
- .
- n) Rating Plate : Motor and actuator shall have Stainless steel nameplate(s) showing all particulars as per relevant IS/ IEC and following additional information:
- i. Type of bearing and recommended lubricants.
 - ii. Temperature rise under normal/abnormal conditions.
 - iii. Degree of Protection
 - iv. In addition to above, an arrow block shall be screwed on to the body of motor on the non-driving end to indicate normal direction of rotation of motor.
 - v. Year of Manufacture

1.5 Tests

The actuator and all components thereof shall be subject to routine factory tests as per relevant IS standards. In addition, if any special test is called for in equipment specification, the same shall be performed.

1.5.1 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum [7] days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc.]

1.5.2 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished with requisite no. of copies for approval of the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E2	[6]	25.09.2014

- b) The equipment shall be dispatched from works only after receipt of owner's written approval of shop test reports.

1.6 Drawings Data and Manuals

The drawings, data & manuals for the motorized actuators shall be submitted as indicated below:

1. [Actuator Data Sheet
2. General arrangement drawing
3. Internal wiring Diagram and Control Schematic.
4. Torque switch and Limit switch contacts development.
5. QAP for Test Reports
6. Manufacturer's Catalogue.
7. Instruction manuals on Installation methods.]

1.7 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

S. NO.	DESCRIPTION	UNIT	DATA
1.	Type		Integral
2.	Application		[As per project specific]
3.	Motor type		Squirrel Cage
4.	Supply voltage	V	415 V, 3 ph, 3 wire.

TECHNICAL SPECIFICATION FOR LV TRANSFORMERS

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E3

1.0 LV TRANSFORMER (DRY TYPE/OIL TYPE)

1.1 General

This specification is intended to cover [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of LV Transformers (Dry type/Oil type) complete with all accessories for efficient and trouble free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

CODE	NAME OF STANDARD
IS:334	Dimensions for porcelain Transformer bushing
IS:335	New insulating oil for transformers and switchgears

CODE	NAME OF STANDARD
NEMA ST 20	Dry Type Transformers for General Applications
CEA	CEA Regulations
CEA	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) The transformers shall be dry type (AN) for indoor location and shall be oil type (ONAN) for outdoor location.
- b) The oil type transformer shall be installed in hot, humid and tropical atmosphere with ambient temperature equal to 50°C. All equipment, accessories and wiring shall be provided with tropical finish to prevent fungus growth.
- c) The transformer shall be capable of continuous operation at specified rating under the following condition:
 - i) Voltage variation - $\pm 10\%$
 - ii) Frequency variation - $[+3\%, -5\%]$
 - iii) Combined voltage and frequency variation (absolute sum) - $[10\%]$
- d) The transformer shall be capable of withstanding the short circuit stresses due to a terminal fault on one winding with full voltage maintained on the other winding for minimum period of two (2) seconds.
- e) The noise level shall be limited to the value specified by NEMA Standard Publication No. TR-1-1993 when measured in accordance with conditions outlines in ANSI/IEEE C57.12.90-1999/IS13964/CBIP publication.
- f) The design shall be such as not to cause any undesirable interference with radio or communication circuits.
- g) Transformers shall accept without injurious heating, combined voltage and frequency variation which produce an over fluxing condition of 120% for one (1) minute.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E3	[3]	25.09.2014

- h) Each transformer shall be sized based on actual load with 10% margin and considering voltage regulation factor. It shall be sized by considering 100% load connected on the bus considering other transformer outage. An appropriate load factor of 0.9 for continuous and 0.2 for intermittent shall be considered.
- i) The impedance of the transformers shall be chosen such that the fault level on the LV switchgear does not exceed 50kA including the motor contributions and also voltage dip while starting the motor does not exceed 15% at motor terminal.

1.4 Specific Requirements of Transformers

1.4.1 Enclosure (for dry type)

- a) The encapsulated cast resin transformer shall be housed in naturally ventilated floor mounted cold rolled sheet steel cubicle with louvers backed by fine brass wire mesh. The enclosure shall be of bolted type fabrication and degree of protection shall be at least IP32. The minimum sheet steel thickness shall be 2 mm.
- b) Enclosure shall be provided with lifting lugs and grounding terminals at both ends. Further the enclosure door shall have pad locking provision.
- c) The enclosure door shall be interlocked with service transformer incoming breaker such that.
 - The door can be opened only when the service transformer HV side circuit breaker is in Test/Isolated position.
 - [6.6] kV side circuit breaker can be closed only when the doors are closed.
- d) Necessary illumination with controls shall be provided in the enclosure.
- e) Thermostatically controlled space heater inside the enclosure of suitable rating shall be provided if necessary.

1.4.2 Tank (for oil type)

- a) For LV transformers, the tank shall be of conventional type.
- b) Tank shall be made from good commercial grade low carbon steel and shall be of welded construction.
- c) Tank shall be designed to permit lifting, by crane or jacks of the complete transformer assembly filled with oil. Suitable lugs and bosses shall be provided for this purpose.
- d) Tank together with radiators, coolers, conservator, bushings vessel and other fittings, shall be designed to withstand full vacuum without permanent distortion.
- e) The transformer top shall be provided with a detachable tank cover with a bolted flanged gasket joint. Lifting lugs shall be provided for removing the cover. The surface of the cover shall be suitably sloped so that it does not retain rain water.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E3	[4]	25.09.2014

- f) The material used for gaskets shall be cork-neoprene or approved equivalent. Gasketed joints for tank and manhole covers, bushings and other bolted attachments shall be so designed that the gasket will not be exposed to the weather. Spare gaskets shall be provided for all openings as shipping gaskets will not be reused.
- g) Tank shall be provided with all necessary valves.
- h) Tank shall be provided with a pressure release device which shall operate at a pressure below the test pressure for the tank and radiators. This device shall be of sufficient size for rapid release of any pressure that may be generated in the tank and which may result in damage to the equipment. The device shall be rain proof after blowing and shall be provided with a device visible from ground to indicate operation. An equaliser pipe connecting the pressure relief device to the conservator shall be supplied. This device shall be provided for all transformers. Pressure relief device shall be equipped with remote monitoring/alarm contacts

1.4.3 Core

- a) The transformers shall be three phase core type. The core shall be built up with high grade, non-ageing, low loss, high permeability grain oriented cold rolled silicon steel laminations especially suitable for core material. Laminations shall be annealed in a non-oxidizing atmosphere to relieve stresses and restore the original magnetic properties of CRGO sheets after the cutting and punching operations.
- b) CRGO sheets shall be coated with insulation varnish. Insulation shall be able to withstand the curing temperature and shall reduce eddy current to minimum. The core shall be protected from corrosion with a rust-resistant coating.
- c) The core clamping brackets shall be designed to provide an even distribution of clamping forces to the core, yokes and legs and shall be rigidly braced to reduce sound levels and losses.

1.4.4 Winding

- a) The coils shall be manufactured from electrolytic copper conductor with sufficient number of radial supports and fully insulated for rated voltage.
- b) The insulating material shall conform to Class F. Coils shall be so insulated that impulse and power frequency voltage stresses are minimum and shall withstand even the severest of temperature fluctuations.
- c) Coil assembly shall be suitably supported between adjacent sections by insulating spacers and barriers. The windings shall be arranged to ensure a free circulation of the air and to reduce the hot spots in the winding.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E3	[5]	25.09.2014

- d) All leads from the windings to the terminal board and bushings shall be rigidly supported to prevent injury from vibration or short circuit stresses. Guide tube shall be used where practicable.
- e) The core and coil assembly shall be securely fixed in position so that no shifting or deformation occurs during movement of transformer, under short circuit stresses, switching or other transients.
- f) All coils rated 1200V or higher shall be subjected to partial discharge tests to ensure a properly cured and void free casting.

1.4.5 Encapsulation (for dry type)

- a) HV and LV coils shall be separately cast under vacuum in fibre glass reinforced epoxy resin compound. The insulation shall be fire resistant, non-inflammable, non-hygroscopic and resistant to temperature fluctuations.
- b) The epoxy shall contain filler material providing characteristics superior to unfilled epoxy including higher temperature rating, better heat conductivity, better arc resistance and adhesion to the conductor, plus a coefficient of expansion closer to that of the conductor material. The epoxy resin shall be self extinguishing.
- c) Encapsulated winding shall be free of internal voids, surface irregularities, etc. No surface finishing of encapsulated winding shall be undertaken after the process of encapsulation.

1.4.6 Insulating Oil (for oil type)

- a) The transformer shall be filled with mineral insulating oil suitably inhibited to prevent sludging.
- b) The quality of oil to be supplied for the transformer shall conform to the parameter specified in IS: 335 with latest amendments. No inhibitors shall be used in oil. Prior to filling oil shall be tested as per IS: 335 for tan delta, specific resistivity, breakdown voltage, moisture content etc.
- c) Transformer shall be dispatched oil filled. 10% excess oil for topping up shall be supplied in non-returnable container suitable for outdoor storage.
- d) Oil preservation shall be by means of conservator tank complete with silica gel breather and oil seal.
- e) Oil preservation shall be by means of bellows/ diaphragm sealed conservator tank with silica gel breather to avoid direct connection between atmosphere and transformer oil. It shall be complete with level gauges, pipes , drain valve etc. The level gauges shall be so placed that same can be readable standing from ground.
- f) Necessary device shall be kept to provide annunciation in the event of rupturing of bellow.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E3	[6]	25.09.2014

1.4.7 Tappings (OCTC)

- a) Off-circuit taps as specified shall be provided on the high voltage winding.
- b) The transformer shall be capable of operation at its rated KVA on any tap provided the voltage does not vary by more than $\pm 10\%$ of the rated voltage corresponding to the tap.
- c) The winding including the tapping arrangement shall be designed to maintain electromagnetic balance between HV and LV windings at all voltage ratios.
- d) A warning plate indicating that switch shall be operated only when the transformer is de-energized shall be provided.
- e) Off circuit tap changer switch where provided shall be 3 phase, hand operated, by an external handle with position markings and pad locking facility and mechanical stops to prevent over cranking beyond extreme positions.
- f) Arrangement shall be such that switch can be operated at standing height from ground level.
- g) The operating handle can be padlocked at any tap position. The design shall be such that the lock cannot be inserted unless the contacts are correctly engaged. The mechanism shall be provided with a mechanical tap position indicator with pad locking facility.

1.4.8 Fittings and Accessories:

The following fittings and accessories shall be provided :

- a) Earthing pads: Two earthing pads of copper or other non-corrodible material shall be welded at the bottom corners of the transformer tank and supplied with clamp type terminals suitable for the purchaser's earthing conductors. Suitable earthing terminals on cable boxes shall also be provided.
- b) Terminal marking and rating plates shall be as per the specified standard.
- c) In case of oil type, the conservator shall be of sufficient volume to maintain the oil seal from the minimum ambient temperature of -5°C up to an oil temperature of 100°C , with oil level varying within the minimum and maximum visible levels with necessary accessories.
- d) In case of oil filled type, Valves shall be supplied on the transformer tank and radiators.
- e) Pressure relief device: Pressure relief device shall be provided for transformers rated 2 MVA and above which shall be of sufficient size for rapid release of any pressure that may be generated within the tank and which may result in damage of the equipment
- f) Gas and Oil Actuated Relay (Magnetic Reed Type Gas & Oil Relay):

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E3	[7]	25.09.2014

A double float type magnetic reed type gas and oil relay as per applicable standard shall be provided for all oil filled transformers. All gas evolved in the transformer shall collect in this relay. The relay shall be provided with a test cock suitable for a flexible pipe connection for checking its operation. The device shall be provided with two electrically independent ungrounded contacts, one for alarm on gas accumulation and the other for tripping on sudden rise of pressure. These contacts shall be wired up to the transformer marshalling box. The relay shall be provided with shut off valves on the conservator side as well as the tank side.

g) Temperature Indicators

i Oil temperature indicator (OTI)

All oil type transformers shall be provided with a 150 mm dial type thermometer for top oil temperature indication. The thermometer shall have adjustable, electrically independent ungrounded alarm and trip contacts, maximum reading pointer and resetting device. The contacts shall be rated minimum 0.5A making and 0.2A breaking at 220V DC.

ii Winding Temperature Indicator (WTI):

A device for measuring the hot spot temperature of the winding shall be provided. The accuracy class of winding temperature indicator shall be $\pm 20^{\circ}\text{C}$ or better.

iii Oil Level Indicator:

A magnetic type oil level indicator shall be provided to indicate oil level in the tank.

iv RTD/transducers for remote annunciation:

In addition to the above mentioned indicators, the Oil and winding temperature measurement, RTDs / transducers shall be provided for remote indication in the DCS. RTDs shall be duplex platinum type with nominal resistance of 100 ohms at zero degree centigrade.

h) Bushing Current Transformers for stand by earth fault protection shall be provided in the neutral bushing and lead shall be brought to Marshalling box.

i) Radiator (oil filled type): Tank mounted radiators banks shall have bolted flanged connections and pipe extensions to permit withdrawal of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E3	[8]	25.09.2014

transformer tank without disturbing the radiators. Flexible joints shall be provided in the interconnecting pipes (unless otherwise approved) to facilitate erection and dismantling and reduce transfer of vibrations from tank to radiator. The interconnecting pipes shall be provided with drain plug and air release vents.

- j) Conservator (For oil filled type): The transformers rated below 7.5MVA shall be provided with conventional single compartment conservator with dry air filling the space above the oil.

1.4.9 Bushings

- a) The bushing shall conform to the requirements of IS:2099 and IS:3347.
- b) All transformer bushings shall be of porcelain (for oil filled)/ epoxy (for dry type).
- c) The neutral terminal of 433V winding shall be brought out on a bushing along with the 433V phase terminal to form a 4 wire system for the 433V. Neutral CTs shall be located in the lead coming out of the winding and location of these CTs shall not be inside the tank.
- d) The neutral terminal of secondary shall be brought out through an outdoor. Further this neutral terminal shall be connected by a copper flat of size [50 mm x 6] mm, which shall be brought down upto 100 mm above ground. The copper flat shall be insulated and supported from the tank body.

1.4.10 Terminal arrangement

- a) Cable boxes
- Wherever cable connections are specified, suitable cable boxes shall be provided and shall be air insulated.
 - Cable boxes shall have drilled gland plate of adequate size to receive cables and to allow easy termination.
 - Removable drilled gland planes shall be provided in the cable boxes.
 - The additional supports for the cable boxes shall be galvanised iron.
 - The contractor shall provide earthing terminals on the cable box, to suit [50mmx6] mm GI flat.
- b) Bus duct
- Wherever Bus duct termination is specified a flanged throat or equivalent connection shall be provided for termination of bus duct enclosure. The winding termination shall be outdoor type bushing. The material of the bus duct termination arrangement of the transformer shall be nonmagnetic. The bus duct may be either phase-segregated or non-segregated.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E3	[9]	25.09.2014

- ii. Tolerance permissible for the height of terminals and bus duct flange location specified for bus duct termination over ground level is $\pm 5\text{mm}$. Contractor has to ensure that radiator, conservator and explosion vent do not obstruct the path of the bus-ducts.

1.4.11 Marshalling box

- a) A sheet steel weather, vermin and dust proof marshalling box shall be furnished. The sheet steel used shall be at least 2.0 mm (CRCA) thick. The box shall be free standing floor mounted/tank mounted type and have a sloping roof. The degree of protection shall be IP-55 in accordance with IS:2147.
- b) The marshalling box shall have a glazed door of suitable size for convenience of temperature indicators reading.
- c) All incoming cables shall enter the marshalling box from the bottom.

1.4.12 Wiring

- a) All control, alarm and indication devices provided with the transformer shall be wired up to the terminal blocks.
- b) Wiring shall be done with 650V PVC wires in conduit or PVC armored cable. *[Minimum wire size shall be 1.5 sq.mm stranded copper. Not more than two wires shall be connected to a terminal. 20% spare terminals shall be provided.]*
- c) Multi-way terminal block complete with mounting channel, binding screws and washers for wire connections and marking strip for circuit identification shall be provided for terminating the panel wiring. *[Terminals shall be stud type, suitable for terminating 2 nos. 2.5 mm2 stranded copper conductor and provided with acrylic insulating cover.]*
- d) All devices and terminal blocks shall be identified by symbols corresponding to those used in applicable schematic or wiring diagram. Each wire shall be identified, at both ends, with interlocking type permanent markers bearing wire numbers as per Bidder's Wiring Diagrams. AC / DC wiring shall have separate colour-coding.
- e) Wire termination shall be made with crimping type connectors with insulating sleeves. Wires shall not be spliced between terminals.

1.4.13 Painting

- a) All steel surfaces shall be thoroughly cleaned by sand blasting and / or by chemical agents, as required to produce a smooth surface free of scales, grease and rust.
- b) The external surfaces, after cleaning, shall be given a coat of high quality red oxide or yellow chromate primer followed by filler coats.
- c) The transformer finished with two coats of epoxy based powder coated paint. The paints shall be carefully selected to withstand tropical heat,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E3	[10]	25.09.2014

rain etc. The paint shall not scale off or crinkle or be removed by abrasion due to normal handling.

- d) Painting shade shall be subject to owner's approval.
- e) Sufficient quantity of touch-up paint shall be furnished for application at site.

1.4.14 Name Plate

Nameplates of approved design shall be furnished at each cubicle (one no. each at front as well as at backside of cubicle) and at each instruments & device mounted on or inside the cubicle. The material shall be lamicaid or approved equal, 3 mm thick with white letter on black background. Self-tapping screws shall hold the nameplate. *[Nameplate size shall be minimum 20 x 75mm for instrument/device and 40 x 150mm for panels. Caution notice on suitable metal plate shall be affixed at the back of terminal Box.]*

1.5 Tests

1.5.1 Type Tests

For each type & rating of LV Transformers, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within *[last five]* years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within *[last five]* years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The following shall constitute the type tests:

- a) Temperature rise test
- b) Dielectric test

1.5.2 Routine Tests

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

The following tests shall be performed on each transformer as a minimum:

- a) After assembly, each core shall be pressure tested for one minute at 2KV (r.m.s.) A.C. between all bolts, side plates, structural steel works and the core.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E3	[11]	25.09.2014

- b) The wiring for auxiliary power and control circuitry shall be subjected to withstand one minute power frequency test with 2.0KV (r.m.s.) to earth
- c) Measurement of winding resistance
- d) Measurement of voltage ratio and check of phase displacement
- e) Measurement of short circuit impedance and load loss
- f) Measurement of no load loss and current
- g) Dielectric routine tests
- h) Excitation loss and current measurements shall be made at 90%, 100% and 110% of the rated voltage as routine test.
- i) Partial discharge test
- j) Tan delta test

1.5.3 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

1.5.4 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings/ Data and Manuals

Drawings, data, and manuals for the transformers shall be submitted as indicated below:

- a) *[General Arrangement Drawing]*
- b) *Dimensioned general arrangement drawing showing enclosure, core coil assembly, terminal arrangement, marshalling box and various fittings.*
- c) *Transport/shipping dimensions with weights, wheel base detail etc.*
- d) *Foundation plan & loading.*
- e) *Bus duct/cable termination arrangement.*
- f) *Control schematics and wiring diagrams.*
- g) *Test reports and QAP*
- h) *Any other relevant drawing or data necessary for satisfactory installation, operation and maintenance.*
- i) *Instruction manuals on Transformer and its various fittings The manual shall clearly indicate method of installation, checkups and tests to be carried out before commissioning of the equipment.]*

**TECHNICAL SPECIFICATION FOR 415V SWITCHGEAR,
MCC & DBs**

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E4**1.0 415V SWITCHGEAR, MCC AND DB****1.1 General**

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of 415V Switchgear MCC and DBs, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

Codes	Name of Standard
IS : 1248	Direct acting indicating analogue electrical measuring instruments and their accessories
IS: 2551	Danger notice plates
IS :2705	Current transformers-specification
IS :3156	Voltage transformer specification
IS :3231	Specification for electrical relays for power system protection
IS: 8084	Specification for interconnection busbars for AC voltages above 1kV up to and including 36kV.
IS :8623	Specification for low-voltage switchgear and control gear assemblies
IS :8686	Specification for static protective relays
IS :10118	Code-of practice for selection installation and maintenance of switchgear and control gear
IS :12021	Specification for control transformers for switchgear and control gear for voltages not exceeding 1000 v ac
IS : 13947 (Part 1)	Specification for low-voltage switchgear and control gear
IS : 13947 (Part 2)	Specification for low-voltage switchgear and control gear –part 2: circuit breakers
IS : 13947 (Part 4)	Specification for low-voltage switchgear and control gear -part 4 : contactors and motor feeders

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[1]	25.09.2014

Codes	Name of Standard
IS : 13947 (Part 5)	Low-voltage switchgear and control gear specification Part 5 : control circuit devices and switching elements
IEC 61439	Low voltage switchgear and control gear assemblies.
CEA	CEA regulations for installation and operation of meters 2006.
CEA	Standard technical specifications for main plant package

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) All 415V Switchgear, MCC and DB shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The Switchgear shall be suitable for operation in a highly polluted environment.
- b) All 415V Switchgear, MCC and DB shall be suitable for following voltage & frequency variations as follows:

Voltage Variation	:	(±) 10%
Frequency Variation	:	(+) 3% to (-) 5%
Combined Variation of Voltage & Frequency	:	10% (absolute sum)
For DC system	:	-15% to +10%

- c) 415 V switchgear & MCCs shall be of indoor /outdoor, double front/single front [Preferably single front] and fully draw out type. ACB feeder may be of single tier/two tier configuration depending upon rating. DBs (ACDB / DCDB) shall be of single / double front [Preferably single front] and fixed type. These shall be CRCA sheet metal enclosed and assembled to form a rigid, free-standing floor mounted structure. Vertical units shall be assembled to form a continuous line up of panels. Compartmentalized multi-tier configuration shall be provided.
- d) All AC motor starters shall be suitable for Direct on Line (DOL) starting. Motors rated below [132]kW shall be provided with combination starters consists of MCCB/MPCB, contactors and electronic over load relay and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[2]	25.09.2014

the motor starter shall comply with Type – 2 coordination conforming to relevant code and standards. Motors rated [132] kW and above shall be breaker controlled and shall be provided with comprehensive motor protection relay. Motors rated above [160]kW shall be fed from MV Switchgear [Only for firefighting system Motor rated up to 200kW shall be fed from 415V switch board].

- e) For 415 V switchgear & MCCs Feeders rated [630A] and above shall be equipped with Air Circuit Breaker (ACB). Outgoing/Incoming feeders rating below [630] A shall be MCCBs.
- f) For DBs Incomer rated 630A and above shall be ACB. Incomer below 630A shall be MCCB. Outgoing feeder may be MCCB/MCB depending upon the bus fault level.
- g) All ACB shall be draw out type & should have Service, test and disconnected positions with positive indications for service & test positions. It shall be possible to charge the springs manually, if, required
- h) Local/remote selection shall be provided for all incoming/Outgoing ACB module. Incoming/Outgoing breaker shall be closed at service position from remote (DCS) and at test position from Local(Switchgear).
- i) Two out of three breaker logic shall be considered for switchgear/MCC. However mechanical interlock shall be considered for income of MCCB operated DBs.
- j) Also, Local/remote selection switch shall be provided for all motor modules for control from Remote(DCS). Also for breaker operated motor, breaker shall be closed in Test position from local(Switchgear).
- k) All motors shall be provided with Emergency stop push button.
- l) Control circuits shall operate at suitable voltage of 110V AC or 220V DC. Necessary control supply transformers having primary and secondary MCCB/MCB shall be provided for each MCC, 2 x 100% per section. However breaker shall operate on 220V DC. The auxiliary bus bars for control supply shall be segregated from bus bars. This control supplies shall be monitored.
- m) All the numerical relays shall have communication on two ports, local front port communication to laptop and a second port with [IEC 61850 protocol] to communicate with DCS.

1.4 Specific Requirements

1.4.1 Construction

All 415V switchgear, MCC and DBs shall have following minimum features.

- a) All 415V switchgear, MCC and DBs shall be metal enclosed, indoor, floor mounted and free standing type. The panels shall be suitable for cable entry at bottom and busduct connection at top.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[3]	25.09.2014

- b) Between 415V Switchgear and dry type transformers, non segregated phase bus duct is considered. Hence switchgear shall be suitable for this connection and necessary flange connection and co ordination with busduct manufacturer in this regards is covered in this specification.
- c) All frames and load bearing members shall be fabricated using mild steel structural sections or pressed and shaped cold rolled sheet steel of thickness not less than 2 mm.
- d) Frame shall be enclosed in cold rolled sheet steel of thickness not less than 2 mm. Doors and covers shall also be of cold rolled sheet steel of thickness not less than 1.6 mm. Removable gland plates of thickness 3mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material)shall be provided for all panels. Suitable removable type lifting hooks and / or jacking pad shall be provided on each panel or shipping section for ease of lifting of switchgear. These hooks when removed shall not leave any opening in the panels
- e) Each breaker shall be housed in a separate cubicle, complete with an individual front access door. Each vertical section shall have a removable back cover.
- f) The switchgear enclosure shall confirm to the degree of protection IP-54 (for outdoor). For indoor, enclosure shall confirm to IP52, however for Busbar chamber of switchboards rated above 1600A, degree of protection shall be IP-42.
- g) Paint shade for complete panels excluding end covers shall be [RAL 9002] and [RAL 5012] for extreme end covers for all board.
- h) The switchgear assembly shall comprise a continuous, line-up of single / multi tier cubicles. The installations of circuit breakers however shall be limited to the bottom two tiers only. Working height shall be limited to [250 mm to 1800 mm] from the floor level.
- i) Metallic barriers shall be provided between vertical sections and also between adjacent modules to ensure prevention of accidental contact with live parts during routine inspection/maintenance of functional units or cable terminations of one or more functional units when working on those of adjacent units. These barriers shall have insulating inserts as necessary for taking the interconnections etc
- j) A nameplate with switchgear designation shall be fixed at the top of the central panel. A separate nameplate giving feeder details shall be provided for each compartment. A separate nameplate giving details of bus section shall also be provided for switchgears having more than one bus section.
- k) Name plate shall be provided for each equipment (lamps, push buttons, switches, relays, auxiliary contactor, etc) mounted on the switchboard. Special warning plates one each on each feeder of a shipping section shall be provided on removable covers of doors giving access to cable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[4]	25.09.2014

terminals and busbars. Name plate size shall be minimum of 20x75 mm for Instruments/devices and 40x50 mm for panels. Thickness shall be minimum 3 mm.

- l) For MCC/DB a full height vertical cable chamber with cable supports shall be provided in each section to facilitate unit wiring.
- m) 2x100%, 415V/110V AC control transformer shall be provided for control, Indication and annunciation supply for contactor operated motor feeder. All the necessary auxiliary and main contactor shall be provided suitable for this control supply.
- n) Two 220V DC feeders shall be provided for control, Indication and annunciation of breaker operated module.
- o) Compartment door shall be interlocked with main power isolating device for safety with provision for defeating it by authorized person.
- p) Supplier shall provide total 20% or minimum one (1) no. spare feeder of each type & rating with respect to total requirement of the switchgear.
- q) Motors of rating 30 kW and above shall be provided with anti-condensation heaters. Necessary provision for supply of motor space heating shall be considered in the switchgear.
- r) The incoming connection to transformer of more than 1000kVA and inter-connecting sections between switchboards shall preferably be of bus ducts.
- s) It should be possible to carryout maintenance on a feeder with adjacent feeders alive.

1.4.2

Bus and Bus taps

- a) The main buses and connections shall be of high [conductivity Aluminum / Copper] alloy sized for specified current ratings with temperature rise limited [to 40°C over ambient temperature of 50°C].
- b) Silver plating shall be done on copper bar wherever copper to copper and copper to aluminum contacts are envisaged. All connection hardware shall be non-magnetic and shall have high corrosion resistance. Adequate contact pressure shall be ensured by means of two bolts connection with plain & spring washers and locknuts. Temperature rise shall not exceed 105 degree for silver plated joints over an ambient temperature of 50 degree.
- c) Bus bars and connections shall be fully insulated for working voltage with adequate phase / ground clearances. Insulating sleeves for bus bars and shrouds for joints shall be provided.
- d) Bus insulators shall be flame-retardant, track resistant type with high creepage surface. All buses and connections shall be supported and braced to withstand the stresses due to maximum short-circuit current and also to take care of thermal expansion.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[5]	25.09.2014

- e) Bus bars shall be color coded for easy identification and so located that the sequence R-Y-B shall be from left to right, top to bottom or front to rear, when viewed from the front to switchgear assembly.
- f) Power shall be distributed to each module or compartment by a set of vertical bus bars. The vertical bus bars shall run behind the modules. Necessary tee off connectors shall be used for distributing auxiliary supply to each vertical panel. Rubber grommets shall be used for all wire entries to make the entries dust and vermin proof.
- g) The clearance between the individual bare phase power bus bars and between the phase and earth bus bars in air shall be not less than [25.4] mm.
- h) Three phase, neutral (with at least [50] % rating of main Bus bar and continuous earth bus shall be provided. Bus bar and tapping shall be provided with color coded PVC sleeves.

1.4.3

Air Circuit Breaker

- a) All Circuit Breakers for incoming feeders and Bus couplers shall be [four] poles; single throw, motor operated and air break type. Circuit breaker for outgoing feeders shall be triple pole, single throw and air break type. However for supply feeders it shall be [four] pole.
- b) Circuit Breakers shall be [draw out type] having Service, Test & Disconnected positions with positive indication for each position.
- c) Circuit breakers of identical rating shall be physically and electrically interchangeable.
- d) Bolted disconnected links shall be provided for all outgoing feeders for isolation of neutral, if necessary.
- e) For motor wound mechanism, spring charging shall take place automatically after each breaker closing operation. One open – close – open operation of the circuit breaker shall be possible after failure of power supply to the motor when the spring is charged after a closing operation.
- f) Mechanical safety interlock shall be provided to prevent the circuit breaker from being racked in or out of the service position when the breaker is closed.
- g) Automatic safety shutters shall be provided to fully cover the female primary disconnects when the breaker is withdrawn.
- h) Each breaker shall be provided with an emergency manual trip, mechanical ON-OFF indicator, an operational counter and mechanism to indicate spring charge / discharge condition.
- i) In addition to the auxiliary contacts required for normal breaker operation and indication, each breaker shall be provided with followings for interlocking purpose:-
 - i. Position / cell switch with 4 No + 4 NC contacts.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[6]	25.09.2014

- ii. Limit / auxiliary switches shall be convertible type that is facility for changing N.O. contact to N.C. and vice-versa.
- iii. Mechanical stopper to prevent accidental falling while withdrawing.
- j) Breaker cannot be racked in from 'isolated' to 'test' position with the door open together with provision for defeat of this interlocking, however, the door can be closed only when the breaker is brought back to 'isolated' position. Insertion of breaker into 'Service' position not possible if the shutters are not free.
- k) Door can be opened only when breaker is OFF and is in 'Isolated' position. Remote closing of breaker not permitted with door open.
- l) Anti pumping relay / device to ensure that there can be only one closing operation for each closing command.
- m) Suitable trolley arrangement shall be provided for breaker/starter modules. Two trolleys per switchgear room shall be provided so that top most breaker module of all types, sizes and rating can be withdrawn on trolley and lowered for maintenance purpose.
- n) Closing and tripping coil shall operate satisfactorily under the following conditions.
 - i. Closing Coil: 85% to 110% of rated voltage.
 - ii. Tripping Coil : 70% to 110% of rated voltage.

1.4.4 Contactors, MCCB and MPCB

- a) Incomers for MCCs and DBs rated below 630A shall be MCCB.
- b) Incomer and bus coupler rated below 630A shall be mechanically Interlocked.
- c) Motor starter contactors shall be of air break, electromagnetic type. Suitable for DOL starting of motor, and shall be of utilization category AC-3 for ordinary and AC-4 for reversing starters. DC contactor shall be of DC-3 utilization category.
- d) The contactors shall be three pole, air break type designed for [duty class III category A.C. –3 with non-bouncing silver / silver alloy.]
- e) Each contactor shall be provided with two (2) normally open and two (2) normally closed auxiliary contacts unless otherwise specifically stated. Rating shall be decided by the bidder.
- f) Reversing contacts shall be electrically and mechanically interlocked.
- g) Contactors with delayed dropout feature shall be provided for some essential auxiliaries. These contactors shall not dropout on power failure if the voltage is restored within 3 seconds.

1.4.5 Electronic over load relays

- a) Electronic overload relays shall conform to IEC:292-1 and shall be triple pole, ambient temperature compensated with adjustable setting, inverse time lag, built in single phase preventer and hand/auto reset type

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[7]	25.09.2014

provided as per requirement along with necessary command, feedback cable, coupling relays etc.

- b) Provided with 1 NO and 1NC contact of rating same as the auxiliary contact of the contactors.
- c) The relay shall be able to withstand prospective short circuit current without damage or injurious heating till the motor protection MCCB/MPCB clears the fault.
- d) Relays may be direct acting or CT operated, depending on current rating. CTs shall be included in the scope of supply.

1.4.6 Bus Transfer scheme:

Each switchgear of two incomer and bus coupler shall be provided with the following provisions.

- i) Dead bus closing.
- ii) Manual live change over (Momentary paralleling)
- iii) Automatic bus transfer scheme.

1.4.7 Current Transformer

- a) Current Transformers shall be cast-resin type. All secondary connections shall be brought out to terminal blocks where wye or delta connection shall be made.
- b) CTs shall have polarity makings indelibly marked on each transformer at the lead terminations and at the associated terminal block. Facility shall be provided for short circuiting and grounding the CT secondary at the terminal blocks. Secondary terminals shall be provided with protective cap.
- c) CT terminal block shall be disconnecting type and suitable for round type lugs with facility for testing and short circuiting of individual CT.
- d) All CTs shall be provided with supports independent of busbars / busbar supports. The CTs shall be located in such a way that they can be easily approached for maintenance without necessitating shutdown of adjacent feeders.
- e) CTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.8 Voltage Transformer

- a) Voltage transformers(VT) shall be cast-resin type with an accuracy class of 1.0 for metering and 3P for protection.
- b) VTs shall be of the single-phase type. VTs shall be protected on their primary side by MCCBs with interrupting ratings corresponding to breaker rating and by MCB (with auxiliary contacts) on the secondary sides.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[8]	25.09.2014

- c) VTs shall have continuous over voltage factor of 1.2 and short time over voltage factor of 1.5 for 30 seconds for effectively earthed system
- d) It shall be possible to replace VTs without having to de-energise the main busbars.
- e) VTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.9 Transducer

For all the incoming and the outgoing of 415V Switchgear / MCC/ DB Feeders requiring remote metering and/or current monitoring shall be provided with multi-functional transducers. The output shall be 4-20 mA DC which shall correspond to the normal range.

1.4.10 Secondary Wiring

- a) The switchgear shall be fully wired at the factory to ensure proper functioning of control, protection and interlocking schemes.
- b) Fuse /MCB and links shall be provided to permit individual circuit isolation from bus wires without disturbing other circuits. All spare contacts of relays, switches and other devices shall be wired up to terminal blocks.
- c) Secondary wiring within the switchgear shall be carried out in a neat and systematic manner and securely held in position (either loomed or run in conduit / trunking). Wherever wiring passes through compartment, it shall be run in conduit / trunking, if metallic shall be bonded to the main earth busbar.
- d) Wiring shall be done with flexible, 1.1/0.650kV grade, PVC insulated switchboard wires with [stranded copper conductors of 2.5 mm² for CT & PT circuits and 1.5mm² for control circuit wiring.]
- e) Each wire shall be identified, at both ends, with permanent markers bearing wire numbers as per bidder's wiring diagrams. Wire terminations shall be made with crimping type connectors with insulating sleeves, wire shall not be spliced between terminals.

1.4.11 Terminal Blocks

- a) Terminal blocks shall be 660V grade box-clamp type with marking strips, similar to 10 mm² or equal. Terminals for C.T. secondary leads shall have provision for shorting.
- b) Not more than two wires shall be connected to any terminal. If more than two wires at one terminal are required, separate terminals with function wise shorting links shall be provided. [Spare terminal equal in number to 20% of active terminals shall be furnished.]
- c) Terminal blocks shall be located to allow easy access. Wiring shall be so arranged so that individual wires of an external cable can be connected to consecutive terminals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[9]	25.09.2014

1.4.12 Ground bus

- a) A ground bus, rated to carry maximum fault current, shall extend full length of the switchgear. The ground bus shall be provided with two-bolt drilling with G.I. bolts and nuts at each end to for connection to the grounding conductor / flat.
- b) Each unit shall be connected directly to the ground bus. The frame of each circuit breaker and draw out V.T. unit shall be grounded through heavy multiple contacts at all times except when the primary disconnecting devices are separated by a safe distance.
- c) C.T. & V.T. secondary neutrals shall be earthed through removable links so that earth of one circuit may be removed without disturbing others. All hinged doors shall be earthed by flexible copper bride.

1.4.13 Space Heater

- a) Each vertical section shall be provided with thermostat controlled space heater 5A, 3 pin socket plug.
- b) In addition, motor feeders rated [30 KW and above] shall be wired up for feeding the motor space heater through suitably rated breaker auxiliary NC contact and/or contactor.
- c) Cubicle heater, Motor heater, and Plug socket circuit shall have individual switch fuse units/MCB.

1.4.14 AC Distribution Boards (ACDBs)

- a) AC Distribution Boards shall have MCCB/MCB at incomer depending upon the short circuit rating. Distribution Boards may be fed from switchgear and shall have two incomers. AC distribution Boards shall be of two types - one with 415V, 4-wire, triple pole and neutral (TPN) outgoing feeders and the other with 240V, 2-wire, single pole and neutral (SPN) outgoing feeders.
- b) For small loads, MCB boards with TPN MCB as incomer and TPN/SP MCBs for outgoing may be considered. The feeder rating and quantity shall be as per requirement.
- c) Board shall be single/double front [preferably single front], metal clad, front matched, dust and vermin proof, fixed type, compartmentalized and extensible on both sides.
- d) Bus bars shall have same cross section throughout the length. Rating of the neutral bus bar shall be 50% of the main bus bar. Earth bus bar shall run in bottom chamber throughout the length of the Board.

1.4.15 DC Distribution Boards

DCDBs shall have two incomers and a bus coupler. Incomers and outgoing feeders of DCDBs shall be MCB/MCCB modules. They shall be fixed type and floor mounted. Other constructional features shall be similar to ACDB.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[10]	25.09.2014

The feeder rating and quantity shall be as per requirement.

1.4.16 Control & Indication

The circuit breaker shall be wired up for local & remote operation. Each breaker cubicle shall be equipped with following:

- a) Remote selector switch with pistol grip handle and key interlock for breakers with motor wound spring charging mechanism. In Remote position, the breaker can be operated in service position with all interlock and protections. In switchgear position, the breaker shall be operated from switchgear only in test position with only protection (no interlock).
- b) Two (2) heavy duty, oil-tight, push buttons for Trip & Close.
- c) Circuit breaker shall be indicated electrically. The following indication colour shall be used.

Breaker open - GREEN

Breaker closed - RED

Spring Charged - WHITE

Breaker Auto Trip- AMBER

- d) However, any other indication shall be provided as per owner's requirement.
- e) Lamps shall be LED type with resistance for voltage protection. Lamp and lens shall be replaceable from the front.
- f) For all MCCB feeders, trip indication lamp shall be provided on front of the compartment.
- g) For all starters, ON, OFF and trip indication lamps shall be provided on front of the compartment.

1.4.17 Relays, Protection & Metering

- a) The hardware design for protection and associated equipment shall use latest state-of-the-art technology and shall generally be integrated numerical/digital, modular in nature. Where design is based on numerical technology, adequate self testing/monitoring/diagnostic facilities shall be provided.
- b) All numerical relays, auxiliary relays and devices shall be of types, proven for the application; satisfying requirements specified elsewhere and shall be subject to Purchaser's approval. Numerical Relays shall have appropriate setting ranges, accuracy, resetting ratio, transient overreach and other characteristics to provide required sensitivity to the satisfaction of the Owner.
- c) All protective relays shall be in draw out or plug-in type / modular cases with proper testing facilities. Necessary test plugs / test handles shall be supplied loose and shall be included in supplier's scope of supply.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[11]	25.09.2014

- d) All AC operated relays shall be suitable for operation at 50 Hz. AC voltage operated relays shall be suitable for 110 Volts VT secondary and current operated relays for [1 or 5] amp CT secondary. All relays and timers shall be rated for control supply voltage as mentioned elsewhere under parameters and shall be capable of satisfactory continuous operation between 80-120% of the rated voltage. Voltage operated relays shall have adequate thermal capacity for continuous operation.
- e) Energy meters shall be provided for incomer of 415V Switchgear and MCC and shall be able to communicate with DCS. These meters shall be as per CEA regulation 2006 "Installation and operation of meters". Accuracy class shall not be less than 1.0S.
- f) Provision shall be made for easy isolation of trip circuits of each relay for the purpose of testing and maintenance.
- g) All protective relays and alarm relays shall be provided with one extra isolated pair of contacts wired to terminals exclusively for future use.
- h) The relay shall be designed to perform satisfactorily under highly noisy electrical environment. Sufficient degree of high frequency disturbance immunity and impulse voltage withstand capacity shall be built into electronic designs as stipulated in relevant standards.
- i) All protections shall be furnished complete with necessary auxiliary, supervisory, lock out relays. Suitably separate sets of single phase auxiliary C.T with multiple taps shall be provided with relay whenever required.
- j) Visual and audible alarm annunciation shall be initiated in the event of operation of protective/supervisory relay.
- k) D.C supply shall be supervised by DC supervision relays.
- l) Trip circuit shall be supervised by Trip circuit supervision.
- m) Tripping shall be done through high speed lock out relays.
- n) All meters/ instrument shall be flush mounted on front panel, at least 96mm² size with 90° linear scales and accuracy class of 2.0.
- o) Interposing relays for ON/OFF command or any other command shall be as per system requirement.
- p) For alarm and Indication at DCS end necessary contacts shall be provided at switchgear end.
- q) Metering and protection shall be as per below table

a)	Incomers	
	Protections	Metering
i	Time graded short circuit protection	Local Current (single phase) indication and remote indication through transducer.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[12]	25.09.2014

ii	Over current protection	Voltage Measurement for all three phases and remote indication through transducer.
iii	Earth fault protection	KW, Kwhr
b)	Bus coupler	
	Protections	Metering
i	Over current protection(51)	Local Current (single phase) indication.
ii	IDMT Earth fault protection(51N)	
c)	Contactor controlled motor feeders [90kW and above motor only]	
	Protections	Metering
i	Time graded short circuit protection	Local Current indication and remote indication through transducer.
ii	Over current protection	
c)	[Motor Feeders [of 132KW and above only]]	
	Protections	Metering
	Composite motor protection to cover a minimum of protections such as over current, short circuit, earth fault, locked rotor, Negative phase sequence, thermal overload etc.	Local Current indication and remote indication through transducer.
[Other feeders]		
a)	Bus PT / Line PT Modules	
	Protections	Metering
	Under voltage protection	[Voltage – phase to phase,]
	Fuse failure protection	
b)	Motor feeders (MPCB/MCCB with Contractors)	
	Protections	Metering
	Electronic Overload relay (with single phase preventor), short circuit protection (through fuse/MCCB/MPCB as specified)	
c)	Incoming feeders for ACDB/DCDB	
	Protections	Metering

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[13]	25.09.2014

	Short circuit protection (if MCCB)	[Voltage (single phase and, Phase Current (1 Phase))] Local indication only.
d)	Outgoing feeders of ACDB/DCDB	
	Protections	Metering
	Short circuit protection (through fuse/MCCB)	

1.5

Tests

I) Type Test

For each type & rating of 415V Switchgear, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the switchgear similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

The minimum tests shall be conducted are as follows:

- Measurement of insulation resistance of Circuit Breaker in closed and open positions.
- Measurement of milli-volt drop across Circuit Breaker main contacts and other joints.
- Measurement of Circuit Breaker/Contactor operating time for close & open at nominal voltage and 80% of rated voltage.
- Measurement of resistance, IR value and drop-off/pick-up voltage of close and trip coils.
- Healthiness of limit switch contacts.
- Spring charging motor functional checks.
- Verification of phase sequence and checking of clearances of busbars between phase to phase and phase to earth.
- Measurement of milli-volt drop across busbar joints

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[14]	25.09.2014

- i) Torque tightness test.
- j) High voltage test on busbar.
- k) Measurement of CT/PT polarity, ratio and knee point voltage.
- l) Electrical and mechanical interlock checks.
- m) Secondary injection of all protection relays by using service settings and simulation of all protection functions.
- n) Secondary injection of all metering circuits.
- o) Functional tests to demonstrate the specified control and interlocks

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates:

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawing & Documents

Drawings, data & manuals for the motors shall be submitted as indicated below

- a) [General Arrangement drawings and cross-section showing constructional features & cable entry with bottom view with opening.
- b) Bill of Materials.
- c) Technical Data sheet and Catalogue.
- d) Foundation drawing details with bottom view of switchgear.
- e) Descriptive write-ups and literature for the main equipment offered including relays, meters, etc.
- f) Control Schematics & Wiring diagram.
- g) Inspection and Test Plan (ITP).
- h) Suggestive list of protective relays.
- i) Transport/shipping dimensions and weights].

1.7 Ratings & Requirements

415V switchgears, MCC and DB shall comply with the particulars indicated in the following tables.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E4	[15]	25.09.2014

Table- 2.0

S. No.	DESCRIPTION	UNIT	DATA
1.0	General		
1.1	Name of Manufacturer		
1.2	Place & Country of manufacture		
1.3	Specifications and Standards		
2.0	Switchgear Details		
2.1	Rated voltage, phases & frequency		415 Volts, 3 Phase, 4 wire 50 Hz.
2.2	System neutral earthing		Solidly earthed
2.3	Voltage & frequency variation	%	+/-10%, -5%to +3% Hz.
2.4	Rated frequency	Hz	50Hz
2.4	One minute power frequency Voltage a) For power Circuits b) For Control Circuits		a) 2.5kV b) 1.5kV
2.5	Continuous current rating of busbars under site reference ambient temp.		[As per Project requirement]
2.6	Reference ambient temperature		50°C
2.7	Maximum temperature of bus bars and droppers/connectors under site conditions specified		90°C for busbars having non-silver plated joints 105°C for busbars having silver plated joints
2.8	Short circuit current withstand for busbars and droppers		
a	Short time	kA (rms)	50
b	Dynamic Rating	kA (peak)	105
2.9	Whether busbars have been insulated	Yes	Required
2.10	Type of insulation		[By Bidder]
2.11	Material of bus bar supports		[By Bidder]

Document Number	Rev No.	Description	Page No.	Date of Issue

TECHNICAL SPECIFICATION FOR 415V NON
SEGREGATED PHASE BUS DUCTS**

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E5**1.0 415V NON SEGREGATED PHASE BUS DUCT****1.1 General**

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of 415V Non Segregated Phase Busduct, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

IS 8084	Interconnecting Bus bar for AC Voltage above 1KV up to and Including 36kV
IEC 60947	Low Voltage Switchgear and Control gear
ANSI/IEEE C37.20	Metal-Clad and Station-Type Cubicle Switchgear
ANSI/IEEE C37.24	Guide for Evaluating the Effect of Solar Radiation on Outdoor Metal Enclosed Switchgear
IEC 60439	Low-voltage switchgear and control gear assemblies.
BS 159:1957	Bus bar and Bus bar connection
CEA	CEA regulations and standards

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3 Design Criteria

- a) The 415V Non-segregated phase bus duct shall serve as an interconnection between the 415V Switchgear and 11/0.433kV LV Transformer. The Non-segregated phase bus duct shall be installed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E5	[1]	25.09.2014

indoor/Outdoor in a hot, humid and tropical atmosphere. All panels associated with Non-segregated phase bus duct shall be located indoors/Outdoors.

- b) Bus duct, associated equipment and wiring shall be provided with tropical finish to prevent fungus growth. All ventilation openings shall be screened and drains shall be filtered to prevent entrance of dust and insects.
- c) For continuous operation at specified ratings, temperature rise of the bus duct and auxiliary equipment shall be as specified in Clause 1.7 Rating and requirements.
- d) Bus duct and auxiliary equipment shall be capable of withstanding the mechanical forces and thermal stresses of the required short-circuit currents.
- e) The bus ducts and supporting structures shall be designed & constructed so as to withstand without damage the horizontal / vertical ground accelerations due to earthquake.
- f) The bus ducts shall be self cooled and shall not be equipped with blower or any other type of forced ventilation.
- g) The equipment rating shall be based on an ambient temperature. Same phase disposition shall be maintained throughout the run of the bus duct. Phase crossover units, if required, shall also be provided inside the Busduct itself.
- h) Bus ducts shall be suitable for continuous operation at maximum system voltage and shall be adequately sized to withstand short circuit current.

1.4 Specific Requirements

1.4.1 General

- a) 415V Non Segregated Phase Busduct is provided for connection between low voltage side of 11/0.433kV cast resin dry type /oil type transformers and associated 415V Switchgears shall be of TPN (3 phase and neutral) along with necessary bends, flexible at both transformer & switchgear ends, flanges, phase crossover chambers (if required), support structures & accessories including terminations at the equipment ends.
- b) The 415V bus duct shall be metal enclosed, non-phase segregated enclosure type, self cooled and insulated for 1.1kV voltage. The cooling medium inside the duct shall be air.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E5	[2]	25.09.2014

- c) All parts and accessories shall have appropriate match mark and part numbers for easy identification and installation at site.
- d) The 415V non-segregated phase bus duct will be installed indoor or partially indoor & outdoor depending upon the location of equipment being interconnected in a hot, humid and tropical atmosphere. All panels associated with LV non-segregated phase bus duct will be located indoors.
- e) The continuous current rating and momentary peak withstand current rating of the Busduct between transformers & their associated switchgears shall be same as that of the associated switchgears and as indicated in the specification.
- f) All supporting steel structures shall be hot dip galvanized.
- g) The bus ducts shall be provided with space heaters to control moisture. Slicagel breather if required same shall be provided.

1.4.2 Enclosures

- a) The enclosure shall be rectangular and shall be made of [aluminium alloy/Mild steel] of grade [19000H2] as per IS-5082. The entire bus duct shall be designed with dust, weather and vermin-proof construction. The inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The bare enclosure with above painting shall be designed so as not to exceed the temperature specified in IS: 8084.
- b) *[Phases shall be enclosed in a weather-proof, dust-tight, non-magnetic metal (aluminum alloy) of 3mm for bus rating including and above 3000A whereas enclosures for normal bus current rating (<3000 A) shall be sheet steel fabricated type of 2.5mm thick].*
- c) Enclosures shall be provided with flange ends with drilled dimensions to suit the flanges at the switchgear and transformer ends.
- d) Circumferential neoprene rubber gaskets shall be provided for dust tight joints with adjacent enclosure section.
- h) The bus enclosure shall have extended bellows or equivalent means to allow for temperature changes and vibrations. Flexible joints shall be provided in enclosures at all points where the bus duct terminates at equipment to withstand vibration, expansion / contraction and at suitable intervals in any straight run of the bus duct where expansion and contraction would otherwise result in stresses in the supporting structures.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E5	[3]	25.09.2014

- i) All outdoor bus-enclosures shall be so designed & constructed as to prevent accumulation of rain water on top sheet. Similarly all Gasketed flanged joints shall be suitably protected against direct splashing of rain water in case of outdoor runs. The connection flanges shall be sufficiently stiffened so as not to bend while tightening the bolts.
- j) Outdoor portions of the bus duct, if any, shall have continuous rain hood of non magnetic material or with suitable arrangement for rainwater prevention.
- k) Suitable inspection openings shall be provided for access to support insulators, bus joints, transformer terminals, switch gear terminals etc. All inspection openings shall have reliable sealing arrangement with neoprene gaskets.
- l) Seal-off bushings complete with wall-frame and support plates shall be provided where the bus duct penetrates the building wall. The seal is to prevent free exchange of air between indoor and outdoor portions of the bus duct.
- m) In case, the bus duct penetrates the firewall, the wall frame assembly and the seal shall be designed for the same fire rating as the firewall.
- n) Silica-gel breather shall be provided on both indoor and outdoor portions of the bus duct. Space Heaters shall be provided in the bus duct.
- o) Filtered drains for drainage of condensate shall be provided at the lowest points and at such locations where accumulation of condensate can be expected.
- p) Shipping length of the Busduct shall be not more than three (3) meters in length.
- q) Minimum Degree of protection of Busduct enclosure shall be IP-52 for indoor and IPW-55 for outdoor section of the Busduct.

1.4.3 Bus Conductor

- a) The bus conductor shall be of high conductivity, [Aluminium alloy / Aluminium].
- b) The bus conductors shall be given a coat of matt black paint to facilitate heat dissipation. However the sizing of the bus conductor shall consider the conductor as bare.
- c) The bus conductor shall be designed for bolted connections throughout the run.
- d) Flexible connection shall ensure an efficient and trouble-free connection.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E5	[4]	25.09.2014

- e) Silver plating shall be done on copper bar wherever copper to copper and copper to aluminium contacts are envisaged. All connection hardware shall be non-magnetic and shall have high corrosion resistance.
- f) The bus conductors and their support insulators shall be designed to withstand, without damage, the forces developed while carrying the short circuit current.
- g) The bus bar shall be sleeved with FRLS heat shrinkable, colour coded PVC sleeves at intermittent points for phase identification.
- h) The material of the conductor shall be aluminium alloy of grade [63401WP] as per IS: 5082. The temperature rise of conductor shall be 40 degree over design ambient temperature of 50 degree. Also, the temperature of the bus shall not exceed 250°C while carrying the specified short circuit current for one second when a fault occurs at the operating temperature.

1.4.4 Disconnect Link

- a) Removable bolted disconnected link shall be provided in the bus for the purpose of isolation.
- b) Disconnect link shall consist of a removable section of conductor and shall be so constructed as to permit easy removal or reinsertion without alignment difficulties.
- c) The bus on both sides of the link shall be rigidly supported so that the disconnect link is equal in mechanical strength to any other section of the bus.
- d) A minimum clearance of [300 mm. (12")] shall be provided between the disconnected bus sections with the link removed.

1.4.5 Insulators

- a) The bus conductor supporting insulators shall be flame retardant, non-hygroscopic, high impact and high dielectric strength material with an anti tracking contour.
- b) Material of insulator shall be [Epoxy SMC moulded /FRP].
- c) Spacing of the bus support insulators shall be considered by giving due factor of safety to withstand the forces due to the short circuit current assigned to the bus duct.
- d) Bus support insulators shall be interchangeable, high creepage, high strength, wet process, fine glazed porcelain. Alternatively good quality cast resin insulators may be offered.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E5	[5]	25.09.2014

- e) Insulator shall be mounted in such a way so as to permit easy removal or replacement without disassembly of the bus. The insulator mounting plate shall be designed for cantilever loading to withstand the short circuit.
- f) The conductor shall be fastened on the insulator through fixed and slip joints so as to allow conductor expansion or contraction without straining the insulator.
- g) Space heater shall be provided preferably located near to each insulator to avoid moisture condensation within bus duct.

1.4.6 Connections & Terminations

- a) All matching flanges, seal-off bushings, gaskets, fittings, hardware and supports required for termination of the Busduct at the switchgear, transformers and other equipment shall be furnished.
- b) In this connection the bidder is required to coordinate with the switchgear and auxiliary transformers manufacturer with regard to connection details, mechanical and thermal stresses.
- c) Flexible connections both for conductor and enclosure shall be furnished at all equipment termination to provide for misalignment up to 25 mm in all directions.
- d) The equipment terminal connections shall be readily accessible and shall provide sufficient air gap for safe isolation of equipment during testing.

1.4.7 Supporting Structures

- a) All supporting structures required for hanging and/or supporting the complete bus duct shall be furnished. These include all members, indoor/outdoor posts, bolts, shims, base plates, beams, hangers, brackets, bracings and hardware.
- b) All buses shall be adequately supported and braced to successfully withstand normal operation, vibration, thermal expansion, short circuit forces and all specified design loads including wind & earthquake forces.
- c) Support shall be designed to provide tolerance of ± 12 mm in the horizontal and vertical directions.
- d) All steel members shall be hot-dip galvanized after fabrication. All hardware shall be of high strength steel with weather resistant finish.
- e) The mounting arrangement of Busduct on the supporting structure shall be designed to allow movement of the Busduct during expansion and contraction.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E5	[6]	25.09.2014

- f) All structure shall be self supporting and in no case rely for support on equipment to which the busbars are connected.

1.4.8 Ground bus

- a) The ground bus of two numbers of separately run [50x10 mm] minimum GS flat shall be provided along the run of the bus duct. All parts of the bus enclosure, supporting structures and equipment frames shall be bonded to above ground bus.
- b) Ground bus shall be finally to connected to power plant earth grid at one end.

1.4.9 Wiring

All wiring for space heaters shall be done with insulated stranded copper conductor of not less than [2.5 mm² cross-section]. Each wire shall be identified at both ends with wire designation as per bidder's wiring diagram and shall be brought out to a terminal box outside the bus duct.

Terminal blocks shall be box-clamp type minimum 10 mm² with marking strips.

At [least 20% spare terminals] shall be furnished in the terminal block.

1.4.10 Name Plate

Suitable name plate shall be furnished with each piece of equipment.

[Materials for name plate shall be plastic / lamicaid, 3 mm thick, using white letters on black background.]

1.4.11 Space Heater

Thermostatically controlled Space heaters shall be provided in the bus ducts, wherever the manufacturer considers them necessary and recommends their provision for preventing harmful moisture condensation. At least one number space heater with thermostat shall be provided at each transformer and switchgear end.

The space heaters shall be suitable for continuous operation on single phase supply, and shall be automatically controlled by thermostats. Necessary wiring up to junction boxes mounted on bus duct and from junction boxes to switchboards shall be provided.

1.4.12 Painting and Finish

- a) All surfaces to be painted including interior and enclosures and other metal parts shall be shot or sand blasted or chemically treated to remove all rust, scale, grease and other adhering foreign matters as far as

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E5	[7]	25.09.2014

possible shall be painted with not less than two (2) coats of Acid and corrosion resistant paint

- b) Steel surfaces, exposed to weather shall be given two (2) coats of zinc chromate and two (2) coats of an 'approved' Manufacturer's paint of 'approved' colour.
- c) All metal parts not accessible for painting shall be made of corrosion resistant materials. All machine finished or bright surfaces shall be coated with a suitable rust preventive compound and wrapped or otherwise protected.
- d) Inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The shade of exterior surface finish shall be [RAL 5012].
- e) The interior surface finish shall be as per manufacturer's standard.
- f) Pretreatment consisting of degreasing, de-rusting etc. shall be done on all fabricated parts before painting or galvanizing.
- g) Paints shall be carefully selected to withstand heat and weather conditions. The paint shall not scale-off or crinkle or get removed by abrasion due to normal handling.
- h) Sufficient quantities of all paints and preservatives required for touching up at sites shall be furnished.
- i) The paint shade shall be subject to owner's approval.

1.5 Tests

l) Type Test

For each type & rating of 415V Non segregated phase bus duct, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the Busduct similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E5	[8]	25.09.2014

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

Some of the specific tests required are listed below.

- a) Visual inspection and verification of dimensions
- b) Dry power frequency voltage withstand for 1-minute
- c) Milli-volt drop test & Water tightness test

1.6 Drawings and Documents

Drawings, data & manuals for the 415V Non segregated phase bus duct shall be submitted as indicated below:

- a) [Dimensional GA drawing]
- b) Data sheets
- c) Typical calculation for arriving at the size of conductor and the insulator spacing.
- d) Type test report (short circuit, temperature rise test) for similar bus duct manufactured by the proposed manufacturer.
- e) Foundation layout and requirements
- f) The bidder may note that the drawings, data and manuals listed are minimum requirement only. The bidder shall ensure that all other necessary write-ups, curves and information required to fully describe the equipment offered are submitted with his bid.]

1.7 Ratings and Requirements

Major technical parameters of 415V non segregated Bus Duct are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

Table: 2.0

S. No.	Technical Particulars	Unit	Parameters	Remarks

ANNEXURES-E6**1.0 220 V DC SYSTEM****1.1 General**

This specification is intended to cover the *[design, engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning]* of 220V DC system with its all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC / IEEE as given below except where modified and/or supplemented by this specification.

Table: 1.0

Code		Name of Standard
IS- 266	:	Specification for Sulfuric Acid
IS- 1069	:	Specification for Water for Storage battery
IS- 1146	:	Specification for rubber and Plastic Containers for Lead Acid Storage Batteries
IS-1652-1991	:	Stationary Cells and Batteries, lead acid type (with Plante positive plates) – Specification
IS- 3116	:	Specification for Sealing Compound For Lead Acid Batteries
IS- 8320	:	General requirements and methods of tests for lead acid storage batteries.
IS- 6071	:	Specification for synthetic separators of lead acid storage batteries.
IS-10918-1984	:	Specification For Vented Type Nickel-Cadmium Batteries.
IS-14782-2000	:	Code of Practice for maintenance and testing of large Lead Acid Batteries in Generating Station and Substation.
ANSI-C-	:	Guide for surge withstand capability test.

IS : 9000	:	Basic environmental testing procedures for electronic and electrical items.
IS:13703	:	Low voltage fuses for voltages not exceeding 1000 V AC, 1500VDC.
EEUA-45D	:	Performance requirements for electrical Alarm Annunciation system

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity (IE) Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) 220 V DC Systems shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The system shall be suitable for operation in a highly polluted environment.
- b) The permissible voltage variation for 220V battery shall be from -15% to +10%.
- c) The battery shall be of storage type [Lead Acid Plante Positive Plate/Ni-Cd] Type. The Battery shall be of high discharge performance type. The plates shall be designed for maximum durability during all service conditions including high rate of discharge & rapid fluctuation of load.
- d) While estimating the battery size, temperature correction factor [based on lowest expected temperature 5 Deg C], margin on capacity [10%] and aging factor [1.0 for Lead Acid Plante and 1.2 for Ni-Cd] shall be considered.
- e) Cell Voltages for Lead Acid batteries:

i.	Nominal Discharge Voltage/cell	2.0 V
ii.	Float Voltage/cell	2.2 V
iii.	Boost Voltage/cell	2.7 V
iv.	Capacity for ten(10) hour rate at 27°C any time during the entire duty	1.85 V/Cell

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[4]	25.09.2014

	cycle	
--	-------	--

f) Cell Voltages for Ni-Cd Batteries

i.	Nominal Discharge Voltage/cell	1.2 V
ii.	Float Voltage/cell	1.42 V
iii.	Boost Voltage/cell	1.7 V
iv.	Capacity for five(5) hour rate at 27°C any time during the entire duty cycle	1.14 V/ Cell

- g) 2x100% sets, 220V of either Lead-Acid Plante Type or Nickel-Cadmium battery banks with 2 x100% float cum boost charger catering to 100% of unit as well as station loads shall be provided.
- h) Permissible voltage variation for 220V battery shall be from 190V to 240V.
- i) The Ampere-Hour capacity of DC Storage Battery shall be based on [Three] hours' continuous DC supply at rated voltage to essential auxiliaries.
- j) Batteries shall be suitable for being boost charged to fully charged condition from fully discharged condition within 10 hours.
- k) Lead acid batteries shall be boost charged at about 2.7 volts per cell maximum and float charged at about 2.2V/cell.
- l) Ni-Cd batteries shall be boost charged at about 1.54 to 1.7 volts per cell maximum and float charged at about 1.42V/cell.
- m) The float-cum-boost charger shall be rated to cater to the following:
- Trickle charging current of the battery
 - Equalizing charging of the Battery
 - Boost charging of the Battery
 - Continuous load on the DC system
 - 25% spare capacity over above loads.

1.4 Specific Requirements

1.4.1 Constructional requirements of battery

a) Containers

Container shall be made of transparent glass for lead acid and polypropylene for Ni-Cd batteries. It shall be robust, heat resistance, leak

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[5]	25.09.2014

proof, non-absorbent, acid resistant, non-bulging type and free from flaws, such as wrinkles, cracks, blisters, pin holes etc. Electrolyte level lines shall be marked on container. The marking for the electrolyte level should be for the upper and lower limits. Container shall be closed / sealed lid type.

The pole sealing arrangement should be such that no acid particle gets entrapped due to acid creep as a result of capillary action and it should be possible to remove and refix the sealing to carry out the maintenance.

b) Vent Plugs

Vent plug shall be provided in each cell. They shall be anti-splash type, having more than one exit hole shall allow the gases to escape freely but shall prevent acid from coming out. The design shall be such that the water loss due to evaporation is kept to minimum. In addition the ventilator shall be easily removed for topping up the cells and of such dimensions that the spring type hydrometer can be inserted into the vent to take electrolyte sample.

c) Plates

The plates shall be designed for maximum durability during all service conditions including high rate of discharge and rapid fluctuation of load. The construction of plates shall conform to latest revisions of standards as applicable for type of battery.

The separators shall maintain the electrical insulation between the plates and shall allow the electrolyte to flow freely. Separators should be suitable for continuous immersion in the electrolyte without distortion. The positive and negative posts shall be clearly marked.

The plante positive plates shall be supported from the ledges of the SAN container. They should not be supported at the bottom of container. Sufficient space shall allowed to allow the creepage of the plates.

d) Sediment Space

Sufficient sediment space shall be provided so that the cells shall not have to be cleaned out during normal life and prevent shorts within the cells.

e) Cell Insulators

Each cell shall be separately supported on PVC / Porcelain / Hard rubber insulators fixed on the racks with adequate clearances between adjacent cells. Minimum distance between adjacent cell shall be more than the bulge allowed for two cells in accordance with relevant IS standard.

f) Electrolyte

The electrolyte shall be prepared from battery grade sulphuric acid conforming to IS: 266 and distilled water conforming to IS: 1069 for lead

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[6]	25.09.2014

acid batteries and battery grade potassium hydroxide for Ni-Cd batteries. The cells shall be shipped dry uncharged. The electrolyte shall be supplied separately in a separate non-returnable container. 10% extra electrolyte shall be furnished to cover spillage in transit or during erection.

g) Connectors and Fasteners

Lead or Lead coated copper connectors (For Lead acid Plante Type batteries) and Nickel coated copper connectors (for Ni-Cd batteries) shall be used for connecting up adjacent cells and rows. Bolts, nuts and washers shall be effectively lead coated/Nickel coated to prevent corrosion. The thickness of lead coating of connectors should not be less than 0.025 mm. All the terminals and cells inter-connectors shall be fully insulated or have insulated shrouds. End take-off connections from positive and negative poles of battery shall be made by single core cables having stranded aluminum conductors and XLPE insulation. Necessary supports and lugs for termination of these cables on battery shall also be supplied. All connectors and lugs shall be capable of continuously carrying the 30 minutes discharge current of the respective battery and through fault short circuit current which the battery can produce and withstand for the period declared. Suitable number of inter rack connectors shall be supplied by the bidder to suit the battery room layout during the detail engineering.

h) Battery Racks

Steel racks with anti-corrosive epoxy paint for all the battery shall be provided. They shall be free standing type mounted on porcelain / hard rubber / PVC pads insulators. Battery shall be located in the single tier arrangement. However battery having a complete cell weight of lower than 50 Kg could be located in the double tier arrangement. The battery rack and support for cable termination shall be coated with three (3) coats of anti-acid paint of approved shade. Numbering tags, resistant to acid, for each cell shall be attached on to the necessary racks. The bottom tier of the stand shall not be less than 150 mm above the floor.

Wherever racks are transported in dismantled condition, suitable match markings shall be provided to facilitate easy assembly.

i) Manufacturer's Identification Systems

The following information shall be indelibly marked on outside of each cell:

- i. Manufacturer's name and trade marks
- ii. Country and year of manufacture
- iii. Manufacturer type of designation
- iv. AH capacity at 10 hour discharge rate
- v. Serial number

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[7]	25.09.2014

1.4.2 Constructional Requirements of battery charger

- a) The Charger shall be indoor, floor mounted, self supporting sheet metal enclosed cubicle type. All necessary base frames, anchor bolts and hardware shall be supplied. The charger shall be fabricated using cold rolled sheet steel shall not less than 1.6 mm and shall have folded type of construction. The panel frame shall be fabricated using cold rolled sheet steel of thickness not less than 2.0 mm. Removable undrilled gland plates of at least 3.0 mm sheet steel and lugs for all cables shall be supplied. The lugs for cables shall be made of electrolytic copper with tin coat. The chargers shall be tropicalised and vermin proof. Ventilation louvers shall be backed with fine brass wire mesh. All doors and covers shall be fitted with synthetic rubber gaskets. The chargers shall have hinged double leaf doors provided on front / or backside for adequate access to the charger internals. All the charger cubicle doors shall be properly earthed. The degree of protection of charger enclosure shall be at least IP-42.
- b) All indicating instruments, control and selector switches and indicating lamps shall be mounted on the front side of the charger.
- c) Electronic equipments shall be of modular design consisting of plug in modules in standard 19 inches metallic racks with metallic card guides. The cards should be provided with proper handles. Card to card wiring should be preferably through a motherboard. Unplanned jumpering and track modifications are not permitted and track modifications are not permitted. Mechanical interlocks to prevent wrong insertion of cards should be provided. Each card shall have its junction and test points identified. Maintenance aids such as extension printed wiring boards and jumper leads shall be provided.
- d) The layout of charger equipment shall be such that their heat losses do not give rise to excessive temperature within the charger panel surface. Location of the electronic modules shall be such that temperature rises of the location, in no case, shall exceed 10°C over ambient air temperature outside the charger.
- e) Printed Circuit Boards (PCB)
PCB shall be made of glass epoxy of 1.6 mm thick, fire resistant, bonded with 99.8% pure copper foil, free of wrinkles, blisters, scratches and pinholes. The contact surface of the edge connectors of the PCBs shall be plated with hard gold to a minimum thickness of 5 microns. Component identification shall be printed on PCB by silk screen method. All PCBs shall be tropicalised and masked.
- f) Contactors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[8]	25.09.2014

All battery chargers shall have an AC contactor on the input side. It shall be of air break type and suitable for continuous duty. The operating coil shall be rated for 415 Volts AC.

g) Thermal Overload Relay

A thermal overload relay incorporating a distinct single phase protection (using differential movement of bimetal strips) shall also be provided for the AC input. The relay shall trip the above contactor.

h) Rectifier-Transformer and Chokes

The rectifier-transformer and chokes shall be dry and air cooled (AN) type. The rating of the rectifier transformers and chokes shall correspond to the rating of the associated rectifier assembly. The rectifier-transformers and chokes shall have class-B insulation with temperature rise limited to class A insulation value.

i) Rectifier Assembly

The rectifier assembly shall be full wave bridge type and designed to meet the duty as required by the respective charger. The rectifier cells shall be provided with their own heat dissipation arrangement with natural air cooling. The rectifier shall utilize diodes / thyristors and heat sinks rated to carry 200% of the load current continuously and the temperature of the heat sink shall not be permitted to exceed 85 °C absolute duly considering the maximum charger panel inside temperature. Calculations to show what maximum junction temperature shall be and what the heat sink temperature shall be when operating at 200% and 100% load current continuously duly considering the maximum surrounding air temperature of 50°C outside the panel have to be submitted. Necessary surge protection devices and rectifier type fast acting fuses shall be provided in each arm of the rectifier connections.

1.4.3 System Concept for 220 V DC system

- a) First float cum boost charger shall be normally ON in float mode, supplying the D.C. load and at the same time trickle charging the battery and shall (a) provide occasional equalizing charge (b) boost charge the battery up to 2.7/1.7 Volts per cell as required.
- b) The characteristics shall be such that if load is high and exceeds the charger capacity, the excess load shall be supplied by the battery.
- c) The second float-cum-boost charger shall be normally in stand-by (auto float/charge) mode and shall come into the circuit automatically (a) to take over the functions of first float cum boost charger in case of its failure (b) to provide occasional equalizing charge as required, (c) boosting charge the battery up to 2.7/1.7 Volts per cell.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[9]	25.09.2014

- d) The float-cum-boost charger shall also have provision for float, equalizing, and boost charging the battery through manual selection. On failure of station A.C. supply, float-cum-boost charger shall go out of service and battery shall take over to supply emergency loads.

1.4.4 Operational requirements of charger

- a) The float-cum-boost charger shall be sized to restore the fully discharged battery to full charge condition in ten (10) hours with 10% margin over maximum charging rate and also to operate as a float charger.
- b) The batteries & chargers shall be so designed that the maximum fault level on DC DB is limited to 15KA (Indicative only; the actual value shall be decided by the contractor after substantiating the same by calculation.)
- c) The battery shall be trickle charged at 2.15 to 2.25 V per cell and 1.4 to 1.42V per cell for lead acid and Ni-Cd battery respectively. All chargers shall also be capable of boost charging the associated battery at 2.0 to 2.7 V per cell for lead acid and 1.53 to 1.7V for Ni Cd at the desired rate. The chargers shall be designed to operate, as mentioned above, at an ambient air temperature of 50 °C.
- d) Necessary interlocks shall also be provided to avoid accidental boost mode operation when loads are connected to the bus.
- e) The battery chargers as well as their automatic regulators shall be of static type. Battery chargers shall be capable of continuous operation at the respective rated load in trickle mode i.e. trickle charging the associated lead acid battery/Ni-Cd battery while supplying the DC loads.
- f) Battery chargers shall have a selector switch for selecting the battery charging mode i.e. whether trickle / float or Boost charging.
- g) All battery chargers shall be provided with facility both automatic and manual control of output voltage and current. A selector switch shall be provided for selecting the mode of output voltage / current control, whether automatic or manual. Means shall be provided to avoid current / voltage surges of harmful magnitude/ nature which may arise during changeover from Auto to Manual mode or vice versa under normal operating condition.
- h) Soft start feature shall be provided to build up the voltage to the set value slowly within fifteen (15) seconds. The chargers shall have load limiters which shall cause, when the voltage control is in automatic mode, a gradual lowering of the output voltage when the DC load current exceeds the load limiter setting of the charger. The load limiter characteristic shall be such that any sustained overload or short circuit in DC system shall neither damage the charger nor shall it cause blowing of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[10]	25.09.2014

any of the charger fuses. The charger shall not trip on overload or external short circuit. After clearance of fault, the charger voltage shall build up automatically when working in automatic mode.

- i) When on automatic control mode, during trickle / float charging, the charger output voltage shall remain within (\pm) 1% of the set value for AC input voltage variation of (\pm) 10%, frequency variation of (+) 3 / (-) 5%, a combined voltage and frequency variation of 10% (absolute sum) and a continuous DC load variation from zero to full load. Uniform and step less adjustment of voltage setting (in both manual and automatic modes) shall be provided on the front of the charger panel covering the entire trickle / float charging output range specified. Step less adjustment of the load limiter setting shall be possible from 80% to 100% of the rated output current for trickle / float charging mode.
- j) During boost charging, the battery chargers shall operate on constant current mode (when automatic voltage regulator is in service). It shall be possible to adjust the boost charging current continuously over a range of 50% to 100% of the rated output current for Boost charging mode. The charger output voltage shall automatically go on rising, when it is operating on boost mode, as the battery charges up. For limiting the output voltage of the charger, a potentiometer shall be provided on the front of the panel, whereby it shall be possible to set the upper limit of this voltage anywhere in the output range specified for boost charging mode. All voltage and current setting potentiometers shall be vernier type.
- k) Energizing the chargers with fully charged battery connected plus 10% load shall not result in output voltage greater than 110% of the voltage setting. Time taken to stabilize, to within the specified limits as mentioned elsewhere shall be less than fifteen (15) seconds.
- l) Momentary output voltage of the charger, with the battery connected shall be within 94% to 106% of the voltage setting during sudden load change from 100% to 20% of full load or vice versa. Output voltage shall return to, and remain, within the limits specified as mentioned elsewhere in less than 2 seconds after the above mentioned change.
- m) The charger manufacturer may offer an arrangement in which the voltage setting device for trickle/ float charging mode is also used as output voltage limit setting device for Boost charging mode, and the load limiter of the trickle / float charging mode is also used as Boost charging current setting device.
- n) Suitable filter circuits shall be provided in all the chargers to limit the ripple content (peak to peak) in the output voltage to 1% irrespective of the DC load, even when they are not connected to a battery.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[11]	25.09.2014

1.4.5 Auxiliary Equipment

- a) DC Voltmeter, DC ammeter and AC voltmeter in 96 mm square shall be provided for each charger. The instruments shall be 240 scale, antiglare glass, flush mounted type, dust proof and moisture resistant. The instrument shall have easily accessible means from zero adjustments. The instruments shall be of 1.5 accuracy class.
- b) In addition to above, following metering provision shall be given for remote metering / recording at PLC/DCS
 - i. Battery Voltage
 - ii. DC voltage of float & Boost charger
 - iii. DC current of float & Boost charger
 - iv. DC load voltage
 - v. DC load current
 - vi. DC Voltage and Current at FCBC
 - vii. Centre Zero Ammeter with Shunt to read Discharge/Charge current
 - viii. Ammeter for Battery Trickle Charge current
 - ix. DC Bus Voltmeter indicating - +ve to Earth, -ve to Earth and +ve to -ve with Selector switch.

The following indications shall be provided

- i. AC Supply – R,Y,B Healthy
- ii. DC supply – Available
- iii. Charger in Float Mode
- iv. Charger in Equalising mode
- v. Charger in Boost mode
- vi. Charger tripped on fault
- vii. D.C Earth fault sensing & alarm

Suitable soft link to be provided for interfacing with DDCMIS.

c) Air Break Switches

All chargers shall have AC input and DC output switches of air break, single throw, load break and fault make type. The contacts of the switches shall open and close with a snap action. Switches shall be rated for 120% of maximum continuous load. 'ON' and 'OFF' position of the switch shall be clearly indicated.

d) Control and Selector Switches

Control and selector switches shall be rotary, stay put type with escutcheon plates showing the functions and positions. The switches shall be of sturdy construction and suitable for mounting on panel front. Switches with shrouding of live parts and sealing of contacts against dust ingress shall be preferred. The contact ratings shall be at least the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[12]	25.09.2014

- i. Make and carry continuously - 10 Amps
- ii. Breaking current at 220V DC - 0.5 Amp (inductive)
- iii. Breaking current at 240V AC - 5 Amp. at 0.3 p.f.

e) Fuses

Fuses shall be of HRC cartridge fuse link type. Fuses shall be mounted on fuse carriers which are mounted on fuse bases. Wherever it is not possible to mount fuses on fuse carriers, fuses shall be directly mounted on plug in type bases. In such cases one insulated fuse pulling handle shall be supplied for each charger. Kick-off fuses (trip fuses) with alarm contacts shall be provided for all DC fuses.

f) Indicating Lamps

Three (3) indicating lamps shall be provided to indicate AC supply availability. The indicating lamp shall be of panel mounting, LEDs and capable of clear status indication under the normal room illumination. The lamps shall be replaceable from front. The lamp covers shall be preferably screwed type, unbreakable and moulded from heat resistant material.

g) Blocking Diode

Blocking diode shall be provided in the output circuit of each charger to prevent current flow from the Battery into the charger.

h) Annunciation System

Following annunciation shall be provided for local and remote indications in all chargers(List is indicative only)

- i. AC supply failure
- ii. Rectifier fuse failure
- iii. Surge circuit fuse failure
- iv. Filter capacitor fuse failure
- v. Load limiter operated
- vi. Charger fail / trip
- vii. Battery on Boost
- viii. Battery on Trickle
- ix. DC output fuse failure
- x. Positive grounded
- xi. Negative grounded
- xii. Battery fully discharged
- xiii. AC input under voltage
- xiv. DC voltage low
- xv. DC voltage high
- xvi. DC system earth fault

The annunciation system shall have audio-visual arrangement and shall incorporate acknowledge, reset and test push buttons. On occurrence of fault, the corresponding window lights up and shall stay in lighted

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[13]	25.09.2014

condition till the fault is cleared and the reset push button is pressed. At least 20% spare annunciation windows with accessories shall be provided.

i) Lamp / Space Heaters / Receptacles

The charger panels shall be provided with:

- i. Internal illumination lamp with door switch.
- ii. Space heater with thermostat control.
- iii. 3-pin 5A receptacle with plug.
- iv. Lamp, heater and receptacle circuits shall have individual switch fuse units/MCB.

1.4.6 Battery Accessories

Each battery shall be furnished complete with following:

- a) First charge of electrolyte plus 10% extra.
- b) Teak wood racks with 3 coats of anti-acid paints.
- c) Stand insulators 5% extra.
- d) Cell inter-connectors 5% extra and one extra end take-off.
- e) Lead-coated connection hardware 5% extra
- f) Cell numbering tag with fixing arrangements
- g) Insulated cable clamps with hardware
- h) Six (6) extra cell with all accessories but without acid
- i) In addition to the above each battery shall be furnished with a set of following accessories.
- j) One (1) Interconnector bolt wrench
- k) One (1) Hydrometer syringe
- l) One (1) Thermometer with specific gravity correction scale.
- m) One (1) Cell testing voltmeter with leads.
- n) One (1) Pocket thermometer
- o) One (1) set of Acid resisting funnels
- p) One (1) set of Acid resisting jugs of adequate capacity
- q) One (1) set of Rubber aprons
- r) One (1) set of Rubber gloves
- s) PVC spill trays under the battery cells
- t) Spanner for cells

Catalogues and Instruction manuals of battery and battery charger to be furnished.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[14]	25.09.2014

1.4.7 Painting

- a) All surfaces shall be sand blasted, pickled and grounded as required to produce a smooth, clean surface free of scale, grease and rust.
- b) After cleaning, the surfaces shall be given a phosphate coating followed by 2 coats of high quality lead oxide primer and stoved after each coat.
- c) The equipment shall be finished in Siemens Gray RAL: 9002 color with two coats of epoxy based powder coated paint except end covers and RAL 5012 for end covers. The coating shall be done electro statically followed by stoving.
- d) Sufficient quantity of touch-up paint shall be furnished for application at site.

1.4.8 Installation

- a) The battery room floor shall be acid resistant type and walls shall have acid resistant tiles up to a suitable height. Alternatively acid resistant paints are also acceptable. Adequate ventilation shall be provided in the battery room for the removal of hydrogen.
- b) The Battery charger along with D.C. distribution board shall be located in separate rooms.
- c) After erection and connection of the Battery Charger, the contractor shall complete the charging discharging cycles recommended by the manufacturer. The contractor shall rig up a suitable discharge resistor for this purpose.
- d) Connection from Battery terminals shall be made by means of cables. Lead coated terminal connector shall be furnished for this purpose.

1.5 Tests

1) Type Test

For each type of Battery and battery charger, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[15]	25.09.2014

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

All Battery, Battery chargers, Inverters and its components thereof shall be subject to shop tests as per relevant IS/IEC standards. The tests on Battery chargers shall include but not limited to the following:

- a) Voltage regulation check from 0 to 100% loads with $\pm 10\%$ input voltage variation.
- b) Ripple content measurement.
- c) D.C short circuit test to prove ability of current limit.
- d) Measurements of transient overshoot/undershoot during switching ON/load throw-off.
- e) Current limiter operation.
- f) Special tests for electrical equipment, when specified in relevant Indian / International standard shall be carried out on at least one item of each rating.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports. Drawings, Data & Manuals:

1.6

Drawings, Data & Manuals

1. Following drawings/ data and Manuals to be submitted for approval:

- a) [Dimensional battery layout diagram and plan & section.
- b) Connection details of take-off terminals.
- c) Dimensional general arrangement drawings of battery charger clearly showing device dispositions, cable entry, space requirement, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E6	[16]	25.09.2014

- d) Sectional views of battery charger.
- e) Charger foundation plan and loading.
- f) Charger schematics and wiring diagrams.
- g) Test reports
- h) Detailed bill of materials
- i) Any other relevant drawing or data necessary for satisfactory installation, operation and maintenance.
- j) Instruction manuals of battery and battery Charger. The manual shall clearly indicate method of installation, check-ups, and tests to be carried out before commissioning of the equipment.
- k) Bidders shall note that the drawings, data and manuals listed herein are minimum requirements only. The Bidders shall ensure that other necessary write-ups, curves and information required to fully describe the equipment are submitted with their bids].

ANNEXURES-E7

1.0 HV CABLEs

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of HV cables complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified or supplemented by this specification.

Table: 1.0

IS: 2982	:	Copper conductor in insulated cables and cords.
IS: 3961	:	Recommended current ratings for cables.
IS: 3975	:	Mild steel wires, strips and tapes for armouring cables
IS: 5609	:	Specification for low frequency wirers and cables with PVC insulation and PVC sheath
IS:5831	:	PVC insulation and sheath of electric cables
IS: 6380	:	Specification of elastomeric insulation of sheath of electric cables.
IS:7098(Part II)	:	XLPE insulated PVC sheathed cables for working voltage from 3.3kV up to and including 33kV
IS: 8130	:	Conductors for insulated electric cables and flexible cords
IEC: 60	:	High voltage test techniques
IEC: 230	:	Impulse tests on cables and their accessories
IEC: 287	:	Calculation of the continuous current rating of the

		cables(100% load factor).
IEC: 288	:	Nominal cross sectional area and composition of conductor of insulated cables.
IEC-331	:	Fire resisting characteristics of electric cables
IEC: 332-1	:	Test on electric cables under fire conditions.
IEEE: 383	:	Standard for type test for class IE electric cables, filled splices and connection for nuclear power generation station.
IEC: 502	:	Extruded solid dielectric insulated power cables for rated voltages from 1kV upto 30kV.
IEC: 540	:	The methods for insulations and sheath of electric cables and cords(elastomeric and thermoplastic compounds)
IEC-754-I	:	Test method for acid gas generation
NEMA-WC-5	:	Thermoplastic insulated wires and cables for transmission and distribution of electrical energy.
ASTM-D-2843	:	Standard test method for density of smoke from burning/decomposition of plastics.
ASTM-D-2863	:	Test for determination of oxygen index.
CEA	:	CEA Regulations
CEA	:	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended upto date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E7	[2]	25.09.2014

1.3 Design Criteria

- a) The cables shall be installed in hot, humid tropical atmosphere with ambient temperature of 50°C.
- b) All HV cables shall be suitable for operation under the following voltage & frequency variations:

Voltage Variation : (±) 10%

Frequency Variation : (+) 3% to (-)5%

Combined Variation of Voltage & Frequency : 10% (absolute sum)

- c) The HV power cables shall be 6600V unearthed grade, single/multi core stranded Aluminum conductor, extruded XLPE insulated with extruded PVC inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-2). These cables shall conform to IS 7098 (Part II).
- d) The continuous and short time current carrying capacity of XLPE insulated cables shall be based on maximum operating temperature of 90°C and 250°C respectively.
- e) HV power cables shall be sized taking into account the following derating factors:
 - i. Max Ambient air temperature
 - ii. Max Ambient ground temperature
 - iii. Grouping of cables/Method of laying
 - iv. Depth of laying for cable buried in ground.
 - v. Soil thermal resistivity for cable buried in ground.
- f) HV cables shall be chosen taking into account the following factors:
 - i. System Fault level.
 - ii. Maximum time for fault clearance (i.e, operating time of the backup protection relays plus the time of operation of the circuit breakers).
 - iii. Full load current of the circuit.
 - iv. Short circuit current and duration (for breaker protected cables)
 - v. Installation conditions.
 - vi. Voltage drop under normal running and starting condition
 - vii. Voltage drop at motor terminals shall be within permissible limit during starting & normal running. i.e 5% during steady state and 15% during transient or starting at motor terminal.
 - viii. The cable should withstand the maximum fault current corresponding to the particular voltage level for the minimum time before the fault is cleared.
 - ix. Consideration shall also be given to limit the cable to the nearest standard sizes instead of using too many types.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E7	[3]	25.09.2014

1.4 Specific Requirements

1.4.1 Type of Cable

- a) HV cables shall be 6600V unearthed grade, heavy duty, stranded aluminium conductor, XLPE insulated, extruded black FRLS PVC inner sheathed, armoured and overall FRLS extruded black PVC outer sheathed (Type ST-2) cables conforming to IS: 7098 part II.

1.4.2 Conductor

The cable conductor shall be made from standard Aluminum to form compact conductor having a resistance within the limits specified.

1.4.3 Conductor Shield

The conductor having a semi-conducting screen shall ensure perfectly smooth profile and avoid stress concentration. The conductor screen shall be provided over the conductor by applying non metallic semi conducting tape or by extrusion of semi conducting tape or by extrusion of semi-conducting compound or a combination of the two. The semi conducting polymer shall be cross linked for XLPE cables.

1.4.4 Insulation

The insulation of the HV cables shall be XLPE type. It shall be designed and manufactured for the specified system voltage. The manufacturing process shall ensure that insulation shall be free from voids. The insulation shall withstand mechanical and thermal stresses under steady state and transient operating conditions. The extrusion method should give a very smooth interface between semi conducting screen and insulation. The insulation of the cables shall be of high standard quality.

1.4.5 Insulation Shield

A non magnetic semi conducting shield shall be put over the insulation to confine electrical field to the insulation. The XLPE cable insulation shield shall be strippable.

The metallic layer of the insulation shield shall be grounded at least at one location in the cable's run. In the case of single conductor cable, care should be taken with regard to ampacity when grounding at more than one point.

For all the cables having insulation shield, it shall have some form of stress relief measure at every splice at termination. This can be stress cones, moulded devices, heat shrink or cold shrink kits. All kits must be suitable for the voltage class and cable size.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E7	[4]	25.09.2014

1.4.6 Inner Sheath

The sheath shall be suitable to withstand the site conditions and the desired temperature. It shall be of adequate thickness and applied by a continuous process to produce a sheath of consistent quality free from all defects. PVC sheath shall be extruded with FRLS properties.

1.4.7 Armour

HV cables shall be provided with galvanized steel wire/strip armouring. The hard drawn aluminium wire for armour shall be of H4 grade, as per IS-8130 (having tensile strength above 150 N/mm²). The diameter of the aluminium wire shall be as per the table for the dimensions of the galvanized steel wire armour given in the relevant standard.

1.4.8 Outer sheath

Outer sheath shall be extruded layer of FRLS PVC compound (ST-1). Sheath shall be resistant to water, Ultra Violet radiations, fungus, termites and rodent attacks. The color of the sheath shall be black.

1.4.9 Packing

[Cables shall be supplied in non-returnable drums]. Drum lengths shall be such so that cable joints are totally avoided. The drums shall be of heavy construction. *[All wooden parts shall be manufactured from seasoned wood.]* All ferrous parts used shall be treated with suitable rust preventive finish or coating to avoid rusting during transit or storage. *[Wooden cable drum shall be treated by immersing in copper-nitrate solution.]*

The ends of each cable length shall be sealed before shipment. Heat shrinkable cable cap shall be used for this purpose.

[A label shall be securely attached to each end of the reel indicating the Purchaser's order number, Owner's identification mark, length, type, voltage grade, conductor size and number of cores of the cable.] A tag containing the same information shall be attached to the leadings end of the cable inside. An arrow and necessary instructions shall be marked on the drum indicating the direction in which it should be rolled. Drum numbers are to be indicated on the cable drums. Drum length shall not be less than 500m or as per required length.

1.4.10 Identification of cores:

HV power cables shall be identified by color code.

1.4.11 Constructional Requirements

- a) Cable shall have suitable filters laid up with the conductors to provide a substantially circular cross section before the sheath is applied. Fillers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E7	[5]	25.09.2014

shall be suitable for the operating temperature of the cable and compatible with the insulating material. All materials shall be new, unused and of finest quality.

b) Workmanship shall be neat, clean and of the highest grade.

c) Special Properties:

All the above cables shall be conforming to the relevant Indian/IEC standard in general, with the following special properties:

- i. Oxygen Index of the outer sheath shall not be less than 29, when tested as per ASTM-D-2863.
- ii. Temperature Index of the outer sheath shall not be less than 250 °C, when tested as per ASTM-D-2863.
- iii. Halogen acid contents in outer sheath shall not be more than 20%, when tested as per IEC-60754.
- iv. The maximum smoke density in percent light absorption should not exceed 60% in case of PVC compound and 20% in case of fire survival cables, when tested as per ASTM-D-2843.
- v. Swedish chimney test as per SS-4241475 class F3 and ladder test for flammability as per IEEE-383.
- vi. The cables shall be tested for resistance to Ultraviolet radiation. The retention values of tensile strength and ultimate elongation after test shall be minimum 60% of tensile strength.
- vii. Outer sheath of cable shall be subject to tests for water absorption. The methodology shall be as per IS 10810 part 33.

1.4.12 Joints and Terminations

Materials of construction for a joint/termination shall perfectly match with the dielectric chemical and physical characteristics of the associated cables. The material and design concepts shall incorporate a high degree of operating compatibility between the cable and joints. The protective outer covering (jacket) used on the joints/terminations shall have the same qualities as that of the cable outer sheath in terms of ambient/operating temperature withstand capability and resistance to hazardous environments and corrosive elements. No joints shall be allowed unless the cable drawn length is exceeded.

1.4.13 Cable Identification

Cable identification shall be provided by embossing the following on the outer sheath:

- a. [Manufacturer's name or trade mark]
- b. Voltage grade
- c. Year of manufacture
- d. Type of insulation.
- e. Type of outer sheath e.g. "FRLS" etc.

Document Number	Rev No.	Description	Page No.	Date of Issue

f. ISI marks

g. Nominal cross sectional area of the conductor & no of cores

h. Sequential marking

i. Owner's identification mark]

1.4.14 Fire Proof sealing system

i) General

- a) Fire proof sealing system shall consist of Fire-stops/fire-seals for sealing of cable/cable tray and conduit/pipe penetrations, both horizontal and vertical, through brick or RCC walls/floors, to prevent the spread of fire from one area, which is separated from others by fire-resistant barriers.
- b) 'Fire-breaks' provided on long runs of cable racks/trays to prevent the propagation of fire along the cable rack, within a single fire-area or fire- zone.
- c) The FPS system shall also include all the necessary accessories and equipment required for supporting, holding in position, fixing and installation of the fire-stop/fire-break.
- d) The FPS system shall comply in all respects with the requirements of the codes and standards listed below

IEEE-634 ASTM-E-814

ANSI-IEEE-383 IEC-331 IEC-332

ii) Fire stop/ seal

The FPS system adopted for cables or cable trays penetrating through walls and floor constitute a openings, or cables passing through embedded conduits / pipes / pipe- sleeves, fire stop / seal', which is meant to prevent spreading of fire between areas separated by fire-resistant barriers.

iii) Fire Break

The fire proofing system, other than fire-stops, adopted to retard flame propagation long runs of horizontal or vertical cable trays in the same fire zone or area, in an event of a fire, shall constitute a 'fire-break' and shall be provided by applying a suitable fire –resistance coating on cables and cable trays for the required length, with or without a fire resistant panel, at the point of the fire break to obtain the fire-rating specified.

iv) Application of fire proof sealing system

Fire stops shall be provided for cable penetration openings listed below

The passage of cables/cable trays pipe sleeves/embedded conduits through walls / floors.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E7	[7]	25.09.2014

Vertical raceways, which carry cables between successive floors, through openings provided in the RCC floor slab, shall be sealed by fire stops at each floor level.

Cable entry through openings in floor slabs below HT/LT switchgear, MCCs, various Control and relay panels and other bottom entry panels, shall be effectively sealed by fire stop

Location of fire breaks

Firebreaks shall be provided on both cable rack and trenches at all cable tray Intersections and tee-offs.

On linear runs of cable trays between fire stops or fire breaks, fire breaks shall be provided at intervals of 15 metres on horizontal cable runs and 5 m on vertical cable runs.

Fire breaks in linear runs of cable trenches between intersections and tee-offs shall be provided at intervals of 30 metres.

Bidder shall furnish the test certificates for the fire stops and fire breaks after award of contract for Owner/Owner's Representative review. If the certificates are not satisfactory all the tests shall be conducted free of cost. The offered system i.e. fire stops and fire breaks shall be identical (or better) with the system which is successfully type tested for the specified rating i.e. the composition density of the material, thickness of coating in case of fire breaks and any other properties of the material / system offered shall be identical or better than the tested system and shall be subject to Owner / Owner's Representative.

v) Test on fire stops

The fire stops shall be subjected to the following type tests:

- a. Fire Rating Test
- b. Hose Stream Test

Type tests shall be conducted on different fire stop test specimens described above as per IEEE-634. The sizes of the fire stop test specimens shall be similar to the largest of the sizes being used in the plant.

Preconditioning of fire stop test specimens before conducting the fire rating and hose stream tests, each test specimen shall be preconditioned for thermal ageing, water immersion and vibration.

Test on Fire Stops

During the fire rating test, the transmission of heat through the cable penetration fire stop shall not raise the temperature on its unexposed surface above the self ignition temperature of the outer cable covering, the cable penetration fire stop material, or material in contact with the cable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E7	[8]	25.09.2014

penetration fire stop, with a maximum temperature limit on the unexposed surface of 200°C.

Tests on fire breaks

Firebreaks shall undergo the following tests as per ANSI-IEEE-383:

- Ampacity test
- Flame test

1.5 Tests

1.5.1 Type Test

For each type & rating of HV cables, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The list of type tests are as follows:

- a) Tests on conductor:
 - i. Annealing test (for copper)
 - ii. Tensile test (for aluminum)
 - iii. Wrapping test (for aluminum)
 - iv. Conductor resistance test.
- b) Test for armouring wires/strips
- c) Test for thickness of insulation and sheath
- d) Physical tests for insulation and outer sheath:
 - i. Tensile strength and elongation at break
 - ii. Ageing in air oven
 - iii. Shrinkage test
 - iv. Hot deformation
 - v. Loss of mass in air oven
 - vi. Heat shock test
 - vii. Thermal Stability
- e) Insulation resistance test
- f) High voltage test (water immersion test)
- g) High voltage test at room temperature
- h) Flammability test

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E7	[9]	25.09.2014

1.5.2 Routine Test

Cables shall be subject to acceptance and routine tests as per IS codes. Acceptance tests and FRLS test as specified earlier shall be conducted on cables and the same shall be witnessed by purchaser.

The FRLS test shall be carried out on one cable of each batch of compound used. Other acceptance tests shall be carried out on drums selected as per sampling plan as indicated in IS. Test certificates for routine acceptance and special tests shall be furnished by the Bidder for review and approval of purchaser.

1.6 Drawings, Data and Manuals

The following drawings/documents and calculation as listed below but not limited to shall be furnished along with the bid for review

- [Cable datasheets and cross sectional drawings]
- [Cable sizing calculation]
- [QAPs & Test Reports]
- [Relevant catalogues]
- [Estimated weight of cable and cable drum]

1.7 Ratings and Requirements

1.7.1 H.V. Power cable, 6600V unearthed grade

Table: 2.0

S.No.	Technical Particulars	Unit	Parameters	Remarks
1.	System voltage		6.6 V	
2.	Voltage Grade		6.6/6.6kV Unearthed	
3.	Ambient Temperature		50°C	
4.	Maximum conductor temperature for continuous operation for XLPE cables		90°C

ANNEXURES-E8

1.0 LV CABLES

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of LV cables for power & control applications complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified or supplemented by this specification.

Table: 1.0

IS:1554(Part I)	:	PVC insulated (heavy duty) electric cables for working voltage up to and including 1100V
IS: 2982	:	Copper conductor in insulated cables and cords.
IS: 3961	:	Recommended current ratings for cables.
IS: 3975	:	Mild steel wires, strips and tapes for armouring cables
IS: 5609	:	Specification for low frequency wirers and cables with PVC insulation and PVC sheath
IS:5831	:	PVC insulation and sheath of electric cables
IS: 6380	:	Specification of elastomeric insulation of sheath of electric cables.
IS:7098(Part I)	:	XLPE insulated PVC sheathed cables for working voltage up to 1.1kV
IS: 8130	:	Conductors for insulated electric cables and flexible cords
IEC: 60	:	High voltage test techniques

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E8	[1]	25.09.2014

IEC: 230	:	Impulse tests on cables and their accessories
IEC: 287	:	Calculation of the continuous current rating of the cables(100% load factor).
IEC: 288	:	Nominal cross sectional area and composition of conductor of insulated cables.
IEC-331	:	Fire resisting characteristics of electric cables
IEC: 332-1	:	Test on electric cables under fire conditions.
IEEE: 383	:	Standard for type test for class IE electric cables, filled splices and connection for nuclear power generation station.
IEC: 502	:	Extruded solid dielectric insulated power cables for rated voltages from 1kV upto 30kV.
IEC: 540	:	The methods for insulations and sheath of electric cables and cords(elastomeric and thermoplastic compounds)
IEC-754-I	:	Test method for acid gas generation
NEMA-WC-5	:	Thermoplastic insulated wires and cables for transmission and distribution of electrical energy.
ASTM-D-2843	:	Standard test method for density of smoke from burning/decomposition of plastics.
ASTM-D-2863	:	Test for determination of oxygen index.
CEA	:	CEA Regulations
CEA	:	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E8	[2]	25.09.2014

The electrical installation shall meet the requirements of Indian Electricity Rules as amended upto date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) The cables shall be installed in hot, humid tropical atmosphere with ambient temperature of 50°C.
- b) All LV cables shall be suitable for operation under the following voltage & frequency variations:

Voltage Variation : (±) 10%

Frequency Variation : (+) 3% to (-)5%

Combined Variation of Voltage & Frequency : 10% (absolute sum)

- c) The LV power cables shall be 1100V grade, single/multi core stranded Aluminum conductor, extruded XLPE/PVC insulated with extruded PVC inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-1). These cables shall conform to IS 7098 (Part I) for XLPE and 1554(part 1) for PVC insulation.
- d) The control cables shall be 1100 V grade, multi core, stranded annealed high conductivity copper with extruded PVC insulated inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-1).
- e) The continuous and short time current carrying capacity of XLPE insulated cables shall be based on maximum operating temperature of 90°C and 250°C respectively.
- f) The continuous and short time current carrying capacity of PVC insulated cables shall be based on maximum operating temperature of 70°C and 160°C respectively.
- g) LV power cables shall be sized taking into account the following derating factors:
 - i. Max Ambient air temperature
 - ii. Max Ambient ground temperature
 - iii. Grouping of cables/Method of laying
 - iv. Depth of laying for cable buried in ground.
 - v. Soil thermal resistivity for cable buried in ground.
- h) Power cables shall be chosen taking into account the following factors:
 - i. System Fault level.
 - ii. Maximum time for fault clearance (i.e, operating time of the backup protection relays plus the time of operation of the circuit breakers).
 - iii. Full load current of the circuit.
 - iv. Short circuit current and duration (for breaker protected cables)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E8	[3]	25.09.2014

- v. Installation conditions.
- vi. Voltage drop under normal running and starting condition
- vii. Voltage drop at motor terminals shall be within permissible limit during starting & normal running. i.e 5% during steady state and 15% during transient or starting at motor terminal.
- viii. The cable should withstand the maximum fault current corresponding to the particular voltage level for the minimum time before the fault is cleared.
- ix. Consideration shall also be given to limit the cable to the nearest standard sizes instead of using too many types.
- x. The minimum size of cables to be used shall be as follow :
 - Aluminium conductor : 6 Sq. mm.
 - Copper conductor : 2.5 Sq. mm

1.4 Specific Requirements

1.4.1 Type of Cable

- a) LV power cables shall be 1100V grade, heavy duty, stranded aluminium conductor, XLPE/ PVC insulated, extruded black FRLS PVC inner sheathed, armoured and overall FRLS extruded black PVC outer sheathed (Type ST-1) cables conforming to IS: 1554(Part 1) for PVC insulation and IS 7098(Part 1) for XLPE insulation.
- b) Control Cables shall be 1100 V grade, heavy duty with annealed high conductivity stranded copper conductor, PVC insulated, FRLS PVC inner sheathed, armoured and FRLS extruded black PVC outer sheathed (Type ST-1) cables conforming to IS : 1554.
- c) LV power cables of size above 35 sq. mm may be provided with XLPE insulation. Bidder shall clearly indicate the type of insulation provided in the technical bid.

1.4.2 Conductor

The cable conductor shall be made from standard Aluminum for LV Power cables and Copper for control cables to form compact conductor having a resistance within the limits specified. All the cables of size 25mm² and above shall have sector shaped conductors.

1.4.3 Insulation

The insulation of the LV power and control cables shall be [XLPE/PVC] type. It shall be designed and manufactured for the specified system voltage. The manufacturing process shall ensure that insulation shall be free from voids. The insulation shall withstand mechanical and thermal stresses under steady state and transient operating conditions. The extrusion method should give a very smooth interface between semi conducting screen and insulation. The insulation of the cables shall be of high standard quality.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E8	[4]	25.09.2014

1.4.4 Inner Sheath

The sheath shall be suitable to withstand the site conditions and the desired temperature. It shall be of adequate thickness and applied by a continuous process to produce a sheath of consistent quality free from all defects. PVC sheath shall be extruded with FRLS properties.

1.4.5 Armour

LV power and control cables shall be provided with galvanized steel wire/strip armouring. The hard drawn aluminium wire for armour shall be of H4 grade, as per IS-8130 (having tensile strength above 150 N/mm²). The diameter of the aluminium wire shall be as per the table for the dimensions of the galvanized steel wire armour given in the relevant standard.

1.4.6 Outer sheath

Outer sheath shall be extruded layer of FRLS PVC compound (ST-1). Sheath shall be resistant to water, Ultra Violet radiations, fungus, termites and rodent attacks. The color of the sheath shall be black.

1.4.7 Packing

[Cables shall be supplied in non-returnable drums]. Drum lengths shall be such so that cable joints are totally avoided. The drums shall be of heavy construction. *[All wooden parts shall be manufactured from seasoned wood.]* All ferrous parts used shall be treated with suitable rust preventive finish or coating to avoid rusting during transit or storage. *[Wooden cable drum shall be treated by immersing in copper-nitrate solution.]*

The ends of each cable length shall be sealed before shipment. Heat shrinkable cable cap shall be used for this purpose.

[A label shall be securely attached to each end of the reel indicating the Purchaser's order number, Owner's identification mark, length, type, voltage grade, conductor size and number of cores of the cable.] A tag containing the same information shall be attached to the leadings end of the cable inside. An arrow and necessary instructions shall be marked on the drum indicating the direction in which it should be rolled. Drum numbers are to be indicated on the cable drums. Drum length shall not be less than the following:

- a) Power cables: 500m
- b) Control cables: 1000m

1.4.8 Identification of cores and spares:

LV power cables shall be identified by color code. However LV control cables shall be identified by the number of its cores.

[Multi-core control cables shall have 20% spare core, minimum one spare.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E8	[5]	25.09.2014

1.4.9 Constructional Requirements

- a) Cable shall have suitable filters laid up with the conductors to provide a substantially circular cross section before the sheath is applied. Fillers shall be suitable for the operating temperature of the cable and compatible with the insulating material. All materials shall be new, unused and of finest quality.
- b) Workmanship shall be neat, clean and of the highest grade.
- c) Special Properties:
All the above cables shall be conforming to the relevant Indian/IEC standard in general, with the following special properties:
 - i. Oxygen Index of the outer sheath shall not be less than 29, when tested as per ASTM-D-2863.
 - ii. Temperature Index of the outer sheath shall not be less than 250 °C, when tested as per ASTM-D-2863.
 - iii. Halogen acid contents in outer sheath shall not be more than 20%, when tested as per IEC-60754.
 - iv. The maximum smoke density in percent light absorption should not exceed 60% in case of PVC compound and 20% in case of fire survival cables, when tested as per ASTM-D-2843.
 - v. Swedish chimney test as per SS-4241475 class F3 and ladder test for flammability as per IEEE-383.
 - vi. The cables shall be tested for resistance to Ultraviolet radiation. The retention values of tensile strength and ultimate elongation after test shall be minimum 60% of tensile strength.
 - vii. Outer sheath of cable shall be subject to tests for water absorption. The methodology shall be as per IS 10810 part 33.

1.4.10 Joints and Terminations

Materials of construction for a joint/termination shall perfectly match with the dielectric chemical and physical characteristics of the associated cables. The material and design concepts shall incorporate a high degree of operating compatibility between the cable and joints. The protective outer covering (jacket) used on the joints/terminations shall have the same qualities as that of the cable outer sheath in terms of ambient/operating temperature withstand capability and resistance to hazardous environments and corrosive elements. No joints shall be allowed unless the cable drawn length is exceeded.

1.4.11 Cable Identification

Cable identification shall be provided by embossing the following on the outer sheath:

- a. [Manufacturer's name or trade mark]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E8	[6]	25.09.2014

- b. Voltage grade
- c. Year of manufacture
- d. Type of insulation.
- e. Type of outer sheath e.g. "FRLS" etc.
- f. ISI marks
- g. Nominal cross sectional area of the conductor & no of cores
- h. Sequential marking
- i. Owner's identification mark]

1.5 Tests

1.5.1 Type Test

For each type & rating of LV power and control cables, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The list of type tests are as follows:

- a) Tests on conductor:
 - i. Annealing test (for copper)
 - ii. Tensile test (for aluminum)
 - iii. Wrapping test (for aluminum)
 - iv. Conductor resistance test.
- b) Test for armouring wires/strips
- c) Test for thickness of insulation and sheath
- d) Physical tests for insulation and outer sheath:
 - i. Tensile strength and elongation at break
 - ii. Ageing in air oven
 - iii. Shrinkage test
 - iv. Hot deformation
 - v. Loss of mass in air oven
 - vi. Heat shock test
 - vii. Thermal Stability
- e) Insulation resistance test
- f) High voltage test (water immersion test)
- g) High voltage test at room temperature
- h) Flammability test

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E8	[7]	25.09.2014

1.5.2 Routine Test

Cables shall be subject to acceptance and routine tests as per IS codes. Acceptance tests and FRLS test as specified earlier shall be conducted on cables and the same shall be witnessed by purchaser.

The FRLS test shall be carried out on one cable of each batch of compound used. Other acceptance tests shall be carried out on drums selected as per sampling plan as indicated in IS. Test certificates for routine acceptance and special tests shall be furnished by the Bidder for review and approval of purchaser.

1.6 Drawings, Data and Manuals

The following drawings/documents and calculation as listed below but not limited to shall be furnished along with the bid for review

- [Cable datasheets and cross sectional drawings]
- [Cable sizing calculation]
- [QAPs & Test Reports]
- [Relevant catalogues]
- [Estimated weight of cable and cable drum]

1.7 Ratings and Requirements

1.7.1 L.V. Power and control cables, 1100 V grade

Table: 2.0

S.No.	Technical Particulars	Unit	Parameters	Remarks
1.	System voltage		415 V	
2.	Voltage Grade		1.1 kV	
3.	Ambient Temperature		50°C	
4.	Maximum conductor temperature for continuous operation for XLPE/PVC cables		For XLPE: 90°C For PVC: 70°C

TECHNICAL SPECIFICATION FOR ILLUMINATION SYSTEM

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E9

1.0 ILLUMINATION SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Illumination System complete with luminaries and all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

Code		Name of Standard
IS 1913	:	Electrical lighting fittings- General and safety requirements
IS 2418 - Part I	:	Tubular fluorescent Lamp
IS 3480	:	Flexible steel conduits for electrical wiring
IS 3646 (Part I to III)	:	Code of Practice For Interior Illumination
IS 4012	:	Dust proof electric lighting fittings
IS4013	:	Flame proof enclosure
IS 6665	:	Code of practice for industrial lighting
IS 5077	:	Decorative light fittings
IS 9537 - Part II	:	Rigid steel conduits for electrical installations

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[1]	25.09.2014

IS 9583	:	Emergency lighting units
IS 9900	:	High pressure mercury vapor lamp
IS 9974	:	High pressure sodium vapor lamp
IS 10322	:	Luminaries for street lighting
CBIP Manual	:	Substation Equipment, Illumination and Layouts
IES (Illuminating Engineering Society of North America)	:	Application and Reference Volume
IEC 60598	:	Luminaries
CEA	:	CEA regulations and standard technical specification.

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All illumination systems shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The illumination systems shall be suitable for operation in a highly polluted environment.
- b. Lighting fixtures shall be suited for the following range of frequency and voltage variations:
 - i. Voltage Variation : $\pm 10\%$
 - ii. Frequency Variation : 50Hz (+)3% to (-)5%
 - iii. Combined Variation of Voltage & Frequency : 10% (absolute sum)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[2]	25.09.2014

- c. All emergency DC lighting systems shall be suited for voltage variation from -15% to + 10% of rated voltage.
- d. The design of the lighting systems shall be such that it shall ensure average lux levels specified for different areas.
- e. The illumination system shall comprise of the following:
 - i. Normal AC lighting
 - ii. Normal cum emergency lighting system
 - iii. 220V DC Emergency lighting system
 - iv. Maintenance 24V AC lighting system
 - v. Portable emergency lights with self contained battery packs.

1.4 Specific Requirements

1.4.1 Scope of work

The scope of work shall include design, preparation of Lighting design and manufacture, supply, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with Lighting system for following areas Listed below but not limited to the following:

[Note: With reference to particular package, scope of work shall be modified.]

a) TG Area:

- i) TG Platforms.
- ii) TG area Grade Levels Maintenance area.
- iii) Switchgear room and cable gallery.
- iv) All roads within battery limit.
- v) Perimeter and boundary illumination of the above premises.
- vi) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.

b) Boiler Area:

- i) Boiler Platforms
- ii) Boiler Grade Levels covering coal mill and Maintenance area.
- iii) ESP Platforms
- iv) ESP/FOPH switchgear room and cable gallery.
- v) FOPH area.
- vi) Transfer towers & Conveyor galleries.
- vii) All roads within battery limit.
- viii) Perimeter and boundary illumination of the above premises.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[3]	25.09.2014

- ix) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- c) Balance of plant Area:
 - i) Lighting system for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- d) CHP Area:
 - i) Switchgear rooms
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- e) AHP Area:
 - i) Switchgear rooms.
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard control room
 - ii) GIS building (if applicable)
 - iii) Transformer area
 - iv) All roads within battery limit.
 - v) Perimeter and boundary illumination of the above premises.
 - vi) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.

1.4.2 Illumination System Description

The plant illumination system shall comprise of the following categories:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[4]	25.09.2014

a. Normal AC lighting

In this system, the lighting circuits shall be fed by the 3 phase, 4 wire normal AC supply from the normal lighting distribution boards (LDB). All the lighting fixtures connected to this system shall be available as long as the 415V station / unit auxiliary service supply is available.

b. Normal cum emergency lighting system

Certain lighting fixtures considered essential shall be connected to this system. In this system the lighting circuits shall be fed from lighting distribution board connected to 415V Normal cum Emergency Switchgear. The lighting fixtures connected to this system shall be available whenever normal supply is available in the plant and also whenever DG set supplies the power to 415V Normal emergency switchgear.

These lighting fixtures will go off for a few seconds when normal supply fails but will be automatically restored when the emergency AC bus is re-energized by automatic transfer to standby DG supply.

[20% of the total fittings shall be fed from Emergency lighting for areas such as Switchgear room and control rooms etc.]

c. Emergency 220 V D.C. Lighting

The Emergency DC Lighting System shall be located strategically in critical operating areas and at emergency exits. Emergency DC lighting shall also be provided in the Control rooms, Switchgear/ MCC rooms and other strategically important areas. These fixtures shall be fed from respective Emergency DC Lighting Panels. The Emergency DC Lighting Panels (DC ELLP) shall be fed from 220V DC Distribution Boards (DCDB).

These lights shall remain normally OFF but on failure of AC supply these lights shall be automatically ON. Tube lights with Electronic choke suitable for 230 V, AC / DC operation or other Energy Efficient Lamps may be used for DC emergency lighting.

d. Maintenance 24 V AC Lighting System

For lighting facilities comprising portable hand lamps and/or connection of portable hand tools etc., required during the routine maintenance work, 24V single phase 3 pin sockets with switches shall be provided at selected points in the areas listed below. Such sockets for routine maintenance shall be clearly identified by colour coding in order to distinguish them from the normal 240V power outlets. Necessary outlets shall be made on the inside walls of the building near equipments.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[5]	25.09.2014

- i. Boiler area: Near inspection manholes on the boiler platforms and near boiler drum at different levels on all four sides.
- ii. TG building: Near HP & LP heaters, turbine flash tank, blow down tank, near condenser water box and near bus duct termination of generator end.
- iii. ESP columns: Near inspection manholes
- iv. Near de-aerator.
- v. Cable galleries.

Any other areas considered necessary identified during detailed engineering.

e. Portable Emergency Lights

This system shall be provided by portable self-contained battery / automatic charger / inverter fed compact fluorescent lamps in isolated buildings / areas where station D.C. supply is not available. These portable emergency light units shall be switched on automatically on loss of normal AC supply. *[Battery packs for portable emergency lights shall be rated for minimum 3 hours duty and the battery shall be of Ni-Cd.]*

f. Exit lights

Emergency escape signs shall be provided at the exit doors, escape routes, intersection corridors, at different floor levels/directions, windowless rooms, toilets, firefighting equipment, lifts, control rooms, switchgear rooms and the areas considered necessary by bidder. *[9W CFL]* lamp shall be used for exit lamps.

The contractor shall design emergency exit lighting system based on plant layouts and install escape lights at suitable locations considering the various escape routes. Emergency exit lights will be fed from normal-cum-emergency lighting panel, wherever available, *[and will be with in-built battery (Ni-Cd) back up of 3 hours operation.]*

1.4.3

Illumination Calculation

- a. Standard Lumen method shall be adopted for interior and exterior lighting in order to determine the number of lighting fixtures for obtaining the desired average level of illumination.
- b. The coefficient of utilization shall be considered to take care of Lumen loss due to:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[6]	25.09.2014

- i. Effect of room dimensions.
 - ii. Absorption of light in luminaries.
 - iii. Absorption of light at various room surfaces i.e. ceiling wall etc.
 - iv. Floor cavity, ceiling cavity.
 - v. Mounting height.
- c. Moreover a maintenance factor shall also be considered to account for the fall of illumination due to aging, pollution like dust deposits etc.
 - d. Voltage drop at the fixture terminals from the MLDB shall [not exceed 3%]. Circuit loading of each lighting Panel shall be done in such a way that almost balanced loading in all the phases i.e. R, Y and B is achieved. At least two sub circuits shall be used for illumination of a particular area. Sub circuit loading of each lighting panel shall be restricted to 2000 Watts.
 - e. Design of lighting system shall be such that the average lux level as specified is achieved. The Bidder shall submit illumination calculation/layout for the purchaser's review.

1.4.4 Lighting Distribution System

- a. Separate lighting transformers shall be provided inside the lighting distribution boards located at required location. Lighting distribution system shall be distinct and separate from the LV main distribution. Lighting transformers shall be encapsulated cast resin dry type.
- b. AC lighting panels shall have 240V single-phase, 2 wire incomer controlled by earth leakage circuit breaker and number of single phase outgoing circuits controlled by MCBs. The lights connected to a circuit or few circuits shall be 'ON' automatically through photocell for outdoor lighting. Provision shall be made for switching 'ON' the rest of the lights. Lighting fixtures in indoor areas shall be controlled from the respective lighting panels
- c. Normal 240 V AC Lighting System
For this system, lighting points shall be supplied at 240 V AC through 415 V, 3-phase, 4-wire, 50 Hz, LDB. The supply shall be derived from 415 V, 3-phase, 4-wire, 50 Hz switchgear through delta/star lighting transformer. The secondary of lighting transformer shall be connected to respective 415 V, 3-phase, 4-wire AC lighting distribution board (LDB). The LDBs shall be provided with number of outgoing circuits controlled by double pole MCBs to feed the lighting panels distributed in and around the plant. Different circuits shall be used from different source. The whole lighting network shall be balanced as far as possible.
- d. Normal/Emergency 240V AC System
For these systems, the distribution shall be by 415V, 3-phase, 4-wire, 50 Hz supply. This supply shall be derived from 415 V, 3-phase, 4-wire, 50

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[7]	25.09.2014

Hz normal emergency switchgear for NE & lighting through delta/star lighting transformer. The secondary of lighting transformer shall be connected to respective 415 V, 3-phase, 4-wire AC lighting distribution board (LDB). The LDBs shall be provided with number of outgoing circuits controlled by double pole MCBs to feed the lighting panels distributed in and around the plant.

e. Emergency 220 V DC Lighting System

The power supply shall be obtained from the nearest 220 V DC switchboard. DC lighting panel will have one (1) incomer controlled by double pole MCB, Outgoing circuits will be controlled by DP MCB. Upon failure of the normal-cum-emergency AC supply, emergency DC lighting fixtures will be made automatically ON. The change over in the reverse direction shall also be automatic.

f. Maintenance 24V AC Lighting System

24 V AC supply for maintenance purposes (for hand lamps and/or hand operated tools) shall be supplied from 24 V AC distribution panel, which receives 240 V power supply from 415 V/240V transformer modules of N/E switchgear. 24 V AC distribution panel consists of one incomer controlled by MCB, one 240/26.5 V dry type transformer of adequate rating and number of outgoing circuits controlled by MCB.

1.4.5 Illumination levels and choice of lighting fixtures

The area-wise distribution of average illumination levels and type of luminaries shall be as indicated below:

[Note: These are indicative only. However as per specific Existing project, Bidder may refer section I of this specification for exact details of type of fixtures.]

Table 2.0

Sl. No.	Area/Structure	Average Illumination Level in Lux	Type of Fixture	Type of Luminaries
A - TURBINE GENERATOR BUILDING				
1.1	General (auxiliary equipment areas)	200	Industrial well glass fixture, dust & jet proof, die cast aluminium body, stove enamel finish, vitreous enamel reflector integral mounted control gear/industrial bulk head with integral mounted control gear.	1x70 W/ 1x150 W HPSV lamp

Sl. No.	Area/Structure	Average Illumination Level in Lux	Type of Fixture	Type of Luminaries
1.1	Control room	400	Energy Efficient 2x40W FTL industrial type of vitreous enamel finish and with Electronic choke suitable for 220V DC operation	CFL lamp
1.2	Other areas	250	Energy Efficient 2x40W FTL industrial type of vitreous enamel finish and with Electronic choke suitable for 220V DC operation	CFL lamp

1.4.6 Area wise distribution of Lighting system in plant

Area wise lighting distribution shall be as below:

Table: 3.0

Area/building	Percentage Distribution of Lighting		
	Normal	Normal & Emergency	220V DC
Turbine Generator Building (all the bays)	80%	20%	10%
Control rooms	80%	20%	10%
Boiler Area (Grade level & Platforms)	80%	20%	5%
Service building	90%	10%	5%
Various pump houses and electrical switchgear rooms such as AHP, CHP, FOPH switchgear room, etc.	90%	10%	5%
Electro static precipitator	90%	10%	5%
Switchyard and Transformer yard	80%	20%	5%

1.4.7 Lighting System Design

The lighting system design shall comply with the acceptable norms and the best engineering practices. The system design shall consider principles of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[12]	25.09.2014

lighting specified in following paragraph. The lighting layout shall be designed to provide uniform illumination with minimum glare. The layout design shall meet all the statutory requirement, local rules etc.

a. Indoor Lighting

The recommended values of illumination level for various areas in the plant are indicated in the table above. Lighting layouts shall be designed such that the ratio of minimum to average illumination shall not be less than [0.6]. Following factors shall be considered while arriving at the utilization factor to determine the number of fixtures for each area/buildings in the plant.

i. Maintenance Factor:

- Air conditioned clean interiors like office rooms, Laboratories, Auditoriums : 0.8
- Air conditioned clean interiors like office rooms, Laboratories, Auditoriums : 0.8
- Industrial areas with normal interiors such as workshops, stores : 0.7
- Industrial areas with dusty interiors : 0.6
- Industrial areas with very dusty interiors such a crusher house and junction towers : 0.5

ii. Reflection factor for wall/ceiling

- White and very light colors : 0.7
- Light colors : 0.5
- Middle tints : 0.3
- Dark colors : 0.1

iii. The working plane shall be considered at 0.85 m from the floor level.

iv. The value of the ratio of spacing (S) to mounting height (H) shall be commensurate with the type of fittings selected and uniformity of illumination. The suspension height for suspended fixtures shall not exceed 1 meter.

b. Outdoor Lighting

- i) The recommended illumination levels for outdoor areas are indicated in the above table.
- ii) Mounting height, spacing of flood lights shall be based on lamp wattage, uniformity of illumination and vertical angles. Ratio of minimum to average illumination shall not be less than 0.3 and for minimum to maximum shall not be less than 0.05.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[13]	25.09.2014

- iii) Maintenance factor shall be generally 0.6 under average conditions.
- iv) Flood lights for area lighting shall be mounted on building structures. For outdoor lighting i.e. around the power plant building and transformer yard provision to be made with 400W outdoor type lamps mounted on wall/structures.
- v) Automatic switching ON/OFF shall be shall be provided through timers/photo cells.
- vi) For road illumination inside the boundary limit lighting poles shall be provided and the distance between the poles shall not exceed 30m.
- vii) Aviation obstruction lights shall be provided on tall installations (Chimney, Cooling Towers etc) as per Airports Authority and international standards. Aviation warning lights shall be high intensity type-A flashing LED type with varying intensity for day and night.
- viii) In an area, the lighting fixtures shall be arranged in different phase / LPs such that even in case one lighting panel is faulty complete lighting is not affected. In any location the lighting shall be arranged from two phases.
- c. The circuit loading on each circuit shall be restricted to 80% of the MCB rating.
- d. The voltage drop from LDB and any fixture shall not exceed 3%.
- e. All lighting design calculations, layouts, conduit wiring diagrams, LDBs and LPs drawings and technical data sheets etc shall be furnished for Owner/ Owner's consultant's approval.

1.4.8 Lighting system equipment

- a. Lighting Distribution Boards (LDB) & Lighting Panels (LP)
 - i. The Lighting Distribution board shall be fed through 415V/433V lighting transformers with off circuit taps $\pm 5\%$ in steps of 2.5%. The lighting transformer shall be cast resin dry type , vector group of [Dy1], class F insulation with temperature rise limited to class F and shall be housed in a suitable enclosure. In general, the transformers shall conform to the specification covered under 'Service transformers. The lighting distribution boards shall consist of MCCB incomer and required number of double pole MCB controlled out going feeders to LPs. The LDB shall be designed for the required short circuit level of [20] kA. All the distribution boards shall be sheet steel clad, dust and vermin proof, cubicle type with degree of protection conforming to IP-52. Outdoor panels shall be weather proof type with IPW-55 protection. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[14]	25.09.2014

thickness of sheet steel enclosures shall be CRCA, 2 mm minimum for load bearing and 1.6 mm for other members.

- ii. Number of outgoing feeders in each LDB shall be provided as per requirement including the minimum 3 nos spare feeders for "Purchaser use". Each outgoing MCB in LDB's shall be of 15 A, but load to be limited to 2 kW or maximum 10 nos. fittings to be connected to one MCB
 - iii. Individual control in office buildings shall be through single pole flush type switches/MCBs. In those areas where group controls are required, rotary switches shall be provided
 - iv. External area lighting shall be fed from separate boards located at suitable places. Automatic switching ON/OFF of these circuits shall be done through timers/photo cell.
 - v. In high bays, walkway shall be provided for maintaining light fittings. At other places suitable ladder / platform / approach shall be provided for maintaining / replacement of light fittings.
 - vi. Each of the LDBs shall be provided with voltmeter and ammeter along with selector switches, "SUPPLY ON" indicating lamps, etc. The switch boxes, receptacle boxes etc. shall be made up of 18 SWG sheet steel.
 - vii. Two ground pads with bolts and nuts shall be provided on each board for connection to 50x6/25x3 mm GS flat.
- b. Lighting Fixtures and Lamps
- i) Fluorescent fixtures with electronic ballast shall be generally provided for a room height upto 5m. Type of fixture shall be industrial type with gasket, clear acrylic cover and enamelled reflector or decorative type to suit the aesthetics. For areas with false ceiling, recessed mounted decorative fixtures with mirror optic louvres shall be used. In control room / computer rooms, decorative mirror optic fluorescent light fittings with antiglare features shall be provided. The surface finish shall be smooth, unobtrusive and scratch resistant.
 - ii) Reflector shall be of sheet steel or aluminium, minimum 20 SWG thick and securely fixed by fastening device of captive type.
 - iii) Fixture shall be suitable for 19 mm conduit entry and 16 SWG GI earth wire connection.
 - iv) Fixture shall be furnished complete with lamps and integrally mounted accessories. These shall include holders, ballast, capacitor, starter, ignitors (separate type) etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[15]	25.09.2014

- v) For corrosive areas, corrosion proof lighting fixture shall be provided. For hazardous areas, light fittings, conduits, junction boxes etc. shall have to meet the corresponding area classification requirement.
- vi) Medium bay or high bay type of lighting fixtures with HPMV/HPSV lamps shall be used depending on the mounting heights for indoor areas having room height more than 5m. Medium/ High bay fixtures shall be provided with vibration damper wherever required.
- vii) For areas like boiler and outdoor areas such as roads, street, transformer areas and open yards, weatherproof HPSV flood/ street lighting fixtures shall be used. For areas like boiler platforms, weatherproof well glass type HPSV fixtures with wire guards shall be used.
- viii) All type of fluorescent lamps including Compact Fluorescent Lamp (CFL) shall be bi-pin rotary type and either cool daylight or white.
- ix) Mercury / Sodium vapour lamp shall be colour corrected type with screwed cap.
- x) Lamps shall be suitable for use in position and capable of withstanding small vibrations.
- xi) Ballasts shall be of heavy duty, low loss and polyester-filled type with copper winding.
- xii) Ballasts for Mercury / Sodium vapour lamps shall be provided with suitable tappings to set the voltage within range specified.
- xiii) Ballasts shall be free from hum. Ballasts which produce humming sound shall be replaced, free of cost.
- xiv) In multi-lamp fixture, each lamp shall be provided with individual ballast.

c. Switches, Receptacles

- i. In the plant areas, the lighting circuits shall be controlled directly from the MCBs in the lighting panels. Wherever the lighting panel is not in the same area, separate switches shall be provided. For cabins, rooms, etc., separate switches shall be provided for each point. Similarly for entrances, building periphery lighting separate switches shall be provided
- ii. 240V, 50 Hz, 3 pin Power Receptacles (5A, 15A) shall be provided in all building/areas of the plant. Inside a building, receptacles shall be provided at interval of 30m or part thereof for hand tools, water coolers, exhaust fans etc. Inside each cabins at

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[16]	25.09.2014

least two receptacles shall be provided and the same shall be indoor/outdoor/flameproof as per the location. Minimum 2 nos of 5A and 1 no 15A receptacles shall be provided in each room. Receptacles shall be heavy duty, complete with individual plug and switch as described below:

Table: 4.0

S.No.	Type	Description
1	RA	5A, 240V, 2 Pole, 3 Pin with third pin earthed - Suitable for flush mounting in office areas and control room. The switch shall also be flush mounting piano type.
2	RB	15A, 240V, 2 Pole, 3 Pin with third pin earthed - Wall/column mounted, metal clad gasketed construction, suitable for 19 mm conduit entry, screwed metal cover tied with metal chain, weatherproof construction suitable for indoor/outdoor installation. This shall be provided at an interval of 30m, or minimum one in each room.
3	RC	63A, 415V, 3 Phase, 5 pin interlocked plug and switch with fifth pin earthed. Wall/column mounted, metal clad gasketed construction weather proof, suitable for loop in/ loop out connection of 4 Core 35 sq.mm AYWY cable. These receptacles shall be provided at an interval of 50m throughout the Plant Area.
4	RD	100A, 415V, 3 phase, 5 Pin interlocked plug and switch with fifth pin earthed Wall/column mounted metal clad gasketed construction weather proof, suitable for loop in/ loop out connection of 3.5 Core, 95 sq.mm AYWY cable.

d. Cables and Wiring

- i. Wiring from lighting DBs/panels to individual fixtures, plug points, fans, etc. shall be of single core, 2.5sq.mm, 1100 V grade PVC stranded copper conductors through surface mounted or concealed medium duty GI conduits confirming to IS 1239 with earth wire. The wires in the conduits shall not exceed 60% of the conduit area.
- ii. 1100V grade stranded copper conductor, PVC insulated, colour coded, wires laid in GI conduits shall be used for lighting in non-hazardous area. In the hazardous area, outdoor areas like transformer yard and road lighting, cabling shall be adopted. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[17]	25.09.2014

specification of cable shall conform to the details indicated in "Cabling System" section.

- iii. Minimum size of wires in case of conduit wiring shall be 2.5sq.mm copper in case of lighting and 4sq.mm copper in case of receptacle wiring
- iv. Wires of different phases shall be run in separate conduits. However, wires of same phase but having different circuit nos. can be run in same conduit. Wires of lighting and power receptacles shall be carried out in separate conduits and on separate circuits. Wires of AC and DC lighting system shall be carried out in separate conduits
- v. For outdoor lighting, the cable shall be buried at a minimum depth of 750 mm from ground level or run in cable trays. The buried cables shall have suitable bedding, protective covers and markers
- vi. Material used for saddles, clamps, JBs, etc. shall be galvanized
- vii. Office buildings, laboratory buildings shall have concealed wiring with 2.5sq.mm wires using PVC conduits. In heat zones, i.e. in the areas where ambient temperature is 600 C and above, heat resistant control cables shall be used in hot dip galvanised rigid steel surface mounted conduits

e. Fans and Regulators

- i. The fans shall have three well balanced blades, double ball bearings and shall be reasonably free from noise. Fan motor shall be totally enclosed type with copper winding and class-E insulation. Sweep shall be given as 1200 /1400 mm.
- ii. Regulators shall have minimum five steps. Electronic Regulators with smooth control shall be provided.

f. Flame-Proof Equipment

- i. The enclosure of all flameproof equipment for use in hazardous areas where gases/vapors of Group I, IIA, IIB are present, shall be of cast iron/cast aluminum, stove enamel finished. Chemical corrosion resistant epoxy finish shall be provided in corrosive areas. The construction shall comply with relevant applicable standards
- ii. If the enclosures are additionally required to be weather proof, neoprene gaskets shall be provided to make the enclosure dust and weather proof providing a degree of protection of IPW 55.
- iii. All ferrous parts, exposed to atmosphere shall be suitably plated/galvanized

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[18]	25.09.2014

- iv. All internal wiring shall be connected to terminal blocks provided in terminal enclosure on incoming side.
- v. Flameproof cable gland entries shall be provided suitable for the cable sizes. The number of required cable entries for junction/terminal boxes as required for branching, terminating of cables for lighting distribution shall be provided. All unused cable entries shall be closed by flameproof plugs.
- vi. Flameproof receptacle unit (socket with associated switch/MCB and plug) shall have interlocking feature such that plug cannot be inserted or taken out with switch/MCB in "ON" position.
- vii. Adequate mounting lugs with necessary hardware shall be provided for mounting the equipment on wall/structure.
- viii. These enclosures shall have inscription warning against opening the enclosure unless the circuit is isolated. Equipment rating and ON/OFF positions of switches/MCBs shall also be designated.
- ix. The BIDDER shall indicate that the enclosures have been tested and certified by relevant statutory authorities for use in hazardous areas.

g. Lighting poles and towers

- i. Lighting poles for street lights and flood lights shall be of swaged and welded steel, pole of height 9M/11M and shall conform to relevant standard. Poles shall be hot dip galvanized internally and externally after fabrication as per IS 2629 / IS 2633 / IS 4759 standards. The Poles shall be designed to withstand the maximum wind speed as per IS 875. The steel sheet used to manufacture steel poles shall be of minimum thickness of 3 mm and shall conform to relevant standard . Junction boxes shall be provided with weather proof flush doors and locking facility. Bidder shall design and furnish the foundation drawings for the poles to withstand basic wind speed of minimum [50]meter/sec.
- ii. The supply of poles/Towers shall be complete with base plate, foundation bolts, hot dip galvanized brackets / necessary pipe reducer for fixing the fitting and also include the necessary associated pole mounted junction boxes.
- iii. Towers for mounting flood lights shall be e of continuously tapered poly gonal cross section and shall be supplied with all acesssories. Steel structure for towers shall be made of hot dip galvanized steel. A steel ladder and platform at the top shall be provided. The length of each step of the ladder shall be at least

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[19]	25.09.2014

300 mm and spacing between two adjacent steps not more than 300 mm. The structure shall be suitable for mounting the required number of flood lights, weights of maintenance crew and specified wind pressure. The factor of safety shall be [2] for each part and section. The Contractor's structural design drawings shall be approved by the Purchaser before fabrication.

1.4.9 Name Plate

Name plates shall be furnished for identification of devices and circuits. All switches, controls and indications shall be permanently and legibly marked in English regarding the functions.

1.4.10 Painting

All surfaces shall be sand blasted, pickled and grounded as required to produce a smooth, clean surface free of scale, grease and rust.

After cleaning, the surfaces shall be given a phosphate coating followed by 2 coats of high quality primer and stoved after each coat.

The equipment shall be finished in approved color shade by owner with two coats of epoxy based powder coated paint. The coating shall be done electro statically followed by stoving.

Sufficient quantity of touch-up paint shall be furnished for application at site.

1.5 Tests

I) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant /purchaser or his representative.

Tests on Lighting Distribution Boards / Panels shall include:

a. Wiring continuity tests.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[20]	25.09.2014

- b. High voltage and insulation tests.
- c. Operational tests.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6

Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *Lighting panels & distribution boards.*
- b) *Receptacles & Junction boxes.*
- c) *Street light poles & towers.*
- d) *Lighting fixture complete with lamps and accessories.*
- e) *Non-integral/separate type control gear box for lighting fixtures, as applicable.*
- f) *Lux level calculations for each area.*
- g) *Data sheets for lighting fixture, lamps, accessories with light distribution curves, co-efficient of utilization charts etc. Type and routine test certificates of transformer and cables.*
- h) *Control schematic and wiring diagram of 415V AC/220V DC lighting panel with automatic changeover from AC to DC and vice-versa, 415V normal AC Street/area lighting panel with automatic ON/OFF feature.*
- i) *Technical leaflets and data sheet on each piece of equipment/ device such as MCB, switch, fuse, receptacle etc. Type and routine test certificates of transformer and cables.*
- j) *QAP and relevant test certificates*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E9	[21]	25.09.2014

- k) Lighting layouts showing the disposition of fixtures, lighting panels/boards, circuit distributions, conduit & wire routing.
- l) Key Single Line Diagram for lighting distribution, board wise single line diagram with feeder loading, cable schedule and interconnection chart, design calculation for lighting.]

1.7

Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

S. No.	DESCRIPTION	UNIT	DATA
1.0	GENERAL		
1.1	Normal Supply Voltage, Phase and Frequency	AC DC	240V, 1Ph, 50Hz 220V DC

TECHNICAL SPECIFICATION FOR CABLE CARRIER
SYSTEM**

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E10

1.0 CABLE CARRIER SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Cable Carrier system complete with all accessories for efficient and trouble free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS 800	Code of Practice for structural Steel
IS 1646	Code of Practice for Fire Safety of buildings
IS2667	Fittings for Rigid steel Conduits
IS 3419	Fittings for Rigid Non – Metallic Conduits
IS 3837	Accessories for Rigid Steel Conduits
IS 4649	Adaptors for Flexible Steel Conduits
IS 5216	Guide for Safety Procedures and Practices in electrical Work

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E10	[1]	25.09.2014

1.3 Design Criteria

- a) Cable and cable trays shall be installed in an ambient temperature of 50 °C and relative humidity of 95%.
- b) The cable carrier system shall be designed considering the following:
 1. Facility for easy laying of cables.
 2. Access to maintenance.
 3. Neat and aesthetic appearance.
 4. Safety of equipment & personnel.
 5. Ground water seepage.
- c) Cables shall be laid in prefabricated ladder/perforated type trays and in conduits. Direct burial of cable shall be mostly avoided.
- d) Upper cable trays and all vertical cable trays shall be provided with tray covers.
- e) Cable filling in the trays or racks shall not exceed 80%. Conduits if used, the wires in the conduits shall not exceed 40% of the conduit area.
- f) Different voltage grade cables shall be laid in separate trays when trays are arranged in tiers. H.V cables shall be laid in top trays and cables of subsequent voltage grade in lower tier of trays. Instrumentation cables shall be laid at bottom most tray.
- g) At least 300mm clearance shall be provided between HV and LV cables & LV and control/Instrumentation cables.
- h) Support system for cables shall be prefabricated type.
- i) Single core cables shall be laid in trefoil touching formation. Trefoil clamp shall be provided in a staggered manner.
- j) 1100V grade power cables of [120] mm² size and above shall normally be laid in single layer in trays/on racks.
- k) 1100V grade power cables below [120] mm² may be run in double layers in case of space restrictions.
- l) Control and instrumentation cables can be laid up to a maximum of three layers in each tray/rack.

1.4 Specific Requirements

1.4.1 Scope of work:

The scope of work shall include Design, Preparation of Cable Tray, Trench/Duct bank/Conduit Layout, supply of Cable tray and its Accessories, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with the Cable Carrier System

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E10	[2]	25.09.2014

for following package. The below list indicates area where cable carrier system to be provided but not limited to:

[Note: With reference to particular package, scope of work shall be modified.]

a) TG Area:

- i) TG Platforms.
- ii) TG area Grade Levels Maintenance area.
- iii) Preparation of Cable schedules and Inter Connection schedules/Diagram.
- iv) Laying and Termination of power & control cables for all the equipments of TG package.

b) Boiler Area:

- i) Boiler Platforms
- ii) Boiler Grade Levels covering coal mill and Maintenance area.
- iii) ESP Platforms
- iv) ESP/FOPH switchgear room.
- v) FOPH area.
- vi) Preparation of Cable schedules and Inter Connection schedules/Diagram.
- vii) Laying and Termination of power & control cables for all the equipments of Boiler package.

c) Balance of Plant Area:

- i) Cable Carrier System for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, Transformer area, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
- ii) Laying and Termination of power & control cables for all the equipments of BOP package.

d) CHP Area:

- i) CHP Switchgear room
- ii) Conveyor.
- iii) Crusher House
- iv) Stacker and Reclaimer
- v) Any other area covered in this package.
- vi) Laying and Termination of power & control cables for all the equipments of CHP package.

e) AHP Area:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E10	[3]	25.09.2014

- i) AHP Switchgear room.
- ii) Silo Area.
- iii) Any other area covered in this package.
- iv) Laying and Termination of power & control cables for all the equipments of AHP package.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard
 - ii) Transformer yard
 - iii) Inter plant cabling.
 - iv) Any other area covered in this package.
 - v) Laying and Termination of power & control cables for all the equipments of eBOP package.
- g) All civil and structural works necessary for successful installation and commercial operation of all electrical equipment to be erected under this specification. Supply of cement, sand, stone etc. required for the execution of the contract shall be the responsibility of the Bidder.
- h) All other ancillary works in connection with the items of work described above which are not specifically mentioned but are necessary to complete the work.
- i) For Terminal Points and Exclusions of Cable Carrier system and Specific scope of work Bidder may refer section I of this specification.

1.4.2 General Installation Requirements:

- a) Cable trays shall be fabricated from 14 gauge mild steel sheets. Cable trays shall be of hot dip galvanized Steel of ladder/perforated type, complete with all necessary coupler plates, elbows, tees, bends, reducers, stiffeners and other accessories and hardware as detailed in the relevant drawings to be submitted by Bidder. All hardware (i.e. bolts, nuts, screws, washers, etc.) shall be hot dip galvanized.
- b) Constructional details, supporting arrangement and installation details for cable trays shall be furnished by Bidder.
- c) Each 2.5 meter section of all types of cable trays and all elbows, tees, crosses, etc. shall be provided with two side coupler plates and associated bolts, nuts and washers.
- d) Cable tray covers shall be fabricated from 16 gauge MS sheets. Cable tray covers shall be hot dip galvanized and same shall be provided for all outdoor cable trays and vertical raceways/trays. Covers for vertical raceways shall be in individual, easily removable sections to facilitate cable maintenance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E10	[4]	25.09.2014

- e) Cable Tray of Standard width of 600mm shall be followed. However, trays with 450, and 300, 150 mm width may be used in some places considering the requirement and space restrictions. For instrumentation and control purpose, some perforated type cable trays of width 150 mm may be used particularly in Boiler Platform area, and 600, 450, 300 mm perforated trays may be used depending on site requirement.
- f) Cable trays shall be ladder type with maximum rung spacing 250 mm depth 100 mm and rung width not less than 50 mm.
- g) Cable trays in areas subjected to excessive coal dust, or mechanical damage shall have hot-dip galvanized sheet metal tray cover installed on front tray in vertical run and inverted 'V' type on upper tray in horizontal run. Where covers are used on trays containing power cables, consideration should be given to ventilation requirements. Areas where corrosive chemicals are likely to be handled, cable tray and covers shall be epoxy painted.
- h) Suitable embedded steel inserts shall be provided on wall/floor/ ceiling surfaces for welding of cable tray bracket in order to make the cable tray system withstand horizontal / vertical accelerations due to seismic forces for indoor trays and also wind load for outdoor trays such as on Boiler platforms in addition to normal tray cable loadings.
- i) Cable installation work shall mean erection of cable trays/racks, supports, hangers, junction boxes, conduits, laying of cables either in ground or on trays inside trenches tunnels/overhead trays in conduits etc. dressing and clamping, jointing and termination inclusive of supply of necessary jointing/termination kits, lugs, glands, ferrules, tapes etc. and other accessories, grounding of cable armor. In case of direct laying in ground, all excavation work, necessary back-filling, supply of bricks and protective concrete slabs, removal of excess earth shall be part of the installation work.
- j) Erection of cabling work shall be executed keeping in view all necessities and requirements of fire fighting codes for Generating Stations having an adverse industrial environment.

1.4.3 Cable Routing/Laying

- a) Cables shall generally be laid on ladder type cable trays either in trenches or overhead supported from building steel/structures except in some

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E10	[5]	25.09.2014

cases cables may have to be laid underground and for short runs in conduits for protection while crossing roads and other facilities.

- b) For interplant connections, the cables may be routed through an overhead cable bridge or cable trenches/tunnels selection being dependent on site constraints.
- c) For underground crossing of railways, roads etc. hume pipes shall be used and shall be laid at a depth of minimum 1000 mm such that cables shall not be damaged.
- d) In boiler area, trench shall be avoided as far as practicable. The cable racks shall be supported from Boiler structure in vertical configuration with suitable cover to avoid deposition of coal dust as far as practicable.
- e) Different voltage grade cables shall be laid in separate trays when trays are arranged in tiers. Power cables shall be on top trays and Control/Instrumentation cables on bottom trays, and it is recommended that trays for cables of different voltage levels be stacked in descending order with higher voltage level above.
- f) Cables for redundant equipment/system shall be run in separate trays in separate route.
- g) Cables from two different services viz. supply from station board and supply from unit board shall be fully segregated to prevent simultaneous damage due to fire in one of the services.
- h) Low level signal cables and other special Instrumentation and Control cables shall run in separate trays. In general, a minimum of 1500 mm clearance shall be maintained between these cables and noise generating equipment (large motors, generators, transformers etc.).
- i) The cable spreaders of each unit shall be compartmentalized by provision of fire proof partition wall and fire proof doors.
- j) The floor of the cable spreader rooms shall have to be made water proof so that water does not percolate to lower levels in the event of fire fighting operations. Adequate arrangement for efficient drainage of water shall be provided. The cable raceways should also be suitably planned to avoid water entry through this place.
- k) Cables shall generally be laid on cable trays either in concrete trenches or overhead supported from building steel/structures. Cables shall be run in concrete trenches in those electrical rooms at ground level, which are without any spreader room below. In mechanical equipment areas (Indoor), overhead cable trays shall generally be used.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E10	[6]	25.09.2014

- l) For inter plant connections, the cables shall be routed through an overhead cable bridge pipe cum Cable Bridge. For isolated but long outdoor cable route with very few cables of 3/4 nos., the cables may be directly buried with prior permission from the purchaser.

1.4.4 Installation of Cables

- a) The Bidder shall install, terminate and connect up all cables and conduits with supporting arrangements as per drawings, cable schedules and interconnection chart/drawings.
- b) The HV power cables of 6.6kV shall be laid in trays or racks as follows:
- In single layer only.
 - 3 core cables to be laid in touching formation.
 - Cables in trefoil groups of the same circuit shall be laid as indicated below so as to ensure balanced current distribution:

Y Y Y Y

R B B R R B B R and so on.

- c) 1100V grade power cables shall be laid in single layer in trays depends on size of cables. Cable of up to 120 sqmm shall be laid in two layers. Beyond this size single layer will be followed.
- d) Control and Instrumentation cables can be laid up to a maximum of three layers in each tray.
- e) The trays shall be run with a vertical spacing of 300 mm for overhead cable trays as well as inside cable trenches. A minimum of 225 mm clearance shall be provided between the top of tray and beams, cold piping, 500 mm clearance for hot piping/object to facilitate installation of cables in tray.
- f) Adequate pull boxes shall be provided in conduit run to facilitate cable pulling in long runs and also to ensure that there shall not be more than 2 nos. 90 Deg. Bends between pull points.
- g) Cable tray/conduit system shall be installed to accommodate cable manufacturer's recommended maximum pulling tension, minimum bending radius and no. of bends.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E10	[7]	25.09.2014

- h) All openings in the floor and wall for cable access shall be sealed after installation of the cable system with non-inflammable materials, as follows :
- Fire stop/Penetration seal shall be installed in the cable spreaders and cable raceways.
 - Similarly in the trenches fire stop/penetration seals shall be provided at suitable interval to avoid spread of fire.
 - For all HV, LV, Relay and Control panels, Control desk, instrumentation panels, battery charger, D.C. Dist. boards and other miscellaneous panels, fire-stops should be provided below base plate.
- i) All floor/wall openings for cable entry to the electrical equipment and accessories shall be sealed with non-inflammable materials, after completion of cable installation. Thickness of such materials shall be equal to the thickness of floor/wall unless specified otherwise.
- j) The portion of galvanized steel, which, if required, undergoes any welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.

1.4.5 Cable Termination and Joints (if applicable and not covered in cable specification)

- a) The Bidder shall supply cable termination and jointing kits in requisite quantity for HV. Power Cables, LV. Power, Control Cables, etc. along with all accessories & consumables required for making termination and joints complete . All the materials and components of the termination/joints shall be suitable and compatible with the type of cables for which the terminals/joints are intended.
- b) The straight through joints of HV. cables shall be heat shrinkable and pre moulded push on type. The end termination kits for HV. cables shall be of {Raychem/3M/Elastimold} type. Cable joint or end terminations on Electrical equipment shall be suitable for Indoor & Outdoor use, as the case may be.
- c) Glands and lugs required for termination of HV, LV. shall be supplied by the Bidder in required quantity.
- d) Cable glands shall be tinned brass gland, double compression type complete with necessary armour clamp and tapered washer etc. Cable glands shall match with the sizes of different HV/LV/Control cables.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E10	[8]	25.09.2014

- e) Cable lugs shall be suitable for termination of different cross-sections of L.V./Control cables and shall be of following types:
 - i. Aluminium tubular terminal end for solderless crimping to aluminium conductors.
 - ii. Copper tubular terminal end for solderless crimping to copper conductors.
 - iii. Solderless crimping of terminals shall be done by using corrosion inhibiting compound. The cable lugs shall suit the type of terminals provided on the equipment. Lugs for control/instrumentation cables shall be PVC insulated/sleeved type.
 - iv. Cable lugs for control cable termination shall be insulated. These lugs shall be pin type/flat type/ring type/U type to suit the terminals provided in the panels.
 - v. The terminations shall with tinned copper only.
 - vi. For mill area, the cable shall be routed through GI pipes embedded in Ground.
 - vii. In heat zone areas as far as possible the cables shall be taken away from the area to avoid heat. If cabling in the heat zones can not be avoided, the cables shall be terminated in junction box of IP 67 protection class away from the heat zones and small length of cables may be laid from junction box to the respective equipment to facilitate easier replacement in case of fire. Bunching of cables in the heat zones and boiler areas shall be avoided and laid in separate groups.

1.4.6 Identification

- a) The complete cabling system shall be properly identified. Methods for identification of cabling system will be furnished to the Bidder and the Bidder shall strictly adhere to the said methods.
- b) Each cable and conduit run shall be tagged with numbers that appear in the cable and conduit schedule.
- c) Location of cables laid directly underground shall be clearly indicated with cable marker made of galvanized iron plate, projected above ground level.
- d) Cable tags shall be provided on all cables at each end (just before entering the equipment enclosure), on both sides of a wall or floor crossing, on each duct/conduit entry, at each bend and at every thirty (30) meters in cable tray/trench runs. Cable tags shall also be provided

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E10	[9]	25.09.2014

inside the switchgear, MCC, control & relay panels etc. wherever required for cable identification, such as where a number of cables enter together through a gland plate.

1.5 Tests

I) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant / purchaser or his representative.

- a) Checking of continuity / phasing and IR values for all the cables before and after HV test
- b) Checking of continuity / phasing and IR values for all the cables before and after HV test.
- c) HV test and measurement of leakage current after termination of cable kits (for HT cables).
- d) Checking of earth continuity for armour.
- e) Check for mechanical protection of cables.
- f) Check for identification (tag number system) distance placement of cable marker, cable joint etc. as per the cable layout drawing.
- g) Check earthing of cable structures.
- h) Check safe head room in gallery area
- i) Check clearance from ventilation duct and light fittings for cable structures.
- j) Check proper fixing of cable structures.
- k) Check for proper drainage and removal of water (if any).

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors –Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E10	[10]	25.09.2014

obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *[General arrangement drawing Cable Tray]*
- b) *[Cable Tray Accessories like Tee, Cross, Bends, Coupler, Reducer etc]*
- c) *[Cable Tray support materials]*
- d) *[Technical Data sheets for cable carrier system].*

1.7 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

SL NO.	DESCRIPTION	UNIT	DATA
1.	Make/Manufacturer		[By bidder]

ANNEXURES-E11

1.0 EARTHING AND LIGHTNING PROTECTION SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Earthing and Lightning Protection System complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS:2309	Code of Practice for the protection of building and allied structures against lightning.
IS:2629	Recommended practice for hot dip galvanizing of iron & steel
IS:2633	Method for testing uniformity of coating on zinc coated articles.
IS:3043	Code of practice for Earthing
IS:9537	Conduits for electrical installation.
IEEE:80	IEEE guide for safety in AC substation grounding
IEEE:142	Grounding of Industrial & commercial power systems
CEA	CEA Regulations and standard technical specification for main plant package.

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[1]	25.09.2014

1.3 Design Criteria

- a) Earthing system design shall consist of earth grids and electrodes buried in soil in the whole plant area, embedded in concrete inside all the buildings to which all the electrical equipment, metallic structures are connected to have earth continuity for safety reasons.
- b) The main objectives of earthing system is to:
 1. Provide safety to personnel from contact of dangerous potential caused by ground fault.
 2. Ensure sufficient grounding current for effective relaying.
 3. Stabilize circuit potential with respect to ground.
- c) The earthing conductor shall be designed for fault current of [50 kA] for duration of 1 second.
- d) It is the responsibility of the Bidder to undertake the soil resistivity measurements at site and select suitable size of conductor based on the soil resistivity.
- e) Ground conductor shall be of galvanized steel for above ground and mild steel for embedded and below ground earthing.
- f) Main earth grid conductor shall be mild steel (MS) of [40] mm dia.
- g) Suitable corrosion allowance shall be considered over ground conductor size depends upon soil resistivity.
- h) The main purposes of lightning protection system are to :
 1. Provide protection to structures from lightning strokes.
 2. Provide a low resistance-conducting path to lightning discharge.
 3. Lightning protection shall be provided as per IS: 2309 for Boiler area and other tall structures within the battery limit.

1.4 Specific requirements

1.4.1 Scope of Work

The scope of work shall include Design, Preparation of Earthing and Lightning Layout, supply, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with the safety earthing and Lightning Protection system for following areas Listed below but not limited to the following:

[Note: With reference to particular package, scope of work shall be modified.]

- a) TG Area:
 - i) TG Platforms.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[2]	25.09.2014

- ii) TG area Grade Levels Maintenance area.
- iii) All equipments, structures etc of TG package.
- iv) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- b) Boiler Area:
 - i) Boiler Platforms
 - ii) Boiler Grade Levels covering coal mill and Maintenance area.
 - iii) ESP Platforms
 - iv) ESP/FOPH switchgear room.
 - v) FOPH area.
 - vi) All equipments, structures etc of Boiler package.
 - vii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- c) Balance of plant Area:
 - i) Earthing and lightning protection system for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, Transformer area, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
 - ii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- d) CHP Area:
 - i) Switchgear rooms
 - ii) All equipments, structures etc of Boiler package.
 - iii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- e) AHP Area:
 - i) Switchgear rooms
 - ii) All equipments, structures etc of Boiler package.
 - iii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard, Transformer yard and BTG area are provided with earth mat of [40] mm dia MS Rod conductor buried below 600mm from ground level. Areas like AHP, CHP, Boiler and TG, and all other

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[3]	25.09.2014

BOP area below grounding system are covered in this eBOP package and above ground earthing for AHP, CHP, Boiler, TG and Mechanical BOP are covered in respective package itself. System Neutrals are earthed through Treated Earth Pit. All areas of power plant are interconnected to form an integrated single earthing system. Lightning system for above ground are covered in respective packages and below ground is covered in this eBOP package in same way as earthing system.

1.4.2 Earthing system

- a) Earthing system shall be designed in accordance with IS 3043 and Indian Electricity Rules and Acts.
- b) Fault current for the earthing system shall be designed for [50] KA for duration of 1 sec.
- c) All electrical equipment, non-current carrying metal parts, structures, building steel, lightning protection system, transformer neutrals shall be connected to station ground grid.
- d) Treated earth pits including riser shall be provided for transformer neutral earthing.
- e) Connection between the equipment earth lead and the grid conductor shall be welded. For rust protection, the welds shall be treated with zinc chromate primer and coated with zinc rich paint.
- f) Entire erection of grounding work shall be carried out in such a way as to be capable of withstanding the intended services of carrying full short circuit level currents to ground mat without any damage/deformation.
- g) All off site area of AHP , CHP etc shall be provide with peripheral earthing with at least two connection to main station earth grid through treated earth pit.

1.4.3 Ground Grid Conductor

- a) Ground grid conductor of mild steel rod shall be used.
- b) *[The minimum conductor section is determined on the basis of ground fault current. This section is then increased by an allowance to account for the soil corrosion loss of 0.12 mm (on diameter of conductor) per year over the design life of 40 years.]*
- c) However bidder shall consider as per CBIP norms “ Manual on Earth mat design” the corrosion allowance as below:
 - For soil resistivity greater than 100 ohm-meter: No allowance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[4]	25.09.2014

- For soil resistivity greater than 25- 100 ohm-meter: 15% allowance.
- For soil resistivity less than 25 ohm-meter: 30% allowance.

1.4.4 Underground Grid

- The ground grid mesh is designed to keep the touch and step voltages within safe limits as per recommendation of IEEE 80.
- [The ground grid conductors shall be buried in earth at a depth of 600 mm]. The length of ground conductors below earth shall be sufficient to ensure a ground resistance less than one (1) ohm.
- The ground grid conductor shall be so laid as to provide short and direct connection to building steel and major electrical equipment.
- Ground rods shall be provided at the points where system neutrals/lightning protections are connected to the ground grid.
- All ground grid conductor connections shall be welded type.
- Ground grid shall be interconnected with the ground grid of neighboring areas at least at two (2) points for further reducing the ground grid resistance.
- Suitable pigtails shall be provided and shown in the [layout drawing] for connection with ground grid of neighboring areas.
- A minimum earth coverage of [300] mm shall be provided between the ground grid conductor and the bottom of trenches, tunnels, underground pipes, foundations, railway tracks etc. The ground grid conductor shall be re-routed in case it fouls with equipment foundations.
- In some cases, it may happen that the construction work of cable trench, foundation and laying of underground pipes are being taken up after the grounding mat has been laid. It may be required to cut a portion of grounding conductor to avoid fouling with cable trench, equipment foundations, underground pipes etc. In this case, the ground conductor shall be properly rerouted and rejoined/reconnected with the main grounding mat during the construction/laying of above underground objects and good electrical continuity of grounding conductor shall be ensured.
- Grounding conductors crossing the road may have to be laid at greater depth to suit the site conditions.
- Grounding conductor around the building shall be buried in earth at a minimum distance of [1200] mm from the outer boundary of the building.
- The Bidder shall carryout the grounding of all electrical equipments and connection to main earth grid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[5]	25.09.2014

1.4.5 Ground Electrode

Ground electrodes shall be [40] mm dia. and [3] metre long M.S. rod. These are to be fabricated and driven into the ground by the side of mat conductors. All connections to the conductors shall be done by arc welding process.

1.4.6 Above Ground Connections

- Galvanized steel flats shall be used for all connections above earth.
- Inside building, ground conductors shall be run for each floor supported on building steel and/or cable trays. These ground conductors in turn shall be connected to the station ground grid through riser (at least two) coming up along building columns/cable shafts.
- Two separate and distinct ground connections shall be provided for each electrical equipment in compliance with I.E. Rules.
- All steel columns and structures shall be connected to the earth mat through earth leads.

All connections above ground shall be welded type except connection to equipment/structures which shall be bolted type.

1.4.7 Risers

Risers are required for connecting the equipment and structures with the ground mat. Risers are to be provided from underground mat to above ground levels where the ends shall be left free for connecting to the equipment. Each riser shall be 1 No. [40] mm dia. M.S. rod and shall project above grade level/concrete floor level by minimum 300 mm. They are to be clamped or supported along the outer edge of the concrete foundation. Connection to the ground mat shall be done by arc welding.

1.4.8 Equipment Ground Lead

- Equipment ground connections shall be sized to carry the ground fault current. Considerations shall also be given to mechanical ruggedness of the connections and to limit the number of sizes.
- The minimum ground conductor sizes for various equipment and structures are given in below.

Table 2.0

DESCRIPTION	SIZE	MATERIAL
a) Main Grounding Grid Conductor	[40] mm dia Rod	Mild Steel
b) Riser/Pigtail From Grounding Grid/Mat	[40] 40 mm dia Rod	- Do -

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[6]	25.09.2014

DESCRIPTION	SIZE	MATERIAL
c) Electrode	[40] mm dia, [3000] mm long Rod	- Do -
d) Conductor used for connection of various equipment/structures as listed below		
HV motors, Earthing ring, Earthing lead to earth pits etc.	[50 x 10] mm	Galvanised steel
Structures, Control Panels, Cable Trays etc.	[50 x 10] mm Flat	- Do -
415V Power Control Centres, Motor Control Centres, Distribution Boards etc.	[50 x 10] mm Flat	- Do -
Local Panels, Lighting Panels	[25 x 6] mm Flat	- Do -
Motors :		
Above 90 kW	[50 x 10] mm Flat	Galvanised steel
Above 30 kW Upto 90 kW	[25 x 6] mm Flat	- Do -
Above 5 kW Upto 30 kW	[25 x 3] mm Flat	- Do -
Upto 5 kW	[8] SWG	- Do -
Miscellaneous Items, viz. Push Button Station, Junction Boxes etc	[8] SWG	- Do -

{The Above size of Earth flat is indicative only. Bidder shall refer Volume II Section I for size of earth flat used for existing plant or as per design.}

1.4.9

Jointing and Connection

- All ground conductor connections below ground level shall be done by electric arc welding with low hydrogen content electrode. The contact surfaces shall be thoroughly cleaned to provide good electrical continuity.
- The bending of the large diameter ground conductor where necessary shall be done by gas heating.
- The projected portion of riser/pigtail above ground shall be coated with two coats of bitumen paints (anti-corrosive paints) with a minimum thickness of 1 mm after connection.
- The connections between the riser/pigtail and earthing conductors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[7]	25.09.2014

(galvanized steel flats) and between the earthing conductors above ground level shall be made by electric arc welding.

- e) The portion of galvanized steel flats, which undergoes welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.
- f) The earthing connections to equipment grounding pads/terminals and some removable structures shall be bolted type with GI bolts and nuts. The contact surfaces shall be thoroughly cleaned (to free from scale, paint, enamel, grease, rust) before connection to ensure good electrical contact.
- g) Equipment/structures ground connections shall be coated with weather resistant paints/cold galvanizing paints after proper checking / testing.
- h) Whether specifically shown or not, all conduits, trays, cable armour and cable end box, electrical equipment such as motors, switchboards, panels, cabinets, junction boxes, lockout switches, fittings, fixtures, etc. shall be effectively grounded.

1.4.10 Earthing system installation

- a) The spacing between two electrodes shall be at least equivalent to twice the length of the electrode.
- b) Earthing conductor running exposed on column, walls, etc., shall be supported by suitable cleating, at intervals of 750 mm.
- c) The earthing conductor crossing the road / track shall be laid in hume pipe or laid at a greater depth to avoid damage.
- d) When earth conductor passes through floors, walls, etc suitable pipe sleeves shall be provided and the same shall be sealed after installation.
- e) The connection between earthing pads / terminal to the earth grid shall be made short and direct and shall be free from kinks & splices.
- f) Metallic conduits and pipes shall not be used as earth continuity conductor.
- g) Street lighting poles, flood light poles & towers, their junction boxes shall be connected to the earthing conductor to be run along with supply cable. This earth conductor shall be in turn connected to earth grid at two extreme points.
- h) The steel columns, metallic stairs, hand-rail etc. of the building where electrical equipment are located shall be connected to the nearby ground mat by earthing conductor. Electrical continuity shall be ensured by bonding the different sections of handrails and metallic stairs.
- i) Fence within the ground grid shall be bonded to the plant ground system at regular interval not exceeding ten [10] metres. Fence gate shall be separately grounded with flexible connection to permit movement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[8]	25.09.2014

- j) [50 x 10] mm galvanized steel flats(minimum size) shall be run as main earthing conductors above ground along building columns, walls, steel structure, etc. for equipment and other structures earthing. These earthing conductors shall be interconnected between them and to the main ground grid through risers/pigtail. The connection between earthing conductor and riser shall be made above ground. Earthing conductors can be embedded in concrete floor of the building wherever necessary without having direct contact with the reinforcement rods. At the crossing of building walls, floors etc. the earthing conductor shall be passed through galvanised conduit sleeves. Both ends of the sleeve shall be sealed to prevent the passage of water through the sleeves.
- k) All indoor and outdoor electrical equipment and associated non-current carrying metal works, supporting structures, building/ boiler columns, fence, system neutrals, lightning masts/arresters shall be connected to the plant ground system.
- l) Miscellaneous devices such as junction boxes, pull boxes, pushbutton stations, lockout switches, cable end boxes, lighting fixtures, receptacles, switches etc. shall be effectively grounded whether specifically shown or not.
- m) Metallic conduits and pipes shall not be used as earth continuity conductor. These shall be grounded at both ends.
- n) A continuous [50 x 10] mm (minimum size) G.S. flat earthing conductor shall run along the cable trays and supporting structure of all cable routes. This earthing conductor shall be attached to each section of cable tray/trays through [50 x 10] mm G.S. flats. The earthing conductor shall be securely connected to the earth mat at both ends.
- o) Flexible earth conductors shall be provided at expansion joints for earthing the gates, operating handles, etc.
- p) Equipment bolted connection after being checked and tested shall be painted with anti-corrosive paint / compound.
- q) Connection between the equipment earth lead and the grid conductor shall be welded. For rust protection, the welds shall be treated with zinc chromate primer and coated with zinc rich paint.
- r) The cable sheaths, screens armour shall be earthed at both ends for multi-core cables. For single core cables the same shall be done at one end (switchgear end) only.
- s) All bimetallic connections shall be treated with suitable compound to prevent moisture ingress.
- t) Main plant earth grid and switchyard earth grid shall be interconnected each other by minimum two numbers of leads.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[9]	25.09.2014

1.4.11 Lightning Protection System Design

- a) Lightning protection design and installation work shall be provided on the basis of IS 2309 Code of Practice.
- b) Lightning protection system shall consist of vertical air termination rods, horizontal roof conductors, down conductors and pipe electrodes.
- c) The need for providing the lightning protection system shall be established by calculating risk index value for each building structure, etc., as per procedure given in IS-2309 and any building whose risk index is more than value specified in IS shall be provided with lightning protection. However, Boiler areas, station building, switchyard building shall be provided with lightning protection irrespective of the arrived risk index.
- d) Shielding angle for one vertical air termination shall be 45 degrees. For more than one rod, shielding angle between the rods shall be taken as 60 Degrees.
- e) Down conductors shall run along the outer surfaces of the building and shall have a test joint about 1500 mm above ground.
- f) A Lightning electrode shall be provided at the connection point of the down conductor with the station ground.
- g) Galvanized steel rods and flats shall be generally used for air termination and connections. All connections shall be welded type.

1.4.12 Air Terminations

- a) The vertical air terminal rods shall be installed at the roof of Turbo generator building, Boiler and chimney etc to protect these objects from lightning strokes.
- b) The projected length of the Air termination rod shall be as required to protect the object (on which the rod is fixed) from lightning stroke.
- c) The air terminal rod shall be properly fixed on the top of the building/structure to withstand very high wind pressure. In case the air terminal rod is embedded at the top of roof of building, the portion embedded inside the concrete shall not touch the reinforcement bars and shall be duly insulated from them.
- d) All the vertical air terminal rods shall be electrically connected together by means of horizontal conductors of size [50 x 6] mm galvanized steel flats.
- e) For chimney air termination, rods interconnected by circumferential conductors will be provided at the apex of flue and also upon outer shell of the chimney. The air termination system will be formed by lead coated copper conductors to prevent melting and corrosion of conductors due to flue gas.
- f) For cooling towers, air termination system will comprise of horizontal

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[10]	25.09.2014

circumferential conductors at the top

1.4.13 Down Conductors

- a) Galvanized steel down conductors of suitable size [25 x 6] shall be connected with air terminal rod/horizontal conductor at the top of roof/structure and other end connected to the nearest 40 mm dia. mild steel rod riser from ground electrode.
- b) Each down conductor shall have an independent earth termination. In no case conductors of the lightning protection system shall be connected with the conductor of grounding system above ground level.
- c) The connection between each down conductor and rod electrode (by means of 40 mm mild steel rod riser) shall be made by others. However Bringing down comer with test link at a level of 1500mm approximately from above ground level shall be boiler contractor scope of work.
- d) The down conductor shall be laid straight and sharp bends shall be avoided as far as practicable. These shall be cleared on outside of the building wall and column/structure at about 750 mm intervals unless stated otherwise in the drawing.
- e) At all supports for down conductor along the column/wall of the buildings etc. the portion embedded inside the building concrete should not touch the reinforcement bars.
- f) All exposed metallic parts of the buildings shall be bonded to the down conductors. Such parts shall include ladders, balconies, conduits etc.
- g) The down conductors shall be protected at the ground level against mechanical injury by means of non-metallic pipes, viz. PVC pipes filled with bituminous compound.

1.4.14 Switchyard Lightning protection

- a) For switchyard lightning protection shall be provided by lightning masts and/or shield wires.
- b) In case of lightning protection by shield wire, the shield wires provided shall be of GS wire strung across the pinnacles of the gantry tower structures. The size of shield wire shall be based on the lightning impulse current expected and the time duration for which it is likely to flow. Allowance shall be given in the final size to account for corrosion of the shield wire during service at rate of [0.03] mm per annum. However, minimum size of the shield wire shall not be less than [70]sq.mm. The zone of coverage for the shield wire shall be considered as 60 deg between the two shield wires and 45 deg for end shield wires. The down conductors from shield wires shall be run along the towers and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[11]	25.09.2014

connected to rod/pipe electrodes.

- c) In case of lightning protection by lightning protection masts, the down conductors from the masts/peaks/shield wires shall be run along the tower and connected to the test links mounted on the towers at 1500m from the ground level. Conductors from the test links shall be connected to the rod/pipe electrodes which in turn are connected to the main earth grid in the switchyard. Calculations for sizing and determining topography and number of lightning masts shall be furnished for approval.

1.4.15 Electrodes (for Lightning Protection)

The electrodes shall be [40 mm] diameter [3000 mm] long mild steel rod. These shall be driven into the ground.

All the electrodes shall be interconnected by means of one (1) [40 mm] dia mild steel rod which shall be laid under ground at a minimum depth of [600 mm] below finished grade level unless stated otherwise. This ground mats/electrode in turn shall be connected to main grounding grid.

1.4.16 Riser (for Lightning Protection)

All risers connected to grounding mat shall be [40 mm] mild steel rods and shall be projected 300 mm above grade level unless stated otherwise.

1.4.17 Jointing & Connection

- a) All ground conductor connections below ground level shall be done by electric arc welding with low hydrogen content electrode.
- b) The projected portion of riser above ground shall be coated with two (2) coats of bitumen paints (anti-corrosive paints) with a minimum thickness of 1 mm after connection.
- c) The joints in the lightning conductors shall be kept to a minimum and there shall be no joint in the underground portions of conductors.
- d) All the joints shall be done by arc welding process overlapping of the conductors at straight joints shall not be less than 150 mm. The contact surfaces shall be cleaned properly before jointing.
- e) The portion of galvanized steel flats, which undergoes welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.
- f) The bolted joint of the test link shall be covered with thick coating of bitumen paint after successful testing.
- g) The air terminal rods and shielding mast shall be coated with weather resistant anti-corrosive paint (zinc chromate followed by two coats of aluminium paint).
- h) The steel to copper connection shall be brazed type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[12]	25.09.2014

- i) The lightning protection of inflammable liquid storage tanks wherever required, shall be provided with horizontal conductors strung between tall poles covering the entire zones or with air terminal rods mounted on top of poles/structure. These horizontal conductors/vertical air terminal rods shall be connected to rod electrodes, which in turn shall be connected to station ground mat.
- j) The sizes and materials of earthing conductors to be used in lightning protection system are listed below :
- k) Note: The above sizes are indicative only. Actual size shall be as per Bidder design or as per existing plant details as provided in Section I in case of replacement work as called for.

Table 3.0

DESCRIPTION	SIZE	MATERIAL
a) Vertical Air Termination	[20] mm dia Rod	Galvanised steel
b) Horizontal Conductor	[50 x 6] mm flat [25 x 6] mm Flat	-----do-----
c) Down Conductors	[25 x 6] mm Flat	-----do-----
d) Ground electrode / riser	[40] mm dia Rod	Mild Steel
e) Interconnection with earth mat	[40] mm dia Rod	Mild Steel

1.5

Tests

l) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E11	[13]	25.09.2014

Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant /purchaser or his representative.

The following test shall be conducted:

- a) Measurement of earth resistance for each electrode.
- b) Measurement of total earth resistance.
- c) Measurement of earth loop resistance for E/F path of biggest LV drive.
- d) Check tightness of all earth connections
- e) Check earthing of all metallic equipments, cable trays, bus bar supporting structures, building column (if steel all elect equipments, pipe lines etc. as per the drawing / specification)

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6

Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *[Earthing Material like conductor , flat , welding description etc]*
- b) *[Air termination rod and its accessories etc]*
- c) *[Technical Data sheets for Earthing and Lightning system].*

Document Number	Rev No.	Description	Page No.	Date of Issue

ANNEXURES-E12

1.1 General

This specification is intended to cover the [design, engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning] of 6.6 Switchgear, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] Of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

Codes	Name of Standard
IS : 226	Structural steel (standard quality)
IS : 375	Switchgear bus bars, main connections and auxiliary wiring, marking and arrangement
IS : 722	AC electricity meters
IS : 728	Galvanized steel structures
IS : 2099	Specification for bushings for alternating voltages above 1 000 volts
IS : 2147	Degree of protection
IS : 2516	Alternating current circuit breakers
IS : 2544	Specification for porcelain post insulators for systems with nominab l voltages greater than 1 000 volts
IS : 2705	Current transformer specification
IS : 3043	Code of practice for earthing
IS : 3156	voltage transformers specification
IS : 3231	specification for electrical relays for power system protection
IS : 3427	A.C. metal enclosed switchgear and control gear for rated voltages above 1 kV and upto to and including 52 kV.
IS : 4710	Switches and switch isolators above 1000 V but not exceeding 11000 v.
IS : 5082	Specification for wrought aluminum and aluminum alloy bars, rods, tubes and selections for electrical purposes.
IS : 6875	Control switches push buttons

Codes	Name of Standard
IS : 8084	Specification for interconnecting bus-bars for ac voltage above 1 kV up to and including 36 kV
IS : 8686	Specification for static protective relays
IS : 9046	Specification for ac contactors for voltages above 1000 v up to and including 11 000 v
IS : 9224	Low voltage fuses
IS : 9385	HV fuses
IS : 9431	Specification for indoor post insulators of organic material for system with nominal voltages greater than 1000 volts upto and including 300 kV
IS : 9921	Alternating current disconnectors (isolators) and earthing switches for voltages above 1 000 v
IS : 10601	Dimensions of terminals of high voltage switchgear and control gear
IS : 11353	Guide for uniform system of marking and identification of Conductors and apparatus terminals.
IS : 13118	Specification for high voltage ac circuit breakers
IEC 6044-1	Current transformer
IEC 6044-2	Voltage transformer
IEC 6056	High voltage alternating current circuit breakers
IEC-60099-1	Non-linear resistor type gapped arrestor for AC systems
IEC-60099-4	Metal oxide surge arrestor without gap for AC system
IEC 60129	A.C disconnectors and earthing switches
IEC 60255	Electrical Relays
IEC-60298	High voltage metal enclosed switchgear and control gear.
IEC 60529	Degrees of protection provided by enclosures
IEC-62271-100	High voltage alternating current circuit breakers.
CEA	CEA regulations
CEA	Standard technical specifications for main plant package

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[2]	25.09.2014

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All 6.6kV Switchgear shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The Switchgear shall be suitable for operation in a highly polluted environment.
- b. All 6.6kV Switchgear shall be suitable for following voltage & frequency variations as follows:

Voltage Variation	:	(±) 10%
Frequency Variation	:	(+) 3% to (-)5%
Combined Variation of Voltage & Frequency	:	10% (absolute sum)
For DC System	:	(+)10% to (-)15%

- c. All motors rated above 160kW shall be feed from 6.6kV switchgear.
- d. Motor rated [160-600kW] shall be provided with [vacuum contactor/vacuum circuit breaker] and motor rated above [600kW] shall be provided shall be provided with vacuum circuit breakers.
- e. 6.6kV switchgear shall be Indoor, metal clad, floor mounted, Single front and fully draw out type. Design and construction shall be such as to allow extension at either end. These shall be CRCA sheet metal enclosed and assembled to form a rigid, free-standing floor mounted structure. Vertical units shall be assembled to form a continuous line up of panels
- f. All 6.6 kV Circuit breaker shall be draw out type & should have Service, Test and Disconnected positions with positive indications for service & test positions. It shall be possible to charge the springs manually, if, required
- g. Local/remote selection shall be provided for all incoming/Outgoing Circuit Breaker modules. Incoming/Outgoing breaker shall be closed at service position from remote (DCS) and at test position from Local (Switchgear).
- h. Two out of three Incomer logic for 6.6kV Switchgear shall be provided. For Unit and station board one Incomer shall be there from Unit Transformer and Station Transformer respectively. Tie feeder shall be provided between Unit and station switchgear such that in case of loss of supplies to unit switchgear from UAT, the same shall be restored from respective station switchgear. In order to achieve the same, fast bus transfer shall be provided at Unit switchgear.
- i. All motors shall be provided with Emergency Stop Push buttons.
- j. Control and Indication voltage level shall be 220V DC.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[3]	25.09.2014

- k. Maximum system fault level at 6.6kV bus including initial motor contribution shall be 40kA for 1 sec.
- l. 6.6kV System shall be earthed through resistance to limit fault current to 300A.
- m. Surge arrestor shall be provided for each motor feeder/Transformer feeder.
- n. The switchgear will be located in a clean but hot humid and tropical atmosphere.
- o. Duty involves direct-on-line starting of large induction motors with motor starting current varying 6 times the full load current. For BFP starting current varying 4.5 times of full load current.
- p. For continuous operation at specified ratings, temperature rise of the various switchgear components shall be limited to the permissible values stipulated in the relevant standards and this specification.
- q. The switchgear and components thereof shall be capable of withstanding the mechanical forces and thermal stresses of the short circuit current without any damage or deterioration of material.
- r. All the numerical relays shall have communication on two ports, local front port communication to laptop and a second port with [IEC 61850 protocol] to communicate with DCS.

1.4 Specific Requirements

1.4.1 Construction

All 6.6 kV switchgear shall have following minimum features.

- a. 6.6 kV switchgear shall be of indoor, metal clad, single front, single tier, floor mounted, horizontal drawout type with vacuum circuit breaker and free standing type. The Panels shall be suitable for cable entry at bottom and bus duct connection at top.
- b. Between 6.6kV Switchgear Incomer and transformer, segregated phase bus duct is considered. Hence switchgear shall be suitable for this connection and necessary flange connection and co ordination with bus duct manufacturer in this regards is covered in this specification.
- c. All frames and load bearing members shall be fabricated using mild steel structural sections or pressed and shaped cold rolled sheet steel of thickness not less than 2 mm.
- d. Frame shall be enclosed in cold rolled sheet steel of thickness not less than 2 mm. Doors and Covers shall also be of cold rolled sheet steel of thickness not less than 1.6 mm. Removable gland plates of thickness 3mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material)shall be provided for all panels. Suitable removable type lifting hooks and / or jacking pad shall be provided on each panel or shipping section for ease of lifting of switchgear. These hooks when removed shall not leave any opening in the panels.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[4]	25.09.2014

- e. Each breaker shall be housed in a separate cubicle, complete with an individual front access door. Each vertical section shall have a removable back cover.
- f. The switchgear enclosure shall confirm to the degree of Protection of the [IP4X] for indoor installation. However degree of protection of LV chamber shall be [IP-52]. No louvers/Opening shall be provided on the top of panel. All the other louvers if provided shall have very fine brash or GI mesh screen.
- g. Paint shade for complete panels shall be [RAL 5012] for extreme end covers for all board.
- h. The working zone shall be restricted to [750mm to 1800mm] from floor level. Total height of the switchgear panels shall not exceed [2600 mm].
- i. Metallic barriers shall be provided between vertical sections and also between adjacent modules to ensure prevention of accidental contact with live parts during routine inspection/maintenance of functional units or cable terminations of one or more functional units when working on those of adjacent units. These barriers shall have insulating inserts as necessary for taking the interconnections etc.
- j. A nameplate with switchgear designation shall be fixed at the top of the central panel. A separate nameplate giving feeder details shall be provided for each compartment. A separate nameplate giving details of bus section shall also be provided for switchgear having more than one bus section.
- k. Name plate shall be provided for each equipment (lamps, push buttons, switches, relays, auxiliary contactor, etc) mounted on the switchboard. Special warning plates one each on each feeder of a shipping section shall be provided on removable covers of doors giving access to cable terminals and busbars. Name plate size shall be minimum of 20x75 mm for Instruments/devices and 40x50 mm for panels. Thickness shall be minimum 3 mm.
- l. Two 220V DC feeders shall be provided for control, Indication and annunciation of breaker operated module at any one cubicle. Further distribution to all verticals shall be in the scope of bidder.
- m. Compartment door shall be interlocked with main power isolating device for safety with provision for defeating it by authorized person.
- n. Supplier shall provide total 10% or minimum one (1) no. spare feeder of each type & rating with respect to total requirement of the switchgear.
- o. Switchgear shall have provision to receive 415V, 3ph, 4wire supply. Single phase 240V balanced supply shall be derived from 415V, 3ph, 4 wire supply. Each cubicle shall be provided with thermostat controlled space heaters suitable for operation from 240 V \pm 10%, single phase, 50 Hz, + 3% - 5% supply and 5A, 240V AC, 3 pin plug socket and cubicle lamp. The space heaters shall be located at the bottom of the switchboards. Cubicle heater, plug/socket/lamp circuits shall have individual switch fuse units. Motors shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[5]	25.09.2014

be provided with anti- condensation heaters at 240V.Necessary provision for supply of motor space heating shall be considered in the switchgear.

- p. All relays, meters, switches and lamps shall be flush mounted on the respective cubicle door or on control cabinet built on the front of the cubicle.
- q. Controls and interlocks as required for the safe switching, operation and maintenance of the switchgear shall be provided. Mechanical interlocks shall be provided in addition to electrical wherever possible.
- r. It should be possible to carryout maintenance on a feeder with adjacent feeders alive.
- s. The Fast Bus Transfer (FBT) panel shall be totally enclosed, floor mounted panel conforming to degree of protection IP-42. The minimum thickness of cold rolled sheet steel used shall be 2.0 mm. The ABT panel shall consist of a lineup of control boards, with cable entry provisions from bottom of panel. The height of FBT panel inclusive of mounting channel, anti-vibration pads etc. shall be restricted to [2400 mm].
- t. The switchgear shall be [natural cooled].
- u. The circuit breakers, contactors, bus VTs shall be mounted on withdrawable truck which shall roll out horizontally from service position to isolated position.

1.4.2

Bus and Bus Taps

- a. The main buses and connections shall be of high conductivity [aluminum / aluminum alloy].Control and auxiliary buses shall be of electrolytic copper/copper wires.
- b. Bus bars and connections shall be fully insulated for working voltage with adequate phase / ground clearances. Insulating sleeves for bus bars and shrouds for joints shall be provided.
- c. Bus insulator shall be flame-retardant, non-hygroscopic, track resistant type with high creepage surface. This shall be of non-carbonizing material such as epoxy bonded fiberglass. Bus bars shall be color coded for easy identification.
- d. The bus bar supports shall be able to withstand stresses due to maximum short circuit and also take care of any thermal expansion.
- e. Bus bars shall be color coded for easy identification and so located that the sequence R-Y-B shall be from left to right, top to bottom or front to rear, when viewed from the front to switchgear assembly.
- f. The continuous rating of the main bus bars shall be same as that of the incomer circuit breaker and shall carry this continuous current without exceeding the temperature of [90 °C]. For silver plated joints maximum temperature shall be limited to [105 °C].

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[6]	25.09.2014

- g. The busbar chamber shall be provided with inter panel barrier with epoxy cast seal off bushings through which the buses will pass through so as to prevent fire from one panel to another.

1.4.3

Circuit Breaker

- a. The circuit breaker shall be of vacuum type.
- b. The circuit breakers shall be fully draw-out type, having service, test and disconnected positions with positive indicators for service & test positions.
- c. The breakers shall have motor operated spring charged mechanism. It shall be possible to charge the springs manually, if, required. Breakers shall be trip free and shall have an anti-pumping device. The operating duty cycle shall be 0 -3 min.-CO-3 min.-CO.
- d. For motor, spring charging shall take place automatically after each breaker closing operation. One 'open-close-open' operation of the circuit breaker shall be possible after failure of power supply to the motor.
- e. Automatic safety shutters shall be provided to ensure the inaccessibility of live parts after the breaker is drawn out. There shall be distinct overall door for the breaker compartment and shall be lockable.
- f. Truck shall have distinct service, Test and Isolated positions. It shall be possible to close the breaker compartment door in isolated position also. The truck and breaker frame shall get earthed while the truck is being inserted in the panel and positive earthing of the truck and breaker frame shall be maintained in all positions.
- g. Outgoing breakers shall be suitable for switching transformers and motors at any load. Motor feeders shall be suitable for frequent direct on-line starting of motor.
- h. Mechanical safety interlocks shall be provided to prevent
 - i. The circuit breaker from being racked in or out of the service position when the breaker is closed.
 - ii. Racking in the circuit breaker unless the control plug is fully engaged
- i. Breakers shall be adequately de-rated to account for design ambient temperature and temperature inside the cubicle.
- j. Equipment and component rating and quantities shall be suitably selected according to the requirements with adequate margin.
- k. Closing and tripping coil shall operate satisfactorily under the following conditions.
 - i. Closing Coil: 85% to 110% of rated voltage.
 - ii. Tripping Coil : 70% to 110% of rated voltage

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[7]	25.09.2014

1.4.4 Contactor

High voltage contactor shall be of AC-3 utilization category and shall be of vacuum type. Fuse and contactor shall be mounted on withdrawable truck. The contactor shall be latched type and shall be complete with mechanical trip indicator, anti pumping relay, surge suppresser, single phasing preventor etc.

1.4.5 Bus Transfer scheme:

The 6.6kV Unit Switchgear shall be connected to their respective unit auxiliary transformer through bus duct. These buses of unit switchgear shall also be connected to 6.6kV buses of station switchgear through tie feeders and breakers located at the unit and station end. Automatic Fast bus transfer scheme shall be provided between 6.6kV unit and station switchgear such that in case of loss of supplies to unit switchgear from UT, the same shall be restored from respective station switchgear. The automatic bus transfer system shall consist of fast, slow etc. transfer in Auto/ Manual mode.

In addition to above, each switchgear shall be provided with the following provisions-

- Dead bus closing
- Manual live change over (Momentary paralleling)
- Automatic slow bus transfer.

1.4.6 Current Transformers

- a. Current Transformers shall be cast-resin type. All secondary connections shall be brought out to terminal blocks where wye or delta connection shall be made. They shall have sufficient thermal and mechanical capacity to withstand the maximum momentary current rating of the breakers.
- b. CTs shall have polarity makings indelibly marked on each transformer at the lead terminations and at the associated terminal block. Facility shall be provided for short circuiting and grounding the CT secondary at the terminal blocks. Secondary terminals shall be provided with protective cap.
- c. CT terminal block shall be disconnecting type and suitable for round type lugs with facility for testing and short circuiting of individual CT.
- d. All CTs shall be provided with supports independent of busbars / busbar supports. The CTs shall be located in such a way that they can be easily approached for maintenance without necessitating shutdown of adjacent feeders.
- e. CTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.
- f. Accuracy class of CT shall be 5P20 for protection, PX for differential protection and 0.5 for metering.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[8]	25.09.2014

1.4.7 Voltage Transformer

- a. Voltage transformers (VT) shall be cast-resin type with an accuracy class of 1.0 for metering and 3P for protection.
- b. VTs shall be of the single-phase type. VTs shall be protected on their primary side by fuse and by MCB (with auxiliary contacts) on the secondary sides.
- c. VTs shall have continuous over voltage factor of 1.2 and short time over voltage factor of 1.5 for 30 seconds for effectively earthed system
- d. It shall be possible to replace VTs without having to de-energise the main busbars.
- e. VTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.8 Transducer

For Incoming and outgoing feeders remote metering transducer shall be provided. The output shall be 4-20 mA DC which shall correspond to the normal range. All the transducer shall be dual output type.

1.4.9 Secondary wiring

- a. The switchgear shall be fully wired at the factory to ensure proper functioning of control, protection and interlocking schemes.
- b. Fuse and links shall be provided to permit individual circuit isolation from bus wires without disturbing other circuits. All spare contacts of relays, switches and other devices shall be wired up to terminal blocks.
- c. Secondary wiring within the switchgear shall be carried out in a neat and systematic manner and securely held in position (either loomed or run in conduit / trunking). Wherever wiring passes through compartment, it shall be run in conduit / trunking, if metallic shall be bonded to the main earth busbar.
- d. Wiring shall be done with flexible, 1.1/0.650kV grade, PVC insulated switchboard wires with *[stranded copper conductors of 2.5 mm² for CT & PT circuits and 1.5mm² for control circuit wiring (applicable for internal panel wiring).]*
- e. Each wire shall be identified, at both ends, with permanent markers bearing wire numbers as per bidder's wiring diagrams. Wire terminations shall be made with crimping type connectors with insulating sleeves, wire shall not be spliced between terminals.

1.4.10 Terminal blocks

- a. Terminal blocks shall be of 1100 V grade, stud type with marking strips. Terminals for CT secondary leads shall have provision for easy shorting, earthing and shall be suitable for connecting 2 cables of 2.5 mm² copper.
- b. Sufficient terminals shall be provided on each terminal block to ensure that

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[9]	25.09.2014

not more than two outgoing wires are connected per terminal. All spare contacts of auxiliary relays, timers etc. shall be wired up to the terminals. [20%] spare terminals shall be provided on each terminal block.

- c. Terminal blocks shall be located to allow easy access. Wiring shall be grouped such that the individual wires of a cable can be connected to consecutive terminals.

1.4.11 Ground bus

- a. A ground bus, rated to carry maximum fault current, shall extend full length of the switchgear. The ground bus shall be provided with two-bolt drilling with G.I. bolts and nuts at each end to for connection to the grounding conductor / flat.
- b. Each unit shall be connected directly to the ground bus. The frame of each circuit breaker and draw out V.T. unit shall be grounded through heavy multiple contacts at all times except when the primary disconnecting devices are separated by a safe distance.
- c. C.T. & V.T. secondary neutrals shall be earthed through removable links so that earth of one circuit may be removed without disturbing others. All hinged doors shall be earthed by flexible copper bride.

1.4.12 Control & Indication

- a. The circuit breaker shall be wired up for local & remote operation. Each breaker shall be equipped with following:
- b. Remote selector switch with pistol grip handle and key interlock for breakers with motor wound spring charging mechanism. In Remote position, the breaker can be operated in service position with all interlock and protections. In Local position, the breaker shall be operated from switchgear only in test position.
- c. Each cubicle shall be provided with Auto/ Manual Switch. Trip selection switch and Trip-Neutral- Close (TNC) switch.
- d. Circuit breaker shall be indicated electrically. The following indication color shall be used.
Breaker closed – Red
Breaker opened – Green
Spring Charged – White
Breaker Auto trip – Amber
- e. However any other indication shall be provided as per owner's requirements.
- f. Lamps shall be LED type with resistance for voltage protection. Lamp and lens shall be replaceable from the front.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[10]	25.09.2014

- g. Breakers shall be controlled locally and/or remotely as per plant operational requirement. Necessary Interposing relays & feedback signal shall be provided based on the DCS IO list.
- h. Breaker control supply shall be of 220 V DC. Breaker spring charging motor shall be suitable for 220 V DC.

1.4.13 Cable termination

Switchgear shall be designed for cable entry from the bottom. Sufficient space shall be provided for ease of termination and connection.

1.4.14 Bus duct connection

Bus duct connection shall be generally from top of the switchgear.

All connection bus work shall have the same continuous rating as associated switchgear bus and shall be fully braced for the short circuit current mentioned in specification.

All provision such as matching flange and other accessories shall be furnished for connection to bus duct.

1.4.15 Painting

All sheet steel surfaces shall be chemically cleaned, degreased and pickled in acid to produce a smooth, clean surface free of scale, grease and rust. After cleaning, the surface shall be given a phosphate coating followed by a coat of high quality primer and baking in the oven.

The paint shade shall be subject to owner's approval. Sufficient quantity of touch up paint shall be furnished for application at site.

1.4.16 Relays, Protection & Metering

- a. The hardware design for protection and associated equipment shall use latest state-of-the-art technology and shall generally be integrated numerical/digital, modular in nature. Where design is based on numerical technology, adequate self testing/monitoring/ diagnostic facilities shall be provided.
- b. All numerical relays, auxiliary relays and devices shall be of types, proven for the application; satisfying requirements specified elsewhere and shall be subject to Purchaser's approval. Numerical Relays shall have appropriate setting ranges, accuracy, resetting ratio, transient overreach and other characteristics to provide required sensitivity to the satisfaction of the Owner. All numerical relays shall be compatible with IEC 61850.
- c. All protective relays shall be in draw out or plug-in type / modular cases with proper testing facilities. Necessary test plugs / test handles shall be supplied loose and shall be included in supplier's scope of supply.
- d. All AC operated relays shall be suitable for operation at 50 Hz. AC voltage

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[11]	25.09.2014

operated relays shall be suitable for 110 Volts VT secondary and current operated relays for [1 or 5] amp CT secondary. All relays and timers shall be rated for control supply voltage as mentioned elsewhere under parameters and shall be capable of satisfactory continuous operation between 80-120% of the rated voltage. Voltage operated relays shall have adequate thermal capacity for continuous operation.

- e. Energy meters shall be provided for incomer of 6.6kV Switchgear and shall be able to communicate with DCS. These meters shall be as per CEA regulation 2006 "Installation and operation of meters". Accuracy class shall not be less than [0.2S]. The accuracy class of CT and VT for energy metering shall have accuracy class of [0.5]
 - f. Provision shall be made for easy isolation of trip circuits of each relay for the purpose of testing and maintenance.
 - g. All protective relays and alarm relays shall be provided with one extra isolated pair of contacts wired to terminals exclusively for future use.
 - h. The relay shall be designed to perform satisfactorily under highly noisy electrical environment. Sufficient degree of high frequency disturbance immunity and impulse voltage withstand capacity shall be built into electronic designs as stipulated in relevant standards.
 - i. All protections shall be furnished complete with necessary auxiliary, supervisory, lock out relays. Suitably separate sets of single phase auxiliary C.T with multiple taps shall be provided with relay whenever required.
 - j. Visual and audible alarm annunciation shall be initiated in the event of operation of protective/supervisory relay.
 - k. D.C supply shall be supervised by DC supervision relays.
 - l. Trip circuit shall be supervised by Trip circuit supervision.
 - m. Tripping shall be done through high speed lock out relays.
 - n. All meters/ instrument shall be flush mounted on front panel, at least 96 mm² size with 90 degree linear scales and accuracy class of [2.0.]
 - o. Interposing relays for ON/OFF command or any other command shall be as per system requirement.
 - p. For alarm and Indication at DCS end necessary contacts shall be provided at switchgear end.
 - q. Interposing relays for ON/OFF command or any other command shall be as per system requirement.
- For alarm and Indication at DCS end necessary contacts shall be provided at switchgear end.
- r. Metering and protection shall be as per below table

1.5 Tests

I. Type Test:

For each type & rating of 6.6kV Switchgear, the Bidder shall submit the reports

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E12	[14]	25.09.2014

of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening for Owner's approval. These reports should be for the tests conducted on the switchgear similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II. Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative. However the following minimum routine tests shall be conduct.

- Power-frequency voltage tests on the main circuit
- Dielectric tests on auxiliary and control circuits
- Measurement of the resistance of the main circuit
- Partial discharge measurement
- Mechanical operation tests
- Heat Run test
- Pressure tests of gas-filled compartments
- Tests of auxiliary electrical, pneumatic and hydraulic devices
- Verification of correct wiring

III. Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV. Test Certificates:

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawing & Documents

Drawings, data & manuals for the motors shall be submitted as indicated below.

- a. *[General Arrangement drawings and cross-section showing constructional features & cable entry with bottom view with opening]*
- b. *Bill of Materials.*
- c. *Technical Data sheet and Catalogue.*
- d. *Foundation drawing details with bottom view of switchgear.*
- e. *Descriptive write-ups and literature for the main equipment offered including relays, meters, etc.*
- f. *Control Schematics & Wiring diagram.*
- g. *Inspection and Test Plan (ITP).*
- h. *Suggestive list of protective relays.*
- i. *Transport/shipping dimensions and weights].*

1.7 Ratings & Requirements

6.6kV Switchgear shall comply with the particulars indicated in the following tables.

Table 2.0

S. No.	DESCRIPTION	UNIT	DATA
1.0	General		
1.1	Name of Manufacturer		<i>[By Bidder]</i>
1.2	Place & Country of manufacture		<i>[By Bidder]</i>
1.3	Specifications and Standards		As per Table 1.0
2.0	Switchgear Details		
2.1	Rated voltage(Nom/Max), phases & frequency		6.6 kV/7.2 kV, 3 Phase, 3 wire, 50 Hz.
2.2	System neutral earthing		Non Effectively earthed (Fault current Limited to 300A by neutral grounding resistor)
2.3	Voltage & frequency variation	%	+/-10%, -5%to +3% Hz.
2.4	Rated frequency	Hz	50Hz

DIN 41488	:	Electrical engineering dimensions
-----------	---	-----------------------------------

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) All VFDs shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The VFDs shall be suitable for operation in a highly polluted environment.
- b) All VFDs shall be suited for uninterrupted operation under the following variations in bus voltage and frequency:
 - i. Voltage Variation : +/-10%
 - ii. Frequency Variation : 50Hz (+)3% to (-)5%
 - iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency
- c) The VFD shall be of modern design for similar applications in power plants. The system shall be commutated inverter type with minimum [six] pulse design, [IGBT based] and PWM controlled or better control system.
- d) VFD shall consist of Input section (rectifier and filter), control section and output section (PWM module, base drive circuits).
- e) VFD shall include an input filter for limitation of the harmonic current. General requirements of VFD shall conform to IEC 61800-2 and IEEE-519.
- f) VFD shall follow EMC directives as specified in IEC-61000.
- g) VFD model shall be suitably selected based on actual cable length from VFD to motor terminals. Shielded cables suitable for VFD applications shall be provided by the bidder.
- h) For [12 pulse] VFD, required 3 winding transformer and necessary cabling shall be provided by the bidder.
- i) Bidder shall provide inverter duty motor to withstand voltage stresses produced by PWM action

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[3]	25.09.2014

1.3.1 Performance requirements:

- a) The system shall be energy efficient, designed as standard product and shall provide very high reliability, high power factor, low harmonic distortion and low vibration / wear / noise.
- b) The system shall be suitable for the load characteristics and the operational duty of the driven equipment.
- c) The drive system shall be designed to operate in one or more of the following operating modes as to suit characteristics of the driven equipment:
 - i. Variable torque changing as a function of speed i.e. speed squared.
 - ii. Constant torque over a specific speed range.
 - iii. Constant power over a specific speed range where the torque decreases when speed increases.
- d) The drive controller shall be equipped with microprocessor based digital regulator with programmable functions. The system shall be designed for linear continuous speed control from [10% to 100%] of driven equipment's rated speed and shall be of a modern proven design.
- e) The total harmonic distortion (THD) of the voltage and current at inverter output shall be as per IEC 61800-4 and it shall be considered in the design of the motor.
- f) Unless otherwise specified, the overload capacity of the controller shall be 150% of rated current of motor for one minute for constant torque applications, and 115% of rated current for one minute for variable torque applications at rated voltage. If the motor load exceeds the limit, the drive shall automatically reduce the frequency and voltage to the motor to guard against overload. If load demands exceed the current limit for more than one minute, the drive shall shut down to prevent over heating of the motor and damage to the drive.
- g) During operation, the system shall be capable of developing sufficient torque under all load conditions to respond to a 20% alteration in speed set point within a time limit up to 60 seconds.
- h) The integrator action of the speed set point alteration shall be independently adjustable for both an upward and a downward alteration. The minimum time interval between set point adjustments by the distributed control system shall be considered as 10 seconds.
- i) The drive shall trip in case the speed exceeds 105% of the maximum operational speed or reduces to 95 % of the minimum operational speed for more than 10 seconds.
- j) Maximum noise level of motor shall be measured as per relevant IS standard.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[4]	25.09.2014

- k) Variable frequency drive shall be arranged so that it can be operated in an open circuit mode, disconnected from the motor for startup adjustments and troubleshooting/ maintenance.
- l) Voltage at motor neutral shall be maintained at ground potential for the total operating condition.

The drive system shall ensure following:

- i. VFD induced torque pulsation are limited to maximum 1% (even at low speed) so there is minimal stress to the equipment
- ii. Motor is protected from dv/dt stresses.
- iii. No appreciable increase in motor audible noise.

1.3.2 Control requirement:

- a) The VFD and motor characteristics shall be suitable for load specific torque-speed characteristics.
- b) Short time voltage dips up to 20% of nominal voltage (e.g. in case of a large motor start up connected to the same bus as VFD) shall not cause the control system to stop functioning and shall not trip the drive system.
- c) The system shall also be equipped with a facility which shall restart the system in case of voltage dip over 20% or power interruptions for less than 2 seconds, with recovery of the voltage to its nominal value. The drive shall have the facility to block this feature, if required by the operator. Upon restart the converter shall be capable of synchronizing on to a rotating motor and develop full acceleration torque within 10 seconds.
- d) The power controller shall be controlled to always start the motor in the forward direction. Logic shall be provided to prevent the motor from being started in the reverse direction.
- e) The drive motor shall be speed controlled corresponding to 4-20 mA reference input signal unless otherwise specified upon complete loss of the user's speed reference signal, the drive shall automatically run at constant speed at the last speed reference available prior to the loss of signal.
- f) It shall be possible to vary the speed of the drive in either manual or auto mode. Auto/manual selection shall be from VFD panel unless otherwise specified.
 - i. With the selector switch in "manual" mode, the operator shall be able to set the speed through keypad, mounted on front of the drive panel or from speed increase/decrease push buttons from the field. Motor operated potentiometer shall be provided as a speed set point device.
 - ii. With the selector switch in "auto" mode, speed of the motor shall be controlled from a 4-20 mA signal, from owner's DCS (Process Control) system. Necessary equipment required for interfacing with DCS shall also be provided in the drive panel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[5]	25.09.2014

- g) The required provision for the interface with remote I/O (*as per requirement*) shall be through hardwired connection (with potential free contacts and transducers)
- h) Drive system shall have provision for interface with upper level automation such as electrical control system.
- i) The closed loop control feedback for the drive system having output transformer shall be tapped from the secondary side of the output transformer.
- j) Bypass Feature
 - i. Bypass breaker / contactor-HRC fuse complete with protection, annunciation and metering shall be provided.
 - ii. All Variable frequency drives (VFD) having bypass feature shall have motor protection relay along with necessary control and metering etc. Switching scheme shall be such that in case of drive mal-operation, the motor could be taken on bypass control manually, while the drive could be attended by opening its isolation devices.
 - iii. Safety interlock between inverter and bypass breaker/contactors shall be provided such that closing of healthy device is inhibited in case of external fault.

1.4 Specific Requirements

1.4.1 Constructional Requirements

- a) Panel Construction
 - i. The panel shall include suitable semi conducting power devices (Diodes / IGBT) modules with protective devices, reactors (if required), filters (if required), control circuit, control accessories, indication and annunciation etc. The construction of the panel shall provide effective protection against electromagnetic emissions and shall meet the design requirement of integrated standards.
 - ii. Upstream breaker include suitable semi conducting power devices (Diodes / IGBT) modules will be provided on the front door.
 - iii. Safety Interlock shall be provided so that power cabinet cannot be opened unless the upstream breaker is disconnected, safety-grounding switch is closed and DC link capacitor is discharged. Power source breaker can only be closed once the earthing switch is open and panel door is closed with lock defeat facility.
 - iv. The drive shall be suitably housed in sheet steel panels fabricated with 2 mm thick cold rolled sheet steel. The panel shall be suitable for indoor installation, if not otherwise specified. The panel shall be free standing with degree of enclosure protection as IP-31. The maximum and minimum operating height shall be 1800 mm and 400 mm respectively.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[6]	25.09.2014

- v. Bolted un-drilled gland plate shall be provided at bottom. Clamp type terminals shall be used for connection of all wires up to 10 mm² and terminal for higher sizes shall be bolted type suitable for cable lugs. Minimum space for power cable termination shall be 600 mm clear from bottom of the cable gland plate.
- vi. Bus bars shall be of electrolytic copper, color coded separately for AC and DC system. All the live parts shall be sleeved / shrouded to ensure complete safety to personnel intending to carry out routine inspection by opening the panel doors. All the equipment inside the panel and on the doors shall be provided with suitable nameplate.
- vii. All the switches component and accessories which are essential for normal and emergency operation shall be mounted on the door and shall be operable externally. Digital meters shall be preferred. Analogue instruments, where provided, shall be switchboard type, back connected, 72x72mm. Scale shall have red mark indicating maximum permissible operating rating.
- viii. All panels shall be of same height so as to form a uniform line-up, to give good aesthetic appearance.
- ix. All the control wiring shall be enclosed in plastic/ metal channel. Each wire shall be identified at both ends by self-sticking wire marker tapes or PVC ferrules. Power and control wiring inside the panel shall be done with PVC insulated, fire retardant, copper conductor wire. 1.5 mm² size wire shall be used for control circuits, 2.5 sq.mm for CT/PT circuits and 0.75 mm² for electronic circuits. The control fuse rating is 10 Amps or less and 2.5mm² size for control fuse rating above 16A for electrical circuits and 0.7 mm² for electronic circuits. All wires shall be ferruled and terminals shall be properly numbered. Minimum 20% spare terminals shall be provided.
- x. All electronic modules and components shall be accessible from front of panel only. Modular assemblies for both the system control electronic equipment and power electronic equipments shall be used.
- xi. All low voltage compartment and cabling shall be electrically and physically separated from the high voltage compartment.
- xii. DC link capacitor and pre charging and discharging circuit shall be preferably mounted in the rear of the panel. Suitable removable type hooks shall be provided for lifting the panel.
- xiii. Drive keypad, operator control panel required for control, monitoring and measurements shall be supplied and installed outside the panel on the front door. It shall be accessible for operation without opening the front door and shall be non-removable type.
- xiv. All equipment shall be complete with double compression glands, lugs etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[7]	25.09.2014

b) Cooling

- i. The drive panel shall be naturally cooled or water cooled type as per manufacturer's standards. However it is preferred to have natural air cooled system. If unavoidable, forced type-cooling system shall be provided. Cooling system shall include well-dimensioned panel, adequate cooling airflow path, module cooling fan and if necessary, panel cooling fan or water-cooling system shall be considered. Bidder shall ensure that the panel dimensions and flow paths have been designed for continuous running at the specified ambient without overheating. For fan cooled drives, redundant ventilating fans (N + 1) shall be provided.
- ii. Necessary starters shall be provided within the VFD panels for the ventilation fans, any other auxiliary motor etc.
- iii. The system provided shall be interfaced with drive starting and shut down such that safety interlocks such as start permit from cooling system to drive and trip signal from cooling system to drive in case of cooling system failure etc., shall be incorporated in the overall sequence logic.
- iv. MCB for motor space heater, auxiliary power supply if required for local panel, drive panel space heater etc. shall be included and mounted in easily accessible location.

1.4.2 Motor

The motor shall be designed, constructed and tested in accordance with the Specification for high Voltage Induction / Synchronous Motor, in addition to the following requirements:

- a) The motor shall be suitable for VFD control.
- b) The motor shall be suitable for the current waveforms produced by the power supply including the harmonics generated by the drive.
- c) The motor shall be designed to operate continuously at any speed in the operating range for the driven equipment (ie; ID fan / Coal feeder).
- d) The permitted voltage variation shall take into account the voltage drop across the AC drive and all other system components upstream the motor.
- e) Motors required to be transferred to DOL by-pass mode shall be rated for specified variations in system line voltage and frequency. Starting current of motor in DOL bypass mode shall be limited to value specified in motor specifications.
- f) The motor shall be constructed to withstand torque pulsations resulting from harmonics generated by the solid-state power supply.
- g) The motor insulation shall be designed to accept the applied voltage waveform, within the Vpeak and dv/dt limits as per IEC-61800-4.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[8]	25.09.2014

- h) The drive manufacturer shall be solely responsible for proper selection of the motor for the given load application and the output characteristics of the drive.

1.4.3 Static Power Converter

- a) The static power converter shall consist of a line side converter for operation as a rectifier and a load side power converter for operation as a fully controller inverter. Power converter shall be fast switching, most efficient and low loss type.
- b) The converter shall be co-ordinated with the transformers. The converter shall be able to withstand a three phase short circuit current until interrupted by normal breaker operation.
- c) Adequate short circuit and over voltage protection shall be provided for the converter and inverter system.
- d) All power converter devices shall include protective devices, snubber networks and dv/dt networks as required.
- e) The current rating of the converters semi-conductor components shall not be less than 120% of the nominal current flowing through the elements at full load of the VFD through the whole speed range. If the parallel connection of semi conductor is applied, the above current rating shall not be less than 140% of the above values.
- f) All power diodes shall be of silicon type with minimum V_{BO} rating at 2.5 times the rated operating voltage.
- g) The power converter circuit shall be designed so that motor can be powered at its full nameplate rating continuously without exceeding its rated temperature rise nor reducing its service factor due to harmonic currents generated by the inverter operation.
- h) The conversion devices and associated heat sinks shall be assembled such that individual devices can be replaced without requiring the use of any special precautions / tools.
- i) The cooling system of the electronic components, if provided, shall be monitored and necessary alarms shall be provided to prevent any consequential damage to the power control devices.

1.4.4 Converter Transformer

- a) The converter transformer, if provided, shall be copper wound dry type. Insulation class of dry type transformer shall be H with temperature rise of body limited to 75°C. Dry type transformer shall preferably be mounted inside the drive system panel. The impedances of converter input transformers with more than one secondary winding for minimum 18 pulse systems shall be selected to ensure equal load / current sharing

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[9]	25.09.2014

between the secondary windings, the converters and the motor windings under all operational conditions including starting and restarting.

- b) The transformation ratio, impedances, taps and secondary voltage shall be chosen by the drive vendor to optimize system performance.

1.4.5 DC link reactor

- a) Smoothing reactors for the DC link shall be designed to sufficiently decouple the rectifier and inverter portion of the converter and to limit fault currents in this circuit.
- b) Unless otherwise specified, the reactor shall be dry type, air cored, air-cooled or fan cooled type located within the panel.
- c) Reactor shall be suitable for withstanding earth fault continuously and for operation with the non-sinusoidal current wave shapes and DC components under all operational conditions of the system without exceeding its temperature limits.
- d) Noise level shall not exceed value specified in NEMA TR-1

1.4.6 Output filter

- a) VFD output current waveform should be inherently sinusoidal at all speeds, with harmonic limits as specified in this specification. Output filter shall be provided if required. Output filter capacitors shall be provided with discharge circuits to ensure that all residual stored charge is reduced to less than 50 V DC within 300 seconds after a loss of AC voltage. All capacitor shall be maintenance free and self-healing type.
- b) The VFD system shall inherently protect motor from high voltage dv/dt stress, independent of cable length to motor. Output filter shall be an integral part of the VFD system and included within the VFD enclosure.

1.4.7 Protection, Control, Metering, Indication and Annunciation

- a) The Bidder shall provide all the necessary system control, protection, alarm equipment and metering for the entire drive system and its auxiliary equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[10]	25.09.2014

- b) Automatic sequence control shall include start-up of cooling system, auxiliary system of the motor, interlock checking, automatic start and run-up of drive, planned and emergency shutdown. The same shall be processed through microprocessor-based system.
- c) Protective Relays:
For details on protective relays used, refer to Technical Specifications on MV Switchgear
- d) Operator Control Panel
- i. Each drive shall be equipped with a front mounted operator control panel consisting of a backlit alphanumeric display and a keypad with keys for parameterization and adjusting parameter which shall not be limited to start/Stop, Local/Remote, auto/manual, Increase/Decrease, menu navigation and protection and measurement parameter selection, etc.
 - ii. All parameter names, fault messages, warnings and other information shall be displayed in complete English words or standard English abbreviations to allow the user to understand what is being displayed without the use of a manual or cross-reference table. This shall also be used for the modification of all electrical values, configuration parameters, drive menu parameters, application and activity function access, faults, local control, adjustment storage, self test and diagnostics. Keypad shall be operable with password for changing the protection setting, safety interlock etc. However the parameters such as measurements, setting, mode of drive etc. shall be allowed to be viewed without any password.
 - iii. Operator console shall have facility /port to connect external hardware such as Lap-Top etc. Console shall have facility for upload and download of all parameter settings from one drive to another identical drive for start up and operation.
 - iv. Drive system control shall also have facility to receive tripping signal from upstream breaker for tripping and also provision for closing up stream breaker after all required process parameters are achieved.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[11]	25.09.2014

- v. User-friendly software for operation and fault diagnostic shall be loaded in the drive system panel before commissioning.
 - vi. Suitable interface with DCS to be provided for control and status signals of VFD.
- e) Local Motor Control Station
- i. The local motor control station shall be installed near the motor. Components and accessories that are required in the local motor control station may be mounted on the local field mounted panel envisaged for the driven equipment.
 - ii. Meters in the local control station shall be suitable for 4-20mA transducer outputs and shall be calibrated for the actual motor current. Further, for drives with bypass facility, the meters shall be capable of reading bypass full load and starting currents, as well as the drive current.
 - iii. Requirement of controls and indications required in the Local Control Station shall be as specified in the data sheet.
- f) Protective Features:
- The system offered shall incorporate adequate protective features, properly coordinated for the drive control and for motor but not limited to the following:
- i. Incoming line surge protection
 - ii. Under / Over voltage protection
 - iii. Phase loss, phase reversal protection.
 - iv. Programmable Over current protection and under load protection.
 - v. Motor differential protection for motor rated above 1000 kW
 - vi. Inverter Fault.
 - vii. Over frequency operation.
 - viii. Ventilation loss,
 - ix. Over temperature of equipment.
 - x. Over speed of motor.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[12]	25.09.2014

- xi. Specific motor protection, including motor winding, bearing temperatures, over-current, overload, negative phase sequence, locked rotor and earth fault protections etc.
- xii. System Earth fault protection.
- xiii. Excitation system protection for synchronous motor
- xiv. Over and under frequency, rotor earth fault, field failure protection for synchronous motor
- xv. Additional protection for drive system

g) Control features

The following controls shall be provided as a part of the Operator Control Panel or through separate switches.

- i. Start/Stop
- ii. Speed control (Raise/lower)
- iii. Forward/Reverse(if Specified)
- iv. Auto/Manual /test mode
- v. Local/remote
- vi. Emergency stop
- vii. Start/stop for by pass starter (where specified)
- viii. Trip-Remote Breaker
- ix. Excitation control system for synchronous motors
- x. Sequential switching of filters

h) Metering

Digital display of the following parameters shall be as a part of the Operator Control Panel, selectable by the operator.

- i. Input AC Current
- ii. Input AC voltage
- iii. Input AC frequency
- iv. Output voltage
- v. Output current VFD / Bypass
- vi. Output frequency
- vii. Motor thermal state

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[13]	25.09.2014

- viii. Drive thermal state
- ix. Motor speed
- x. Motor energy meter
- xi. DC Link voltage
- xii. Hour Run
- xiii. Voltage and current meter for excitation system for synchronous motor.
- xiv. KVAR, power factor meter for synchronous motors
- xv. Necessary transducer shall be provided with 4-20mA output for indicating motor speed and motor current in DCS unless otherwise specified for other parameters.

i) Indications

Bidder shall provide indications as required for normal operation and for easy maintenance, which shall not be limited to the following indications both at local and at plant DCS.

- i. Motor running
- ii. Motor stopped
- iii. VFD System Fault
- iv. System ready to start
- v. AC mains ON
- vi. Motor over speed
- vii. Rectifier output 'ON'
- viii. Motor zero speed
- ix. Remote breaker trip
- x. Excitation system healthy for synchronous motors

Above indications may be provided as a part of the operator control panel, i.e., door mounted keypad or through hardwired indicating lamps/LEDS.

Potential free contacts of items i- iv shall be wired separately for remote indications in DCS.

j) Audio-visual annunciations

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[14]	25.09.2014

- i. The system shall incorporate audio-visual annunciations for protection, for various fault conditions, for the Drive motor, Supply cables, DC Reactor and the Converter, output transformer etc.
- ii. Alarms shall also be included for the failure of various auxiliaries together with identification of the failing unit, loss of cooling system, various protection devices provided for converter transformer etc.
- iii. Audio-visual window annunciations shall be provided on the front of the panel All annunciations as required for normal and satisfactorily operation of the drive system shall be included as per Bidder standards. These annunciations can be part of operator console panel or separately mounted type.
- iv. Bidder shall include audio-visual alarm as required for normal operation and maintenance of the system but not be limited to the following,
 - Rectifier fuse failure
 - Main AC failure
 - Inverter fuse failure
 - Inverter overload
 - Inverter high temperature
 - Cooling system failure
 - Motor failed to start
 - Transformer failure
 - Excitation system failure for synchronous motor
 - Battery monitoring healthiness
 - Communication and measurement system un healthy
 - Motor temperature high
 - Harmonic filters monitoring
- i. Common potential free contacts shall be provided for above annunciations and these shall be wired up to terminals of DCS I/O panels for remote alarm and monitoring.

k) Fault Diagnostic

Fault diagnostic shall be built into the system to supervise the operation and failure of the system. The information regarding failure of any of the system including shut down of the system shall be available for a period of minimum 4 days (96 hours) after a shut down even though no supply

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[15]	25.09.2014

would be available to the system. The system may be totally de-energized for maintenance or otherwise. It shall be possible to retrieve the record of events prior to tripping of the system or de-energisation. Auxiliary supply to the system components or to the electronics (firmware) for the diagnostics / display shall be taken care by the manufacturer for this purpose.

1.4.8 External Power supply for auxiliary and Control Circuit

Auxiliary power supply for devices external to VFD module, space heater supply for Motor, VFD panel space heater, auxiliary power supply for transformers, cubicle lamps (CFL) etc. shall operate on 240 volts single phase AC.

All control circuit shall operate at voltage of 110V AC or 220V DC.

Bidder shall include supply of all control transformers, protective devices, required accessories etc. and any other control supply voltage as required for the system.

1.4.9 Maintenance features

The controller design shall incorporate the following maintenance features:

- a) Modular construction
- b) All components shall be easily accessible.
- c) Standard diagnostics to aid maintenance personnel. These shall include LED or alphanumeric displays, test or measurement points.

1.4.10 Painting

- a) All metal surfaces shall be thoroughly cleaned and de-greased to remove mill scale, rust, grease and dirt. Fabricated structures shall be pickled and then rinsed to remove any trace of acid. The under-surface shall be prepared by applying a coat of phosphate paint and a coat of yellow zinc chromate primer. The under-surface shall be made free from all imperfections before undertaking the finishing coat.
- b) After preparation of the under surface, the panel shall be provided with epoxy based powder coating. The color shade of the final paint shall be as per manufacturer's standard, unless otherwise specified. Panel finish shall be free from imperfections like pinholes, orange peels, runoff paint, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[16]	25.09.2014

- c) All unpainted steel parts shall be zinc passivated, cadmium plated or suitably treated to prevent rust and corrosion. If these parts are moving elements, then these shall be greased.

Final paint shade shall be light gray and dove gray 631 and 632 as per IS-5 for indoor and outdoor equipment respectively unless otherwise specified

1.5 Tests

The Routine and Type Tests to be performed on the drive system in the presence of the purchaser or consultant shall be as follows:

1.5.1 Type Tests

For each rating and type of VFD, the Bidder shall submit for Owner's approval, the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

All type tests shall be conducted as per relevant standards and test certificates of similar panels conducted within last 5 years shall be furnished.

1.5.2 Routine tests

- a) Visual Inspection
- b) It involves checking of the various equipments/components fault diagnostic unit, Wiring, Terminals, earthing ratings etc. in line with the approved drawings and visual inspection shall not be limited to the following:
- c) Insulation Test
- d) Light Load and Functional Test
- e) Load characteristics test
- f) Load duty test
- g) Checking of Auxiliary Devices
- h) Checking the properties of the control equipment

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B, Annexure-E13	[17]	25.09.2014

- i) Checking the Protective Devices
- j) Checking of control and functional requirements
- k) High voltage test
- l) Leakage and pressure test for cooling water system where provided
- m) Shaft current/bearing insulation
- n) Automatic restart/re-acceleration

Additional tests on switchgears and dry type transformers shall be carried out based on the requirement defined in the technical specification.

1.5.3 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

1.5.4 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings, Data and Manuals

The engineering services scope and the documentation to be issued with the bid are described hereafter. The list shows the minimum requirements for the documentation, so that any additional documentation considered as necessary will be added to this.

- a) Engineering, manufacturing, delivering and test schedule
- b) Sub-Supplier lists.
- c) General arrangement drawings(plan, elevation, section view) with dimensions
- d) Foundation drawing including loading data.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling Plant Volume-II, Section-II, Part-B,Annexure-E13	[18]	25.09.2014

- e) Technical Data sheets.
- f) Electrical and control wiring diagram.
- g) Terminal arrangement drawing, interconnection wiring diagram.
- h) Cross sectional drawing.
- i) Inspection and test plan.
- j) Manufacturing Quality Plan.

1.7 Ratings and requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

Table 2.0

Sl. No	Technical Parameters		
		6.6 kV	415 V

1

GENERAL

This specification is intended to provide the technical guidelines for the fully coordinated Control & Instrumentation (C & I) system for the Ash Handling C&I and its Auxiliaries of [210/215/220/250] MW, Coal fired Subcritical Thermal Power Plant.

The technical specification shall serve as the guide specification for the proprietary controls of Ash Handling System and its Auxiliaries, equipments as also various stand alone system controls included as part of sub-packages, as in case of system auxiliaries.

It is to be noted that where equipment or system for the Ash Handling system and its auxiliaries are described, it shall be understood that the quantities described are per unit basis, i.e., identical sets to be furnished for each of the units (If plant have multiple units). Where equipment or systems for common facilities are described, it shall be understood that the quantities described are the total quantities required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[1]	25.09.2014

2 SYSTEM DESCRIPTION

C&I system shall consist of all local instruments Viz. Pressure Gauge, Temperature Gauge, limit switch, Ash hopper switch, Ash overflow transfer tank displacer switch, other field sensors, Local panel & push button station, AHP control room equipment, as required erection hardware & interconnecting cables required for the control & monitoring of the entire Ash handling Plant. A dedicated PLC based control system shall be provided for each of Part-A (BAH), Part-B (FAH) for operation, control, interlocking, tripping and all associated equipment whenever required under specified abnormal conditions.

All 6.6 KV drives shall be provided with fluid coupling temperature/ bearing Temperatures measurement & shall be measured with Duplex RTD. Redundant Temperature Measurement sensor shall be provided for all bearing temperature measurement. Stator winding temperature measurement element shall be duplex type and all temperature measuring points shall be connected to PLC. Winding temperature high alarm shall be generated in the PLC system. 6.6 KV drives shall also be provided with vibration monitoring devices and shall be connected with PLC.

2.1 General Requirements

1. The control and instrumentation system for Ash handling Plant shall be designed and constructed to meet all the specification requirements. All instruments/ equipments offered shall be capable of satisfactory operation for prolonged period of time and shall perform accurately and safely under the environmental & operating conditions described in the specification.
2. All equipment, and accessories furnished under the specification shall be from the latest proven control and instrumentation product range of qualified manufacturers whose successful performance has been established by a considerable record of satisfactory operation in power stations. C&I devices & systems shall employ latest state-of-the art technology to guard against any obsolescence. In any case, it shall be required to ensure supply of spare parts for lifetime of the plant.
3. Design requirements as specified in the specification shall be followed while selecting the control and instrumentation items.
4. Each component and system shall be of established reliability. The minimum target reliability of each piece of equipment like each electronic module/ card, power supply, peripheral etc. shall be established, considering its failure rate/ Mean Time Between Failures (MTBF), Mean Time To Repair(MTTR), such that the availability of the complete C&I system is assured for 99.8%.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[2]	25.09.2014

5. To ensure smooth and optimal maintenance, easy interchange ability and efficient spare parts management of various C&I items/ PLCs, it shall be ensured that each C&I item/ PLC is of same make, series and from same family of hardware (as far as practicable).

2.2 PLC system

PLC system shall be redundant with respect to Power Supply, Processor and Communication. Redundant Input card shall be used for measurement of Critical points related to protection of the equipment. All output commands to MCC/ SWGR shall be provided through interposing relay .The control panel shall be IP 55 protection class.

The control system shall have hooter with required hardware and driven from PLC output. Test, Accept and Reset Push Button shall be connected to the PLC system and programmed for alarm annunciator.

A table top mounted PC loaded with editable programming software and HMI shall be provided and placed on a table located on the side of the control panel. There shall be facility of operation from LCD based Operator's station.

2.3 Interfacing With Plant DCS

Interface facility shall be provided for the interface requirements with plant DCS. AHP PLC shall be linked with plant DCS through redundant Unidirectional OPC link in addition to some hardware interface signals. Proper co-ordination shall be maintained with the DCS vendor in achieving the successful & complete interface.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[3]	25.09.2014

3 DESIGN PHILOSOPHY

This section covers the design philosophy which shall be used for all control & instrumentation system for Ash Handling System & its auxiliaries.

1. Pressure indicators shall be used wherever indicating type Pressure transmitters are not envisaged. The applications include:
 - a) Suction and discharge lines of pumps, including header section, if two or more pumps are employed for the same service.
 - b) All input and output lines of process equipments.
2. Pressure Switches shall be avoided as far as possible and in place, smart pressure transmitters with soft limit value monitoring in control system shall be used. The applications shall include the following:
 - a) On all process lines / Equipments where parameter abnormality / status including pre trips alarms to be communicated to the operator in control room.
 - b) For all permissive and protection conditions governed by safety operation of the equipments. e.g. pressure adequate, pressure very high / very low conditions.
 - c) For all interlock conditions, governing starting of standby equipment or subsequent equipments for safety operation of the system.
 - d) Inlet and outlet of filters / strainers.
3. Differential Pressure Switches (indicating type) shall be used across filters/strainers for remote monitoring.
4. Smart Pressure Transmitter shall be used for all control applications and as demand by the process. Pressure stubs with isolating valves shall be used.
5. Differential Pressure Transmitter shall be used for all the requirements of differential pressure, flow, level measurement. Pressure stubs with isolating valves shall be used.
6. Temperature indicators (Thermometers) shall be used for following applications
 - a) On all process lines where local indication is warranted by the system either for monitoring or testing.
 - b) On the inlet/outlet of equipments such as Coolers for both the fluid media.
7. Differential temperature indicator shall be used across suction and discharge service.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[4]	25.09.2014

8. Temperature Elements: RTDs shall be used for casing metal temperature monitoring and bearing temperature monitoring of HT drives/motors.
- a) Six nos. (2 nos. per phase) Resistance temperature detectors (RTD's) shall be used for all HT motors, for winding temperature monitoring. Each element shall be 3-wire type, duplex with thermowell assembly. RTDs shall be terminated in the external terminal box, for connection to Ash Handling Control system.
 - b) 1 no. duplex PRT-100 type RTD shall be used for each bearing of HT equipment and its driving equipment (motor).
 - c) All RTDs shall be PRT-100 type with each element being 3-wire type, duplex with thermowell assembly. RTDs shall be terminated in the external terminal box, for connection to Ash Handling Control system.
 - d) For process temperature up to 200 degree C, RTD shall be used.
 - e) Temperature measurement shall have upscale / down scale protection features not to cause major process upset in case of sensor failure.
9. Level gauges shall be used on all tanks and the maximum length of one gauge glass shall not exceed 1 meter. The gauge glasses shall be stacked to cover the complete height of the tanks including over flow level. There shall be an overlap of minimum 100mm, when more than one level gauge is required.
10. Level switches: The instrument shall be used for the following applications:
- a) On all equipments (storage vessel) where parameter abnormality/status has to be communicated to the operator in the control room.
 - b) All permissive, interlock and protection conditions governed by the safe operation of the equipment.
 - c) The instrument shall be external cage type with SW connection with isolation facility for surface mounted tanks and top mounted with still pipe for all sumps. Still pipes shall be used with adequate supports.
 - d) Radar type level switches shall be used for bulk material bunkers/hoppers.
11. Level Transmitters Stubs with impulse pipes, root valves for mounting Level transmitters shall be used on process equipments where continuous remote monitoring and/or control of level is envisaged. Wherever necessary standpipes or float chambers and also makeup line shall be used for filling up the constant level vessel.
- a) The instrument shall be differential pressure type or torque tube type for other applications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[5]	25.09.2014

- b) Radar type level transmitter shall be used for bulk material bunkers/hoppers.
- c) Admittance or Radar type shall be for sludge and slurry applications.
- 12. Flow Glasses shall be used at the outlet of the pipe lines and shall be employed under the following conditions:
 - a) Coolers
 - b) The instrument shall be rotary type with glass mounted for indication
 - c) Up to 6 inch on-line flow glasses shall be supplied and above 6 inch bypass type flow glasses shall be used. Sight flow and variable flow indicators shall be used for low pressure and low temperature applications.
- 13. Pneumatically Operated Control Valves shall be used for all control application. If the process demands any other control, then control valves shall be used for those applications also. Where a single control valve cannot meet the turn down ratio as dictated by the process, control valves with split range application shall be used.
 - a) All bypass valves of control valves shall be motor operated valves suitable for inching operation provided with position transmitters.
 - b) All integrated bypass valves shall be motor operated. Electro-pneumatic positioners shall be used for all pneumatic control valves.
 - c) Pressure test points & drains shall be used across each control valve
- 14. The pneumatically operated control valves shall be used with Smart Positioners, diagnostics and HART compatibility. Control Valve diagnostics shall be transmitted through this HART Protocol to control system.
- 15. Solenoid Valves shall be used for all pneumatic control valves hooked up with process interlock requirements and where direct tripping is involved. All solenoid valves shall be uniformly rated for 24V DC or 220V DC. The number of ways for solenoid valve shall be used as indicated below:
 - a) On line two (2) way solenoid valves shall be used, where process line of less than 2 inch with low pressure & temperature application is involved.
 - b) Three (3) way solenoid valves shall be used commonly, where the pressure is admitted or exhausted from a diaphragm valve or single acting cylinder. E.g.: Pneumatic operated spray water block valve.
 - c) Four (4) way solenoid valves shall be used for operating double acting cylinders (If applicable). E.g.: Pneumatically operated on-off type dampers.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[6]	25.09.2014

- d) Dual coil, latch, unlatch type Solenoid valves shall be supplied for equipment trips/critical applications.
- 16. Position Transmitters shall be used for all motorized inching valves. Position transmitters shall be 24 V DC, 2 wire, non-contact type.
- 17. Electro-Pneumatic positioners shall be used for all pneumatically operated control valves, power cylinders etc., for converting controller output of 4-20 mA to appropriate pneumatic signal
- 18. Air Filter Regulators along with gauges shall be used in each of the:
 - a) Air supply line to valve positioner/power cylinders
 - b) Air supply line to pneumatic interlocked block valves
- 19. Interposing relay for interface to the following:
 - a) Solenoid valve (if output module cannot directly drive SOV) - Relays with contact rating of minimum 2 Amps.
 - b) DC Starter ((if output module cannot directly drive) - Relays with contact rating of minimum 0.2 Amps.
 - c) Hardwired signal exchange – as required.
- 20. For all HT rotating equipment bearings provision for mounting vibration probes shall be used.
- 21. Junction Boxes/Field termination cabinet: All JBs /FTCs shall be SS. Junction Boxes shall be used for:
 - a) Termination of all sensors located equipment wise.
 - b) Termination of Duplex RTDS
 - c) Termination of limit switch, torque switch, position transmitter and control demand, independently for each valve.
 - d) Area wise or Elevation wise bunching of cables.
- 22. Instrumentation & control cables and Prefabricated Cables with Anti-Rodent treatment shall be used to:
 - a) Connect field instruments to field junction boxes/Local Panels. For switches, both the SPDT contacts of switches shall be wired up to the J.B.
 - b) Connect limit switches, torque switches and position transmitters to their respective field junction boxes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[7]	25.09.2014

- c) Compensating cable shall be supplied for connection between the element and the respective junction boxes / system cabinets as per guidelines.
 - d) Prefabricated cable for connecting between system cabinets, marshalling cabinet to system cabinet, system cabinet to Relay Rack, system cabinets to engineering work stations etc.
 - e) Entire C&I cable within the battery limits.
23. All field instruments including electronics located outside control room areas shall be tropicalized and shall be designed to work in site specific atmosphere/climatic conditions and enclosed in dust tight, waterproof and weatherproof enclosures. In general, transmitters and switches installed at outdoor location shall be mounted in closed type transmitter enclosure. For other areas (indoor), open type racks may be used for installation of transmitters and process switches.
24. All alarm shall be displayed in the control system HMI/LCD. However where local panels are used for local operation/monitoring, PLC driven alarm annunciation system with LED type lamps for local panel shall be used.
25. Pressure, temperature and flow test points shall be used in line with latest performance test code requirements.
- In general, pressure and temperature test points shall be used for the following services:
- a) At the discharge of all pumps
 - b) At the inlet and outlet of each control valve
26. The ranges of the instruments shall be selected based on the following philosophy:
- a) For pressure measurements, the maximum operating pressure shall be within 70 to 80% of the maximum scale range.
 - b) For temperature measurement, the maximum operating temperature shall be within 80 to 90% of the maximum scale range.
 - c) For pressure switches and temperature switches, the set points shall fall within 40% to 70% of the scale range selected.
 - d) For level measurement, the maximum of the range shall cover the overflow point or six inches from the top of the vessel and the minimum of the range shall be six inches above the bottom of the vessel. Also, the gauge glasses shall be stacked with overlap to cover permissive, alarm and trip levels.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[8]	25.09.2014

- e) For flow measurement, the maximum range shall be fixed at about 10 to 15% above the maximum operating flow
- 27. Spring-loaded/ Cage clamp type terminals shall be used for termination of instrumentation cables at field JBs, FTCs and local panels.
- 28. Signal Exchange Between Ash Handling Equipments/System and control System
 - a) All the signals required for interlock/alarm/SER purpose (to be implemented in the control System) shall be hardwired.
 - b) All binary outputs provided to local panels/sensors for connection from control System shall be potential free contacts with a rating of 0.2 amps at 220 V DC or 2 amps at 24 V DC or 5 amps at 240 V AC. All check backs to control System shall only be potential free contacts.
 - c) All analog outputs provided to local panels/sensors for connection from control System shall be isolated 4-20 mA DC.
 - d) Command outputs from control System to motorized valve actuator shall be logic level signal (24 V DC) and necessary interposing relays suitable to accept 24 V DC logic level command signal shall be used in MCC module for MOV actuator.
- 29. All indication lamps shall be LED type.
- 30. All interposing relays shall be Plug in type with screw type base & LED for status indication. Relay modules/boards etc. are not acceptable.
- 31. All Limit Switch shall be Non-Contact type. If there is constraints because of process conditions/space, mechanical lever actuated Limit switch may be used.

4 DESIGN CRITERIA

This section covers the general design criteria to be adopted in designing the Control & Instrumentation system for the Ash Handling System Package.

4.1 General Requirements

Ambient Conditions

Instruments, devices and equipment for location in outdoor / indoor / air-conditioned areas shall be designed to suit the environmental conditions indicated below and shall be suitable for continuous operation in the operating environment of a coal fired Power plant and also during periods of air conditioning failure without any loss of function, or departure from the specification requirements covered under this specification.

Table 4.1
Protection Class Requirement

Ambient Temperature (outside temperature)	Pressure	Relative Humidity	Atmosphere	Required Protection class of panels /cabinets /desks
Outdoor Location				
55 °C max	Atmosphere	100%Max	Air (dirty)	IP 65
4 °C min	Atmosphere	5% Min	Air (dirty)	IP 65
Indoor Location				
55 °C max	Atmosphere	95% Max	Air	IP 54
4 °C min.	Atmosphere	5% Min	Air	IP 54
Air-conditioned Area				
24 +/- 2 °C normal	Atmosphere	95% Max	Air	IP 44
50 °C Max.	Atmosphere	5 % Min	Air	IP 44
a) For Ventilated enclosures, protection class shall be IP 42. b) For hazardous areas the protection class shall be in accordance with the requirements of the relevant NEC code for the location. c) For PCs, OWS, EWS, Servers, Printers and other peripherals, maximum temperature limit shall be 35 °C, For LCD the same shall be 25 °C & for UPS the same shall be 40 °C				

4.2 Codes & Standards

All equipment, system and service covered under this specification shall comply with the requirements of the latest statutes regulations and safety

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[10]	25.09.2014

codes as applicable in the locality where the equipment/systems shall be installed.

The equipment, systems and services furnished as per this specification shall conform to the codes and standards mentioned in this section. However in the event of any conflict between the requirements of two standards or between the requirements of any standard and this specification, all equipments under this specification shall be given tropical treatment for the climatic conditions prevailing at site as described under project data. Tropical protection shall conform to IS-3202 or any other applicable international standard for protection of Electrical power equipments against climatic conditions.

Reference Codes and Standards

The design, manufacture, inspection, testing, site calibration and installation of all equipment and systems covered under this specification shall conform to the latest editions of codes and standards mentioned below and all other applicable ANSI, ASME, IEEE, NEC, NEMA, ISA, DIN, VDE and Indian Standards and their equivalents.

Temperature Measurement

- Instrument and apparatus for temperature measurement ASME PTC 19.3(1974)
- Temperature measurement by electrical resistance thermometers – IS: 2806.
- Thermometer-element-platinum resistance-IS-2848 / DIN 43760/ IEC 751

Pressure Measurement

- Instrument and apparatus for pressure measurement - ASME PTC 19.2 (1964)
- Bourdon tube pressure and vacuum gauges - IS 3624 – 1966

Flow Measurement

- Instrument and apparatus for Flow measurement – ASME PTC 19.5 (1972) Interim supplement, Part-II
- Measurements of Fluid flow in closed conduit – BS 1042 / ISO 5167.

Electronic measuring Instruments & Control hardware

- Automatic null balancing electrical measuring instruments - ANSI C 39.4 (Rev. 1973)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[11]	25.09.2014

- Safety requirements for electrical and electronic measuring and controlling instrumentation - ANSI C 39.5 - 1974.
- Compatibility of analog signals for electronic industrial process instruments - ISA-S 50.1: ANSI MC 12.1 - 1975.
- Dynamic response testing of process control instrumentation - ANSI MC 4.1 (1975): ISA-S26 (1968).
- Surge withstand capability (SWC) tests - ANSI C 37.90a (1974) IEEE Std. 472 (1974). IEC - 254.1.
- Printed circuit boards - IPC TM-650, IEC 326 C
- General requirements and tests for printed wiring boards - IS 7405 (Part-I) - 1973
- Edge socket connectors - IEC 130-11.
- Requirements and methods of testing of wire wrap terminations DIN 41611 Part-2.
- Dimensions of attachment plugs & receptacles ANSI C73-1973.
- Direct acting Electrical Indicating Instruments: IS-1248-1968.

Electronic Cards, Subassemblies & Components

1. Unpackaged

- Vibration IEC 68.2.26
- Shock IEC 68.2.27
- Drop & Topple IEC 68.2.31

2. Packaged

- Vibration, Drop & Static Compression – NSTA

3. Electromagnetic Compatibility

- Electrical Fast Transient – IEC 801.4
- Surge Withstand – IEC 255.4
- Radiated Electromagnetic Field – IEC 801.3
- Electrostatic Discharge – IEC 801.2
- Electromagnetic Emissions – VDE 0871, Class B

Instrument Switches and Contacts

- Contact rating - AC services NEMA ICS Part-2 125, A600

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[12]	25.09.2014

- Contact rating - DC services NEMA ICS Part-2-125, N600.

Enclosures

- Types of enclosures - NEMA Std. ICS-6-110.15 through 110.22 (Type 4 to 13).
- Racks, panels, and associated equipment - EIA: RS-310-B (ANSI C83.9 - 1972)
- Protection Class for Enclosure, Cabinets, Control Panels and Desks - IS-13947, 1993 & IEC 529.

Apparatus, enclosures and installation practices in hazardous areas

- Classification of hazardous area - NFPA Art. 500, Vol.70-1984.
- Electrical Instruments in hazardous dust locations - ISA-RP 12.11
- Intrinsically safe apparatus - NFPA Art.493 Vol.4.1978
- Purged and pressurized enclosure for electrical equipment in hazardous location - NFPA Art. 496 1982.

Annunciator

- Specifications and guides for the use of general purpose annunciator - ISA RP 19.1-1979.
- Surge withstand capability tests - ANSI C.37.90a - 1974 and IEEE std. 472-1974

Interlocks, Protections

- Relays and relay system associated with electric power apparatus - IEEE std.3.13.
- Surges withstand capability tests - ANSI C.37.90a - 1974 and IEEE Std. 472 - 1974.
- General requirements & tests for switching devices for control and auxiliary circuits including contactor relays - IS-6875 (Part-I) 1973.

Control Valves

- Flow Equation for Sizing Control Valves – ISA S39.2, 1972
- Control Valve Seat Leakage – ANSI / FCI 70.2
- Face to face Dimensions of Control Valves – ANSI B16.10, ISA – S75.03 & ISA – S75.16
- Steel Pipe, Flanges & Flanged Fittings – ANSI B16.34
- Control Valve Capacity Test Procedure – ISA – S75.02

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[13]	25.09.2014

- Industrial Process Control Valves - IEC 534

Process Connection and Piping

- Codes for pressure piping power piping ANSI B31.1
- Seamless carbon steel pipe ASTM A-106.
- Forged and Rolled Alloy steel pipe flanges, forged fittings, valves and parts - ASTM A-182.
- Material for socket welded fittings - ASTM A-105.
- Seamless Ferritic alloy steel pipe - ASTM A-335.
- Pipe fittings of wrought carbon steel and alloy steel - ASTM A-234.
- Composition bronze or metal castings - ASTM B-62.
- Seamless copper tube, bright annealed ASTM B-168.
- Seamless copper tube - ASTM B-75.
- Dimensions of fittings - ANSI B-16.11
- Valves flanged and butt welding ends - ANSI B16.34.
- Nomenclature for Instrument tube fittings ISA-RP-42.1 - 1982.

Instrument Tubing

- Seamless carbon steel pipe - ASTM - A106.
- Material for socket welds fittings - ASTM - A105.
- Dimensions of fittings - ANSI B16.11
- Code for pressure piping, welding, hydrostatic testing - ANSI B31.1.
- Nomenclature for Instrument Tube Fittings – ISA RP 42.1,198
- Seamless Stainless Steel Tubes ASTM A 312 TP 304

Cables

- Colour coding of single or multi-pair cables - ICEA S-61- 402. (Third edition) NEMA WCS-1979.
- Guide for design and installation of cable systems in power generating stations (insulation, jacket materials) - IEEE Std. 422 - 1977.
- Requirements of vertical tray flame test - IEEE 383 - 1974.
- Standard specification for tinned soft or annealed copper wire for electrical purpose - ASTM B-33 - 81.
- Oxygen index and temperature index test - ASTM D-2863.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[14]	25.09.2014

- Smoke generation test - ASTM D-2843 and ASTM E-662.
- Acid gas generation test - IEC-754-1.
- Swedish chimney test - SEN - 4241475 (F3)
- Instrumentation cables and internal wiring IS-1554 (Part-I, 1976) and IS: 5831(1984).
- Mono-mode Fibre – ITU-T G.652 for Optical Fibre Cable
- IEEE 1138, 1994 / IEC 1089 / EIA-455 B for Optical Fibre Cable

Cable Trays, Conduits

- Guide for the design and installation of cable systems in power generating station (cable trays, support systems, conduits) - IEEE Std. 422, NFPA-70-1984.
- Guide for the design and installation of cable systems in power generating station (Cable trays, support systems, conduits) Test Standards, NEMA VE-1 - 1979.
- Galvanizing of Carbon steel cable trays - ASTM A-386-78.

4.3

Power Supply

All instruments and control devices shall be designed to operate on power supplies as follows:

- Electric:
 - 230 volts AC, 50 hertz, single-phase for low torque drives with guaranteed satisfactory operation when equipment is continuously energized at any voltage from 216VAC to 264VAC.
 - 24V DC for PLC.
 - 24 VDC, 110VAC or 230 VAC for Field Instruments.
- Pneumatic:

Clean, dry, and oil free instrument air at 4.2 to 8.6 bars gauge. All necessary pressure reducing controls, where required, shall be furnished by the equipment supplier as specified at some other place under air compressors section.

4.4

Standard Ranges Of Analog Signals

The ranges of analog signals shall normally be as follows:

- (a) Electric -- 4 to 20 mA dc.
- (b) Pneumatic -- 0.2 to 1.0 kg/cm².

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[15]	25.09.2014

The use of any signal range other than the above shall not be acceptable.

4.5 Contact Ratings

The ratings of all instrument contacts used for alarms and interlocks shall be as follows:

Table 4.2
Contact Ratings

Voltage Rating (volts)	Continuous Rating	Switching Rating (break)
a) 240 AC	480 volt-amperes	1200 volt-amperes
b) 220 DC	60 watts	200 watts
c) 24 DC	12 watts	25 watts

The ratings of all microprocessor-based controller or programmable controller output contacts shall be as required by the controlled devices. Where necessary for higher current ratings or isolation, interposing relays shall be used.

4.6 Reliability and Availability

- Each component and system shall be of established reliability. The minimum target reliability of each piece of equipment like each electronic module/card, power supply, peripheral etc. shall be established by considering its failure rate/mean time between failures (MTBF), meantime to repair (MTTR), such that the availability of the complete C&I system is assured for 99.7%.
- Detailed reliability calculations shall be used for each system/ equipment (with the help of a schematic of various sub-system connected in series or in parallel as the case may be and MTBF & MTTR values for the various equipments). Availability calculation shall be as per IEEE Standard-P1046 or equivalent.
- When more than one device uses the same measurement or control signal, the transmitter and other components/ module shall be fully equipped to provide all signal requirements. The system shall be arranged so that the failure of any monitoring device or control components or spurious intermediate grounding in the signal path shall not open the signal loop nor cause the loss or malfunction of signal to other devices using the same signal.
- To ensure availability, adequate redundancy in system design shall be used at hardware, software and sensor level to satisfy the availability criteria. For the protection system, independent sensing device shall be used to ensure adequate safety of plant equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[16]	25.09.2014

4.7 Standardization & Uniformity of Hardware

To ensure smooth and optimal maintenance, easy interchange ability efficient spare parts management of various C&I instruments, ensure that all instruments/devices (Processor modules, input/output modules, power supply modules etc.) are of the same family of hardware. For example, all 4-20 mA electronic transducers, control hardware, control valves, actuators instruments/ local devices etc. being furnished shall be manufacturer specific.

4.8 Redundancy

1. Reliability of the Control System shall be established by judicious incorporation of redundancy. In general all critical parts shall have hot standby feature to render the system immune to any single failure.
2. Measurement system (MS), Closed Loop Control System (CLCS) and Open Loop Control System (OLCS) shall all be configured with redundancy at processor modules, communication modules, data bus and power supply modules.
3. Both CLCS & OLCS shall be configured with I/O channels redundancy for each sensor/signals. Where redundant sensors are provided redundant I/O channels shall be used for each sensors/signals.
4. Two out of three measurements philosophy shall be adopted for the control of all closed and critical open loop variables for reliability of operation. The control system shall select the median value for the normal control purpose.

4.9 Operability & Maintainability

1. The design of the control systems and related equipments shall adhere to the principle of 'Fail Safe' operation wherever safety of personnel / plant equipment is involved. 'Fail Safe' operation signifies that the loss of signal or failure of any component shall not cause a hazardous condition. However, it shall also be ensured that occurrence of false trips are avoided / minimized.
2. The types of failure which shall be taken into account for ensuring operability of the plant shall include but not be limited to:
 - Failure of sensor or transmitter,
 - Failure of main and/or redundant controller/other modules,
 - Loss of motive power to final control element,
 - Loss of control power.
 - Loss of instrument air

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[17]	25.09.2014

3. The choice of hardware shall also take into account sound maintainability principles and techniques. The same shall include but shall not be limited to the following:

- Standardization of parts.
- Grouping of functions.
- Interchangeability.
- Malfunction identification facility/self surveillance facility.
- Easy modular replacement.
- Fool proof design providing proper identification and other features to preclude improper mounting and installation.
- Appropriate derating of electronic components and parts.

4.10 Metering Bases of Units

The following system of units shall be followed throughout the specification unless otherwise mentioned.

Table 4.3
Metering Bases of Units

S.No	Parameter	Unit
1	Pressure	Kg/sq. cm
2	Differential pressure	mm of H ₂ O column or Kg/sq. cm
3	Draught	mm of H ₂ O column
4	Vacuum	mm of Hg
5	Temperature	Degree Celsius
6	Flow	Tonnes / hr or Kg/hr
7	Flow (Air / Gas)	Tonnes / hr or N. Cu. M /hr
8	Density	gm / c.cm
9	Level	mm or M

4.11 Grounding System

All panels, desks, cabinets shall be used with a continuous bare copper ground bus. The ground bus shall be bolted to the panel structure on bottom on both sides. The bolts shall face inside of panels.

The system ground shall be isolated from the panel ground with suitable isolators. All internal component grounds or common shall be connected to the system ground, which shall be fabricated of copper flat (size 25 mm x 6 mm min, length as applicable).

Shield on instrumentation cables shall be grounded on panel side. When shielding termination is required in cabinets furnished under this

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[18]	25.09.2014

specification, suitable terminals shall be furnished on copper flat forming system ground. System and shield ground shall be connected to earthing strip at 0.0 meter level using suitable size of cable.

4.12 Drive Control Philosophy

The Drive control & measurement philosophy for the project is detailed in this section.

1. Bi-directional drives (inching or open/close)
 - (a) All bi-directional drives shall be operable from Remote i.e. from CR.
 - (b) Remote manual operation of all drives shall be carried out from OWS.
 - (c) Remote Open/Close commands, generated in control system shall be issued to MCC module through interposing relays. Latching of commands shall be used in control system logic which shall be reset by Limit/Torque switch feedback. The Limit/Torque switch feedback from drive shall be directly wired to Control System.
 - (d) Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
 - (e) Following signal exchange shall be envisaged between Drive & Control system:
 - Open Limit Switch (Both NO & NC contacts)
 - Close Limit Switch (Both NO & NC contacts)
 - Open Torque Actuation
 - Close Torque Actuation
 - Position feedback (4-20 mA, two wire electronic type) for inching drive
 - (f) Following signal exchange shall be envisaged between MCC & Control system (Remote I/O cabinet of control system located in/near MCC room):
 - Switchgear available
 - Switchgear disturbance
 - Open Command
 - Close Command
2. Unidirectional LT drives
 - (a) Unidirectional LT drives shall be operable only from Remote i.e. from CR. In addition, Local pushbutton shall be used only for emergency stopping of drive. Local start operation of the drive is not envisaged.
 - (b) Remote manual operation of all drives shall be carried out from OWS.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[19]	25.09.2014

- (c) Remote Start/Stop commands shall be generated in Control system & shall be issued to MCC module through interposing relays.
- (d) Emergency stop of the drive shall be envisaged from the local pushbutton provided near the drive. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to MCC.
- (e) Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
- (f) Current transducer with 4-20 mA type outputs shall be used in the MCC for monitoring the current in Control System for all Drives greater than 90 KW. Auxiliary power supply to these transducers shall be from the control supply of the respective MCC modules.
- (g) Following signal exchange shall be envisaged between MCC & Control system (Remote I/O cabinet of control system located in MCC room):
 - Switchgear available
 - Switchgear disturbance
 - On Feedback
 - Off Feedback
 - Start Command
 - Stop Command
- (h) All Numerical relays/Intelligent controllers for LT drives shall be interfaced to Control System through IEC 61850 protocol.

3. Solenoid Operated drives

- (a) Solenoid operated drives shall be operable only from Remote i.e. from CR.
- (b) Remote manual operation of all drives shall be carried out from OWS.
- (c) Remote Open/Close commands shall be generated in Control system & shall be issued to the Solenoid through interposing relays.
- (d) Necessary process interlocks shall be realized in Control system.
- (e) Following signal exchange shall be envisaged between solenoid drive & Control system:
 - Open Limit Position
 - Close Limit Position
 - Open Command
 - Close Command

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[20]	25.09.2014

4.13 HT drives

1. HT drives shall be operable only from Remote i.e. from CR. In addition, Local pushbutton shall be used only for emergency stopping of drive. Local start operation of the drive is not envisaged.
2. Remote manual operation of all drives shall be carried out from OWS.
3. Remote Start/Stop commands shall be generated in Control system & shall be issued to MCC module through interposing relays.
4. Emergency stop of the drive shall be envisaged from the local pushbutton provided near the drive. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to MCC.
5. Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
6. Current transducer with 4-20 mA type outputs shall be used in the MCC for monitoring the current in Control System for all Drives. Auxiliary power supply to these transducers shall be from the control supply of the respective MCC modules
7. Following signal exchange shall be envisaged between MCC & Control system(Remote I/O cabinet of control system located in MCC room):
 - Switchgear available
 - Switchgear disturbance
 - Master Trip relay Operated
 - On Feedback
 - Off Feedback
 - Trip Feedback
 - Emergency stop feedback
 - Start Command
 - Stop Command
8. Current Feedback

All Numerical relays/Intelligent Controllers for HT drives shall be interfaced to Control System through IEC 61850 protocol.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[21]	25.09.2014

4.14 Variable Frequency Drives (VFD)

1. VFD shall be operable from Remote i.e. from CCR/LCR & from VFD Local Display unit. In addition, Local pushbutton shall be used only for emergency stopping of drive.
2. Remote manual operation of VFD shall be carried out from OWS.
3. Remote Start/Stop commands shall be generated in Control system & shall be issued to VFD Panel through interposing relays.
4. Emergency stop of the drive shall be envisaged from the local pushbutton provided in the field. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to VFD panel.
5. Necessary Electrical protections shall be realized at VFD module whereas process interlocks & protections shall be realized in Control system.
6. Following signal exchange shall be envisaged between VFD & Control system:
 - Switchgear available
 - Switchgear disturbance
 - On Feedback
 - Off Feedback
 - Trip Feedback
 - Emergency stop feedback
 - Start Command
 - Stop Command
 - Current Feedback
 - Speed feedback
 - Speed Setpoint
7. The VFD shall also be interfaced with control system via Modbus soft link.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[22]	25.09.2014

5 ASH HANDLING CONTROL SYSTEM

5.1 General

1. The design of the control system and related equipment shall adhere to the principle of "fail safe" operation at all system levels (i.e.) loss of signal, loss of power or failure of any component should not cause a hazardous condition; and at the same time prevent occurrence of false trips and provide reliable and efficient operation of the plant under dynamic conditions and attainment of maximum station availability.
2. The Ash handling plant system shall be divided into following sub-systems:
 - Bottom Ash handling system (BAH)
 - Fly Ash Handling System (FAH)
 - Fly Ash Handling Unloading System
 - Conveying Air System
3. For operation and control of the Ash Handling Plant, system shall be provided with Microprocessor based Programmable Logic Controller based control and instrumentation system which shall cover the total functional requirements of the plant which includes sequence control, interlock & protection, monitoring, alarm, data logging, fault analysis etc. Integral instrumentation for monitoring, Protection and smooth operation of all the Plant and machineries shall be envisaged.

The following signals as minimum shall be hardwired directly from Ash Handling Plant PLCs to DCS:

- Ash Hopper Level Indication
- Ash Flow Indication
- Ash Handling Plant in operation
- Ash Handling Plant in trouble

5.2 Bottom Ash Handling System

1. Control, supervision and monitoring of pumps required for bottom ash system shall be carried out through the AHP PLC. The clinker grinders and valves in the vicinity of the Bottom Ash Hopper shall be operated from the Bottom Ash Local Control Panel, located near the hopper. Separate PLC for BAHS can be considered or RIO of AFP PLC can be placed near BAHS.
2. All drive motors, motorised actuators & pneumatic valves shall be controlled from PLC with starting interlocks & permissive in remote mode and also from local start/stop Push button station in de-interlocked local mode by means of "Local/Remote Selection" switch.
3. The basic operation and control related to the bottom ash handling system shall be carried out as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[23]	25.09.2014

a. Bottom Ash Water Recirculation system

The bottom ash water recirculation system comprising dewatering bin, settling tank, surge tank, decanted water recycle pumping facility, ash slurry/sludge return facility, ash water pumping arrangement etc. shall be operated from the AHP PLC through OWS/LVS.

The operation of the Bottom Ash water Recirculation System for the hydro bin shall be done from Bottom Ash water recirculation local panel. This panel shall be interfaced with AHP PLC for monitoring from AHP control room.

b. Bottom Ash Removal System

Bottom ash removal system shall have local manual operation from the Bottom Ash Local Panel to be provided near bottom ash hopper. Bottom ash removal shall be operated/ monitored from AHP PLC as well as Bottom Ash local Panel. Complete annunciation system (driven by PLC) should be available in this local control panel. From the local panel it shall be possible to carry out the ash cleaning operation of BA hopper on receipt of necessary start signal from the PLC and shall also convey appropriate 'cleaning over' signal to PLC after completion of the operation.

4. The control equipment for bottom ash control system shall be located in two areas. One to be located near the bottom ash hopper in outdoor location and the other one at RIO room/Control Room.
5. The local panel shall be outdoor type suitable for vertical column/floor mounting with IP-65 protection category. The panel shall contain a mimic diagram of the system with push buttons and LED indicating lamps for different equipment in the system.
6. Bottom Ash Local Panel shall include but not be limited to the following features/accessories:
 - "Start", "Stop" and "Reverse" push buttons with indicating lamps for clinker grinder motors.
 - Safety feature such as proximity speed switch for detecting clinker grinder jamming by sensing High Torque and thereby stopping it.
 - Open and close push buttons for hopper feed-gate which shall have the features of "stay put" and "inching".
 - Open and close push buttons with indications lamps for each remote operated valve in water line to jet pumps, clinker grinder seal water line and bottom ash slurry line.
 - Mimic diagram depicting the bottom ash cleaning operation along with slurry line interconnection arrangement (if any) with other two units.
 - Indicating lamps for ON and OFF condition of HP & LP water pumps.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[24]	25.09.2014

- Fault indication lamps for the above are to be located in Bottom Ash Local Panel.
7. Bottom Ash Local Panel shall be provided with indication lamps for each of the following conditions :
- Water pressure to jet Pump - low
 - Instruments air pressure - low
 - Grinder gland seal water pressure - low
 - Clinker Grinder - tripped (for each grinder motor)
8. The bottom ash removal system shall be furnished with at least the following protective features and safety interlocks to ensure safe operation of the system.
- In the event of jamming of the grinder, the grinder motor shall stop. Jamming if any is to be cleared by reversing the grinder operation.
 - The grinder motor shall trip and corresponding hopper gate shall close under such circumstances.
 - It shall be possible to open the hopper feed gate only when the corresponding clinker grinder is started and running.
 - It shall not be possible to open the jet pump water line valve of one unit when the same for other is already open.
 - For each bottom ash slurry line it shall not be possible to open the valve of one unit, when the interconnecting valve from other unit is already open.
9. The operation of desludging of settling tank and surge tank through sludge pumps shall be provided continuously to avoid any settlement of ash in the subject tanks. There may be necessity for arranging flushing/back washing of this desludging piping and pumping operation. This shall be achieved by complete auto sequencing with provision of manual supervising/overriding.

5.3 Fly Ash Handling System

1. The Fly ash handling control shall be through AHP PLC located in AHP control room & operation shall be through OWS/LCD.
2. Local Pneumatic Control panels shall be provided near each conveying vessel for local control/manual operation & indications.
3. The ash conveying system shall be capable of operating in both Level mode as well as Timer mode.

5.3.1 Measurement philosophy

Following is the indicative list of measurements for the system. These measurements shall be available in OWS/LCD of PLC at the AHP control room.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[25]	25.09.2014

- Indication of conveying air pressure on individual supply line after discharge header, after air receiver.
- Indication of instrument air pressure on individual supply line after discharge header, after air receiver.
- Indication of fluidizing blower air pressure at the discharge of each blower.
- Indication of fluidizing blower air pressure at the common discharge header near Main Silo.
- Indication of fluidizing air temperature after heater for buffer hopper.
- Indication of fluidizing air temperature after heater for main silo.
- Indication of level in silos (radar type), buffer hopper (radar type) and feeder vessel (RF type level switch).
- Indication of differential pressure across each Bag filter.
- Indication of Vacuum in all streams

5.3.2 Local Indications

Following local gauges shall be envisaged for the system in addition to other local instruments:

- Local indication of vacuum in all the streams.
- Local indication of cooling water pressure.
- Local indication of pressure of ash conditioning water.
- Local indication of pressure at the discharge header of each compressor.
- Local indication of pressure at discharge line of each air blower.
- Local indication of temperature at discharge line of silo aeration blower.
- Local indication of differential pressure across each Bag filter

5.3.3 Alarms & Interlocks

Following is the indicative list of alarms and interlocks for fly ash conveying system to be executed through PLC. All alarms shall be available in PLC. The system shall be provided with these and other alarms and interlocks as necessary for safe and smooth operation.

1. Alarms

- Vacuum low at the conveying of all ash streams.
- Fly ash conveying air pressure low.
- Instrument air pressure low.
- Conveying air common header discharge pressure low.
- Level in feeder vessel high.
- Control blower discharge pressure low.
- Air blower discharge pressure low.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[26]	25.09.2014

- Fly ash level in ash silo high (80%)
- Fly ash level in buffer hoppers high.
- Trouble in any hopper during cleaning operation.
- Any alarm not specifically mentioned but needed for safe and coordinated operation.
- All tripping shall have alarm- annunciation

2. Interlocks/Protections

Protection and safety interlocks for the following conditions shall be provided for safe operation:

- It shall be possible to start and run the fly ash cleaning operation only when the desired vacuum is achieved.
- It shall be possible to start and run the system only if the instrument air pressure is above preset value.
- It shall be possible to start and run the system only if respective/branch isolation valves as applicable in fly ash conveying line are open.
- Any other protection and safety interlocks required but are not mentioned specifically.

5.3.4

Operation Logics

1. The following shall be logic of operation
 - Vacuum in system is above the low set level.
 - Conveying air pressure is above low set value.
 - Instrument air pressure is above low set value
 - Ash silo level is not high (90%)
 - Start Mode selected from OWS/LCD and local pneumatic control panel.
2. Under level mode of operation, the conveying cycle initiation signal shall be generated by the hopper level switch. Under timer mode of operation the initiation signal shall be generated by the suitable delay timer. Under both the modes of operation, the conveying cycle shall be identical.
3. Once all the conditions are achieved, the conveying cycle shall start and the system shall lock into that state until the cycle under operation is completed. During the operation of a cycle, if any of the conditions are not satisfied, then also the conveying cycle shall continue to work as usual, except for the conditions which are to be rechecked. If the recheck condition is not satisfied, the system shall be locked in the annunciated state till the corrective action is taken.
4. The ash conveying cycle from buffer hopper to ash silo shall be as indicated below :

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[27]	25.09.2014

- First the top intake valve provided below the buffer hoppers shall open for a preset time.
- After the lapse of set time, the vessel inlet valve shall close and valve seat shall inflate which shall be ensured by an independent pressure switch.
- Once the desired seal pressure is achieved, the ash conveying air shall be allowed to enter into the conveying system by opening blow valve.
- Once the minimum conveying time is completed and low vessel pressure is achieved, resetting of timer / pressure switch shall be actuated. The system shall remain inactive till all the conditions as stated above are achieved once again.
- On pressing the purge push button momentarily, the conveying system shall cycle once without opening the ash vessel i.e. without any conveying material.
- The ash evacuated from surge hopper shall be collected in one of the fly ash silos.

5.4 Fly ash Silo unloading System

1. Ash evacuated from Intermediate Surge Hopper; would be collected in one of the two Fly Ash Storage silos. Ash is unloaded to trucks manually through rotary unloaders.
2. The silo unloading panel shall be provided near the ash silos. This panel shall have start/stop push buttons, selector switches & indication lamps for the operator interface. The annunciation window shall be provided for alarm annunciation.
3. The logics, alarms & interlocks for the silo unloading system shall be implemented in AHP PLC.

5.5 Conveying Air System

1. The Conveying & Instrument air systems shall be provided with microprocessor-based control system for each compressor and shall be fully automated, using the manufacturer's standard control package, with single button system start/stop from the AHP Control room and with status/alarm information provided to the operator via the AHP PLC. Local control units with display shall be provided for the compressors to allow local operation & monitoring. In addition, local panel shall be provided for operation & monitoring of other equipments like dryers. All common logics for compressors such as selection, auto change over, duty cycle etc. shall be implemented.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[28]	25.09.2014

2. Isolation valves on instrument air distribution headers and sub-headers shall be provided with a pressure gauge, downstream of the valve, located at a suitable operational position.
3. Junction box / local panel shall be provided for terminating the On, Off commands from AHP PLC to each compressor and the On, Off & fault feedbacks from each compressor to AHP PLC. Supply.
4. The control equipment shall be interfaced with the AHP PLC through Modbus/suitable communication, such that the operator can monitor the operation of the compressors and be aware of problems as and when they occur.
5. A protection system shall be provided to shut down the compressor in emergency situations. The protection system shall be independent of the PLC and any proprietary control systems and shall be operational under all operational conditions. An interface to the AHP PLC from the protection system shall be provided to advise the operator that the protection has operated and the cause for its operation.
6. The control scheme shall be suitable for operating the compressors such that all the compressors shall be equally loaded and ensures power consumption is also optimized.
7. Any of the compressor and Air drying Plant may be selectable for "shut down", "working" or "standby" duty.
8. On tripping of working equipment, the standby equipment shall come into operation automatically in case of very low air pressure in the system.
9. All abnormal conditions use for tripping the compressor or Air drier shall be provided with pre-trip audio-visual indication/annunciation in the control panel.
10. Independent switches shall be used for alarms (annunciations) and tripping or interlock.
11. An electrically operated automatic valve shall be provided on cooling water supply line of each compressor & dryer (if applicable) which shall automatically shut off the cooling water supply, in case any of the compressor/dryer is not running for more than set time duration. Suitable interlock shall also be provided for opening the valve before starting of any of the compressor.
12. All important and critical measurements required for protection of equipments shall be provided with adequate redundancy.
13. The Compressed Air system shall have following minimum features:
 - Capacity regulation at constant pressure shall be provided. This mode of constant pressure control shall be provided when the system pressure

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[29]	25.09.2014

must be held constant with varying capacity requirement. The capacity control of compressor shall be inlet guide vane control.

- Compressor driver motor shall be protected against damage or an inadvertent shut-down resulting from overload.
- Shaft vibration monitoring system shall be provided. Control system shall issue an alarm signal for high shaft vibrations and shall issue a trip/shut-down signal in case of excessive high vibrations. The vibration levels corresponding to alarm and trip shall be settable. Compressor shall also be protected from excessive vibration during start-up and shut-down.
- Selector switches to permit constant generation of air from one compressor and regulation of flow in the other compressor.
- Provision shall be made for auto-start of the stand-by compressor in case of tripping of any of the running compressor with a provision for manual override.

14. The following indications shall be made available in the AHP control room:

- Status of each compressor
- Instrument air pressure low /high
- Conveying air pressure low/high
- Status of each ADP

5.5.1

Measurement Philosophy

Following is the list of minimum required measurements for air Compressors & driers. However, additional measurements required, if any, for efficient operation of the offered system, shall also be included.

1. Measurements for Compressors

- Indication of suction pressure after suction air filters for each compressor.
- Indication of inter stage pressure.
- Indication of temperature of compressed air after intercooler and after after-cooler.
- Indication of pressure of compressed air in each air receiver.
- Indication of pressure of lube oil after oil filter.
- Indication of differential pressure across lube oil filter.
- Oil Level of Indication of lube oil sump.
- Sight glass in common cooling water return line from each compressor.
- Indication of pressure at the supply & return line of common header of cooling water of compressor cooling circuit.
- Indication of Flow measurement at the common discharge airline.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[30]	25.09.2014

2. Measurements at AHP LCR

- Indication of Air pressure of individual compressor discharge header and on each air receiver.
- Dew point of Instrument air.

5.5.2

Alarms & Interlocks Philosophy

Following is the list of minimum required alarms & interlocks for operation & monitoring of Compressors & driers. However, additional alarms & interlocks required, if any, for efficient operation of the offered system, shall also be included.

1. Alarms & Interlocks for Compressors

Following audiovisual alarms and interlocks shall be provided for each compressor.

Table 5.1
Alarms & Interlocks for Compressor

S.No	Signal	Alarm/Trip
1	Suction pressure of air after suction filter low	Alarm
2	1 st stage suction air pressure low	Alarm/Trip
3	Temperature of air after Inter cooler, after 2 nd stage & after after-cooler	Alarm/Trip
4	Pressure of air after after-cooler high	Alarm/Trip
5	Temperature of cooling water to each compressor high	Alarm
6	Temperature of cooling water to each compressor too high	Alarm/Trip
7	Flow of cooling water from each compressor low	Alarm
8	Flow of cooling water from each compressor too low	Alarm/Trip
9	Differential pressure across lube oil filter high	Alarm
10	Pressure of lube oil to compressor low	Alarm
11	Pressure of lube oil to compressor too low	Alarm/Trip
12	Temperature of lube oil to compressor high	Alarm
13	Motor winding temperature high	Alarm/Trip
14	Manual tripping	Alarm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[31]	25.09.2014

5.6 Operation and Control Philosophy

1. The operation and control of the Ash Handling Plant (AHP) and associated systems shall be performed from its own dedicated PLC located in the Ash Handling Plant Local control Room through two nos. (2) Operator Stations (per unit) and one (1) number Engineering/Operator Work Station (per unit). The One (1) No. 52" LCD per unit shall be configured to display alarm and also serve normal operation.
2. One (1) no. A3 size dot matrix printer (per unit) shall be provided which shall be connected to the data highway and One (1) no. A4 size Colour Laser jet printer (per unit) shall be provided which shall be connected directly to the engineering work station. The required furniture such as operator desk/Consoles, chairs, etc shall be provided. The AHP PLC shall be interfaced to DCS through redundant OPC link by fiber optic cable as well as some signals shall be hardwired to DCS for monitoring purposes.
3. The PLC shall be interfaced to the Switchgears and protection relays through a redundant communication link with open protocol.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[32]	25.09.2014

6 PROGRAMMABLE LOGIC CONTROL (PLC)

6.1 General Technical & Design Requirements

Programmable Logic Controller (PLC) shall be microprocessor-based system. The PLC shall be versatile, expandable, user friendly and latest state of art technology. The system shall be envisaged for the purpose of sequential operation, protection and interlock, data acquisition system, alarm functions, closed loop control and data archiving for fully automatic operation. Logic controller shall be used with adequate and reliable protection safeguard for various equipments and to assist the operator for easy safe and efficient starting and stopping of various drives in the process. The system shall be designed by selecting high-grade components of proven quality and proper design of system electronics. The system shall be able to operate satisfactorily with reference to the specified environmental conditions as indicated in the specification.

1. The system shall be modular in construction and expandable in future by adding additional electronic modules, which shall be easily accessible for maintenance and repair. The modules shall preferably be Rack/Rail mounted. The types of modules shall be kept to minimum possible in order to have interchangeability and spares inventory.
2. The system shall have extensive self-diagnostic hardware and software features for easy and fast maintenance of the PLC. Safety barriers shall be used for intrinsically safe input / output circuits.
3. The PLC shall have very high noise immunity in order to ensure safe and reliable operation when subjected to electrical radio frequency interference and electromagnetic disturbances expected in a power plant.
4. The system shall be programmed as per the logic requirements required for the functioning of the systems and equipment.
5. Operation of the PLC shall be completely unaffected by a momentary power loss of the order of 20 milliseconds.
6. On-line replacement of any module shall be possible in such a way that the removal and addition of the module shall be possible without de-energizing the system or causing any interruption in the system while replacing a faulty module except for the inputs /outputs which are being handled by that module. However, in case of triple modular redundant or dual PLC configurations, there shall not be any process upset while replacement.
7. PLC shall be used with 20% hard wired installed spare I/O Channels.
8. The system shall be capable of handling the long-term storage of data for 15 days and retrieval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[33]	25.09.2014

9. The system shall be used with programming and diagnostic facility. Each PLC (Except ESP PLC) shall be used with one no. Laptop of latest configuration with programming software & communication cable.
10. The system shall be facilitated with the time synchronization ports in order to time synchronized with plant DCS.

6.2 PLC System Configuration

The Ash Handling System shall be operated, monitored and controlled through a centralized and dedicated PLC, located in the Ash Handling Plant control room.

The PLC shall be redundant and operated through PC based station (OWS, EWS). A large video display (LCD type) is also shall be envisaged. PLC with work station and the large display shall be located in the control room of AHP. Additionally an OWS (per unit) is envisaged to be installed in the Central Control Room for monitoring. Operation and control shall also be possible from this OWS under predetermined conditions.

Remote Input-Outputs (RIO) concept shall be envisaged. RIO shall be located at different geographical locations (such as bottom ash RIO room/ control room, compressor house for Conveying & Instrument Air System, silo blower room, silo utility building, MCC room etc.) and shall communicate to the AHP PLC located in the control room, through dual redundant fibre optic cable links. The exact locations for RIO shall be decided during detail engineering.

PLC shall be networked with the Plant DCS by dual redundant communication link – based on Ethernet TCP/IP using bidirectional OPC connectivity, on fibre optic cable. The data network shall be extended using redundant link on fibre optic cable up to central control room for installation of one operator workstation at the central control room.

6.3 Input/output Sub system

1. I/O subsystem shall be suitable for accepting discrete inputs, BCD inputs and analog inputs. The I/O modules shall be mounted in the I/O racks.
2. Each I/O shall be electrically isolated from external control circuit by suitable means. The minimum isolation level between I/O and logic circuit shall be 500 V DC.
3. Each module shall have LED for each digital I/O channel to indicate the status of each input / output. Redundancy in I/O level shall be maintained as per the process requirement.
4. PLC inputs shall be used with potential free dry contacts. All the inputs shall be double ended i.e., two wires per input and not common return for all inputs. The contact interrogation voltage for input contacts shall be 24V DC minimum. Each input channel shall be protected by separate fuse.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[34]	25.09.2014

5. Output contacts from the PLC shall be potential free dry contacts. Each output shall be short-circuit proof and protected by fuse.
6. Visual indication of fuse blown must be provided for each input and output channel.
7. There shall be at least 20% spare capacity available on input & output modules, over and above the system requirement.
8. All input/output cards shall have quick disconnect terminations allowing for card replacement without disconnection of external wiring and without switching of power supply.
9. PLC shall have the following monitoring features:
 - Power supply monitoring.
 - Contact Bounce filtering.
 - Optical isolation between input and output signals with the internal circuits.
 - In case of power supply failure or hardware fault, the critical outputs shall be automatically switched to the fail-safe mode.
 - Further, keying-in of individual wire connectors shall be used to ensure that only the correct card is plugged on the I/O module. It shall be possible to remove I/O module without disconnecting wiring from field inputs or outputs.

6.4 Processor Sub system

1. The processor sub system shall include CPU, memory, power supply, communication interface etc.
2. Dedicated PLC's shall be envisaged for each Auxiliary system. The processor shall have capability to implement all the control functions required. The processor shall have sufficient memory for storage of the program instructions as applicable to the logic requirements. CPU shall be of 32/64 bit or upgraded version of microprocessor.
3. Memory shall be non-volatile, preferably EEPROM type. However, in case volatile memory is provided, battery backup shall be used for a minimum of three months to keep the stored program intact. A battery drain indication shall be used at least one week before the battery gets drained. Memory shall be used with adequate capacity with 40% spare capacity under worst loading condition.
4. The healthiness of processor hardware and software shall be continuously monitored by watchdog timer.
5. PLC's shall be used as a minimum with dual redundant processor subsystem including CPU, memory and power supply. Redundancy shall be used such that, in case of failure of the main processor, the standby processor shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[35]	25.09.2014

take over automatically and vice - versa. The changeover shall be bumpless and shall not result any process or system upset.

6. In case of failure of complete processor system i.e., both processors, outputs shall take fail safe state automatically.
7. The scan time of programmable controller shall be of the order of 100 milliseconds or better. Scan time of PLC is defined as the cycle time taken by the system to read input, process input executing logic and update control output for all the logics configured within the system. Other activities like diagnostic routines, output / dump of data to peripherals, or any other activity which consume processor time shall also be accounted while computing scan time.

6.5 Communication Sub system

1. The communication subsystem shall provide reliable and high speed data transfer between the processor subsystem, I/O subsystem, PLC console and other devices connected to the system.
2. Redundancy in communication subsystem shall be used, such that on the failure of the active device, communication link or bus, the redundant device communication link or bus shall take-over automatically without interrupting the system operation. The communication bus shall be of coaxial / Fiber optic type.
3. Information about the failed device shall be displayed locally as well as on the PLC console. It shall be possible to manually switch-over the communication from main bus device to redundant bus device without interrupting the PLC functions.
4. The PLC shall have provisions of communication interface facility with Plant DCS system in order to make the entire system operational from CCR. Bi-directional, Redundant soft links shall be used in the PLC for the connectivity with the Plant DCS.
5. Following are also included in the system:
 - Cables required for interfacing with DCS.
 - Implementation of Tags and establishing the Link.
 - Any other software/hardware required.

6.6 System Power Supply

1. For PLC system, redundant 24 V DC power supply shall be used. The required power supply cable shall be used from the UPS DCDB & ACDB for Ash Handling control system
2. For separately mounted I/O racks, separate power supplies shall be used. Power supply module shall be of ample capacity to supply all modules. In addition 20% spare capacity for future shall be used. All the drives shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[36]	25.09.2014

switched ON/OFF through 24V DC coupling relays to be provided in HT/LT SWGR panels.

3. For the Operator Stations and Engineering Station the power supply shall be from the 230 VAC UPS system.

6.7 PLC Console

1. PLC Console or operating panel/display panel shall be used as operator Interface station for control and monitoring of the plant. This shall be done through dynamic mimic displays and control displays.
2. PLC console shall also be used for program storage, display, fault diagnostic and alarm monitoring. It shall be possible to modify, add or delete the application program on-line without affecting the outputs. It should be possible to modify or create new displays from PLC Console.
3. Isolation shall be used between programming terminal and related subsystems, if there is any possibility of high voltage from TFT being transmitted to other subsystems.
4. The PLC system shall have provision to shift the Operator Station/ Engineering Station to the CCR in future with third party interactive communication facility.

6.8 Displays

The system shall be capable of reading the status of equipments, acquiring the analog signals, displaying the status in the form of mimic diagram, video trend, bar graph, periodic display, alarm display, alarm overview display, logs such as hourly/shift/daily logs, alarm logs etc.

Displays include plant mimic diagrams, which shall include the complete auxiliary plant system indicating each major components of the system and the operating status of individual equipment and devices

6.9 Alarms

1. The system shall display history of alarms in chronological order of occurrence on the Operator Station TFT. At least three (3) levels of alarm priority shall be available which shall be displayed in different color. It should be possible to display and print alarms. System shall have all alarm related functional keys like acknowledge, reset etc. Other design features like set point / dead band adjustment, alarm priority, manual and automatic inhibition based on predefined logic etc. shall be used, which shall be as finalized during detail engineering.
2. The alarm display shall be built bottom up with the most recent alarm at the top of the list. When a point returns to normal, the associated alarm line shall change color suitably and on acknowledgement, the line shall be blanked out.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[37]	25.09.2014

3. The alarms below the blank lines shall move upward to fill the empty lines. If the capacity of the OWS display page is exceeded, alarm history shall be stored in memory to accept the over- flow. This alarm history shall be displayed upon operator demand. The format and details of alarm displays shall be finalized during detail engineering.
4. When a point goes into an alarm state and appears on the alarm screen, the time of alarm shall flash until acknowledged by the operator. Acknowledgement by the operator shall cause the time to stop flashing. All alarm initiations and return to normal, shall be logged on a printer.

6.10 System Software

1. Complete licensed software for PLC based system including the communication software system shall be supplied and implemented to meet completely the specification requirements.
2. Application software shall be built based on approved logic diagram, graphics etc and shall include controls, graphics, logs, trends, history, report generation etc.
3. The system software shall include all programs for the PLC and PLC console which are required to perform all the PLC functions including communication and self-diagnostics.
4. Diagnostic software shall have the capability to provide information about the failed module / system either in the form of a system configuration display or provide information in the form of a statement.
5. The software's shall not be machine specific. All software licenses shall be valid for the continuous service life of the plant and equipment.
6. Password security shall be used in order to ensure security level to the plant operation.

6.11 Peripherals

Following Peripherals shall be used for ESP PLC only:

1. VDU/ TFT shall be multi-sync, 21" color monitor with intelligent terminal and key board. TFT shall be used with graphic and mimic capabilities with minimum 64 distinct colors. The graphic resolution shall be 600x 1280 dots minimum with 0.25 mm dot pixel and refresh rate shall be 85 Hz or better
2. Suitable optical filter for minimum secondary glare shall be used.
3. One number black & white laser printer shall be used for printing A4 size paper. Printing speed shall be minimum 24 ppm. The printer shall be heavy-duty type with minimum 50,000 pages/month printing capability, 600 dpi resolution, 128 MB memory and 3000 sheet input capability.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[38]	25.09.2014

7 UNINTERRUPTED POWER SUPPLY (UPS)

Redundant, 230 VAC Uninterrupted Power Supply (UPS) System for AHP control system consisting of 2x 100% capacity static inverters, 2 x 100% capacity static switches, Manual by-pass switch, 1x 100% capacity float-cum-boost chargers, Battery with accessories, Step-down transformer, Voltage Stabilizer, AC Power Distribution Boards etc. shall be provided. UPS shall be provided with all interconnecting cable between UPS equipment and battery, UPS system cabinets and enclosures etc.

UPS shall be provided with all equipment and accessories required for completeness of the system including any feeder distribution as required for protecting UPS equipment and connected inputs and outputs shall be furnished in line with the specification.

7.1 Technical requirements

1. The equipment furnished under this subsection of the specification shall meet the requirements of all applicable codes and standards including ANSI, NEMA, IEEE, NEC and IS.
2. The UPS equipment and the complete system shall have Surge Withstanding Capability (SWC) to meet the requirements of ANSI C 37.90a - IEEE Standard 472-1974.
3. The UPS shall be provided to cater to all the loads for systems, equipment and instruments requiring UPS supply. Spare feeders of at least 10% of the total number of feeders shall be built in.
4. The selection and selective co ordination of all the protecting devices including fuse free circuit breakers/ fuses shall conform to the requirements of National Electric Code NEC –1984 and other applicable codes and standards. The selectivity ratios of the fuses shall be such that there is a sufficient margin between the total electric energy of the upstream fuse. The selectivity ratio shall be finalised during the detailed engineering stage but the same shall not be less than 2:1 in any case.
5. The following general requirements shall be met for ensuring proper branch and circuit protection.
6. The feeder fuse ampere rating and feeder conductor ampacity must be at least 100% of the non continuous load plus 125% of the continuous load as calculated per Article 220 (220-10 G) of NEC Code- 1984. The feeder conductor must be protected by a fuse not greater than the conductor ampacity.
7. Each ungrounded service entrance conductor shall have a fuse in series with a rating not higher than the ampacity of the conductor.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[39]	25.09.2014

8. If secondary fuses are sized not greater than 125% of transformer secondary current, individual transformer fuses are not required in the primary, provided, the primary feeder fuses are not larger than 250% of the transformer rate primary current.
9. The UPS system shall be suitable for operation at ambient conditions indicated in the specification.

7.2 Functional requirements

1. The Uninterrupted Power Supply (UPS) system of continuous duty shall supply regulated, filtered and uninterrupted 230V, 50 Hz, single-phase power, within specified tolerances. Each of the UPS loads shall receive one feeder each from the AC Distribution Board of Inverter A& B. However, each inverter shall supply only 50% loads under normal conditions.
2. Each UPS System component shall be compatible for satisfactory and well coordinated operation with other related components as well as with the input and output systems.
3. The KVA rating of the UPS shall be guaranteed at 230VAC, 50 Hz, single phase output at 50 deg C ambient temperature and load factor of 0.8 lagging.

7.3 Normal Operation

1. During normal operation, UPS loads shall be supplied by both 100% capacity inverters each working at 50% load. The inverters shall receive power from DC source (Charger/Battery) and their static switches shall be in the respective "Inverter" position. In this mode the two inverters shall act as hot standby for each other.
2. Necessary paralleling networks shall be included to ensure equal load sharing by both inverters. The rating of the paralleling device / circuit shall be such that it does not act as a limiting factor on the fault clearing capability of the inverters individually and when working in parallel. Load sharing network details shall be provided to establish all functionalities including fuse clearance.
3. One inverter shall act as "Master", working on its internal oscillator and the other inverter shall follow by using the synchronising signal from master inverter for automatic control of its output frequency.

7.4 Emergency operation

In case of failure of any inverter, the static switch shall automatically transfer the UPS loads of faulty inverter (say Inverter-"A") to the healthy Inverter-"B" which shall start working at 100% capacity. Thus the feeding of UPS power is continued automatically to all loads connected to both inverters despite the failure of one inverter and the quality power supply to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[40]	25.09.2014

all UPS loads connected to both inverters shall be maintained without interruption. Isolation of faulty inverter shall be automatic and achieved in less than 4 mille seconds.

On inverter failure, the plant AC source is automatically brought in as the standby source to healthy Inverter working at 100% capacity. In this mode, the healthy Inverter shall get the synchronizing signal from the standby AC source.

Operation on internal oscillator and transfer/retransfer to standby source shall be as follows :

1. The output frequency of the healthy inverter shall be automatically synchronised with the plant stand-by AC source supplied through step down transformer and voltage stabliser using synchronising signal from the standby source. If the frequency of the standby source is beyond these limits, the inverter frequency control shall be automatically disconnected from stand-by synchronising signal and the inverter shall maintain the output frequency at 50 Hz within + 0.1 percent under all conditions of load and input voltage by working on its own internal oscillators.
2. During operation on its own internal oscillator, the inverters shall continuously monitor the frequency of standby source. Upon restoration of proper frequency conditions of stand-by source, the inverter shall automatically start using stand-by source frequency as the synchronising signal for inverter output frequency control.
3. During the operation of any inverter on its internal oscillator due to synchronising frequency being beyond the specified limits, the transfer of static switch from "Inverter" to "Standby source" shall be inhibited.
4. While one of the inverters (healthy) is feeding 100% load and the AC source is acting as standby, and in case this invertor also fails, the 100% load shall be automatically transferred from invertor to standby AC source through static switch, provided the standby source is synchronised to the invertor (synchronous transfer). However, such transfers shall be inhibited during operation of invertor on its internal oscillator due to standby AC source frequency being beyond the synchronisation limits. Asynchronous transfer of invertor loads to standby AC source with a beak, on invertor failure shall be provided.
5. Retransfer of loads from standby AC source to invertor shall be automatic or manual as pre selected by the operator and shall be accomplished only after synchronism of the invertor output with the standby source has been automatically accomplished.
6. The manual bypass switch shall have the provision for fully by-passing the UPS system and connecting all UPS loads to the standby AC source.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[41]	25.09.2014

7.5 Static inverters and auxiliary equipment

The static inverters shall be solid state type employing silicon controlled rectifiers or power transistors and other solid state devices to convert direct current power to essentially sinusoidal alternating current power as per this guidelines. Ferro resonant type inverters shall not be acceptable. The inverter equipment shall include all necessary circuitry and devices to conform to requirements like voltage regulation, current limiting, wave shaping, transient recovery, surge suppression network, automatic synchronisation etc. as specified herein. Inverter shall be of continuous duty. Natural convection or forced cooling using redundant fans shall be used. Equipment shall be designed for operation with full load even with cooling fans failure / non-availability.

7.5.1 Inverter Capacity

Each static inverter shall have the following minimum capabilities.

Continuous full load rating: meeting specification stipulations

Over load capacity: 125% of full load rating for 10 minutes and 200% for 10 seconds minimum and 300% for 4ms minimum for all specified input voltages.

The inverter shall have sufficient I²t capability to clear a slow acting HRC fuse having a continuous current rating equal to at least 20% of the continuous full load current rating of the inverter, while feeding 100% rated loads of the inverter.

Voltage regulation: $\pm 1\%$ for 0-100% load at all input voltage and all power factors.

Step load pick up: Upon transfer of full load, the inverter output voltage shall not drop below 85% of nominal voltage during the first half cycle after transfer and 90% of nominal voltage in the next half cycle. The recovery to within $\pm 1\%$ of voltage shall be in less than 50 milliseconds.

7.5.2 Input / Output Voltage

The inverters shall be fed from Battery and chargers which do not feed any other loads. Input voltage shall be nominal DC output voltage of battery and charger of range from final voltage after discharge of battery to maximum DC bus voltage during equalize charging of battery. The inverter shall also be capable of working satisfactorily meeting all specification requirements with only the chargers connected to its input without battery in circuit. Filtering on the input of the inverters shall be furnished as required to operate with the output ripple of the chargers. Each inverter shall include equipment necessary to protect itself from damage resulting from excursions, loss or restoration of DC input voltage and synchronizing voltage. The inverter output voltage shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[42]	25.09.2014

be 230V AC, 50 hz, single phase. Total harmonic content shall be 4% (max) and harmonic content of any single harmonic shall not exceed 3%. The inverter efficiency at 100% load and 0.8 pf shall be minimum 85% and at 50% load and 0.8 pf shall be minimum 80%.

7.5.3 Over loads, Short Circuits and Load loss

1. The inverters shall be provided with suitable fuses at the input and output which shall permit proper co-ordination with other protective devices and at the same time protect the inverter against damage due to internal faults. All necessary equipment shall be provided to protect the inverters against over loads, short circuits and 100% loss of load. The inverter shall be self protecting against damage if energized with full load connected. All the fuses used in inverter power & control circuits shall be fast acting type, operating in less than 5 ms.
2. The inverter shall be provided with current limiting circuitry which shall limit the output current to a value which shall not damage the inverter or blow its fuses.
3. The inverter shall have sufficient I²t capability to prevent damage to itself until short circuit conditions on the output are cleared.
4. Each inverter shall be capable of operation with non linear loads. Details of non linearity for the loads shall be furnished. Output waveform of the inverters) shall remain within specified limits when operating with non linear loads at 100 percent rated load.
5. The inverters shall be self protecting against all AC and DC transients, voltage surges and steady state abnormal voltages and current likely to be encountered in utility power station.

7.5.4 Automatic Synchronization

1. Inverter equipment shall include stable solid state oscillator devices designed to automatically maintain the inverter output in phase and in synchronism with the standby AC source. The frequency regulation shall be automatic within +/- 0.1% for all conditions of inputs, loads and temperature occurring simultaneously or in any combination.
2. Facility shall be provided for automatic transfer to internal oscillator operation when the standby source frequency is not within the synchronisation limits.
3. Provision shall be made for step less adjustment of synch disconnect frequency range from 50 Hz +/- 0.5 Hz to 50 Hz +/- 2 Hz.
4. Automatic adjustment of phase relationship between inverter output and standby AC source shall be gradual, at a controlled slew rate which shall not exceed one Hz per second.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[43]	25.09.2014

5. The inverter shall normally work on the internal oscillator with either of the two inverters as master synchronizer and the other following it. Suitable selector facility shall be provided to select the master. When any one inverter fails the healthy inverter gets the synchronizing signal from the standby A.C. source.

The DC input current shall never exceed the full load current except for a short circuit within the inverter. This limitation applies to transient as well as steady state currents and includes inrush currents upon initial energisation of the UPS, load energisation, short circuits external to the inverter etc. For any value of the load and load power factor drawn by the equipment served, the inverter shall not impose on DC source any voltage oscillations in excess of 5 volts (RMS total, all frequencies) or any current oscillations in excess of 3 percent (RMS total, all frequencies) of the DC current at full load.

7.5.5 Static inverter auxiliary equipment

In addition to the inverter equipment specified above, auxiliary equipment shall be furnished with each static inverter as follows:

1. Output ammeter, Output voltmeter, Output KVA meter, Input voltmeter, Frequency meter, Power factor meter, Inverter ON-OFF switch, Alarm Reset Push Button etc. of one number each shall be provided on the front panel of the inverter enclosures.
2. Indicating lights shall be furnished on front of the UPS panels. For those abnormal conditions which could be of a momentary nature, the indicating lights shall remain energized and the contact remain closed until cleared by a reset push button on the panel.
3. The following indications shall be provided as a minimum i.e. DC voltage to the Inverter Low/ High, Loss of DC input to the inverter, Inverter output voltage High/ low, Inverter failure, Standby AC source failure, Inverter synchronized with standby AC source in case of failure of the other inverter, Inverter feeding 100% UPS load, Standby AC source feeding 100% UPS loads, Fan failure and temperature high etc.
4. In addition to the above indications, electrically independent, potential free contacts for each of the above conditions shall be furnished. These contacts shall be rated for 0.5 Amps, 220 Volts DC and shall be wired to the terminal blocks.
5. The signals such as 4-20 mA signals for Inverter A & B output voltages, output currents, output frequency etc. shall be available.

7.1 Static transfer switches and auxiliary equipment

The static transfer switches shall be provided to perform the following functions

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[44]	25.09.2014

1. To transfer the load automatically between the Inverter to the standby inverter as described under automatic synchronisation.
2. To transfer UPS load under manual control from standby AC source to inverter when placing the UPS System in service and from inverter to standby AC source when taking the UPS out of service.
3. The static transfer switches shall have two modes of operation namely automatic and manual.
4. The static transfer switches shall use silicon controlled rectifiers and other static devices required for automatic transfer of load from Inverter" to Standby" source and vice versa.
5. The static switches shall be provided with the requirements specified herein including the following:

- | | | |
|----|-----------------------------|---|
| a) | Capacity(continuous) | Continuous full load capacity of the inverter. |
| b) | Capacity (overload) | As per overload capacity of inverter indicated in the specification |
| c) | Capacity (Peak) | 1000% of continuous rating for 5 cycles. |
| d) | Transfer Time | 1/4 cycle maximum. (The transition shall be "make before break". Voltage failure shall be sensed at the output of static switch |
| e) | Voltage Rating (Nominal) | 230 Volts, 50 Hz, single phase. |
| f) | Transient Voltage Tolerance | 340 Volts peak above the normal line voltage. |
| g) | Ambient temperature | 50 deg C max. |
| h) | Cooling | Natural or forced circulation, using redundant fans. |
| i) | Duty | Continuous |

6. The transfer of static switch from normal "Inverter" position to "Stand-by" position shall be initiated by Inverter failure and UPS system trouble, Static switch output voltage failure, over current or manual push button operation.

The UPS bus shall be monitored by two voltage detectors. One fast acting circuit shall be used for detecting a complete and instantaneous voltage loss while the other slower acting averaging circuit with adjustable trip level shall be employed to detect voltage deviation beyond selected limits. Both voltage detector circuits shall automatically initiate operation of static transfer switch.

UPS bus current shall be continuously monitored by a current monitoring

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[45]	25.09.2014

detector. This detector shall operate the static transfer switch when the load current exceeds the overload rating of any inverter. The detector shall rest when the load current falls below the rated current of the inverter resulting in retransfer of static switch with inverter position.

The static switch shall automatically transfer the load from inverter to stand-by AC source when the maximum I_{2t} capability of the inverter is reached or when the inverter output voltage drops below 90%.

Over current transfer limit shall be continuously adjustable from inverter continuous rating to inverter current limit rating.

7. Transfer Inhibit of static switch shall be under the following conditions:

Automatic or manual synchronous transfer of load from inverter to stand-by AC source or vice versa, shall be inhibited when the inverter frequency is not synchronized to the alternate source. However, asynchronous transfer facility under such condition shall be provided.

Transfer resulting from overload shall be inhibited when the standby AC source is not available. In this case the load fed by the inverter shall be automatically disconnected.

8. Static transfer switches shall be provided with necessary protective devices (circuit breakers) both in "Normal" as well as "Stand by" position.
9. The static switches shall be furnished with contacts to alarm failure of the alternate source or opening of any fuse protecting the static switches.
10. Auxiliary equipment for static transfer switch
11. Following auxiliary equipment shall be furnished with each static transfer switch a minimum:

- Red indicating Light to indicate switch in "Normal" position, Green indicating Light to indicate switch in "Standby" position, White indicating Light to indicate "Normal" and "Standby", power sources in synchronism, Push-button to simulate normal AC UPS power failure (sensed at static switch output) to test the satisfactory working of static switch, transfer labeled "Transfer Test", Push-button for manual retransfer of static switch to "Normal" position, Push-button for manual transfer from normal to alternate source, Light to indicate standby AC source voltage deviation high, Light to indicate voltage transfer enabled, Light to indicate voltage transfer disabled etc shall be provided on the front of the enclosure.
- Two (2) number each of NO contact for static switch transfer to "Standby" position and standby source voltage deviation > +/- 2 % from normal shall be provided within the static transfer switch enclosure.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[46]	25.09.2014

A. Manual by-pass switch

- a) The manual by-pass switch shall be used to isolate any static switch from its load and stand-by power supply and to take the static switch out of service without power interruption to the load. In doing so, the manual by-pass switch shall connect both load buses to a single inverter. The manual bypass switch shall provide the facility for by passing the entire UPS system during the operation of the UPS in the option of the operator.
- b) The manual bypass switch shall have "make before break" contacts to ensure continuous supply to UPS loads during the operation of the same.
- c) The manual bypass switch shall be rated for 600 Volts, 50 Hz, single phase operation. It shall have continuous load carrying capacity equal to full load inverter current and necessary short term load carrying and interrupting capacity to meet the requirements of the UPS system.
- d) Another bypass and disconnect devices shall be provided as required for orderly start up, shut down and maintenance of UPS system and system components-
- e) The manual by-pass switch and required disconnect devices shall be available with duly mounted and wired in enclosure.

B. Float-cum-boost chargers and auxiliary equipment

- a) Two 100% capacity chargers shall be furnished for the UPS system. Each charger shall confirm to the following requirements.
- b) Each charger furnished for UPS system shall be adequately rated to ensure that any one shall meet full DC load of UPS system operating at 100 % rating plus recharge the fully discharged UPS batteries within 8 hours.
- c) The chargers shall be served from a 415 volt, 50 Hz, 3 phase system. The chargers shall maintain the output voltage within plus and minus 0.5 % from no load to full load, with an input power supply deviation in voltage level of +/- 10 % and input power supply deviation in frequency of +/- 5 % and with both deviations present in any combination.
- d) In addition to supplying DC power for inverters, the chargers shall be designed to charge a fully discharged battery without over loading or causing over voltage or without causing interrupting operation of AC or DC circuit breakers for the entire range of intended operating regimes. Suitable solid state electronic circuits shall be provided to ensure that the charging current is voltage regulated and current limited. After the battery is recharged the charger shall maintain the battery at full charge until the next emergency operation when the UPS battery is again required to provide DC power.
- e) In addition to supplying DC power for inverters, the chargers shall be designed to charge a fully discharged battery without over loading or causing over voltage or without causing interrupting operation of AC or DC circuit breakers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[47]	25.09.2014

for the entire range of intended operating regimes. Suitable solid state electronic circuits shall be provided to ensure that the charging current is voltage regulated and current limited. After the battery is recharged the charger shall maintain the battery at full charge until the next emergency operation when the UPS battery is again required to provide DC power..

- f) Float and equalising controls shall have an adjustment range of +/- 5% continuous (without steps).
- g) The chargers shall be self-regulating, solid state, silicon controlled, full-wave rectifier type designed for single and parallel operation with the battery specified. The chargers shall be designed for automatic load sharing during parallel operation.
- h) The charger shall be current limited at 125% of full load to reduce output voltage for charger circuit protection and for protection of battery from overcharge. The current limit shall be continuously adjustable from 80% to 125%.
- i) All necessary equipment and devices shall be provided to protect the charger from short circuits, transient voltages, surges, load and supply fluctuations including sudden loss of input or load.
- j) The charger shall have a slow walk-in circuit which shall prevent application of full load DC current in less than 10 seconds after AC power is energised.
- k) The minimum full load efficiency at nominal input and float output shall be 90% or better. The output regulation, ripple content and power factor shall meet the requirements of UPS system offered.

7.5.6 Battery Charger Auxiliary Equipment

Following auxiliary equipment shall be furnished for battery charger a minimum:

AC Voltmeter, DC Voltmeter, AC Ammeter, DC Ammeter, Charger On-Off push buttons, Potentiometers (one "Float Voltage Adjust" and one "Equalising Voltage Adjust", both with manual adjustment knobs, the settings of these knobs, shall be independent of each other), Selector Switch for float charge / Equalising charge, Charging rate setter, Selector switch and lights for ground fault detector, Indicating lights with proper actuating devices, Circuitry and legend etc shall be furnished on the front of the panel of the charger enclosure.

Indications such as Failure of input AC supply, Charger failure, System on battery operation, Battery equalise timer 'on', Low battery voltage, DC ground fault, Redundant fan failure and temperature high (if provided), Charger fuse failure, Low DC output voltage, High DC output voltage etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[48]	25.09.2014

One set of independent potential free contacts rated for 0.5 amps, 220 volt DC shall be furnished for the alarms above and wired to terminal block for use of alarm annunciation system.

7.5.7 Ground Detector System

Each charger shall be furnished with a ground detector system consisting of a relay and a centre tapped resistor. The resistor shall be connected between the positive bus and the negative bus. The relay coil shall be connected to resistor and ground. The relay shall be furnished with one normally open and one normally closed contact wired to terminal blocks for connection to external circuits.

Two indicating lights and one three position spring return to centre selector switch mounted on front of charger cabinet shall be provided for each ground detector system.

7.5.8 UPS Battery

1. The battery shall be heavy duty Nickel-cadmium type and shall have sufficient Amp-hour capacity to supply 100% full load current of UPS for 30 min. The Ni-cd battery shall conform to IS: 10918 and shall be sized according to IEEE Std. 1115.
2. The battery shall be high discharge performance type to withstand discharge/charge cycles throughout life without loss of capacity. In battery sizing calculation, take into account a minimum voltage drop of 2.5 volts from battery room to the inverter input.
3. Bidder shall furnish battery sizing calculations, supporting curves/data etc. with the proposal to demonstrate that the proposed battery capacity meets the above specification. Various correction factors such as capacity factor, temperature derating factor (at a minimum electrolyte temperature of 4°C), design margin as per data given below:
 - a. Temperature derating factor (At : (Td)
an electrolyte temperature of :
40C)
 - b. Design margin : 20% = 1.2
 - c. Capacity factor (KT) (For : AH capacity of chosen cell
discharge duration of 1 hr. & : /(discharge current in amp for
end cell voltage of 1.1 volts) chosen cell Corresponding to
1 hour) x Float correction
factor.
 - d. The UPS battery shall be :
furnished as specified herein
and shall meet following
requirements.
 - i) iNominal Voltage : As per the requirement of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[49]	25.09.2014

		nominal DC voltage level at the input of the inverters.
ii)	Ambient temperature	: 50 ° C max.
iii)	Specific gravity, full charge	: 1.19 ± 0.01
iv)	Voltage per cell	
	Nominal	: 1.2 V
	Floating	: 1.40 V to 1.42V
	Boost	: 1.53 V to 1.67V
	End cell voltage	: 1.1 Volts

7.5.9 Battery Accessories:

2 nos of Hydrometer along with syringes suitable for vent holes in different cells, Thermometers, Specific gravity correction chart, Wall mounted type holder made of teak wood for hydrometer & thermometer, Cell testing voltmeter (3-0-3V), Acid/Alkali mixing jar 2 nos, Rubber apron, Rubber gloves, Set of spanners, Goggles (industrial) Instruction Card, Variable metallic resistor & shunt, Inter cell connectors, Suitable terminal lugs for cables, Two tier teakwood battery rack, Jack for lifting the cells etc shall be provided as accessories and fittings of the Batteries and auxiliaries.

7.5.10 Step-down transformer & voltage stabiliser

One 415 Volt, 3 phase to 240 Volt, single phase transformer along with associated voltage stabilizer shall be furnished.

This transformer and stabilizer combination shall convert 415 Volt +/- 10% plant auxiliary AC supply to 230V, +/- 2% single phase standby AC Power, which shall serve as UPS system back up supply source.

The transformer and stabilizer shall be sized for 100 % UPS load and shall co-ordinate with the largest branch circuit protection device for feeder short circuit current without sacrificing voltage regulation. The voltage stabilizer shall employ silicon solid state circuitry and shall maintain a stabilized voltage for 0 -100% load with input voltage variations as indicated above.

The stabilizer shall meet the following characteristics as a minimum. Fast rate of correction - within 5 cycle; Output distortion - less than 5% under worst conditions; Efficiency shall be better than 94%; No load losses less than 5%.

7.5.11 AC Distribution Boards

Panel boards for distribution of continuous AC power to essential loads shall be dead-front type panel boards rated for 600 V, AC service. Sheet steel thickness shall be 3 mm for load bearing member and 1.6 mm for other members. The hinged panel board front shall cover the fuses and wiring gutter but not the switch handles. The hinged front and switch handles shall be covered by the enclosure-door.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[50]	25.09.2014

Each panel board shall be constructed for 2 wire, single phase distribution with solid neutral bar. Phase and neutral bars shall be of copper. Rating of the main lugs shall be equal to the rated continuous full load current of each inverter. Type of enclosure shall be IP 42 as a minimum.

Each panel board shall have one fused disconnect switch of adequate rating for incoming feeder for AC Bus and requisite single pole, suitably rated disconnect switch branch circuit devices. Fused switches shall be equipped with arc quenchers, visible blades and quick-make quick-break operating mechanisms.

However, 25% spare feeders with fuses of each rating shall be provided.

Wiring and interconnections

All interconnections required from input to output terminals or outgoing inverter, transfer switches and distribution board equipment shall be provided within the enclosures, applicable international standards and good engineering practice. Internal wiring in factory pre-wired electronic systems cabinets may be installed according to the standard as to wire size, insulation and method of termination on internal equipment. Wiring for external circuits including all alarm contacts shall be brought to grouped terminal blocks located for convenient connection for external circuits entering from top or bottom.

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[51]	25.09.2014

8 FIELD INSTRUMENTS & FINAL CONTROL ELEMENTS**8.1 Pressure / Differential Pressure / Level Transmitter**

Table 8.1
Specifications for Pressure / Differential Pressure / Level Transmitter

S.N	Features	Minimum Requirements
1	Type	Microprocessor based 2 wire type, HART protocol compatible
2	Sensor Type	Capacitive/ Piezo-electric
3	Output Signal	4-20 mA signals superimposed with HART signal.
4	Signal Processing Unit	Microprocessor based
5	Overpressure	150% of max. operating pressure. For vacuum service, the element shall have under – range protection to full vacuum
6	Turn-down Ratio	10:1 for vacuum / very low pressure applications. 100:1 for other applications.
7	Stability	± 0.1% of calibrated span for six months up to 70 Kg/cm ² and ± 0.25% for range more than 70 Kg/cm ² (g).
8	Span and Zero drift	± 0.015% per deg. C at max span & 0.11% per deg. C at min. span.
9	Enclosure Class	Weather proof as per IP 67 with corrosion resistance coating. For hazardous area explosion proof enclosure as described in NEC article 500
10	Zero & span adjustability	Continuous, tamper proof, remote as well as manual from instrument with zero suppression and elevation facility.
11	Local Indicator	To be provided
12	Display	Digital LCD Integral Display (minimum 5 digit) Engineering Unit
13	Process connection	½ " NPT (F)
14	Electrical Connection	½ " NPT
15	MOC of Electrical Housing	Aluminum Alloy or better
16	Ambient Temperature	65 Deg. C
17	Operating Voltage	16 – 48 Volts DC
18	Load	600 Ohms (minimum) at 24 Volts DC
19	Accuracy	± 0.075% of span or better
20	Response Time	100 millisecond or better
21	Adjustment/ calibration/ maintenance	Port/provision for Centralised PC based system maintenance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[52]	25.09.2014

S.N	Features	Minimum Requirements
22	Diagnostic	Self Indicating feature
23	Accessories	Diaphragm seal, pulsation damper, siphon, 3-valve or 5valve manifolds.

- All transmitters shall be equipped with all necessary accessories like valve manifolds, mounting bracket etc. Pulsation dampeners shall be used where the process media is unstable for measurement such as at the discharge of a pump. For absolute pressure transmitter, 2 valve manifold; for gauge / vacuum pressure transmitter, 3 valve manifolds and for DP / level / flow transmitter, 5-valve manifold shall be provided. In case if it becomes necessary to use a DP transmitter for pressure measurement then a 3 valve manifold shall be used in place of 2 valve manifold.
- Pressure transmitter shall have easily accessible span, zero and time constant adjustments. A range suppression / elevation device shall be used wherever required.
- For pressure / differential pressure transmitter, proof pressure shall be 200% of maximum static process pressure.
- All transmitter cases shall be dust – tight and rugged. Weather – proof and explosion – proof cases shall be used in outdoor and hazardous areas respectively. Protection clause shall be of IP 67 or better.
- Transmitters for pressure / DP measurements of liquid shall always be installed below the sampling point, preferably with the connection at the top.
- Transmitters for pressure / DP measurements for gases and air shall always be installed above the sampling point, preferably with the connection at the bottom.
- Transmitters with diaphragm seal system shall be considered when
 - The process temperature is outside of the normal operating ranges of the transmitter and cannot be brought into those limits with impulse piping.
 - The process is corrosive and would require frequent transmitter replacement or unusual materials of construction or
 - The process contains suspended solids or is viscous and may plug the impulse piping or
 - There is a need to make density or interface measurements or
 - The process medium may freeze or solidify in transmitter or impulse piping.
- Diaphragm seal shall be either capillary type or direct mounted type depending upon the application. Parts below the diaphragm shall be removable for cleaning. The entire volume above the diaphragm shall be completely filled with an inert liquid suitable for the application.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[53]	25.09.2014

9. Differential pressure type level transmitters shall be used for range above 1219 mm, for services requiring purge or where liquid might boil in external portions.
10. Differential pressure type level transmitters for use on corrosive service shall generally be diaphragm wafer with extended filled capillary type. Flush or extended diaphragm type DP transmitter shall be considered for special application. Diaphragm material shall normally be stainless steel or any other special alloy.
11. Differential pressure type flow transmitters shall have in-built square-root extractors.

8.2 Temperature Transmitter

Table 8.2
Specifications for Temperature Transmitter

S.N	Features	Minimum Requirements
1	Type	2-Wire, Smart (HART)
2	Output Signal	4-20 mA signals superimposed with HART signal.
3	Signal Processing Unit	Microprocessor based
4	Accuracy	± 0.075 % of span or better
5	Local Indicator	To be provided
6	Display	Digital LCD Integral Display (minimum 5 digit) Engineering Unit
7	Input	Ohm input from Pt-100 RTD
8	Stability	± 0.1 % of reading or 0.1° C, whichever is greater, for 24 months for RTDs.
9	Output	4-20 mA DC, linear
10	Load	600 Ohms (minimum) at 24 Volts DC
11	Power Supply	24 VDC, 2- Wire Loop Power
12	MOC of Electrical Housing	Aluminum Alloy or better
13	Enclosure Class	IP 67 with corrosion resistance coating. For hazardous area explosion proof enclosure as described in NEC article 500

1. The temperature transmitter of following types (2-wire Loop Powered temperature transmitter) compatible with RTDs shall be used.

Single Input DIN-rail mounted Temperature Transmitter

These shall be suitable for mounting on DIN-rails in Panels/JBs in air conditioned room. This temperature transmitter shall be the ones which are especially designed for DIN-rail mounting with IP 20 protection class. These shall have terminals for input/output provided on front side when mounted

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[54]	25.09.2014

on DIN-rail. Head mounted temperature transmitter with clamps to make it suitable for DIN-rail mounting shall not be acceptable under this category.

Dual-input Temperature Transmitter with Indicator

These shall be suitable for mounting on pipes/ supports. Indicator shall be used with these transmitters. These transmitters shall have bump-less change over facility to second sensor in case first sensor fails. This changeover is to be alarmed. Protection class shall be IP67 minimum.

The exact applications for which this type of transmitter is to be provided shall be finalized during detailed engineering.

2. Transmitters shall be used with following features:

- Sensor drifts alarm for sensor failure prediction
- Differential & average temperature measurement if required.
- Automatic switch-over to back-up sensor on primary sensor failure.
- Accepts any combination of two sensor types (RTDs, T/Cs, mV or ohms)
- Ambient temperature compensation
- Fault detection for electronics & sensors with fail-safe alarming.
- Provision of built-in CJC

3. Transmitters to be used for RTD sensors shall be used with RTD EMF correction features so that it shall detect and eliminate EMF errors which are the result of small voltage produced by RTD sensing elements.

4. The product and make shall be selected so that with one make of transmitter all applications with respect to measuring range, temperature sensor (resistance thermometer) and connection type (2/3/4) wire connection of resistance thermometers) shall be covered.

5. Transmitters shall be capable of communication with HART (Highway Addressable Remote Transducer) communicator. HART communicator shall be used with transmitters for tuning / configuring / diagnosing / maintenance of the transmitters. It shall meet the intrinsic safety requirement if required depending upon the application.

6. All transmitters' cases shall be dust-tight and rugged. Weather-proof and explosion-proof cases shall be used in outer and hazardous areas respectively.

8.3 Resistance Temperature Detector (RTD)

Table 8.3
Specifications for RTD

S.N	Features	Minimum Requirements
1	Type	3 / 4 wire , Pt-100 (100 ohm at 0 deg C) (as per DIN 43760)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[55]	25.09.2014

S.N	Features	Minimum Requirements
2	No. of Element	Duplex
3	Housing/Head	IP-65/Diecast Aluminium. Plug in connectors are to be provided for external signal cable connection
4	Sheathing of RTD	Metal sheathed , mineral insulated, ceramic packed
5	Calibration and accuracy	As per DIN-43670 Class-A for RTD
6	Stability	Zero & span drift within 0.1% of span for a 6 month period.
7	Characteristic	Linear with respect to temp, within $\pm 1/2$ percent of top range value
8	Standard	As per DIN-43670 for RTD & ASME PTC-19.3 for Thermowell
9	Accessories	a) Adjustable Nipple-Union-Nipple with thermo well connection / plug in connectors
		b) Compression fittings / unions
		c) Flanges etc.
		d) Thermowell as per requirement

- RTDs shall be of duplex, platinum three / four wire type with a nominal resistance of 100 ohms at 0°C and conform to DIN 43760 / BS 1904.
- Stability of RTD over full range shall be better than 0.05 ohms and the repeatability figure shall be better than 0.02 ohms. Accuracy shall be of the order of 0.15% or better and response time shall be less than 20 seconds with thermo well.
- The protective-sheath material shall be SS 316, seamless tubes using compacted magnesium oxide packing for insulation. The insulation resistance at 540°C shall not be less than 5 mega-ohms.

8.4 Thermowell for Temperature Elements

- The design of the thermo well shall take into consideration the temperature, pressure, medium and fluid velocity specified in the process in accordance with ASME Standard PTC 19.3, 1974.
- Welded type thermo wells with 38 mm O.D. for welding & ½" NPT internal threads shall be used for pressure above 100 kg / sq cm or temperature above 400 deg C. Socket weld type thermo well with 34 mm O.D. for welding & ½" NPT internal thread, shall be used for pressure between 40-100 kg/cm² and temperature up to 400°C. Screwed type thermo wells with ½" NPT internal threads & M33X2 (M) outer threads shall be used for pressure below 40 kg/cm² and temperature below 400°C. For pipes having

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[56]	25.09.2014

probability of prolonged vibration, seal welding may be done all around after tightening the thermo well within the base.

3. RTD used in air path shall be supported by suitable protection tube of adequate strength with welded cap at the end. The connection size of the temperature detector with the protection pipe shall be adjustable flange type. The length of the protection pipe shall be such that it supports at a distance nearly 2/3rd length of the immersed temperature detector inside the duct using a heat insulated ring support in between.
4. Thermo wells used in Mill classifier Outlet area shall be made of suitable material of sufficient abrasion resistance such as alloy cast iron / 'Ni-hard' / Tungsten Carbide of hardness approx. 400 BHN. Protection rod in front of thermo wells for mill classifier if required shall be used.
5. Thermo well manufacturing drawing covering material specification, dimensional details, details of special treatment, finish etc. as well as test procedure. Material certificate shall have to be furnished for each thermo well.
6. The thermo well immersion depth (U) shall be sufficient to eliminate conduction error. A general rule which may be followed is to use an immersion length equaling a minimum of 10 times the diameter of the protective tube or well. In general, immersion length of thermo wells for different line sizes shall be as follows:

Table 8.4
Thermowell Immersion Length

S.N	Line Size	Immersion Length
1	From 4" to 6"	65 mm
2	From 8" & onwards	140 mm
3	Vessels	400 mm

8.5

Pressure Gauge/ Differential Pressure Gauge

Table 8.5
Specification for Pressure Gauge/ DP Gauge

S.N	Feature	Minimum Requirement
1	Type	Bourdon / Bellows / Diaphragm
2	Sensing Element Material	AISI 316 SS
3	Movement Material	AISI 304 SS
4	Case Material / Protection Class	SS / IP 65
5	Dial Size	150 mm
6	Scale	Black lettering on white background in 270 °C arc

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[57]	25.09.2014

S.N	Feature	Minimum Requirement
7	Range Selection	Normally operate at 75% of its maximum pressure range. Instruments measuring varying pressures shall operate in a band of 60% of its maximum pressure range.
8	Over range Protection	150% of maximum range by internal stop. External stop below zero.
9	Adjustment	External Micrometer screw for zero adjustment. Internal micrometer screw for range adjustment.
10	Stop at Max. Reading	Shall be used
11	Element Connection	Argon welding
12	Process Connection	½" NPT(M) bottom connection for local mounting, back connection for panel mounting
13	Accuracy	+/- 1.0 % of full scale or better
14	Operating Ambient Temperature	50 °C (Max. continuous)
15	Safety Feature	Neoprene Safety Diaphragm (Blowout disc) at the back
16	Window	Shatter-proof glass
17	Chemical Seal Unit	SS 316 Flange and Diaphragm, PTFE coated / block, Silicon Oil filling fluid
18	Accessories	Snubber for pulsating fluid applications / 3-way gauge cock / 2-valve manifold / Pigtail / Gauge Saver, if maximum or Design Pressure is very high than the Operating Pressure / Counter Flanges / Bolts, Nuts, Gaskets / SS Tag Plate

1. Directly connected pressure measuring instruments shall be diaphragm, bourdon or bellow type elements depending upon the services conditions. In general, diaphragm elements shall be used in the range of 0 to 1000 mm water column pressure, bellow type element for ranges of 0 to 1 Kg/cm² and bourdon type element for ranges greater than 1 Kg/cm².
2. Primary element material shall be corrosion resistant to process fluid or diaphragm seals shall be used for protection.
3. Snubber shall be floating pin type, externally mounted and externally adjustable. It shall be used for all pulsating services.
4. Diaphragm seals, filled type or mechanical type shall be furnished where plugging of the element may occur or where suitable material is not available in highly corrosive services. When chemical seals are required, they shall be the clean out type with flushing connection.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[58]	25.09.2014

5. Over-range protection shall be used to at least 150 % of range. For vacuum service, the element shall have under-range protection to full vacuum
6. Ranges of the gauges shall be so selected that the gauge normally operates in the middle third of the scale and conform to IS 3624 standard dials, wherever necessary.
7. The sensing elements for all gauges shall be properly aged and factory tested to remove all residual stresses and shall be SS 316 with forged socket and tip of the same material. Elements above 70 Kg/sq. cm range shall be bored instead of drawn.

8.6

Temperature Gauge

Table 8.6
Specification for Temperature Gauge

S.N	Feature	Minimum Requirement
1	Type	Mercury filled
2	Sensing Element material	Bourdon AISI 316 SS
3	Movement Materials	AISI 304 SS
4	Case Material/Protection class	SS / IP65
5	Capillary Armouring	SS Flexible
6	Capillary	SS 316 (5 mtr. Length for Local & 15 metre for panel Mounting)
7	Bulb/Stem Diameter	12 mm
8	Dial Size	150 mm
9	Window	Shatterproof glass
10	Scale	Black lettering on white background in 270 °C arc
11	Adjustment	Micrometer screw for zero adjustment. Internal micrometer screw for range adjustment.
12	Pointer	Externally Adjustable
13	Range Selection	Normal Process Temperature – approximately two third of Temperature range.
14	Stop at Max. Reading	Shall be used
15	Over range Protection	150% of FSD
16	Instrument Connection	Bottom connection for local mounting, back connection for panel mounting.
17	Process Connection	½ " NPT with Thermowell
18	Performance :-	
a	Accuracy	+/-1.0% of full scale or better
b	Repeatability	Less than 0.5% of full range

Document Number	Rev No.	Description	Page No.	Date of Issue

S.N	Feature	Minimum Requirement
c	Response Time	30 seconds (max.) with Thermowell and 15 seconds Bare.
15	Operating Ambient Temperature	50 °C (Max. continuous)
16	Accessories	Mounting brackets, Bolts, Nuts, Gaskets / SS Tag plate, SS Thermowell etc.

1. Temperature gauges shall be dial thermometers (liquid spring / metal expansion thermometer), either rigid stem or capillary tube depending upon application; if this is not possible for design reasons, industry type liquid – in – glass thermometers shall be used.
2. Case shall have back or bottom connection with adjustable gland to permit adjustment of thermometer into the thermo well.
3. Thermometer stem adjustable gland with union connection and bushing shall be suitable for ½ inch NPT connection.
4. Bi-metallic type dial thermometer, if used, shall be hermetically sealed, back or bottom connection type, with 150 mm dial.
5. The gauges shall be used with automatic ambient temperature compensation.
6. Scale ranges shall be selected so that normal process temperature in middle two – third of full scale range

8.7

Level Gauge

Table 8.7
Specification for Level Gauge

S.N	Feature	Minimum Requirement
1	Sensing Element & material	Tempered toughened Borosilicate gauge glass steel Armored reflex or transparent type
2	Body Material	Forged carbon steel / 304 SS
3	End Connection	Process connection as per ASME PTC and drain / vent 15 NB
4	Accuracy	+ 2 %
5	Scale	Linear vertical
6	Range Selection	Cover 125 % of max. of scale
7	Over Range Test	Test pressure for the assembly shall be 1.5 to the Maximum design pressure at 38 degree C
8	Housing	CS / 304 SS leak - proof
9	Identification	Engraved with service legend or or laminated phenolic Name plate

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[60]	25.09.2014

S.N	Feature	Minimum Requirement
10	Packing	PTFE Teflon
11	Illumination	220 V, 50 Hz, 25 / 40 Watts either with deflector or diffuser (for transparent type level gauge) / 220V , 50 Hz, 25 /40 Watts with red and green filter for bicolor gauge
12	Accessories	Gasket for all KEL – F shield for transparent type vent and drain valves of CS / SS as per requirement
13	Others	Anti – Frost extension for low temperature service. Heating / cooling arrangement

- Level gauges shall be steel armoured reflex or transparent or bi –colour type, top and bottom connection as per pressure vessel standard of ASME PTC code and 15 mm NB (1/2 inch NPT) Drain and Vent connection.
- Body material and cover material shall normally be forged carbon steel, 304 stainlesssteel or other superior material.
- Reflex type gauges shall be used for clean and colorless liquids and transparent type for other liquids. For treated water, the transparent type with KEL – F shields shall be used to avoid their attack on the glands.
- The gauge glass must have a rating equal to or more than the vessel design pressure and temperature.
- The maximum length of a single gauge glass shall not exceed 1400 mm. Where large range is required, multiple gauges of preferably equal lengths shall be used with 50 mm over – lapping in visibility.
- Stand – pipes shall be used for multi – gauge glass and level controller installation and on horizontal vessel with top and bottom connections to have visibility of the complete span. The stand pipe shall not be used with block valves.
- Primary isolation valves shall be used In addition to the gauge glass valves unless otherwise specified. When the process fluid may create lugging or leakage problem, gauge valves may be omitted. For low temperature liquid having high vapor pressure at ambient temperature, isolation and gauge valves shall not be permissible. Safety valve shall be used at the vent connection of the gauge glass where isolation is required.
- Bi – colour level gauges shall have following features:
 - Temperature equalizing column expansion bend and chain patterned hand – wheel

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[61]	25.09.2014

8.8 Pressure/ Differential Pressure Switch

Table 8.8
Specification for Pressure/DP Switch

S.N	Feature	Minimum Requirement
1	Type	Piston for high pressure application Bellow/Diaphragm for low pressure application
2	Sensing Element material	AISI 316 SS
3	Wetted Parts material	AISI 316 SS
4	Case Material	Epoxy coated Die Cast Aluminium
5	Setter Scale	Black graduation on white linear scale. Graduation 0 – 100% with red pointer for set points.
6	Over range for Pressure / Vacuum Switch	150% of maximum pressure
7	Set Point	Adjustable throughout switch operating range.
8	Static Pressure for Differential Pressure Switch	Maximum Line Pressure or Static Pressure on either side without permanent deformation or loss of accuracy.
9	Adjustments	Internal – set point Differential adjustable feature
10	Process Connection	½ " NPT(M) bottom connected
11	Switch Configuration	2 SPDT / 1 DPDT
12	Switch Rating	230 V, 5A AC / 220 V, 0.25 A DC/24 V, 2A DC
13	Switch Type	Snap acting, shock and vibration-proof
14	Cable Connection	½ " ET conduit connections or compression gland
15	Enclosure Class	Weather proof as per IP 65 with corrosion resistance coating.
16	Accuracy	1% of span up to 3Kg/cm2 0.5% of span for more than 3 Kg/cm2.
17	Repeatability	0.5% of span
18	Accessories	
a)		Snubber for pulsating fluid application.
b)		Tag Number, service engraved in SS tag plate
c)		Teflon back-up sheath protection, as required.
d)		i) Remote diaphragm seal with SS 316 armored capillary for typical application. MOC of seal material shall be as per process fluid requirement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[62]	25.09.2014

S.N	Feature	Minimum Requirement
		ii) Silver coated diaphragm for corrosive services like chlorinated water.
e)		Retention ring and screws for surface mounting.
f)		3-way Gauge Cock (SS 316) for PS / 5-Valve Manifold (SS 316) for DPS.
g)		mp for 2 " pipe, bolt & nut.

- The pressure switches shall have sensing elements made of copper alloy or stainless steel sealed diaphragm and piston actuated for high pressure service and bellows for low pressure / vacuum service.
- Low differential pressure switches for low static pressure ranges shall be diaphragm type with snap action switch elements.
- Low differential pressure switches for high static pressure shall be elbows and torque tube type and snap – action switch elements and metric scale dial indicators.
- For corrosive, viscous process fluids diaphragm sealed with completely filled inert liquid shall be used. Material of diaphragm and wetted parts shall be selected considering the nature of process fluid.
- The sensing elements shall be properly aged and factory tested to remove all residual stresses. They shall be able to withstand at least 150 % the full scale pressure without any damage or permanent deformation.
- Actuation set point, dead band shall be internally adjustable throughout the range with tamper proof facilities.
- Electrical connection for the switch devices shall be suitable for plug in type connection.
- Process connection shall be ½ inch NPT. Process piping connections shall include necessary union, nut, nipple, tail pipe, isolation valve and test connection to permit servicing, testing, calibration and removal of the instrument device.
- Pressure switches shall be tested as per BS – 6134.

8.9 Ultrasonic Level Transmitter

Table 8.9
Specification for Ultrasonic Transmitter

S.N	Feature	Minimum Requirement
1	Application	Level measurement in silos, sump water level etc.
2	Medium	Coarse, hard solid materials like ash etc. Materials may be slowly falling through the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[63]	25.09.2014

S.N	Feature	Minimum Requirement
		detection range.
3	Type	Non contact Microprocessor based 2 wire type, HART protocol compatible Ultrasonic Transmitter
4	Principle	Time of flight
4	Sensor Material	Corrosion resistant material to suit individual application requirement.
5	False signal tolerance	Transmitter shall be capable of ignoring false echoes from internal tank / sumps obstructions such as pipes, heating coils or agitator blades. Also transmitters shall have adjustable damping circuitry.
7	Range	Capable of covering the complete level span of tank/vessel taking care of blocking distance, frequency, attenuation due to surface, obstructions, vapours etc.
8	Output	4 – 20 mA DC with 600 ohms load with HART compatibility.
9	Display	minimum 4 characters display with Integral keypad, access protected by user code.
10	Diagnostics	Loss of echo alarm etc.
11	Resolution	+/- 0.1 % of range or better
12	Accuracy	+/- 2 mm or 0.2% of span
13	Repeatability	3 mm or better
14	Operating temperature	0 to 60° C
15	Power supply	24 V DC + / - 10 %
16	Mounting	Flanged connection at top of covers / side walls as per requirement.
17	Accessories	a) All weather canopies for protection from direct sunlight and direct rain.
		b) For hazardous areas, explosion proof enclosure as per NEC article 500 shall be used.
		c) All mounting hardware and accessories required for erection and commissioning. Mounting fittings material shall be SS 316.

1. The power and frequency of transmission for the transmitter shall be selected to assure a sufficient signal / noise ratio.
2. The transmitter shall be designed with an electronic circuit having the features such as temperature compensation, rejection of unnecessary echoes

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[64]	25.09.2014

and noises and adjusting 'zero' and 'span'. It shall consist of sensors, electronic unit and accessories.

8.10

Guided Wave Radar Type Level Transmitter

Table 8.10
Specification for Guided Wave Radar Type Transmitter

S.N	Feature	Minimum Requirement
1	Application	Level measurement of vessel under vacuum or low pressure application
3	Type	Guided wave radar
4	Principle	TDR (Time domain reflectometry)
5	Probe Material	SS 316
6	Accuracy	5 mm or better
7	Resolution	+/- 0.1 % of range or better
8	Signal Output	4 – 20 mA DC with 600 ohms load with HART compatibility
9	Power Supply	24 V DC + / - 10 %
10	Display	Integral
11	Mounting	External cage type
12	Transmitter housing Protection Class	IP-65 with corrosion resistance coating
13	Accessories	a) All weather canopies for protection from direct sunlight and direct rain.
		b) For hazardous areas, explosion proof enclosure as per NEC article 500 shall be used.
		c) All mounting hardware and accessories required for erection and commissioning. Mounting fittings material shall be SS 316.

8.11

RF Type Level Switch

Table 8.11
Specification for RF Type Level Switch

S.N	Feature	Minimum Requirement
1	Application	Solids
2	Particle size	Fine dust to 400 mm
3	Process Temperature	0 – 100°C
4	Vessel pressure	up to 60 bar
5	Insertion length	As required
7	Mounting	Side or top or top vertical at $\pm 15^\circ$
8	Process connection	40 NB thread or flanged

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[65]	25.09.2014

S.N	Feature	Minimum Requirement
9	Protection Class	IP 67
10	Electronics	Remote
11	Cable connection	½ "NPT cable gland Plug-in cable connector

8.12 Sight Glass Indicator (Flow Glass)

Table 8.12
Specification for Flow Glass

S.N	Feature	Minimum Requirement
1	Application	Online observation of fluid flow in Pipeline
2	Type	Double window for pressurized pipe with rotary wheel for installation in horizontal or vertical pipeline. Full view for non-pressurized pipeline.
3	Size	Double window up to 12" and 600 lbs rating. Full view up to 6" and 150 lbs rating.
3	Body Material	SS 316
4	Glass	Pyrex tempered glass
	Others	Rotor & wetted parts shall be bronze All accessories shall be SS316
5	Protection class	IP-65
6	Connection	Screwed up to 50 NB size Flanged ANSI 150 RF – above 50 NB size
7	Accessories	Name plates, mating flanges with gasket, bolts & nuts etc.

8.13 Control Valves

8.13.1 Introduction

The control valves and accessories equipment furnished by the Supplier shall be designed, constructed and tested in accordance with the latest applicable requirements of code for pressure piping ANSI B 31.1, the ASME Boiler & Pressure Vessel code, Indian Boiler Regulation (IBR) & ISA or acceptable equal standards.

8.13.2 Control Valve Design & Sizing

- The design of all valve bodies shall meet the specification requirements and shall conform to the requirements of ANSI for dimensions, material thickness and material specification for their respective pressure classes.
- The valve sizing shall be suitable for obtaining maximum flow conditions with valve opening at approximately 80% of total valve stem travel and minimum flow conditions with valve stem travel not less than 10% of total

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[66]	25.09.2014

valve travel. All the valves shall be capable of handling at least 120% of the required maximum flow. Further, the valve stem travel range from minimum flow condition to maximum flow condition shall not be less than 50% of the total valve stem travel. The sizing shall be in accordance with the latest edition of ISA Handbook on control valves. While deciding the size of valves, Supplier shall ensure that valves outlet velocity does not exceed 8 m / sec. for liquid services, 150 m/sec. Manufacturer shall furnish the sizing calculations clearly indicating the outlet velocity achieved with the valve size selected by him as well as noise calculations.

3. Control valves for water applications shall be designed to prevent cavitations, wire drawing, flashing on the downstream side of valve and downstream piping. Thus for cavitations / flashing service, only valve with anti-cavitations trim shall be used. Detailed calculations to establish whether cavitations shall occur or not for any given application shall be furnished.
4. Trim shall be multistage type having sufficient number of discrete pressure drop turns (stages) to ensure elimination of vibration, erosive – action, cavitations. Identity the number of pressure drop turns in the given equipment and shall also provide calculation demonstrating compliance to the trim exit velocity.
5. To prevent flow induced vibration and to protect the valve internals from foreign particles such as weld slag flow, direction shall be a flow to close (over the plug) configuration for liquid applications. To maximize noise attenuating benefits and to allow for constant fluid expansion, flow direction shall be under the plug for gas applications.
6. Control valves for application such as SH spray control, RH spray control, Heavy oil pressuring & control system shall have permissible leakage rate as per leakage class V. All other control valves such as low and high range feed control valves etc shall have leakage rate as per leakage class IV.
7. The control valve induced noise shall be limited to 85 dBA at 1 meter from the valve surface under actual operating conditions. The noise abatement shall be achieved by valve body and trim design and not by use of silencers.
8. The characteristic of the control valves shall be determined based on the application / service.
9. On supply air or electrical failure for pneumatic / electrical drive, the valve shall remain full closed, open or stay – put position as per process safety requirement.

8.13.3 Valve Construction

1. Proper selection of valve type and material of construction to meet operating requirement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[67]	25.09.2014

2. All valves shall be of globe body design and straightaway pattern with single or double port unless otherwise recommended by the manufacturer to be of angle body type. Rotary valve may alternatively be offered when pressure or pressure drops permit.
3. Valves with high lift cage guided plugs & quick charge trims shall be supplied.
4. Cast iron valves are not acceptable.
5. Bonnet joints for all control valves shall be of the flanged and bolted type for easy dis – assembly. Bonnet joints of internal threaded or union type shall not be acceptable.
6. Plug shall be of one – piece construction either cast, forged or machined from solid bar stock. Plug shall be screwed and pinned to valve stems or shall be integral with the valve stems.
7. All valves connected to vacuum on down stream side shall be used with packing suitable for vacuum applications (e.g. double vee type chevron packing).
8. Valve characteristic shall match with the process characteristics.
9. Extension bonnets shall be used when the maximum temperature of flowing fluid is greater than 2800c.
10. Flanged valves shall be rated at not less than ANSI pressure class of 300 lbs.
11. Teflon shall be used for valve gland packing to suit process requirement.
12. The valve body shall be marked to show direction of flow.

8.13.4 Valve Materials

1. The control valve body material shall be
 - Carbon steel as per ASTM – A216 GR WCB for non – corrosive, non – flashing and non – cavitations services below 275 deg c temperature.
 - Alloy steel as per ASTM A – 217 GR WC 6 for low flashing / cavitations services like drain cooler normal level control etc.
2. The control valve trim material shall be
 - 17 – 4 PH SS for severe services listed under item D.1, 2nd point & 3rd point above
 - 316 SS for services listed at D.1, 4th point above and
 - 316 SS with stellite faced guide parts and bushings for remaining applications.

8.13.5 End Preparation

Valve body ends shall be either butt welded / socket welded, flanged or screwed. The welded ends wherever required shall be butt welded type as

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[68]	25.09.2014

per ANSI B 16.25 for control valves of sizes 65 mm and above. For valves sizes 50 mm and below welded ends shall be socket welded as per ANSI B 16.11. Flanged ends wherever required shall be of ANSI pressure – temperature class equal to or greater than that of the control valve body.

8.13.6 Valve Actuator

1. The regulating control valves shall be furnished with pneumatic actuators. The supplier shall be responsible for proper selection and sizing of valve actuators in accordance with the pressure drop and maximum shut off pressure and leakage class requirements. The valve actuators shall be capable of operating at 60 °C continuously.
2. Valve actuators and stems shall be adequate to handle the unbalanced forces occurring under the specified flow conditions or the maximum differential pressure specified. An adequate allowance for stem force, at least 0.15 kg / cm² per linear millimeter of seating surface, shall be used in the selection of the actuator to ensure tight seating unless otherwise specified.
3. The travel time of the pneumatic actuators shall not exceed 10 seconds.
4. For quick opening / closing services (such as fuel oil shut – off valve), the actuator shall be pilot solenoid operated pneumatic drive; the rating of solenoid shall be 24 V DC.
5. Selection of actuator shall be such that it meets the requirements of thrust / torque, stroke length, angular movement, full scale travel time, repeatability & accurate positioning for successful operation of final control element.
6. All the actuators shall have also provision for manual operation during emergency / maintenance along with graduated local position indicator.

8.13.7 Control Valve Accessory Devices

All control valve accessories such as air locks, hand wheels / hand-jacks, limit switches, SMART positioners, diffusers, external volume chambers, reversible pilot for positioners, tubing and air sets, solenoid valves and junction boxes etc. shall be used as per the requirements.

Table 8.13
Specification for E-to-P converter

S.N	Feature	Minimum Requirement
1	Air Supply	1.5 Kg/Sq. cm
2	Input Signal	4-20 mA DC
3	Output Signal	0.2 to 1.0 Kg/ Sq. cm
4	Linearity	0.5 % of span or better
5	Hysteresis	0.1 % of span or better
6	Ambient Temperature Effect (-20 to +60 °C)	<0.2 % of span per Degree centigrade

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[69]	25.09.2014

S.N	Feature	Minimum Requirement
7	Mounting	Close to Actuator
8	Protection class	IP-65
9	Enclosure	Die cast Aluminium
10	Drift	+/- 2% of set point per hour

Table 8.14
Specification for Smart Positioners

S.N	Feature	Minimum Requirement
1	Input	4-20 mA DC
2	Power Supply	24 V DC Loop powered
3	Type of Electronics	Microprocessor based with self diagnostic facility & digital communication by means of HART Protocol
4	Valve position sensing	Non-Contact type with 4-20 mA DC Output
5	Enclosure Type/Material	Weather & Dust proof to IP-65/ Die cast Aluminium
6	Ambient conditions	Suitable for - 30 to +80 *C temperature & 0-95% Humidity
7	Operating Range	Suitable for Full range & Split Range operation
8	Modes of operation	Suitable for Direct & reverse valve action
9	Flow characteristics	Suitable for Linear & Equal percentage Characteristics
10	Fail safe/Freeze feature	Required
11	Air Capacity	Sufficient to handle the Valves Selected/Boosters to be supplied if required.
12	Air supply pressure	To suite the Air Supply Pressure / Quality available
13	Process Connection	1/4" NPT
14	Characteristic Deviation	< =0.5% of span
15	Ambient Temperature effect	< =0.01%/Deg C or better
16	Configuration	Remote Calibration, Auto & Manual Calibration shall be possible
17	Cable Entry	½" NPT, Side or Bottom Entry to avoid water ingress
18	Accessories	a) Display with push buttons for configuration and Display on the positioner itself (Password Protected / Hardware Lock).
		b) For Supply & Output Pressure, Filter Regulator and other accessories shall be used as on required basis for making system complete

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[70]	25.09.2014

S.N	Feature	Minimum Requirement
		c) Valves Mounting Assembly For Sliding Stem / Rotary / Single Acting / Double Acting on required basis

1. SMART positioner shall be a Double stage positioner. The first stage of the positioner shall be typically a flapper-nozzle that serves as a high-gain pre-amplifier. This sensitivity shall be maintained over a wide range of dynamic conditions. Second stage shall be a power amplifier that provides power to drive the actuator. Preferably this shall be a pneumatic relay. Spool Driven type SMART positioners are not preferred due to Higher Dead Band and Poor responsiveness. The SMART positioner shall have pressure sensors to measure the pneumatic outputs to the actuator.
2. The control algorithm for the positioner shall use feedback signal from the motion of the pneumatic relay beam instead of pressure feedback to minimize pneumatic related effects and for stable and smooth response of the control valve. The SMART positioner shall have user adjustable tuning sets to identify the optimum tuning for the total valve assembly. SMART Positioner with HART Communication facility shall communicate all the valve diagnostics to Plant DCS.

Table 8.15
Specification for Air Filter Regulator (AFR)

S.N	Feature	Minimum Requirement
1	Type	Constant Bleed type
2	Inlet Pressure	10 Kg/Sq. cm (maximum)
3	Output	Adjustable from 0-2 Kg/Sq. cm or 0-7 Kg/Sq. cm (Continuous) as required
4	Filter Element	5 microns
5	Filter Element Material	Phosphor Bronze
6	Bowl Material	Metallic
7	Drain	Automatic
8	Enclosure Protection class/ Material	IP-65/ Die cast Aluminium
9	Process connection	¼ " NPT
10	Accessories	All mounting accessories. 2" dial size Pressure gauge.

Table 8.16
Specification for Position Transmitter

S.N	Feature	Minimum Requirement
1	Power Supply	24 V DC Loop powered
2	Type	Non-Contact/ LVDT type

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[71]	25.09.2014

S.N	Feature	Minimum Requirement
3	Output	4-20 mA DC/ Linear
4	Accuracy	+/- 1 %
5	Enclosure Protection class/ Material	IP-65/ Die cast Aluminium
6	Cable Entry	½" NPT, Side or Bottom Entry to avoid water ingress.
7	Accessories	All mounting accessories

Table 8.17
Specification for Limit Switch (Non Contact Type)

S.N	Feature	Minimum Requirement
1	Type	Non-contact type inductive Proximity/Namur type
2	Sensing distance	10 mm minimum
3	Hysteresis	Maximum 10% of sensing distance
4	Indicator	LED indication
5	Protection class	IP 67
6	Integral Cable	1 mtr.
7	Power supply	24 V DC/ 8 V DC
8	Mounting	Flush mounting with check nut
9	Other Feature	Explosion proof enclosures shall be used wherever required by the application. Shock & Vibration proof.

8.13.8 Test & Examination

- All valves shall be tested in accordance with the quality assurance programme agreed which shall meet the requirement of IBR and other applicable codes.
- The tests shall include but not but limited to the following:
 - Non-destructive test as per ANSI B – 16.34.
 - Hydrostatic shell test in accordance with ANSI B16.34 prior to seal leakage test.
 - Valve closure test and seal leakage test in accordance with ANSI B16.34 and as per the leakage class indicated under clause no. B.6.
 - Functional test: The fully assembled valves including actuators control devices and accessories shall be functionally tested to demonstrate times from open to close position.
 - All control valves shall be tested with the positioners for accuracy of positioning and reproducibility over the full range of travel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[72]	25.09.2014

- CV Test: CV test shall be carried out as type test on each size, type and design of the valves as per AISA 75.02 standard.
- Magnetic particle inspection shall be performed on all machined surfaces of valves having ASA rating of 1500 lbs ASA or greater. All carbon steel valves with 1500 lbs ASA or greater shall receive 100% radio graphic examination in accordance with ASTM – E71.

8.14

Pneumatic Power Cylinder

Table 8.18
Specification for Pneumatic Power Cylinder

S.N	Feature		Minimum Requirement
1	Applicable standard		ISO 6431
2	Mounting Type		Fixed Position mounting/ Trunion mounting
3	Material	Cylinder	Seamless Steel Tube
		Piston rod	Hard Chrome Plated Steel
		Tie rod	Stainless steel
		End Cover	Cast Iron
		Sealing	Polyurathane
4	Control Signal		4-20 mA DC signal to Smart positioner with HART protocol for modulating purpose. Solenoid valve operating on pneumatic line for open & closing purpose of ON-OFF Damper.
5	Supply Air		0-7 Kg/cm ²
6	Accuracy		Better than +/- 1 %
7	Repeatability		Better than 0.5 % of full travel
8	Hysteresis		Less than +/- 0.2% of full travel
9	Dead Band		+/- 0.1 %
10	Selection		Based upon thrust/torque, stroke length, angular movement, full scale travel time, repeatability, space factor etc. Provision for air-to-open or air-to-close operation
11	Accessories		Air lock relay, hand wheel, AFR, Volume booster, Limit switch, Positioner, Solenoid valve, position transmitter & all required mounting accessories etc.
12	Fail safe operation		Stay put for regulating duty

8.15 Solenoid Valves

Table 8.19
Specification for Solenoid Valves

S.N	Feature	Minimum Requirement
1	Operating Principle	Electromagnetic (noiseless), Pilot operated
2	Coil Voltage Rating	24 V DC (in general)/220 V DC/230 V AC/110 V AC as required
3	Ways	3 ways in general others as required
4	Port size	¼ " NPT all ports
5	Body	SS Bar stock/Brass
6	Trim	AISI 316 SS
7	Manual Operation	In built
8	Duty	Suitable for continuous Energisation
9	Sealing	Airtight & leak proof
10	Coil Enclosure	SS 316/Moulded type
11	Insulation class	Class H
12	Coil Casing	IP-67
13	Mounting	Suitable for mounting On pipe or in panel
14	Cable connection	½ " NPT Cable gland
15	Accessories	Mounting Bracket, nuts, bolts etc.
16	Other Features	LED Indication

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[74]	25.09.2014

9 PROCESS CONNECTION PIPING

Installation and testing of all required material for completeness of impulse piping system, sample piping system and air piping system as per the requirements of this clause on as required basis for the connection of instruments and control equipment to the process and make the system complete.

Control and instrument piping & connections shall generally be designed in accordance with the following criteria and these criteria shall be closely co-ordinated with Mechanical Piping / Erector to fulfill the Mechanical Design Criteria also. This is a guideline for Piping design & selection.

1. Pressure connections and piping up to the root valves for all pressure indicators, pressure switches, pressure transmitters, etc., shall be as indicated for miscellaneous piping.
2. Temperature indicators, temperature controllers, temperature switches, temperature detectors, and test well connections shall be used.
3. Flow transmitter connections and piping up to the root valves shall be 25 mm for all piping except orifice flanges, where 15 mm piping and valves shall be used.
4. Level switch connections and piping up to root valves shall be 25mm.
5. Level controllers and level transmitters of the displacement type shall have connections and piping up to root valves of 50 mm.
6. Level controllers and level transmitters of the differential pressure type shall have connections and piping up to root valves of 25 mm.
7. Instrument columns at tanks and pressure vessels shall generally be 65 mm minimum.

a) Design Pressure and Temperature

Instrument primary piping design pressure and temperature shall be selected consistent with the requirements discussed in Mechanical Design Criteria of this specification, for the process pipe to which the instrument primary piping is connected. The following general criteria shall also apply:

Instrument primary piping for other systems shall be designed for 1-½ times the maximum sustained process pressure and temperature (plus 20°C).

b) Materials for Instrument Primary Piping

Material for instrument primary piping connecting to the root valve shall preferably be the same as that used in the process system to which it is connected. Higher strength materials may be substituted in the interest of standardization; however, welding procedures at the point of joining the instrument primary piping to the process piping must be appropriate to the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[75]	25.09.2014

combination of materials involved. Copper may be used only for compressed air services that use copper process piping.

c) Insulation of Instrument Primary Piping

Instrument primary piping connecting to high temperature systems, which might become hot enough to injure personnel during blow down of the instrument line, shall be insulated where such hazard exists. Insulation materials, exterior finish, and metal lagging shall conform to the standards adopted for the process piping.

All materials supplied shall be suitable for intended service, process operating conditions and type of instruments used and shall fully conform to the requirements of this specification.

9.1 Impulse Piping, Tubing, Fittings, Valves & Valve Manifolds

All impulse pipes shall be of seamless type conforming to ANSI B36.10 for schedule numbers, sizes and dimensions etc. The material of the impulse pipe shall be same as that of main process pipe. For various applications specification of impulse pipe materials and associated fittings and valves shall be as given in Table –9.1 (Process Connection Piping).

Table 9.1
Process Connection piping

S. N	Service	Size		Impulse tube material	Impulse tube material	Impulse line fitting material	valves material
		Pipe	Tube			ANSI rating	ANSI Rating
						3000LBS	400LBS
1	Water system	SCH.80 21.34m m OD	12.7 mm ODX 1.65mm THK	SS316	ASTM-A-106-Gr-B (carbon steel)	ASTM-A-105-Gr-II	ASTM-A-105-Gr-II
						3000LBS	400LBS
						3000LBS	150LBS
2	Instrument air system	SCH.40 21.34m m	12.7 mm ODX	SS316	IS 1239 Heavy Class	ASTM-A-105-Gr-II	ASTM-A-105-Gr-II

LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[76]	25.09.2014

S. N	Service	Size		Impulse tube material	Impulse tube material	Impulse line fitting material	valves material
		Pipe	Tube			ANSI rating	ANSI Rating
		OD(pipe through out)	1.65mm THK		(Galvanized)	3000LBS	150LBS
3	Service air system	SCH.40 21.34m m OD	12.7 mm ODX 1.65mm THK	SS 316	IS 1239 Heavy Class (Black)	ASTM-A-105-Gr-II	ASTM-A-105-Gr-II
						3000LBS	150LBS
						3000LBS	150LBS

Notes:-

1. Impulse pipe thickness shall be selected as per ANSI B 36.10. based on the schedule indicated against each service.
2. Wherever impulse tubes are provided, all the fittings required for these shall be SS316.

The following guidelines shall also be considered along with the Table 9.2 for size, material and rating for impulse line/tube fittings and accessories:

a) Impulse line / tube fittings and accessories

1. Nipple shall be used for root valve size more than ½ inch and the nipple size shall be same as the root valve size. Reducer / adapter shall be used to suit instrument connection, where nipple, root valve size is more than ½ inch.
2. Bulk head fitting socket welded type to be provided at instrument rack / enclosure.

b) Fittings

1. All fittings except the last fitting connecting to the instrument shall be socket welded. The size of the fittings shall be same as the impulse line size.
2. The fitting connecting to the instrument shall have a size and thread to suit the instrument connection.

c) Instrument Valves

1. Type of the valve shall be needle valve with built in drain valve.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-005	01	Tender Document for Selection of R&M Contractors – Ash Handling System Volume-II, Section-II, Part-C	[77]	25.09.2014

2. Sizing of the valve shall be ½”.

d) Right / left threaded fittings

1. This shall be used for installation / removal of instruments without disturbing the tubing / piping.
2. A suitable adapter shall be used to install the instruments on ½” right-left threaded fittings.

e) A ½” vent line with a ½” isolation valve shall be used in the instrument rack for air and compressible fluids or other wise if the installation call for eg., for liquid service where the transmitter is located at a higher elevation than the tapping point.

f) Stainless steel tube shall be used inside enclosures and racks from tee connection to valve manifold and then to instrument. For high pressure/temperature applications the material shall be ASTM A 213 TP 316H and for other applications material shall be ASTM A 213 TP 316L. The wall thickness of the tube shall be in accordance with the ANSI B31.1 standard.

All fittings shall be forged steel and shall conform to ANSI B16.11. The material of forged tube fittings for shaped application (e.g. tee, elbow etc.) shall be ASTM A182 Gr. 316 H for high pressure/ temperature applications (as defined above) and ASTM A182 Gr. 316L for other applications. The material for bar stock tube fitting (for straight application) shall be 316 SS. Metal thickness in the fittings shall be adequate to provide actual bursting strength equal to or greater than those of the impulse pipe or SS tube, with which they are to be used.

The disc and seat ring materials of carbon steel and alloy steel valves shall be ASTM A-105 and ASTM A-182, Gr. F22, hard faced with stellite (minimum hardness - 350 BHN.) The surface finish of 16 RMS or greater is required in the area of stem packing. The valve design shall be such that the seats can be re-conditioned and stem and disc may be replaced without removing the valve body from the line.

The valve manifolds shall be of 316 s Furnishing Recommended protection interlock logics stainless steel with pressure rating suitable for intended application. 2-valve manifold and 3 valve manifold shall be used for pressure measurements using pressure transmitters/ pressure switches and differential pressure transmitters/ switches respectively. 5-valve manifold shall be used for remaining applications like DP, flow and level measurements.

For Pressure/D.P gauges in fluid application two-way globe valve on each impulse line to the instrument and in air application two way gate valve on each impulse line to the instrument shall be used near the instrument. These
