4.37 Care of Facilities

The Contractor shall be responsible for the care and custody of the Facilities or any part thereof until the date of Completion of the Facilities, where the Contract provides for Completion of the Facilities in parts, until the date of Completion of the relevant part, and shall make good at its own cost any loss or damage that may occur to the Facilities or the relevant part thereof from any cause whatsoever during such period. The Contractor shall also be responsible for any loss or damage to the Facilities caused by the Contractor or its Subcontractors in the course of any work carried out.

4.38 Loss of or Damage to Property; Accident or Injury; Indemnification

The Contractor shall indemnify and hold harmless the Owner and its employees and officers from and against any and all suits, actions or administrative proceedings, claims, demands, losses, damages, costs, and expenses of whatsoever nature, including attorney's fees and expenses, in respect of the death or injury of any person or loss of or damage to any property (other than the Facilities whether accepted or not), arising in connection with the supply and installation of the Facilities and by reason of the negligence of the Contractor or its Subcontractors, or their employees, officers or agents, except any injury, death or property damage caused by the negligence of the Owner, its contractors, employees, officers or agents.

4.39 Insurance

- a) The Contractor shall at its expense take out and maintain in effect, or cause to be taken out and maintained in effect, during the performance of the Contract, the insurances set forth below in the sums and with the deductibles and other conditions as specified. The identity of the insurers and the form of the policies shall be subject to the approval of the Owner, who should not unreasonably withhold such approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 45-	30.09.2015.

- Cargo Insurance during Transport:-Covering loss or damage occurring while in transit from the Contractor's or Subcontractor's works or stores until arrival at the Site, to the Plant and Equipments (including spare parts thereof) and to the Contractor's Equipments.
 - Installation All Risks Insurance:-Covering physical loss or damage to the Facilities at the Site, occurring prior to Completion of the Facilities, with an extended maintenance coverage for the Contractor's liability in respect of any loss or damage occurring during the Defects Liability Period while the Contractor is on the Site for the purpose of performing its obligations during the Defects Liability Period.
 - Third Party Liability Insurance: - Covering bodily injury or death suffered by third parties (including the Owner's personnel) and loss of or damage to property occurring in connection with the supply and installation of the Facilities.
 - Automobile Liability Insurance:-Covering use of all vehicles used by the Contractor or its Subcontractors (whether or not owned by them) in connection with the execution of the Contract.
 - Workers' Compensation:-In accordance with the statutory requirements applicable in any country where the Contract or any part thereof is executed.
 - Owner's Liability: - In accordance with the statutory requirements applicable in any country where the Contract or any part thereof is executed.
 - Other Insurances Such other insurances as may be specifically agreed upon by the parties.
- b) The Owner shall be named as co-insured under all insurance policies taken out by the Contractor pursuant except for the Third Party Liability, Workers' Compensation and Owner's Liability Insurances, and the Contractor's Subcontractors shall be named as co-insured's under all insurance policies taken out by the Contractor except for the Cargo Insurance During Transport, Workers' Compensation and Owner's Liability Insurances. All insurers' rights of subrogation against such co-insured's for losses or claims arising out of the performance of the Contract shall be waived under such policies.
- c) The Form of Contract Agreement, deliver to the Owner certificates of insurance (or copies of the insurance policies) as evidence that the required policies are in full force and effect. The certificates shall provide that no less than twenty one (21) days' notice shall be given to the Owner by insurers prior to cancellation or material modification of a policy.
- d) The Contractor shall ensure that, where applicable, its Subcontractor(s) shall take out and maintain in effect adequate insurance policies for their personnel and vehicles and for work executed by them under the Contract, unless such Subcontractors are covered by the policies taken out by the Contractor.
- e) The Owner shall at its expense take out and maintain in effect during the performance of the Contract those insurances specified.
- f) the Owner may take out and maintain in effect any such insurances and may from time to time deduct from any amount due the Contractor under the Contract any premium that the Owner shall have paid to the insurer, or may otherwise recover such amount as a debt due from the Contractor. If the Owner fails to take out and/or maintain in effect the insurances the Contractor may take out and maintain in effect any such insurances and may from time to time deduct from any amount due the Owner under the Contract any premium that the Contractor shall have paid to the insurer, or may otherwise recover such amount as a debt due from the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 46-	30.09.2015.

Owner. If the Contractor fails to or is unable to take out and maintain in effect any such insurances, the Contractor shall nevertheless have no liability or responsibility towards the Owner, and the Contractor shall have full recourse against the Owner for any and all liabilities of the Owner herein.

- g) The Owner shall give to the Contractor all such reasonable assistance as may be required by the Contractor. With respect to insurance claims in which the Owner's interest is involved, the Contractor shall not give any release or make any compromise with the insurer without the prior written consent of the Owner. With respect to insurance claims in which the Contractor's interest is involved, the Owner shall not give any release or make any compromise with the insurer without the prior written consent of the Contractor.
- h) Wherever total damages/loss of equipments/materials, would occur, the Contractor will be entitled to payment of all payments received from the underwriters except the following amounts:
 - The amount paid to the Contractor under the Contract in respect of equipments/materials damaged/lost (excluding the pro-rata initial advance) but including the entire amount of escalation, if any, already paid to the Contractor.
 - Custom Duties and taxes which have already been paid by the Owner.
 - In case of damage to any equipments/materials during any stage, the Contractor upon rectification of the damaged equipment to the satisfaction of the Owner shall be paid to the extent of full claims settled by the underwriters.
- i) All the Plants & Equipment being supplied by the Owner free of cost for installation of the equipment, cabling, earthing and lightning protection etc. by the Contractor, covered by this specification shall be kept insured by the Contractor against loss, damage, theft, pilferage, fire etc. from the point of unloading at Site up to the time of taking over by the Owner including handling, in plant transportation, storage, installation, testing and commissioning, etc. and the Contractor shall be fully responsible for making good of any loss or damage at his own cost within a reasonable time as mutually agreed upon by the Owner and the Contractor. Any loss/damage shall be brought to the Owner's notice immediately. The premium paid by the Contractor to the Insurance Company for such insurance shall be reimbursed by the Owner to the Contractor at actual against documentary proof to be furnished by the Contractor. The Contractor shall obtain competitive quotation for such insurance and shall take prior approval from the Owner before taking the insurance. The insurable value of the equipment being procured by the Owner will be intimated to the Contractor for the purpose of insurance.
 - It will be the responsibility of the Contractor to lodge, pursue and settle all claims with the Insurance Company in case of any damage, loss, theft, pilferage, fire, etc. and the Owner shall be kept informed about it. The losses, if any, will have to be borne by the Contractor, if the claims are not lodged and pursued properly or in the time or if the same are not settled by the Insurance Company.

4.40 Change in Laws & Regulation

- a) If, after the date [seven (7)] days prior to the date of Bid submission, in India, any law, regulation, ordinance, order or by-law having the force of law is enacted, promulgated, abrogated or changed (which shall be deemed to include any change in interpretation or application by the competent authorities) that subsequently affects the costs and expenses of the Contractor and/or the Time

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 47-	30.09.2015.

for Completion, the Contract Price shall be correspondingly increased or decreased, and/or the Time for Completion shall be reasonably adjusted to the extent that the Contractor has thereby been affected in the performance of any of its obligations under the Contract. However, these adjustments would be restricted to direct transactions between the Owner and the Contractor and not on procurement of raw materials, intermediary components etc. by the Contractor. Notwithstanding the foregoing, such additional or reduced costs shall not be separately paid or credited if the same has already been accounted for in the price adjustment provisions wherever applicable.

4.41 Force Majeure

- (a) Force Majeure" shall mean any event beyond the reasonable control of the Owner or of the Contractor, as the case may be, and which is unavoidable notwithstanding the reasonable care of the party affected. Force Majeure events include Acts of God, Acts of Government, war, sabotage, riots, civil commotion, revolution, flood, earthquake, cyclone, fire, epidemic etc.
- (b) If either party is prevented, hindered or delayed from or in performing any of its obligations under the Contract by an event of Force Majeure, then it shall notify the other in writing of the occurrence of such event and the circumstances thereof within *[fourteen (14)]* days after the occurrence of such event.
- (c) The party who has given such notice shall be excused from the performance or punctual performance of its obligations under the Contract for so long as the relevant event of Force Majeure continues and to the extent that such party's performance is prevented, hindered or delayed.
- (d) The party or parties affected by the event of Force Majeure shall use reasonable efforts to mitigate the effect thereof upon its or their performance of the Contract and to fulfil its or their obligations under the Contract, but without prejudice to either party's right.
- (e) No delay or non-performance by either party hereto caused by the occurrence of any event of Force Majeure shall
 - constitute a default or breach of the Contract
 - to any claim for damages or additional cost or expense occasioned thereby
 if and to the extent that such delay or non-performance is caused by the occurrence of an event of Force Majeure.
- (f) If the performance of the Contract is substantially prevented, hindered or delayed for a single period of more than *[sixty (60)]* days or an aggregate period of more than one hundred and *[twenty (120)]* days on account of one or more events of Force Majeure during the currency of the Contract, the parties will attempt to develop a mutually satisfactory solution.
- (g) Force Majeure shall not apply to any obligation of the Owner to make payments to the Contractor herein.

4.42 Change in the Facilities

(a) Introducing a Change

- The Owner shall have the right to propose, and subsequently require, the Contractor during the performance of the Contract to make any change, modification, addition or deletion to, in or from the Facilities (hereinafter called "Change"), provided that such Change falls within the general scope of the Facilities and does not constitute unrelated work and that it is technically practicable, taking into account both the state of advancement of the Facilities

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 48-	30.09.2015.

and the technical compatibility of the Change envisaged with the nature of the Facilities as specified in the Contract.

- The Contractor may from time to time during its performance of the Contract propose to the Owner (with a copy to the Project Manager) any Change that the Contractor considers necessary or desirable to improve the quality, efficiency or safety of the Facilities. This includes any additional scope of work that the contractor thinks is essential for achieving the minimum performance level specified in the SCC or the Contract. The Owner may at its discretion approve or reject any Change proposed by the Contractor.
- No change made necessary because of any default of the Contractor in the performance of its obligations under the Contract shall be deemed to be a Change, and such change shall not result in any adjustment of the Contract Price or the Time for Completion.

(b) Changes Originating from Owner

- If the Owner proposes a Change, it shall send to the Contractor a "Request for Change Proposal," requiring the Contractor to prepare and furnish to the Project Manager as soon as reasonably practicable a "Change Proposal," which shall include the following:
 - ✓ brief description of the Change
 - ✓ effect on the Time for Completion
 - ✓ estimated Cost of the Change
 - ✓ effect on Functional Guarantees (if any)
 - ✓ effect on any other provisions of the Contract.
- The pricing of any Change shall, as far as practicable, be calculated in accordance with the rates and prices included in the Contract. If the rates and prices of any change are not available in the Contract, the parties thereto shall agree on specific rates for the valuation of the Change.
- If before or during the preparation of the Change Proposal it becomes apparent that the aggregate effect of compliance therewith and with all other Change Orders that have already become binding upon the Contractor to increase or decrease the Contract Price as originally set forth in the Contract Agreement by more than fifteen (15) percent, the Contractor may give a written notice of objection thereto prior to furnishing the Change Proposal as aforesaid. If the Owner accepts the Contractor's objection, the Owner and the Contractor shall agree on specific rates for valuation of the change.
- Upon receipt of the Change Proposal, the Owner and the Contractor shall mutually agree upon all matters therein contained including agreement on rates if such rates are not available in the Contract or if the limit of 15% set forth has been exceeded. Within *fourteen (14)* days after such agreement, the Owner shall, if it intends to proceed with the Change, issue the Contractor with a Change Order.
- If the Owner is unable to reach a decision within *fourteen (14)* days, it shall notify the Contractor with details of when the Contractor can expect a decision.
- If the Owner decides not to proceed with the Change for whatever reason, it shall, within the said period of *fourteen (14)* days, notify the Contractor accordingly.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 49-	30.09.2015.

- If the Owner and the Contractor cannot reach agreement on the price for the Change, an equitable adjustment to the Time for Completion, or any other matters identified in the Change Proposal, the Owner may nevertheless instruct the Contractor to proceed with the Change by issue of a "Pending Agreement Change Order."

Upon receipt of a Pending Agreement Change Order, the Contractor shall immediately proceed with effecting the Changes covered by such Order. The parties shall thereafter attempt to reach agreement on the outstanding issues under the Change Proposal.

(c) Changes Originating from Contractor

- The Contractor shall submit to the Project Manager a written "Application for Change Proposal," giving reasons for the proposed Change and including the information. Upon receipt of the Application for Change Proposal, the parties shall follow the procedures indicated above for "Request for Change Proposal."

4.43 Extension of Time for Completion

- (a) The Time(s) for Completion specified in the SCC shall be extended if the Contractor is delayed or impeded in the performance of any of its obligations under the Contract by reason of any of the following:

- Any Change in the Facilities or
- any occurrence of Force Majeure or
- any suspension order given by the Owner or reduction in the rate of progress or
- any changes in laws and regulations or
- any default or breach of the Contract by the Owner, or any activity, act or omission of any other contractors employed by the Owner or
- any other matter specifically mentioned in the Contract;

By such period as shall be fair and reasonable in all the circumstances and as shall fairly reflect the delay or impediment sustained by the Contractor.

- (b) Except where otherwise specifically provided in the Contract, the Contractor shall submit to the Project Manager a notice of a claim for an extension of the Time for Completion, together with particulars of the event or circumstance justifying such extension as soon as reasonably practicable after the commencement of such event or circumstance. As soon as reasonably practicable after receipt of such notice and supporting particulars of the claim, the Owner and the Contractor shall agree upon the period of such extension.
- (c) The Contractor shall at all times use its reasonable efforts to minimize any delay in the performance of its obligations under the Contract.

4.44 Suspension

- (a) The Owner/ Project Manager may, by notice to the Contractor, order the Contractor to suspend performance of any or all of its obligations under the Contract. Such notice shall specify the obligation of which performance is to be suspended, the effective date of the suspension and the reasons thereof. The Contractor shall thereupon suspend performance of such obligation (except those obligations necessary for the care or preservation of the Facilities) until ordered in writing to resume such performance by the Project Manager/ Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 50-	30.09.2015.

If, by virtue of a suspension order given by the Project Manager/ Owner, other than by reason of the Contractor's default or breach of the Contract, the Contractor's performance of any of its obligations is suspended for an aggregate period of more than *[ninety (90)]* days, then at any time thereafter and provided that at that time such performance is still suspended, the Contractor may give a notice to the Project Manager requiring that the Owner shall, within *[twenty eight (28)]* days of receipt of the notice, order the resumption of such performance or request and subsequently order a change, excluding the performance of the suspended obligations from the Contract.

- (b) If the Contractor is unable to carry out any of its obligations under the Contract for any reason attributable to the Owner, including but not limited to the Owner's failure to provide possession of or access to the Site or other areas;

Then the Contractor may by *[fourteen (14)]* days' notice to the Owner suspend performance of all or any of its obligations under the Contract, or reduce the rate of progress. If the Contractor's performance of its obligations is suspended or the rate of progress is reduced, then the Time for Completion shall be extended, and any and all additional costs or expenses incurred by the Contractor as a result of such suspension or reduction shall be paid by the Owner to the Contractor in addition to the Contract Price, except in the case of suspension order or reduction in the rate of progress by reason of the Contractor's default or breach of the Contract.

- (c) During the period of suspension, the Contractor shall not remove from the Site any Plant and Equipment, any part of the Facilities or any Contractor's Equipment, without the prior written consent of the Owner.

4.45 Termination

(a) Termination for Owner's Convenience

The Owner may at any time terminate the Contract for any reason by giving the Contractor a notice of termination. Upon receipt of the notice of termination, the Contractor shall either immediately or upon the date specified in the notice of termination

- (i) cease all further work, except for such work as the Owner may specify in the notice of termination for the sole purpose of protecting that part of the Facilities already executed, or any work required to leave the Site in a clean and safe condition.
- (ii) terminate all subcontracts, except those to be assigned
- (iii) remove all Contractor's Equipments from the Site, repatriate the Contractor's and its Subcontractors' personnel from the Site, remove from the Site any wreckage, rubbish and debris of any kind, and leave the whole of the Site in a clean and safe condition
- (iv) The Contractor, subject to the payment, shall
 - ✓ deliver to the Owner the parts of the Facilities executed by the Contractor up to the date of termination
 - ✓ to the extent legally possible, assign to the Owner all right, title and benefit of the Contractor to the Facilities and to the Plant and Equipments as at the date of termination, and, as may be required by the Owner, in

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 51-	30.09.2015.

any subcontracts concluded between the Contractor and its Subcontractors

- ✓ Deliver to the Owner all non-proprietary drawings, specifications and other documents prepared by the Contractor or its Subcontractors as at the date of termination in connection with the Facilities.

In the event of termination of the Contract for Owner's convenience, the Owner shall pay to the Contractor the following amounts

- ✓ the Contract Price, attributable to the parts of the Facilities executed by the Contractor as on the date of termination
- ✓ the costs reasonably incurred by the Contractor in the removal of the Contractor's Equipment from the Site and in the repatriation of the Contractor's and its Subcontractors' personnel
- ✓ any amounts to be paid by the Contractor to its Subcontractors in connection with the termination of any subcontracts, including any cancellation charges
- ✓ costs incurred by the Contractor in protecting the Facilities and leaving the Site in a clean and safe condition
- ✓ the additional cost of satisfying other obligations, commitments and claims that the Contractor may in good faith have undertaken with third parties in connection with the Contract.

(b) Termination for Contractor's Default

- (i) The Owner, without prejudice to any other rights or remedies it may possess, may terminate the Contract forthwith in the following circumstances by giving a notice of termination and its reasons thereof to the Contractor:

- If the Contractor becomes bankrupt or insolvent, has a receiving order issued against it, compounds with its creditors, or, if the Contractor is a corporation, a resolution is passed or order is made for its winding up (other than a voluntary liquidation for the purposes of amalgamation or reconstruction), a receiver is appointed over any part of its undertaking or assets, or if the Contractor takes or suffers any other analogous action in consequence of debt
- If the Contractor assigns or transfers the Contract or any right or interest therein in violation of the provision.
- If the Contractor, in the judgement of the Owner has engaged in corrupt or fraudulent practices in competing for or in executing the Contract.

For the purpose of this Sub Clause:

"corrupt practice" means the offering, giving, receiving or soliciting of anything of value to influence the action of a public official in the procurement process or in contract execution.

"fraudulent practice" means a misrepresentation of facts in order to influence a procurement process or the execution of a contract to the detriment of the Owner and includes collusive practice among Bidders (prior to or after bid submission) designed to establish bid prices at

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 52-	30.09.2015.

artificial non-competitive levels and to deprive the Owner of the benefits of free and open competition.

(ii) If the Contractor

- has abandoned or repudiated the Contract
- has without valid reason failed to commence work on the Facilities promptly the progress of Contract performance for more than **[twenty eight (28)]** days after receiving a written instruction from the Owner to proceed
- persistently fails to execute the Contract in accordance with the Contract or persistently neglects to carry out its obligations under the Contract without just cause
- refuses or is unable to provide sufficient materials, services or labor to execute and complete the Facilities in the manner specified in the program at rates of progress that give reasonable assurance to the Owner that the Contractor can attain Completion of the Facilities by the Time for Completion as extended

then the Owner may, without prejudice to any other rights it may possess under the Contract, give a notice to the Contractor stating the nature of the default and requiring the Contractor to remedy the same. If the Contractor fails to remedy or to take steps to remedy the same within **[fourteen (14)]** days of its receipt of such notice, then the Owner may terminate the Contract forthwith by giving a notice of termination to the Contractor.

(iii) The Contractor shall, either immediately or upon such date as is specified in the notice of termination,

- cease all further work, except for such work as the Owner may specify in the notice of termination for the sole purpose of protecting that part of the Facilities already executed, or any work required to leave the Site in a clean and safe condition
- terminate all subcontracts, except those to be assigned to the Owner pursuant to paragraph (d) below
- deliver to the Owner the parts of the Facilities executed by the Contractor up to the date of termination
- to the extent legally possible, assign to the Owner all right, title and benefit of the Contractor to the Works and to the Plant and Equipment as at the date of termination, and, as may be required by the Owner, in any subcontracts concluded between the Contractor and its Subcontractors
- Deliver to the Owner all drawings, specifications and other documents prepared by the Contractor or its Subcontractors as at the date of termination in connection with the Facilities.

(iv) The Owner may enter upon the Site, expel the Contractor, and complete the Facilities itself or by employing any third party. The Owner may, to the exclusion of any right of the Contractor over the same, take over and use with the payment of a fair rental rate to the Contractor, with all the maintenance costs to the account of the Owner and with an indemnification by the Owner for all liability including damage or injury to persons arising out of the Owner's use of such equipment, any Contractor's Equipments

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 53-	30.09.2015.

owned by the Contractor and on the Site in connection with the Facilities for such reasonable period as the Owner considers expedient for the supply and installation of the Facilities.

Upon completion of the Facilities or at such earlier date as the Owner thinks appropriate, the Owner shall give notice to the Contractor that such Contractor's Equipment will be returned to the Contractor at or near the Site and shall return such Contractor's Equipments to the Contractor in accordance with such notice. The Contractor shall thereafter without delay and at its cost remove or arrange removal of the same from the Site.

- (v) The Contractor shall be entitled to be paid the Contract Price attributable to the Facilities executed as at the date of termination, the value of any unused or partially used Plant and Equipments on the Site, and the costs, if any, incurred in protecting the Facilities and in leaving the Site in a clean and safe condition. Any sums due to the Owner from the Contractor accruing prior to the date of termination shall be deducted from the amount to be paid to the Contractor under this Contract.
- (vi) If the Owner completes the Facilities, the cost of completing the Facilities by the Owner shall be determined.

If the sum that the Contractor is entitled to be paid, plus the reasonable costs incurred by the Owner in completing the Facilities, exceeds the Contract Price, the Contractor shall be liable for such excess.

The Owner and the Contractor shall agree, in writing, on the computation described above and the manner in which any sums shall be paid.

(c) Termination by Contractor

- i. If
 - the Owner has failed to pay the Contractor any sum due under the Contract within the specified period, has failed to approve any invoice or supporting documents without just cause pursuant to [-----] (Terms and Procedures of Payment) of the Form of Contract Agreement, or commits a substantial breach of the Contract, the Contractor may give a notice to the Owner that requires payment of such sum, requires approval of such invoice or supporting documents, or specifies the breach and requires the Owner to remedy the same, as the case may be. If the Owner fails to pay such sum, fails to approve such invoice or supporting documents or give its reasons for withholding such approval, fails to remedy the breach or take steps to remedy the breach within **[fourteen (14) days]** after receipt of the Contractor's notice, or
 - the Contractor is unable to carry out any of its obligations under the Contract for any reason attributable to the Owner, including but not limited to the Owner's failure to provide possession of or access to the Site or other areas or failure to obtain any governmental permit necessary for the execution and/or completion of the Facilities which the Owner is required to obtain as per provision of the Contract or as per relevant applicable laws of the country,
- then the Contractor may give a notice to the Owner thereof, and if the Owner has failed to pay the outstanding sum, to approve the invoice or

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 54-	30.09.2015.

supporting documents, to give its reasons for withholding such approval, or to remedy the breach within *[twenty eight (28) days]* of such notice, or if the Contractor is still unable to carry out any of its obligations under the Contract for any reason attributable to the Owner within twenty eight (28) days of the said notice.

then the Contractor may terminate the Contract forthwith by giving a notice of termination to the Owner.

- ii. If the Owner becomes bankrupt or insolvent, has a receiving order issued against it, compounds with its creditors, or, being a corporation, if a resolution is passed or order is made for its winding up (other than a voluntary liquidation for the purposes of amalgamation or reconstruction), a receiver is appointed over any part of its undertaking or assets, or if the Owner takes or suffers any other analogous action in consequence of debt, then the Contractor may terminate the Contract forthwith by giving a notice of termination to the Owner,.
 - iii. If the Contract is terminated, then the Contractor shall immediately
 - cease all further work, except for such work as may be necessary for the purpose of protecting that part of the Facilities already executed, or any work required to leave the Site in a clean and safe condition
 - terminate all subcontracts, except those to be assigned to the Owner pursuant to paragraph (d)(ii)
 - remove all Contractor's Equipment from the Site and repatriate the Contractor's and its Subcontractor's personnel from the Site
 - In addition, the Contractor, subject to the payment, shall
 - ✓ deliver to the Owner the parts of the Facilities executed by the Contractor up to the date of termination
 - ✓ to the extent legally possible, assign to the Owner all right, title and benefit of the Contractor to the Facilities and to the Plant and Equipments as of the date of termination, and, as may be required by the Owner, in any subcontracts concluded between the Contractor and its Subcontractors
 - ✓ Deliver to the Owner all drawings, specifications and other documents prepared by the Contractor or its Subcontractors as of the date of termination in connection with the Facilities.
 - iv. If the Contract is terminated, the Owner shall pay to the Contractor all payments, and reasonable compensation for all loss or damage sustained by the Contractor arising out of, in connection with or in consequence of such termination.
- (d) The expression "Facilities executed" shall include all work executed, Erection Services provided, any all Plant and Equipments acquired (or subject to a legally binding obligation to purchase) by the Contractor and used or intended to be used for the purpose of the Facilities, up to and including the date of termination.
- (e) In calculating any payment due from the Owner to the Contractor, account shall be taken of any sum previously paid by the Owner to the Contractor under the Contract, including any advance payment paid.

5 SPECIAL CONDITIONS OF CONTRACT (SCC)

5.1 Contract Details

- **Name of Contract:** Renovation & Modernization of Turbo Generator & Auxiliaries Package for [-----]
- **Bid Document No. :** [-----]
- **The Owner is:**
 - Name of Owner: [-----]
 - Address of Owner: [-----]
 - Telephone No. : [-----]
 - Fax No: [-----]
 - E-Mail: [-----]
- **The Project Manager is:**
 - Name of Project Manager: [-----]
 - Address of Project Manager: [-----]
 - Telephone No. : [-----]
 - Fax No: [-----]
 - E-Mail: [-----]

5.2 Effective Date

The Owner shall inform the successful Bidder of its acceptance of the Tender by a formal Letter of Acceptance. This Letter of Acceptance will be the Effective Date for determining the Time for Completion of the facilities and other milestones for execution of the Renovation & Modernization work as per the scope of work under this tender by the Contractor.

The following three activities will be completed within **[two (2)]** months from the date of Letter of Acceptance:

(a) The contract agreement will be executed by the Owner and the Contractor. (b) The Contractor will submit to the Owner the Contract Performance Bank Guarantee, any Additional Contract Performance Bank Guarantee by assignee, JV Partner, Consortium Member etc if applicable, and the Advance Payment Bank Guarantee.

(c) The Owner will pay the Contractor the Advance Payment as per the Terms of Payment.

The Owner will make the advance payment promptly once Contractor has fulfilled the necessary conditions specified in Terms of Payment. If payment of Advance is delayed beyond two months from the date of Letter of acceptance for reasons attributable to the Owner, the date of payment of advance shall be the effective date for determining the time for completion of facilities. However, failure of the contractor to provide all the required Bonds/Guarantees within the prescribed period will cause the Bid Security to be forfeited.

5.3 Time for Commencement and Completion

The Time Schedule for the execution of the scope of work by the Contractor under this tender and commencement of unit shut down by Owner shall be as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 57-	30.09.2015.

1.	Time for completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network	By [.....] months from Effective Date
2.	Time for Commencement (by Owner) of Unit Shut Down. (Note: In case Contractor fails to complete the engineering, supply and mobilization activities as at serial no.1, Owner may, at its discretion, reschedule commencement of unit shut down	By [.....] months from Effective Date
3.	Time for Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender	By [.....] days from start of unit shut down
4.	Performance Guarantee Test (By Contractor)	By [.....] months from the completion of trial operation after completion of R&M activities

5.4 Liquidated Damage for Delay

5.5 Rate of Liquidated Damage for Delay

If the Contractor fails to successfully achieve completion of R&M activities and commissioning of the retrofitted facilities as per the scope of work within the time period specified in SCC, the Contractor shall pay to the Owner amount calculated as per the rates given in the following table as Liquidated Damage and not as penalty.

1.	Delay in completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network	Liquidated Damage payable at the rate Rs.[.....] for each week of delay
2.	Delay in Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender	Liquidated Damage payable at the rate Rs [.....] for each day of delay

The Liquidated Damage for Delay in completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network and Liquidated Damage for Delay in Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender are independent and shall be applied separately.

5.6 Liquidated Damage for Non-fulfillment of Functional Guarantees

If the Contractor fails to successfully achieve the Functional Guarantees during Performance Guarantee Test as per the Tender Specification, the Contractor shall pay

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 58-	30.09.2015.

to the Owner amount calculated as per the rates given in the following table as Liquidated Damage and not as penalty.

Sl. No.	Functional Guarantee Parameter	Rate of Liquidated Damage
1	Gross Output of each unit	[.....] INR per kW shortfall
2	Turbine Cycle Heat Rate	[.....] INR per kCal/kWhr increase
3	Condenser Pressure (mm of Hg)	[.....] INR per mm HG increase in Condenser Pressure
4	Auxiliary Power in kW	[.....] INR per kW increase

The reference condition for Performance Guarantee Parameters shall be as per Volume-II Technical Specification.

The Liquidated Damage for non-fulfillment of the different Functional Guarantee Parameters are independent of one another and shall be applied separately.

{Note: The rate of LD for any Functional Guarantee Parameter shall be at least 1.5 times the corresponding Bid Evaluation Factor}

5.7 Maximum Leviable Liquidated Damages

The amount of Liquidated Damage for delay shall be limited to a maximum of 10 % of the total contracts price (i.e. sum of Ist, IInd and IIIrd)contracts, as applicable) price including price variation as per the provisions of the contract and excluding price of Mandatory Spares. This limit is applicable for the Liquidated Damage for Delay in completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network and Liquidated Damage for Delay in Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender taken together.

The aggregate amount of **Liquidated Damage for non-fulfilment of functional guarantee shall be limited to** a maximum of 10 % of the total contracts price (i.e. sum of Ist, IInd and IIIrd)contracts, as applicable) price including price variation as per the provisions of the contract and excluding price of Mandatory Spares.

The limit on maximum leviable Liquidated Damage for Delay and maximum leviable Liquidated Damage for non-fulfillment of functional guarantee are independent of each other and shall apply separately.

5.8 Contract Price

- The Contract Price shall be as (Contract Price and Terms of Payment) of the Form of Contract Agreement.
- The Contractor shall be deemed to have satisfied itself as to the correctness and sufficiency of the Contract Price, which shall, except as otherwise provided for in the Contract, cover all its obligations under the Contract.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 59-	30.09.2015.

5.9 Terms of Payment

- a) The Contract Price shall be paid as Terms and Procedures of Payment to the Form of Contract Agreement. The procedures to be followed in making application.
- b) No payment made by the Owner herein shall be deemed to constitute acceptance by the Owner of the Facilities or any part(s) thereof.
- c) The currency or currencies in which payments are made to the Contractor under this Contract to the Form of Contract Agreement, subject to the general principle that payments will be made in the currency or currencies in which the Contract Price has been stated in the Contractor's bid.

5.10 Bank Guarantees

- a) The Contractor shall provide the Bank Guarantees specified below in favour of the Owner at the times, and in the amount, manner and form specified below.
- b) Advance Payment Bank Guarantee
 - The Contractor shall, within [thirty (30)] days of the Notification of Contract Award, provide a security for an amount equal to the advance payment, and in the same currency or currencies, with a initial validity of up to [ninety (90)] days beyond the date of Completion of Facilities.
 - The security shall be in the form of an Unconditional Bank Guarantee. The Advance payment Bank Guarantee shall be reduced prorata every three (3) months after First Running Account Bill/Stage Payment under the Contract based on the value of equipment/facilities received. The cumulative amount of reduction at any point of time shall not exceed ninety percent (90%) of the advance corresponding to cumulative value of the Facilities supplied and received as per a certificate issued by the Project Manager and the balance of 10% shall be released on Completion of those Facilities. It should be clearly understood that reduction in the value of security for advance shall not in any way dilute the Contractor's responsibility and liabilities under the Contract including in respect of the Facilities for which the reduction in the value of security is allowed.
- c) Performance Bank Guarantee
 - The Contractor shall, within [twenty-eight (28)] days of the notification of award, provide a Bank Guarantee for the due performance of the Contract for ten percent (10%) of the Contract Price with an initial validity upto [ninety (90)] days beyond the Defects Liability Period. If the Owner enters into the Contract with the Assignee of a foreign Contractor, the said Assignee, in addition to the Contract Performance Bank Guarantee to be provided by the Contractor for ten percent (10%) of the value of all the Contracts shall provide within [thirty (30)] days of the Notification of Award, a separate Contract Performance Bank Guarantee equivalent to five percent (5%) of the value of Contract entered into with the assignee (i.e. five percent of the aggregate value of the component Contracts entered to with the Assignee) , for the due performance of Contract with an initial validity up to [Ninety (90)] days beyond the Defects Liability Period.
 - If the bidder is a joint venture of two firms who collectively meet the Qualifying Requirement, in addition to the Contract Performance Guarantee (CPBG) of 10% furnished by the bidder, each of the JV partner shall furnish Additional Contract Performance Guarantee equal to 1% of Contract Price. To clarify further, in such a case, the value of Contract Performance Bank Guarantee furnished by the Bidder and Additional Contract Performance Bank Guarantee furnished by the JV partners taken together shall be 12% of the Contract Price.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 60-	30.09.2015.

- If the bidder is a Consortium of two firms, in addition to the Contract Performance Guarantee (CPBG) of 10% furnished by the Consortium Leader, the other consortium member will furnish Additional Contract Performance Bank Guarantee equal to 2% of Contract Price. To clarify further, in such a case, the value of Contract Performance Bank Guarantee furnished by the Bidder (Consortium Leader) and Additional Contract Performance Bank Guarantee furnished by the other consortium member taken together shall be 12% of the Contract Price.
- d) The performance Bank Guarantees shall be denominated in the currency or currencies of the Contract, or in a freely convertible currency acceptable to the Owner.

Form of Contract Agreement

THIS CONTRACT AGREEMENT is made the _____day of _____, 20_____.
 BETWEEN (1) [Name of Employer], a corporation incorporated under the laws of [country of Employer] and having its principal place of business at [address of Employer] (hereinafter called “the Employer”), and (2) [name of Contractor], a corporation incorporated under the laws of [country of Contractor] and having its principal place of business at [address of Contractor] (hereinafter called “the Contractor”)

WHEREAS the Employer desires to engage the Contractor to dismantle/disassemble, design, manufacture, test, deliver, install, complete and commission certain Facilities, viz.

[.....]
 [.....]
 [.....]

(“the Facilities”) and the Contractor have agreed to such engagement upon and subject to the terms and conditions hereinafter appearing.

NOW IT IS HEREBY AGREED as follows:

1.1 Contract Documents

a) Contract Documents means this signed Contract agreement and its annexure/appendices, and the complete documents, which are the basis of finalization of the contract, including correspondence exchanged from issue of tender till date of signing the contract. The following will constitute the Contract Documents:

- i. The signed Contract Agreement & the annexure/ appendices thereto (highest precedence)
- ii. Letter of award.
- iii. Special Condition of Contract
- iv. General Condition of Contract
- v. Technical specification & Tender Drawing submitted by the contractor.
- vi. The bid & its schedules/ attachment.

a) All documents forming part of the Contract (and all parts thereof) are intended to be correlative, complementary and mutually explanatory. The Contract shall be read as a whole.

b) The Contract will be signed in three originals and the Contractor shall be provided with one signed original and the rest will be retained by the Employer.

1.2 Order of Precedence of Contract Documents

In case there is any ambiguity of conflict between different contract documents, the order of precedence shall be as follows:-

- i. The signed Contract Agreement & the annexure/ appendices thereto (highest precedence)
- ii. Letter of award.
- iii. Special Condition of Contract
- iv. General Condition of Contract
- v. Technical specification & Tender Drawing submitted by the contractor.
- vi. The bid & schedules/ attachment.

1.3 Definitions

The Definitions of terms and expressions shall be as per GCC clause 4.1. Terms and expressions not defined in GCC shall have the same meaning as are assigned to them in the Indian Sale of Goods Act (1930), failing that in the Indian Contract Act (1872) and failing that in the General Clauses Act (1897) including amendments thereof, if any.

1.4 Contract Price

The Employer hereby agrees to pay to the Contractor the Contract Price in consideration of the performance by the Contractor of its obligations hereunder:

The Contract Price shall be the aggregate of: [amount of foreign currency in words], [amount in figures], and [amount of local currency in words], [amount in figures], or such other sums as may be determined in accordance with the terms and conditions of the Contract.

1.5 Term of Payment

The terms and procedures of payment according to which the Employer will reimburse the Contractor are given in Contract Schedule 1 (Terms and Procedures of Payment) hereto.

1.6 Time for Commencement and Completion

The Time Schedule for the execution of the scope of work by the Contractor under this tender and commencement of unit shut down by Employer shall be as follows:

1.	Time for completion (by Contractor) of Engineering and Supply activities and other resources mobilization that are required to be completed before unit shut down as per L-2 network	By [.....] months from Effective Date
2.	Time for Commencement (by Employer) of Unit Shut Down. (Note: In case Contractor fails to complete the engineering, supply and mobilization activities as at serial no.1, Employer may, at its discretion, reschedule commencement of unit shut down	By [.....] months from Effective Date
3.	Time for Completion of all R&M activities that are to be carried out under unit shut down and subsequent commissioning activities including trial operation as per the scope of work under this tender	By [.....] days from start of unit shut down
4.	Performance Guarantee Test (By Contractor)	By [.....] months from the completion of trial operation after completion of R&M activities

The detailed Time Schedule shall be as per Contract Schedule 2.

Contract Schedules

The Contract Schedules listed in the attached list of Contract Schedules shall be deemed to form an integral part of this Contract Agreement.

Document Number	Rev No	Description	Page No.	Date of Issue

VI. Terms of Payment for Civil Works

1	10% of Total Price for Civil Works	Initial Advance on Acceptance of Letter of Award by the Contractor, Signing of Contract Agreement and submission of Contract Performance Bank Guarantee, Additional Contract Performance Bank Guarantee and Advance Payment Bank Guarantee by Contractor
2	75% of Price for Civil Works as progressive payment	On certification by Employer regarding value of work completed & successfully passing of quality checks
3	10% of Total Price for Civil Works	On Completion of Facilities
4	5% of Total Price for Civil Works	Successful completion of Performance Guarantee Test

VII. Terms of Payment for Price Adjustment Amount

Any increase in the Price of any component Contract shall be paid as per the Terms of Payment for base price. The initial 10% advance payment pertaining to increase in price shall be paid along with progressive payment of that equipment. Reduction to the Contract Price, if any, due to price adjustment provisions, shall be effected by recovering 100% of the reduction amount (including advance) from any of the Contractor's bills falling immediately due for payment.

VIII. Terms of Payment for Taxes & Duties

Any Tax or Duty payable by Employer as per the Terms & Conditions of Contract and is directly payable to Statutory Authorities/Government as per law shall be directly paid to the concerned authority or Government by the Employer. Any other Tax or Duty payable by Employer as per the Terms & Conditions of Contract shall be reimbursed to the Contractor/Assignee upon receipt of corresponding Plant & Equipment or Spare at site and submission of evidence by the Contractor/Assignee to the Employer as to the Contractor/Assignee having paid such Taxes & Duties.

IX. Terms of Payment for Statutory Variation in Taxes & Duties

Any amount towards statutory variation in Taxes & Duties payable by Employer as per the Terms & Conditions of Contract shall be reimbursed to the Contractor/Assignee upon submission of evidence by the Contractor/Assignee to the Employer as to the Contractor/Assignee having paid such variation.

Contract Schedule-2

PRICE ADJUSTMENT

- (i) The Contract Price shall be subject to price adjustment during performance of the Contract to reflect changes in the cost of labour and material in accordance with the provisions described below.
- (ii) Only following components of the Contract Price will be subject to Price adjustment :
 - (a) Ex-Works (India) price of plant and equipment excluding Mandatory Spares manufactured within India and FOB price component for plant and equipment excluding Mandatory spares supplied from abroad. The price adjustment amounts towards these price components shall be without any ceiling.
 - (b) Erection Services component of the Contract Price. The price adjustment amounts towards this price component shall be without any ceiling.
 - (c) Civil Works component of the Contract Price. The price adjustment amounts towards this price component shall be without any ceiling.
- (iii) Price adjustment amounts towards aforesaid components of Contract Price shall be paid in the respective currencies of Contract.
- (iv) The indices for price adjustment shall necessarily be of the country of origin of goods/labour and shall be well established and nationally recognized in that country. Preferably Government indices shall be used.
- (v) The price adjustment formula for the components of the Contract Price above shall be as stipulated hereinafter.
- (vi) **Ex-Works/FOB price component of Plant and Equipment excluding mandatory spares**

The price component of the equipment for any shipment/ dispatch comprises of a fixed portion (designated as 'F' and the value of which is specified hereunder) and a variable portion linked with the indices for various materials and labour.

The amount of price adjustment towards variable portion payable/recoverable on each shipment/dispatch shall be computed as under:

$$ES = ES_1 - ES_0$$

ES₁ will be computed as follows:

$$ES_1 = ES_0 \left\{ F + a \times \frac{A_1}{A_0} \times f_1 + b \times \frac{B_1}{B_0} \times f_2 + c \times \frac{C_1}{C_0} \times f_3 + Lb \times \frac{L_1}{L_0} \times f_{lb} \right\}$$

Where

ES = Adjustment to Ex-Works/FOB price component expressed in the currency of the Contract payable to the contractor for each shipment/dispatch

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-I, Annexure & Schedules-2	[8]	30.09.2015

- ES₁ = Adjusted amount of Ex-works/FOB price component expressed in the currency of the Contract payable to the Contractor for each shipment/dispatch
- ES₀ = Ex-works/FOB price for the plant and equipment in the currency of the Contract, shipment/dispatch wise.
- The fixed portion of the ex-works/FOB component of the Contract Price (F) shall be 0.15.
 - a, b, c etc. shall be co-efficient of major materials/items involved in the ex-works/FOB component of the Contract Price. The sum of these co-efficient shall be between 0.50 to 0.60.
 - A, B, C etc. shall be published price indices of corresponding major materials/items. Such indices shall necessarily be of the country of origin of goods.
 - 'Lb' shall be co-efficient for labour component in the ex-works/ FOB component of the Contract Price which shall be between 0.25 to 0.35.
 - 'L' shall be labour index.
 - Sum of all the material co-efficient and the labour co-efficient shall be 0.85.
- f₁, f₂, f₃, f_{lb} etc - f₁, f₂, f₃ etc. are Exchange rate correction factors for the respective materials and f_{lb} is the exchange rate correction factor for labour with reference to the currency of the country of origin of index and the respective contract currency, such that

$$f = \frac{Z_0}{Z_1}$$

where Z is the no. of units of the currency of the country of the origin of index, which is equivalent to one unit of the respective contract currency. The exchange rates to be used for calculation of factor 'f' shall be as per State Bank of India Bills Selling Exchange Rates.

For the indices(A, B, C etc.), subscript 'o' refers to indices as on 30 days prior to original scheduled date for opening of Part-I Bid.. For 'Z₀', subscript 'o' refers to value as on the date of opening of Part-I Bid.

Subscript '1' refers to indices/exchange rates as of:

(a) three months prior to the date of shipment/dispatch for labour, and

(b) six months prior to the date of shipment/dispatch for material.

In case of shipments/dispatches which are delayed beyond the schedule date of shipment/dispatch for reasons attributable to the Contractor, the price adjustment provision shall not be applicable for the period of time between the schedule date of shipment/dispatch and the actual date of shipment/dispatch.

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-I, Annexure & Schedules-2	[9]	30.09.2015

The above formula for price adjustment will be applicable if the currency in which the contract price is expressed is different from the currency of the country of origin of labour and material indices. In other case, formula shall be applied without the exchange rate correction factor 'f'.

(vii) Erection Services Component

The price component for erection services comprises of a fixed portion and a variable portion linked with the index of labour.

The monthly price adjustment amount for the erection services component of the Contract Price will be computed separately for Indian currency and for foreign currency part, if any, related to expatriate supervision/labour as per the formula given below:

(a) Indian Rupee part of the Erection Services

$$ER = ER_1 - ER_0$$

ER₁ will be computed as follows:

$$ER_1 = ER_0 (0.15 + 0.85 \frac{FL_1}{FL_0})$$

Where:

ER	=	Adjustment to erection services component of contract price expressed in Indian Rupees payable to the contractor for each billing.
ER ₁	=	Adjusted amount of erection services component of Contract Price expressed in Indian Rupees payable to the Contractor.
ER ₀	=	Value of the Erection work done in the billing period (month)
FL	=	Indian field labour index namely, All India Consumer Price Index for Industrial Workers (All India Monthly Average) as published by Labour Bureau, Simla, Government of India.

(b) Foreign Currency portion of the Erection Services

$$EE = EE_1 - EE_0$$

EE₁ will be computed as follows:

$$EE_1 = EE_0 (0.15 + 0.85 \frac{EF_1}{EF_0} \times f)$$

Where:

EE	=	Adjustment to erection services component of Contract Price expressed in foreign currency payable to the contractor for each billing.
EE ₁	=	Adjusted amount of erection services component of Contract Price expressed in foreign currency payable to the contractor for each billing.
EE ₀	=	Value of foreign currency portion of Erection work done in the billing period (month)

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-I, Annexure & Schedules-2	[10]	30.09.2015

EF = Index for Expatriate field labour component of the Erection Price of Installation work. Such index shall necessarily be of the country of nationality of the labour.

f = Exchange rate correction factor for expatriate labour with reference to currency of country of origin of index for expatriate labour and the respective contract currency, such that

$$f = \frac{Z_0}{Z_1}$$

where Z is the no. of units of the currency of the country of origin of index, which is equivalent to one unit of the respective contract currency. The ex-change rates to be used for calculation of factor 'f' shall be as per State Bank of India Bills Selling Exchange.

For the indices, subscript 'o' refers to indices as on 30 days prior to date set for opening of bids. For 'Z₀', subscript 'o' refers to value as on the date of opening of Part-I Bid.

For the indices, subscript '1' refers to the indices as applicable for the month of execution of the erection work. For the exchange rates, subscript '1' refers to the exchange rates as applicable on the last day of the month of execution of the erection work.

In case of erection activities which are delayed beyond the schedule date for reasons attributable to the contractor, the price adjustment provision shall not be applicable for the period of time between the schedule date of completion and actual date of completion of the respective erection activity.

(viii) The following components of the contract price shall not be subject to price adjustment and shall remain firm during the execution of the contract :

- (1) Ocean Freight and Marine Insurance for Plant and Equipment, mandatory spares and recommended spares.
- (2) Ex-works/FOB price component for Mandatory spares & Recommended Spares.
- (3) Inland Transportation charges (including Inland Transit Insurance, port clearance, port handling & port charges) for plant & equipment and Spare Parts.

(ix) Civil Works Component

The Price of Civil Works for any month comprises a fixed part designated as 'F' and variable parts linked to indices for labour, steel, cement, other commodities and Fuel & Power. The monthly price adjustment amount for the civil works component of the Contract Price will be computed as per the formula given below:

$$EC = EC_1 - EC_0$$

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-I, Annexure & Schedules-2	[11]	30.09.2015

EC₁ will be computed as follows:

$$EC_1 = EC_0 \left\{ F + a \times \frac{MI_1}{MI_0} + b \times \frac{LI_1}{LI_0} + c \times \frac{FI_1}{FI_0} + d \times \frac{SI_1}{SI_0} + e \times \frac{CI_1}{CI_0} \right\}$$

Where

EC = Adjustment to Civil Works price component expressed in the currency of the Contract payable to the contractor for each month

EC₁ = Adjusted amount of Civil Works price component expressed in the currency of the Contract payable to the Contractor for each month

EC₀ = Value of Civil Works done expressed in the currency of the Contract for the billing period (month).

- The fixed portion (F) of the Civil Works component of the Contract Price shall be 0.15.

- 'a' is the coefficient for material cost other than cement and steel involved in the Civil Works component of the Contract Price and it shall be 0.15.

'b' is the coefficient for labour cost involved in the Civil Works component of the Contract Price and it shall be 0.3.

'c' is the coefficient for Fuel & Power cost involved in the Civil Works component of the Contract Price and it shall be 0.05.

'd' is the coefficient for steel cost involved in the Civil Works component of the Contract Price and it shall be 0.25.

'e' is the coefficient for cement cost involved in the Civil Works component of the Contract Price and it shall be 0.10.

- MI shall be All India Whole Sale Price Index for all commodities as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry.

LI shall be All India Consumer Price Index for industrial labour as published by Labour Bureau, Government of India

FI shall Index Number of Wholesale Price for group Fuel & Power as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry

SI shall Index Number of Wholesale Price for Steel as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry

CI shall Index Number of Wholesale Price for Cement as published by the Economic Adviser to Government of India, Ministry of Commerce & Industry

For the indices(MI, LI,FI, SI and CI), subscript 'o' refers to indices as on 30 days prior to original scheduled date for opening of Part-I Bid. Subscript '1' refers to indices as of one prior to the month for which Civil Works is being billed.

CONTRACT PERFORMANCE BANK GUARANTEE FORMAT

[To be furnished by Contractor]

[Bank Guarantee shall be executed on non-judicial stamp paper of appropriate value]

Place:

Bank Guarantee No:

Date:

To:

[Name & Address of Owner (Utility)]

.....]
.....]

Dear Sirs,

- 1 In consideration of the [.....] hereinafter referred to as the 'OWNER', which expression shall, unless repugnant to the context or meaning, thereof include its successors, representative and assignees, having awarded in favour of M/s.....[Contractor's Name] having its registered office at.....hereinafter referred to as the 'CONTRACTOR', which expression shall, unless repugnant to the context or meaning thereof include its successors, administrators, representatives and assignees, a Contract, hereinafter referred to as the "CONTRACT" for the.....on terms and conditions set out inter alia, in the OWNER's Contract/Letter of Award No.....dated.....as well as 'CONTRACT' documents, valued at [amount of foreign currency in words], [amount in figures], and [amount of local currency in words], [amount in figures] and the same having been unequivocally accepted by the CONTRACTOR and the CONTRACTOR having agreed to provide a **Contract Performance BANK Guarantee** for the faithful performance of the entire CONTRACT including the Warranty Obligations /Liabilities under the CONTRACT equivalent to 10% (ten percent) of the said value of the CONTRACT to OWNER amounting to Rs.....(Rupees.....only) as Contract Security in the form of a Bank Guarantee.

- 2 We,.....[Name & Address of Bank] and having its Head Office at....., hereinafter referred to as the 'Bank' which expression shall, unless repugnant to the context or meaning thereof, include its successors, administrators, representatives and assignees do hereby irrevocably guarantee and undertake to pay the OWNER merely on demand without any previous notice and without any demur and without referring to any other source, any and all monies payable by the CONTRACTOR by reason of any breach of the said CONTRACTOR of any of the terms and conditions of the said CONTRACT including non-execution of the 'CONTRACT AGREEMENT', to the extent of(%)..... of the Contract price to OWNER amounting to

Document Number	Rev No	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-I, Annexure & Schedules	[1]	25.09.2014

Rs.....(Rupees.....only). Any such demand made by the OWNER on the Bank shall be conclusive and binding, absolute and unequivocal notwithstanding any difference between the OWNER and CONTRACTOR or any dispute or disputes raised/ pending before any Court, Tribunal, Arbitrator or any other authority. The Bank agrees that the guarantee herein contained shall continue to be enforceable till this sum due to the OWNER is fully paid and claims satisfied or till the OWNER discharges this Guarantee.

- 3 The Bank further irrevocably guarantees and undertakes to pay any amount due and payable by the CONTRACTOR by reasons of non-fulfilment of any of the following obligations of the Contractor:
 - (a) Successful and satisfactory operation of the plant & equipment supplied and erected under the said Contract as per the Technical Specifications and other Tender/Contract documents.
 - (b) That the equipment installed under the said Contract shall be new and in accordance with Contract Documents and be free from all defects in design, engineering, material workmanship and performance for a period of 12 calendar months after final takeover of the equipment by the OWNER and that upon written notice from the OWNER, the CONTRACTOR shall remedy free of any expense to the OWNER, such defects as noticed and developed under the normal use of the said plant & equipment, within the said guarantee period.
- 4 The OWNER shall have the fullest liberty without affecting in any way the liability of the Bank under this guarantee, from time to time, to extend the time of Performance by the CONTRACTOR. The Bank shall not be released from its liabilities under these presents by any exercise of the OWNER of the liberty with reference to the matter aforesaid.
- 5 The OWNER shall have the fullest liberty, without affecting this guarantee to postpone from time to time the exercise of any powers vested in them or of any right which they might have against the CONTRACTOR and to exercise the same at any time in any manner, and either to enforce or to forbear to enforce any covenants, contained or implied in the CONTRACT between OWNER and the CONTRACTOR or any other course or remedy or security available to the OWNER and the Bank shall not be released of its obligations/liabilities under these presents by any exercise by the OWNER of his liberty with reference to the matters aforesaid or any of them or by reasons of any other act or forbearance or other acts of omission or commission on the part of the OWNER or any other indulgence shown by the OWNER or by any other matter or thing whatsoever which under law would, but for this provision, have the effect of relieving the Bank Guarantee. The Bank further undertakes not to revoke this guarantee during its currency without the previous consent of the OWNER.
- 6 The Bank further agrees that the decision of the OWNER as to the failure on the part of the CONTRACTOR to fulfill their obligations as aforesaid and/or as to the amount payable by the Bank to the OWNER hereunder shall be final, conclusive and binding on the Bank.
- 7 The OWNER shall have the fullest liberty to lodge their claim for encashment of the guaranteed sum either in full or part, in the manner suitable to them. However, payment made for a sum lesser than the guaranteed amount shall not relieve or discharge the bank from their obligations guaranteed under the bank guarantee, till the contractual obligations are fully performed by the Contractor or the Bank Guarantee is discharged by the OWNER, as the case may be and the Bank Guarantee shall continue to be in force till such time.
- 8 The Bank also agrees that the OWNER shall be entitled at his option to enforce this guarantee against the Bank as a Principal Debtor, in the first instance notwithstanding any other security or guarantee that it may have in relation to the CONTRACTOR's liabilities.

1 INTENT OF SPECIFICATION

- 1.1 This Project Specification is for the Renovation & Modernization of Unit No [..] of [Name of the Power Plant] located at [...], [District], [State]. The intent of this Specification is to Renovate and Modernize various equipment & systems of Turbo Generator and it's auxiliaries including but not limited to *[HP & LP bypass valve, HP & LP Heaters, Deaerator, Condenser, Boiler Feed Pump (BFP), Condensate Extraction Pump (CEP), Turbine Cycle Piping (Excluding Main Steam, Cold Reheat, Hot Reheat, Upstream & downstream piping of HP & LP Turbine bypass valve and Auxiliary Steam Piping), Valves and all associated Electrical system, Control & Instrumentation systems and associated Civil & Structural work]* as envisaged at Clause No. 4.6. The renovated Turbo Generator shall be capable of producing the output of *[210/215/220/250]* MW with the given steam/water parameters at the terminal point of Turbine as per Table:1.1 below:

Table: 1.1

Description	Units	Design Parameters
Steam Flow at Final ESV inlet	T / hr	[...]
Steam Pressure at ESV inlet	kg/cm ²	[...]
Steam Temperature at ESV inlet	deg C	[...]
Re-heater Flow	T / hr	[...]
Steam Pressure at IV inlet	kg/cm ²	[...]
Steam Temperature at IV inlet	deg C	[...]
Feed Water Flow	T / hr	[...]
CW flow to Condenser	m ³ /h	[...]
CW Temperature at Condenser Inlet	deg C	[...]
Allowable Temperature Rise across Condenser	deg C	[...]
Available CW pressure at condenser inlet	mwc	[...]
Allowable Pressure drop across condenser	mwc	[...]

- 1.2 The Bidder shall carry out the required replacement / refurbishment / retrofitting of the Turbo Generator & its Auxiliaries as per the requirements of his design so as to make the same capable of operating for an extended life of *[20/25]* years

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[1]	15.01.2016

and producing the output as mentioned in Clause No. 1.1 above with defined number of start-ups/shut down and stipulated steam parameters as delineated in Table-1.1. The scope of replacement / refurbishment / retrofitting shall include but shall not be limited to the scope of work mentioned at clause 4.6 which is based on the recommendation of RLA/CA and EA studies conducted during [.....]. However, any other items/systems which have not been specifically mentioned but are considered necessary by the Bidder for giving the intended performance of the Turbo Generator & its Auxiliaries, shall also be included in the scope of Bidder and shall be separately highlighted by the Bidder in his proposal.

- 1.3 Bidders are required to quote the performance guarantee values for Turbo Generator output, Turbine Cycle Heat Rate and the Auxiliary power consumption in response to the minimum performance parameters specified in the Table 1.2 below.

Table: 1.2

S.No.	Parameter	Performance Guarantee Values
1	Turbo Generator Output (MW)	[.....]
2	Turbine Cycle Heat Rate (kCal/kWh)	[.....]
3	Auxiliary Power Consumption (kW)	[.....]

Bidders to note that in case performance guarantee values quoted for Turbo Generator output is inferior to the minimum specified value, the bids will be considered as non responsive. In case of Turbine Cycle Heat Rate and Auxiliary power consumption, the best quoted value shall be considered as base parameter and other bids shall be cost loaded as per difference between base parameter and respective quoted guaranteed parameter multiplied by evaluation factors specified in the Commercial Volume (Volume-I).

- 1.4 The modified/replaced/retrofitted equipment will conform to the requirement of the Specification prescribed in Section-II of Volume-II. The relevant technical details like OEM's Specifications and Drawings for the existing equipment required to be modified / replaced / retrofitted have also been provided in Volume-II, Section-II for the reference of the Bidders.
- 1.5 Bidders are required to carry out necessary modifications / replacement in the existing mechanical / electrical /C&I equipment or systems including related civil/structural works as per Specification requirement and also based on their own assessment.
- 1.6 The scope of work for R&M shall include designing / re-designing, basic and detailed engineering, re-engineering, refurbishing / retrofitting, supply, inspection and testing at supplier's works, packing, forwarding to site, forwarding from site to Bidder's facilities, unloading and storage at site, pre-assembly, machining if required, site fabrication, erection, replacing of various equipment and systems,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[2]	15.01.2016

application of thermal insulation, carrying out all pre-commissioning checks/ tests and any other work required to complete the system, commissioning and trial operation, performance tests of various equipment and systems covered under this Specification. Bidder's scope shall also include dismantling of the existing equipment/ facilities, including unloading & transportation to designated storage / disposal yard, wherever required as a result of augmentation of existing mechanical, electrical, I&C and civil/structural/ architectural works. The Bidder shall restore the equipment/ facilities, whenever applicable, after carrying out necessary renovations/modifications under the scope of R&M works.

All the tools & tackles, labour and other facilities required for dismantling and restoration shall also be in the scope of the Bidder.

Bidder shall also put back into service all the systems/equipment of the units after completion of R&M works, whether any modification is carried out on the same or not. All necessary tools, tackles, labour, instruments, spares, consumables etc. required for putting back into operation shall also be provided by the Bidder.

- 1.7 It is not the intent to specify completely herein all aspects of services and equipment to be provided by the Bidder who in any case shall be responsible for fulfillment of the intent of Specification. Irrespective of whether specifically mentioned or not, the services, equipment and systems to be provided in accordance with this Specification shall also form a part of the scope of work and shall conform in all respects to the highest standard of engineering, design, quality and workmanship so that after completion of R&M work by the Bidder, the plant shall be capable of performing completely in a safe, reliable and sustained manner under various modes of operations as acceptable to the Owner.
- 1.8 Unless otherwise specifically clarified by the Owner, interpretation by the owner in respect of scope of supplies & services and the meaning of the Specifications, drawings, requirements of operation, maintenance, redundancy etc., shall be final and binding on the Bidder. Owner shall have the right to reject or accept any work or material which in his assessment is not technically complete and proven to meet the requirements of this Specifications and/or applicable National and International Codes & Standards mentioned elsewhere in this Specification.
- 1.9 The requirements, conditions, appendices etc, given in various parts/ sections of technical Specifications shall form integral part of this Specification. Bidder is required to carefully examine and understand the Specifications and seek clarifications, if required, to ensure that he has understood the Specifications as intended by the Owner. In the absence of any specific clarifications made to the Owner during bidding stage, the interpretation of Owner shall be final. The Bidder's offer should not carry any sections like clarifications, interpretations and/or assumptions. All such points are required to be clarified & resolved during bidding stage.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[3]	15.01.2016

- 1.10 Any deviation or variation from the scope of supply and services or the intent of the Specification shall be clearly brought out under the schedule of Technical / Commercial deviations, irrespective of the fact that such deviation / variation may be standard practice or possible interpretation of the Specifications by the Bidder. In case, no clear and specific deviation is taken by the Bidder in the relevant schedule of Bid Proposal Sheet while making his Bid proposal, it will be construed that the Bidder shall comply with the stipulations of the Specification fully with regard to scope of services and supplies to be provided by him to achieve the objective of R&M. Further, unless otherwise specifically clarified by the Owner, the interpretation by the Owner in respect of scope of supplies and services to be performed by the Bidder shall be final and binding.
- 1.11 If the Bidder feels that, in his opinion certain features brought out in his offer are superior to what has been specified, these may be highlighted separately in the Bid. The Bidder at his own discretion may also make alternate offers, which in his opinion are of superior technology, material etc. to the specified requirements leading to better performance like efficiency / output etc. of the units after renovation. In such case, the Bidder shall carry out a comprehensive study and clearly identify the scope of offer in his alternate proposal. The Bidder shall furnish that detailed study to Owner along with the Bid where the Bidder shall bring out in detail the scope of modifications required to be carried out by him in the various systems and equipment including but not limited to *[Turbo Generator and its Auxiliaries, HP & LP Bypass Valve, HP & LP Heaters, Deaerator, Condenser, Boiler Feed Pump (BFP), Condensate Extraction Pump (CEP), Turbine Cycle Piping (Excluding Main Steam, Cold Reheat, Hot Reheat, Upstream and downstream piping of turbine bypass valve and Auxiliary Steam Piping), Valves and all associated Electrical system, Control & Instrumentation systems and associated Civil & Structural work etc.]*
- Such Alternate proposals shall be supplemented with sufficient amount of information like specified design standards and performance requirements, Bidder's experience, operating feedback, provenness, etc. for justifying such proposals. Implications of such Alternate offers on the performance, output, efficiency, auxiliary power consumption, etc. shall be clearly brought out in the Bid to enable the Owner to determine the advantages, superiority and acceptability of the proposals.
- However the Bidder's Base offer shall necessarily be in line with the Specification requirements. Under no circumstances the equipment and services as specified shall be brought out as an Alternate offer.
- The Base offers will be evaluated as per procedure outlined in the Bid documents and the Alternate Offers of the lowest evaluated Bidder will only be considered for acceptance or otherwise. Owner may reject alternative proposals submitted by the Bidder at his sole discretion, without assigning any reason what so ever.
- 1.12 In the event of conflict between requirements of any two clauses of the Specification documents or requirements of different Codes/ Standards specified,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[4]	15.01.2016

the more stringent requirement as per the interpretation of the Owner shall apply, unless confirmed otherwise by the Owner in writing.

- 1.13 The General technical conditions pursuant to the Contract, placed separately in this Specification, shall form an integral part of the Specification. These conditions shall supplement all the detailed technical Specification and requirement identified in this Specification.
- 1.14 Out of complete unit comprising of mechanical, electrical, C&I systems and equipment, some components/systems are envisaged to be replaced with new ones having better design features while some of the other components are to be refurbished / upgraded by the Bidder under present R&M Work. It shall be the responsibility of the Bidder to ensure that components/ equipment/ systems being supplied new OR components/ equipment/ systems being refurbished / upgraded by him are fully compatible and integrated with the existing equipment / systems so as to give safe, reliable and sustained operation of the complete unit. Modifications needed on the assembled equipment to ensure complete integration are to be brought out by the Bidder in the Bid and such modifications, if any, after Owner's approval shall be carried out by the Bidder to the satisfaction of the Owner.
- 1.15 The unit shall be designed to operate continuously in base load, cyclic load operation. The systems shall operate without any restriction over the entire range of operating conditions. The Bidder shall ensure that after R&M there are no restrictions/ alterations in modes of operations of this unit, as per the original/existing plant operation philosophy, including achieving base load, peak load and cyclic load operation.
- 1.16 As the various equipment/ systems/ components are to be fitted in the unit, Bidder is advised to visit the plant site to get fully conversant with the job, site conditions, and constraints, and collect all the information as required and as available before quoting against this Specification.
- 1.17 A brief extract of the existing unit, the original design details/ performance parameters along with plant details, operating history and known problem areas; wherever possible are brought out in the successive section of this Specification. Relevant plant layout drawings and certain key schematic drawings, as available, have also been furnished in Annexure-I of this section of the Specification for the purpose of familiarization & guidance only. The successful Bidder shall prepare and provide the additional drawings and documents describing the design and engineering details and the manuals for carrying out erection, commissioning and operation of the renovated unit.

3

EXISTING PLANT DETAILS

The Power Plant, is of the configuration of [...x...MW]. The Unit no. [...] of the power plant, which is proposed to be taken up for Renovation and Modernization was first commissioned in the year [...]. For the above unit, M/s [...] and M/s [...] are the Original Equipment Manufacturers (OEMs) for the Boiler and Turbo-Generator, respectively. The boiler for the unit is of [PF/CFBC] design. The boiler is provided with [front & rear/ corner/down shot] firing system. LP stage of Turbine is designed with [Bauman] exhaust. Condenser cooling system of the unit is designed on [once through / re-circulation system]. Power generated from the unit is being supplied to [...State/Central grid]. Power is being evacuated through [...numbers of 220/400kV Double/Single Circuit lines] to [... substation.] The primary fuel is [domestic/imported/blended] [coal/lignite] fuel being sourced from [...&...] coal mines. The consumptive water for the power plant is being sourced from [...river /...sea].

3.1

Operational Background

Unit No [...] of [...] Thermal Power Station having a Generating Capacity of [210 MW] was commissioned in the year [...]. The boiler is of [...] design and the turbine is of [LMZ] design. Though the boiler was originally designed for coal with Gross Calorific Value (GCV) of [...kCal/kg], it presently operates on coal supplied with GCV of about [...kCal/kg]. The deterioration experienced over the years in Plant's Average Performance Parameters is shown in Table 3.1.

{Furnish in the Table 3.1 below, the Average Values over the life (say 25 years)}

Table-3.1

Unit's Average Performance Parameters over the life

3.1.2

Stack Emissions, Ambient Air Quality and Process Effluents

The Project has been regularly monitoring the environmental parameters such as stack monitoring, ambient air quality (AAQ), noise pollution and liquid waste pollution in accordance with applicable norms by employing [M/s....., which is an agency approved by State Pollution Control Board].

The existing environmental data at rated load and the limits specified for different pollutants, the locations of their measurements and the frequency of monitoring are given in the table below.

Table 3.4

Status of Stack Emissions, Ambient Air Quality and Process Effluents

3.1.6

Record of Reportable Accidents

[The record of reportable accidents for the past three years, is mentioned in the Table below]

Table-3.8

Year	Man hours lost due to accidents	No. of Fatal Accidents	No. of Accidents leading to Permanent Disablement	Actions taken to reduce the number of accidents
Two Years Back
One Year Back
Current Year

3.1.7

Operation & Maintenance Difficulties due to Plant Limitations

[Difficulties are being experienced in day to day maintenance of the plant due to design deficiency, layout of the plant, obsolescence of equipment and non availability of spare parts etc. These are mentioned in the Table below]

Table: 3.9

S.No.	Nature of Difficulty	Specific Reason
		(Design deficiency/ layout of the plant / obsolescence of equipment / non availability of spare parts etc)

3.2 Salient Technical Feature of Power Plant

{Describe in this chapter, the Design Parameters and Salient Features of all the important Equipment and Systems of the Turbine Generator & Auxiliaries as mentioned below}

3.2.1 Turbine & Auxiliaries

A) Steam Turbine

[The steam turbine is of three cylinder, 3000rpm, tandem compound, condensing type designed to operate on a re-heat and re-generative feed water cycle. The LP stage of turbine is designed with Bauman exhaust. The turbine is provided with HP/LP bypass system of 30% / 60% capacity of Steam Generator MCR. The turbine is provided with an electro - hydraulic control system, automatic turbine run up system and turbo supervisory instrumentation. The condensing system consists of a surface condenser of single shell and two pass, divided water box construction. Cooling water being supplied to the condenser is of raw water/ clarified water quality. The design parameters of the steam turbine are furnished below]

F) Gland Steam Cooler

[A Gland Steam Cooler has been provided to condensate the leak-off steam from intermediate chambers of end sealings of HP and IP turbine, thereby heating the main condensate water. The Gland Steam Cooler consists of shell, tube bundle and removable water box.]

G) LP Heaters and Drain Coolers

[Each steam turbine is provided with four numbers of low pressure heaters to increase the temperature of the condensate in stages. LP Heater -1 consists of two halves and is installed in neck of the condenser. The remaining LP Heaters are of shell and tube design and have been placed vertically. An integral drain cooling section is provided in each LP Heater. The design details of LP Heaters and Drain coolers are furnished in the table below.]

3.2.2 Electrical System

A brief extract of the existing Equipments and Systems of Turbo Generator & Auxiliaries package describing the original design details are given below. Relevant plant layout drawings and certain key schematic drawings have also been furnished in Annexure-I of this section of the specification for the purpose of familiarization and modification if required.

A) Generator & its Auxiliary system

[Turbo Generator is having rated output of 210/215/220/250 MW with the Voltage rating of [as per existing generator voltage] kV provided with Static/Brushless excitation system. The design parameters of Generator and Its auxiliary system are furnished below:].

Description	Units	Design Parameters

B) Generator Protection & Metering Panel

[Generator protection panel is covering Protection requirements of Turbo Generator, Generator Transformer (GT) and Unit Transformer (UT). It has been envisaged that there are two groups of protection each are physically, mechanically and electrically separated into two separate systems. And Metering systems will comprise of Metering requirements of Generator, GT and UT transformers. The design parameters of Generator Protection panel and Metering Panel are furnished below:]

Description	Unit	Design Parameters

Type of cooling (NSPBD)	[.....]
Maximum temperature rise of conductor over 50oC ambient	deg C	[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[65]	15.01.2016

Maximum temperature rise of enclosure over 50°C ambient	deg C	[.....]
One minute power frequency voltage withstand	kV (RMS)	[.....]
Continuous current rating at 50°C design ambient air temperature	A	[.....]
One second short circuit withstand rating	kA (RMS)	[.....]
Momentary short circuit withstand current	kA (Peak)	[.....]

F) 6.6 kV Switchgear

6.6 kV Switchgear is envisaged for feeding unit auxiliaries as well as station auxiliaries at {6.6} kV level. These 6.6 kV Unit and Station switchgear are connected to Unit Transformer and Station Transformer respectively through 6.6 kV segregated phase bus duct. Motors of rating greater than [160] kW is envisaged at these boards. And also provided power to Mechanical system of AHS, CHS, Intake Water system etc at this level. The design parameters of 6.6 kV switchgear are furnished below:.

Description	Units	Design Parameters
Make/Manufacturer		[.....]
Rated voltage, phases & frequency	V, Hz	[.....]
System neutral earthing	[.....]
Maximum system voltage	V	[.....]
One minute power frequency Voltage	kV (rms)	[.....]
Impulse withstand voltage	kV (Peak)	[.....]
Continuous current rating of bus	[.....]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[66]	15.01.2016

Description	Units	Design Parameters
bars		
Short Circuit rating of Bus bar with duration	kA & sec	[.....]
Dynamic Withstand rating	kAp & sec	[.....]
Bus bar Material	Al/Cu	[.....]

L) 220 V DC SYSTEM

[The 220 V DC system covered in TG package will be provided with 2 x100% battery with Battery Charger. This 220 V DC system will comprise of DC load requirement of Boiler, TG package and other mechanical system packages except CHS, Intake Water System. The design parameters of the 220 V DC system comprising of Battery and Battery Charger are furnished below:

Description	Units	Design Parameters
BATTERY		
Make/Manufacturer	[.....]
DC System Voltage	V	[220V.....]
Battery Type	
AH Rating/Rated Capacity	AH	
Number of cells	
End Cell Voltage	V

O) ILLUMINATION SYSTEM

[The illumination system is categorized mainly as Normal, Emergency and DC lighting. The illumination system requirement of TG area and its boundary, perimeter and road lighting within TG area battery limit is covered in this specification. Other areas like Boiler area, Balance of plant, Ash Handling Plant and Coal Handling Plant are covered in respective package itself. Lighting Distribution Board (LDB) is normally getting supply from 415V PMCC. Each LDB is provided with lighting transformer for isolation of lighting circuit from power circuit and also for limiting short time current rating. Outgoing circuits of LDB will feed Lighting panels which is placed local to fixtures. It is envisaged that separate LDB for indoor as well as for outdoor area will be provided. Emergency Lighting system is same as normal system however it will get supply from Emergency 415V PMCC backed up with DG set. The Design parameters of Illumination System and its major components comprising of LDB with transformer, Lighting Panel, Lighting Fixtures, Lighting wires and Lighting Poles are furnished below]:

Description	Units	Design Parameters
Lighting System:		
Voltage		
a) AC system

P) CABLE CARRIER SYSTEM

[The Cable Carrier system is described as below: Indoor Buildings are provided with Cable cellar/Trench and outdoor areas are provided with Pipe cum cable rack/Duct bank/Trench. Separate Tray is envisaged for HV cables. LV cables, Control cables and Instrumentation cables in the order that HV cables Tray at the top followed by LV, Control and Instrumentation Tray. Ladder type tray is used for HV, LV and Control cables, however Perforated Tray to be used for Instrumentation cables. The Cable carrier system other than TG area battery limit is covered in respective packages. The Design parameters of Cable Carrier System are furnished below]:

Description	Units	Design Parameters
Make/Manufacturer	[.....]
Size of Tray	mm	[.....]

3.2.3 Control & Instrumentation

[The existing control and instrumentation system generally is an old analogue based system and requires large scale replacement owing to obsolescence of the existing equipment. Integrated microprocessor based closed loop control, open loop control, sequential control and bulk data acquisition system for TG & auxiliaries, station C&I including auxiliaries in hierarchical levels and integrated unit monitoring and station monitoring systems in the upper level are therefore to be envisaged for the plant. DCS & other common system/items, if applicable and procured by Owner separately shall not be considered under TG package.]

3.2.4 Civil Works

Bidder shall go through the details of the existing Buildings / Structures / Foundations / Facilities mentioned hereunder (but not limited to) for the thorough understanding of conditions of the same. In order to assess the quantum of Civil / Structural / Architectural R&M work within the package, Bidder shall also carry out a brief or detailed survey (as required) of the site to acknowledge and obtain any other information/data about present conditions at site and identification of modification requirements in any other structure or foundation not included here. Conditional details of important buildings / structures / foundations / facilities which require major modifications have been described below:

{Details of the existing buildings / structures and their foundations in the Turbine Generator area like TG Building, deaerator bay, bunker bay, condenser pit,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[83]	15.01.2016

central control building, DG building, A/C plant building, TG foundations, BFP foundation etc. shall be indicated in this section. Also the available GA/Construction Drawing including Load Data shall also be provided.}

Turbine Generator Area

[..x200 MW units have been placed side by side. Centre to centre placing of units is [.... m.] The railway entry has been provided from the rear side of Power House Building. Turbine Generator (TG) Sets have been placed between AB rows of columns are laid out longitudinally. The TG bay, also houses, the Boiler Feed Pumps, Regenerative Heaters, Lube Oil System and other TG accessories. The total length of TG bay for ...x210 MW units is [.... m] and width [.... m]. The spacing of the column is at [..... m]. TG bay is provided with ... Nos. of overhead EOT Cranes. In order to make the handling facilities of the cranes available to the heat exchangers, boiler feed pumps and other equipment, removable chequered plates have been provided at appropriate locations.

A sub zero floor has been avoided except for the localized pits required for Condensate Pump, pipe channels and HP Heaters etc. This sub zero pits are suitably connected and provided with a common sump for drainage purposes.

Three stairs for approaching the operating floor level at [+..... m] have been provided in this bay adjacent to B row columns. In addition, there are stairs for providing access to various equipment at intermediate platforms and sub zero pits.

Switchgear and Control Room bay has been provided in the BC bay which is [.... m] wide. The length of the bay is [..... m]. A common Control Room for all the three units is provided at [..... m] floor. In BC bay at [... m] elevation, equipment for chemical dosing, air handling and MCC for soot blowers etc have been located. The deaerator is placed at an elevation of [.... m]. Air washer units and cooling water tanks are also located at [..... m] floor.

Mill Bunker Bay, designated as CD bay, has a span of [.... m] which accommodates coal bunkers, coal feeders and coal mills. CD bay houses the vertical mills at Zero m and has space for collection of disposal of mill rejects at sub zero levels adjacent to 'D' row. A stair to connect operating floor at [..... & m] of BC & CD bay has been provided.]

LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[84]	15.01.2016

4 SCOPE OF SUPPLY & SERVICES

4.1 The scope of supply and services to be provided by the Bidder shall include all such activities as required to meet the target and intent of this Specification. The scope for each unit shall generally cover, but will not be limited to the following:

- (i) Replacement of some of the existing components with new components of improved and better design.
- (ii) Incorporation of new systems / components wherever required in line with the Specification.
- (iii) Refurbishing / Retrofitting of some of the components in the existing equipment/system.
- (iv) Modification of layouts, wherever requires for Replacement/ Refurbishing / Retrofitting of new Equipment/Components.

All types of civil/structural works like modification and strengthening of foundation of existing and upgraded equipment, making new structures or foundations (if applicable), dismantling, restoration, supply and erection of any temporary supports or any other construction work required for implementation of renovation work.

All structural modifications/strengthening of existing structure of building , Turbo Generator, Condenser, Deaerator, Boiler Feed Pump, Condensate Extraction Pump, Heaters, modification of pipe supports etc. including supply, fabrication and erection of any new structure and provision of any additional platform if required for access to new equipment or existing equipment as specified.

Supply of all materials, equipments, machinery and manpower required for civil/structural R&M works.

Site enabling works as per the requirements to support civil/structural R&M works.

- (v) Design, engineering, submission of design calculations for review and approval, manufacturing, inspection and testing at suppliers' works, packing, forwarding to site, unloading, erection, supervision, pre-commissioning, testing and commissioning and performance testing of the equipment / system and works indicated in clause No. 4.6 of this technical Specification.
- (vi) Mandatory spares, start-up and commissioning spares. The general requirements in respect of various types of spares are given in Clause 9 of this section of Technical Specification.
- (vii) Packing, transportation and transit insurance of all materials required for renovation / replacement work as per this Specification from the supplier's/sub supplier's works to [Name of the Plant], unloading, preservation and storage at site. Packing, transportation, transit insurance, clearance from all concerned agencies etc. of all components/materials required to be forwarded from [Name of the Plant] to Bidder's facilities and back to [Name of the Plant].

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[85]	15.01.2016

- (viii) Dismantling of the systems, handling and storage of dismantled equipment, reassembly and re-erection / reinstallation along with associated inspection, testing, commissioning and trial run of equipment individually as well integrated with the overall plant trial operation.
- (ix) Materials which are removed from the existing machines but are not re-used during the re-assembly of the machines as well as those components which are found to be beyond refurbishment shall be the property of Owner and shall be deposited at Owner's designated stores. Bidder shall prepare a record of all such dismantled material and hand it over to the Owner.
- (x) Loading, transportation, unloading and disposal of scrap to the designated storage/disposal yard.
- (xi) It shall be responsibility of the Bidder to obtain on behalf of the Owner the necessary approvals of Inspection Authority / Chief Inspector as may be required for design and design calculations, manufacturing, erection procedure repairing / servicing and renovation. Bidder shall also be responsible for obtaining approval from the other statutory authorities in India, as may be required, for other plants and systems supplied by him. All such documentation submitted to statutory authorities shall also be submitted to the Owner for his review.

Handling of materials at site including handling / transportation as required to take equipment components to the workshop for carrying out the modification work and to bring it back for installation. All arrangement for such activities is to be done by the Bidder.
- (xii) Erection of all material supplied new for renovation (including erection of components, replacing old components). Re-erection of any component / equipment removed for modification so as to make complete unit consisting of Turbo Generator and related auxiliaries including electrical & control and instrumentation equipment /system ready for commissioning.
- (xiii) All gas cutting / dismantling, edge preparation, welding, bolting etc. and conductance of all NDTs like radiography, ultrasonic testing, MPI, die penetration testing etc. Any new matching pieces, piping, hangers & supports etc. required for assembly of equipment/ systems, as per system requirements shall also be included in the scope of the Bidder.
- (xiv) All Pre-commissioning activities as may be required such as hydraulic testing, air & gas tightness test, steam blowing, floating of safety valves, oil flushing etc. including erection and dismantling of all temporary systems like piping / tanks etc. and Conductance of all demonstration tests including performance test.
- (xv) Assisting and coordinating with Owner in tuning various control loops finalizing protection and control requirements of all Turbo Generator & auxiliaries.
- (xvi) Insurance for all items / activities in line with the provisions of General Condition of Contract as specified in Volume-I of this Technical Specification.

- (xvii) Civil / Mechanical work (such as grouting, cutting, welding etc.) related to mounting of New Cabinets, CRT / Keyboards, laying & termination of associated Cables.
- (xviii) Supply of all necessary tools, tackles, commissioning spares, test instruments and deputing of experienced personnel for completion of the above erection, testing and commissioning work.
- (xix) Dismantling of existing C&I cabinets along with associated cabling, for Turbo Generator & Auxiliaries related to the unit for retrofitting the new C&I systems, based on requirement as described in clause No. 4.6.
- (xx) Providing all site execution and supervision by qualified and experienced engineering personnel during execution of all works under the scope of Bidder. Also providing all facilities and qualified personnel for implementing the approved quality assurance programme.
- (xxi) Dismantling of the existing Instrumentation Cables and relaying of new cables as may be required.
- (xxii) The Bidder shall conduct all shop and site tests as per the requirements of this specification and Owner approved "Quality Assurance Program" to be finalised before the award of this Contract. Facilitating inspection, witness of shop and site tests by the representatives of Owner shall be in the scope of the Bidder.
- (xxiii) Performance Guarantee tests after successful completion of initial operation.
- (xxiv) Construction Water
[Construction water shall be made available to Bidder at a single point in a suitable location. The Bidder shall arrange at his own cost the required pumps, distribution pipe line network for further distribution as required to carry out construction work.]
- (xxv) Construction Power
[Construction power shall be made available to bidder at single point at [....] kV level. Further distribution as required to carry out the construction work shall be carried out by Bidder at his own cost.]
- (xxvi) Providing all other services necessary for meeting the intent and requirement of this Specification. This shall include but not limited to system engineering, furnishing drawings, data, information for owner's review, participation in meeting & reviews, System warranty, revision of O&M Manuals etc.

4.2 Tools & Tackles

One (1) set of special tools and tackles required for the maintenance of equipment/systems have to be supplied by the Bidder. These tools and tackles shall be separately packed and brought to site. These shall not be used for erection/commissioning purposes and shall be in an unused and new condition,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[87]	15.01.2016

when they are handed over to the Owner. A list of all such special tools and tackles shall be submitted along with the offer.

For C&I system, Bidder shall supply one set for each unit of special non standard tools, module testing kit, cables, and any other equipment required for erection commissioning, testing, trouble shooting, calibration, maintenance and inspection of all systems / equipment provided. Any tools required to make changes (DIP shunt cutter, soldering irons, tips, wire wrap guns and bit unwrapping tools, strippers, terminal guard, connector repair tool, dies etc.) shall also be supplied.

Bidder's scope shall also include supply of all Cranes, welding sets and NDT testing equipment, scaffolding, special tools and tackles, jigs and fixtures as may be required during modification / erection and commissioning. Those items specifically brought to site solely for erection / modification purpose and if no more needed for regular maintenance of the equipment, can however, be taken back by the Bidder after completion of the work at site, subject to the approval of Owner.

4.3 Safety

4.3.1 The design of the equipment shall incorporate every reasonable precaution and provision for the safety of all personnel and for the safety and security of all persons and property. The design shall comply with all appropriate statutory regulations relating to safety.

Newly constructed structures and equipment shall be designed and constructed to withstand every foreseeable static and dynamic loading condition, including loading under earthquake conditions, with an adequate margin of safety.

Ready and safe access with clear head room shall be provided to all the newly supplied parts of the plant for operation, inspection, cleaning and maintenance.

4.3.2 While carrying out the R&M work as per this Specification, the Bidder may have to modify the existing equipment foundations, or do the excavation work and make new foundations. The Bidder may also have to make new supporting arrangements with / without modified loads for the items/ equipment supplied by him. Under all such conditions Bidder shall be solely responsible for ensuring the safety of the adjacent equipment / foundations and of the existing supporting structures. The R&M work by the Bidder shall be carried out in such a manner that no damage is caused to existing equipment / foundations / structure and all precautions, including strengthening of existing structures, as may be necessary, shall be taken by the Bidder to ensure safety of existing plant / equipment / foundation / structures.

4.4 Training Requirements

Bidder shall include in his offer the training programme for Owner's Operation & Maintenance staff in view of introduction of new systems/ equipment. This training shall be organized before handing over the unit.

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

4.5 In case there is any difference in scope of work and services as described in this section of the Specifications and individual Specification volumes, then more stringent of the Scope of work and services shall prevail.

4.6 Detail Scope of Work:

4.6.1 Steam Turbine & Its Auxiliary System

{Describe in this chapter, all the equipment/components which need to be replaced/refurbished/retrofitted as finalized in the DPR on the basis of RLA/CA and EA report. Scope with regard to Civil, structural and architectural work as required for the Power Plant due to incorporation of new equipment/components shall also be incorporated in this chapter.}

The Bidder shall include in his scope the following works for the R&M of the Unit, which are based on RLA/CA and EA studies. The overall scope of work shall include but shall not be limited to the scope of work mentioned below in Table 4.1. Any other items not specifically mentioned but considered necessary by the Bidder for carrying out the R&M work, shall also be included in his scope so as to meet the intended performance of Turbo Generator & Auxiliaries as specified in Clause No. 1.1

4.6.2 Miscellaneous

- a. In addition to the above listed works, scope of civil / structural / architectural works and supplies shall be as detailed below.

Bidder shall be provided with the existing drawings and documents as listed in Annexure-I by the Owner to facilitate the civil / structural / architectural , refurbishment and replacement works.

Bidder shall carry out a brief or detailed survey (as required) of the site to acknowledge and obtain any other information/data about present conditions of the buildings, structures, foundations & facilities mentioned in this specification and identification of modification requirements in any other structure or foundation not included here.

Subsequently Bidder shall prepare and submit for approval by Owner, a detailed scheme including methods techniques, requirements etc. for carrying out civil/structural/architectural R&M works to executed in the plant.

- b. The scope of Civil / Structural / Architectural works to be carried out by the Bidder under this package shall generally cover the following:

- Inspection, checking the design adequacy and foundation analysis of the existing structure foundations like [turbine generator, boiler feed pump, heaters, TG building, control building, DG building etc.] for all the applicable loads and construction of new foundations / modification of existing, wherever required.
- Inspection and checking the design adequacy of existing structures [such as TG building, control building, DG building, pipe & cable racks etc.] for any corrosion/damage and rectification / strengthening of the same.
- Carrying out all interior / exterior architectural modification and replacement works [such as flooring, painting, plastering, door/windows, roof finishing, water proofing, sheet cladding, roof sheeting, new false ceiling, glass partitions, lighting works replacement or modification of AC duct where ever applicable] is also included in contractors scope. etc.
- Any other civil related work required in buildings / structures of the package from aesthetics ambience & ease of operation point of view.

In addition to this any other modification/alteration to existing nearby foundation/structural steel/concrete/underground pipes work if required for satisfactory execution of intended work covered under this specification shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[112]	15.01.2016

carried out by the Bidder. Supply of all material required for the above work is included in Bidder's scope.

c. Supplies for Civil/Structural Work

The Bidder shall supply all material needed for completion of all civil, structural and architectural works as per this specification. The Bidder's scope of supply generally includes but is not limited to the following:

- Supply of cement, steel (for reinforcement as well as for any other use), grout, admixture for RCC work, sand and all other construction/architectural / building materials as may be required for any repair/modification of existing civil works / foundation or for construction of new foundation / civil works.
- Supply of structural steel for all structural erection / modification / strengthening.
- Supply of all foundation bolts, and nuts base plates, embedments with lugs, miscellaneous steel where ever needed
- Supply of steel helical springs and viscous dampers for new equipment (if any).

d. Construction Enabling Works

[The owner shall provide the following facilities to the by Bidder to carry out the construction work.

- *Temporary Stores to store construction material.*
- *Fabrication Yard]*

e. Quality Control Laboratory

[To conduct acceptance test on all construction material, weldments, concrete cubes etc laboratory facilities if available in the existing unit shall be used. In case the laboratory facility is not available within the unit, Bidder shall get the testing at his own cost from a reputed test laboratory approved by the Owner.]

f. Construction Tools & Materials Supplied By the Bidder. The Bidder shall arrange adequate number and type of machinery and equipment for proper setting out and timely completion of the various works covered under the scope of the work. All arrangements for transporting the equipment to and from the site shall be done by the Bidder at his own expense.

The Bidder shall provide all fuels and lubricants required for the operation and maintenance of construction machinery and equipment as well as his transport vehicles at his own cost.

g. The Bidder shall furnish manufacturer's test certificate for all the manufactured items supplied by him. Representative specimens of the material shall also be submitted to the Owner and shall be tested at a recognised testing laboratory at the Bidder's cost in case Owner so desire.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[113]	15.01.2016

h. Work Execution and Supervision:

The Bidder shall have at the site accredited and qualified engineers and foremen / supervisors with adequate number of years of experience in execution of similar works and also operators of machinery and equipment, for satisfactory progress and timely completion of the works.

i. The Bidder shall be fully responsible for the correctness and accuracy of the tests performed, results obtained / tabulated, interpretation of test results and recommendations made. The work shall be executed in a professional manner with full understanding of the importance of work for a R&M project of this magnitude.

j. In the event of occurrence of any accidents at / near the site of the work or in connection with execution of the work, a report shall be made immediately to the Owner, giving full details of the accident. He shall also report such accidents to all the competent authorities wherever such reports are required by those authorities.

k. Owner reserves the right to order in writing, from time to time, during the progress of the work, removal and re-execution of any work which in the opinion of the Owner is not in accordance with the specification / bid document.

l. During inclement weather, rain etc., the Bidder shall suspend all works for such time as the Owner may direct and shall protect from damage all works already in progress or completed just then. All such temporary protective measures shall be at the Bidder's cost and any damage to works shall be made good by the Bidder at his own expense.

m. Safety of Adjacent Plant/Equipment and Civil Structure

While carrying out the R&M work as per this specification, the Bidder may have to modify the existing equipment foundations, or do the excavation work and make new foundations. The Bidder may also have to make new supporting arrangements with / without modified loads for the items / equipments supplied by him. Under all such conditions Bidder shall be solely responsible for ensuring the safety of the adjacent equipments / foundations and of the existing supporting structures. The R&M work by the Bidder shall be carried out in such a manner that no damage is caused to existing equipments / foundations / structures and all precautions, including strengthening of existing structures, as may be necessary, shall be taken by the Bidder to ensure safety of existing plant / equipment / foundation / structures.

4.6.3 Spares

All spares as specified in Annexure-II of this Specification in accordance with Clause No. 9.

4.6.4 Consumable, Oil & Lubricants

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[114]	15.01.2016

All the first fill and consumables such as greases, oil, lubricants, servo fluids/control fluids, gases and essential chemicals etc. as required up to the complete commissioning of the Turbo Generator & Auxiliaries, are covered in the scope of Bidder. Suitable standard lubricants as available in India are preferable. Efforts should be made to limit the variety of lubricants to minimum.

4.6.5 Embedded Parts & Fixture

All fixtures, embedded parts, steel embedment including fixing lugs and welding between them, foundation plates, grouting, nuts, bolts etc. for fixing all the equipment, piping on civil works shall be included in scope work of this package. All structures which would be required by the Bidder for supporting the piping shall also be included in scope of work of this package.

4.6.6 Other Services

The scope of Erection, Commissioning and Testing shall include the following:

- a) Complete pre-commissioning work including tests of facilities such as line flushing, hydraulic testing of various pressure parts, chemical cleaning, steam blowing, etc. and all other tests as mutually agreed in the Bidder's quality assurance programme as well as those identified in the Specification.
- b) Supply of all consumables (except coal and fuel oil for firing) like chemicals for chemical cleaning, passivation, inhibition etc., oil for line flushing, nitrogen for blanketing, consumables for air/gas tightness tests and any other consumable as required for above pre-commissioning/ commissioning activities.
- c) Necessary arrangement as requires for the start up of Turbo Generator & Auxiliaries. However, Owner will arrange start up power, instrument & service air and DM water as required for the star up purpose of the Turbo Generator & Auxiliaries system.
- d) Supply of all temporary equipment such as tanks, piping, including supports, valves, nitrogen blanketing equipment including nitrogen cylinders, pumps and all necessary instrumentation for successful conductance of pre-commissioning and commissioning activities. All temporary equipment and instruments shall be clearly listed out in the Bid.
- e) Providing safety barricades and signage during dismantling, erection and testing etc.
- f) Supply of all labour, skilled/semi skilled supervisors, engineers and any other manpower.
- g) All the erection materials and consumables like shims, welding rods, soldering and brazing alloys, industrial gases insulating tapes, compounds, chemicals etc. required for the erection and commissioning works.

Note: The temporary equipment specifically brought by the Bidder solely for the pre-commissioning and commissioning work shall, on completion of these activities, remain the property of the Bidder. Nitrogen blanketing equipment

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[115]	15.01.2016

including nitrogen cylinders shall get included in the Bidder's permanent scope of supply and become property of the Owner.

The selection of material of all the temporary equipment/instruments shall be compatible with the service conditions expected during pre-commissioning/commissioning activities.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[116]	15.01.2016

5 TERMINAL POINTS & EXCLUSIONS

5.1 Terminal Points

[For all terminal points, scope of this contract shall include supply of matching flanges, gaskets, bolts, nuts etc and including any isolation valve. Terminal Points mean Engineering, Procurement and Erection in entirety. The terminal points of the complete package to be supplied shall be as follows.

(i) Mechanical

- (a) *Main Steam: Inlet of Main Steam Stop Valve at Turbine hall*
- (b) *Cold Reheat: Outlet of HP turbine*
- (c) *Hot Reheat: Inlet of Reheat Steam Stop Valve.*
- (d) *Feed Water: At Economiser Inlet*
- (e) *Turbine Bypass Piping: HP Turbine Bypass valve inlet & Outlet and LP turbine bypass valve inlet & outlet.*
- (f) *Condenser Cooling Water System (CW system):*
[CW Inlet Header near A row of TG Building at : Deg N, Deg E
CW Outlet Header near A row of TG Building at : Deg N, Deg E]
Exact elevation of the pipe shall be furnished during detail engineering.
- (g) *ACW System:*
[ACW Inlet Header near A row of TG Building at : Deg N, Deg E
ACW Outlet Header near A row of TG Building at : Deg N, Deg E]
- (h) *DM water make up to Condensate Storage Tank:*
[Bidder shall terminate the DM water lines at the inlet to the flow meter(s) to the Condensate Storage Tanks (CSTs). at Deg N, Deg E]
- (i) *Service Water:*
[One no. stub connection with isolation valve shall be provided on service water supply header Near C row at 4m elevation for TG Building atDeg N, .Deg E].
- (j) *[Drinking Water*
One no. Stub connection with isolation valve shall be provided on potable water supply header near C row at 4m elevation for TG Building at Deg N,.. Deg E].
- (k) *[Compressed (Service & Instrument air System) Air System*
Service Air Header near A row of TG Building at : Deg N, Deg E
Instrument Air Header near A row of TG Building at : Deg N, Deg E]

(ii) Electrical

The terminal points for the electrical equipment under TG package shall be as below:

- (a) *Isolated Phase Bus Duct: LV terminals of generator transformers and HV terminals of Unit transformers. Termination of Bus duct on Unit Transformer is in the scope of bidder.*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[117]	15.01.2016

- (b) 6.6 kV Segregated Phase Bus Duct: LV terminals of Unit transformers and Station Transformers. Termination of Bus duct on Unit/Station Transformer is in the scope of bidder.
- (c) 6.6 kV Power Supply to SG Package: At the terminal of 6.6kV Unit Switchgears for power supply to transformers and HV Motors of SG Package. All Power and control cables up to terminals of 6.6 kV Unit Switchgears and termination is included in the scope of SG package-1.
- (d) 6.6 kV Power Supply to CW Pump Motors: At the terminal of 6.6 kV Unit switchgears. All Power and control cables up to terminals and Termination at 6.6 kV Unit Switchgear are included in the scope of BOP package
- (e) 6.6 kV Power Supply to BOP Package: At the terminal of 6.6 kV Station / Unit switchgear for power supply to numerous load centers of BOP package and BOP motor loads. All Power and control cables up to terminals of 6.6 kV Station / Unit Switchgear and termination are included in the scope of BOP package
- (f) 220 V DC Power Supply to SG Package: At the outgoing terminals of Unit DCDB. Power Cables interconnection between Unit DCDB to the DCDB of SG package and termination is included in scope of SG Package.
- (g) Power Supply to Boiler MCC, Boiler Valve MCC, Soot Blower MCC: Power supply at 415V level at the outgoing terminals of 415 V Unit Switchgear / 415 V Emergency PMCC. All cables from the above terminal points and termination are included in the scope of SG package.
- (h) Power Supply to BOP MCCs: Power supply at 415V level at the outgoing terminals of 415 V Unit Service Switchgear / 415 V Station Switchgear/ MCC/ 415 V Emergency PMCC. All cables from the above terminal points and Termination are included in the scope of BOP package.
- (i) Power Supply to Illumination System of SG area: Power supply at 415V level at the outgoing terminals of 415 V Lighting Service Switchgear. All cables from the above terminal points and Termination are included in the scope of SG package.
- (j) Power Supply to Welding System of SG area: Power supply at 415V level at the outgoing terminals of 415 V Welding Service Switchgear. All cables from the above terminal points are included in the scope of SG package.
- (k) Earthing and Lightning Protection System: All above Ground earthing is in the scope of bidder. Terminal point is Riser at 300mm above FGL provided by others. Connection to Equipments of TG package and to riser is in the scope of bidder. Building with more than one floor, all the floor other than ground floor will be provided with periphery earth conductor for connecting to equipment, and intermediate floor will be connected by earth conductor at four corner of the building is included in the scope of bidder. Terminal point for Lightning system is bring the down conductor at 0.3m above FGL. Risers will be provided by others at 300m above FGL Terminal point for connection to below ground is 0.3m above FGL. Bidder Grounding for Steam Turbine Generator (TG) Island and including Main Under Ground Grounding Grid for TG Island & transformer yard and grounding connection to all equipment included in scope of TG package. Under Ground Grounding Grid shall be connected to Grounding Grid of SG package at least at four (4) points and nearby BOP Package at least at 2 points at each side.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[118]	15.01.2016

- (l) For the inputs required by TG package contractor from other packages, the required auxiliary relays, control cables including their laying & termination shall be in the scope of other package contractor. Similarly, necessary contacts required by other package contractors shall be provided by this package bidder.

(iii) Control & Instrumentation

- (a) Inst. & Control Cabling: Up to ATRS/ATT/ Turbine protection/ TSI panel for TG integral control systems and for rest upto DDCMIS Panels Terminal Block.
- (b) Field Instruments: Up to Economiser Inlet and Boiler steam lines (MS, CRH & HRH)

5.2 Exclusions

- (a) Boiler & Its Auxiliary Equipment including Coal Mills, Coal Feeders, Primary Air fans, Forced Draft fans, Induced Draft fans, Electro Static Precipitator, Main stem piping, Cold reheat piping, Hot reheat piping, Auxiliary Steam System
- (b) HP/LP turbine Bypass piping: Entire upstream and downstream steam piping of HPTB Valve. Entire upstream and downstream steam piping of LPTB Valve.
- (c) Plant Water System including DM plant. However; CW, ACW, DM water, potable water & service water piping, valves, fittings etc. within terminal point is under the scope of Bidder.
- (d) Air Conditioning & Ventilation System
- (e) Compressed Air System, However; service and instrument air piping, valves, fittings etc. within terminal point is under the scope of Bidder.
- (f) 400kV and 220kV switchyard.
- (g) Generator Transformer (GT).
- (h) Unit Transformer (UT).
- (i) Station Transformer (ST).
- (j) Boiler and BOP switchgear, cables, interconnection and other system.
- (k) Interplant earthing, cabling and lighting system work.
- (l) Plant communication system.
- (m) Any other equipment/system which not in battery limit of TG package.
- (n) Boiler Integral Controls]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[119]	15.01.2016

6 GENERAL TECHNICAL REQUIREMENTS

6.1 Codes & Standards

6.1.1 Apart from some specific application, the proposed R&M equipment shall comply with the appropriate Indian Standard / DIN or equivalent international Standard. Specification as listed below in this section and mentioned in detailed Specifications, each incorporating the latest revisions at the time of tendering.

6.1.2 Wherever specified or required the Plant & Equipment shall conform to various statutory regulations such as Indian Boiler Regulations, Indian Electricity Act / Rules / Regulations, Factories Act, etc.

6.1.3 In the event of any conflict between the codes and standards referred above, and the requirements of this Specification, the requirements, which are more stringent, shall govern.

6.1.4 In case of any change of code, standards and regulations between the date of purchase order and the date, the Bidder proceeds with manufacturing, the Owner shall have the option to incorporate the changed requirements.

6.1.5 List of Reference Codes/Standard

- a) American Society of Mechanical Engineers (ASME).
- b) American National Standards Institute (ANSI).
- c) American Society for Testing and Materials (ASTM).
- d) American Institute of Steel Construction (AISC).
- e) American Welding Society (AWS).
- f) Architecture Institute of Japan (AIJ).
- g) Bureau of Indian Standards Institution (BIS).
- h) British Standards (BS)
- i) Central Board of Irrigation and Power (CBIP) Publications.
- j) Deutsches Institut für Normung (DIN).
- k) Electricity Act 2003.
- l) Electric Power Research Institute (EPRI).
- m) Emission regulation of Central Pollution Control Board (CPCB)
- n) Federal Occupational Safety and Health Regulations (OSHA)
- o) Heat Exchanger Institute (HEI).
- p) Hydraulic Institute (HIS).
- q) Indian Electricity Rules.
- r) Indian Boiler Regulations (IBR).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[120]	15.01.2016

- s)** Indian Explosives Act.
- t)** Indian Factories Act.
- u)** Institute of Electrical and Electronics Engineers (IEEE).
- v)** International Electro-Technical Commission Publications.
- w)** Instrument Society of America (ISA).
- x)** International Organization for Standardization (ISO).
- y)** International Electro-technical Commission (IEC).
- z)** Japanese Standards (JIS).
- aa)** Japanese Electro-technical Committee (JEC).
- bb)** National Fire Protection Association (NFPA).
- cc)** National Electrical Manufacturer's Association (NEMA).
- dd)** National Electric Code (NEC).
- ee)** Power Test Code for Steam Turbines (PTC).
- ff)** Pollution Control regulations of Dept. of Environment, Govt. of India
- gg)** Regulations of CEA
- hh)** Standards of Manufacturer's Standardization Society (MSS).
- ii)** Stipulations made by Ministry of Environment & Forests and Climate Change while issuing clearance to the Project
- jj)** Stipulations made by State Pollution Control Board while issuing consent to the Project
- kk)** Tariff Advisory Committee (TAC) rules.
- ll)** Tubular Exchanger Manufacturer's Association (TEMA).
- mm)** VDI Standards

6.2 Name Plates

- 6.2.1** Instruction plates, nameplates or labels shall be permanently attached to each main and auxiliary item of plant in a conspicuous position. These plates shall be engraved with the identifying name, type and manufacturers serial number, together with the loading conditions under which the item of plant has been designed to operate.
- 6.2.2** Items such as valves, which are subject to hand operation, shall be provided with nameplates so constructed as to remain clearly legible throughout the life of the plant giving due consideration to the difficult climatic conditions to be encountered. Nameplates shall be securely mounted where they will not be obscured in service by insulation, cladding, actuators or other equipment. Direction of flow is also to be engraved.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[121]	15.01.2016

6.2.3 All trade nameplates and labels shall be in Bilingual language. All measurements shall be in M.K.S. Units.

6.2.4 The size and location of nameplates shall be subject to Approval of the Owner.

6.3 Guards and Fences

6.3.1 Effective guards and fences must be provided to prevent injury to operators.

6.3.2 Mesh guards which allow visual inspection of equipment with the guard in place are generally preferable. The guards shall be constructed of mesh attached to a rigid framework of mild steel rod, tube, or angle and the whole galvanized to prevent loss of strength by rusting or corrosion. The guards shall be designed to facilitate removal and replacement during maintenance.

6.3.3 Guards for couplings and rotating shafts shall be in accordance with BS 5304-1975 or similar approved standard. All rotating shafts and parts of shafts must be covered.

6.4 Operation, Maintenance & Availability

6.4.1 Equipment/works offered shall be designed for high availability, high reliability, low maintenance and ease of operation & maintenance. The Bidder shall specifically state the design features incorporated to achieve high degree of reliability, availability, operability and ease of maintenance. He shall also furnish details of availability records in plants stated in his experience list.

6.4.2 Wherever required platforms and walkways with access ladders having hand rails shall be provided to facilitate operation and maintenance.

6.5 Materials

6.5.1 In selecting materials of construction of equipment, the Bidder shall pay particular attention to the atmospheric conditions existing at the Site and the nature of material/fluid handled. Wherever deviations are taken in respect of materials specified, the reasons shall be spelt out clearly in the proposal.

All materials shall be new, and shall be of the quality most suited to the proposed application.

6.5.2 As far as possible; materials shall be in accordance with Indian or international standard Specifications. Where such standards are not available, sufficient information shall be provided to allow the Owner to assess the suitability of the material for the particular application.

All materials used shall have performed lengthy satisfactory service in similar or more arduous conditions to those proposed by the Bidder.

6.5.3 All parts which could deteriorate or corrode under the influence of the atmospheric, meteorological or soil conditions at the Site, or under the influence of the working conditions shall be suitably and effectively protected so that such deterioration or corrosion is a minimum over the life of the plant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[122]	15.01.2016

6.6 Lubricants, Control Fluids and Chemical

- 6.6.1 Provision shall be made for suitable efficient lubrication where necessary to ensure smooth operation free from undue wear.
- 6.6.2 Non ferrous capillary tubing shall be used throughout.
- 6.6.3 Oil baths shall be provided with filling and drain plugs, both of adequate size. An approved means of oil indication including level switches and temperature indication shall be provided.
- 6.6.4 Lubrication points shall be conveniently situated for maintenance purposes. It must be possible to carry out lubrication from a gangway or landing and without the removal of guarding or having to insert the hand into it. Where accessibility to a bearing for oiling purposes would be difficult a method of remote lubrication shall be fitted.
- 6.6.5 The Bidder shall provide a detailed and comprehensive Specification for all lubricating oils, greases and control fluids required for the for Turbo Generator and its Auxiliaries. A sufficient supply of these shall be provided by the Bidder for initial commissioning, first fill and till handing over of the unit.
- 6.6.6 The Bidder shall supply a detailed schedule giving the lubricant testing, cleaning and replacement procedures. All equipment and facilities necessary for the testing, cleaning and changing of lubricants and control fluids shall be provided. The Bidder shall endeavour to reduce the varieties and grades of required lubricants, chemicals and control fluids to a minimum, matching them where possible to those already in use in the generating station in order to simplify procurement and minimise storage requirements. All lubricants, chemicals and control fluids shall be of internationally recognised standards and shall be easily obtainable from a large number of Indian suppliers. Bidder shall also indicate the equivalent Indian Standard for the above for easy procurement in future.
- 6.6.7 No lubricant or control fluid shall have toxic or other harmful effects on personnel or on the environment.

6.7 Plant Life and Modes of Operation

- 6.7.1 On completion of the R&M project, the plant/equipment and systems individually and collectively shall be possible to operate continuously with routine maintenance and overhauls for an economic service life of not less than **[20/25 years]** under the prevailing site conditions and for the type of duty intended.
- 6.7.2 After R&M of Turbo Generator and associated auxiliaries, the unit shall be able to operate to its rated capacity continuously and there shall be no restriction of the operation of the unit during Base Load, Peak Load & Cyclic Load operation.
- 6.7.3 The capability of the unit operations including Cold, Hot & Warm Startups shall be in no way inferior to its original design capabilities. Accordingly, Bidder shall indicate the operation capabilities in various regime of operation in his Bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[123]	15.01.2016

6.8 Packaging & Marking

All the equipment shall be suitably protected, coated, covered or boxed and crated to prevent damage or deterioration during transit, handling and storage at site till the time of erection. While packing all the materials, the limitations from the point of view of availability of railway wagon sizes in India should be taken account of. The details of various wagons normally available with Indian Railways for transportation of heavy equipment shall be considered by the Bidder. The Bidder shall be responsible for all loss or damage during transportation, handling and storage due to improper packing.

The identification marking indicating the name and address of the consignee shall be clearly marked in indelible ink on two opposite sides and top of each of the packages. In addition the Bidder shall include in the marking gross and net weight, outer dimension and cubic measurement. Each package shall be accompanied by a packing note (in weather proof paper) quoting specifically the name of the Bidder, the number and date of Contract and names of the office placing the Contract, nomenclature of contents and Bill of Material.

6.9 Protection

Equipment having antifriction or sleeve bearings shall be protected by weather-tight enclosures. Coated surfaces shall be protected against impact, abrasion, discoloration and other damages. Surfaces Paints which are damaged shall be repainted.

Electrical and C&I equipment shall be protected against moisture and water damages. All external gasket surfaces and flange faces, couplings, rotating equipment shafts, bearings and like items shall be thoroughly cleaned and coated with rust preventive compound as specified above and protected with suitable wood, metal or other substantial type covering to ensure their full protection. All exposed threaded parts shall be greased and protected with metallic or other substantial type protectors.

All piping, tubing and conduit connections on equipment and other equipment openings shall be closed with rough usage covers or plugs. Male threaded openings shall be closed with rough usage covers or plugs. Female threaded openings shall be closed with forged steel plugs. The closures shall be taped to seal the interior of the equipment. Open ends of piping, tubing and conduit shall be sealed and taped.

Returnable containers and special shipping devices shall be returned by the manufacturer's field representative at the Bidder's expense.

6.10 Painting

6.10.1 General

All exposed metallic surfaces subject to corrosion shall be protected by shop application of suitable coatings. Surfaces not easily accessible after shop assembly shall be treated before-hand and protected for life of the equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[124]	15.01.2016

Surfaces to be finish painted after installation shall be shop painted with at least two (2) coats of primer. Steel surfaces, which are not to be painted, shall be coated with suitable rust preventive compound subject to the approval of the Owner.

All paints shall be used in accordance with the manufacturer's instructions. No thinners or other substance shall be added to the coating material without the approval of the Owner. The quality and vendor of the paints shall require approval of the Owner.

All paints, when applied in a normal full coat, shall be free from runs, sags, wrinkles, patchiness, brush marks or other defects.

All primers shall be well marked into the surface, particularly in areas where pitting is evident, and the first priming coat shall be applied as soon as possible after cleaning, within four hours maximum. If the drying interval between successive coats, which should not exceed one week, has been so long as to endanger the adhesion of the following coat, the paint already applied shall be lightly rubbed down with fine abrasive paper before putting on the next coat.

Paint spraying on large surfaces shall not normally be done indoors, except with the approval of the Owner. Spray guns shall not be used outdoors in windy weather or near unprotected surfaces of a contrasting colour and under no circumstances shall spray guns be used where spray may be carried into or onto exposed electrical equipment.

Paint containers shall not be opened until required and the paint shall be mechanically mixed thoroughly before use, and agitated occasionally during use.

Electrical equipment shall be shop finished with one or more coats of primer and two coats of high-grade oil resistant enamel. The interior of all panels' cabinets and enclosures shall be finished with gloss white enamel.

The Bidder shall furnish sufficient touch up paint for one complete finish coat on all exterior factory surfaces of each item of equipment. The touch up paint shall be of the same type and colour as the factory applied paint and shall be carefully packed to avoid damage during shipment. Complete painting instructions shall be furnished.

Shop primer for steel and iron surfaces which will have a continuous operating temperature below 35 °C shall be selected by the Bidder, in accordance to the relevant standard. Special high temperature primer shall be used on surface exposed to operating temperature above 35 °C.

The colour scheme shall be submitted during execution of Contract for approval by the Owner.

6.10.2 Preparation

Oil and grease shall be removed from the surface by washing with a suitable detergent, rinsing with clean water, and drying.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[125]	15.01.2016

Surfaces to be shot blasted shall be cleaned to Swedish Standard SA 2.5 or equivalent, and all dust remaining after cleaning shall be removed.

The priming coat shall be applied without delay.

6.10.3 Damaged Paintwork

Any damaged paintwork shall be corrected / modified as follows:

- a) The damaged area, together with an area extending 25mm around its boundary, shall be cleaned down to bare metal.
- b) A priming coat shall be immediately applied, followed by a full paint finish equal to that originally applied and extending 50mm around the perimeter of the original damage.
- c) The repainted surface shall present a smooth surface. This shall be obtained by carefully chamfering the paint edges before and after priming.

6.10.4 Painting Systems

The requirements for the dry film thickness (DFT) of paint and the materials to be used shall be as stated below, unless otherwise specified elsewhere in this Specification.

a) Surfaces Subject to Weathering

All surfaces shall have a minimum of four coats of paint made up as follows:

Primer coat	:	35 micron DFT
Tie coat	:	35 micron DFT
Finishing coat (2 Nos.)	:	35 micron DFT per coat

The total minimum DFT shall be 140 micron.

b) Surfaces Inside Buildings

All surfaces shall have a minimum of Four coats of paint made up as follows:

Primer coat	:	35 micron DFT
Tie coat	:	35 micron DFT
Finishing coat (2 Nos.)	:	25 micron DFT per coat

The total minimum DFT shall be 120 micron.

The type and colour of primer & finish coat shall be selected by the Bidder after approval by the Owner.

6.11 Environment Protection

6.11.1 Environment Protection

The plant & equipment under this R&M project shall be designed for installation and operation in harmony with the surrounding environment and all measures of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[126]	15.01.2016

pollution control shall be ensured by the Bidder to restrict pollution from the liquid effluent and stack emission within the limits as given below with due consideration of Environment (Protection) Rules.

6.11.2 For Liquid Effluent

During construction activities, Bidder shall maintain the statutory compliance of State Pollution Control Board and MoE&F in respect of pollution control and environmental protection within and around plant boundary. Any specific requirement of State Pollution Authorities over and above shall be maintained.

6.11.3 Noise Level Requirement

The plant & equipment under this R&M project will be designed, constructed and provided with suitable acoustic measures to ensure the noise level criteria as per the following stipulations of MoEF & State Pollution Control Board.

- a) Maximum noise level shall not exceed 85 dB (A) when measured at 1.0 m away from the noise emission source.
- b) Maximum noise level from its source within the premises shall not exceed 70 dB (A) as per Environment (Protection) Rules 1986, Schedule-III, 'Ambient Air Quality Standards' in respect of noise.
- c) Any statutory changes in stipulations regarding noise limitation that may occur in future according to State Pollution Control Board or Central pollution Control Board or Ministry of Environment & Forest regulation during tenure of the contract, the Bidder shall comply with the updated/amended requirement.

An exception will be made for the plant at startup operations of other big pressure reducing devices operating during emergency periods and for the safety valves.

6.12 Inspection and Testing

6.12.1 Inspection and Tests during Manufacture

6.12.1.1 The method and techniques to be used by the Bidder for the control of quality during manufacture of all plant and equipment shall be agreed with the Owner prior to the Award of Contract.

6.12.1.2 The Owner's general requirements on quality control and shop tests is mentioned in Section II of Volume-II.

6.12.1.3 Owner shall be informed for witnessing the shop tests of any item of the plant or equipment for checking the compliance with the Specification requirement and or related standards prior to leave place of manufacturing.

6.12.1.4 Advance notice shall be given to the Owner as agreed in the Contract, prior to the stage of manufacture being reached, and the piece of plant must be held at this stage until the Owner has inspected the piece, or has advised in writing that

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[127]	15.01.2016

inspection is waived. If having consulted the Owner and given reasonable notice in writing of the date on which the piece of plant will be available for inspection, the Owner does not attend, the Bidder may proceed with manufacture having forwarded to the Owner duly certified copies of his own inspection and test results.

- 6.12.1.5 The Bidder shall forthwith forward to the Owner the Test Certificates in [...] copies for approval.
- 6.12.1.6 Under no circumstances any repair or welding of castings be carried out without the consent of the Owner. Proof of the effectiveness of each repair by radiographic and/or other non destructive testing technique, shall be provided to the Owner.
- 6.12.1.7 All the individual and assembled rotating parts shall be statically and dynamically balanced in the works.
- 6.12.1.8 Where accurate alignment is necessary for component parts of machinery normally assembled on site, the Bidder shall allow for trial assembly prior to dispatch from place of manufacture.
- 6.12.1.9 All materials used for the manufacture of equipment covered under this Specification shall be of tested quality. Relevant test certificates shall be made available to the Owner. The certificates shall include tests for mechanical properties and chemical analysis of representative material.
- 6.12.1.10 All pressure parts connected to pumping main shall be subjected to hydraulic testing at a pressure of 150% of design pressure. The duration of the pressure tests shall be sufficient, as approved by the Owner, to show any leakage paths and to permit a thorough examination of the component whilst under pressure.
- 6.12.1.11 All necessary non destructive examinations shall be performed to meet the applicable code requirements.
- 6.12.1.12 All welding procedures adopted for performing welding work shall be qualified in accordance with the requirements of Section-IX of ASME code or IBR as applicable. All welded joints for pressure parts shall be tested by liquid penetrant examination according to the method outlined in ASME Boiler and Pressure Vessel code. Radiography, magnetic particle examination magnaflex and ultrasonic testing shall be employed wherever necessary/ recommended by the applicable code. At least 10% of all major butt welding joints shall be radiographed. Payments in respect of IBR approvals including inspection shall be made by Owner. Bidder scope shall be limited to preparation of all necessary documents, coordination and follow up for above approvals.
- 6.12.1.13 The Bidder shall furnish the quality procedures to be adopted for assuring quality from the receipt of material at site, during storage, erection, pre-commissioning to tests on completion and commissioning of the complete system/equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[128]	15.01.2016

6.12.2 Performance Tests at Site

- 6.12.2.1 The full requirements for testing the system shall be agreed between the Owner and the Bidder prior to Award of Contract. The completely erected System shall be tested by the Bidder on site under normal operating conditions. The Bidder shall also ensure the correct performance of the System under abnormal conditions, i.e. the correct working of the various emergency and safety devices, interlocks, etc.
- 6.12.2.2 The Bidder shall provide complete details of his normal procedures for testing, for the quality of erection and for the performance of the erected plant. These tests shall include site pressure test on all erected pipe work to demonstrate the quality of the piping and the adequacy of joints made at site.
- 6.12.2.3 For details of specific tests required on individual equipment refers to respective section of this specification.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[129]	15.01.2016

7 LAYOUT CONSIDERATION

{Effort shall be made to keep the Layout of the newly equipped system / packages under the R&M project unchanged to the extent possible with respect to existing layout to avoid disturbance to the existing equipment & facilities for which any modification/changes are not envisaged based on RLA/LA and EA assessment. However a general guidelines, which needs to be followed, as required, are given below :}

The broad salient features of the existing and expected layout arrangements of various equipment in the main plant building housing the turbine generator and its auxiliaries and Boiler area are given as hereunder:

- 7.1 The arrangement of the turbine- generator in the main plant building is of *[longitudinal type]*. The boiler centre line is in the *[same as that of TG condenser]*. Unit pitching distance between centre lines of two boilers is *[approximately 120m]*. The column spacing of main plant building is *[about 10 m]*.
- 7.2 *[The conventional arrangement of AB, BC and CD longitudinal bays with D row as first row of boiler columns is adopted with their respective widths of about 30m, 10m and 11m. The mill bunker building is about 12m wide].*
- 7.3 *[Two transverse bays at 0.0 m elevation equivalent to minimum area ofm² has been provided for unloading and maintenance at one end of main plant building].*
- 7.4 *[The location of control room (common for two units) is in BC bay at the operating floor level. Adjoining the control room, there is a control tower which accommodates control equipment room, AC plant room, battery room and UPS for C&I system, cable vault etc. at its different floor levels].*
- 7.5 The local pits/trenches in main plant building/ mill bunker bay building/ boiler/ ESP area is to be avoided as far as possible.
- 7.6 Clear walk ways of minimum 1.5 m width at all the levels shall be provided in the main plant building. Adequate fire escape staircases shall be provided with fire doors at each landing.
- 7.7 *[Interconnecting walkways (minimum 2.0 m clear) shall be provided between main plant building and boiler on either side of boiler at three elevations viz. mezzanine, operating and deaerator floor levels].*
- 7.8 *[The layout arrangement of critical piping connecting the steam generator and steam turbine shall be developed in such a way as to optimize the use of materials and resulting in minimum pressure losses in the steam flow].*
- 7.9 *[In the TG building area, facility of crane/ chain pulley block/ monorail hoist etc. will be provided, as required, along with provision of space for maintenance/ overhauling of equipment/components such as Turbo Generator, Boiler Feed Pump, Condensate Extraction Pump, Motors, Heaters and Valves etc.]*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[130]	15.01.2016

- 7.10 Trestles to be provided for routing of cables, pipes etc. shall have a clear height of 8.0m at road crossings so as to clear the road spaces, approach to maintenance bays of different equipment. A walkway with hand rails and toe guards of 750mm (minimum) width shall be provided all along length of the trestle for maintenance of cables and pipes. Ladders for approach to these platforms shall be provided near roads, passage ways.
- 7.11 Floor drains shall be provided at all floors and drain discharge pipes shall be properly sized taking into account the fire water sprinkler system wherever provided.
- 7.12 Valves shall be located in accessible positions. All piping shall be routed at a clear height of minimum 2.5 m from the nearest access level for clear man movement. Best engineering practices shall be adopted for keeping the minimum clear working space around equipment and clear headroom within main structures and cable trays etc.
- 7.13 Fire water pipes in main plant area may be routed in trenches filled with sand and covered with pre-cast RCC covers.
- 7.14 The safety requirements as per the Factories Act, Indian Electricity Rules and other applicable codes/standards etc. shall be observed while developing the layout.
- 7.15 The Existing layout details of the plant are indicated in the enclosed drawings as per Annexure-I. However, the Bidder to suggest his own modified layout arrangement which shall be subject to approval of the purchaser.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[131]	15.01.2016

8 PERFORMANCE GUARANTEES

The term "Performance Guarantees" wherever appears in this Section shall have the same meaning and shall be synonymous to "Functional Guarantees".

Similarly the term "Performance Tests" wherever appears in this Section shall have the same meaning and shall be synonymous to "Guarantee Test(s)".

The term "BMCR" (Boiler Maximum Continuous Rating) appearing in the Technical Specification shall mean the maximum continuous steam output at super heater outlet of Boiler at rated parameters.

The term "TMCR" (Turbine maximum continuous rating) appearing in the Technical Specification shall mean [210/215/220/250] MW electrical power output at generator terminals under [3%] cycle make-up and [76] mm Hg (abs) condenser pressure, unless used in conjunction with a different cycle make-up.

8.1 General Requirements

8.1.1 The Bidder shall guarantee that the equipment offered shall meet the ratings and performance requirements stipulated for various equipment covered in this technical Specifications.

8.1.2 The guaranteed performance parameters furnished by the Bidder in the Bid proposal, shall be without any tolerance values and all margins required for instrument inaccuracies and other uncertainties shall be deemed to have been included in the guaranteed figures.

8.1.3 The Bidder shall demonstrate all the guarantees covered herein under Category I, II & III during functional guarantee / acceptance test. The various tests which are to be carried out during performance guarantee/acceptance test are listed elsewhere in this-Section. The guarantee tests shall be conducted by the Bidder at site in presence of Owner on the unit.

8.1.4 All costs associated with the tests including the cost associated with the supply, calibration, installation and removal of test instrumentation shall be included in the price offered by Bidder.

8.1.5 At all times during the Performance Tests, the emissions and effluents from the Plant shall not exceed the Guaranteed Emission and Effluent Limits.

8.1.6 It shall be the responsibility of the Bidder to make the plant ready for the performance guarantee tests.

8.1.7 All instruments required for performance testing shall be of the type and accuracy required by the code and prior to the test, the Bidder shall get these instruments calibrated in an independent test institute approved by the Owner. All test instrumentation required for performance tests shall be supplied by the Bidder and shall be retained by him upon satisfactory completion of all such tests at site. All calibration procedures and standards shall be subjected to the approval of the Owner. The protecting tubes, pressure connections and other test connections required for conducting guarantee test shall conform to the relevant codes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[132]	15.01.2016

- 8.1.8 Tools and tackles, thermowells (both screwed and welded) instruments/devices including flow devices, matching flanges, impulse piping & valves etc. and any special equipment, required for the successful completion of the tests, shall be provided by the Bidder free of cost.
- 8.1.9 The Performance/ Acceptance test shall be carried out as per the agreed procedure. The PG test procedure including demonstration tests shall be submitted within **[90 days]** of the date of Notification of Award and finalization of the PG test procedure shall be done within **[180 days]** from the date of Notification of Award. After the conductance of Performance test, the Bidder shall submit the test evaluation report of Performance test results to Owner promptly but not later than one month from the date of conductance of Performance test. However, preliminary test reports shall be submitted to the Owner after completing each test run.
- 8.1.10 The P&G test procedures shall be submitted for equipment/ system & subsystem under Bidder's scope for all Guarantees under category I, II & III as mentioned below, as per ASME PTC 6 or latest International codes & standard including correction curves, meeting the Specification requirements along with sample calculations & detailed activity plan of preparation (including test instrumentation), conductance and evaluation of Guarantees.
- 8.1.11 The Bidder shall submit for Owner's approval the detailed Performance Test procedure containing the following:
- Objective of the test.
 - Various guaranteed parameters & tests as per Contract.
 - Method of conductance of test and test code.
 - Duration of test, frequency of readings & number of test runs.
 - Method of calculation.
 - Correction curves.
 - Instrument list consisting of range, accuracy, least count, and location of instruments.
 - Scheme showing measurement points.
 - Sample calculation.
 - Acceptance criteria.
 - Any other information required for conducting the test.
- 8.1.12 In case, during performance guarantee tests, it is found that the equipment/systems has failed to meet the guarantees, the Bidder shall carry out all necessary modifications and/or replacements to make the equipment/system comply with the guaranteed requirements at no extra cost to the Owner. However, if the Contractor is not able to demonstrate the guarantees, even after

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[133]	15.01.2016

the above modifications/replacements within *[ninety (90)]* days or a reasonable period allowed by the Owner after the initial performance guarantee tests have been completed, the Owner will have the right to impose the stipulated clauses under Guarantee Category I, II & III as specified in this specification:

8.1.13 For Category-I Guarantees

Reject the equipment/system/plant and recover from the Contractor payments already made

(OR)

Accept the equipment/system/plant after levying Liquidated Damages (LD) as specified in Clause No. 5.6 of Volume I of this specification. The LD's shall be prorated for the fractional parts of the deficiencies.

8.1.14 For Category-II Guarantees

Reject the equipment/plant/system and recover, from the Contractor, the payments already made. Conformance to the performance requirements under Category-II is mandatory.

8.1.15 For Category-III Guarantees

Reject the equipment/system/plant & recover, from the Contractor, the payments already made.

(OR)

Accept the equipment/system after assessing the deficiency in respect of the various ratings, performance parameters and capabilities and recover from the contract price an amount equivalent to the damages as determined by the Owner. Such damages shall however be limited to the cost of replacement of the equipment/systems replacement of which shall remove the deficiency so as to achieve the guaranteed performance.

8.2 Performance Guarantees under Category-I

The performance guarantees which will attract liquidated damages shall be as follows:

- (i) Maximum continuous electrical output, in MW, at Generator terminals of each unit at rated parameters under VWO Condition.
- (ii) Turbine Cycle Gross Heat rate in kCal/kWh at rated steam conditions at 76 mm Hg (abs) design condenser pressure with 3% make up at 100% TMCR load. Heat rate shall be calculated as per the formula shown in clause 8.2.2
- (iii) Condenser Pressure with Unit Operating at VWO Condition.
- (iv) Unit Auxiliary Power Consumption at 100% TMCR unit load at condenser pressure of *[76]* mm Hg (abs)] with 3% make-up and with design ambient air condition.

Note: Power consumption of each of the pump/fan/compressors etc. wherever mentioned shall be measured with its own drive.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[134]	15.01.2016

8.2.1 Limit of Technical Parameters under Liquidated Damages Applicable For Category-I Guarantees:

Table: 8.1

S.No.	Parameter	Performance Limit for Rejection (LD is Applicable within below mentioned Limit. Beyond the Limit as below, the equipment/system/plant will call for Rejection.)
1	Gross Output of each unit	Shortfall beyond [1%] of guaranteed value (i.e. – [1.0 %])
2	Turbine Cycle Heat Rate	Increase beyond [1%] of guaranteed value (i.e. + [1%])
3	Condenser Pressure	Increase beyond [1%] of guaranteed value (i.e. + [1%])
4	Auxiliary Power	Increase beyond [5%] of guaranteed value/. (i.e. + [5.0 %])

8.2.2 Calculation of Turbine Heat Rate

a) Turbine Cycle Heat Rate

Turbine Cycle Heat Rate shall be calculated as follows & indicated in all computed heat balance diagrams:

$$\text{Heat Rate} = \frac{M1 (H1-h1) + M2 (H3-H2) + Mis (h1 - his) + Mir (H2 - hir)}{Pg}$$

Where,

M1 Quantity of live steam entering the turbine stop valve including any live steam supplied to valve stems, or glands etc. in kg/hr.

M2 Quantity of Reheat steam from reheater to turbine in kg/hr.

Mis Quantity of desuperheating water flowing into Superheater system for regulation of steam temperature in kg/hr.

Mir Quantity of desuperheating water flowing into reheater system for regulation of steam temperature in kg/hr.

H1- Enthalpy in kCal/kg of live steam.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[135]	15.01.2016

- H2 Enthalpy in kCal/kg of steam HPT Exhaust to reheat.
- H3 Enthalpy in kCal/kg of reheated steam from reheater to IP turbine.
- h1 Enthalpy of feed water in kCal/kg at the downstream of the junction of feed flow and bypass flow of HP heaters.
- hir Enthalpy of desuperheating water flowing into reheat system in kCal/Kg.
- his Enthalpy of desuperheating water flowing into Superheater System in kCal/Kg.
- Pg Unit output after deducting the power consumption by auxiliaries as listed below and the same shall be [210/215/220/250] MW at 100% TMCR unit load:
- Power taken by Excitation system (kW) including transformer losses, as applicable for various guarantee points in case of static excitation system. (The transformer losses at various points shall be based on factory test to be conducted).
 - Power required for ventilation of oil and control fluid tanks, if ventilating fans are separately driven (kW).
 - Power required for lubrication, if lubricating pumps are separately driven (kW).
 - Power required for control fluid pumps, if control fluid pumps are separately driven (kW).
 - Power required for hydrogen, seal oil auxiliaries, if separately driven (kW).
 - Power required for stator water cooling system, if cooling pumps are driven separately (kW).
 - Power required for Gland Steam Exhauster (GSC) if GSC Exhausters are separately driven.

Notes:

- Corrections Applicable for Turbine Cycle Heat rate & Turbine Generator Output tests

Based on cycle condition & covering entire range of operation for Turbine following correction curves for variation in Turbine Cycle Heat rate & Turbine Generator output to be furnished:

- Variation in main steam pressure and temperature.
- Variation in reheater steam temperature.
- Correction Curves, if applicable, due to change in superheater spray quantities with respect to coal properties.
- Correction Curves, if applicable, due to change in reheater spray quantities with respect to coal properties.
- Variation in condenser pressure for main condenser.
- Variation in power factor, frequency, generator hydrogen pressure and voltage.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[136]	15.01.2016

- ii) It may be noted that the heat balance diagrams and guarantees shall be furnished considering the quantities of water for super heater and reheater sprays with any mill combination in service to the Owner's choice.
- iii) The above list of correction curves is conclusive & curves in addition to above shall not be applied.

8.2.3 Condenser Pressure/Vacuum

Condenser Pressure Test, with Unit operating at VWO Condition, shall be carried out as per ASME PTC 12.2. .

8.2.4 Auxiliary Power Consumption

a) Auxiliary Power Consumption

The auxiliary power consumption shall be calculated using the following relationship.

$$P_{au} = \sum P_u$$

P_{au} = Guaranteed Auxiliary Power Consumption.

P_u = Power consumed by each of the auxiliaries of the unit under test.

While guaranteeing the auxiliary power consumption the bidder shall necessarily include all continuously operating unit auxiliaries.

[The auxiliaries to be considered shall include but not be limited to the following:

- i) *Boiler Feed Water Pumps (BFPs) including booster pumps and lube oil pump sets of BFPs*
 - ii) *Condensate Extraction Pumps*
 - iii) *Condenser Vacuum Pumps*
 - iv) *Excitation Power of Turbo Generator Set*
 - v) *DM CCW Pumps for Turbo Generator Auxiliaries*
 - vi) *LP Drain Condensate Pumps*
 - vii) *Turbine Oil Pumps*
 - viii) *Control Oil Pumps*
 - ix) *Seal Oil Pumps*
 - x) *Oil Vapor Extractor Fans*
 - xi) *Gland Steam Condenser Vapor Extractor Fans*
- Power consumption of any other continuously operating auxiliary for unit*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[137]	15.01.2016

operation at 100% TMCR]

Note:

1. The Bidder shall furnish a list of equipment to be covered under auxiliary power consumption, which shall be subject to Owner's approval.
2. The Bidder shall ensure that power supply to all such equipment to be covered under unit auxiliary power consumption is fed from unit board of the respective unit.

8.3 Guarantees under Category-II

Liquid Effluent:

[Liquid Effluent discharge to an outside body, from the battery limit, shall meet statutory requirements State Pollution Control Board.]

8.4 Guarantees under Category-III

The parameters/capabilities to be demonstrated for various systems/ equipment shall include but not be limited to the following:

8.4.1 Noise

All the plant, equipment and systems covered under this Specification shall perform continuously without exceeding the noise level over the entire range of output and operating frequency specified.

Noise level measurement shall be carried out using applicable and internationally acceptable standards. The measurement shall be carried out with a calibrated integrating sound level meter meeting the requirement of IEC 651 or BS 5969 or IS 9779.

Equivalent "A" weighted Sound pressure shall be measured all around the equipment at a distance of 1.0 m from the Noise emitting source.

A minimum of 6 points around each equipment shall be covered for measurement. Additional measurement points shall be considered based on the applicable standards and the size of the equipment. The measurement shall be done with slow response on the A - weighting scale. The average of A-weighted sound pressure level measurements expressed in decibels to a reference of 0.0002 micro bar shall not exceed the guaranteed value. Corrections for background noise shall be considered in line with the applicable standards. All the necessary data for determining these corrections, in line with the applicable standards, shall be collected during the tests.

If the noise level recorded is beyond the limits specified above, the Bidder should provide suitable acoustic cladding to mitigate the noise level to within allowable limits.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[138]	15.01.2016

8.4.2 Start-up, loading, Unloading and Shutdown Capabilities

a) Unit Start-up

Start-up time (up to full load), and loading capabilities for the complete unit turbine generator together with associated Auxiliaries for cold start conditions [(greater than 36 hours shutdown)], warm start conditions [(between 8 and 36 hours shutdown)] and hot start conditions [(less than 8 hours shutdown)] as indicated by the Bidder in the offer and accepted by the Owner shall be demonstrated, ensuring that the various turbine operational parameters like vibration, absolute and differential expansion, eccentricity and steam-metal temperature mismatch etc.

b) Sudden Total Loss of External Load

When the steam turbine generator unit experiences sudden total loss of all external load, the steam turbine generator unit shall not trip on over speed but shall continue to be in operation (house-load conditions) under the control of its speed governor to supply power for the plant auxiliary load while staying within the agreed limits of steam metal temperature mismatch, exhaust hood temperature, absolute and differential expansion, vibration and eccentricity. The same shall be demonstrated.

c) Steam Metal Temperature

The maximum permissible steam-metal temperature differential for cold, warm and hot start conditions and loading/unloading and shutdown conditions shall be as indicated by the Bidder and accepted by the Owner.

8.4.3 Other Parameters for Steam Turbine and Auxiliaries

(a) HP & LP Bypass system should satisfy the following functional requirements under automatic interlock action. It should come into operation automatically under the following conditions:

- Generator circuit breaker opening
- HP-IP stop valves closing due to turbine tripping
- Sudden reduction in demand to house load

Under all these conditions, while passing the required steam flows as per the relevant heat balances, the condenser should be able to swallow the entire steam without increasing the exhaust hood temperature and condenser pressure beyond the maximum permissible value indicated by the Bidder in its offer and accepted by the Owner. The same shall be demonstrated.

(b) Run back Capability

Run back, rate of change of load and sudden load change withstand capabilities as guaranteed in the respective technical specifications volume.

(c) Following Parameters shall be demonstrated for steam condensing Plant:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[139]	15.01.2016

- i. Temperature of condensate, at outlet of condenser, shall be less than Saturation temperature corresponding to the condenser pressure at all Loads.
 - ii. Oxygen content in condensate, at hot well outlet, shall not exceed *[0.015 cc per liter]* over the entire load range and shall be determined according to calorimetric indigo – Carmine method.
 - iii. Air leakage in the condenser under full load condition shall not exceed more than 50% of design value taken for sizing the condenser air evacuation system.
 - iv. When one half of the condenser is isolated, condenser shall be capable of taking at least 60% TG load under TMCR conditions.
 - v. The air and vapour mixture from air cooling zone of condenser shall be 4.17 °C below the saturation temperature corresponding to 25.4 mm hg (abs) suction pressure. Correction curves for establishing the same at site conditions shall also be furnished.
 - vi. Life of sponge rubber balls and number of balls lost during 1000 hours of plant operation (for the Condenser on-load tube cleaning system) shall be as indicated by Bidder in the offer and accepted by the Owner.
- (d)** Following parameters shall be demonstrated for Feed Water Heaters and Deaerator:
- i. TTD's and DCA's of feed water heaters in line with 100 % TMCR heat rate guarantee heat balance.
 - ii. Dissolved O₂ content at Deaerator outlet without chemical dosing at all loads, not to exceed *[0.005 cc/liter]* determined as per ASTM-D-888 - Reference method A or Indigo Carmine method.
 - iii. Difference between saturation temperature of steam entering the Deaerator and temperature of feed water leaving Deaerator.
 - iv. Continuous & efficient operation and performance of feed heating plant without undue noise and vibrations at all loads and duty conditions.

(e) Boiler Feed Pumps

The pumps with its drives will operate satisfactorily at site for the whole range of rated operating condition as specified. The controls such as auto starting of pumps, speed, recirculation, etc. will also be tested for satisfactory performance. Parallel operation of pumps with different combinations will also be tested. During entire range of operation the vibration level will conform to VDI 2056.

(f) Condensate Extraction Pump

The pumps with its drives will operate satisfactorily at site for the whole range of rated operating condition as specified. The controls such as auto starting of pumps, speed, recirculation, etc. will also be tested for satisfactory performance. Parallel operation of pumps with different combinations will also be tested. During entire range of operation the vibration level will conform to VDI 2056.

LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[140]	15.01.2016

(g) [Drip Pump (if Applicable)]

- i. Each drip pump shall be capable of delivering flow & total dynamic head corresponding to design point as specified.
- ii. The vibration and noise level shall be demonstrated.

8.4.4 Auxiliary Water System Pumps

Capacity and head and power consumption of all the pumps dedicated to Turbo Generator & its Auxiliaries at the rated duty point (to be demonstrated and proved at shop with the respective job motors).

Vibration, noise level and parallel operation of all the pumps at the rated duty point shall be demonstrated at site.

8.4.5 Equipment Cooling Water System

- a) Parallel operation of pumps shall be demonstrated at site.
- b) Pressure drop across the heat exchanger on the primary & secondary water circuit shall be demonstrated at site.

9 SPARE PARTS

The Bidder shall include in his scope of supply all the necessary mandatory spares, start up and commissioning spares and recommended spares and indicate these in the relevant schedules. The general requirements pertaining to the supply of these spares is given below:

9.1 Mandatory Spares

The list of mandatory spares considered essential by the purchaser is enclosed in Annexure-II of this Specification. The Bidder shall indicate the prices for each and every item (except for items not applicable to the Bidders design) in the 'Schedule of mandatory spares' whether or not he considers it necessary for the Owner to have such spares. If the Bidder fails to comply with the above, the cost of such spares shall be deemed to be included in the Contract price. The Bidder shall furnish the population per unit of each item in the relevant Schedules. Whenever the quantity is mentioned in "sets" the Bidder has to give the item details and prices of each item.

Whenever the quantity is indicated as a percentage, it shall mean percentage of total population of that item in the R&M Contract unless specified otherwise, and the fraction will be rounded off to the next higher whole number. Wherever the requirement has been specified a 'set', it will mean as applicable for one complete Unit or each type & size of the Equipment being taken up for refurbishment or replacement. .

All mandatory spares shall be delivered at site at least two months before scheduled date of initial operation of the first unit. However, spares shall not be dispatched before dispatch of corresponding main equipment.

Wherever quantity is specified both as a percentage and a value, the Bidder has to supply the higher quantity until and unless specified otherwise. Price of mandatory spare parts will also be evaluated.

9.2 Recommended Spares

In addition to the mandatory spare parts mentioned above, the Bidder shall also provide a list of recommended spares for [five (5)] years of normal operation of the plant and indicate the list and total prices in relevant schedule. The list shall take into consideration the mandatory spares specified and should be independent of the list of the mandatory spares. The purchaser reserves the right to buy any or all of the recommended spares. The recommended spares shall be delivered at project site at least two months before the scheduled date of initial operation of first unit. However, the spares shall not be dispatched before the dispatch of the main equipment.

Prices of recommended spares will not be used for evaluation of the Bids. The price of these spares will remain valid up to execution of the Contract. However, the Bidder shall be liable to provide necessary justification for the quoted prices for these spares as desired by the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[142]	15.01.2016

9.3 Start-up & Commissioning Spares

Start up and commissioning spares are those spares which may be required during the start-up and commissioning of the equipment/system. The Bidder shall provide all such start up and commissioning spares and keep an adequate stock of the same to be brought by him to the site for the plant erection and commissioning. These must be available at site before the equipment are energized. The unused spares, if any, should be removed from there, only after handing over of the plant. All start up spares which remain unused at the time shall remain the property of the Bidder.

9.4 General Requirements

The Bidder shall indicate the service expectancy period for the spares parts (both mandatory and recommended) under normal operating conditions before replacement is necessary.

All spares supplied under this Contract shall be strictly inter-changeable with the parts for which they are intended for replacements. The spares shall be treated and packed for long storage under the climatic conditions prevailing at the site e.g. small items shall be packed in sealed transparent plastic with desiccators packs as necessary.

All the spares (both mandatory and recommended) shall be manufactured along with the main equipment components as a continuous operation as per same Specification and quality plan.

The Bidder will provide Owner with cross-sectional drawings, catalogues, assembly drawings and other relevant documents so as to enable the Owner to identify and finalize order for recommended spares.

Each spare part shall be clearly marked or labeled on the outside of the packing with its description. When more than one spare part is packed in a single case, a general description of the content shall be shown on the outside of such case and a detailed list enclosed. All cases, containers and other packages must be suitably marked and numbered for the purposes of identification.

All cases, containers or other packages are to be opened for such examination as may be considered necessary by the purchaser.

The Bidder will provide the Owner with all the addresses and particulars of his sub-suppliers while placing the order on Vendors for items/ components/ equipment covered under Contract and will further ensure with his Vendors that the Owner, if so desires, will have the right to place order for spares directly on them on mutually agreed terms based on offers of such Vendors.

The Bidder shall warrant that all spares supplied will be new and in accordance with the Contract documents and will be free from defects in design, material and workmanship.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-I	[143]	15.01.2016

In addition to the recommended spares listed by the Bidder, if the Owner further identifies certain particular items of spares, the Bidder shall submit the prices and delivery quotation for such spares within 30 days of receipt of such request for consideration by the Owner and placement of order for additional spares if the Owner so desires.

The Bidder shall guarantee the long term availability of spares to the Owner for the full life of the equipment covered in the Contract. The Bidder shall guarantee that before going out of production of spare parts of the equipment covered under the Contract, he shall give the purchaser at least 2 years advance notice so that the latter may order his bulk requirement of spares, if he so desires. The same provision will also be applicable to Sub-Bidders. Further, in case of discontinuance of manufacture of any spares by the Bidder and/or his sub-Bidders, Bidder will provide the purchaser, two years in advance, with full manufacturing drawings, material Specifications and technical information including information on alternative equipment makes required by the Owner for the purpose of manufacture/procurement of such items.

The prices of all future requirements of spares beyond *[five (5)]* years shall be derived from the corresponding FOB/Ex-works price at which the order for such spares have been placed by the Owner as a part of the mandatory spares or recommended spares. FOB/Ex-works order price of future spares shall be computed in accordance with the price escalation formula to be furnished by Bidder indicating base price reference variation indices for material, labour etc. Based on the formula and considering escalation indices prevailing at the time of order of spares, order price shall be worked out. The base indices will be counted from the scheduled date of successful completion of trial operation of the last plant/equipment under the project. The above option for procuring future recommended spares by the purchaser shall remain valid for the period of fifteen *[fifteen (15)]* years from the date of successful completion of trial operation of the last plant/equipment. In case the spare parts from the same sub-Vendor are not available due to obsolescence or any other reason, the Bidder shall supply the spares for a period of *[fifteen (15)]* years from an alternative source.

ANNEXURES-II

Mandatory Spares

{Applicable Mandatory Spares for the equipment system to be replaced / refurbished / retrofitted under the scope of this R&M Tender shall be provided as detailed in Annexure-II. Available Mandatory spares of the existing Unit, which can be used after completion of R&M work, shall also be verified before finalization of the below mentioned Spare List. Mandatory Spares shall be defined as for each Unit. The unit, 'set', indicated in the table below will mean as applicable for one complete Unit or each type & size of the Equipment being taken up for refurbishment or replacement.}

A. MECHANICAL

1. TG & Auxiliaries

Sl. No	Description	Unit	Quantity	Remarks
1.0	TURBINE & AUXILIARIES			
1.1	HP Turbine			
1.1.1	All studs, bolts, washers and nuts in HP inner and outer casings other than in the inlet and outlet connections	Set	1	
1.1.2	All studs, bolts, washers and nuts for steam inlet and outlet connections to and from the HP casing.	Set	1	
1.1.3	Gland sealing rings with springs assembly	Set	1	
1.1.4	All keys, pins, bushes and screws	Set	1	
1.1.5	Inter-stage seal strip and caulking wire (both rotating and stationary)	Set	1	Set consists of total length of seal strip and caulking wire in all stages both in the casing and the rotor for 1 turbine.
1.1.6	Sealing rings for M.S inlet and CRH outlet insert connection	Set	1	
1.1.7	Balance weight along with fixing screws for	Set	1

5.0.10	Thrust collar if not integral with shaft	No.	1	
5.0.11	Recirculation valve with actuator	Sets	1	
5.0.12	Motor bearings of each type & size	Set	1	
5.0.13	Terminal bushings of each type	Nos.	1	
5.0.14	Cooling fan assembly	No.	1	
5.0.15	Boiler Feed Pump Motor complete	No	1	
5.1	Lubrication oil pump for Boiler Feed pump set			
5.1.1	Rotating Assembly complete	Set	1	Rotating assembly consists of all the rotating parts except bearings.
5.1.2	Bearings	Set	1	
5.1.3	Wearings rings for centrifugal pump (if applicable)	Set	1	
5.1.4	Lubricating oil pump motor	No.	1	
5.1.5	Bearings for Lubricating oil pump motor	Set	1	
5.1.6	Duplex filter assembly	Set	1	
5.1.7	Duplex Filter elements	Sets	3

LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-I, Annexure-II	[18]	25.09.2014

Sl. No	Description	Unit	Quantity	Remarks
6.0	BOOSTER PUMP FOR BOILER FEED PUMP			
6.0.1	All Bearings	Set	1	
6.0.2	Shaft with shaft sleeves, keys and locknuts	Set	1	
6.0.3	Wearing rings	Sets	2	
6.0.4	Shaft coupling between Motor and booster pump along with coupling bolts, bushes, nuts and washers	Set	1	
6.0.5	All O-rings, U-rings/V-rings, oil seals and gaskets	Sets	2	
6.0.7	Mechanical seal assembly complete	Sets	3	
6.0.8	Rotating assembly complete	Set	1	Rotating assembly consists of all the rotating parts except the bearings.
6.0.9	Impeller	No.	1	
6.1	Booster pump suction strainers			
6.1.1	Fine mesh screens	Sets	3	
6.1.2	Coarse mesh screens	Sets	3	
6.1.3	Gaskets	Sets	2	
6.1.4	Bolts, nuts & washers	Set	1	
7.0	HYDRAULIC COUPLING FOR BOILER FEED PUMP			
7.0.1	All bearings	Sets	1	
7.0.2	Primary and secondary wheels along with shafts	Set	1	
7.0.3	Scoop tube & actuator	Set	1	
7.0.4	Oil filter elements	Sets	3	
7.0.5	All Gaskets, oil seals, O-rings, U-rings/ V-rings and sealing rings	Sets	2

SI.No	Description	Unit	Qty.	Remarks
11.0	415 V Distribution Board (ACDB/PDB/MLDB)			
	<i>(Spares to be repeated for each make of BOARD)</i>			
11.1	<i>Busbar support insulator</i>	<i>Nos.</i>	<i>10</i>	
11.2	<i>Fuses of each type and rating:</i>			
11.2.1	<i>Power</i>	<i>Nos.</i>	<i>10</i>	
11.2.2	<i>Control</i>	<i>Nos.</i>	<i>20</i>	
11.3	<i>MCB of each type & rating</i>	<i>Nos.</i>	<i>2</i>	
11.4	<i>Switch Fuse Units of each rating & type</i>	<i>Nos.</i>	<i>2</i>	
11.5	<i>MCCB of each rating & type</i>	<i>Nos.</i>	<i>2</i>	
11.6	<i>Meters of each type</i>	<i>Nos.</i>	<i>1</i>	
11.7	<i>Switches of each type and rating</i>	<i>Nos.</i>	<i>1</i>	
11.8	<i>Terminal Blocks</i>	<i>Nos.</i>	<i>10</i>	
12.0	415 V Sub-Distribution Board/FUSE DBS/LDBS/ALDBS			
	<i>(Spares to be repeated for each make of Board/panel)</i>			
12.1	<i>Fuses of each type and rating</i>	<i>Nos.</i>	<i>10</i>	
12.2	<i>Push button</i>	<i>Nos.</i>	<i>10</i>	
12.3	<i>Terminal Blocks</i>	<i>Nos.</i>	<i>10</i>	
12.4	<i>MCB of each type & rating</i>	<i>Nos.</i>	<i>2</i>	
12.5	<i>SFU of each rating & type</i>	<i>Nos.</i>	<i>3</i>	
13.0	LT TRANSFORMER (Oil/Dry type)			
	<i>(for each type and rating of transformers)</i>			
13.1	<i>Complete Winding Temperature indicating equipment</i>	<i>Set</i>	<i>1</i>	
13.2	<i>CTs of each type and rating</i>	<i>No.</i>	<i>1</i>	
13.3	<i>Support Insulators</i>	<i>Set</i>	<i>2</i>	
13.4.1	<i>HV bushing</i>	<i>Nos</i>	<i>4</i>	
13.4.2	<i>LV bushing</i>	<i>Nos</i>	<i>4</i>	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-I, Annexure-II	[32]	25.09.2014

SI.No	Description	Unit	Qty.	Remarks
13.4.3	LV neutral Bushing	Nos	2	
13.4.4	Bushing CT(LV) of each rating	Nos	2	
13.4.5	Complete set of gaskets	Sets	2	
13.4.6	One valve of each type	Sets	2	
13.4.7	Magnetic oil level gauge with contacts (for oil type)	Nos	2	
13.4.8	Winding temperature indicator(WTI) with all accessories	Nos	2	
13.4.9	Dial type Oil temperature indicator(OTI) (for oil type)	Nos	2	
13.4.10	Silica gel breather	Nos	2	
13.4.11	Buchholz relay	Nos	2	
13.4.12	Radiator unit	No.	1	
13.4.13	Pressure relief device	Nos	2	
13.4.14	Tap Changer Contact	Set	1	
14.0	220 V DC SYSTEM			
14.1	Battery			
14.1.1	Stand Insulators	Nos.	50	
14.1.2	Connectors with Nuts and Bolts	Nos.	50	
14.2	Battery Chargers			
14.2.1	Contactors of each type	Nos.	10	
14.2.2	Coils for each type of Contactor	Nos.	10	
14.2.3	Main & Aux Contact sets	Nos.	10	
14.2.4	DC Ammeter of each type	Nos.	2	
14.2.5	DC Voltmeter of each type	Nos.	2	
14.2.6	AC Ammeter of each type	Nos.	2	
14.2.7	AC Voltmeter of each type	Nos.	2	
14.2.8	Control Switch of each type	Set	1	
14.2.9	Current regulators of each type	Set	1	
14.2.10	Fuses/MCBs of each type & rating	Nos.	2	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-I, Annexure-II	[33]	25.09.2014

SI.No	Description	Unit	Qty.	Remarks
14.2.11	Over load relays of each type	No.	1	
14.2.12	Filter condenser & Filter Fuses	Set	2	
14.2.13	MCCBs of each rating	Nos.	2	
14.2.14	LED Lamps	Sets	2	
14.2.15	PCBs of each type	No.	1	
14.2.16	Control Unit Relay	Nos.	10	
14.2.17	SCR module of each type	Nos.	5	
14.2.18	Blocking diode for Battery Charger per board	Nos.	5	
14.2.19	Push Buttons	Nos.	5	
14.2.20	Cooling Fan	No.	1	
15.0	NOT USED			
16.0	NOT USED			
17.0	NOT USED

C. CONTROL & INSTRUMENTATION

Sl.No	Description	Unit	Qty.	Remarks
1.0	<u>TURBINE SPARES</u>			
1.1	<u>Gland seal system</u>			
1.1.1	Limit switches for positioning actuator for seal steam supply and pump valves (gland seal system)	Nos	4	
1.2	<u>Reheater stop valves</u>			
1.2.1	Proximity sensor / limit switch for Reheater stop valves position of each type and range as applicable	Nos	2	
1.2.2	Limit switches/inductive displacement transducer for Reheater interceptor valve	Nos	2	
1.3	<u>Reheater control valve</u>			
1.3.1	Limit switches/Proximity sensor of each type	Nos	5	
1.4	<u>Governing system</u>			
1.4.1	Electrical speed measuring device	Nos	2	
1.4.2	Electronic cards for governing system			
1.4.2.1	Power supply module (24V DC)	%	10	
1.4.2.2	CPU module (MPU)	%	10	
1.4.2.3	Main power supply unit	%	10	
1.4.2.4	Analog module (I/O)	%	5	
1.4.2.5	Controller module	%	10	
1.4.2.6	RS 232 / RS 422 Communication cable of each type.	%	10	
1.4.2.7	Specialized pre fabricated cable	%	5	
1.4.2.8	Digital module	%	10	
1.4.2.9	Special types of fuses of each type and rating	%	5	
1.4.2.10	Terminal strips of each type and rating	%	5	
1.4.2.11	Isolator / MCB of each type and range	%	5	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-I, Annexure-II	[35]	25.09.2014

Sl.No	Description	Unit	Qty.	Remarks
1.4.2.12	Termination module	%	5	
1.4.2.13	Contactor (of each type and range)	%	5	
1.4.2.14	Power supply for unit for governing control system	%	10	
NOTE: Cards applicable as mentioned above and any other card used in the system other than mentioned above also shall be included as 10% of each type of modules used in the system for each unit or minimum one no. Whichever is higher				
1.4.3	All types of limit switches / proximity sensors for position indication used in governing system of each type	Nos	5	
1.4.4	All type of solenoids valve in the governing system of each type	Nos	2	
1.4.5	Trip solenoids of each type	Nos	2	
1.5	<u>Oil system</u>			
1.5.1	Oil tank level indicator	Nos	1	
1.5.2	Oil tank level transmitter	Nos	1	
1.5.3	Pressure limiting valve	Nos	1	
1.6	<u>ESV</u>			
	<u>Main steam stop valve</u>			
1.6.1	Limit switches / Proximity sensor	Nos	2	
1.7	<u>MSCV (main steam control valve)</u>			
1.7.1	Limit switches / Proximity sensor of each type	Nos	5	
1.8	<u>Valves & Specialties</u>			
1.8.1	Position transmitter for all valves of each type and make	Nos	1	
1.8.2	Solenoid operated valve used in Turbine area (of each type)	Nos	2	
1.8.3	Solenoid valves (of various types) each type and make	Nos	2	
1.9	<u>Turbine instruments (for both BFP Turbine & Main Turbine)</u>			
1.9.1	Bearing oil drain temp. Indicator of each type	Nos	2	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-I, Annexure-II	[36]	25.09.2014

1 TURBINE GENERATOR & AUXILIARIES

1.1 General Information

[The steam turbine-generator shall be located within a weather proof enclosure with a roof above the operating floor. The turbine-generator shall consist of a 3000 RPM tandem compound, single reheat, uncontrolled extraction, condensing type turbine, directly coupled to the generator. The HP, IP and LP casing shall be either independent of each other or a combination of these. The turbine low pressure ends shall be arranged for bottom exhaust to water cooled condenser.

The unit shall have nominal 210/215/220/250 MW output. The steam turbine generator shall be horizontal, fully enclosed, hydrogen cooled type or direct water-cooled stator and hydrogen cooled rotor conductors. All the auxiliaries for turbine generator shall be provided.

Each 210/215/220/250 MW Steam Turbine shall be connected to a Steam generator. The steam turbine shall be supplied with steam for generation of power and for regenerative feed heating through uncontrolled extraction points. Determination of number of turbine casing extraction points, turbine stages for extraction and final feed water temperature extraction parameters shall be based on the cycle optimization study by the Bidder considering turbine manufacturer's proven standard design.

The turbine shall provide extraction steam for feed water heating, gland sealing, as required.

This section of the specification shall be read in conjunction with the other Sections & Volumes of the specification as appropriate and the equipment offered shall meet the requirement as spelt out there-in and to complete the system requirement.]

{The double flow Baumann exhaust of LP stage of LMZ design Steam Turbine shall be retrofitted to improve the efficiency of LP Turbine. In addition retrofitting of LP Stage/ HP stage / IP stage / both HP & IP stages shall be carried out both for LMZ and KWU Turbines as per the findings of Steam Path Audit conducted during the RLA studies. The Utilities may appropriately incorporate the specifications of retrofitting the Turbines in Section-II of the specifications after the scope of work under Section-I is finalized.}

1.2 Material Requirements

The Bidder shall submit the schedule of materials used in turbine construction. The materials to be used shall not be inferior to those mentioned below.

Table: 1.1

S.No	Description	Material
i)	<i>[Turbine casing]</i>	
	HP outer casing	GS-17 Cr. Mo V 511

Document Number	Rev No.	Description	Page No.	Date of Issue

LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[2]	15.01.2016

1.3 Maintenance Requirements

i)	Wet Steam washing	a)	Each turbine shall be provided with Wet Steam washing facility as per standard proven practice of the OEM. For this necessary stub connections on turbine and required piping shall be provided, if required.
		b)	Recommended Washing procedures as per standard proven practice of the OEM shall be furnished.
ii)	Forced Cooling of Turbine		Necessary equipment shall be provided for forced cooling of turbine as per standard proven practice of the OEM to have quick access during emergency condition.
iii)	Turbine preservation	a)	This shall be provided to protect turbine against corrosion during non working Period.
		b)	Write up for the recommended preservation system shall be submitted.

1.4 Accessories to be Furnished

Each steam turbine-generator shall include the following equipment:

- i. *[Turbine rotor shall be of solid forged type. The Bidder shall provide material certificate including material chemical composition, high temperature mechanical properties, allowable temperature range, non-destructive testing method and manufacturer's name. Minimal contact between the rotor and the cylinder should not cause rotor damage or bending of the rotor shaft.]*
- ii. *[Steam pipe from inlet of emergency stop valve up to exhaust flange including all extraction valves and interceptor valves complete with all integral accessories. For hot reheat line, scope of Turbine proper shall be limited up to and including the interceptor valve near the turbine. For cold reheat line, scope of turbine proper shall be limited up to and including non return valve at the turbine exhaust.]*
- iii. *[Complete turbine integral piping and other piping including all valves (isolating, regulating, non-return, hand-operated and/or pneumatic, motorized), actuators, air vents, safety valves, relief valves, drains, hangers, supports, anchors and other fittings.]*
- iv. *[Power operated (hydraulic/pneumatic) quick closing non-return flow valves for each extraction line and cold reheat line at HP exhaust.]*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[3]	15.01.2016

- v. [60% BMCR capacity High Pressure (H.P) and Low Pressure (L.P) steam by-pass station and complete spray system, control valves, desuperheating devices, valves, controls and instrumentation etc.]
- vi. [Turbine Digital electro hydraulic governing system with triple redundancy including governors, low vacuum tripping device, bearing protective devices, solenoid trip etc. as specified hereinafter and all equipment mounted/local instruments, pressure, temperature, level switch, primary sensing devices etc. as required.]
- vii. [Suitable turning gear device, either High-speed hydraulic type or motorised turning gear as per standard proven practice of the Bidder with the provision for manual barring.]
- viii. [Complete high pressure control oil/fluid and lubricating oil systems with tanks, shaft driven oil pumps and other necessary pumps and drives, lube oil coolers, Jacking oil pumps, all connected piping, valves, filters, strainers, vapour extractors, instruments etc.]
- ix. [Turbine control and protective valve high pressure hydraulic actuation system.]
- x. [Gland steam sealing system with steam pressure regulators, desuperheater (if required), all piping, valves, steam traps, specialties and associated instruments and also gland steam condenser, vapour extractors etc Gland sealing system.]
- xi. [All piping, valves and accessories for turbine flanges, casing and stud heating system as recommended by Bidder for unitized and common system.]
- xii. [Steam turbine exhaust hood spray system including nozzles, power operated valves and specialties, hangers, supports and insulation, instruments etc.]
- xiii. [Turbine drain system complete with integral piping, valves, fittings, Motor Operated (M.O) valves, hangers, supports and insulations. Wet steam washing system for Turbines, if recommended by the OEM.]
- xiv. [Blanking discs for emergency stop and reheat interceptor and control valves and special bonnets, as required for steam blow out. Provision for steam blow-out pipe connection with cold Reheat line non-return valve.]
- xv. [Turbine exhaust casing pressure ruptures diaphragms.]
- xvi. [3x50% hot well makeup pumps taking suction from CST. Hotwell makeup pumps shall serve the makeup requirement of DM water in condenser normal/emergency makeup, ECW system, AC system chilled water expansion tank and stator water expansion tank through an alkalizer.]
- xvii. [DC solenoid operated pneumatic vacuum breaker valve with provision for remote operation.]
- xviii. [Thermal insulation and lagging for turbine equipment and piping covered under this turbine generator package.]
- xix. [All inserts / embedment / anchor bolts with necessary templates.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[4]	15.01.2016

- xx. [Coupling between turbine and generator including coupling guard as necessary.]
- xxi. [Excitation system including AVR, field suppression/flushing equipment, inter-connecting cables/ bus ducts.]
- xxii. [Generator hydrogen system equipment and controls including associated piping, valves, coolers, motor starters and control panels as required and necessary CO₂ system, defrostery, manifold, piping and monitoring instruments.]
- xxiii. [Generator terminal bushings and current transformers.]
- xxiv. [Stator water cooling system (if required).]
- xxv. [All pumps and fans.]
- xxvi. [Generator protection equipment such as rotor grounding device and alarms and runback for abnormal conditions, frame grounding pads, and neutral enclosure.]
- xxvii. [Acoustic cladding for complete steam turbine generator units along with turbine generator load.]
- xxviii. [Preservation System: Turbine preservation system consisting of adequate numbers of air drives including fans, motors, filters, heater drying wheel, connecting piping, valves, fittings etc. for preservation of corrosion of turbine during idle periods shall be provided.]

Miscellaneous Items

- i. [All sole plates, sub-sole plates, shims, jack-screws and wedges, as required, to set and align the turbine generator unit.]
- ii. [All foundation frames/base plates, anchor bolts, sleeves, nuts etc. for all equipment under this section.]
- iii. [Special lifting slings, lifting beams etc. for erection and maintenance of the turbine cylinders and rotors, generator stator and rotor, bolt heating device, tongue wrenches etc.]
- iv. [Suitable lifting attachments i.e., lifting lugs, eye bolts slings, etc. for all equipment to facilitate erection/maintenance.]
- v. [Closed Cycle DM Cooling Water System along with 3 x 50% DM cooling water pumps, 3 x 50% Plate type heat exchangers, DMCW make-up tank (10 cubic m capacity), chemical dosing system to maintain pH of closed system, with all valves, distribution piping etc. for steam Turbine and auxiliaries shall be provided.]

1.5 Steam Turbine Rating

1.5.1 Indicative Steam Turbine Parameters

[Bidder is free to optimize all terminal parameters viz main pressure, temperature final feed water temperature and condenser back pressure together with turbine

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[5]	15.01.2016

cycle configuration to offer high availability and most economical plant operation. Turbines, thus offered shall be highly reliable, proven and well established and shall be in operation for not less than two (2) years, continuously. Performance requirements shall be as follows]:

Table: 1.2

(i)	Output under maximum continuous rating (TMCR) (guaranteed output load) at generator terminals.	[210/215/220/250] MW
(ii)	Over-pressure operation	As per IEC 45
	Turbine heat rate at 100% TMCR at rated condenser vacuum and 0% make-up	Not more than [1955] kCal/kWh
(ii)	Turbine throttle steam pressure	Not less than [130] kg/cm ² (abs) at the inlet of HP turbine inlet nozzle
(iii)	Turbine throttle main steam temp.	[537] °C
(iv)	Reheat steam temp. at turbine inlet	[537] °C
(v)	Variations in rated steam temp. & pressure	As per IEC 45
(vi)	Pressure drop in reheat circuit i.e. between H.P. turbine exhaust & IP turbine inlet.	[10%] of H.P.T exhaust pressure (max.)
(vii)	Condenser design pressure	[76] mm Hg or as applicable for heat rate optimization
(viii)	Turbine speed	3000 rpm
(ix)	Frequency variation range around rated frequency of 50 Hz	+ 3% to – 5% (47.5 Hz to 51.5 Hz)
(x)	Max DM water make up to thermal cycle under	3% of throttle steam flow

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[6]	15.01.2016

	TMCR condition	
(xi)	Final feed water temp. for Heat Rate guarantee point & TMCR condition	As optimized by the Bidder but not less than [247]° C
(xii)	Turbine protection against water induction	As per ASME-TDP-I-Latest Edition
(xiii)	Design Circulating Water(CW) Temperature	[33]° C
(xiv)	Quick start capability	Turbine shall have quick start capability under all modes of start up. Start up time shall not be more than 360 minutes during absolute cold start.

1.5.2 Operational Capabilities

Table: 1.3

(i)	H.P. heaters out of service:	Turbine Generator set shall be capable of continuous operation under HP heaters out of service with maximum output Commensurate with boiler max heat duty at BMCR condition but not less than rated output. (Heat Duty at BMCR shall be calculated based on the respective HBD)
(ii)	Variation in parameters	(a) Bidder shall indicate the turbine over pressurization (under V.W.O) possible and ensure corresponding continuous output of TG set (if applicable). (b) Turbine shall be capable of accepting variation in steam temperature & pressure as per IEC-45 in case continuous over pressure operation is possible.
(iii)	Two shift & cyclic load	Turbine shall be suitable for two-shift operation & cyclic load variations.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[7]	15.01.2016

(iv)	Part load & start up	<p>Turbine shall be capable of operation on constant pressure mode as well as on variable pressure. Mode during part load & start up operation</p> <p>TG set shall be capable of being started from cold condition to full load operating conditions in as short time as possible even without availability of HP/LP Bypass system.</p>
(v)	House load operation:	<p>TG set shall be capable of operating on house load during sudden total export load throw off using HP-LP bypass system. Unit shall not trip on over speed in the event of total export load throw-off. Same shall be physically demonstrated prior to handing over of the unit.</p>
(vii)	Operation in High Condenser back pressure in emergency condition	<p>Turbine Generator set shall be capable of continuous operation under high condenser pressure at 89 mm Hg to generate [210/215/220/250] MW output. (Condenser pressure corresponding to Max [36] °C water temperature).</p> <p>Bidder shall also indicate the maximum allowable condenser back pressure at the rated MCR load.</p>

The turbine generator unit shall comply with general requirements and standards of relevant latest versions of IEC & IEEE or their approved equivalents or as per the supplier's standard practices to be mutually agreed between the Bidder and Owner and the additional requirements as specified hereinafter. All materials, equipment and fabrication procedures, wherever applicable for the equipment covered in this specification, shall also be in accordance with the latest applicable code requirements of the Indian Boiler Regulations.

The generator and accessories shall withstand, without damage, any rate of acceleration/deceleration, which the steam turbine may impart and any transient electrical conditions caused by sudden load reduction or electrical trip. The steam turbine and accessories shall be able to withstand, without damage, any transient thermal stresses, acceleration and deceleration to which they may be subjected within limitations set by proper function of the supervisory and protective devices, and within the limitations set forth in the Bidder's operation and maintenance manuals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[8]	15.01.2016

The turbine generator unit shall be capable of synchronizing and running in parallel with utility Power Grid. The turbine generator and all its auxiliaries including integral piping shall be designed for continuous and cyclic load operation.

The rotating components of the turbine-generator shall be statically and dynamically balanced. The Bidder shall indicate the maximum vibration level that can be tolerated on the bearing housings and shaft (and on bearing housing only for Exciter) during operation of the machines. The turbine-generator shall also be capable of operation at any speed above the rated speed up to 110 percent of the rated speed without exceeding the maximum vibration specified below, and without showing any sign of stress or instability. The unit shall be sufficiently strong to withstand without damage any stresses or deflections that might result from transient speed up to 120 percent of the rated speed.

1.5.3 Other General Requirements

In case the Bidder anticipates the use of spray and make up water during the performance guarantee test, the corresponding heat rate shall be guaranteed and the related heat balances shall be furnished with the bid.

The Bidder shall furnish correction curves applicable for heat rate calculations under varying parameters of steam (pressure and temperature), reheat circuit pressure drop, inlet temperature of condenser cooling water and condenser vacuum.

Bidder shall state the maximum continuous capability of the Turbine with valves wide open (VWO) and indicate the maximum flow passing ability of the machine corresponding to rated steam parameter and at rated condenser vacuum at [76] mm Hg absolute and with condenser cooling water temperature [33] °C.

The units shall be capable of operating with all the H.P. heaters out and no extraction steam supply to them. The Bidder shall indicate the maximum output the unit is capable of delivering continuously under such condition.

The turbine generator units shall be designed to operate satisfactorily under prevailing climate. They shall be suitable for indoor installation on reinforced concrete foundation.

The turbine generator units shall comply with general requirements and standards of relevant latest versions of IEC & IEEE or their approved equivalent or as per the Supplier's standard practices to be mutually agreed between the Bidder and Owner and the additional requirements as specified hereinafter. All materials, equipment and fabrication procedures, wherever applicable for the equipment covered in this specification, shall also be in accordance with the latest applicable code requirements of the Indian Boiler Regulations.

For quick restarting and flexibility during start-up of the Turbine-Generator, a suitable HP-LP bypass system shall be provided. Bidder should specifically

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[9]	15.01.2016

indicate the feature considered for bypass system and the minimum flow requirement to enable warm and hot start-up of the machine.

The rotating components of the Turbine-Generator shall be statically and dynamically balanced. Bidder shall indicate the maximum vibration level that can be tolerated on the bearing housings and shaft (and on bearing housing only for Exciter) during operation of the machines. Maximum vibration shall be within "GOOD" range of VDI- 2056.

1.6 Salient Design Features of Turbine and its Accessories

1.6.1 Steam Turbine

i) Casing

The casing shall have provision for temperature sensing elements (RTD's or thermocouples) to indicate metal temperatures in casing, nozzle block, and steam chest. Dual element temperature sensing elements shall be provided. The main horizontal and vertical joints in the turbine shell shall be metal-to-metal. The turbine low-pressure ends shall be arranged for bottom exhaust condenser.

Each turbine casing shall be provided with efficient draining facility. The parts of the turbine casing which may come in contact with wet steam in normal operation or during start-up, shall be provided with an inter-stage drainage system whereby extracted water shall be prevented from re-entry to the blading and shall be transferred to either a convenient heater extraction branch or to the condenser. The casing drains shall be provided with temperature sensing devices to ensure proper evacuation of drains.

The steam extraction branches shall be located on the lower half casings and shall be machined with weld end preparation except in the case of LP casing where bolted flanges will be acceptable.

Pressure relief bursting diaphragm for LP casing(s) to limit the exhaust hood pressure within a safe margin from design pressure shall be provided. A completely self contained exhaust hood spray system for L.P casing(s) to protect the turbine against excessive temperature due to windage at no load / low load and HP/LP Bypass operations shall also be provided.

Dismantling of casing should be possible with minimum removal of insulation.

Guide rods to prevent damage to blades during erection and maintenance shall be provided.

Bearing inspection should be possible without necessity of dismantling the turbine casing.

The supports of the turbine on the foundation shall be designed considering the expansion and contraction of the machine during thermal cycling. Axial movements shall be allowed by anchoring at one point and central position shall be maintained by fitted keys.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[10]	15.01.2016

ii) Rotor

After the assembly of the blades, each complete rotor shall be balanced for both static and dynamic conditions so that the assembled rotor will perform satisfactorily under all conditions of operation.

Ensure heat stabilization of the rotor as per SEP 1950, ASTM-A-472, Maximum permissible shaft vibration measured at bearing housing will be as per zone A of ISO 7919 (or approved equivalent standards) and maximum permissible bearing vibration measured at bearing housing will be as per zone A of ISO 10816-2 The turbine generator unit shall be designed to withstand the stresses due to an over speed of 20% above the normal synchronous speed, without reducing the life of the machine.

iii) Nozzles & Blading

All nozzles and blading shall be of hard; corrosion and erosion resisting alloy steel suitable for the temperatures encountered. In the low pressure stages where the moisture percentage and the blade peripheral speeds are high, additional protection against erosion by way of hardened surface of blades or strips of erosion and corrosion resistant material such as stellite, secured to the leading edge, shall be provided. LP stage blade hardening upto 1/3rd (min) of blade length & width 25mm (min) or stellite as per the proven standard practice shall be provided.

Ensure stress induced in LPT blading due to back end steam loading under V.W.O. conditions not to exceed 90% of design stress value.

Suitable arrangement for the removal of moisture from at least the last LP stage shall be provided.

The method of fixing of the blades to the rotor needs to have been satisfactorily proven by long use in operation. Care shall be taken to ensure that the natural frequency of the rotor blades is far away from the rotational frequency of the machine, which may vary from 47.5 Hz to 51.5 Hz.

L.P. Turbine shall have stand-alone type blades capable of sustaining + 3% to - 5% grid frequency variations.

1.6.2 Bearings and Seals

All Turbine Generator main shaft bearings shall be provided with seals to control oil and vapor leakage along the shaft. Bearings shall be of the self-aligning type and split to permit removal of the upper half for inspection. Bearings shall be accessible for inspection without removal of the turbine shells. Each main shaft bearing shall be equipped with a minimum of one dual element type temperature-sensing element imbedded in each main bearing. In addition, thermocouples shall be located in all main bearing drains.

Each thrust bearing shall be equipped with dual element type temperature sensing elements located in each front and back thrust bearing plate or shoe to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[11]	15.01.2016

provide for indication of excessive thrust bearing temperature. Pressure switches sensing thrust-bearing position shall be provided and shall initiate automatic tripping of the turbine in case of excessive thrust bearing wear.

1.6.3 Couplings

The couplings connecting the turbine and generator and the various turbine shafts shall be of a type that can be readily disconnected for purposes of inspection and repair.

1.6.4 Main Steam Emergency Stop Valves

Hydraulically operated stop valves shall be provided in the main steam line and shall be capable of being tripped automatically during over speed or at other predetermined limit points. The stop valves shall be designed with provisions for sequential remote testing while the unit is in operation. Triple-coil servo valves for valve positioning using hydraulic fluid shall be provided.

Start-up bypass operation shall be controlled from TGCS and valve position shall be indicated on the DCS via redundant communications links.

1.6.5 Reheat Stop and Intercept Valves

Combination reheat stop and intercept valves, or individual reheat stop valves and intercept valves shall be furnished with provisions for sequential remote testing while the unit is in operation. All valves shall be furnished with triple redundant position transducers that input to the TGCS for control and indication. Triple-coil servo valves for valve positioning using hydraulic fluid shall be provided.

1.6.6 Steam Strainers

Each main steam stop valve and each reheat intercept valve or combination reheat stop and intercept valve shall be equipped with permanent, integral strainers made of mesh, perforated steel plate, or equivalent elements for normal operation. Each valve shall also be equipped with removable fine-mesh strainers for initial operation. Strainer screens shall be removable without disturbing steam piping.

1.6.7 Control Valves

Governor-controlled, hydraulically operated turbine control valves shall be provided. Provisions for sequential remote testing while turbine is in operation shall be provided. All valves shall be furnished with triple redundant position transducers that input to TGCS for control and indication. Triple-coil servo valves for valve positioning using hydraulic fluid shall be provided.

The Bidder shall also submit valve opening/ closing characteristic curves for both high pressure control valves (HPCV) and intermediate pressure control valves (IPCV) respectively.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[12]	15.01.2016

1.6.8 Turbine Oil System

Complete lubrication and oil pumping system, including, but not necessarily limited to, the following shall be provided:

- i. Oil reservoir with top mounted relief valves and access doors (manholes), and all associated instrumentation and controls.

The turbine set shall be provided with an oil reservoir of adequate capacity. The capacity of the tank shall be so chosen that the full quantity of oil circulating through the system is retained for a controlled time ensuring thereby proper sedimentation and air removal. The retention time should be indicated. The capacity of the oil tank shall also be adequate to contain the total volume of oil that can be drained from the circuit into the tank. It shall be provided with removable stainless steel basket strainers and at least two oil level indicators out of which one should be visible from turbine operating floor. High and low level alarm switches to be connected to the supervisory control panel annunciation system and overflow device shall be provided. A suitably located temperature switch (with duplicate contacts), for remote high temperature annunciation, indicating the possibility of fire inside the tank, shall be provided. Two independent connections shall be provided for the tank - one for draining and sampling and the other to facilitate connection to oil purification system. Necessary manholes with self closing covers, pipe connections with flanges etc., as required shall be provided. The proposal shall include necessary access ladders, platforms and railings. 2x100% capacity A.C. vapour extractors, driven by explosion proof motors shall be furnished. The extracted vapour shall be led outside the turbine house building and provided with mist eliminator/oil separator at the terminating end of the vapour extractor line. The necessary supports, piping, accessories etc., shall also be furnished. The outer surfaces of all piping in the reservoir and the inner surface of the tank shall be coated with corrosion resistant paint

- ii. Pumping System

(a) A self contained oil system for each TG Unit consists of:

- Centrifugal / gear type, Main oil pump (MOP) directly driven by Turbine as per Bidder's standard practice with capacity to cater control oil, lube oil for bearings & emergency seal oil requirement.
- 2x100% AC Auxiliary oil pumps for start-up shut down of TG unit and as standby to M.O.P. for automatic operation, each pump having capacity to cater to lube oil and turning gear oil requirement.
- One (1x100%) DC motor driven emergency oil pump with sufficient capacity for meeting lube oil requirement of bearings during emergency with automatic starting on low lube oil pressure preset value.
- 1x100% each AC & DC jacking oil pumps having reset solenoid with an interlocking not to start till lube oil pressure is established.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[13]	15.01.2016

- Each Unit Lube Oil tank to have capacity to allow 5 to 8 oil changes per hour (at normal operating level), fitted with non-corrodable strainers, level indicator visible from turbine operating floor, and necessary manholes, platforms, railings, necessary piping, supports and accessories etc.
- 2x100% DM water cooled lube oil coolers with 10 % excess tube surface area, designed as per TEMA having oil pressure greater than water pressure fitted with Dial type Thermometer and Manual 3-way valve on oil side for change over of coolers. Oil temperature at outlet of coolers to be maintained within permissible limits at the inlet to the bearings.

All the pumps shall be provided with necessary strainers, valves and other fittings. Pressure switches shall be provided for the automatic sequential starting of the motor driven oil pumps. A panel incorporating pressure switches, transmitters and testing push buttons shall be furnished for on-load testing of all interlocks. Such on-load testing shall be so arranged that safety of the system is not jeopardized at any time.

iii. Purification System

Provide permanently Connected, Continuous Oil Purification having following major equipment.

- Oil centrifuge having capacity to purify 20% of total oil charge in system per hour and constructed from high grade stainless steel. Purified oil with no free moisture & maximum particle size conforming to code 15/12 as per ISO 4406. This shall be demonstrated with inlet oil quality conforming to code: 21/18 as per ISO: 4406.
- Carbon steel anti flood tank for each purifier.
 - Positive displacement feed & discharge pumps (if required), each having capacity 10% higher than purifying unit. Necessary interlocks for preventing centrifuge operation in case these feed and discharge pumps are not operating shall be provided.
 - Indirect Electric oil heater to heat oil to temperature not more than 65°C with possibility to cut heater elements in steps.
 - Entire purification equipment to be mounted upon a substantial metal base having a raised lip around the outside with a drain connection.
- Filters & Strainers

Duplex type filters/strainers with stainless steel element, with differential pressure switches with alarm at suction of each pump and common oil supply line shall be provided. The filter element size shall be of five (5) microns or a size suited to TG manufacturer's requirements. In addition to above, the Bidder may provide filter/strainers at oil supply line to /oil return lines from bearing and generator seals as per his standard
- Fire hazard safety precautions shall determine the design of oil piping in the high temperature zones of the turbine lubrication oil system. Oil piping shall be stainless steel. Flanged joints shall be used where necessary for assembly and dismantling of oil piping.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[14]	15.01.2016

1.6.9 Turning Gear

The turbine generator shall be equipped with an electric motor-driven or oil driven rotor turning gear capable of continuously rotating the turbine shaft to affect fast uniform cooling and warming during the coasting down and start up respectively.

An AC motor driven turning gear shall be furnished, complete with oil piping and all associated hangers and valves, and all necessary interlocks to prevent the turning gear from operating until proper oil pressure has been established in the turbine-generator bearings. The turning gear motor shall have provisions for rotating the motor shaft manually to engage the turning gear with the main turbine shaft. The turning gear shall automatically disengage when the turbine-generator speed rises above the turning gear speed and re-engage on turbine shutdown, when the turbine speed slows down to preset speed. Local turning gear instrumentation, including control switches and indicating lights, shall be provided.

1.6.10 Turbine Governing System, Protective Devices and Unloading Gears

1.6.10.1 Governing System

The steam turbine generator unit shall be equipped with an electro-hydraulic governing system with mechanical-hydraulic back up or electro-hydraulic system with 100% hot back-up. The turbine governing system shall meet the following requirements:

- i. The governing system shall be capable of controlling with stability the turbine speed between zero to maximum power output when the unit is operating in isolation *[or in parallel with other units]*.
- ii. Over speed during full load loss shall be limited to 8% of the rated speed.
- iii. Adjustable steady state speed regulation shall be provided between +3% to +6% of rated speed.
- iv. Dead band at rated speed and at any power output within rated output shall not exceed 0.06% of rated speed.

1.6.10.2 Speed Load Changer

The governing system shall be equipped with speed and load changers to control the speed or power output of the steam turbine within the limits. The speed/load changer provided shall be capable of adjusting the speed of the turbo set to any value in the range of 94% to 106% of rated speed for manual/auto synchronization of the generator with the bus. It shall be capable of varying the load on the machine from no load to full load.

For remote control, suitable motor drive shall be provided. Indication of the speed/load changer position shall be provided on the operator's work station and console panel insert.

1.6.10.3 Load Limiting Device

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[15]	15.01.2016

The governing system shall be equipped with a load limiting device capable of being operated both locally as well as remotely from unit control room for the purpose of limiting the amount of opening of the governor controlled valves to set the load at a pre-determined limit, while the turbine is in operation. A remote position indicator shall be provided on the console panel insert for indication of the setting of the load limit. Contacts shall also be provided on the load limiter for signaling load limited operation in unit control room.

1.6.10.4 Turbine Protection Devices

Emergency governor

- i. Bidder shall provide a separately actuated overspeed device called quick acting emergency governor to trip the unit at 110% of rated speed in case speed governor fails to limit the turbine overspeed.
- ii. The emergency governor resetting shall be as per manufacturer's standard practice. However, it shall meet the IEC-45 requirements for overspeed trip.
- iii. Bidder shall provide means for testing the operation of emergency governor when the machine is on load without exceeding the rated speed of the unit.

Emergency hand trip

Bidder shall provide emergency hand trip device on front pedestal/panel near turbine to facilitate manual tripping of the unit along with facility to trip turbine from UCB.

1.6.10.5 Other protection devices

The following other turbine protection devices shall also be included. Essentially the protection system shall include:

- i. Manual trip from control room and from local.
- ii. Mechanical over speed trip.
- iii. Electrical over speed trip with sensors independent of speed governing sensors (with triple sensors).
- iv. Thrust bearing excess wear trip (with triple sensors).
- v. Condenser very low vacuum trip (with triple sensors).
- vi. Lube oil pressure very low trip (with triple sensors).
- vii. Control oil pressure very low trip (with triple sensors).
- viii. Main steam temperature low trip (with triple sensors).
- ix. Generator trip
- x. Reverse power relay operated trip
- xi. Under frequency relay operated trip
- xii. Boiler trip operated trip (with triple signals)
- xiii. Power failure for turbine control and protection system (triple signals)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[16]	15.01.2016

- xiv. DDCMIS trip, closure of valve and reduction in the load and also Alarm for operator guidance in case of defects in the Turbine Control System (TCS).
- xv. Any other trips recommended by Bidder (which shall be with triple sensors)
All normal annunciations shall be configured in DDCMIS and displayed on HMI. Certain critical annunciation shall be hardwired to the panel envisaged.

1.6.10.6 Steam Turbine Supervisory Equipment

The steam turbine supervisory equipment shall indicate and record the behaviour of the steam turbine under varying conditions and provide adequate warning of the development of potentially dangerous steam turbine conditions. The steam turbine supervisory equipment shall include detection and recording of, but not limited to the following:

- i. For Bearing, shaft vibration indication in the Vibration Monitoring system (VMS) and recording in the DDCMIS (Digital distributed control management information system) shall be provided.
- ii. Shaft eccentricity
- iii. Differential expansion.
- iv. Axial shift of rotor bearing vibration indication in the Vibration Monitoring system (VMS) and recording in the (DDCMIS).
- v. Overall expansion
- vi. Vibrations in the bearing pedestals
- vii. Steam turbine speed
- viii. Load
- ix. Main steam, emergency stop and governing valve positions
- x. Interceptor stop and control valve positions
- xi. Load limiter position
- xii. Speed Changer position
- xiii. Inlet steam temperatures and pressures
- xiv. Metal temperature
- xv. Cylinder/flange metal temperatures, top and bottom casing temperatures including differentials
- xvi. Bearing metal temperatures
- xvii. Body metal temperatures of main steam and reheat steam stop and control valves
- xviii. Oil drain temperatures
- xix. Turbine Stress Control System (TSCS) capable of maintaining the thermal stresses within allowable limits and suitably integrated into plant DDCMIS.
- xx. Turbine acceleration in the DDCMIS.

1.6.10.7 Unloading Gear

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[17]	15.01.2016

Initial Pressure Regulator

- i) Initial pressure regulator shall ensure turbine unloading to a preset point to run on house load in case main steam pressure falls below a predetermined value.
- ii) It shall be possible to adjust or bypass the initial pressure regulator from UCB at start up condition to facilitate starting with low steam pressure and during sliding pressure operation.
- iii) Contact shall be provided for signaling the device in 'Operation' and 'Reset'.

Low vacuum unloading gear (if applicable)

- i) Based on the standard proven practice of the Bidder, the Bidder shall provide a low vacuum unloading gear which shall ensure progressive decrease of steam flow to turbine below a preset value of condenser vacuum, thus restoring the condenser vacuum.
- ii) Contact shall be provided for signaling the device in 'Operation' and 'reset'.

1.6.10.8 Vacuum Breaker

Bidder shall provide suitable device for rapid reduction of vacuum in condenser for turbine rotor to be brought to rest as quickly as possible. Provision shall be made to operate it both manually and through DC actuator.

1.6.11 Gland Sealing System

The turbine shall be provided with Labyrinth type gland seals to prevent steam leakage to the atmosphere or air leakage into the turbine. The Labyrinth will be of multiple section spring backed type, which would allow for any temporary deformations of the rotor shaft without overheating the rotor due to friction. A gland seal regulator shall automatically control steam pressure to the gland seals over the entire load range. The gland exhausting system shall include a surface type seal steam condenser suitable for the inlet condensate temperature and pressure provided with drip level indicators/ gauges and two 2x100% capacity AC motor driven exhausters. The system shall operate automatically. Means shall also be provided for manual operation of the gland seal system when the regulator is out of order.

Suitable arrangement shall be provided to bypass gland steam condenser (designed to operate under vacuum condition also) along with desuperheating arrangement, if required, for the bypass. The exhaust shall be discharged above the TG hall roof level. The gland steam condenser shall be provided with bypass on water side also.

The turbine shall be self sealing during normal operation of the unit. During startup and low load operation, sealing steam shall be supplied from high temperature or low temperature auxiliary steam header or CRH depending upon the sealing requirement. Facility shall be provided for automatic switchover from alternative source to the main source and vice versa.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[18]	15.01.2016

During changeover of steam supply source from turbine or CRH or auxiliary steam header, there shall be no rubbing at glands and no undue increase in vibration and the system shall be capable of withstanding thermal shock

Effective drain system shall be provided along with instrumentation to monitor and maintain the required temperature to avoid thermal shock to the rotor during changeover from self sealing to alternate source of sealing steam.

Two nos. modulating type control valves shall be provided, one discharging surplus steam to condenser and other for supplying extra steam to gland sealing header from steam source to maintain sealing steam header pressure at a preset value. These control valves shall be provided with electrically operated bypass valves. Control valves shall be stay put during power failure and sealing steam header pressure shall be maintained by manual control of these valves.

Gland sealing arrangement provided by the Bidder shall permit easy examination and replacement of glands without lifting the upper half of the turbine casing.

1.6.12 High Pressure Hydraulic System

Each unit will be provided with a high pressure hydraulic system which shall supply the required active power for operation of the electro-hydraulic control system and shall utilize a phosphate ester or equivalent fire resistant fluid. All the elements of the system shall be furnished with compatible hydraulic fluid, and shall include, but not necessarily is limited to, the following:

- i) Fluid reservoir of sufficient capacity to contain all the hydraulic fluid when the turbine is shutdown. The reservoir shall be provided with access cover plates for cleaning, fluid level indicator, high and low level alarms and independent critical high alarm, high and low temperature alarms, and provisions for filling and draining by means of fluid transfer and filtering unit which shall be included.
- ii) Two (2) independent pumping systems, each consisting of motor driven variable displacement pump with automatic stroke adjustment, wire-mesh suction strainer on the intake side of the pump and a disposable cartridge filter in the pump discharge line, and a pressure compensator on each pump to maintain the preset pressure by stroke adjustment.
- iii) The filters at the pump discharge shall be designed for maximum particle size of not more than 5 microns. Excess pressure drop shall be annunciated in the unit's DCS and automatic start-up of the standby pump shall be initiated if the filter pressure drop continues to increase and no remedial action is taken.
- iv) Two (2) full capacity fluid-to-DM coolers. The coolers shall be arranged for either single or parallel operation and shall be located on the return side of the hydraulic fluid to the reservoir.
- v) Two (2) nos. thermostatically oil tank heaters indirect type to regulate the oil temperature.
- vi) One (1) air dryer for the air breather by the fluid reservoir, of the desiccant type filled with layers of activated alumina, charcoal, and silica gel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[19]	15.01.2016

- vii) FRF recirculation pumps two (2) nos. to recirculate the oil in earth filters/mechanical filter and to facilitate oil top up & using oil from drain tank.
- viii) Hydraulic accumulators, charged with nitrogen, in sufficient number to provide immediate source of hydraulic fluid when required for sudden transient conditions.
- ix) Transfer and filtering unit for filling the system and filtering the fluid before it enters the reservoir. The unit shall be complete with motor-driven pump, filter, relief valve, discharge and suction hoses, and all operating valves. The unit shall form an integral part of the high pressure hydraulic system.
- x) Fuller's Earth filtering equipment, installed in the reservoir to maintain low neutralization of the hydraulic fluid.

All the above equipment shall be installed on a common skid for mounting below the turbine. High pressure stainless steel piping and tubing to all points of usage of the high pressure hydraulic fluid system with all necessary hangers and supports shall be included. Also, the initial charge of the hydraulic fluid shall be included.

1.6.13 Steam Turbine Extraction

The uncontrolled extraction steam system shall supply steam for the regenerative feedwater heaters and direct contact heater (Deaerating Heater). Extraction steam system piping shall be routed and supported in such manner as to provide for thermal expansion and to maintain end reaction forces and moments within allowable limits. All low-pressure extraction piping inside the steam turbine exhaust hood shall have sleeved inconel bellows expansion joints.

A forced closed check valve (pneumatically or hydraulically operated), SCNRV and a motor operated stop valve shall be provided in each extraction line. However, 2 nos. forced closed check valve shall be provided in the direct contact heater (deaerator). The check valves shall protect the steam turbine from over speeding due to reverse flow of steam from the extraction piping when the steam turbine is tripped and is under a vacuum condition. The motor operated shutoff valves, operating in conjunction with the automatic drain valves, which are located, both upstream and downstream of the valve station containing the reverse flow check valve and the motor operated isolation valve, shall protect the steam turbine against water induction. During a steam turbine trip, controls shall automatically initiate the closing of all forced closed check valves and the opening of all the drain valves. High water level in a heater shall initiate a high water level alarm in the affected heater and opening of its alternate drains. All piping drains shall be routed to the main condenser.

The steam shall be bled as un-controlled extractions from the high, intermediate and low pressure stages for regenerative feed heating. Suitable arrangements shall be provided to prevent induction of water into turbine in accordance with manufacturer's standard practice and the stipulations of ASME Standard No. ASME-TDP Part-I (Latest edition).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[20]	15.01.2016

1.6.14 HP/LP Bypass System

The HP bypass system shall have capacity not less than 60% of BMCR steam flow with [2x50%] valves considering rated main steam parameters at upstream of valves and CRH steam parameters corresponding to 60% TMCR condition on the down stream with constant pressure operation and no steam extraction for regenerative feed heating except deaerator pegging at 3.5 ata with only MDBFP in service. The system should be capable of opening in a fast mode (within 2 seconds) under emergency conditions like sudden load throw-off, turbine tripping etc. Suitable arrangement shall be made to achieve such fast opening of the bypass valves

The high pressure (HP) portion of the steam turbine bypass system shall include a pressure-reducing valve and attemperator that shall accept steam flow diverted around the HP steam turbine. The valve and attemperator shall reduce the main steam pressure and temperature to a level where it can be safely admitted to the cold reheat piping and reheater.

The LP bypass system shall consist of [2x50%] valves and shall be designed to condition the incoming steam from reheater to parameters matching with those of LP turbine exhaust steam and the capacity shall be commensurate with that of the HP bypass system plus the spray water used in HP bypass. The low pressure (LP) portion of the steam turbine bypass system shall include a pressure-reducing valve and attemperator and a diffuser in a circuit receiving steam flow diverted around the IP and LP steam turbines to the main condenser. The diffuser shall be designed to protect the condenser. Materials and design parameters for equipment downstream of the LP bypass pressure reducing valve and attemperator are set by both the condenser and bypass system suppliers. The control system for the Steam Turbine Bypass will be configured in the Turbine Control System (TCS).

HP bypass shall be designed to accept continuous spray water at temperature corresponding to all HP heaters out of service and deaerator pegged at 1.5 ata. Spray water shall be sprayed at the most turbulent zone inside the valve having steam velocity in the order of 350 to 400 m/s. The entire atomization and evaporation of spray water shall be complete within shortest possible distance but not exceeding 1.0 m from the spray point. The HP bypass spray controller shall have state controller with observer to achieve accurate control over outlet steam temperature under different operating conditions including the transients.

For LP bypass system, desuperheating may be done outside the valve body with spray water tapped from condensate pump discharge

The steam turbine bypass system shall be used mainly to reduce startup times for the steam generator under hot and cold startup situations. Feed water is the source of the high-pressure bypass spray water. Condensate is the source of low-pressure bypass spray water.

Each turbine bypass system shall consist of the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[21]	15.01.2016

- i) [Two (2)] high pressure hydraulically actuated steam pressure reducing valves with integral (or separate) desuperheaters.
- ii) [Two (2)] high pressure hydraulically actuated spray water isolation valves.
- iii) [Two (2)] low pressure hydraulically actuated steam pressure reducing valves.
- iv) [Two (2)] low pressure desuperheaters for mounting on the condenser L.P. bypass inlet nozzles.
- v) [Two (2)] low pressure hydraulically actuated spray water admission valves with split range type (i.e. low load & High Load).
- vi) [Two (2)] hydraulic supply units, each with redundant hydraulic oil pumps.

The HP/LP Bypass System is intended for use at following situations:

- i) On hot starts to facilitate matching boiler steam to turbine metal temperatures prior to steam admission to the turbine thus achieving a faster start-up and reduced thermal stresses in the turbine.
- ii) The turbine bypass system shall be utilized to warm up the boiler and main steam lines after an appropriate vacuum is established.
- iii) During cold starts, for Boiler temperature control and condensate conservation.
- iv) On load rejection or turbine trips, the bypass system will handle sufficient steam flow to avoid a boiler trip out, thus allowing rapid reloading when fault condition clears.
- v) The HP Bypass valve shall serve as pressure relief valve in case of transient main steam pressure excursion. The HPBP valve shall modulate to maintain HP turbine inlet pressure, if it goes at about 6 kg/sq.cm above normal operating pressure.

The turbine bypass system controls shall perform the following functions:

- i) The control system shall generate the steam generator pressure/flow and reheat pressure/flow characteristics.
- ii) High pressure bypass valves and low pressure bypass valves shall open to control pressure in the main steam lines and reheat steam lines.
- iii) Water shall be added to the bypasses to control high pressure bypass temperature and limit low pressure bypass enthalpy.
- iv) All valves shall be designed to fail closed.
- v) The turbine shall be protected from bypass system malfunction by temperature trips.
- vi) Water valve control shall be consistent with ASME Standard TDP-1 Fossil Fueled Plants "Recommended Practices for the Prevention of Water Damage to Steam Turbines used for Electric Power Generation" or International equivalent.
- vii) Bypass system control shall be integrated into the Turbine Control System (TCS) and fully coordinated with normal turbine operation.
- viii) The bypass system shall be operationally tested to assure acceptable functional performance of the bypass control system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[22]	15.01.2016

- ix) The HP/LP bypass system shall come in operation automatically in case of (a) generator breaker opening (b) turbine trip i.e. ESV/CV close (c) sudden reduction in load.

1.6.15 Vacuum Trip and Pressure Relief Diaphragms

Triple redundant condenser vacuum sensors shall be provided as inputs to TGCS to initiate a closure of the turbine stop valves and control valves when the turbine exhaust pressure rises above a set limit. The vacuum trip shall be part of the turbine trip system and have the capability of testing via the DCS. Pressure relief diaphragms shall be provided and located in the turbine exhaust casing for condenser overpressure protection.

1.6.16 Turbine Exhaust Hood Spray Control System

Steam turbine exhaust hood spray cooling system shall be provided to permit low load operation of the turbine- generator set without excessive rise in the exhaust-hood temperature. Steam turbine exhaust hood spray cooling system shall be self-contained and complete with spray arrangements, associated piping, instrumentation and control devices, valves and fittings, motor/solenoid operated valves and specialties, hangers, supports and insulation etc. The spray arrangement shall be activated automatically under the condition of low load or exhaust hood temperature exceeding the permissible value.

1.6.17 Supplemental Protective Devices

In addition to the protective devices specified herein this technical specification, the following shall be provided:

- i) High exhaust hood temperature switches for alarm and trip.
- ii) Low bearing oil pressure switches for alarm and trip.
- iii) Thrust bearing wear and failure switches for alarm and trip.
- iv) TG shaft vibration high alarm/ trip as per the OEM's design requirements.
- v) Turbine over speed mechanical protection, mounted on turbine rotor shaft at 10% to 11% above the rated speed.
- vi) Vacuum breaker valves for an automatically initiated vacuum relief system complete with actuation initiation devices.

1.6.18 Warming Up, Drain, Vent System And Flash Tanks

1.6.18.1 The Bidder shall provide warming-up and drainage system for the turbine system to drain away the condensate which may be formed due to steam coming into contact with cooler metal during start-up and stagnant steam sections. The system shall comply with the requirements of ASME TDP-1, "Recommended practices for the prevention of water damage to steam turbines used for electric power generation". The drainage system shall be provided but not limited to the following:

- i) Main steam, CRH and HRH line drains

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[23]	15.01.2016

- ii) Main steam stop and control valves
- iii) Reheat stop valves and interceptor valves
- iv) Steam lead and turbine drains
- v) Steam seal system
- vi) HP & LP bypass valves and warming up line
- vii) Turbine extraction steam piping system

The drains shall be provided for every low point with automatic disposal of collected condensate. The drains shall be connected to the flash tanks via headers. The connections on the header shall be graded according to the pressure, the farthest from the tank being the drain connection with highest pressure. The drains from main steam piping, HRH, CRH, and auxiliary steam headers etc. shall also be connected to the flash tanks described herein.

1.6.18.2 The following flash tanks shall be provided as a minimum to receive the drains and safety valve connections from various equipments and systems.

- i) Unit flash tank
- ii) Turbine drain flash tank (left)
- iii) Turbine drain flash tank (right)
- iv) HP drain flash tank
- v) LP drain flash tank
- vi) FWSV discharge flash tank

The arrangement for connection of various drains to the flash tanks shall be as under:

- i) The drains from MS piping and HP bypass piping including warm up line shall be connected to unit flash tank.
- ii) The turbine integral and power cycle drains shall be connected to turbine flash tanks. The left side drains shall be connected to left side flash tank and right side drains to the right side flash tank.
- iii) The drains from CRH, HRH, LP bypass piping including warm-up line, extractions to HP heaters, CRH and auxiliary steam line and deaerator (high pressure side) and drain, vent and safety valve connections on HP heaters shall be led to the HP flash tank. The drains of extractions to LP heaters, IP extractions, CRH to deaerator (low pressure side), auxiliary steam header, drain, vent and safety valve connections of LP heaters and drain coolers, deaerator overflow and CEP discharge vent shall be led to the LP flash tank.
- iv) The drains led to HP drain flash tank, LP drain flash tank and turbine drain flash tanks shall be recovered by connecting drains and vents of these vessels to the condenser. The vents of unit flash tank shall be open to atmosphere and drains of these tanks shall be led as waste to the plant drain/ channel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[24]	15.01.2016

- v) The above drain connections are indicative only. The Bidder may provide alternative scheme/ arrangement for connection of drains to different flash tanks as per his standard practice which shall be subject to approval of the purchaser.

Drains shall be tapped off from main line through a drip pot with provision for removal of entrapped dirt. Each drain shall be provided with one locked open manual valve followed by one motor/ pneumatic operated leak proof angle valve on downstream side to be used for draining and warming-up the pipes as applicable. For sections having drain formation during normal plant operation such as auxiliary steam header lines and alternate steam lines to deaerator, steam trap assembly shall be provided in parallel to the motorized/ pneumatic drain valve.

The drain valves shall be located in accessible positions to facilitate their maintenance.

Facility shall be provided for remote manual operation of the drain valves from the control room. Motor operated drain valves shall be interlocked to open/ close as per the process requirements. Detailed operation philosophy/interlocks shall be furnished by the Bidder along with the bid.

1.6.18.3 On the CRH line downstream of NRV, a drain pot shall be provided at the lowest point in the CRH line. The following features shall be provided for drain pot valve control system:

- i) On high level in the drain pot, the motorized drain valve shall open automatically and an alarm shall be initiated in the control room. Closing of motorized valve shall be by remote manual.
- ii) On high-high level in the drain pot, an alarm shall be raised in the control room, and an automatic repeat command shall be given for opening of the motorized drain valve.
- iii) Position indication of drain valve shall be provided in the control room.

Flash Tanks

- i) The flash tanks shall be adequately sized to take care of the total drains in the complete power cycle piping system. There shall be sufficient margin to accommodate the possible variation in drain quantities as well as flash steam. Flash tanks shall be designed as per the requirement of ASME boiler and pressure vessels (B&PV) codes, and ANSI standard.
- ii) The design pressure and temperature for the pressure vessels (except bellows) to be designed shall be 3.5 kg/cm² and 215 °C respectively. Flash tanks shall also be designed for full vacuum condition.
- iii) Corrosion allowance of 3 mm shall be added to the design thickness of the shell and head of the vessels. The minimum thickness of the vessels including corrosion allowance shall not be less than 8 mm.
- iv) The flash tanks and manifolds shall be designed to take care of the impact forces due to incoming drains.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[25]	15.01.2016

- v) The temperature in the flash tanks shall be maintained by using condensate spray or service water spray (for flash tanks open to atmosphere). The spray shall be automatically controlled. However, for flash tanks open to atmosphere continuous spray through an orifice shall also be acceptable.
- vi) In case the spray is in the manifold, the material for the flash tank manifolds shall conform to ASTM A335 Gr. P22 or better and its thickness shall not be less than Schedule 100 of ANSI B36.10 irrespective of temperature of the fluid handled.

1.16.18.4 Constructional features

- i) Flash tanks shall be vertical, cylindrical design and of welded construction with torispherical or hemispherical heads.
- ii) Drain/hot water inlet nozzles shall be tangential/ radial to the vessel periphery. Suitable vortex breaker arrangement shall be made at the liquid outlet to the vessel. In case the Bidder finds better alternate arrangement, the same can be submitted for the purchaser's acceptance and approval.
- iii) A manhole shall be provided on the flash tanks for inspection purpose. It shall be of minimum 500 mm diameter. The manhole shall be of devit type and shall be provided with grip.
- iv) The flash tanks shall be located on the ground/ mezzanine floor of the power house. Necessary structural supports including anchor bolts shall be provided. Three support legs at 120 degree spacing shall be provided on each flash tank. Necessary lifting lugs for handling by the main plant building EOT crane shall be provided.
- v) The flash tanks shall be provided with a full length level indicating gauge glass complete with protective rods, isolation valves and drains. Temperature indicators and temperature switches shall be provided on the flash tanks.
- vi) The flash tanks shall be provided with access ladders.

Schedule of materials

Shell and head	: ASTM 285 Gr. C
Wear plate/ baffle	: ASTM 285 Gr. C
Nozzle neck	: ASTM A 106 Gr. B
Manhole nozzle flange and cover	: ASTM 285 Gr. C
Couplings	: ASTM A 105
Bolts and studs	: ASTM A 193 Gr. B7
Nuts	: ASTM A 194 Gr. 2H
Gaskets	: Spiral wound SS 316 with graphite

In place of ASTM 285 Gr. C material, the Bidder may also offer ASTM A 516 Gr 60 or IS 2062 Gr B materials provided the relevant code/standard permits use of these materials for the intended design parameters.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[26]	15.01.2016

1.6.19 Drains and Drain Valves

Drains shall be provided at all low points of the turbine shells, steam chest, valves and interconnecting pipes. The individual drains shall be brought into a common manifold header which shall discharge into the condenser. Automatic valves remotely controlled from the control room shall enable draining and warming of the turbine, piping and valves with steam during startup. A second manual locked-open shutoff valve shall be provided upstream of each drain valve.

1.6.20 Valves

All miscellaneous gate, globe, and check valves shall be designed in accordance with ASME B16.34 or International equivalent.

Electric valve operators shall be designed to withstand, in both directions, the stalled torque that may be developed at 110 percent of the rated voltage.

1.6.21 Insulation

The turbine casing, valves, piping and equipment shall be thermally insulated by non-combustible materials where the hot surface temperature is above 60 °C. The insulation above the turbine operating floor shall be covered with metal lagging formed into panel jackets arranged for convenient removal. All insulation which is normally removed during routine turbine inspection shall be of the reusable "blanket" type. All blankets shall be tagged and identified on an insulation arrangement drawing supplied with the turbine. Aluminium jacketing on all pipe insulation shall be included. The insulated portion of the steam turbines shall be provided with suitable anti-drumming and sound pressure attenuating material inside. The insulation and steel covering should be so designed and erected as to provide easy accessibility to parts requiring frequent inspection.

Thermal insulation of the crossover pipe shall be covered with aluminium sheeting. Split metal covers, packed with insulation shall be used to cover the exhaust flanges and permit bolt access. The feed heating system, drain coolers, ejectors, deaerator and its storage tank including all accessories, flash vessels, H.P. and L.P. bypass systems and all associated piping and valves shall be efficiently insulated.

1.6.22 Vibration Limits

The turbine-generator unit at the rated speed of 3000 rpm shall not exceed the vibration and shaft movements specified as follows:

With the rotor on turning gear, the rotor eccentricity measured at any bearing oil ring shall not be more than 1 mil (0.0254 mm) double amplitude. When measured directly on the turbine shaft, the eccentricity at each bearing point shall not exceed 3 mil (0.0762 mm) double amplitude during the startup period. Maximum permissible vibration measured at bearing housing will be as per zone A of ISO 10816-2 and ISO 7919-2:2001.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[27]	15.01.2016

1.7 Steam Turbine Performance Requirements

- i. The steam TG set apart from being capable of operation on base load shall also be suitable for two shift operation and cyclic load variations as the unit is expected to operate in automatic load-frequency control system. For catering to two shift and cyclic operation, turbine shall have following design features:

- Low thickness and weight of components
- Uniformity and symmetry of section
- Small rotor diameters
- Small size horizontal flanges for casings
- Thinner casing outer shells

- ii. Operation with HP/LP Bypass System

The unit will be provided with a HP/LP bypass system. The HP/LP bypass system will be provided primarily to enable suitable steam/metal temperature matching at the turbine for a quick restart following a steam turbine generator (STG) trip out as well as to prevent a steam generator trip in case of steam turbine generator trip. The bypass system will also be used during cold start-up of the STG unit. The capacity of the HP bypass system shall be 60% of BMCR flow.

- iii. **Operating Frequency Range**

The STG unit shall be capable of safely operating and continuously delivering 100% unit output (with maximum condenser cooling water inlet temperature to the condenser) under following operating conditions:

- With a frequency variation of +3% and -5% over the rated system frequency of 50 Hz.
- Within +5% and -5% of voltage variation of the rated generator voltage at maximum and minimum of rated frequency range.

- iv. Auxiliary Equipment Performance with Fluctuation in Power Supply conditions

- v. Although the rated system frequency is 50 Hz, it is expected that reduced frequencies will prevail over sustained periods of time. All motor driven auxiliary equipment and accessories shall be capable of continuously delivering satisfactorily their rated outputs for a voltage variation of +/-10% and a frequency variation of + 3 % and – 5% and a combined variation of +10%.

- vi. **Rate of Loading**

The unit shall be loaded as fast as practicable subsequent to synchronisation after cold/warm/hot start-up with the bypass system in service. The Bidder shall indicate the criteria that will govern the rate of loading.

Start-up, Loading, Unloading and Shutdown Requirements

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[28]	15.01.2016

Each unit shall be capable of being started-up and loaded in the shortest possible time. The unit shall be able to start up and synchronise within the start up time indicated below:

- Cold start – *[Greater than 36 hours shutdown- To achieve Synchronization within 6.0 hours and to achieve full load within 3.5 hours from Synchronization]*
- Warm start – *[Between 8 and 36 hours shutdown- To achieve Synchronization within 3.5 hours and to achieve full load within 2.0 hours from Synchronization]*
- Hot start - *[Less than 8 hours shutdown-- To achieve Synchronization within 1.0 hour and to achieve full load within 1.0 hour from the Synchronization]*

Following cyclic loading criteria shall be considered in design:

Cold starts : *[150 nos. for 20 years]*
 Warm starts : *[1000 nos. for 20 years]*
 Hot starts : *[4000 nos. for 20 years]*

- vii. *[The units shall be designed for operation in the modified sliding pressure mode between 40 % and 90% load. The unit has to fulfill the following Indian grid code requirement:*

“The unit shall be capable of (and shall not in any way be prevented from) instantaneously picking up five percent (5%) extra load when frequency falls due to a system contingency. After an increase in generation as above, the unit may ramp back to the original level at a rate of about one percent (1%) per minute in case continued operation at the increased level is not sustainable”.

Bidder shall highlight in his bid how the above condition could be fulfilled. In any case Bidder shall consider adequate throttle reserve in the design so that Turbine VWO (valve wide open) flow capable of generating 105% TMCR loads.]

viii. **Operation without Top Feed Water Heater**

The steam turbine generator shall be designed for operating continuously corresponding to the condition when any one the top high pressure feed water heaters is out of service.

ix. **Sudden Loss of External Load**

On occasions, the unit may experience sudden total loss of all external load. Under these conditions, the HP-LP bypass system shall operate and the Boiler and the steam turbine generator together shall continue operation without tripping to supply power for the power plant auxiliaries (about 5-6% of 100% TGMCR). The complete instrumentation and control system shall be adequately designed to take care of the above operation of the power plant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[29]	15.01.2016

x. **Sound Pressure Levels inside Power Plant Area**

The individual machines / components / system shall be acoustically designed for a surface sound pressure level of < 85 dB (A), measured in accordance with ISO 2746 respectively at a distance of 1 m from equipment surface and at a height of 1.5 m above floor level. The surface sound pressure level (Lp) shall be averaged over the measurement surface and corrected for effect of background noise and the influence of reflected sound at measurement surface (environmental correction).

- xi. Bidder shall provide adequate temperature measurement and other instrumentation etc. for adequately guiding the operator to regulate loading of unit to keep the thermal stresses and fatigue levels within safe limit.
- xii. TG set shall be capable of operating on constant as well as variable pressure mode. Necessary facilities shall be provided for switching over to variable pressure mode of operation from constant pressure operation and vice versa from unit control board.
- xiii. Adjustable throttling reserve from 0 to 20% shall be provided.
- xiv. TG set shall be capable of operating continuously with HP heaters out of service, with [89] mm Hg condenser pressure, 3% make-up and auxiliary steam requirement tapped from CRH, generating maximum output without overstressing turbine components.
- xv. The peak to peak value of vibration measured on bearing housing shall be minimized and shall be within limits as per ISO 10816 and ISO 7919.
- xvi. During HP and LP bypass operation, the deaerating feed water heater and accessories shall be able to heat feed water from [45 deg C to 140 deg C].
- xvii. All cycle drains shall be led to condenser through flash tanks. In addition, the provision shall be kept for main steam line drains and HP bypass line drains to be led to a separate atmospheric flash tank.
- xviii. Condenser shall be designed to accept additional flows from boiler during startup (as applicable).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[30]	15.01.2016

2 CONDENSER AND CONDENSER AIR EVACUATION SYSTEM

2.1 General

The condenser shall be designed to receive and condense the whole of the exhaust steam from the turbine, including HP-LP steam bypass system and drains & vents under all modes of operation. The condenser shall be designed for a temperature raise of [10 deg C]. Each Turbine Generator unit shall be provided with steam condensing plant consisting of condensers to suit the requirement of the turbo generator sets proposed by the Bidder, and a set of air extraction equipment and accessories as described in this specification. The steam inside condensers shall be cooled by cooling water pumped by circulating water pumps and recirculated through cooling towers. During start up and other operating conditions, steam will be dumped into the condensers fully or partly bypassing the steam turbine. The Condensers shall be suitably designed to receive such bypass steam.

The Air extraction equipment to be used for creating the necessary vacuum in the condensers during starting up of the unit and during normal operation by removing non-condensable vapours and gases and shall be designed suitably to work satisfactorily in conjunction with the condensing unit.

2.2 Codes and Standards

Nomenclature, definitions, design, materials and construction of the condenser and air removal equipment furnished under this specification shall comply in all respects with requirements of the latest edition of Heat Exchange Institute (HEI) standards for steam surface condenser. HEI standards or equivalent shall be followed for thermal design and IS-2825 for strength design of condenser.

Table: 2.1

S.No.	Code	Description

Other standards such as, DIN, BS, IS etc. shall also be accepted subject to the Purchaser's approval. In case bidder intends to use alternate standards (if same is acceptable to Owner), Bidder shall furnish a copy of the same in English version during detail engineering.

2.3 Design Parameters

2.3.1 Condenser

- i) The steam condensing plant shall be designed, manufactured and tested as per HEI (latest edition). The condenser(s) shall be designed for heat load corresponding to unit operation for valves wide open (VWO) conditions, 3% make-up, design condenser vacuum and other conditions specified in the given below table. The value of design condenser pressure to be measured at 300 mm above the top row of condenser tubes shall be guaranteed under VWO condition, 3% make-up, design CW inlet temperature and CW flow. The condenser vacuum shall be measured with a vacuum grid utilizing ASME basket tips. The grid is fitted with at 300 mm above top row of tubes of condenser.
- ii) The condenser hotwell shall be sized for three (3) minute storage capacity (between normal and low-low level) of total design flow with the turbine operating at VWO condition, 3% make-up, design condenser pressure. The low low level of hotwell shall be at least 200 mm above the bottom of hotwell.

Table: 2.2

S.No.	Particulars	Value
1	Condenser design parameters	
a	Number of passes	[Divided water box type, Double pass]
b	Design cold water temp/Type of water	[33 °C] Clarified water
d	Minimum thickness of the tube	22 BWG
e	Tube velocity	1.6 to 2.2 m/sec
f	Design condenser pressure	[76] mm Hg (abs)
h	Temperature rise of circulating water	[10] °C
i	Tube material	Stainless steel ASTM A249 TP304
j	Cleanliness factor	0.9
k	Fouling factor	As per HEI
l	Tube plug margin	5% under design condenser condition

LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[33]	15.01.2016

S.No.	Particulars	Value
	Test pressure	1.3 times the design pressure (minimum)

- iii) Condenser shall be designed to receive exhaust steam from steam turbine, HP-LP bypass system, heater drains and vents, drains during startup, low-load and abnormal conditions.
- iv) Steam dumping device shall be provided for dumping of desuperheated steam from LP bypass. Sizing of steam dumping device shall be adequate to accept the steam from HP-LP bypass with necessary spray water including abnormal condition like HP heaters out of service etc.
- v) Air removal section shall be designed to cool the air and vapour mixture to at least 4.17°C below saturation temperature corresponding to 25.4 mm Hg (abs). Connections to air evacuation pumps shall be made at this section.
- vi) Condenser shall be designed to carry flooded weight (upto tip of last stage of LP turbine blades) for hydraulic and hydrostatic testing of condenser without installation of temporary supports or bracing.
- vii) CW butterfly valves with actuators shall be designed as per AWWA-C-504-80 or purchaser approved equivalent standards. Valve material shall be suitable for the duty intended.
- viii) CW expansion joints shall be made from high quality natural/synthetic rubber with stainless steel reinforcement rings and with flanges of 125 lb as per ANSI B16.25. The materials used shall be suitable for service intended. The expansion joints shall be designed to the deflection fluid pressures throughout plant life and shall be suitable to withstand full vacuum without collapse and the proposed arrangement for this shall be indicated in the offer. Further the design shall limit the reaction forces/ moments on condenser CW nozzles and on CW piping.
- ix) There shall not be any damaging effect due to vibrations during normal, abnormal and transient conditions and during turbine trip from full load to HP-LP bypass operation. Satisfactory operation under all operating conditions shall be ensured including HP-LP bypass operation, feed heaters out of operation, VWO condition, 100% load and start-up conditions etc.
- x) Condenser design shall provide for maximum deaeration and removal of non condensable gases from steam and make-up water. Air removal section shall be suitably baffled to prevent water carryover.
- xi) Condenser shall be provided with arrangement for complete drainage of water from the hot well.
- xii) Catch trough shall be provided below tube sheet in hotwell for detection of water leakage into steam side.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[34]	15.01.2016

2.3.2 Condenser Air Evacuation System

Each unit shall be provided with 2x100% vacuum pumps with all accessories for condenser air evacuation. Pumps shall be sized as per latest HEI requirements. Capacity of each pump in free dry air at standard condition with condenser operating at design pressure of 1inch (25.4 mm) of Hg (abs) and sub-cooled to 4.17°C below temperature corresponding to absolute suction pressure shall not be less than 30 scfm (51 m³ per hour) under standard condition (i.e 76 mm of Hg (abs) and 21.1°C). The capacity of each pump during hogging shall be as per criteria given in latest version of HEI plus 20% margin.

Table: 2.3

S.No.	Particulars	Value
1	Source of vacuum pump heat exchanger cooling water	Auxiliary cooling water (ACW)
2	Source of sealing water	Condensate
3	Source of make-up water	Condensate
4	Design pressure (cooling water side) for vacuum pump heat exchanger	Vacuum (0.108 bar(abs)) and 5 kg/ cm2 (g)
5	Pressure of make-up water	CEP discharge pressure
6	Maximum temperature of condenser cooling water	36 deg C
7	Duty code	HEI
8	Design back pressure	25.4 mm (1 inch) of Hg (abs)

Note: Design pressure for CW piping, valves, fittings, COLTCS equipment etc shall be for Vacuum (0.108 bar(abs)) and 5 kg/cm2 (g) minimum.

- Air evacuation pumps shall be single/two stage liquid ring type with both stages (if two stage pump required) mounted on a common shaft. The pumps shall be suitable for indoor installation and for continuous duty.
- Each pump and its accessories shall be mounted on common steel base plate. Pump shall be connected to its motor by flexible couplings.
- Heat exchangers shall be shell and tube type with tubes of SS 316, and shell and tube plates of ASTM-A285 Gr. C15. For U-tube type heat exchangers, the tube bundle shall be of removable type. Alternatively, plate type heat exchangers with SS 316 plates and 20% area margin on plates shall also be acceptable.
- Selection of materials for vacuum pumps and seal water recirculation pump shall be as below:

Casing : Nickel cast iron
 Shaft : Carbon steel (EN8)
 Impeller : Nodular iron/stainless steel

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[35]	15.01.2016

Shaft sleeves : Nodular iron/stainless steel

- v) Air evacuation pumps shall be designed for vibration levels as per VDI – 2056.
- vi) Flexibility shall be provided for operating both pumps during hogging and must be able to evacuate the condenser in specified time as per HEI.
- vii) Standby pump shall cut-in automatically in case running pump fails or when condenser pressure falls back to a preset value.
- viii) Each pump shall be suitable for evacuating 100% designed air steam mixture and non-condensable gas as per HEI.
- ix) Pumps shall be designed for no cavitation under all operating conditions.

2.4 Design and Construction Requirements

2.4.1 Condenser Type and Duty

The condensers shall be of single/dual pressure type two pass, horizontal, surface type with integral air cooling section with water as the cooling medium. The condensers shall be so designed that it can operate satisfactorily under the different off-normal operating conditions of the turbine such as fully or partly by-passing of the turbine, closing of one or more extraction openings etc. The condenser shall be designed for efficiently deaerating the heat cycle make-up, which will be introduced into the condenser. Sub-cooling of the condensate shall be avoided.

The condenser Hotwell should have a minimum available volume sufficient to contain between its "normal" and "low" levels the condensate that may be produced in the condenser in a period of three (3) minutes under condition of maximum steam load. Hotwell shall preferably be divided longitudinally with pump suction from both sides.

The condensers shall be arranged for installation with the tubes at right angle to the axis of turbine rotor and shall be designed for a minimum width and for installation below a reinforced cement concrete turbine generator foundation. Condenser shall be furnished in two sections. Each water box shall be divided into two halves and the two sections shall be completely isolated from each other with separate inlet and outlet connections so that one half of the condenser can be isolated on the cooling water side for inspection and maintenance while the other half is in operation. The cooling water inlet connections shall be at the bottom and outlet connection at the top.

The condenser overall dimensions, together with the space required for withdrawal of condenser tubes and dismantling/opening of each water box cover shall be suitable for the T.G. building dimensions and local pipe layout so that no dismantling of any equipment or CW or other piping or breaking of wall/floor is required for condenser tube/water box maintenance or replacement.

Corrosion allowance of minimum 0.8 mm on each welded side for the shell side and 3.2 mm for water boxes and tube plates shall be applied to the design thickness of each component.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[36]	15.01.2016

2.4.2 Condenser Shell and Fittings

The condenser shell shall be carefully shaped in conjunction with the tube arrangement and provided with baffles as necessary to ensure proper distribution of steam over the whole of the tube nest with minimum shock load and to eliminate all areas of excessive steam velocity. Extraction pipes passing through condenser neck shall be provided with stainless steel shroud around each pipe to prevent erosion due to steam. Condenser shell shall conform to ASTM Specification A285 Gr.C or equivalent. The design shall be as per ASME pressure vessel code. The condenser shell (steam side) shall be designed for full vacuum to a minimum internal pressure corresponding to the bursting / relieving pressure of the turbine exhaust hood safety diaphragm and the same is expected to be 10% more than the saturation pressure corresponding to the condenser design temperatures whichever is greater. The shell side design temperature shall be 120 deg C. The minimum wall thickness for the shell shall be 16 mm and the tube shall be 0.7mm.

Shell shall be designed for a minimum number of site welds. Expansion joints shall be provided in the condenser shell to take care of differential expansion between the shell and tubes.

The condensers shall be adequately supported so that no upward thrust is imposed on the turbine under all conditions of operation. If the design incorporates an expansion piece, it shall preferably be in fully stabilized Austenitic stainless steel all welded type, designed to reduce flow interferences to a minimum. Design of expansion joints shall take care of the set pressure of bursting disc on turbine exhaust and corresponding temperature along with the turbine movements. Means shall be provided to prevent any load being imposed on the turbine casing when the condenser steam space is filled with water during hydrostatic testing of the condenser.

Suitable manhole with hinged covers on the upper part of the shell and hotwell portion shall be provided to facilitate maintenance. Manhole sizes shall be minimum 600 mm.

Necessary connections on the condenser shell and hotwell for air removal, introduction of make-up, recirculation from main condensate line (to maintain minimum flow through condensate extraction pump), drains, vents & instrumentation shall be provided.

At all points where steam and water enter the condenser shell, baffles shall be provided to prevent direct impingement on the tubes. All bolts, nuts, stays etc. inside the steam space shall be of approved material and where such parts project through the tube plates they shall be fitted with approved cap nuts and protective sleeves. Spray piping shall be provided to distribute cold make-up water in such a manner as to provide suitable heating and deaeration. The other fittings shall include but not be limited to the following:

- i) Drain valves with cap and one set of water level gauge for each section of the condenser hot well as also a complete arrangement for sample collection and conductivity measurement from each section.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[37]	15.01.2016

- ii) Nozzles with strainers and vortex breaker for connection to extraction pumps from each section of the hot well. The suction pipe of Condensate Extraction pumps should be laid above ground floor and valves should be easily accessible.
- iii) Air outlet connections.
- iv) Steam throw-off device to effect pressure reduction and condensate spraying on the steam from L. P. bypass station when the turbine is bypassed.
- v) All necessary connections for instrument and controls.
- vi) One isolating valve on the top of the steam space of each condenser shell or top of each turbine exhaust piece for vacuum gauges.
- vii) Suitable thermometer pockets on each of the cooling water inlet and outlet branches, at top of the steam space of the condenser shell, in the air suction branch of the shell, in each section of the hotwell and also thermowells on each end of the condenser shell.
- viii) Flash boxes with manifolds to receive all feed heater drains, and various other system drains; vent and drain piping from each flash box for connection to the condenser steam space and hot well.

2.4.3 Condenser Tube Plates

The condenser tube plates shall be conforming to international standards. The tube plate shall preferably be welded to the shell. The tubes shall be solid drawn type, manufactured and tested in accordance with the approved standard. All tubes shall be of tested quality and the Bidder shall submit the test certificate of the tubes. Each tube shall be eddy current tested for soundness.

Condenser tube material shall be conforming to international standards of adequate thickness and size as per unit size. The tubes shall be cleaned and annealed followed by quenching, pickling and passivation.

The tube water velocity shall be within a range suitable for the material selected as recommended by Heat Exchanger Institute (USA).

Tube nest as a whole shall be slightly inclined to provide self-draining of tubes when the condenser is shut down.

A catch trough shall be provided at the bottom of each tube-plate towards the steam side so that any leakage of cooling water through a tube-tube sheet joint will first get collected in the catch trough. A drain pipe from each catch trough shall be provided penetrating out through the condenser/hot-well shell and having an isolating cock at the outlet end for sampling connection/conductivity measurement.

2.4.4 Tube Support Plates

The tube support plates shall be of appropriate material construction and arranged suitably so that no periodic vibration of tubes may be induced by the running of the Turbo Generator and the maximum span shall be limited such that vibration induced by steam flow may not occur. Tube holes shall be accurately drilled to provide suitable clearances on the diameter of the tube. Edges of the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[38]	15.01.2016

tube holes in the support plates shall be chamfered to facilitate tube insertion and shall be deburred to prevent tube damage.

2.4.5 Water Boxes and Covers

The water boxes shall be designed for a pressure of 5 kg/cm² (g) minimum. (The same shall be checked against the Condenser Cooling Water Pumps shut-off heads.)

Water boxes shall be supported from condenser shell by flange connection. Condenser design and construction shall assure complete support of the fully flooded water boxes from the condenser shell without requiring auxiliary supports.

Material of construction for the water boxes and its covers shall be conforming to international standards.

Water boxes shall be tested with a hydrostatic test pressure as recommended by Heat Exchange Institute (USA).

The water boxes, covers and water side of tube sheets shall be sand blasted, applied with coal tar epoxy primer and then coated with coal tar epoxy paint of minimum 0.25 mm thickness. The outer surface shall be painted with suitable paint after the surface is cleaned and degreased. Cathodic protection of water boxes and tube sheets shall be provided.

Suitable drain and vent connection with necessary valves shall be provided for each compartment of the water box.

Design shall provide the optimum entrance condition to the tubes. Strengthening ribs shall be suitably provided on outside face only.

Access doors and inspection windows shall be provided in each compartment at minimum two levels to permit easy internal access and inspection.

Adequate arrangement shall be made for removal of water box cover for tube replacement without disturbing C.W. piping. Necessary monorail, hoist block etc. shall be included.

2.4.6 Air Evacuation System - Vacuum Pumps

- i) The condenser air evacuation system shall be suitable for operation in conjunction with the turbine and condenser offered. It should comprise 2 x 100% vacuum pumps with all accessories for condenser air evacuation. These mechanical vacuum pumps shall be sized as per latest HEI requirements. Capacity of each pump shall be sufficient to maintain continuously the condenser vacuum corresponding to the saturation pressure of the condensate in hotwell at design cooling water temperature, when the condenser is working at its design capacity of steam, condensate and heat input (VVO steam flow, 3% make-up heater drains diverted to condenser etc.), and also during operation of the unit at lowest TG load for all C.W. Temperature.
- ii) Besides, the pump capacity shall also be such that at starting, with both pumps working in parallel, it is possible to create within 30 minutes sufficient vacuum in the condenser suitable for raising the steam turbine to its full speed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[39]	15.01.2016

- iii) The design capacity of each pump shall be selected to meet both the above requirements with a margin of 10%. The pump TDH shall take into account the pressure drop, in suction pipeline between pumps and condenser and in the pump discharge side including air vent pipe stack outside Turbine building, as estimated for the design capacity. The sizing calculation of the system shall be furnished with the offer.
- iv) The pumps should not trip under low system frequency (47.5 Hz) operation.
- v) The pumps shall be single stage/double stage, as necessary to meet the design conditions. The pumps shall not cavitate under all operating conditions.
- vi) Suitable compression ratio shall be selected so that the pumps operate effectively at all conditions of operation with cooling water temperatures mentioned above.
- vii) The pumps shall be designed for indoor installation and for continuous duty, to handle mixture of air, steam and non-condensable gases. Bidder shall ensure and guarantee that pumps shall not cavitate at any load, including part loads and design point.
- viii) The pumps shall be of liquid ring design with both the stages (in case of two stage pump) mounted on a common shaft. The unit shall require no internal lubrication and shall be free from damage by water vapour, entrained droplets or slugs of water.
- ix) The unit shall be complete with liquid ring vacuum pump, drive motor, flexible coupling and coupling guards, water separator in the discharge air line, (The line should be self draining to pump) with gauge glass and automatic make-up and overflow valves, suction and discharge piping, expansion joints, inlet system valve with differential pressure switches, system vacuum switch to start automatically the standby unit, heat exchanger for seal water cooling, seal water recirculation pumps, air ejector, rotameters for discharge air measurement, vacuum gauge for system inlet pressure, pressure gauge for seal water pressure, temperature gauge for seal water, outlet check valve, relief valves (if required) and other necessary instrumentation, control and wiring. The entire unit shall be mounted on a common steel base frame. Water separator in the vacuum pump discharge air line.
- x) Necessary device shall be incorporated in the design of the equipment so as to prevent loss of vacuum by flow of atmospheric air back into the condenser upon shut down of the pump.
- xi) The heat exchangers shall be arranged to permit access to tubes without disturbing the piping connections. The heat exchanger tubes shall be seamless/ welded. If U-tube heat exchangers are offered, the tube bundle shall be of removable type.
- xii) The material of the pumps shall be so chosen as to accept condensate as the source of sealing water.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[40]	15.01.2016

2.4.7 Air Evacuation System- Steam Jet Air Ejectors

- i) 1x100% single stage non-condensing type Starting Ejector and 2x100% two stage condensing type Main Ejectors shall be provided. The ejectors shall be suitable for operation in conjunction with the turbine and condenser offered.
- ii) Two stage main ejectors shall be provided with inter-condenser and after-condenser.
- iii) Both types of ejectors shall be complete with accessories like steam nozzle, strainer, interconnecting piping, valves, air vent, instruments and controls.
- iv) The ejectors shall be sized as per latest HEI requirements.
- v) Capacity of the starting ejector shall be such that at starting, it is possible to create within 30 minutes sufficient vacuum in the condenser suitable for raising the steam turbine to its full speed.
- vi) Capacity of main ejectors shall be sufficient to maintain continuously the condenser vacuum corresponding to the saturation pressure of the condensate in hot well at design cooling water temperature, when the condenser is working at its design capacity of steam, condensate and heat input (VVO steam flow, 3% make-up heater drains diverted to condenser etc.), and also during operation of the unit at lowest TG load for all C.W. Temperature.
- vii) The air ejectors shall be designed for indoor installation and for continuous duty, to handle mixture of air, steam and non-condensable gases.
- viii) Necessary device shall be incorporated in the design of the equipment so as to prevent loss of vacuum by flow of atmospheric air back into the condenser upon shut down of the air ejectors.

2.4.8 Nozzle Connections

All necessary nozzle connections for the system as required by the Turbine-Generator manufacturer and the heat cycle system shall be provided.

All water (make-up water, exhaust hood spray, condensate recirculation etc.) to the condenser shall be fed through perforated pipes suitably located. The supply shall include necessary internal piping with spray holes. In regions where impingement is likely to occur, the tubes shall be protected by stainless steel baffles & extraction pipes shall be protected by stainless steel shields.

2.4.9 Condensate Storage Tank and DM Make Up Pumps

For normal make up to the power cycle, DM water shall be added in the condenser hot well. The DM water shall be supplied from DM water storage tanks of DM plant, and shall be added in the hot well through a control valve. The indication for status of operating DM water supply pumps shall be provided in the UCB.

Emergency make up to the condenser hot well shall be supplied by 2x100 % centrifugal pumps of adequate capacity taking suction from the condensate storage tank which shall also receive excess flow from discharge of condensate

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[41]	15.01.2016

extraction pumps. The condensate storage tank shall be of epoxy coated mild steel to IS 2062 Gr- B and its capacity shall be to meet 12 hour normal make up requirement of the unit subject to a minimum effective storage of [300 m³]

2.5 Inspection and Testing

- i) The water box and shell shall be hydrostatically tested as per Heat Exchange Institute Standards. During hydro test the gasket tightness shall be to measured extent. Gaskets shall be replaced by new ones after shop test.
- ii) All condenser tubes shall be hydraulically tested to 7.5 kg/cm² g internal and outside pressure and also inspected ultrasonically or by eddy current testing as per ASTM E213-68 and ASTM E243-67T respectively prior to shipment.
- iii) The completely assembled and tubed condenser shall be hydrostatically tested after erection, according to the standards of Heat Exchange Institute.
- iv) Condenser shell shall be tested for any leakage by filling the steam space with water.
- v) A field performance test shall be conducted in conjunction with approved Acceptance Tests Procedure.
- vi) Performance of the air removing equipment shall be tested at the manufacturer's shop according to the applicable ASME Performance Test Code, PTC 24 - "Ejectors" and ASME Performance Test Code, PTC 9- "Vacuum Pump".

2.6 Drawings, Data and Information Required

- i) Characteristic curves for condenser performance showing condenser pressure for heat load range of 30 percent to 120 percent of the design heat load with varying circulating water temperatures (26.9 deg C to 36 deg C) for tube cleanliness factor of 100% and 90%.
- ii) Rubber expansion joint GA drawing with material of construction.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[42]	15.01.2016

3 FEED WATER HEATER AND DEAERATOR

3.1 General

- i) The design shall be capable for meeting all operating conditions including sudden load throw-off, HP-LP bypass operation, one or two heaters out of operation etc.
- ii) The system shall be designed for handling drains from preceding heaters for all operating conditions and emergency drains to condenser bypassing the drain cooling zone.
- iii) Easy for floor mounting and shell dismantling except for LP heater in Condenser neck (if provided).
- iv) Provision for complete drainage from both shell and tube (water box) side.
- v) Provision of start-up and operating vents with orifices and provision for removing non condensable gases to be collected on the shell side to condenser shall be made. Vent orifices shall be sized to pass one half percent of rated steam flow to respective heater.
- vi) Material

Table: 3.1

Tube (For seamless) with circumferential joints	ASTM A 213 Gr. TP 304
Tube (For welded)	ASTM A 688 Gr. TP 304
Tube sheet	Carbon steel as ASTM A 216 Class II or SA 350-LF-2

- vii) The tube sheet shall be welded to shell and water box. Tube support plates of common quality steel of 16 mm (min.) thickness shall be provided.
- viii) Water box channels shall have access opening (manhole openings) of minimum 450 mm dia. This shall be of self sealing type. Bolted design shall not be acceptable.
- ix) The design shall provide prevention of super heated steam contact with tube to tube plate joints at entry to heaters.
- x) Preservation by nitrogen blanketing during shut down.
- xi) Minimum tube thickness shall be 20 BWG (0.89mm) after bending. Stress relieving of U tube bends shall be carried out up to a distance of 150 mm from bend area.
- xii) Minimum fouling resistance at tube side shall be 0.00004098 hr-m²-deg C /kCal and an additional 0.000061475 hr-m²-deg C /kCal on outer tubes as per HEI.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[43]	15.01.2016

- xiii) A corrosion allowance of 3.2 mm shall be considered for each heater shell and water box.
- xiv) Heaters shall be provided with stand pipes with necessary connections for instruments, water level gauges, isolation valves etc.
- xv) Each bled steam line shall have one number power assisted NRV and one number ordinary NRVs, motorized isolation valves except for the L.P. heater No.1, if mounted in condenser neck. However the bled steam (extraction steam) from IP turbine to deaerator shall be provided with two numbers of power assisted NRVs with motorized isolation valves.
- xvi) Baffle plates shall be provided to prevent vibration, ensure uniform steam distribution and enable free drainage of condensate.
- xvii) Shall have provision of pass partition plates to facilitate easy removal and access to tubes.
- xviii) Provide sentinel relief valve on tube side. Relief valve on shell side shall be sized to pass flow from two ruptured tubes (four open ends) or 10% of design water flow at 10% accumulation whichever is higher and set to open at heater design pressure.
- xix) Adequate handling facilities shall be provided for removing the heaters for maintenance in case of horizontal heaters.

3.2 Low Pressure Heaters and Drain Cooler

- i) Vertical / Horizontal type having U-tubes with integral drain cooler except for LP heater no. 1 if mounted in the condenser neck.
- ii) Shell shall be made of ASTM A-516 Gr. 70 with SS-304 bands at cut points on shell to prevent damage against flame impingement during torch cutting.
- iii) Water box shall be made of carbon steel as per ASTM –516 Gr. 70 and shall be welded to tube sheets.
- iv) Expansion of tubes to tube sheets shall be rolled. Tubes shall be cold bent for fabrication.
- v) Roller support shall be provided for shell removal of heaters (in case of horizontal heaters). For LPH-1 roller support shall be provided for heater channel during tube bundle removal if LPH 1 is located in the condenser neck.
- vi) Provision of shell attachments for supports of LPH in condenser neck and Anti-flash baffles to protect the turbine from water ingress shall be made.
- vii) Provision of integral desuperheating, condensing and drain cooling zones except for LPH-1, if mounted in condenser neck shall be made.
- viii) There shall be provision of differential expansion between shell and tube.
- ix) Details of tube sheets, tube to tube sheet joint, tube supports plates, material of construction for drain cooler shall be identical to other LP heaters.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[44]	15.01.2016

3.3 Deaerator

- i) Horizontal, spray-cum tray with integral vent condenser mounted on horizontal storage tank.
- ii) Design and construction shall be as per Indian Boiler regulations, ASME code for unfired pressure vessels, Section- VIII or any other equivalent code.
- iii) The storage tank shall have reinforced wire mesh strainer and anti-vortex baffles at discharge connections from deaerator.
- iv) Fixed and Saddles support shall be provided for the storage tank.
- v) All pressure parts such as shell, heads and nozzles shall be made of carbon steel as per ASTM A 515 Gr. 70. Shell plate shall have thickness of 15.8 mm minimum with welded construction.
- vi) Hardened 400 series stainless steel impingement plates for flashed drain inlet from HP heaters, BFP recirculation, boiler start-up drains etc shall be provided.
- vii) All water spray valves, splash plates, trays, vent condenser and other elements coming in contact with undeaerated water or non-condensable gases shall be made of stainless steel SS 304.
- viii) Deaerator safety valves shall have adequate relieving capacity and shall be made of Stainless steel disc and spindle.
- ix) Vents with orifice plate and vent with motor operated valve shall be provided.
- x) The Deaerator shall be designed for efficient steam distribution and deaeration of condensate under all operating conditions including VWO, 3% make-up, HP-LP bypass, one/both the strings of HP heaters out of operation.
- xi) The Deaerator shall be of variable pressure type (Floating pressure Type) - Pegging pressure shall be 3.5 ata during warm and hot startup, HP- LP bypass operation, major load rejection, turbine trip and low load when extraction steam pressure is less than 3.5 ata. During cold startup the deaerator pressure shall be maintained at 1.5 ata with steam from auxiliary steam header. Deaerator pressure shall vary according to load due to variation in steam parameters of turbine extraction. Design pressure & temperature shall not be less than the extraction or CRH pressure at the downstream of PCV or the worst operating conditions with sufficient design margins.
- xii) Source for heating:
 - a. [Extraction steam from turbine IP-LP crossover pipe (normal operation)].
 - b. [Steam from CRH (up to 60% load)]
 - c. [Steam from auxiliary steam header (for Initial heating & low loads)].
- xiii) Sizing of feed storage tank shall be adequate to take requirements of any steady load from 0% to 110% of rated capacity including boiler start up drains as applicable. Minimum feed storage tank capacity between normal and low-low level shall be 7 (Seven) minutes of BMCR flow.
- xiv) Design shall be adequate to withstand full vacuum and pressure decay during start-up condition.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[45]	15.01.2016

- xv) Shell thickness shall have corrosion allowance 3.2 mm.
- xvi) Provision of sparger pipe and nozzle for feed water heating shall be made.
- xvii) Size of vent orifice shall be for one half percent of rated flow to deaerator.
- xviii) Provision of access platform and ladders with hand rails on deaerator and storage tank shall be made.
- xix) 2 nos. of manholes of 450 mm dia. (min.) each on deaerator and storage tank for maintenance including trays shall be provided.

3.4 High Pressure Heaters

- i) Vertical/Horizontal type HP heaters having U-tubes with integral desuperheating, condensing and drain cooling sections shall be provided.
- ii) Shell shall be made of carbon steel as per ASTM A-516 Gr. 70 and water box as per ASTM A-226 class –II and shall be welded to tube sheet.
- iii) Roller supports for shell removal shall be provided in case of horizontal type.
- iv) Tubes shall be welded to tube sheets and then roller expanded.
- v) Level of condensate in the heaters is to be maintained in the preset range. In case of level rise beyond permissible limits in any of the HP heaters, group/individual (based on the configuration) hydraulic bypass arrangement shall operate and drains shall be led to the condenser.
- vi) Provision for differential expansion between shell and tube shall be made.
- vii) All other features indicated for LP heater shall be applicable to HP heaters also.

3.5 General Performance Requirement

The feed heating system shall be capable of raising the temperature of feed water from that in the condenser to the final optimized value specified at the outlet of the top high pressure heater with turbine generator (T.G) set operating at rated parameters.

The extraction steam pressures and flows shall be determined by the Bidder by working out the turbine cycle heat balance.

The maximum oxygen content of the feed water discharge from the deaerator without chemical dosing shall not exceed 0.005 cc/liter at all loads upto and including the rated capacity. The carbon dioxide content of the feed water discharge shall be nil.

Heaters shall be capable of operation under the condition of preceding lower pressure heater taken out of service. The heaters shall be designed to accommodate increased steam and drain flows (for the next higher pressure heaters and the deaerator) in such an event. Contractor shall submit performance data on affected heaters in the train when one heater at a time is removed from service. Data shall be calculated for conditions when each of the heaters is removed from service individually and/or in group, and the remaining heaters are on line. Besides submission of off-performance data, the Contractor shall also indicate limitation of service, if any, during such condition. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[46]	15.01.2016

deaerator shall be designed for the maximum incoming steam flow when none of the L.P. heaters is working under HP & LP Bypass condition.

During HP & LP By-pass operation, feed water shall be heated in deaerator to a minimum permissible temperature as per boiler requirement. Minimum acceptable H.P. heater outlet temperature during turbine low load operation shall be finalized as per boiler requirement.

The operation of the deaerator shall be stable and free from vibration etc. when subject to transient condition which may occur at full load trip out conditions of the T.G. and during introduction of alternative steam service.

All equipment warrant high reliability, low down time and ease of maintenance.

Equipment offered shall have an operating noise level as per ISO - 85.

3.6 Design & Construction Requirement

3.6.1 Closed Feed Water Heaters

3.6.1.1 Design requirement

The heaters shall be of surface type. Water shall flow inside the tubes and the heating steam outside the tubes. High & Low pressure heaters shall be horizontal U tube as per Manufacturer's standard proven practice. Heaters shall have integral desuperheating sections, as required.

The lowest pressure heater may be located in the condenser neck in case that is the standard arrangement of the manufacturer. In such a case, drain cooler may be provided either internal or external to the heater. L.P Heater mounted inside the condenser neck shall be provided with required shell attachments for supports and for closure plates for sealing the penetrations through the condenser shell. The heater shall also be provided with antflash baffles to protect the turbine from water ingress. Arrangement for heater tube withdrawal shall be provided; piping connected to the heater shall be so routed as to facilitate the tube withdrawal without dismantling the pipes.

Start-up vent from the heater mounted in condenser neck shall be provided with orifice plate.

Contractor shall select the terminal temperature difference and the drain cooler approach of the feed heaters keeping in mind the overall economy. However, following shall be the minimum criteria.

- i) H.P. heaters shall be provided with desuperheating and drain cooling zones in addition to the condensing zone. The maximum terminal temperature difference and maximum drain cooler approach shall be as per the HEI guidelines.
- ii) L.P. heaters shall be provided with drain cooling zone in addition to the condensing zone. Terminal temperature difference shall be as per the HEI guidelines.
- iii) Heat transfer area shall be calculated considering 10% of the tubes plugged. Fouling factor shall be taken as per the recommendation of the Heat Exchanger Institute, USA.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[47]	15.01.2016

The L.P. heaters shall be designed for the shut-off pressure developed by the condensate pumps on the tube side. The H.P. heaters shall be designed for the shut-off pressure of the boiler feed pumps (at maximum speed of operation) on the tube side. The design pressure for the feed piping shall be the shut-off pressure of the boiler feed pumps. Each heater shall be designed for removal from service individually without shutdown of unit, using hydraulically operated or motorized bypass and isolating valves. In addition, spring loaded relief valves shall be provided in the bypass arrangement of HP Heaters so as not to exceed the feed water pressure in heaters above design pressure.

The shell side shall be designed for the maximum extraction steam pressure with 5% margin or 3.5 Kg/Sq.cm (g) whichever is higher. The shell side design flow shall be calculated for the normal operating as well as abnormal conditions as specified and for a tube sheet leakage of 20% of the condensate/boiler feed water flow. Nozzles shall be sized liberally considering various modes of operation and shall be subject to approval by Purchaser. The tube side velocity shall be limited to 2.5 m/sec under all operating conditions.

Corrosion allowance of 3.2 mm shall be applied to the design thickness of each heater shell and water box. Tube thickness shall be increased to compensate for tube wall thinning.

About 0.5% of the steam entering a heater shall be vented (from its condensing zone) to the condenser and orifice plates shall be fitted in the vent pipe work to control the flow. Care should be taken to prevent accumulation of pockets of gas by positioning the vents in such a manner that every part of the tube nest is swept by steam. Each heater shall be separately and continuously vented to the condenser. Cascading of vents from heater to heater will not be permitted. The vent valves shall always remain open, whenever a heater is in service.

Each heater shall be designed for removal from service individually without shutdown of unit, using hydraulically operated or motorized bypass and isolating valves.

Self sealing type hand holes shall be provided on the H.P. heater water box for access to all the tubes. A skirt shall be provided around the tube bundle to shield during a gas cutting of the shell if required for removal of the tube bundle.

The arrangement of the feed water heater internals shall be such as to minimize rapid fluctuations of heater level during operation and the heaters shall be designed to operate without excessive noise and vibration.

Shell side relief valves shall be sized for 10% of the feed water flow, or maximum feed water inflow to shell due to the rupture of two (2) nos. tubes, whichever is greater, at 10% accumulation. Tube side relief valves shall be provided to guard against overpressure from water expansion when inlet and outlet valves are closed. The shell side relief valve set pressure shall be above the maximum working pressure of the extraction steam line, connected to the feed heater, in all possible operating conditions.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[48]	15.01.2016

Necessary vent and drain connections with valves shall be provided. Vents and drains on the feed water side of H.P. heaters shall be provided with double valves.

The heaters shall be designed for the minimum tube side pressure drop, and the same shall be indicated (for rated operating condition) in the Bid.

3.6.1.2

Materials and Construction

The water box for the high pressure heaters shall be of forged construction and welded to the shell. The low pressure heaters may be of bolted head or with welded water box. For bolted head type, copper jacketed gaskets or other metallic packing of approved quality shall be used.

The heater shells shall be of carbon steel welded construction. The tubes shall be of U-type. The L.P. heater tubes shall be roller expanded into the tube plates provided with at least two grooves.

The H.P. heater tubes shall be joined to the tube plates by welding to the stainless steel overlay by a proven technique. The Contractor shall, in his proposal, give complete description of the process adopted.

The tube nest shall be supported by baffles which shall prevent vibration and also ensure an even distribution of steam. Stainless steel impingement plates shall also be provided at all steam and water inlet branches to prevent direct impingement and wear of the tubes. The water box baffle plates shall be positioned to give good flow distribution through the heater tubes. The heaters shall be designed for most economical length and shall have suitable lifting arrangement such that a heater or shell can be removed for maintenance purposes.

The tube sheet shall be of forged carbon steel for L.P. heaters. For H.P. heaters, the tube sheet of forged carbon steel shall be overlaid first with one layer of SS-309, and then another layer of SS-308, to a total thickness of overlay not less than 7 mm. The feed water heater tubes shall conform to the applicable requirements of ASME specification. Seamless or welded type stainless steel (SS-304) tubes shall be provided. Details of experience of the Contractor with the type of tubes provided (seamless or welded) shall be furnished in the bid. Minimum tube diameter shall be 5/8" (0.625 inch/ 15.88mm) and thickness shall not be less than 20 BWG (0.035 inch / 0.89 mm). Stress relieving of U-bends shall be carried out up to a distance of 150 mm from bend area. Drawing and bending lubricants shall be non-chlorinated.

Bolting material, not in contact with steam or water, shall be ASTM A-193 Grade B7. For other bolting, manufacturer's standard corrosion resistant material shall be used.

H.P. water box nozzle connections shall be butt-weld type for sizes above 50 mm and socket weld for sizes below 50 mm. Other connections may be flanged type.

All flanged connections shall be of the bolted type and the use of studs shall not be permitted unless with special approval.

All tube holes in the tube sheets, baffles and supports shall be deburred.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[49]	15.01.2016

Insulation cleats shall be provided on shell and water box.

The interior surfaces of all the heaters shall be cleaned of all mill scale. The exterior surfaces shall be painted as required.

Material of construction for different parts of the drain cooler shall be identical to those specified for LP heaters.

The design pressure of the feedwater line and feedwater heater will be in line with the recommendations of Indian Boiler Regulation (IBR), ASME Section-1 and ASME B31.1 as applicable.

3.6.2

DEAERATOR

3.6.2.1

Design Requirement

Deaerator shall be capable of operating satisfactorily with two of the adjacent L.P. heaters out of service. Adequacy shall also be checked for the condition of HP & LP bypass when no feed heating is taking place in LP heaters and also for initial heating, steam blowing, initial commissioning etc.

Storage tank shall be fabricated at shop in minimum number of sections (to be determined on the basis of the size of tank and the transportation limitations) so as to minimize fabrication work done at site.

A horizontal, direct contact, spray-cum-tray type single deaerating vessel mounted on a horizontal storage tank shall be provided. Spring loaded nozzles for spray control shall be provided for guaranteed operation of the deaerator for a flow range from 100% to 30% without water hammering. The trays shall be provided for final stages of deaeration and shall be of rigid clamped type. The terminal temperature difference shall be zero at all load conditions. The deaerator will be operated for variable pressure. During load swing, cold condensate at hot well temperature and 110% of normal flow may enter the deaerator. The extraction steam during such operation may be zero such that flash steam from the storage tank will flow to the deaerator. For this purpose adequately sized vent pipe from the storage tank to the deaerator and internal water and steam distribution shall be provided.

Alternatively, a spray type (stork or equivalent) deaerator, which otherwise fulfills all design and performance requirements stipulated here in, may be offered.

If the Deaerator is provided with an external shell and tube type vent condenser, the same shall condense all vapour and vent out non-condensable gases to atmosphere. The vent condenser shall minimise loss of steam through the vent connection under all conditions of operation by providing at least 1 deg C sub-cooling of vented vapours over entire load range. The vented gases shall be free of any visible vapour.

The deaerator shall be capable of deaerating all the incoming condensate, HP heater drips and emergency make up water at a rate adequate to provide boiler feed to match the boiler MCR requirements continuously.

The dissolved oxygen content at the discharge from the deaerator without chemical dosing shall not be more than 0.005 cc/liter in the boiler feed water at all loads, up to and including the rated capacity. The deaerator shall also

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[50]	15.01.2016

effectively remove even traces of any other dissolved gases such as CO₂ likely to be present in the condensate/feed water.

The deaerator is proposed to be located to meet all the operating criteria Bidder, however, shall check and confirm the adequacy of this level considering the system offered, types and requirement of Boiler Feed Pumps considered etc. such that system can operate safely and smoothly under all operating conditions, abnormal and transient conditions and also for full load throw off condition.

The operation of the deaerator shall be stable and free from vibration and water hammer when subjected to pressure decay which may occur at full load trip out conditions of the T.G. and during introduction of the alternative steam service.

For supporting of the storage tank, one support leg shall be fixed and the other shall be sliding type to accommodate expansion of the equipment. The supply shall also include suitable ladder, platform & handrailing for access to various parts of the deaerating heater.

The deaerator proper may be supported from the storage tank, or independently from floor level and all support structures in either case shall be included in the Bid.

The following connections shall be provided over & above condensate/feed water inlet and outlet connections:

- i) A perforated pipe connection of suitable size for steam supply for initial heating and deaerating of water stored in feed storage tank at the time of starting of the unit.
- ii) Connections on the tank for boiler feed recirculation, chemical dosing (if required) etc.
- iii) Drain connections with valve and drain pipe to the flash box at ground floor level.
- iv) Suitable over-flow connection on the feed storage tank including control valve and motorized by-pass valve.
- v) HP Heater drip inlet.
- vi) Extraction/pegging steam inlet.
- vii) Safety valve connections.
- viii) Vent connections.
- ix) Sufficient number of inspection openings/man-holes (of minimum 600 mm diameter) with suitable covers for easy cleaning, inspection and maintenance. Covers for these openings/man-holes shall be hinged type.
- x) All local/remote instrument connections including root valves.
- xi) Stand pipe connections.
- xii) Other connections as necessary.

Number, size, location and orientation of the connections, as necessary, shall be decided by the supplier considering the performance of the deaerator. If found necessary, it shall be possible to reorient the nozzle connections of deaerator so as to match the layout of associated piping.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[51]	15.01.2016

Anti-vortex baffle together with a coarse strainer shall be provided for feed water outlet. Safety relief valve/s with adequate compensating pad for full relieving capacity at the worst operating conditions shall be included.

3.6.2.2 Materials of Construction

Following materials of construction shall be used for deaerator:

- i) Shell and heads : ASTM: A-285 Grade C or equivalent
- ii) Spray Nozzles : 304 stainless steel
- iii) Trays : 304 stainless steel
- iv) Tray supports : Stainless steel
- v) Internal bolting : Stainless steel
- vi) All metal parts in contact with non-condensable vapour shall be of type 316 stainless steel.
- vii) Hardened 400 series stainless steel impingement plate shall be provided for the flashed drain inlet from the high pressure heaters and boiler feed pump recirculation.

LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[52]	15.01.2016

4 POWER CYCLE PUMPS

4.1 General Information

4.1.1 Boiler Feed Pumps (BFP) and Drives

[Three (3x50% capacity)] motor driven BFP (with suction booster pumps, drives, hydraulic fluid coupling and accessories), shall be installed for supplying feed water to each Boiler unit. Out of these [three (3)] pumps, [two (2)] feed pump will be operating normally while the [third pump] shall remain as a standby unit and will come into operation automatically in case any of the working pumps fail. Each pump is having separate suction feed line to the booster pump.

The pumps shall receive the water from Deaerator and then pump it through high pressure feed water heaters to the Economizer inlet of the Boiler. The location of the pumps and design shall take care of all the transient operating conditions.

The deaerator shall be supplied with extraction steam from the turbine and shall normally operate at a variable pressure depending on the extraction pressure at different loads. A steam connection from the auxiliary steam header/cold reheat pipe shall be provided for initial heating and deaeration at start-up as well as pegging at low extraction steam pressure. However, the boiler feed pumps shall be capable of withstanding transient instabilities in the suction pressure caused due to load swing of the turbine generator from full load to no load and interruption of steam supply to the deaerator. Boiler feed pumps shall also be adequately designed for turbine by-pass operation.

The pumps shall be designed for efficient and reliable operation and shall be of proven design with at least five years of satisfactory operating experience.

4.1.2 Condensate Extraction Pumps and Drives

Each Unit shall be provided with [3x50%] Condensate extraction pumps. Pumps shall be capable of handling the full condensate from the Condenser to the Deaerator through LP heaters, gland steam condenser etc. Each Pump capacity shall be calculated considering the maximum condensate flow.

The pumps shall be required to handle hot condensate at or near saturation temperature and shall be designed for very low NPSH service. The suction specific speed selected shall be suitable to permit part load operation as per system requirement without any trouble.

The pumps shall be designed to withstand transient due to load swing of the unit from full load to no load. Adequate design margins shall be provided in the pumps for turbine bypass operation.

4.2 Equipment and Accessories to be Furnished

4.2.1 Boiler Feed Pumps and Accessories

[The equipment and accessories for each boiler feed pump and drive shall include, but not be limited to the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[53]	15.01.2016

- i) Horizontal shaft, single suction, multistage, centrifugal type pump with radially split inner assembly encased in a heavy outer barrel type casing, having both suction and delivery openings at the top.
- ii) Horizontal, single stage, split casing, double suction booster pump (if required) directly driven by the boiler feed pump drive motor.
- iii) Sole plates, pin and key blocks or other supporting structures, fabricated steel base plate/plates for the pump, hydraulic coupling, motor and accessories complete with foundation anchor bolts/inserts etc. as required. Preferably the entire pump and drive assembly shall be mounted on a common base frame, with provision for separately collecting any leakage water and leakage oil and draining through isolating valves and also arrangement to facilitate grouting on the foundation.
- iv) Flexible couplings with safety guards between BFP motor, gear box, hydraulic coupling and pump as required.
- v) Hydraulic coupling suitable for variable speed operation of the pumps.
- vi) Motor for the boiler feed pump as required.
- vii) Forced lubricating oil and working oil systems complete with oil reservoir, shaft driven main oil pump and A.C. motor driven 100% standby pump, 2 x 100% lube oil coolers, 2 x 100% working oil (Hydraulic Oil) coolers, duplex cleanable filters with all interconnecting valves, fittings, specialties, pipe work and control panels, provision for connecting purifier with oil tank.
- viii) Low load recirculation system complete with piping up to Deaerator end, all valves, pressure breakdown orifices and control valves, supports, hangers etc. as required.
- ix) The boiler feed pumps shall be capable of withstanding thermal shocks from cold to hot for emergency start and hot to cold during Deaerator transient conditions. No separate warm-up system is preferred.
- x) Balancing drum for axial thrust balance, with balancing chamber leak-off system complete with all piping, valves, fittings, instruments, supports, hangers etc. as required.
- xi) Non-return valves on the pump discharge lines.
- xii) 100% duty temporary strainers with spool pieces complete with counter flanges and fasteners etc. for mounting on Boiler Feed suction piping to each pump.
- xiii) Interconnecting piping with fittings etc. in between Booster pump discharge and Main Pump Suction, if applicable.
- xiv) Set of locally mounted instruments as specified and/or as required.
- xv) Set of interconnecting water and oil piping, valves, fittings and specialties required to render installation complete including seal water cooling system as applicable.]

4.2.2 Condensate Extraction Pump and Accessories

[Condensate Extraction pumps (3 x 50%) together with all accessories required to make complete and well integrated units to satisfy requirements of the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[54]	15.01.2016

specification, including but not limited to the following (for each pump, unless otherwise noted).

- i) Drive motor*
- ii) Pump and motor coupling*
- iii) Temporary strainer before pump suction.*
- iv) All instrumentation and control as specified and/or as required. The scope shall also include initiating contacts for the alarms and interlocks. A gauge board shall be supplied with each pump housing instruments.*
- v) Foundation ring/frame with bolts, nuts, sleeves etc.]*

4.3 General Performance Requirement

4.3.1 Boiler Feed Pump

Capacity and discharge pressure of the pumps shall be selected to meet the requirements of the steam generator. The Bidder shall furnish the pump sizing calculation with the Bid.

The boiler feed pump shall be driven by squirrel-cage induction motor through a variable speed hydraulic coupling. Appropriate step-up gears as required shall be provided.

Each pump shall exhibit the same type continuously rising characteristic from rated duty point to shut-off. The pumps should be capable of parallel operation without instability at all speeds and share equal load. Shut-off head shall not, however, be less than 120% and shall not be more than 130% of the head developed at pump design point.

The pumps shall have their best efficiency at the normal duty point, i.e., corresponding to [210/215/220/250] MW load, 3% (of throttle flow) make up and design CW temperature of [33] deg C.

The pump shall be designed for working at its operating temperature without setting up destructive temperature strain causing warping, buckling, misalignment, rubbing or other objectionable effects.

The pumps shall be capable of accepting, without damage, any transient reduction in suction pressure causing cavitations condition and shall accept, without distress, the re-establishment of normal suction conditions following the transient, with no necessity for a pump shut down.

The Deaerator storage tank shall be located to meet the normal and transient operating condition. Bidder shall check the requirement of NPSH against available NPSH considering the worst transient situation of load dump. Bidder to ensure that adequate margin over the required NPSH shall be available under worst condition for safe and trouble free operation. The booster pump should either be directly driven by the boiler feed pump motor shaft or driven by an independent drive motor. The head developed by the booster pump shall be sufficient to give adequate NPSH at the main pump suction.

Bidder shall furnish necessary calculations to establish the availability of excess NPSH over the actual NPSH requirement of the pump.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[55]	15.01.2016

Suction specific speed for BFP and Booster Pumps must not exceed 9000 US Units.

Pumps shall be capable of withstanding reverse rotation for a limited time required to close discharge shut off valve following an emergency failure of the main discharge Non-Return Valve of a standby pump. All bearings & mechanical seals shall be capable of withstanding this operation.

The capacity, head and efficiency of the pumps shall be guaranteed within the tolerances stipulated by Hydraulic Institute Standards, USA or any other equivalent International Standard.

The pump and drive assembly shall be so constructed that dismantling and repairing may be accomplished without difficulty. Complete interchangeability of parts between the pumps shall be ensured.

Pump and drive assembly shall run smooth, free from undesirable vibration, noise and leaks. Acceptable peak to peak vibration limits of the Hydraulic Institute Standards of USA will be applicable.

The Units shall be so arranged that start-up, running and shut down operation may be carried out from the central control room. Necessary interlock and provisions shall be made so that the standby pump will come into operation automatically and immediately without any thermal shock whenever any operating pump trips.

Speed control range of the BFP drive unit (with hydraulic coupling) shall cover the entire range of boiler feed pump operation, from minimum flow (i.e. pumps on recirculation) to the design head-capacity point with at least 5% margin on pump speed both on the high and low sides.

Pump drive shall be rated for cold water operation. Pumps shall be capable of re-starting following a hot or warm shut-down without recourse to barring or warming up. Bidder shall indicate the maximum allowable conditions for restarting such as maximum casing differential temperature and maximum difference between casing temperature and incoming water temperature.

Boiler Feed Pump first stage impeller and if applicable, the booster pump shall be so designed that wear due to cavitation will not restrict its service life to less than 40,000 - 45,000 running hours when operating under steady state design suction condition.

Boiler Feed Pumps and auxiliaries shall be adequately designed to meet the Turbine HP and LP by pass condition without any problem.

The drive motor shall be so selected that a margin of at least 15% is provided over the total power required by the Boiler Feed Pump, Booster Pump, Oil Pump and losses in the gear box and hydraulic coupling, at the rated condition of the pump. It should also be checked that when the pump operates with control valve stuck open, the power requirement is lower than the drive power, irrespective of whether the pump is working singly or in parallel with the other pumps. Detailed calculation for sizing of motors shall be submitted to the Owner for approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[56]	15.01.2016

Pumps shall have short, stiff shafts, with least number of stages for the specified duty. The critical speed of the rotor assembly, in dry as well as water filled conditions shall be beyond the maximum possible running speed by at least 30%, even after considering power supply to pump drive motor at 51.5 Hz.

Plain cylindrical pressure fed journal type bearings and tilting pad, double acting 100% thrust bearing shall be provided. The sleeve bearings shall be horizontally split type.

Duplex type basket strainers shall be provided on the booster pump suction to protect the fine clearances of the pump. The screening area of the strainer shall be 4-5 times the cross-sectional area of the inlet pipe.

All the design parameters are to be met during under frequency conditions of 47.5 Hz at grid.

The flow impulse for the purpose of recirculation control shall be initiated from flow measuring device installed at the pump suction. Balancing chamber leak-off shall be piped back to the suction of the respective pump.

The Boiler Feed Pump set shall be capable of continuous safe, and trouble free operation under other than normal condition, like under and over frequency (47.5 to 51.5 Hz), abnormal pressure decay in Deaerator, VWO with 3% make-up, overpressure of TG (if envisaged), H.P. heaters out of service, sudden load throw-off, start-up of unit, HP-LP bypass operation, rapid starting and load changes during cyclic load operation.

The successful bidder shall furnish necessary details and calculations establishing the suitability of the proposed pumps for meeting the above requirements.

The motors shall be able to accelerate the pumps from normal standby condition to rated pumping condition in less than 15 seconds after receipt of starting signal. It shall be possible to run the pumps singly as well as in parallel with other pumps.

4.3.2 Condensate Extraction Pump

Vertical "can" type condensate extraction pumps shall be provided.

The contractor shall submit pump sizing calculations for approval of the Owner.

The pump impellers shall be so designed that wear due to cavitations will not restrict its service life to less than 40,000 running hours when operating under steady state design suction conditions.

The pumps shall be designed for highest practicable degree of reliability under all conditions of operation.

The pumps shall have continuously rising head capacity characteristics from design point to shut-off.

The condensate extraction pumps shall be suitable (without cavitation) for handling saturated water, at the maximum possible flow rate from the condenser hot-well, with the NPSH available at hot-well "Low- Low" level.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[57]	15.01.2016

Suction specific speed for condensate extraction pumps must not exceed 9000 U.S. units.

Pumps shall be capable of operating either single or in parallel. Suitable Automatic Starting devices shall be provided to bring the standby pump into operation in case of failure of any operating pump.

Rating of the motor shall be selected with at least 15% margin over the maximum power required within the range of operation.

The shut-off head of the pump shall not be less than 115% of design head.

The pump rotor assembly (with guides) shall be so designed as to keep its vibration, in both wet and dry running conditions, within the safe limits as specified in relevant International Standards/Codes.

4.4 Boiler Feed Pump Design and Construction

4.4.1 General

The pump shall be of the horizontal centrifugal type supported in such a manner as to permit free expansion both axially and radially whilst maintaining alignment. The boiler feed pump and suction booster pump will be expected to accept from the main pipe work reasonable forces and moments, the least values being those stipulated in API-610. Therefore, the Bidder shall ensure that all materials and terminal connections are suitable for such terminal forces and moments.

Inter-stage bleed shall be provided in the pump for reheat desuperheating. Requirement of flow shall be decided by Bidder based on the steam generator demand.

4.4.2 Pump Casing

The casings shall be of suitable design to withstand any possible thermal shock and/or high pressure and shall be constructed of materials specifically selected to prevent erosion and corrosion.

The barrel type outer casing of the BFP as well as the booster pump casing shall be supported at horizontal centre line of the pump. The inner casing shall be of axially/radially split type in accordance with the standard proven practice of Manufacturer. The joints shall be constructed in such a way that the feed water discharge pressure acting between outer barrel and inner casing acts to seal the joints. The casing assembly complete with the rotating elements should be located accurately in the outer barrel and it should be possible to remove this assembly without disturbing the suction and discharge piping connections.

The Bidder shall supply a cradle with rollers and necessary attachments for the removal of the inner assembly.

Pump casings shall be provided with adequate number of vent and priming connections with valves. Casing drain, as required, shall be provided complete with drain valves. Necessary insulation cleats shall also be provided on the casing.

4.4.3 Rotor

i) Shaft

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[58]	15.01.2016

The shaft shall be of tested forgings accurately machined and ground. The material specification and its heat treatment as well as particulars of thermal treatment, proposed to minimize distortion during manufacture, shall be stated in the Bid. Shafts should withstand the stresses set up when the pump will be started quickly. Shaft size should be so selected that full driver output can be easily transmitted without excessive deflection, vibration, distortion or whip.

ii) Impellers

The impellers should be accurately machined, finished to close tolerance and installed individually on the shaft giving special consideration to prevent recirculation between shaft and impeller.

The first stage of inlet impeller should be specially designed to provide most favourable conditions free from cavitation even during stringent suction condition.

Each impeller shall be balanced individually and the entire rotor assembly should be statically and dynamically balanced. The rotor shall be so designed that its first critical speed in air or water is above the operating speed. The first critical speed in water shall be at least 130% of maximum speed of the pumps.

Shaft sleeves of hardened wear resisting material shall be provided at all points of wear. Ferritic wear surfaces shall be preferred. They shall be firmly secured and keyed to the shaft. The material and design shall be such that no internal leakage occurs between shaft and sleeve. The axial thrust of the rotor shall be carried by an approved type of hydraulic balancing device and an external oil lubricated thrust bearing fitted at the outboard end of the pump integral with the journal bearing housing. No axial thrust should be transferred to the electric motor at any condition of operation. The thrust bearing shall be designed for additional load when pump gets vapour bound.

iii) Shaft Seals

Shaft seals shall be of mechanical seal type. The seals shall be designed to have a minimum life of 20,000 running hours between overhauls. Feed Water for sealing shall be supplied from pump discharge header. All pressure reducing and control valves, instruments, fittings and special integral piping etc. shall be included under Bidder's scope of supply. A filter or a fine mesh screen should be installed in the condensate feed line to the seals to ensure clear condensate. Stuffing box should be so designed that easy replacement of the mechanical seal is possible. All necessary protection to prevent damage to seal due to over temperature operation shall be provided by the bidder. Seal water cooler shall be provided if necessary.

iv) Bearings

Each pump shall be equipped with forced oil lubricated babbit lined sleeve bearings and tilting pad, double acting 100% thrust bearing. The sleeve bearings shall be horizontally split type. The thrust bearing shall be of sufficient size to carry the maximum unbalanced load in either direction due to any emergency operating conditions like the non-operation of the balancing device etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[59]	15.01.2016

Thrust bearing shall be suitable for reverse rotation of pump. Temperature sensing elements shall be provided for bearing metal temperature indication and thermometers with alarm contacts shall be provided for bearing oil drain.

v) Lubrication

Each pump, drive motor and hydraulic coupling for motor driven pump set of each unit shall be provided with a complete pressure lubrication system of sufficient capacity for both pump and drive motor, consisting of oil pump, sump tank, water cooled oil coolers (2 x 100%), duplex oil filter, level indicator, sight flow indicator, thermometers, relief valves, pressure regulators and necessary valves, all interconnected piping and accessories. Bidder may offer for common oil pressure lubrication system for each unit. The oil cooler tubes shall be of stainless steel SS-304. The coolers shall be designed for service with demineralised water. The oil pump shall be driven by the feed pump shaft and all parts of the system shall be mounted as an integral part of the feed pump assembly. Provision must be made to ensure continuity of oil supply even during reverse rotation of feed pump, and during low frequency operation of oil pumps.

In addition, a standby electric motor driven lubricating oil pump shall be furnished including the motor drive and pressure switch. This pump will come into operation automatically whenever the normal lubricating system pressure drops below a predetermined setting.

The oil system shall cover the entire lubrication of the pump, motor, step up gears, the booster pump as also the supply of oil to the hydraulic coupling. Arrangement for proper distribution shall be made using needle valves and orifice plates.

Required electrical interlock shall be provided for continuous, safe and trouble-free operation of the lubricating oil system, including supply pressure switches for automatic standby pump start, trip and alarm interlocks.

Provisions of pressure lubrication, if necessary, at the time of coasting down of the feed pump and drive in case of A.C. power failure, shall be arranged by the Bidder.

vi) Base Plate

The base plate for each pump shall be of rugged fabricated steel construction reinforced with heavy ribbing. The common base plate shall also accommodate the drive motor, the booster pump, the fluid coupling and the step up gear box as necessary. Adequate arrangement to collect leakage oil and leakage water separately and draining up to area drains of plant with piping, isolating valves, funnels etc. shall be provided.

vii) Suction and Discharge Nozzle

Heavy reinforced suction and discharge nozzles shall be located vertically upward on the centre line of the BFP casing. The suction shall be flanged raised face type and drilled in accordance with ANSI/ASME code requirement for the rated pressure and temperature. The discharge nozzle shall have approved welding ends. The construction of suction and discharge nozzle must assure

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[60]	15.01.2016

maximum strength and reliability and eliminate possibility of leakage at the joints at any operating condition

viii) Coupling

Adequately sized spacer type, extension type or other approved type flexible couplings shall be used between the pumps, the fluid drive, the step up gear, and the motor drive. Couplings shall have adequate permanent lubrication arrangement and shall be provided with safety guards.

ix) Axial Thrust Balancing Device (Hydraulic)

A suitable device for hydraulic thrust balancing shall be supplied. The balancing drum shall be designed to balance pump axial thrust. Drum designs shall be relatively long so as to reduce the pressure per linear unit and thus the rate of wear. This should be optimized with the pump shaft span.

Combination of disc and drum or any other suitable modifications may be used if proven by satisfactorily long experience, and in every case the Bidder shall furnish in his bid the complete details of the system provided.

It is proposed to lead the balancing chamber leak off back to the respective boiler feed suction line. A flow measuring arrangement shall be provided in the balancing leak off line to monitor the condition of wear in balancing device. All necessary local instruments including leak off flow indicator with alarm contact, valves and fittings required for safe operation of this system shall be supplied by the Bidder.

x) Material of Construction

Each pump shall be constructed preferably with the following listed materials. The Bidder shall offer equivalent or better materials with suitable heat treatment as per the standard of the manufacturer for similar duty.

Part	:	Material
Base Plate	:	Structural Steel
Casing	:	Forged Steel
Shaft	:	ASTM-A-276, Type 410
Impeller	:	ASTM-A-296, Grade CA-6NM
Diffusers	:	ASTM-A-296, Grade CA-6NM
Wearing ring	:	ASTM-A-276, Type 420
Balancing drum	:	ASTM-A-276, Type 420
Balancing head	:	ASTM-A-276, Type 420
Shaft Sleeves	:	ASTM-A-176, Type 410
Bearings:		
Radial	:	Sleeve type (Babbitt metal)
Thrust	:	Tilting pad, double acting, 100% thrust bearing (suitable material)
Pressure bolting	:	Chrome-molybdenum steel

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[61]	15.01.2016

Between rubbing faces a minimum difference in hardness of 50 BHN may be maintained.

xi) Non-return Valve

A non-return valve of approved design and manufacture shall be fitted on the discharge pipe line from each feed pump. The following requirements shall be satisfied.

The closing time of the valve, from the fully opened position, shall not be greater than the time taken for the pump to stop feeding after being tripped. This shall be of the order of one second.

The valve shall be of adequate pressure rating, alloy cast (or forged) steel body, 12-14% chrome stainless steel stellited trim, welding end joint, non-slam type.

Where internal components, other than valve seats, are of welded construction, full penetration butt welds shall be used.

xii) Low Load Protection: Recirculation System

A minimum flow recirculation arrangement shall be provided along with each pump.

Capacity of the recirculation devices shall be so selected (not less than 25% of normal rated flow) that under closed condition of the BFP discharge valve, the temperature rise within the pump remain within allowable limits and the internal recirculation at the pump suction impeller does not give rise to cavitation.

Bidder may offer ON-OFF type recirculation control valve. The impulse for the control valve shall be from the flow measuring device installed at the boiler feed pump suction.

The valve shall be of reputed make and of design proven in similar application for three (3) years.

For reducing the bypass pressure to a value suitable for returning to the deaerator, each pump shall be provided with suitable multiple stellited orifice plates of 11-13% chrome steel with companion flanges for installation in the recirculation piping and adequately designed for prolonged continuous service. Each recirculation line shall be routed independently to deaerator storage tank. An orifice, with a small pressure drop, shall be fitted in each line near the deaerator to prevent any flashing in the pipeline.

The recirculation control valves and all necessary equipment required for making the system complete shall be furnished by the Bidder for each recirculation control system. All equipment shall be welded end type.

The recirculation control valves shall be designed to open in the event of air or power failure. Signal lights shall be mounted in the local panel/remote control room to indicate open/closed position of the valve.

xiii) Pump Warming Up Device

The boiler feed pump should be designed to start working without warming up arrangement and shall accept hot fluid from deaerator immediately on starting.

xiv) High Speed Gear Unit

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[62]	15.01.2016

The gear unit shall be specifically designed for continuous service at the speeds required by this application. Precision and accuracy of manufacture is essential in order to minimize problems of vibration, impact stress, noise (to attenuate noise level of 85 dB at one meter distance), distortion and lubrication.

Dynamically balanced double helical / epicyclic gears shall be used. The high speed pinion integral to BFP shaft and the low speed gear securely keyed to the input shaft should be of approved type of properly heat treated steel according to standard code of practice. The Bidder shall submit detailed specification of the materials used including factor of safety etc. and the detailed description of heat treatment process followed.

Bearings shall be of the split sleeve type, bronze backed with a high grade centrifugally cast tin base babbit lining. Bearings shall be adequately sized and accurately machined to assure perfect alignment. Gear journal bearings shall have babbitted thrust faces next to the gear to act as locating surfaces for the gear train.

The gearing shall be enclosed in an oil and dust proof gear case made of close grained cast iron or fabricated steel. The gear case shall be horizontally split and stress relieved before machining. Two oil level gauges, drain, fill; vent temperature switch, thermometer, dipstick, vibration limit switch and other required connections equipped with approved mountings, valves and fittings shall be furnished for the gear casing. The housing shall be of rigid construction to maintain alignment of rotating parts and keep vibration to a minimum. The arrangement shall be such that it will be possible to lift gear case cover without disturbing the alignment of shaft, gear and pinion.

Forced oil lubrication system shall be adopted to lubricate the gearing and bearings.

xv) Fluid Drive (Hydraulic Coupling)

The fluid drive shall be a full duty, generously sized, infinitely variable, remotely controlled, totally enclosed, hydraulic coupling adequately rated to meet the requirement of pump characteristics while operating in the range of capacities specified and required. The speed of the feed pump shall be varied smoothly and stably (automatic control) over the entire range.

It shall be complete with stainless steel impellers, heavy duty roller bearings, pillow blocks and Kingsbury or Mitchell type thrust bearing for input and output shafts. An enclosed steel housing with removable cover, oil tank, duplex oil filters to remove all particles up to 5 microns, oil temperature and pressure gauges, pumps for oil circulation, stainless steel scoop tube and two full duty integral oil coolers suitable for D.M. Water cooling shall be furnished. The oil cooler shall be adequately rated and shall have arrangement for changing over the cooler without discontinuing the oil flow. Necessary water inlet, outlet, drain and vent piping and valves including sight flow glasses in the water outlet shall be furnished.

Full description of the coupling with cross-section and tentative control circuits, shall be included in the Bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[63]	15.01.2016

The Bidder shall specify the quantity and grade of oil required and mention its Indian equivalent and furnish speed, torque and efficiency curve for the coupling. The power consumption data for various loads with and without couplings shall be furnished in the Bid for economic evaluation.

xvi) Booster Pumps

The booster pump shall be driven directly by the boiler feed pump motor shaft or by a separate motor and shall protect the boiler feed pump from cavitation under all operating conditions. It shall be of single casing, double suction, single stage, horizontally split, self-supported type with adequate number of bearings, designed to carry its load and axial thrust. Shaft sleeve and wearing rings shall be provided at all points of wear.

The material of construction for the booster pumps shall be identical to those specified for the main pump or better.

Each pump shall be furnished with a flanged suction strainer (the duplex strainer as already specified for the Boiler Feed Pump) complete with other accessories as per requirement.

Necessary pipe connection from booster pump discharge to the suction of the main boiler feed pump, complete with pipe hangers, flow meters and other necessary instruments, valves etc., shall be included in the supply.

Proper shaft sealing and lubrication system are to be provided to ensure safe and smooth operation of the pump.

4.5

Condensate Extraction Pump Design and Construction

The pump unit will be of vertical can type design. The unit shall consist of a vertical centrifugal pump submerged in an airtight outer barrel with a pump base plate flange, above which shall be suction and discharge nozzles, a motor mounting stand and a motor coupled to the pump.

The first stage impeller shall be specifically designed for low NPSH requirement and minimum risk of cavitation. The shaft coupling shall be of flexible type in case the thrust bearing is provided on the pump and it shall be of rigid type if the thrust bearing is provided on the motor.

The condensate extraction pumps shall be of heavy duty type suitable for long periods of uninterrupted service. These shall be fitted throughout with renewable wearing parts such as wearing rings, shaft sleeves, stage sealing rings etc.

The design and workmanship shall be such that the pumps are readily assembled or dismantled and that they will operate satisfactorily under all operating conditions without cavitations, pitting, excessive vibration, noise or undue wear.

The glands of the pumps and their associated suction valves shall be suitably sealed to avoid ingress of air into the condensate under all conditions. The casing vent shall also be complete with all valves, piping, etc., for each pump.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[64]	15.01.2016

In selecting material of construction of the pumps only proven material for such services shall be used. The following material of constructions is suggested for guidance only:

Bowl	: Cast Iron
Impeller for 1st stage	: Stainless steel (12% Cr.)
Stage impeller	: Bronze or chromium steel
Shaft	: Stainless steel
Can	: Fabricated steel

The impeller shall be cast in one piece finished all over and carefully balanced both statically and dynamically. Finally the assembled rotor shall be dynamically balanced and checked for eccentricity.

4.6 Drawings, Data and Information Required

The Bidder shall submit the following with his formal Bid besides the different information required/asked in Volume III of this specification.

Characteristic curves of pumps showing effective head, pump input power, efficiency, submergence and NPSH, against capacity ranging from shut-off condition to at least 120% of rated capacity (at several running speeds from minimum to maximum in the case of B.F. Pumps).

Speed Vs. torque curve of the pump corresponding to recommended mode of pump starting, super-imposed on Speed Vs. torque curve of the motor, corresponding to 80%, 90%, 100% rated voltage and also extending from Quadrant-I to Quadrant-II covering reverse flow conditions, if applicable.

Detailed calculations for deriving capacity and head of pumps and sizing of motors.

4.7 Specific Design Criteria for Power Cycle Pumps

Table: 4.1

S.No.	ITEM	CRITERIA	REMARKS
1	Boiler Feed Pump		
1.1	Type	Horizontal barrel type multistage with suction booster pump	
1.2	Number	[3x50%]	
1.3	Rating		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[65]	15.01.2016

S.No.	ITEM	CRITERIA	REMARKS
1.3.1	Design Point:	Combined Flow of 2x50% pumps to be based on 10% margin on feed water flow corresponding to VWO condition with 3% make-up, design Condenser pressure and corresponding head.	1. Pump shall be capable of handle BMCR flow (without taking account of 10% margin) 2.The pumps shall also be capable of sustaining emergency transient consisting like H.P.heater(s) out, Turbine HP & LP bypass in operation etc.
	Best efficiency point	TMCR with design vacuum and 3 % make-up	
	Run out point	One pump to meet 65% unit load.	
	Emergency Point	VWO flow and head corresponding to highest safety valve set pressure and 2% margin on head.	
2	Condensate Extraction Pump		
2.1	Type	Vertical can type centrifugal design.	
2.2	Number	[3x50%]	
2.3	Rating	a) Capacity - Maximum steam flow at exhaust during VWO condition with 3% make-up) operation of turbine with maximum steam inlet pressure plus all heater drains & vents diverted to Condenser.	The pumps shall also be capable of sustaining emergency transient consisting like HP heater(s) out, Turbine HP & LP bypass in operation etc.
		b) Head - Maximum deaerator pressure operation etc. plus static and dynamic head under maximum capacity condition

5 LP CHEMICAL DOSING SYSTEM

5.1 General

This section of specification complete is for the Low Pressure chemical dosing system. It is not the intent of this specification to completely specify all details of design construction and installation here. Nevertheless, the equipment accessories and installation shall confirm to a high standard of engineering design and workmanship and capable of performing continuously and satisfactorily.

5.2 Equipment and Accessories to be Furnished

Low pressure chemical dosing system shall remove residual dissolved oxygen in feed / condensate water and shall maintain the pH of condensate and feed water. Each unit shall be provided with independent and skid mounted LP dosing system. The arrangement shall consist of the total system for dosing hydrazine and ammonia at boiler feed pump suction and on condensate discharge line. The system shall include the following:

- i) Hand pumps complete with flexible hose and couplings for transferring hydrazine from storage drum to mixing / storage tank shall be provided.
- ii) One number hydrazine solution preparation & storage tank for preparation of the hydrazine solution of about 0.6% concentration or as recommended for dosing by the Bidder whichever is higher shall be provided. The tank shall have storage capacity for 48 hours consumption of hydrazine and shall be complete with motorized stirrer, breather to arrest the hydrazine vapours coming out of the tank, graduated level indicator, over flow line with sealing arrangement etc.
- iii) One number hydrazine measuring tank to receive hydrazine from storage tank/container. The flow of hydrazine from measuring Tank to solution preparation/storage tank shall be by means of gravity flow.
- iv) Two numbers hydrazine dosing pumps of 100% capacity complete with drive motors, pressure relief valves and pressure gauges in the discharge line shall be provided. These pumps shall be of positive displacement type. The suction of these pumps shall be from the hydrazine solution metering tank. Each pump shall be provided with duplex filter in the suction line of each pump with differential pressure switch.
- v) The pump shall have the facility of adjusting the stroke to vary pumps discharge from 0 - 100% while the pump is in operation.
- vi) One (1) number bulk aqueous Ammonia storage tank common for [both units] for storing aqueous Ammonia of [33% Concentration] for 6 weeks requirements of both the units shall be provided. This shall be kept outside the main power house building. This ammonia storage tank shall be provided with a receiver tank on the vent to capture fumes during tank filling, vacuum breaker, relief valve and overflow line with sealing arrangement.
- vii) One number Ammonia mixing / storage tank of adequate capacity for 48 hours storage of 1.5% concentrated solution (or the recommended concentration for

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[68]	15.01.2016

- dosing by the Bidder whichever is higher) complete with motorized stirrer, breather, graduate level indicator, over flow line with sealing arrangement shall be provided.
- viii) 2x100% Ammonia transfer pumps complete with drive motors shall be provided for transferring ammonia from bulk aqueous ammonia storage tank to ammonia mixing storage tank.
 - ix) One number Ammonia measuring tank to receive Ammonia from storage tank. The flow of Ammonia from measuring Tank to solution preparation/storage tank shall be by means of gravity flow.
 - x) Ammonia feed (dosing) pumps two (2) nos. each of 100% capacity complete with drive motors, pressure relief valves and pressure gauges discharge line shall be provided.
 - xi) All the inter-connecting piping, valves and fittings, locally mounted instrument and switches shall be included.
 - xii) The Bidder shall supply all necessary C&I for satisfactory operation of the chemical dosing system.
 - xiii) The normal mode of operation of the chemical dosing system shall be through DDCMIS including on/off command of the individual pumps. However Bidder shall provide local free wired control panel complete with (a) start / stop push button, (b) indicating lamps, (c) local/remote indication, (d) stroke position indicator, (e) Raise/ lower push button for stroke position, (f) local annunciation, etc.
 - xiv) Local/remote selection shall be done from control room. The stroke position and adjustment shall be done by 4-20 mA DC signal from DDCMIS and the pump stroke actuation shall be suitable for accepting 4-20 mA DC signal. The pumps shall be provided with 24 V DC, two wire LVDT type position feedback transmitter which shall generate 4-20mA signal indicating stroke position.
 - xv) The LP dosing unit shall be skid mounted. It shall be provided with necessary lifting eyes, special tools & tackles etc. for maintenance.
 - xvi) The drain of all tanks & pipes etc. shall be led to the Owner's chemical pit for neutralization.
 - xvii) All the foundation plates, foundation nuts and bolts, clamps and auxiliary structure required for supporting the equipment, shall be included in the scope of the Bidder.
 - xviii) The material of construction of all the equipment & components including tanks, pumps & valves shall be of stainless steel SS 304.
 - xix) Arrangement shall be made for flushing the various pipe lines and pumps by the condensate. The condensate shall be tapped from the main condensate line for preparation of solution and for flushing.
 - xx) The bidder shall furnish the sizing calculations of the tanks and pumps of LP dosing system for Purchaser's approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[69]	15.01.2016

5.3 Strainer

All strainers shall be Y-type with cast steel body and 50 mesh stainless steel screen. The screen opening area shall be at least 4 times the pipe cross sectional area. Necessary screwed blow off connection fitted with plug shall be provided.

5.4 Piping

All piping shall be supplied under the specification shall be of stainless steel SS 304 for LP dosing system. The size of the piping shall be selected in conformity with the maximum design temperature and pressure of the system

5.5 Valves

All manual operated valves shall be stainless steel SS 304 body and trim for LP dosing system, and shall be related to withstand the design pressure of the system. The valve shall be welded/socket welded ends as applicable.

All flanged terminal shall be provided with necessary counter flanges, bolts, nuts gaskets.

5.6 Control Skid

A group alarm for dosing system shall be provided in the control room for the following conditions:

- i) Pump and stirrer trip due to low level in the tank.
- ii) Manual starting and stopping of stirrer motors and dosing pumps from control room.

5.7 Inspection and Testing

Performance test (head, capacity, efficiency & BHP) of the pump shall be done according to the requirement of the hydraulic institute of USA or approved equivalent.

The pump accessories will be subjected to the tests as per OEM standard

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[70]	15.01.2016

6 PIPING, VALVES & FITTINGS

6.1 General

The Bidder shall design, manufacture, supply, erection, testing and commissioning of complete power cycle piping/fittings/ accessories, associated tanks, vessels, valves and controls within the battery limit along with specialties, strainers, expansion joints, restraints, hangers/ supports with all components, thermal insulation and auxiliary structures as per the scope specified in Section-I of Volume-II. Bidder shall carry-out complete design and engineering including but not limited to pipe sizing, flexibility analysis, hanger support engineering, tanks, vessels and engineering of thermal insulation etc.

Bidder shall carry-out chemical cleaning of piping systems after complete erection, which also includes complete supply, erection and dismantling of temporary piping, valves and fittings etc.

The Bidder shall supply all standard and non-standard matching pieces as may be needed within the piping system and for connection of piping systems with equipment. Pipe stubs for mounting thermo wells and other instrumentation, including for the instruments supplied by others, along with necessary root valves, reducers/matching pieces and instrument tubing shall be provided.

Thermal insulation and cladding along with all necessary accessories for all piping systems, tanks and vessels, etc. shall be provided by the Bidder.

The Bidder shall design and provide for additional guides/ stops/restraints etc. along with auxiliary steel for control of pipe line vibration within allowable/ acceptable limits. Bidder shall provide all valves, actuators and specialties including expansion joints, orifice plate assemblies, steam traps, strainers, instrument root valves, etc.

The Bidder shall also supply special accessories like floor stands, chain operator, extended spindle etc. as required. Valve, especially for which approach from existing floors are not possible for operation and maintenance, Bidder shall provide appropriate platforms with the access ladders for the same. All pipe supporting elements such as constant load spring hangers, variable spring hangers, supports, guides, restraints, stops, etc. and all associated auxiliary steel and hardware such as beams, channels, insert plates section attachments to pipe supports, pipe and beam clamps, straps, slings, stools, shoes, saddles, devices, rods, turn buckles, graphite/steel plate/ Teflon sheet etc. shall be provided by the Bidder.

Bidder shall provide all erection material such as bolts, nuts, washers, gaskets, electrodes, filler materials, welding gas, consumable inserts and backing rings, accessories and miscellaneous specialties required for the proper installation of piping systems. All temporary piping, supports, valves, tanks, vessels, blanking plates, target plates, spool pieces for valves, flow nozzles & specialties and other accessories required to complete the chemical cleaning operation, Hydro testing and steam blowing & arrangement, temporary connections, supports, blowup valve, target plates and associated piping systems as required shall be provided.

LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[71]	15.01.2016

6.2 Codes & Standards

The Design, manufacture, shop testing, erection, testing and commissioning of piping and valves shall conform to the latest revisions of the following codes and Indian Standards or equivalent international codes, in addition to other standards mentioned in the tender documents subject to any modification and requirement as specified hereinafter.

IS: 778	Gunmetal gate, globe and check valves for general purpose.
IS: 780	Sluice valves for water purpose (50 to 300 mm).
IS: 1239	Mild steel tubes and fittings - Part I & II, ERW pipe upto 8" diameter..
IS: 1536	Centrifugally cast (spun) iron pipes for water, gas and sewage.
IS: 8329	Centrifugally cast (Spun) Ductile Iron Pressure Pipe for water, gas and sewage
IS: 1537	Vertically cast iron pressure pipe for water, gas and sewage.
IS: 1538	Cast iron fittings for pressure pipes for water, gas and sewage.
IS: 1703	Ball valves (horizontal) plunger type including floats for water supply purposes.
IS: 2379	Colour for the identification of pipe line.
IS: 2685	Code of practice for erection, installation, and maintenance of sluice valves.
IS: 2906	Sluice valve for water works purposes (350 to 1200 mm).
IS: 3042	Single faced sluice gates (200 to 1200 mm).
IS: 3589	Electrically welded steel pipes for Water gas & sewage (200 to 2000 mm).
IS: 4038	Foot valve for water works purposes.
IS: 4984	High Density polyethylene pipes.
IS: 4985	Unplasticized PVC Pipes.

Pipe lines carrying water, chemicals, air etc. shall be sized generally on the following velocities. However wherever minimum pipe sizes are defined in the tender drawing /data sheets the selected size shall not be less than the specified size.

Table-6.1

Service	Below 50 mm	50-150 mm	200 mm & above
Pump suction	-	1.2 - 1.5	1.2 - 1.5
Pump discharge and recirculation	1.2 - 1.8	1.8 - 2.4	2.1 - 2.5
Header	-	1.5 - 2.4	2.1 - 2.4
Compressed air	6		

Note – All above velocities are in m/sec

Pipe line under gravity flow shall be restricted to a flow velocity of 1 m/sec generally. Channels under gravity flow shall be sized for a maximum flow velocity of 0.6 m/sec.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[75]	15.01.2016

The following "C" Value shall be used in WILLIAM & HAZEN formula for calculating the friction loss in piping systems.

Carbon Steel pipe	-	100
C.I Pipe / Ductile Iron	-	100
Rubber lined steel pipe	-	120
PVC / HDPE / GRP pipes	-	140

For calculating the pump head, at least 10% margin shall be taken over the pipe friction losses.

Material of construction for pipes carrying various fluids shall be as below:-

Table: 6.2

S.No	Service	Recommended Material
1.	Clarified water/Filtered Water	Carbon Steel
2.	Acidic Water	FRP/CPVC/SS
3.	Demineralised Water	SS 316
4.	Passivated Demineralised Water	Carbon Steel
5.	Acid (hydrochloric)	FRP/CPVC/SS
6.	Alkali (Sodium Hydroxide)	FRP/CPVC/SS
a)	Strong (5% & above)	Stainless Steel
b)	Dilute	FRP/CPVC/ SS
7.	Chlorinated Water	Rubber lined Carbon Steel
8.	Sludge	Cast Iron/ Ductile Iron
9.	Instrument Air	Galvanized Steel
10.	Waste effluent	HDPE/ MS Rubber lined

However the portion downstream of the isolation valves of pipe lines conveying flushing water shall be of the material & type as that of the chemical pipelines which is being flushed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[76]	15.01.2016

6.3 Design Basis

- i) Design, fabrication, testing & erection of Power Cycle Piping, valves & specialties for critical piping system under purview of IBR, shall satisfy IBR, and ANSI/ASME B31.1 latest code. The design pressure of the feedwater line and feedwater heater will be in line with the recommendations of Indian Boiler Regulation (IBR), ASME Section-1 and ASME B31.1 as applicable.
- ii) Design, fabrication, testing & erection of Power Cycle Piping, valves & specialties for non-critical piping system which are not purview of IBR, shall satisfy ANSI/ASME B31.1 latest code.
- iii) Sizing, design and installation of safety valves shall conform to IBR and the non-mandatory rules for the design of safety valve installation of ANSI/ASME B31.1.
- iv) Piping Flexibility analysis shall be carried-out for all piping having sizes equal to or above 50 mm NB & design temperature 100 deg C and more, according to ANSI/ASME B-31.1 latest & also satisfying IBR latest.
- v) Design pressure and temperature shall be as per IBR. Wherever not clearly stipulated in IBR, criteria stipulated in ASME/ANSI B31.1 for selecting design pressure & temperature shall be followed.
- vi) Material of construction of piping, valves & specialties shall conform to relevant ASME / ASTM / BS / IS or equivalent codes/standards. In case materials not approved by IBR are used, it is the Bidder's responsibility to obtain IBR approval, without affecting the Construction schedule.
- vii) Type of Hangers, supports etc. shall be selected as per the following criteria:
 - a. Variable spring hangers
 - Where the variation in supporting effort between hot and cold condition does not exceed 20% of the higher of the operating load and cold setting load.
 - The resulting effect of load take-up/ release by a group of hangers in a span does not overstress the piping span or cause overloading at equipment terminals.
 - Thermal deflection between hot & cold conditions does not exceed 40 mm.
 - b. Constant load hangers
When thermal deflection between hot and cold conditions exceeding 40mm, these are used.
 - c. Spring hangers
These should not be loaded more than 80% of the spring travel range.
 - d. Rigid hangers & restraints
To be judiciously selected, without exceeding the stipulated limits of terminal forces & moments and stress level. Struts shall be considered where compressive load is expected.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[77]	15.01.2016

viii) Design Requirement of Hangers & Supports:-

In order to minimize any horizontal force components of the dead weight or any binding of the pin or rocker joints used on the hangers, the hanger rods should be as long as possible. In critical piping systems, the length of the hanger assembly capable of swinging shall not be less than 20 times the maximum expected pipe movement in the horizontal plane at the hanger location.

Constant support type of hangers shall be adopted at all locations on critical piping excepting where the smaller of vertical movements of pipe justifies the use of variable spring hangers.

As far as practicable, connections of hangers to supporting structure shall be achieved without welding to structural members. If welding is inevitable, adequate factor of safety shall be considered in the design and specification of the weld.

The attachment of support brackets to brick walls shall be avoided as far as possible and where this is not possible, details of the attachment shall be furnished to the Owner for his approval. Under unavoidable circumstances, when medium or heavy brackets are bolted to walls, back plates of adequate size and thickness shall be furnished to distribute the load against the wall. Where the use of a back plate is not practical, the brackets shall, be fastened to the wall in an approved manner.

Diameter of hanger rods for piping NB 50 mm and smaller shall not be less than 10 mm and for piping with size NB 65 mm and larger shall not be less than 13 mm.

All components for hangers such as turn buckles, clamps, etc. shall be of forged steel.

ix) Snubbers, dampers etc.

To take seismic / dynamic loads, thrust due to safety valve discharge. Effort shall be made to limit its use by judicious placement of rigid hangers. Bottom support spring hangers are to be avoided as far as possible.

x) Design, materials, fabrication, testing and erection of hangers, supports, anchors, guides etc. shall be as per ANSI/ASME B31.1 latest code. Material of support packing used for alloy steel piping shall be same or better than the parent pipe material.

xi) Hanger suspension rods, tie-rods/ struts should have proper arrangement & adequate length, so that thermal movements in direction which are free are not constrained and should not make an angle more than 4 degree with vertical due to horizontal pipe movement.

xii) Pipe Thickness calculations shall be made on the basis of procedure and formula given in ANSI B31.1. Stress values of piping material for calculation shall be selected from tables given in ANSI B31.1. Thickness, thus calculated shall be checked as per the formula of IBR and the more stringent of the two shall then be selected. If it is seen that sizes arrived at for main steam, hot reheat and boiler

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[78]	15.01.2016

feed pumps discharge pipes are not in the standard range of the manufacturers, ID controlled piping, shall then be selected for these piping systems.

- xiii) Pipe sizing and piping system design shall conform to the requirements of power piping code ANSI B31.1. Statutory requirements as laid down in Indian Boiler Regulations (latest edition) will also be taken care in pipe system designs. Pipe wall thickness as calculated by ANSI Code formula will also be checked for IBR requirements for piping systems falling under IBR purview.
- xiv) Inside diameters of piping shall first be calculated for the flow requirement of various systems. The velocity limits for calculating the inside diameters are listed below used to determine line size if dictated by considerations of pressure drop, NPSH, surges, water hammer, etc.
 - a. Steam
 - Main Steam hot and cold reheat pipes : 75 m/sec.
 - Saturation steam : 40 m/sec
 - Auxiliary steam : 30 m/sec.
 - b. Feed Water :
 - Suction : 2.0 m/sec.
 - Discharge : 5.0m/sec.
 - c. HP bypass :
 - Upstream : 75 m/sec.
 - Downstream : 100 m/sec.
 - d. LP bypass
 - Upstream : 75 m/sec.
 - Downstream : 100 m/sec.
 - e. Extraction steam :
 - Superheated steam : 60 m/sec.
 - Saturated steam : 30 m/sec.
 - HFO & LDO suction : < 1 m/sec
 - HFO & LDO discharge : 2 m/sec
 - f. Condensate :
 - Discharge : 3.4 m/sec.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[79]	15.01.2016

- Suction : 1.5 m/sec.
- g. Heater vents : 25m/sec
- h. Heater drains : 1.5m/sec
- xv) Other piping - As per good engineering practice.
- xvi) Drains shall be provided, at all low points and vents at all high points as per actual layout regardless of whether the same have been shown in the flow diagrams or not. Pipelines shall be sloped towards the drain points. For operating temperatures of greater than 400 °C, drip leg with drains, operated by a motor operated valve shall be provided. At all other drain locations (operating temperatures less than 400 °C) traps shall be provided. All traps shall be provided with strainers, isolating, bypass and free blow valves. Traps shall be thermodynamic type.

6.4 Piping Design

- i) Complete design, engineering, etc. for the power cycle piping systems and other piping systems shall be the responsibility of the Bidder. Owner's responsibility/ function in this connection shall be limited to review and approval of Bidder's design/ calculation, engineering, drawings, documents. Bidder's scope of services for complete engineering of the piping systems shall include but not be limited to the following:
- ii) Preparation of engineering piping diagram indicating flow schematic, flow parameter, pipe sizes, line designations and tag nos. of various components etc.
- iii) Design parameter selection, pipe sizing calculation, pipe schedule, valve schedule, insulation schedule, specialties schedule and hanger schedule for the systems.
- iv) Preparation of preliminary as well as final composite piping layout drawings of pipe size 65mm NB & above.
- v) Design in detail all piping supports including restraints, guides, stops etc., after deciding the final location of hangers and supports and based on final stress analysis and hanger/ support load data.
- vi) Prepare separate sketches for each hanger/ support, restraint, anchor, etc. These sketches shall include the location with reference to column co-ordinates, identification number, bills of material, design loads, operating load, spring stiffness, amount of spring pre-compression etc., the method of attachment to the pipe and steel structure. Additionally the sketches shall show a key plan referenced to plant north and centre line elevation of the pipe at the point of attachment for cold and hot conditions.
- vii) Preparation of fabrication and erection isometric (with material take off) drawings for shop fabricated piping which are of size 65 mm NB and above.
- viii) Sizes of Boiler feed pump suction piping shall be selected to meet the NPSH requirements of the pumps under transient conditions prevailing on loss of steam

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[80]	15.01.2016

supply to feed water tank. Similarly for all pumps, NPSH requirements shall be satisfied in line sizing.

6.5 Stress Analysis

The Bidder shall carryout stress analysis of piping system using proven and validated software and shall submit for Owner's approval.

- i) Following loading conditions shall be considered for stress analysis:
 - Internal pressure
 - Thermal loads due to – (a) Piping thermal expansion and (b) Anchor displacement due to thermal movements of piping anchors.
 - Piping weight consisting of weight of piping, valves, bends, fittings, insulation etc. as well as weight of support components like clamps, shoes, suspension rods, trapeze etc. & weight of contained fluid.
 - Test or cleaning fluid load
 - Equivalent static loads due to discharge of safety valve (SV), Electromatic relief valve (ERV), simultaneous discharge of SV & ERV where applicable.
 - Dynamic load due to steam hammer (if applicable)
 - Seismic loads due to (i) Equivalent static load due to seismic inertia effect and (ii) Equivalent static load due to seismic anchor displacement
 - Wind load where applicable
- ii) Loading combination Design load for supports, restraints, anchors & supporting structures shall be obtained by proper selection of one or combination of two or more of the loads as above based on the possibility of independent or simultaneous occurrence. Loads imposed due to hydrostatic tests shall also be taken into consideration for the design of supports.
- iii) Bidder shall clearly indicate the basis of his judicious selection or loading combination for support, restraints and anchor design. Component of thermal expansion reaction range expected to appear at cold condition, as per equation 9 & 10 of ANSI/ASME B31.1 shall be considered in loading combinations. As overload factor of 1.30 shall be considered over the computed loads except occasional loads before combining them. Bidder shall justify with reasoning in case any one of the specified loads is not considered in analysis.
- iv) Combination of Stresses the computed stress under different loading conditions shall be combined as per equation 11, 12 & 13 of ANSI/ASME B31.1 & the stress shall be within allowable limits.
- v) Allowable stress values for piping materials other than ASME/ASTM materials, values shall be derived as per the criteria defined in Appendix-P of ASME Boiler & Pressure Vessel Code, Section-VIII, and Division 1 while computing pipe wall thickness and flexibility analysis shall be conducted as per ANSI/ASME B31.1.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[81]	15.01.2016

However, higher of pipe wall thicknesses derived between IBR regulation & ANSI/ ASME B31.1 code shall be considered.

vi) Factor to be considered in flexibility analysis.

- Cyclic load operation of the Unit. Bidder shall consider value of stress range reduction factor 'f' for cyclic conditions due to temperature reversals equal to 1.
- Stress intensification factor at all transitions, fittings & all branches as per ANSI/ASME B31.1.
- Variation in supporting effort by variable spring due to pipe movements

vii) Piping Flexibility analysis is to be conducted as per the piping layout in case any modification of piping layout is felt essential to maintain stresses & terminal reactions within allowable ranges, same are to be carried out by the Bidder after discussion with Owner.

The following piping systems shall be analyzed:

- Pipelines with a maximum operating temperature equal to or greater than 100°C having size 50NB or above.
- Regardless of their operating temperatures, all pipelines connected to sensitive rotating equipment such as turbines, feed pumps etc. for which limiting values of pipe reaction have been specified by the equipment manufacturer
- Any other pipeline which in the opinion of the Owner requires a formal analysis.
- A write up on the stress analysis including codes used and design conditions considered.
- A copy of the computer print out for input data for the various design conditions considered for stress analysis along with the stress diagram (piping isometric marked with node points marked.)
- A copy of flexibility analysis software soft copy shall also be submitted for Owner's approval.
- Analysis results in tabular form giving calculated and allowable reactions / forces / moments on equipment nozzles/terminals for the various design conditions considered for analysis.
- Allowable and calculated code stresses at various node points in the piping for the design conditions considered based on code requirements for analysis.
- Analysis results giving calculated forces and moments and movements at various hanger / support / restraint / anchor points from the static analysis corresponding to various thermal / operating conditions, sustained load case,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[82]	15.01.2016

hydro load case (other than water lines) and occasional loads, as applicable, for each piping system analyzed.

6.6 Statutory Approvals

- i) It is the sole responsibility of the Bidder to identify and obtain all necessary approvals from various Government agencies / statutory authorities including IBR, CCoE, etc., as applicable for the design, manufacture and testing of pipes, valves, fittings, specialties etc.
- ii) The Bidder shall also identify and obtain all necessary approvals from the IBR authority in the state where the plant is being installed, for the erection / testing / commissioning and any other requirement as required by IBR.
- iii) It is also the responsibility of the Bidder to get approval(s) from any other statutory authority in other countries from where the supplies are made, as applicable and acceptable to IBR for the design/manufacture/testing etc. for the piping / fittings / valves / specialties etc.
- iv) In order to obtain the above approvals, all necessary documentation etc. required shall be arranged and furnished by the Bidder to the statutory authorities.

6.7 Installation

- i) Cleaning including chemical cleaning of all systems as specified herein and installation of temporary pipe work for the same. All hot bent, forged formed, fabricated and straight pipes shall be chemically cleaned, pickled or wire brushed and purged with air blast or shot/grit blast to remove all sand and scale from the inner surface as applicable.
- ii) Making temporary closures/ stubs on piping system as required for hydrostatic testing and performing hydrostatic test on all piping. All pipes shall be hydro tested at shops for pressures as per standards and all erected piping shall be tested 1.5 times the design pressure.

The Bidder shall carryout the following cleaning after hydro test.

- a. All piping shall be mass flushed, in addition to the specific cleaning operations as described below, as required.
- b. Extraction steam, condensate, boiler feed suction and discharge, heater drains and vents shall be alkaline flushed.
- c. Compressed air piping shall be blown by air.
- d. Turbine lubricating oil piping shall be pickled
- iii) Making interface piping connections at TP with equipment/piping etc. as applicable.
- iv) Apart from carrying out chemical cleaning, the work shall include neutralization disposal of water, clean up, reinstatement of the cleaned piping system, dismantling and removal all temporary piping, equipment and materials from site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[83]	15.01.2016

- v) Painting of piping system shall be in accordance with the stipulations laid down in Vol 2, Annexure II of this specification.
- vi) Weather hood for pipes crossing ceilings and walls.
- vii) Checks after Installation
In order to ensure that all supporting elements, anchor and restraints have been installed and adjusted in accordance with design documentation, the Bidder shall inspect and log the hanger readings for the hangers associated with the power cycle piping system as follows:
 - a. After hydrostatic test with the piping in the cold position, with all travel stops removed, with the pipe completely insulated and in all respect ready for start-up.
 - b. Piping in hot position (rated parameter condition) after six (6) months of operation.
 - c. Piping in cold position during the first complete shutdown after at least six (6) months of operation.
 - d. After steam blowing, in case steam blowing is applicable for the line.
 - e. At the time of each inspection, the Bidder will determine the necessity for revision, adjustment or replacement of pipe supporting elements, restraints and anchors. Any changes proposed shall be subject to the concurrence of the Owner. The changes shall be incorporated by the Bidder after Owner's concurrence.

6.8 Inspection and Testing

All shop tests as required by the applicable codes, ANSI Standards, IBR and other standards specified.

- i) Obtaining approval from Chief Inspector of Boiler as per latest Indian Boiler Regulations (IBR) is the responsibility of the Bidder. This shall include furnishing all necessary certificates for design, manufacture and testing for pipe, valves, fittings, specialties, certificate of manufacture and test for each erected piping in the relevant formats to the Chief Inspector of Boilers, obtaining his approval and furnishing the same to the Employer.
- ii) The Bidder shall also identify and satisfy all other statutory code requirements as may be required for the piping systems covered in this specification.
- iii) Certified copies of test reports for all tests and examinations specified in the specification and for the mandatory test and analysis required by ASME/ ASTM material specification, for the materials used for piping, shall be furnished to Employer.
- iv) Provide complete interface engineering with the suppliers of other equipment and piping with which the piping systems in the Bidder's scope are connected.
- v) Performing all tests and implementing all quality control procedures as specified herein including provision of testing equipment, stress relieving equipment,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[84]	15.01.2016

radiography equipment and any other equipment necessary to meet the requirements of the specification.

6.9 Low Pressure Piping, Valves and Fittings

Low Pressure (LP) piping shall, basically, cover piping systems for the following services:

- a) Circulating water system (Part).
- b) DM water normal make-up system
- c) Condenser normal/emergency make up system / condensate (storage and transfer) system.
- d) Deaerator fill system.
- e) Equipment Cooling Water (ECW) system including its chemical dosing system
- f) Service water system
- g) Instrument Air System.
- h) Service Air System
- i) Lube oil System
- j) Chemical feed lines
- k) Auxiliary cooling water system
- l) Drain & Vents for the piping\equipment etc.
- m) Re-circulation pipes along with valves, break-down orifices etc., wherever required.
- n) Any other piping system required to make the Low Pressure (LP) piping systems complete.

All the piping systems be designed to operate without replacement and with normal maintenance for a plant service life of [20] years, and shall withstand the operating parameter fluctuations and cycling which can be normally expected during this period.

o) Piping Materials and Sizes

All piping system shall be capable of withstanding the maximum pressure and temperature in the corresponding line. The pressure rating of individual piping system component such as valves, flanges etc shall however be not less than that specified. Nominal pipes sizes and pipe outside diameters shall generally be as per ANSI B36.10. In case of deviation BIDDER shall bring it to the specific attention of ENGINEER for prior approval stating reasons for the deviation.

The Steel pipes (Welded type) for the services of water/clarified water/Filtered water shall conform to the following standards or codes.

i)	Pipes upto 150 NB	
a)	IS:1239 Part-I	(Heavy grade-Black)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[85]	15.01.2016

b)	ASTM-A-53 Grade B (Welded)	Sch 80 upto 2 inch nominal size(Minimum)
		Sch 40 above 2 inch nominal size (Minimum).
ii)	Pipes 200 NB and above	
a)	IS:3589 Grade 410	
b)	ASTM – A53 Grade B (Welded)	Sch. 40 (Minimum)

i) Wall Thickness

The calculation of wall thickness required for pipelines subject to internal and/or external pressure shall be based on the formulae and recommendations as given in the applicable codes. Adequate allowances shall be made towards thinning due to bending, weakening at branch connections, threading, commercial tolerances on pipe wall thickness, corrosion and erosion, etc. and the same shall be subject to approval by Owner. In any case a minimum corrosion allowance of 1.0 mm shall be considered while selecting the thickness.

In case of carbon steel materials, the nominal wall thickness of pipeline shall be not less than the minimum acceptable values given below:

NB mm (inch)	15 (1/2)	20 (3/4)	25 (1)	32 (1 1/4)	40 (1.5)	50 (2)	65 (2.5)	80 (3)	100 (4)	125 (5)
Min. thickness, mm	3.2	3.2	3.6	3.6	3.6	3.6	3.6	4.0	4.5	5.4
NB mm (inch)	150 (6)	200 (8)	250 (10)	300 (12)	350 (14)	400 (16)	450 (18)	500 (20)	600 (24)	
Min. thickness, mm	5.4	6.35	6.35	6.35	7.1	7.1	7.1	8.0	8.0	

NB 700 mm to NB 800 mm - 10.00 mm

NB 900 mm to NB 1500 mm - 12.00 mm

NB 1600 mm to NB 2000 mm - 14.00 mm

NB 2100 mm to NB 2500 mm - 16.00 mm

NB 2600 mm to NB 3200 mm - 18.00 mm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[86]	15.01.2016

6.10 Thermal Insulation

The thermal insulation for the turbine casing shall consist of sprayed insulation produced by projecting specially prepared mineral wool along with a fine liquid spray. This should be covered with prefabricated 'blanket' type insulation. These blankets shall consist of high temperature felted mineral insulation fully enclosed in wire inserted asbestos cloth for temperature exposure to 445 deg C to 595 deg C. A single layer of blanket shall not be more than 75 mm thick. Voids around the blankets should be avoided. However, unavoidable voids shall be filled with loose mineral wool.

- i) Nuts and other exposed portions of the casing and valve flanges shall be suitably insulated for minimum heat loss.
- ii) The density of the mineral fiber felt shall be carefully controlled at about 200 kg/m³ and the thermal conductivity of mineral wool shall be 0.052kCal/mh deg C at mean temperature.
- iii) Suitable stainless steel lugs shall be tack welded on turbine casing to support the insulation. In places where welding is not permitted, suitable alternative arrangement shall be provided by the Bidder. The design of the support shall be so as to involve minimum number of lugs.
- iv) The mineral wool shall be capable of passing standard combustibility test, both immediately after application and also after being subjected to its maximum operating temperature for not less than 100 hours. The mineral wool shall be free from objectionable odour at the ambient conditions in which it is used. The mineral wool shall not contain substances which shall support pests or encourage growth of fungi. The mineral wool shall not suffer permanent deterioration as a result of contact with moisture due to condensation. The mineral wool shall not suffer quality deterioration under the specified conditions of use. In this connection, both hot and cold face temperatures are relevant. The mineral wool shall be capable of being applied to the surface concerned without causing corrosion of the surface being insulated or the cladding on it under normal site conditions.
- v) The thermal insulation designed, furnished and installed by the Bidder shall be such that the following items of performance shall be guaranteed, and the specific design and application features adopted shall be so as not to exceed the stipulated limits in temperature differentials. The Owner shall have the option to have any random check of specimen as per his choice, to establish conformity to following guaranteed particulars:
 - a. The temperature difference between the cold face of finished insulation and ambient shall not be more than 15 deg C. The ambient temperature shall be considered as 50 deg C.
 - b. The difference in temperature between upper and lower metallic parts of H.P. and I.P. casings in the zone of governing stage/ steam admission shall not be more the 40 deg C during cooling of the casing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[87]	15.01.2016

The difference in metallic temperatures of upper and lower halves of both H.P. and I.P. casings, during normal operating conditions shall not be more than 15 °C.

6.11 Fittings

Fittings to be used with carbon steel pipes shall conform to IS: 1239 Part-II (Heavy grade) or ASTM A 234 Gr. WPB. for sizes up to 150 NB.

For sizes 200 NB & above steel fittings shall conform to ASTM A 234 Gr. WPB. However for sizes above 300 NB fabricated fittings (mitre bends etc) may be used.

Wherever regular pipe bends are employed for change of direction the same shall be to a radius of 5 times the pipe diameter. Mitre bends shall be 1.5D radius.

Inside surface of all the fittings used for the rubber lined application shall be de beaded and made suitable for rubber lining.

Galvanized pipe application all the fittings shall be galvanized as per IS: 4736. Fittings to be used in other type of piping shall conform to relevant IS/BS ANSI Standards and in conformity with the parent pipe standard.

Branch connections in piping shall be made by the use of wrought or forged seamless fittings such as tees, laterals and crosses. Small stubs as may be required for instrument, drain and vent connection may be provided in the form of weld outlet fittings or forged couplings. Intersection welds are acceptable only in the event of non-availability of fittings.

6.12 Design and Construction

i) Pipes, valves and Fittings

Following items shall be included for piping:

- Pipes, bends, elbows, tees, branches laterals, crosses, reducing unions, couplings, cap, expansion joints, flanges, blank flanges, saddles, shoes, sampling connections etc. necessary for making a reliable piping system.
- Valve, gates, dampers, etc.
- Strainers and filters.
- Instrument tapping connection, stubs and thermo-wells, root valves.
- Matching flanges, pipe spools and matching pipes to connect to equipment, instruments, etc. as necessary.
- Gaskets, ring joint, bracing rings, jointing material etc. as required.
- Bolts, nuts, fasteners as required for interconnecting piping, valves and fitting as well as for terminal points.
- Pipe supports like pedestals, Anchor blocks (for buried / over ground piping), brackets, hangers, clamps, trestles, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[88]	15.01.2016

- Secondary steel for pipe supports and embedded steel. Also pipe supports and necessary embedment required to be embedded in concrete for underground/above ground pipes.
- Painting, anti-corrosive coatings, wrapping and coating, thermal insulation, etc. inside and outside of pipes as necessary.

ii) End connections

Unless otherwise specified, following types of end connections shall be used:

Pipes 50 NB and smaller shall have socket welded joints for chlorine line. For water, air and other services where steel pipes are used, joints of this size range shall be Socket welded/screwed/flanged type (For rubber lined pipes).

All unlined steel pipes 65 NB and above (other than CI pipes and air service pipes) shall be connected by butt welding. All rubber lined pipes shall have flanged joints.

Butt welding edge preparation shall be done as per ANSI B 16.25. The Bidder shall furnish details/specifications for all welding electrodes and welding rods including special ones, if any for approval.

Steel pipe flanges shall be generally slipped on flat face type. Weld neck flanges shall be used when flange follows immediately after a butt welding or where it is required with respect to service conditions. Slip-on type of flanges may be only up to a maximum pressure rating of ANSI 300 lbs. In case of higher pressure ratings, weld-neck type of flanges shall be employed. When weld neck or socket weld flanges are used, their bore must be made the same as that of the pipe being welded to. Socket welded or threaded flanges may be used, with the appropriate piping system for connection of pipe to the flanged equipment.

All the piping flanges and counter flanges shall conform to ANSI B 16.5 Cl. 150 (minimum). However wherever the interferences is involved with the Owner's pipe, the flange/interconnection details shall be designed to match the piping and the details of which will be intimated later.

For easy handling & removal of equipments, valves etc. and for maintenance purpose, break up flanges for 65 NB and above sizes and suitable type of compression flexible coupling for flanged joints of 50 NB and below size shall be provided. The over ground piping wherever routed inside building, shall have a clear head room of minimum 2.2 m from floor in passages/walkways.

6.13 Piping Layout

- Pipes shall be generally routed above ground but where specifically indicated/specified the pipe may be laid in trenches or buried. Buried piping shall be generally installed so that the top of pipe is 1.5 meter below the ground level unless otherwise specifically mentioned. Full length of buried piping shall be provided with 100 mm thick sand bed.
- Complete supporting system for the pipe line shall be designed, fabricated and supplied by the Bidder. Inside the building, the overhead portion of the pipe line may be supported from the building structures. No support shall be taken from

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[89]	15.01.2016

the brick wall. Outdoor, pipes other than buried pipes shall run on steel trestles. Crossing of the road shall be on a pipe bridge with a clear height of at least 8.0 meters (minimum) over the road surface. All the steel structure for the pipe bridge and the supporting posts/trestles along with all necessary hangers clamps, connecting steel, fixing bolts, nuts etc. shall be supplied and erected by the Bidder. All pipe racks shall be provided with 750 mm (Minimum) clear width walkways.

- iii) Hangers and supports shall be capable of carrying the sum of all concurrently acting loads. They shall be designed to provide the required supporting effects and allow pipe line movements as necessary. All guides, anchors, braces, dampener, expansion joint and structural steel to be attached to the building/structure, trenches etc. shall be provided.
- iv) Mitre bends will not be accepted for steel pipes of 250 NB and below. For sizes 300 and above, the mitre bends shall conform to BS: 534.
- v) For rubber lined pipe of acid service, lining should be applied in two (2) layers, giving a total thickness not less than 3 mm.
- vi) Pipe coming under purview of IBR should meet its requirements and getting the IBR approval shall be under Bidder's scope.
- vii) Thickness calculation of CW duct/large diameter buried pipes as per AWWA-M-11
- viii) Anti corrosive protection shall be provided for all buried piping including galvanized steel piping. In case of buried pipes of size 1000 mm NB and above, the Bidder shall stiffen them and/or increase the thickness of pipe adequately against ovality formation in use.
- ix) Flexibility analysis for piping systems wherever required. Whenever, straight run of the above ground yard pipes are more than 50 meters, flexibility analysis shall be conducted by the Bidder to identify the requirement of loops, type of supports etc.
- x) The Bidder shall prepare the flow diagrams, detailed dimensional piping layout/ Isometric/ fabrication/ as built drawings of all the systems along with Cross sectional drawings, showing all supports and equipment as required.
- xi) All pipelines with size greater than NB 50 mm are considered as shop fabricated piping and detailed piping layout drawings shall be prepared for all such pipelines. The drawings shall be to scale and shall be prepared as plan & sections and shall carry the following minimum details:
 - a) Fully dimensioned layout with locating dimensions referred to plant axes and coordinates
 - b) Details of all stub connections and other welded attachments as required for anchors, restraints, hangers supports, etc.
 - c) Slope, drains and vents
 - d) Edge preparation details of weld ends

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[90]	15.01.2016

- e) Mounting and orientation of valves and specialties and maintenance space requirements
 - f) Location and tag numbers of hangers, supports, restraints, anchors, etc.
 - g) Location and magnitude of cold cuts, if any
 - h) Pipe sizes, materials, design parameters, shop and field test requirements
 - i) Insulation details
 - j) Tolerances, if any
 - k) Any specific requirements on shop fabrication and/or field erection
 - l) Any other detail considered necessary by the Owner.
- xii) The piping shall be arranged to provide clearance for the removal of equipment requiring maintenance and for easy access to valves and other piping accessories required for operation and maintenance. Layout drawings shall indicate valve orientations and availability of access to valves and specialties. Layout of all piping shall ensure that all valves including motor operated valves are located as to be accessible conveniently for operation. Valves for operation and maintenance shall have 1.0 m clear approach space. If any of the valves are not accessible, suitable access platform shall be provided by the Bidder.
- xiii) Provision shall be made while preparing piping layout to accept control valves, flow measurement element and any other on-line specialty or equipment. Sufficient upstream and downstream lengths shall be provided for flow measuring devices, control valves, desuperheaters and other specialties as required by the respective equipment manufacturer.

6.14 Valves

- i) All valves shall be suitable for service conditions i.e. flow, temperature and pressure under which they are required. The valves shall be of standard pressure rating as per the relevant code/ standard.
- ii) Either Butterfly type or sluice/gate valves shall be used for isolation purposes in raw water, Clarified & Filtered water application. Butterfly valves shall be of double flanged or lugged wafer type of low leakage rate conforming to AWWA-C-504 class 150 or EN-593 Class 150.
- iii) Manually operated valves shall be provided with reduction gear unit for valves of size 200 NB and above. Valve provided with motorized or pneumatic actuator shall be provided with a hand wheel for manual operation.
- iv) All the valves shall be equipped with adjustable mechanical stop-limiting devices to prevent over travel of the valve disc in the open and closed positions. The valve operators (Hand wheel or Gear reduction unit or Motor actuator etc.) shall be designed as per relevant International Standard.
- v) Ball valves or Globe Valves may also be provided for the application of Raw/ Clarified / Filtered water services for sizes 50 NB and below.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[91]	15.01.2016

- vi) Butterfly valves or proven patented diaphragm valves shall be used for the services of demineralised water application for isolation purposes.
- vii) Sluice valve/knife edge type slide valves shall be used in the sludge and drain pipe line.
- viii) For Air services, globe valves or Ball valves may be used for sizes 50 NB and below. For sizes higher than 50 NB, either Butterfly valve or Ball valves shall be used.
- ix) Check valves for Raw / Clarified / Filtered water may be offered in Gun metal construction and with threaded ends for sizes 50 NB and below conforming to IS:778 or Equivalent.
- x) For Chlorine gas and Chlorinated water application check valve of Lift Ball type may be used in PVC construction (in case of PVC pipes). In case of rubber-lined pipes, the check valves of swing check type shall be lined construction.
- xi) The safety valves / relief valves at the down stream of positive displacement type metering pumps shall be of the standard type manufactured by the pump manufacturer and the material of construction shall suit to the fluid handled.
- xii) Safety valve
- xiii) The butterfly valves for DM water application shall conform to the following requirements:
- xiv) Body shall be lined (minimum 3 mm) with natural rubber, ebonite, polypropylene or PVDF.
- xv) Disc shall be lined with PVDF, polypropylene, or natural rubber.
- xvi) Seat rings shall be of Nitrile rubber or Hypalon
- xvii) Valves for Acid & Alkali Services shall be proven patented diaphragm type. Diaphragm shall be of reinforced teflon, EPDM/Black Butile/appd. eqv. For acid services and reinforced Neoprene/Hypalon/app eqv for alkali services.
- xviii) For air application, Body material of Ball valves shall be leaded Tin Bronze (IS: 318 Gr.2) or stainless steel (AISI: 304/316). Body & Disc of Butterfly valves shall be either cast iron lined with elastomer such as PVDF or PTFE or stainless steel construction (AISI 304/316).
- xix) For the application of alum, lime, coagulant aid solution, DM water and air, the body, cover & Disc of Non return valves shall be lined with natural Rubber, PTFE or Viton.

6.14.1 Design and Construction Features

The following design and construction features of valves shall be complied with.

- i) All gate and globe valves shall be of rising stem, outside screw and yoke type. The design of valves shall ensure a streamlined passage and gate valves shall have low pressure drop. The seats and discs shall be easily renewable and/or shall be suitable for easy refacing and grinding. Valve discs shall be of such design as to keep the seats tight when the valve body is subjected to pressure, temperature variations and piping stresses. Gate valves shall close in both flow directions.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[92]	15.01.2016

- ii) All globe valves shall be capable of being closed against pressure.
- iii) In the case of all end-welded valves, the stub ends of the valves shall project from the valve body a sufficient amount to ensure that the welding process will not distort the valve body and internal parts.
- iv) Valves for regulating duties shall be of the globe type with tapered plug type disc.
- v) Hardness of seating surfaces shall be a minimum of 350 BHN and a minimum differential hardness of 50 BHN shall be provided between seats to prevent galling. This is not applicable for stellited seats.
- vi) Check valves of sizes 400 mm NB and larger shall have dash pot arrangement.
- vii) All gate and globe valves shall have back-seating arrangement to facilitate easy replacement of packing with the valve in service.
- viii) All valves shall be so designed that the hand-wheel moves in a clockwise direction to close the valve. The face of the hand-wheel shall be clearly marked with the words 'OPEN' and 'CLOSE' and an arrow to indicate the direction for opening. All hand-wheels shall be fitted with name plate. All globe valves shall be provided with position indicator.
- ix) Piston lift check valves shall have accurately guided pistons so that the pistons are cushioned in their cylinders as they move up.
- x) All gate, globe, Y-type and angle valves intended for manual operation and falling under the following categories shall be equipped with a gear operator for ease of operation and to ensure fast and tight closure:

ANSI Pressure Rating Valve Sizes for which Gear Operator is required

Class 300 and below	350 mm and larger
Class 600 and above	200 mm and larger

- xi) All gate valves falling in the following categories shall be provided with integral bypass valve. Bypass size shall conform to MSS-SP-45 as a minimum standard. The bypass valve shall be hand operated unless specified otherwise. Pipe for bypass shall be of at least schedule 80 seamless and of a material of the same nominal chemical composition and physical properties as that used for the main line. Orientation of bypass arrangement shall be subject to the approval of Owner.

ANSI Pressure Rating Valve Sizes for which Bypass is required

Class 600 and over	200 mm and larger
Class 300 & 150	350 mm and larger

- xii) All gate valves of ANSI pressure rating class 150 and 300 shall have solid or flexible wedge and ANSI pressure rating class 600 and above shall have flexible or parallel slide type of wedge.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[93]	15.01.2016

- xiii) Valves with flexible wedge shall have provision for relieving the pressure in the neck of the valve when the valve is in the closed position.
- xiv) All valves of ANSI pressure rating up to class 600 shall have bolted bonnet construction and class 900 and above shall have bonnet construction of the pressure seal type. Pressure seal valves shall have stainless steel inlay in the gasket area and silver-plated gaskets or other acceptable proven features.
All carbon steel valves of ANSI pressure rating up to class 150 and 300 shall have stainless steel trim (13% Cr) and ANSI pressure rating class 600 and above shall have stellited trim.
- xv) All alloy steel valves shall have stellited seats.
- xvi) All valves of ANSI pressure rating up to class 900 and higher shall have yoke with anti-friction bearing arrangement.
- xvii) Valves that are to be kept in full 'OPEN'/'CLOSE' position shall be provided with a non-detachable locking arrangement. The locking arrangement provided shall be subject to approval by the Owner.
- xviii) All gate, and globe valves of size 50 mm and below in vacuum service shall have extra deep gland packing without requiring water gland sealing. All gate and globe valves of size 65 mm NB and above in vacuum services shall have adequately deep gland packing and shall be equipped with lantern rings to admit pressurized water for gland sealing. The inlet and outlet connections shall be NB 15mm. The BIDDER shall indicate the maximum and minimum sealing water pressure and the required flow rate.
- xix) Motor actuators for motor operated valves shall meet requirements mentioned in the specification.

6.15 Cleaning

Prior to factory inspection, all manufacturing waste, such as metal chips and filings, welding rods and stubs, rags, debris and all other foreign matter shall be removed from the interior of each valve. All mill scale, rust, oil, grease, chalk, crayon, paint marks and other deleterious material shall be removed from the interior and exterior surfaces. At the time of shipment, valves shall be clean inside and outside.

6.16 Inspection and Tests

Inspection and tests shall be as per the Data Sheet given below.

Defects in excess of acceptance standards shall be removed by suitable means. If removal of surface defects does not result in reduction in wall thickness below 5% of intended thickness of metal at that location, the area shall be blended smoothly into the surrounding surface. Where defect removal results in a wall thickness less than the above resultant cavity may be repaired by welding. The procedure and operator shall be qualified as per applicable standards. Major weld repairs shall be stress relieved or heat treated in accordance with ASME Section VIII Division I-UCS 56.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[94]	15.01.2016

The required area shall be re-examined and the acceptance standards shall be as in the original examination.

Weld repairs made as a result of radiographic examination shall be radiographed after welding. Repairing a particular area more than 2 times is not permitted and the component shall be rejected. The acceptance standards for welds shall be as per ASME Boiler and Pressure Vessel Code, Section VIII, Division I, UW - 51.

Prior approval shall be obtained from the Owner before taking up major weld repairs (major weld repair - when depth of repair exceeds 20% of thickness or 1 inch whichever is smaller). Mapping of major weld repairs is also required.

All valves shall be tested hydrostatically for strength, tightness of seats and tightness of back seating at the pressures, in accordance with MSS-SP 61, "Hydrostatic Testing of Steel Valves". Water used for hydrostatic testing of valves with stainless steel components shall not have chloride content exceeding 20 ppm. Clean potable water may be used for testing of all other valves.

All valves except check valves shall be tested for seat tightness by air at a pressure of 6 bar (g) on both sides of seat.

All check valves shall also be hydro tested at 125% of the seat hydro test pressure.

All valves shall be checked for correctness in respect of specified end details as per applicable standards.

6.17 Painting and Corrosion Protection

Two coats of primer of thickness 35 microns for each coat shall be applied to all steel and cast iron exposed surfaces as required to prevent corrosion, after release has been given for painting and before dispatch. The use of grease or oil, other than light grade mineral oil, for corrosion protection is prohibited. Bores of all valves shall be covered immediately after testing, draining and drying with suitable plastic end covers to avoid ingress of foreign materials.

All pipe lines, piping components shall be adequately protected against corrosion during manufacture, fabrication, shipment and storage by appropriate protective paint. For details, refer Section on Painting.

Note:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[96]	15.01.2016

- i. Testing of body, seat and back seat shall be as per ANSI B16.34
- ii. For water system with sizes greater than NB200 butterfly valves shall be used and shall conform to AWWA C-504.
- iii. All valves of size 400 NB and above shall be provided with electrical actuators.

6.19 Gates

Design standard for gates shall be IS: 3042 or equivalent. The gates shall be rectangular or square sluice, rising spindle type conforming to class-1 of IS: 3042. The Material of Construction shall be as follows:

i)	Frame and Door	:	Cast Iron IS:210 Gr. 260
ii)	Spindles, bolts & nuts	:	ASTM A 182 Gr. F6A
iii)	Face & seat rings	:	Gun metal (as per IS:3042).

All the parts of gates shall be applied with the coats of heavy duty bitumastic paint.

Each of the gates shall be provided with hand wheel, and a position indicator. The gates for DM plant drains shall be rubber lined to a minimum thickness of 4.5 mm.

6.20 Strainers

i) Basket Type Strainers

Basket strainers of simplex design shall have the following materials of construction for raw/clarified/filtered water application.

a)	Body	:	Fabricated mild steel : IS:2062 (Tested quality)
b)	Strainers	:	Wire shall be stainless steel (AISI: 316, 30 mesh suitably reinforced. Reinforcement material shall also be of stainless steel construction)
c)	Drain Plug/Nuts	:	Gun metal

Screen (strainer) flow area shall be at least four times pipe sectional area. Flow area in any portion of Basket strainer assembly shall not be less than the pipe cross sectional area. Pressure drop in clean condition shall not be more than 1.0 MWC.

Basket Strainer shall be provided with lifting lugs and suitable mounting arrangement. Suitable Vent and drain valves shall be provided for the strainers.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[97]	15.01.2016

For DM water service, body shall be rubber lined to minimum 4.5 mm thickness (soft rubber of shore Hardness $65 \pm 5^{\circ}\text{A}$).

ii) Y-Type Strainers

Y-Type strainer for water application shall be constructed of following materials

a)	Body	:	Cast Iron IS: 210 Gr. FG 260
b)	Strainers	:	Wires of stainless steel AISI-316, 30 mesh suitably reinforced. Reinforcement material shall also be of stainless steel construction.
c)	Drain Plugs	:	Gun metal (threaded construction)

Body of the Y-type strainers of alkali, and demineralised water shall be of Cast Iron (IS: 210, Gr.FG 260) and lined with soft or hard rubber to a thickness of 4.5 mm.

For acid services, apart from the rubber lined body material, the screen material shall be Polypropylene or HDPE wire cloth of suitable mesh and thickness.

6.21

Steam Traps

- i) The steam traps shall be inverted bucket or thermodynamic type complete with integral or separate strainers.
- ii) The internal components of traps shall be of AISI-316 stainless steel construction. Material of construction of the body shall be selected by the Bidder based on the service conditions stipulated.
- iii) All Y-type strainers, wherever provided with steam traps or otherwise, shall have AISI-316 stainless steel screen of not more than 20 mesh size. Screen open area shall be at least three (4) times the pipe internal cross-sectional area. The strainer shall have a screwed blow-off connection with a removable plug. Material of construction of the body shall be selected by the Bidder based on the duty conditions specified.
- iv) All traps and strainers shall have socket weld ends as per ANSI B16.11 for size NB 50 mm and smaller and butt weld ends as per B 16.25 for size NB 65 mm and above.

Steam drain traps shall be provided with strainers, inlet and discharge valves and by-passes and test cocks as schematically indicated in the enclosed drawing. Materials and other details of these valves shall meet the specified requirement.

General:

Note: The specification furnished above shall be considered as broad requirement. The Bidder shall consider compatible material and specification for all piping components as well as specialties for the corresponding service applications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[98]	15.01.2016

6.22 Instrument Connections

Unless otherwise called for by Owner all thermo well stubs shall have an internal threading to M33 x 2.

All stubs for pressure or flow measurement for pipelines with a maximum working pressure equal to or above 42 bar(g) or with a maximum working temperature equal to or above 350°C shall be NPS 25 mm and double root valves shall be used.

Stubs, which are used for pressure or flow measurement on pipelines, with a maximum working pressure less than 42 bar (g) and a maximum working temperature less than 350°C shall be of NPS 15 mm size and single root valves can be used.

Measurement stubs on fuel oil lines shall be of NPS 25 mm size and provided with two root valves.

6.23 Drain and Vent Connections

Drain and vent connections on pipelines shall be at least of NPS 25 mm size. All systems having pressure greater than 6.2 MPA shall have double isolating valves on drain, vent lines and instrument connections. For pressure conditions other than as mentioned above single isolating valves are considered adequate. Where with single root valve, instrument and root valve are not accessible, double root valve shall be provided with one root valve near the tap off and the second root valve with instrument at accessible point. For fuel oil drain and vent lines double isolation valves shall be provided irrespective of the pressure and temperature.

6.24 Welding and Heat Treatment

All heat treatment, welding, post and pre weld temperatures shall be as per the code ASME B31.1.

6.25 Underground Protection

Where pipelines are buried, underground protection shall be provided for the piping system as indicated any one of the methods given below:

- i) Coal tar primer, coal tar enamel, inner wrap of fiber glass, final outer wrap of enamel impregnated fiber glass. Total thickness of coating shall not be less than 4.0 mm.
- ii) With anti-corrosive tape of 4 mm thick conforming to IS-10221 and AWWA C 203-93.
- iii) Pipe surfaces shall be cleaned by shot or sand blasting before application. Slag blasting may also be considered.
- iv) Tests to be carried out after application
- v) Bond/Adhesion test
- vi) Holiday test

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[99]	15.01.2016

6.26 Non-Destructive Examination

Mandatory as per ASME B31.1 & Regulation 360(d) of IBR.

Special requirements:

- i) 100% UT/RT & MPI and 3% hardness testing on butt welds of P12, and P11 materials.
- ii) 100% UT/RT & MPI and 100% hardness testing on butt welds of P91, P92 and X20 materials .
- iii) 100% MPI on butt welds of carbon steel materials.
- iv) 100% UT/RT for fittings of 200NB & above for X20 & P91, P92 material.
- v) 100% UT/RT for fittings of all other piping of size OD 508mm & above.

6.27 Hydrostatic Test Pressure

- i) Piping system under IBR purview:
 - a) At Shop: All piping including fabricated piping shall be hydro tested at 1.5 times the design pressure subject to regulation 374 of IBR. However, non-destructive testing in lieu of hydro test is also acceptable subject to regulation 343 (3) of IBR
 - b) After Erection all piping systems shall be hydro tested at 1.5 times the design pressure subject to regulation of 374 IBR. However, for such systems where it is practically not possible to do hydro tests, the tests as called for in ANSI B31.1& IBR in lieu of hydro test shall also be acceptable.
- ii) Non-IBR Piping Systems:-
 - a) At Shop All piping including fabricated piping shall be hydro tested at 1.5 times the design pressure.
 - b) After Erection All piping systems shall be hydro tested at 1.5 times the design pressure. However, for such systems where it is practically not possible to do hydro tests, the tests as called for in ANSI B31.1 in lieu of hydro test shall also be acceptable.

LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[100]	15.01.2016

7 QUALITY ASSURANCE

7.1 Quality Assurance, Inspection & Testing

The Bidder shall adopt Quality Assurance Programmes as per relevant standards subject to Owner's approval, to ensure that the equipment and services under the scope of contract, whether manufactured or performed within the Bidder's works or at his sub-vendor's premises or at the Owner's site or at any other place of work, are in accordance with the specifications. Such programmes shall be outlined by the Bidder and shall be finally accepted by the Owner/Owner's authorized representative after discussions before the award of the contract. The QA programme shall be generally in line with IS/ISO-9001. The Quality Assurance Programme of the Bidder shall generally cover the following:

- i) Organization structure for the management and implementation of the proposed Quality Assurance Programme.
- ii) Quality System Manual.
- iii) Design Control System.
- iv) Documentation and Data Control System.
- v) Qualification data for Bidder's key personnel.
- vi) The procedure for purchase of materials, parts, components and selection of sub-contractor's services including vendor analysis, source inspection, incoming raw-material inspection, verification of materials purchased etc.
- vii) System for shop manufacturing and site erection controls including process, fabrication and assembly.
- viii) Control of non-conforming items and system for corrective actions and resolution of deviations.
- ix) Inspection and test procedure both for manufacture and field activities.
- x) Control of calibration and testing of measuring testing equipment.
- xi) System for Quality Audits.
- xii) System for identification and appraisal of inspection status.
- xiii) System for authorizing release of manufactured product to the Owner.
- xiv) System for handling, storage and delivery.
- xv) System for maintenance of records, and
- xvi) Quality plans for manufacturing and field activities detailing out the specific quality control procedure adopted for controlling the quality characteristics relevant to each item of equipment/component.

7.2 General Requirements - Quality Assurance

- i) All materials, components and equipment covered under this specification shall be procured, manufactured, erected, commissioned and tested at all the stages, as per a comprehensive Quality Assurance Programme. This is, however, not intended to form a comprehensive programme as it is the Bidder's responsibility to draw up and implement such programme duly approved by the Owner. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[101]	15.01.2016

detailed Quality Plans for manufacturing and field activities shall be drawn up by the Bidder and will be submitted to Owner for approval.

- ii) Manufacturing Quality Plan (MQP) will detail out for all the components and equipment, various tests/inspection, to be carried out as per the requirements of this specification and standards mentioned therein and quality practices and procedures followed by Bidder's/ Sub-vendor's Quality Control Organization, the relevant reference documents and standards, acceptance norms, inspection documents raised etc., during all stages of materials procurement, manufacture, assembly and final testing/performance testing. The Quality Plan shall be submitted to the Owner for review and approval.
- iii) Field Quality Plans (FQP) will detail out for all the equipment, the quality practices and procedures etc. to be followed by the Bidder's "Site Quality Control Organization", during various stages of site activities starting from receipt of materials/equipment at site.
- iv) The Bidder indicate in the QP the reference documents/plant standards/acceptance norms/tests and inspection procedure etc., These Quality Plans and reference documents/standards etc. will be subject to Owner's approval without which manufacturer shall not proceed. These approved documents shall form a part of the contract. In these approved Quality Plans, Owner shall identify customer hold points (CHP), i.e. test/checks which shall be carried out in presence of the Owner or his authorized representative and beyond which the work will not proceed without consent of Owner in writing. All deviations to this specification, approved quality plans and applicable standards must be documented and referred to the Owner along with technical justification for approval and dispositioning.
- v) The material shall be dispatched from the manufacturer's works before the same is accepted by the Purchaser/Consultant.
- vi) All material used for equipment manufacture including casting and forging etc. shall be of tested quality as per relevant codes/standards. Details of results of the tests conducted to determine the mechanical properties; chemical analysis and details of heat treatment procedure recommended and actually followed shall be recorded on certificates and time temperature chart. Tests shall be carried out as per applicable material standards and/or agreed details.
- vii) The Bidder shall submit to the Owner Field Welding Schedule for field welding activities in the format enclosed at acceptable to owner. The field welding schedule shall be submitted to the Owner along with all supporting documents, like welding procedures, heat treatment procedures, NDT procedures etc. at least *[ninety days]* before schedule start of erection work at site.
- viii) All welding and brazing shall be carried out as per procedure drawn and qualified in accordance with requirements of ASME Section IX/BS-4870 or other International equivalent standard acceptable to the Owner.
- ix) The welding/brazing procedures shall be submitted to the Owner for approval prior to carrying out the welding/brazing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[102]	15.01.2016

- x) All brazers, welders and welding operators employed on any part of the contract either in Bidder's/sub-vendor works or at site or elsewhere shall be qualified as per ASME Section-IX or BS-4871 or other equivalent International Standards acceptable to the Owner.
- xi) Welding procedure qualification & Welder qualification test results shall be furnished to the Owner for approval. However, where required by the Owner, tests shall be conducted in presence of Owner/Owner's authorized representative.
- xii) For all pressure parts and high pressure piping welding, the latest applicable requirements of the IBR (Indian Boiler Regulations) shall also be essentially complied with. Similarly, any other statutory requirements for the equipment/systems shall also be complied with.
- xiii) On all back-gauged welds MPI/LPI shall be carried before seal welding.
- xiv) Unless otherwise proven and specifically agreed with the Owner, welding of dissimilar materials and high alloy materials shall be carried out at shop only.
- xv) No welding shall be carried out on cast iron components for fabrication or repair.
- xvi) All the heat treatment results shall be recorded on time temperature charts and verified with recommended regimes.
- xvii) All non-destructive examination shall be performed in accordance with written procedures as per International Standards but qualified operator. NDT shall be recorded in a report, which includes details of methods and equipment used, result/evaluation, job data and identification of personnel employed and details of co-relation of the test report with the job.
- xviii) All plates of thickness above 40mm and all bars stock/Forging above 40mm dia shall be ultrasonically tested. For pressure parts, plate of thickness equal to or above 25mm shall be ultrasonically tested.
- xix) The Bidder shall list out all major items/ equipment/ components to be manufactured in house as well as procured from sub-Bidders (BOI).
- xx) For components/equipment procured by the Bidders for the purpose of the contract, after obtaining the written approval of the Owner, the Bidder's purchase specifications and inquiries shall call for quality plans to be submitted by the suppliers. The quality plans called for from the sub-vendor shall set out, during the various stages of manufacture and installation, the quality practices and procedures followed by the vendor's quality control organization, the relevant reference documents/ standards used, acceptance level, inspection of documentation raised, etc. Such quality plans of the successful vendors shall be finalized with the Owner.
- xxi) Owner reserves the right to carry out quality audit and quality surveillance of the systems and procedures of the Bidder's or their sub-vendor's quality management and control activities. The Bidder shall provide all necessary assistance to enable the Owner carry out such audit and surveillance. The Bidder shall also take requisite corrective measures for restoring/ improving the system in line with the outcome of such quality surveillance and audits.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[103]	15.01.2016

- xxii) The Bidder shall carry out an inspection and testing programme during manufacture in his work and that of his sub-vendor's and at site to ensure the mechanical accuracy of components, compliance with drawings, conformance to functional and performance requirements, identity and acceptability of all materials, parts and equipment. Bidder shall carry out all tests/inspection required to establish that the items/equipment conform to requirements of the specification and the relevant codes/standards specified in the specification, in addition to carrying out tests as per the approved quality plan.
- xxiii) Quality audit/surveillance/approval of the results of the tests and inspection will not, however, prejudice the right of the Purchaser to reject the equipment if it does not comply with the specification when erected or does not give complete satisfaction in service and the above shall in no way limit the liabilities and responsibilities of the Bidder in ensuring complete conformance of the materials/equipment supplied to relevant specification, standard, data sheets, drawings, etc.
- xxiv) For all spares and replacement items, the quality requirements as agreed for the main equipment supply shall be applicable.
- xxv) Repair/rectification procedures to be adopted to make the job acceptable shall be subject to the approval of the Owner.
- xxvi) In case any deviation is observed with respect to relevant document or good engineering practices, and the same is considered by the Bidder to be acceptable, as it is or with certain rectifications/ modifications, based on his detailed technical analysis, then the Bidder shall refer the same to Owner along with reason for deviation, proposed corrective action, technical justification for suitability of the proposal and preventive measures for avoiding recurrence of similar deviations. Based on his evaluation, the Owner may accept the proposal as it is or with modifications or may reject the same. Such proposals shall be raised in suitable No-conformity report format (NCR). The NCR can be raised irrespective of the CHP stages in the QP.
- xxvii) Burn in and Elevated Temperature Test Requirement for Electronics Solid State Equipment:
- xxviii) All solid state electronic systems/equipment shall be tested as a complete system/equipment with all devices connected for a minimum of 168 hours (7 Days) continuously under energized conditions prior to shipment from manufacturing works, as per the following cycle.

Elevated Temperature Test Cycle

During the elevated temperature test which shall be for 48 hours of the total 168 hours of testing, the ambient temperature shall be maintained at **[50 °C]**. The equipment shall be interconnected with devices which will cause it to repeatedly perform all operations it is expected to perform in actual service with load on various components being equal to those which will be experienced in actual service.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[104]	15.01.2016

During the elevated temperature test the cubicle doors shall be closed (or shall be in the position same as they are supposed to be in the field) and inside temperature in the zone of highest heat dissipating components/modules shall be monitored. The temperature rise inside the cubicle should not exceed **[10 °C]** above the ambient temp at **[50 °C]**.

Burn in Test Cycle

The 48 hours elevated temperature test shall be followed by 120 hours of burn in test as above except that the temperature shall be reduced to the ambient temperature prevalent at that time.

During the above tests, the process I/O and other load on the system shall be simulated by simulated inputs and in the case of control systems; the process which is to be controlled shall also be simulated. Testing of individual components or modules alone shall not be acceptable.

In case the Bidder/ sub-vendor is having any alternate established procedure of eliminating infant mortality of components, the detail procedures followed by the Bidder/ sub- vendor along with the statistical figures to validate the alternate procedure may be submitted to the Owner for his consideration.

The Bidder/Sub-vendor shall carry out routine test on 100% item at Bidder/sub-vendor's works. The quantum of check/test for routine and acceptance test by Owner shall be generally as per criteria/sampling plan defined in referred standards. Wherever standards have not been mentioned quantum of check/test for routine / acceptance test shall be as agreed during detailed engineering stage.

7.3 QA Documentation Package

The Bidder shall submit the QA Documentation in **[two hard copies]** and **[two CD ROMs]**, as identified in respective quality plan with tick (√) mark.

Each QA Documentation shall have a project specific Cover Sheet bearing name & identification number of equipment and including an index of its contents with page control on each document.

The QA Documentation file shall be progressively completed by the Bidder/ sub-vendor and the same shall be submitted to the Owner in **[2 hard copies]** and **[2 CD-ROMs]**, within **[two weeks]** of dispatch of the equipment.

7.3.1 Typical contents of QA Documentation is as below:-

- i) Approved Quality Plan.
- ii) Material mill test reports on components as specified by the specification and approved Quality Plans.
- iii) Manufacturer / works test reports/results for testing required as per applicable codes and standard referred in the specification and approved Quality Plans.
- iv) Non-destructive examination results /reports including radiography interpretation reports. Sketches/drawings used for indicating the method of traceability of the radiographs to the location on the equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[105]	15.01.2016

- v) Heat Treatment Certificate/Record (Time-temperature Chart).
 - vi) All the accepted Non-conformance Reports (Major/Minor) / deviation, including complete technical details / repair procedure).
 - vii) Inspection reports duly signed by the Inspector of the Owner and Bidder for the agreed Customer Hold Points.
 - viii) Certificate of Conformance (COC) wherever applicable.
- Similarly, the Bidder shall be required to submit *[two sets (two hard copies and two CD ROMs)]*, containing QA Documentation pertaining to field activities as per Approved Field Quality Plans and other agreed manuals/ procedures, prior to commissioning of individual system.

7.4 Inspection, Testing and Inspection Certificates

- i) The word 'Inspector' shall mean the Owner's Inspection engineer and/or Owner's authorized representative acting on behalf of the Owner to inspect and examine the materials and workmanship of the works during its manufacture or erection.
- ii) The Owner's Inspection Engineer and/or Owner's authorized representative acting on behalf of the Owner shall have access at all reasonable times to inspect and examine the materials and workmanship of the works during its manufacture or erection and if part of the works is being manufactured or assembled on other premises or works, the Bidder shall obtain for the Owner's Inspection Engineer and/or an outside inspection agency acting on behalf of the Owner, permission to inspect as if the works were manufactured or assembled on the Bidder's own premises or works.
- iii) The Bidder shall give the Owner fifteen *[(15) days]* written notice of any material being ready for inspection/testing. Such tests shall be to the Bidder's account except for the expenses of the Inspector's. The Owner's Inspection Engineer and/or an outside inspection agency acting on behalf of the Owner, unless the witnessing of the tests is virtually waived and confirmed in writing, will attend such tests within *[fifteen (15)]* days of the date on which the equipment is noticed as being ready for test/inspection failing which the Bidder may proceed with test which shall be deemed to have been made in the inspector's presence and he shall forthwith forward to the Purchaser duly certified copies of test reports in *[two (2) copies]* for his review and approval.
- iv) The Owner's Inspection Engineer and/or Owner's authorized representative acting on behalf of the Purchaser shall within *[fifteen (15) days]* from the date of inspection as defined herein give notice in writing to the Bidder, on any objection to any drawings and all or any equipment and workmanship which is in his opinion is not in accordance with the contract. The Bidder shall give due consideration to such objections and shall either make modifications that may be necessary to meet the said objections or shall inform in writing to the Owner's Inspection Engineer and/or Consultant's inspection agency acting on behalf of the Owner, giving reasons therein, that no modifications are necessary to comply with the contract. After due consideration, Owner may accept or reject the same.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[106]	15.01.2016

- v) When the factory tests have been completed satisfactorily at the Bidder's or sub-vendor's works, the Owner shall issue a certificate to this effect within **[fifteen (15)]** days of completion of tests. The completion of these tests or the issue of the certificates shall not bind the Owner to accept the equipment should it, on further tests after erection be found not to comply with the contract.
- vi) In all cases where the contract provides for tests whether at the premises or works of the Bidder or any sub-vendor, the Bidder, except where otherwise specified, shall provide free of charge such items as labour, material, electricity, fuel, water, stores, apparatus and instruments as may be reasonably demanded by the Owner's Inspection Engineer and/or Owner's authorized representative acting on behalf of the Owner, to carry out effectively such tests on the equipment in accordance with the Contract and shall provide the facilities to accomplish testing.
- vii) The inspection by the Owner's Inspection Engineer and/or Owner's authorized representative acting on behalf of the Purchaser and issue of Inspection Certificate thereon shall in no way limit the liabilities and responsibilities of the Bidder in respect of the contract.
- viii) To facilitate advance planning of inspection in addition to giving inspection notice, the Bidder shall furnish quarterly inspection programme indicating schedule dates of inspection at Customer Hold Point and final inspection stages. Updated quarterly inspection plans will be made for each three consecutive months and shall be furnished before beginning of each calendar month.
- ix) All inspection, measuring and test equipment used by Bidder shall be calibrated periodically depending on its use and criticality of the test/measurement to be done. The Bidder shall maintain all the relevant records of periodic calibration and instrument identification, and shall produce the same for inspection by Owner. Wherever asked specifically, the Bidder shall re-calibrate the measuring/test equipment in the presence of Owner's Inspection Engineer and/or Owner's authorized representative acting on behalf of the Purchaser.

7.5 Shop and Site Tests:

- i) Shop tests will include all tests to be carried out at Bidder's works, at works of his sub-vendor and at works where raw material supplied for manufacture of equipment is manufactured.
- ii) All materials will be of tested quality supported with correlated test certificates. Whenever tested quality material is specified and wherever called upon by Indian Boilers Regulations or by design code, the test pieces are to be prepared and tested to Owner's satisfaction. The results of the tests will be certified.
- iii) Shop and Site tests will include electrical, mechanical, performance and hydraulic tests in accordance with relevant IS, IBR or any other approved standard or any other tests called for by the Owner under these specifications to ensure that the plant being supplied fulfills the requirements of the specifications. For equipment not covered by any IS or other approved standards, the tests to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[107]	15.01.2016

be carried out will be in accordance with the quality plan to be agreed to between the Bidder and the Owner.

General Notes

- a. For IBR items, stamping on the components, inspection and certification will be carried out by the IBR as per the IBR procedures. However; the Bidder will also be identified the same to which project they are meant by stamping/ stenciling.
- b. For non IBR items inspection will be as per mutually agreed QAP. The QAP will be submitted for major items and will be finalized during detail engineering. Joint protocol and dispatch clearance will be based on the agreed QAP.
- c. Major items for which the QAP are to be furnished will be mutually discussed and agreed during detail engineering.
- d. For items/ components not covered in the QAP, Bidder will furnish the certificate of compliance.

7.6

Turbine

- i) The following shop tests will be conducted as applicable on the various components such as rotor, casings, blades, diaphragms, valves, pipes, flanges, etc. All such tests will be documented and forwarded to the Owner for his review.
 - a) Material analysis.
 - b) Boro-scope test.
 - c) Ultrasonic test.
 - d) Magnetic particle test for crack detection.
 - e) Radiographic test at welds.
 - f) Heat stability test.
 - g) Hydrostatic pressure test.
 - h) Resonant vibration tests.
 - i) Examination of threading tolerances etc.
 - j) Overall mechanical inspection.
 - k) Molybdenum content test on blades (moving).
- ii) After the shop assembly of the various components of the turbine, the following tests will be conducted at shop:-
 - a) Verification of fits and operating clearances and dimensions.
 - b) Test at 120% over speed for 2 minutes.
 - c) Tests for checking the proper operation of Governors, control valves and auxiliaries.
 - d) All motor driven oil pumps will be operated at normal speed and checked for proper alignment, smoothness in operation, head and capacity. Oil tanks will be tested at operating temperatures for leaks.
- iii) After completion of erection the following test will be conducted at site:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[108]	15.01.2016

- a) Running test with steam. Running test with steam will include but not be limited to:-
 - Barring gear operation
 - Steam turbine performance to be proved by running at operating speed and maintaining this speed for at least one hour.
 - Governor speeder range to be checked and recorded.
 - Trip and reset speed of emergency governor.
 - Operation of HP turbine stop valves and control valves and IP turbine stop valves and control valves to be checked for tripping.
 - All testing devices (Protective devices) to be checked for satisfactory operation.
- b) Tests for checking the proper operation of governors, control valves and auxiliaries.
- c) All motor driven oil pumps will be operated at normal speed and checked for proper alignment, smoothness in operation, head and capacity. Oil tanks will be tested at operating temperatures for leaks.
- d) Bearing and shaft vibration, shaft eccentricity, bearing oil pressure and return oil temperature will be recorded at increment of speed up to over speed.
- e) Certified copies of casing level records, rotor alignment checks including sling & concentric checks and alignments in cylinder, rotor clearance giving all axial, radial clearance between moving and fixed blades, glands etc. will be furnished.
- f) Tightening strains on high temperature bolts will be recorded.

7.7 Tests on Auxiliaries

The following shop tests will be conducted as applicable on the various auxiliaries:

- i) All the pressure vessels/heat exchangers will be tested at a hydrostatic test pressure of 1.5 times the maximum working pressure or 1.3 times the design pressure whichever is higher or as required by IBR.
- ii) Radiography tests at welds as per requirements of IBR as applicable.
- iii) Functional tests of equipment wherever applicable.
- iv) Overall mechanical inspection.
- v) Complete performance tests of all pumps to establish flow vs head, power input, efficiency and NPSH. Performance curves corrected for site condition will be provided.

7.8 Condenser

- i) All materials used for the manufacture of the equipment covered under this Specification will be of tested quality. Relevant test certificates will be made available to the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[109]	15.01.2016

- ii) All welded joints will be tested by liquid penetrant examinations according to the method outlined in ASME Boiler and Pressure Vessel code. Radiography and ultrasonic testing will be employed wherever necessary. At least 10% of all butt welding joints will be radiographed.
- iii) The water box and shell will be hydrostatically tested as per Heat Exchange Institute Standards. Gaskets will be replaced with new ones after shop test.
- iv) All condenser tubes will be hydraulically tested at [70.0] kg/cm² (g) internal pressure and carefully inspected (ultrasonically or by eddy current testing) as per ASTM E213-68 and ASTM E243-67T respectively prior to shipment. All other parts subjected to pressure will be hydrostatically tested as per relevant ASME Standard.
- v) The completely assembled condenser will be hydrostatically tested at site after erection, according to the standards of Heat Exchange Institute.
- vi) Condenser shell will be tested for tube leakage by filling the steam space with water in which a fluorescent will be added.
- vii) A field performance test will be conducted in conjunction with approved Acceptance Tests Procedure. It will be based on ASME Power Test Code PTC-12.2, or equivalent and include all tests necessary to demonstrate the performance guarantees.
- viii) Performance of the air removing equipment will be tested at the manufacturer's shop in accordance to the applicable ASME Power Test Code.
- ix) Condenser on load tube cleaning system will be tested for increase in pressure drop in cooling water system due to the installation of the same. The various controls provided will also be checked for satisfactory performance. Also, the recovery rate of the balls will be demonstrated at site.

7.9

L.P. & H.P. Heaters

- i) At Manufacturer's Works:
 - a) All heaters will be subjected to manufacturer's standard shop inspection and all inspection and tests called for elsewhere in this specification. Mill certificates for the material for heater shell, tube support plates, tube sheets, water boxes, flash tanks etc. will be submitted to the Owner for review.
 - b) Heat exchanger tubes and water boxes will be tested by one of the following methods for cracks, imperfections etc.
 - Black light
 - Magnetic particles
 - Dye penetrant
 - c) Each tube will be "Eddy Current" tested to detect any imperfection. The following tests will be performed on each lot of Heat Exchanger tubes.
 - Microscopic
 - Chemical Analysis

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[110]	15.01.2016

- Yield strength
- Flattening
- Flanging

d) Hydrostatic testing of the heat exchangers will be done in accordance with ASME TEST CODE for unfired Pressure Vessels Section VIII and I.B.R. as applicable. The LPH-1 will be hydraulically tested at 1.3 times the design pressure.

ii) At site:

The feed water heat exchangers will be field tested along with the TG set as per applicable code to determine the following. :-

- a) Temperature rise of the feed water/condensate at guaranteed capacity points.
- b) Pressure drop in the water circuit.

The Bidder will furnish all instruments necessary to perform the above tests.

7.10

Deaerator

i) At Manufacturer's Works

Each deaerating heater and storage tank will be shop inspected during fabrication in accordance with applicable provisions of ASME "Code for unfired pressure vessel" Section VIII Div 1. Hydrostatic testing will be carried out as per the above code. Mill certificates for all the materials used will be submitted to the Owner's for review. However hydro test for FST will be conducted at site.

ii) At site

The Bidder will conduct field tests on the deaerating feed water heater. Tests will cover the determination of dissolved oxygen and free carbon dioxide in Deaerator outlet water along with thermal and hydraulic performance of the Deaerator.

All performance tests will be done and evaluated as per applicable code..

7.11

Condensate extraction Pump (CEP)

i) All tests will be conducted by the Bidder to demonstrate the capability, guarantees, performance and compliance with the specification. The Bidder will provide all instruments and temporary equipment including their installation for all test requirements. Prior to testing, the detailed test procedure will be submitted for the Owner's approval. After the test, the copies of final report including the performance calculations shall be submitted for Owner's approval. Following Tests shall be conducted.

ii) Tests at Shop

- a) Material analysis and testing.
- b) Radiographic and Magnetic Particle Examination of material and welds.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[111]	15.01.2016

- c) All pressure parts will be subjected to hydraulic testing at a pressure of 150% of shut-off head or 200% of rated head (effective head), whichever is higher, for a period not less than half an hour.
- d) Static and dynamic balancing tests of rotating parts at specified over speeds to determine the mass centre and vibration level.
- e) Performance tests are to be conducted to cover the entire range of operation of the pumps. These will be carried out in the range from 125% of rated capacity to pump shut-off condition. The tests will be conducted as per hydraulic institute standards of USA. Overall performance of the Pump will be tested for the following:
 - Total head developed by the pump at rated capacity.
 - Horsepower required of the pump under rated condition.
 - Efficiency at rated condition.
 - NPSH requirement at rated condition In any of the pump
 - To establish the pump characteristic curves for capacity Vs Head, power NSPH and efficiency.

iii) Tests at Site :

The pumps with its drives will operate satisfactorily at site for the whole range of rated operating condition as specified. The controls such as auto starting of pumps, speed, recirculation, etc. will also be tested for satisfactory performance. Parallel operation of pumps with different combinations will also be tested. During entire range of operation the vibration level will conform to VDI 2056.

7.12

Boiler Feed Pump & Booster pump of BFP

- i) All tests will be conducted by the Bidder to demonstrate the capability, guarantees, performance and compliance with the specification. The Bidder will provide all special instruments and temporary equipment including their installation for all test requirements and performance calculations and submit copies of final report for approval. Prior to testing the detailed test procedure will be submitted for the Owner's approval.
- ii) Tests at Shop
 - a) Material analysis and testing.
 - b) Hydrostatic pressure test of all pressure parts and piping at 1.5 times the maximum operating pressure at closed discharge valve.
 - c) Static and dynamic balancing tests of rotating parts at specified over speeds to determine the mass centre and vibration level.
 - d) Radiographic and Magnetic particle examination of material and welds.
 - e) Calibration tests of instruments.
 - f) Gear box testing at full load for transmission efficiency and smooth operation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[112]	15.01.2016

- g) Overall performance of the boiler feed pumps and its booster pumps will be tested in accordance with ASME power test code PTC 8.2 latest edition or equivalent to obtain the following characteristics. At least one of the pumps BFPs will be tested with water at actual temperature.
- Total head developed by the pump at rated capacity.
 - Horsepower required of the pump under rated condition.
 - Efficiency at rated condition.
 - NPSH requirement for each pump at rated speed and temperature, over the entire operating flow range both for 1% and 3% head drop. NPSH testing shall be governed by ASME PTC and Hydraulic Institute Standards.
 - To establish the pump characteristic curves for capacity Vs Head, power NSPH and efficiency.
 - Gear box testing at full load for transmission efficiency and smooth operation. Noise level to be measured.
 - Hydraulic coupling speed vs. output and efficiency tests.
 - Vibration at bearings and noise level shall be checked during performance tests.
 - Tests for drive motors shall be as specified in the Standard specification for A.C. Electric Motors.

iii) Tests at Site :

The pumps with its drives will operate satisfactorily at site for the whole range of rated operating condition as specified. The controls such as auto starting of pumps, speed, recirculation, etc. will also be tested for satisfactory performance. Parallel operation of pumps with different combinations will also be tested. During entire range of operation the vibration level will conform to VDI 2056.

7.13 Other Major Pumps (More than 75 kW)

- i) Raw material for casing, shaft and impeller will be tested for chemical and physical properties.
- ii) All forgings and castings will be subjected to 100% UT/RT and MPI/DP check respectively.
- iii) Static and dynamic balancing of the rotary parts will be carried out.
- iv) Hydraulic pressure tests will be conducted on pumps casing.
- v) Interchangeability will be maintained and checked.
- vi) Each pump will be subjected to a performance test at the manufacturer's works as per the approved procedure.
- vii) Type Test:
 - a) NPSH test

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[113]	15.01.2016

- b) Under voltage test
- c) Tests to establish unit functioning of pumps at temp. and pressure
- d) Hot standstill and start up tests
- viii) Routine Test:
 - a) Hydraulic test of complete unit
 - b) Over speed test
 - c) Pumps performance
 - d) Unit run at rated voltage
 - e) Cold start up test
 - f) Noise level

7.14 Minor Pumps & Fans (Less than 75 kW):

- i) Impeller and rotor will be dynamically balanced.
- ii) Pumps assemblies will subject to hydraulic test.
- iii) Functional test will be carried out at Manufacturer's works
- iv) Performance tests as applicable will be carried out on first pump/fan of each type and capacity to verify its output against total head, power input, efficiency, vibration, noise level. Capacity Vs Head, efficiency and power input curves corrected for site conditions will be furnished.

7.15 Turbine Oil Purification System

- i) Tests at Shop
 - a) The manufacturer will conduct all tests required to ensure that the equipment supplied will conform to the requirements of this specification and in compliance with the requirements of the applicable codes.
 - b) The test procedures for tests will be submitted to the Owner for approval before conducting the tests.
 - c) All materials and castings used for the equipment will be of tested quality. The test certificate will be made available to the purchaser for review.
 - d) The pressure parts of pumps, heaters, strainers etc. will be subjected to hydrostatic testing as per applicable codes.
 - e) All pumps will be tested for capacity, head, efficiency and brake horsepower. The tests will be performed in accordance with standards of 'Hydraulic Institute' USA.
 - f) Static and dynamic balance tests will be carried out on rotating parts of the centrifuge and pumps to determine vibration level.
- ii) Tests at site

Tests will be conducted at site to prove the performance requirement as specified.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[114]	15.01.2016

7.16 Acceptance Tests for STG

After erection of the TG equipment at site acceptance test will be conducted in accordance with ASME power test code PTC 6 or equivalent. A detailed test procedure will be prepared and submitted to the purchaser for approval at least [3 months] prior to testing. All instruments and accessories for the test will be arranged by the Bidder.

The tests will include but not limited to the following:

- (i) Maximum continuous electrical output, in MW, at Generator terminals of each unit at rated parameters under VWO Condition.
- (ii) Turbine Cycle Gross Heat rate in kCal/kWh at rated steam conditions at 76 mm Hg (abs) design condenser pressure with 3% make up at 100% TMCR load.
- (iii) Condenser Pressure with Unit Operating at VWO Condition.
- (iv) Unit Auxiliary Power Consumption at 100% TMCR unit load at condenser pressure of [76] mm Hg (abs)] with 3% make-up and with design ambient air condition.

Note: Power consumption of each of the pump/fan/compressors etc. wherever mentioned shall be measured with its own drive.

For performance guarantee test, Clause No. 8 of Section-I, Volume-II is also to be referred to.

7.17 Piping & Fittings:

- i) Raw materials for pipes are tested by UT/ECT at mill as follows
 - 100% ECT for thickness <3.6 mm
 - 100% UT for thickness ≥3.6 mm
- ii) All bent pipe will be checked for ovality and thinning by U.T. on first off and on random samples for subsequent pieces.
- iii) Butt welds will be subjected to NDT after stress relieving as follows

For IBR Class I piping

ID ≤ 102 mm: 10%RT

ID >102 mm: 100% RT

MT/ PT is carried out on butt welds after PWHT as follows

P91:100%

For Class II piping: 10% RT
- iv) All load bearing attachment welds will be subjected to MPI after stress relief.
- v) All forged/formed fittings will be checked by UT and / or MPI after forming as follows
- vi) MPI on the parting lines of tees and alloy steel elbows and UT on tees of bore size 508 mm and above.
- vii) Completed pipe work will be subjected to hydraulic pressure test at site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[115]	15.01.2016

7.18 Valves

- i) Pressure retaining parts of valves will be subjected to NDT as per the table given below:

Table: 7.1

Valve Size NB in mm	ANSI class up to 300	ANSI class above 300 up to 600	ANSI class above 600 below 900	ANSI class 900 & above & below 4500
Less than 50	Visual	Visual	Visual	MPI
50 & above but below 100	Visual	Visual	MPI	MPI , RT (on 10% of valves on 100% area)
100 & above but less than 300	Visual	MPI	MPI RT(on 10% of valves on change of section and weld ends)	MPI, RT (on 100% area)
300 and above	MPI	MPI	MPI, RT (on change of sections and weld ends)	MPI, RT (on 100% area)

NOTE: For body and bonnet forgings UT may be adopted in place of RT. for austenitic steel MPI may be replaced by LPI.

- ii) Bar stock/forging above 50 mm diameter for valve trim will be subjected to UT.
- iii) Hardened / stellitted valve disc and seat are to be subjected to LPI and hardness check.
- iv) Colour matching of valve disc / plug and seat will be carried out to ensure contact.
- v) Hydraulic pressure tests and seat leak test will be carried out as per ANSI 16.34.
- vi) Air seat leak test will be carried out as per applicable standards/codes.
- vii) Functional testing will be carried out on each valve to check the following as per the approved valve data sheet:
- smooth operation

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[116]	15.01.2016

- valve travel, closing and opening time
 - current drawn by actuators
- viii) Spring for safety valves will be tested with suitable NDT and for spring rate.
- ix) Safety and safety relief valves will be tested for performance.
- x) Weld preparations on suction and discharge side of the valves will be examined as per relevant code as applicable.

7.19 Heat Exchangers

- i) Tested quality materials will be used for tubes, shell and tube plate etc. for heat exchanger. Welds on pressure parts will be tested with non-destructive testing like RT/UT.
- ii) For Plate heat exchangers, at least 10% plates will be randomly tested by dye-penetrant test.

7.20 Lube Oil Systems / Hydraulic Power Pack

Lube oil system / hydraulic power packs will be tested for performance.

7.21 Motors

Motors will be subjected to the routine and type tests as indicated in Electrical Part of the Tender Specification

7.22 Control & Instrumentation:

C&I inspection and testing will be done as indicated in C&I Part of the Tender Specification

7.23 Site Tests

The successful Bidder will prepare and submit detailed quality plans in the format prescribed by Owner setting out the quality practice and procedures to be adopted by him for assuring quality for each equipment under this specification from the receipt of material at site, during storage, erection, pre-commissioning to final commissioning of the plant. These procedures will necessarily include all checks/tests conducted at site for preservation, assembly, alignment, positioning of the equipment, foundation preparation, welding/bolting, heat treatment, non-destructive examination, hydraulic test, running test, performance test etc. The above will be discussed and finalized by the Bidder with the Owner.

The Bidder will also furnish detailed quality procedure proposed by him for storage, preservation, painting, acid cleaning, alkali boil out, steam blowing, hydraulic test, air/gas tightness test etc. to the Owner. The same will be discussed and finalized by the Bidder with the Owner.

7.24 System Checking / Reliability Trials:

- i) Successful Bidder will carry out tests at site to prove to the Owner that each equipment of the supply complies with requirements stipulated and is erected in accordance with requirements specified. Before the plant is put into trial

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	03	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-A	[117]	15.01.2016

operation the Successful Bidder will be required to conduct tests to demonstrate to the Owner that each item of the plant is capable of correctly performing the functions for which it was specified and its performance, parameters etc. are as per the specified/approved values. These tests may be conducted concurrently with those required under commissioning sequence.

- ii) The tests required will specifically include the following :
- Checks on operation of all fans to ascertain level of noise and vibration.
 - Test running of pumps
 - Calibration test of orifice, flow nozzles, instruments and control equipment to the extent included in these specifications.
 - Tests on C&I Equipment - The Bidder will demonstrate the performance of all C&I equipment.
- iii) The plant after completion of the above test will be put on trial run.

1. GENERATOR & AUXILIARIES**1.1 General**

This specification is intended to cover the *[design, engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning]* of Generator complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]. The renovated Turbo Generator shall be capable of producing the output of [210/215/220/250] MW.

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

Code	Name of Standard
IS 3231	Electrical relays for power system protection
IS 8686	Specification for static protective relays
IS: 13947	Degree of Protection
IEC 60034	Rotating Electrical Machines
IEEE:32	Neutral Grounding Devices
IEEE-STD-4298	Standard for high potential test requirement for excitation system for synchronous machines
IEEE-STD-67	Guide for operation, maintenance of turbine generator
IEEE-STD-1115	Guide for testing synchronous machines
C37.102-1995 (R2001)	IEEE Guide for AC Generator Protection
C37.91-2000	IEEE Guide for Protective Relay Applications to Power Transformers
C37.101-1993 (R2000)	IEEE Guide for Generator Ground Protection
CEA	CEA regulations and standards

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[1]	25.09.2014

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3 Design Criteria

- a) For the purpose of design of equipment/systems, an ambient temperature of [50] deg. Centigrade and relative humidity of [95%] shall be considered. The equipment shall operate in a highly polluted environment.
- b) All equipments are suitable for rated frequency of 50Hz with a variation of [+3% & -5%] and [5%] combined variation of voltage and frequency unless specifically brought out in the specification.
- c) Bidder to provide fully compatible electrical system, equipment, accessories and services.
- d) Paint shade of Generator shall be as per Turbine and shall be finalized during engineering.
- e) Excitation system shall be either of static or brushless and same shall be finalized during detail engineering.
- f) Rated voltage of generator shall be selected in such a way that it should match with existing generator voltage.
- g) Efficiency of generator shall be greater than 98%.

1.4 Specific Requirements

1.4.1 Type and Rating

- a) Type: Three phases, horizontal mounted, indoor installed, two-pole cylindrical rotor type directly driven by steam turbine, class F winding insulation with completely H₂ cooled or Hydrogen cooled rotor and stator core, DM water cooled stator winding.
- b) Generator and its excitation system will have a capability at least matching the declared maximum continuous rated output of the associated steam turbine (for the hydrogen cooler, the secondary cooling water temperature of [39] deg C) at all power factors between 0.85 lagging and 0.95 leading with [+3% to -5%] frequency variation, terminal voltage variation of $\pm 5\%$ and combined voltage & frequency variation of [5] %. It is ensured that when the Generator is working at this capability and cooling water temperature is [39] deg C, no part of the Generator will attain a temperature in excess of the class-B temperature limits as per IEC-60034.
- c) The generator and its excitation system will be capable of continuous

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[2]	25.09.2014

stable operation at the peak output of the associated steam turbine under VWO & HP heater out condition, etc. as available for secondary cooling water temperature [39] deg, at power factors 0.85 lagging with [+3% to -5%] frequency variation, terminal voltage variation of $\pm 5\%$ and combined voltage & frequency variation of [5] % absolute. *[Temperature of different parts may exceed those permissible for class B under such operating conditions, but shall be lower than those permissible for class F insulation as per IEC-60034].*

d) Rated Parameters:

General	
1. Active output	[210/215/220/250MW or as per plant requirement } per unit
2. Apparent output	[247/253/259/294 or as per plant requirement]/MVA
3. Power Factor	[0.85] (lagging)
4. Terminal voltage	[as per plant requirement] KV
5. Frequency	50 Hz
6. Speed	3000 rpm
7. Short circuit ratio	As per existing plant data or mutually agreed between purchaser and manufacturer.
System of cooling	
8. Stator winding	Closed loop system using demineralised water flowing through the hollow conductors.
9. Rotor winding	Directly cooled by hydrogen
10. Stator core	By hydrogen flowing through suitable ventilating ducts.
11. Configuration for Hydrogen	Shaft driven Hydrogen blower. Machine Cooling mounted Hydrogen to water heat exchanger. Secondary cooling water details as indicated elsewhere in technical specification.
12. Capacity with one Hydrogen Cooler out	Capable of delivering at least two third of the rated MVA with ten (10) percent of tubes in each cooler plugged without exceeding the temperature limits of Class B

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[3]	25.09.2014

e) Operational Requirements

1	Voltage Variation	$\pm 5\%$ continuously at rated power factor.
2	Frequency Variation	The generator will be capable of continuous operation, at the range of $[-5\%$ to $+3\%$ i.e. [47.5 HZ to 51.5] Hz.
3	Combined voltage and frequency variation	[5%]
4	Power factor variation	0.85 (lag) to 0.95 (lead)
5	Generator Neutral Earthing	Non-effectively earthed through a distribution transformer, loaded with a resistor. Core design to permit the flow of earth fault current for at least [15] amperes for one second without any major core damage.
6	Short time overload	As specified in IEC 60034-1
7	Over speed	10%
8	Operation under unbalanced load	As specified in IEC 60034-1
9	Operation under unsymmetrical short circuit	Negative sequence current I_2 expressed in per unit of rated current for a duration of 't' second such that the value of $I_2^2 t$ comply to IEC 60034-1
10	Voltage Wave form	The telephone harmonic factor (T.H.F) is within the limit specified in IEC 60034-1.
11	Short Circuit withstanding Capacity as specified in IEC 34-3	Capable of withstanding of 3 phase short circuit at the generator terminals when operating at rated MVA and power factor with 5 % over voltage for a period of not less than 3 seconds.
12	Special operating conditions	Capable of withstanding the electrical,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[4]	25.09.2014

		mechanical and thermal stresses developed during i) Single-phase fast reclosing of high voltage line, transmission line switching faults, ii) Out of step operation, as per the operation curve furnished by Manufacturer. iii) Out of phase synchronization permissible times:
13	Line Charging Capability	Not less than 40% of its rated MVA at zero PF
14	Impulse level & Surge Protection	To be suitable for test voltage of $4U + 5$ KV (where U is rated voltage in kV).
15	Stator over current requirement	Machines shall be able to carry stator over current without damage, of the order of 1.5 p.u for 30 secs
16	Degree of Protection	IP54
17	Maximum continuous negative phase sequence current	8%

1.5 Constructional Features

All components of the generator will be designed to avoid resonance at any of the frequency in the operating range and their multiples. All components requiring inspection and maintenance shall be designed for easy access and replacement.

1.5.1 Stator

1. Stator frame To withstand without any residual deformation, in case of any internal hydrogen explosion. All leads including power, control and instrumentation will be brought out of the generator through gas tight seals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[5]	25.09.2014

2. Handling

Considering the non-availability of suitable crane for lifting the stator, suitable jacks are to be provided for the same. Four numbers of trunions also to be provided for handling the stator. Contractor may detail out his proposal for handling the stator.

3. Transportation

The dimensions of the generator stator body to be within the maximum permissible rail/road transportation dimensions within the country taking into account special wagons available/being made available for transporting such heavy oversize consignment.

4. Manholes

At suitable locations with proper sealing arrangement etc. to facilitate the inspection of back of the core, end winding area and terminal connections.

1.5.2 Stator Core

1. Material

High permeability, low loss, cold rolled silicon sheet steel segmental punching

2. Core assembly

Assemble on core bars in an interleaved manner, To rest on flexible support system such that radial and tangential magnetic vibration of the stator core due to electromagnetic loading transmitted to the outer frame is minimum

3. End packets:

To be adequately strengthened to minimize the magnetic vibration due to end leakage flux.

1.5.3 Stator Winding

1. Winding Configuration

The stator winding will consist of three phase, double layer, short chorded, bar type winding having two parallel paths. The elementary conductors are Roebel transposed in the slot portion.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[6]	25.09.2014

2. Insulation Epoxy thermo-setting type and rated for class 'F' insulation. Adequate protection will be provided on the winding and slots for avoiding the corona and other surface discharges.
3. Ripple springs To be provided in stator slots.

1.5.4 Stator water Distillate Headers (manifold)

1. Inlet and outlet water headers Preferably of stainless steel
2. Insulation The headers and header connections will be suitably insulated from the stator body. It is possible to measure the insulation resistance of the stator winding after simply removing the outside water pipe connection. It is also possible to measure the insulation resistance between the water header and stator body after disconnecting the header grounding.
3. Connection of bars High quality heat resistant and high strength teflon (P.T.F.E) hoses. Single pass cooling arrangement will be preferred.

1.5.5 Winding Connection and Terminal Bushings

1. Winding Star connected, Three (3) phase and the three (3) neutral terminals. In case the stator winding is double-star, a machine with six (6) terminals will be acceptable. All stator terminal lead connections inside the generator will be suitably supported to contain vibration.
2. Overhang portion of winding The overhang portion of the winding will be suitably braced and supported so as to withstand - 3 phase short circuit at its terminals as stipulated in IEC-34 when the machine is operating at rated MVA, power factor and permissible maximum over voltage (105% of rated voltage).
3. Bushing housing Bushing to be housed in lower part of stator frame in a non magnetic steel terminal box.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[7]	25.09.2014

4. Bushing
Porcelain or epoxy based material with non-hygroscopic property. The terminal bushing is cooled by suitable arrangement with cooling water
5. Terminal connector
Silver coated copper having octagonal configuration or any other configuration suitable for connection to the bus duct through flexible for which the operating conductor temperature is 105deg C

1.5.6 Rotor

Machined from single alloy steel forging to give the required mechanical, metallurgical and magnetic characteristics. To have an adequate margin between critical speed and the running speed to ensure smooth running.

1. Rotor Winding

- a) Conductor
Coils made of hard drawn silver bearing copper.
- b) Insulation
Epoxy glass based material rated for class F insulation.

2. Retaining Rings and Nuts

- a) Retaining rings
Machined from high strength, non-magnetic alloy steel forging, with the material specification 18Mn-18Cr resistant to stress corrosion. Floating type shrunk on the rotor body.
- b) Snap rings
High strength non-magnetic alloy steel forging will be provided on the retaining rings to prevent any axial movement.
- c) Centering rings
To be mounted at the end of the retaining rings to support it and prevent the movement of rotor winding in the axial direction due to thermal stresses.

1.5.7 Bearings

Self aligning type bearings mounted on the end shields. The bearing housings as well as bearing shells will be of split construction. The bearing shells will be lined with Tin based Babbitt metal.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[8]	25.09.2014

- a) Seal Labyrinth oil seal for bearing will be provided.
- b) Jacking Arrangement The hydrostatic jacking arrangement in line with turbine bearings
- c) Bearing insulation The bearings are insulated from the generator ground to prevent current flow through the bearing. At the collector end, these components are double insulation. With this arrangement, the insulation of generator bearing can be monitored during generator operation. Insulating material used for the purpose will be non-hygroscopic epoxy glass laminate.
- d) Bearing instrumentation Redundant pick-ups/ transducers for bearing metal temperature and bearing drain oil temperature shall be supplied.

1.5.8 Shaft Seals

- a) Type Double flow ring type, to be provided at both ends and designed in such a way that minimum oil comes in contact with hydrogen during operation to minimize contamination.
- b) Gland sealing ring The inner surface of the gland seal ring will be lined with babbitt metal.
- c) Insulation The shaft seals and associated piping will be adequately insulated to prevent circulation of shaft current.

1.5.9 Collector rings, Brush gears and Brushes

- a) Enclosure For static excitation system, a suitable brush holding arrangement with brush assembly, in a well ventilated enclosure will be provided.
- b) Collector rings Insulated helically grooved, alloy steel collector rings shrunk on the rotor, For cooling the slip rings, , suitable fans will be provided on the rotor shaft adjacent to it.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[9]	25.09.2014

- | | |
|--|--|
| c) Brush position | Located on the upper two third periphery of collector rings. The brushes will be arranged along the length of collector ring to avoid any non-uniform ring wear. |
| d) Access doors and Inspection windows | To be provided to enable replacement and inspection of brushes while the machine is in operation |
| e) Brush holder | Constant pressure type which can be adjusted as per requirement. Suitable insulation will be provided to prevent passage of current through pressure device. |
| f) Rotor winding Insulation and Voltage monitoring shaft | Through a brush, suitably mounted and sliding on an oil free surface shall be provided. |
| g) Earthing brushes | To be provided at the turbine end bearing pedestal. It shall be possible to increase the brush pressure while generator is working. |

1.5.10 Hydrogen Coolers

To be provided with 10% excess tubes. Cooler will be designed for at least 10 Kg/sq.cm. Gauge pressure on the gas side irrespective of a lower normal operating casing pressure.

- | | |
|-------------------------------|---|
| a) Cooler tubes | Corrosion resistant with integral fins and arranged on the top of the stator frame, a tray under cooler avoid water fall during leakage, if any, on the winding insulation |
| b) Water pressure in coolers: | It will be maintained below the operating hydrogen pressure in the generator frame |
| c) Temperature control | Necessary control system including temperature sensing elements, control valves and devices will be provided. Adequate number of temperature and pressure gauges will also be provided on inlet and outlet of cooling water, in case water cooled machine is offered. |

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[10]	25.09.2014

1.5.11 Generator drying arrangement

The drying arrangement shall be provided as per standard & proven practice of manufacturer/supplier.

1.5.12 Generator Instrumentation

The following minimum instruments will be provided for each generator.

I. Resistance temperature detectors (RTD)

a) Temperature Detectors

Resistance temperature detectors (RTD) To be duplex three wire type 100 ohms platinum, calibrated as per DIN standard or other equal international standard and located at points where highest temperature is likely to occur during operation. Manufacturer may also offer thermo-couple (TC) or duplex RTDs. In case simplex RTDs are provided they will be double of those specified as below. All the below thermocouples detector, the thermocouple is simple type detector, Pt100 R.T.D is duplex type.

b) Number and location

i) {Forty-two (42)} duplex PT100 RTDs:

1. 4 numbers of RTDs for each phase of stator winding.
2. 12 numbers of RTDs for stator core.
3. 2 numbers of RTDs for each gas section.
4. 2 numbers of RTDs for each H2 section
5. 2 numbers of RTDs for each bearing.

Detectors for monitoring water temperature of each winding bar in case of water cooled machine. One thermo-couple is installed at each water outlet of stator bar.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[11]	25.09.2014

- ii) {Twenty-four(24)} detectors for stator core out of which {sixteen (16) }will be located in the end zones where maximum temperatures are expected.
- iii) Two (2) duplex detectors per gas cooler section for measurement of inlet and outlet gas temperature.
- iv) Two (2) duplex detectors per H2 cooler section for measurement of inlet and outlet water temperature.
- v) Two (2) detectors per bearing for measurement of babbitt metal and drain oil temperature.
- vi) Sets of detectors for generator shaft sealing, Hydrogen gas and stator water systems required for monitoring the temperature of oil, water and Hydrogen at different salient locations in the system.

- c) Termination of RTD leads At terminal box
- d) Location Terminal box will be at an easily accessible position so as to enable maintenance/testing of the devices when the machine is under operation.
- e) Terminal box construction Dust and vermin proof (IP54)
- f) Interface All the above temperature measurement devices shall be connected to Junction boxes mounted on generator.

II. Rotor winding Temperature Monitoring

Rotor winding temperature shall be calculated by rotor current in the excitation system. Once the calculated rotor temperature is higher than the alarm temperature, the excitation system shall send alarm signal to the DDCMIS.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[12]	25.09.2014

III. On line water temperature monitoring for Individual stator winding bars

Complete with all software and hardware required to detect any abnormalities in the temperature at any given generator operating point and shall be sensitive to generator loads, header flows, pressure, etc. This shall be realised in TG C&I part of DDCMIS.

IV. Vibration monitoring System

Manufacturer informed that their end winding design is of rigid flex structure of cone type and in view of this they do not provided vibration sensors and monitoring system in the end winding.

V. Liquid leakage detector

It will be provided at all the low level points inside the generator frame including end shields along with provisions of indication and alarm during leakage of liquid in generator in case of water cooled machine.

1.5.13 Gas System (For Hydrogen & Water Cooled Machines)

1) Description

Each generator will be furnished with hydrogen and carbon dioxide supply system including hydrogen and CO₂ gas manifold, CO₂ heating system, hydrogen pressure regulator, interconnecting piping, fittings, valves, gauges, thermometers, pressure transmitters and other instruments, panels, etc.

Contractor may indicate the number of cylinders during detail engineering with supporting calculation. Cylinders will be supplied till completion of trial operation getting necessary approval from chief controller of explosives is also in the scope of the Contractor. The contractor will also furnish the necessary test certificates and filling certificates. The cylinders to be supplied under this specification will conform to IS: 8198. Each gas cylinder will be complete with cap and valve as per IS: 3224. Volumetric (water) capacity of each cylinder will be 45.0 litres. Each cylinder will be hydro tested at pressure of 250 Kg/cm² (min).

2) Purity

Purity of hydrogen is from 97 - 99%.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[13]	25.09.2014

- 3) Piping & Valves Seamless steel tubes will be used for valve piping. Valves are of Bellows blocking type, wherever possible.
- 4) Purging During purging, filling and emergency operating conditions, the gases will be expelled to the atmosphere (outside the TG hall) through a manually operated vent valve.
- 5) Hydrogen Safety relief valve to be provided at hydrogen manifold
- 6) Driers 2x100% duty to maintain the hydrogen inside the machine dry with zero deg C dew point at operating pressure.
- Type: Refrigeration type Gas circulation at Standstill
- To run the gas system for short time shut down of generator for which gas circulation arrangement through drier with blower, piping valves and accessories along with required control equipment shall be provided. However Bidder's standard and proven system of generator drying arrangement at standstill is also acceptable. A suitable hot air blowing system complete with blower, heater and thermostatic control etc. will be provided to prevent condensation during long shut down.
- 7) Valve interlocking Three way valve used along with the drier for interconnecting the hydrogen and air line (as applicable) preferably have mechanical interlocking such that closing of the hydrogen side port is positively ensured before opening of the air side port.
- 8) Online dew point measurement On line dew point monitoring system will be provided across the inlet and outlet lines to the drying system along with alarm/annunciation in case of high moisture content in the generator casing hydrogen.
- 9) Nitrogen capping During the transportation and storage the machine will be kept under nitrogen atmosphere. Manufacturer informed that as per their standard and proven design nitrogen capping is not required in stator water tank

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[14]	25.09.2014

10) Gas Analyzer

Thermal conductivity type and continuously analyses the gas discharged from casing during purging and will also analyses samples of the casing hydrogen during normal operation. The analyzer will measure the gas purity under the following three Conditions

- a). Normal % of purity of Hydrogen in air in the generator casing. Purity range will include a low purity alarm.
- b). % of Hydrogen in CO₂ leaving the casing when Hydrogen is being admitted expelled.
- c). % of air in CO₂ leaving the casing when CO₂ is being admitted or expelled.

11) The local control panel will be complete with all switches, lamps, indicators, power Supplies etc. Further following instruments will be provided.

- i) Pressure indicator for the pressure of hydrogen in the hydrogen manifold.
- ii) Dial type thermometer for CO₂ vaporizer and gas drier,
- iii) Gas flow meter
- iii) Pressure guage for hydrogen gas cylinder pressure.
- ii) Pressure indicator / local gauge for gas pressure inside the generator.
- iii) Gas purity indicator.
- iv) Temperature indicator for hot and cold hydrogen inside casing.
- v) Dew point indicator for casing hydrogen across drier inlet and outlet lines

12) Alarms in TG MMI and annunciation contacts for use in station DDCMIS will be provided for these conditions (List is indicative only)

- i). Hydrogen pressure in generator casing Low/High.
- ii). Pressure of cooling water hydrogen coolers Low/High.
- iii). Purity of hydrogen in generator casing-Low.
- iv). Liquid level in the generator casing - High.
- v). Temperature of cold/hot gas in the generator - High.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[15]	25.09.2014

vi). Dew point level, in hydrogen gas across the drier inlet and outlet lines High.

vii). Hydrogen leakage into cooling water.

14) Portable gas analyzer Similar as detailed above under clause "Gas Analyser" will be provided for supervision of the gas purging operation

15) Hydrogen pressure and purity to be monitored and annunciated in TG MMI.

1.5.14 Seal Oil System (For H2 / Water Cooled Machines)

- | | |
|-----------------------------|--|
| a). General | A complete seal oil supply and control system including AC and DC motor operated pump sets, cooler, filters, pressure regulators, oil tanks, de-gassification tanks, regulating and control valves, gauges, thermometers and other instruments, interconnecting piping including hangers and supports, valves and control panel complete with all interlocking relays will be provided. Blowers for venting out Hydrogen gas liberated from oil will be provided suitably mounted at places where such gas accumulation is likely to occur |
| b). Number of pumps | 2X100% AC motor driven pump. 1 no DC motor driven pump. |
| c). Pump starting interlock | The auto starting of standby seal oil pumps shall be interlocked with seal oil pressure. |
| d). Emergency condition | During short time emergency which may arise due to non availability of both AC & DC pumps, unit may be tripped and seal oil supply for such coasting down period will be from a suitable arrangement from lubrication oil system |
| e) Pipes | Carbon steel seamless piping shall be used in the system. |

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[16]	25.09.2014

- f). Seal oil pressure The seal oil pressure will be maintained at a pressure suitably in excess of the generator casing hydrogen pressure. The differential pressure is kept constant, once set at the time of commissioning, at all hydrogen pressures and all regimes of generator operation. The pressure regulator or the regulating valve used for the purpose is adjustable type. The seal oil system will be so designed that it is possible to run the machine at no load in air medium at a slightly positive air pressure without any modification in the system.
- g). Oil level gauge To be provided in the different tanks. To give alarm/annunciation for high and low levels, switches will be fitted in the tank and adequate contacts will be provided for annunciation. Necessary hydraulic sealing arrangement will be provided in H2 side oil discharge line to prevent circulation of gas due to any possible difference of heads developed by fans mounted at the end of the generator rotor.
- h). Coolers Two (2) number 100% duty seal oil coolers along with necessary valves for isolating or bringing one cooler in service, will be provided. These coolers are shell and tube type suitable for using D.M. water of condensate quality.
- i) Cooler tube redundancy Seal oil coolers will be designed to have 15% excess tube surface area over and above designed tube surface area required for the rated load conditions while maintaining the design pressure drop on cooling water side.
- j) Water pressure The oil pressure in the cooler is greater than water pressure under all operating conditions.
- k). Filters Suitable filters of 2x100% duty will be provided. It is possible to carry out cleaning and maintenance of any cooler and filter when the machine is in operation.
- l). Temperature/Flow measurements Temperature gauges and flow meters will be provided at all appropriate locations
- m). Pressure gauges and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[17]	25.09.2014

switches

Pressure gauges and switches will be provided at least at the following locations

- i). At the inlet and outlet of pumps.
- ii). At the outlet of the cooler.
- iii). At the inlet and outlet of the pressure regulators and filters.
- iv). At the oil supply header.

n). Control

The system is controlled as part of turbine control system at CCR. In addition to the remote control and monitoring, local control and monitoring for this system are realised in the local panel mounted near these systems as per Manufacturer's standard. At least the following instruments will be provided on the local panel :

- Indicators for seal oil pressure at the seal (for both hydrogen and air side stream).
- Indicators for seal oil-hydrogen differential pressure.
- Indicators for temp. of seal oil at the seals.
- Indicators for thrust oil pressure.
- Seal oil pump discharge pressure
- Control & status indications for seal oil pumps
- Seal oil tank oil level indication
- Seal oil flow meter
- Seal oil filter-choked
- Seal oil cooler water pressure-High/Low
- Seal oil cooler water temperature-High/Low"

o). Alarms in TG MMI & Annunciation contacts for use in station DDCMIS will be provided for these conditions.(List is indicative only)

- 1 Pressure of seal oil-Low.
- 2 Pressure of thrust oil-Low will be provided for these conditions
- 3 Oil level in damper tank-Low (if applicable)
- 4 Oil level in damper tank-(if applicable Emergency)
- 5 Automatic switching on of AC standby oil pump.
- 6 Automatic switching on of DC emergency oil pump.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[18]	25.09.2014

- 7 Differential pressure between oil and hydrogen-Low.
- 8 AC seal oil motor power supply failure.
- 9 DC seal oil motor power supply failure.
- 10 AC/DC seal oil motor control faulty
- 11 Seal oil temperature -high.
- 12 Seal oil pump discharge pressure
- 13 Control & status indications for seal oil pumps
- 14 Seal oil tank oil level indication
- 15 Seal oil flow meter
- 16 Seal oil filter-choked
- 17 Seal oil cooler water pressure-High/Low
- 18 Seal oil cooler water temperature-High/Low"

1.5.15 Generator synchronization panel

- a) Synchroscope panel with synchroscope, running and incoming voltmeters and frequency meters and indicating lights shall be provided.
- b) Synchronizing shall be possible through Manual or Auto mode. In manual mode, the synchronizing shall be done using synchroscope and synchrocheck relay. In Auto mode, the synchronizing shall be via the synchronizer which shall adjust the frequency and voltage at the generator terminal to match with that of the grid.

1.5.16 Generator Neutral Grounding

- a) The transformer and resistor shall be located in cubicles/compartments adjacent to each other. The cubicles shall have hinged access doors capable of being pad locked. The Neutral Grounding Transformer and resistor shall be of required rating and rated for 1 minutes duty. Rating for continuous duty shall also be indicated.
- b) The transformer cubicle shall be made of angle frame steel construction with formed sheet sides. The resistor cubicle shall be made of angle frame steel construction with hot dip galvanized screen sides. Alternatively it can be painted with heat resistant paint suitable for 250 deg. C. Neutral grounding equipment shall be completely assembled, wired and connected to the neutral bus tap through seal-off bushings.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[19]	25.09.2014

- c) The neutral grounding transformer shall be cast epoxy resin type natural air-cooled single phase connected between generator neutral and ground.
- d) The loading resistor shall be formed of non-aging, corrosion resistant punched stainless steel grid element provided with necessary insulation and designed for indoor service for a temperature rise not exceeding 300 deg. C.
- e) All alarm, protection and indication leads shall be wired up to terminal blocks that shall be mounted in a IP: 52 enclosure suitable for flush mounting and having a fully hinged cover with lock.

1.5.17 Generator Disturbance Recorder (DR)

- a) One no. microprocessor based Disturbance Recorder (DR) shall be provided for each generator to record graphic form of instantaneous values of voltage and current in all three phases and neutral, open and closed positions of relay contacts and breaker during disturbances.
- b) It shall have the facility for slow and fast scan to record transient and dynamic performance of the system.
- c) Both slow and fast scan facility shall have atleast 8 analog and 16 digital inputs.
- d) The slow scan facility shall be provide with the following minimum features:
 - The input shall be MW, MVAR, field voltage, frequency and generator terminal voltage etc. Any transducers, if required for interfacing, shall be provided.
 - It shall be suitable to record the frequency excursions and response of generator field and governor control on system fluctuations.
 - It shall have options to select the scan rate in the range having a min. of 10Hz suitable to facilitate capture of low frequency waveforms in the range of 0.5 - 3Hz.
 - The non-volatile memory shall be suitable for recording for a minimum of 15minute at scan rate corresponding to selected pre-fault zone of recording.
- e) The fast scan facility shall be provide with the following minimum features:
 - The input shall be voltages and current etc. Any transducers, if required for interfacing, shall be provided.
 - It shall have scan rate of 1000Hz or better for sampling each of the analog channel having fundamental frequency of 50Hz. The frequency response for these channels shall be DC on the lower side to 500Hz or better on the upper side. Any interposing devices provided shall be suitable for this frequency response.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[20]	25.09.2014

- The pre and post fault recording time shall be at least 200 ms and 5s respectively.
- f) All external and internal faults in the DR equipment such as power supply fail, printer faults, paper exhausting, processor failure, memory failure etc. are to be indicated by means of light emitting diodes on the front of the panel of restitution unit. The DR shall be provided with a MMI (man machine interface) through a PC with VDU, keyboard and printer.
- g) The internal clock of the system shall be synchronized through the GPS. The output shall be in IEEE/ COMTRADE format. The format shall be compatible for dynamic protection Relay Test Kit Necessary interfacing and software for analysis shall also be provided.
- h) The amplitude resolution of the analog channels shall not be less than 16 bit and event resolution for digital channels shall be 1ms or better.

1.5.18 Stator Water Cooling System

Cooling will be provided with a closed loop stator water cooling system. The system generally includes but not be limited to the following.

- | | |
|----------------------|---|
| a) Stator water tank | One (1) number to be provided. Bidder shall indicate and provide devices to detect, trap, monitor and release the hydrogen that leaks in to the stator water cooling system, to a safe place outside the building through suitable safety valves. |
| b) Make up water | Make-up water for primary water system is tapped off from condensate extraction pump discharge header (before and after the condensate polisher) and from DM water make-up line to the condenser. The level in the tank is maintained by means of suitable valves in the makeup line. |
| c) Water to water | Two (2) 100% capacity the water to water heat |

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[21]	25.09.2014

Heat exchangers

Exchanger will be designed to accept secondary D.M.Water (condensate- quality). The system is so designed that the pressure of primary DM water inside the cooler is always greater than that of secondary DM water (condensate quality) The exchanger is designed to have 10% excess tube surface area over and above the designed surface area required for the rated load condition while maintaining the design pressure drop on cooling water side.

d) Filters

Two (2) 100% capacity fine wire mesh filters with magnet bars of unlimited life for removal of all magnetic particles. The permanent magnet bars will be protected by sleeves of stainless steel. It is possible to clean easily the ferromagnetic particles adhering to the magnet bars during capital Maintenance.

e) Circulating

Two (2) 100% capacity A.C. motor driven. Standby

Water pumps:

pump will cut in automatically in case the working pump fails or the pressure of circulating water drops below a certain preset value.

f) Demineraliser

One (1) mixed bed demineraliser (MBD) of adequate capacity to maintain the required quality of water. The MBD remains continuously in service in order to retain high purity of stator cooling water with its associated electrical resistivity. The Bidder will indicate in the proposal the capacity of MBD necessary to maintain the quality of water at the desired level for time duration of six months or more. It will be designed that the MBD could be taken out of service for refilling without untoward effect on the system which could necessitate load reduction/rejection.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[22]	25.09.2014

g) Piping Set of stainless steel piping including hangers and supports, valves and other fittings for the complete water system.

h) Instrumentation

The following minimum instrumentation will be provided

- i) Set of conductivity meters in the main water circuit and after the demineraliser.
- ii) Set of flow switches (at least two nos.) to monitor low distillate condition and flow transmitters/meters for primary water to stator winding and main bushing, make up water etc.
- iii) Sets of pressure gauges at the inlet and outlet of stator water filters, differential pressure switches for the filters, differential pressure gauge across stator winding and pressure transmitters as required.
- iv) Sets of resistance temperature detectors, local indicators for primary water before and after the generator winding, bushing and cooler. Vapour filled temperature detectors also be provided to give signals for high temperatures.
- v) Set of dial type thermometers for cooling water at the inlet and outlet of the cooler.
- vi) Water level gauge, transmitters, level switches for high and low level alarms and other accessories for primary water tank.

i) Control system

The control system is as specified for seal oil system. At least the following Instruments will be provided on the local panel :

- i) Indicator for primary water flow in the stator winding.
- ii) Indicators for primary water conductivity at the inlet of winding and after the demineraliser.
- iii) Indicator for stator winding differential pressure.
- iv) Indicators for primary water temp. at the inlet and outlet of stator winding.
- v) Indicator for primary water pressure at the inlet of stator winding.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[23]	25.09.2014

Alarms in TG MMI & Annunciation contacts for use in station DDCMIS will provide for these conditions (List is indicative only)

- Water level in the stator water tank-low.
- Water level in the Stator water tank-high
- Temp of primary cooling water at the outlet of stator winding high.
- Temp of primary cooling water at the inlet of stator winding - high.
- Flow of primary cooling water to the stator winding - Low.
- Conductivity of primary cooling water at the winding inlet - high.
- Flow of primary cooling water to the stator winding - very low.
- Conductivity of primary cooling water at the winding outlet-high.
- Pressure of primary cooling at the inlet of winding - Low.
- Differential pressure across the primary water strainer - high.
- Stator water cooling pumps tripped on overload.
- Reserve control supply failure for stator water cooling.
- Differential pressure across stator winding - high.
- Leakage of hydrogen into primary water.

Primary stator bar water temperature - high.

i) Alkaliser

Alkaliser unit required for ensuring a corrosion free operation be provided along with stator water system.

j) On line oxygen monitoring system

To be provided, if the Manufacturer recommends continuous monitoring of dissolved oxygen content in the stator water, to prevent copper corrosion

k) Stator coolant flow

Generator auxiliary system valves, piping, tanks and coolers etc. will be designed for at least 10 Kg/sq.cm gauge pressure irrespective of a lower operating pressure. The maximum continuous rating of the pump and motor at specified ambient temperature will be at least the maximum load demand of the driven equipment in its entire range of operation including run out flow condition when operating at frequency variations from 47.5 Hz to 51.5 Hz.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[24]	25.09.2014

The turbine generator control VDU in the central control room will have graphical display of various generator subsystems, process/flow diagrams such as stator cooling water, seal oil, hydrogen, lube oil, generator stator and rotor parameters along with display of generator capability curves and operating point, generator stator & rotor temperatures and vibration parameter etc. These will have limit values alarm/trips tag numbers etc. clearly displayed on VDUs. In addition operator help features for control of these systems and historical and reference data also be made available for efficient operator guidance of these systems.

1.6 Generator Excitation System

1.6.1 General

- a) The Generator shall be provided with complete excitation system with voltage regulation system. The excitation system is either a completely static excitation system or brushless excitation system to meet the requirement specified herein. The excitation system offered is of proven design and has a satisfactory field service record on machines of similar size and construction incorporating the type of excitation. The AVR shall be digital type.
- b) The excitation system has matching characteristics suitable for satisfactory parallel operation with other generators in the plant.
- c) The various change over relays and other equipment associated with supply system other than AVR control supply, electronic circuits of either channel etc. is such that the loss of their control supply does not lead to the excitation system outage.
- d) The necessary inputs and interface equipment will be provided with Generator Excitation and Automatic Voltage Regulator for connecting with DDCMIS.
- e) Stability studies both dynamic (Long duration, transient) and steady state shall be carried out to evaluate various parameters of the excitation system, e.g response time, response ratio, ceiling voltage, loop gains, PSS parameters etc so as to meet the operational requirements of the grid particularly on loading side as the power station is connected to the grid by long transmission lines.

1.6.2 Equipment Design & Sizing Criteria

a) General

When the generator is subjected to a sudden loss of rated output at rated power factor, the system is capable of restoring the voltage of within 2% of the nominal preset value within negligible time, so as not to initiate the protection equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[25]	25.09.2014

b) Redundancy

The excitation system has two (2) 100% channels including independent AVRs, power converters and controls. Each is equipped for 'Auto Operation' with the facility for selecting either channel in 'Auto' or 'Manual' mode.

c) Margin

Each excitation system channel is designed to continuously carry currents of at least 10% above the field current requirement at generator MCR condition and higher currents for short time duty. Short time duty as mentioned above is on MCR base as per clause 1.14 of part III in VDE 530.

d) Excitation system

Response time sec as per IEEE 421 A < 0.5 sec

Excitation response ratio > 2

Excitation system ceiling voltage Equal to 2.0 times rated load excitation voltage.

e) Field forcing capability

Each excitation system channel is capable of supplying without damage to any of the components, the field forcing voltage and current of the system for a period of 20 seconds without exceeding the limits of temperature for rectifier junction and heat sink, when the equipment starts at normal operating temperature.

1.6.3

Voltage regulator

a) The excitation system is designed in such a manner that due to any fault in AVR firing circuit pulse transformer, rectifying elements in any channel etc. excitation system is available with its full capacity. All rectifying elements have over voltage and short circuit protection.

b) Two numbers fully equipped automatic channels. Either channel is capable of being the main or standby. Either channel is capable of being selected as manual also.

c) Automatic voltage regulators is either of solid state type or microprocessor/PLC based as per Manufacturer's standard and having negligible dead band suitable for a large interconnected system.

d) Inputs to AVR

Current transformer secondary 5A, potential transformer secondary 110V phase to phase.

e) Characteristics

- Auto control range +/- 10% of rated terminal voltage in all modes for voltage level adjustments of generator operation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[26]	25.09.2014

- Frequency range of 47.5 to 51.5 Hz Operation
- Accuracy at which generator voltage to be held better than 0.5% of the set value over the whole load range of the machine
- Range of transformer 0 to 15% drop compensation
- Max. Change in generator less than 0.5% voltage when AVR is transferred from auto to manual under all conditions of excitation.
- Manual control range 70% of no load to 110% full load excitation.

Voltage regulator will have the following provisions.

- a) Maximum and minimum excitation limiter.
- b) Channel reference control either solid state or microprocessor control.
- c) Ramp generation circuit: To enable gradual rise of reference signal applied to the circuit to avoid sudden voltage build up.
- d) Rotor earth fault detection: Two stage rotor earth fault unit for continuous monitoring along with alarm & trip contacts.
- e) Transformer drop Suitable feedback proportional to compensation transformer drop to be provided for compensation.

- f) Power system Stabilizer (PSS) - PSS will be suitable for damping the
The excitation system shall be provided with power system stabilizer for achieving the dynamic stability of the system under the most stringent conditions of operation in the phase of disturbance created by short circuit conditions, load rejections, switching on/off of transmission lines as per manufacturer's practice.
- g). Rotor angle limiter (P/Q) A rotor angle limiter (P/Q limiter) will be incorporated in the system. This will enable to keep the angle between the direct axis of the machine and network vector within the set reference value as determined by stability, by adjusting the excitation.
- h). Stator current limiter The stator current limiter will act immediately in under-excited range. The time delay in overexcited range will enable a temporary overloading of the machine.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[27]	25.09.2014

- i). Rotor Current limiter The regulator will act with time delay, so that the regulation dynamics are not impaired in case of a fault.
- j) Voltage/frequency(V/Hz) To limit the ratio of generator voltage and frequency limiter at all operating conditions to such a value that the maximum generator transformer core flux density does not exceed the value specified.
- .k). Follow up In order to avoid a sudden change in generator voltage when voltage regulation is transferred from 'Main' to 'Standby', or 'Auto' to 'Manual', a suitable arrangement will be provided to follow up changes in 'Auto' mode along with follow up indication in UCB. An alarm and visual indication will be provided to indicate change over from Auto channel-1 to Auto channel-2 or 'Auto' to 'Manual'.
- l). Automatic changeover from Auto-1 to Auto-2 or vice versa: Will be possible in case of trouble in the running channel.
- m). Automatic changeover from Auto to manual: Automatic change over will be possible from 'Auto' to 'Manual' in case of:
- Generator protection circuit operation i.e. after field forcing and over excitation condition with a time delay.
 - Loss of terminal voltage feedback by way of any of the PT fuses blowing up Faulty over excitation condition.
 - Loss of automatic channel reference signal
 - Power supply failure in the automatic channel
 - Manual intervention
 - Any other condition as considered necessary by Bidder.

All the above conditions and the conditions of limiter operations will be annunciated in local panel as well as in TG MMI. Local regulator panel will be complete with necessary facia window sequence logic, power supplies, accept reset test push buttons, indicating lamps, control switches, local/remote switches, auxiliary relays and programmable logic controllers, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[28]	25.09.2014

At least following signals will be provided on local control panel. Further, it will be possible to exchange information with station DDCMIS.

- Generator field current
- Rotor winding temperature
- Auto channel-1 to Auto channel-2 & auto/manual changeover
- Generator field breaker/excitor field breaker control
- PSS control
- Auto and manual channel control of excitation level.
- Rotor Earth fault
- Limiter indication
- Field flashing (for Static Excitation System) and field forcing condition indications.

1.6.4 Static Excitation system

a) General

The static excitation system shall be provided with the following:

- Rectifier transformer
- Thyristor converter
- Voltage regulator
- Field flashing system
- Field circuit breaker

b) Rectifier Transformer

Type Indoor, epoxy moulded dry type, 3 phase step down transformer with class F insulation complete with flanges and terminal lugs for connection to the generator terminals through isolated phase bus ducts. The transformer will conform to IS: 11171/Relevant IEC

Temperature rise: 70 deg.C over an ambient temperature of 50 deg.C.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[29]	25.09.2014

Fault rating: Withstand through fault current for the time duration equal to de-excitation time of the generator field current for such faults under AVR/manual operation.

Housing Sheet steel cubicle

Protection A set of CTs to be provided in the primary of rectifier transformer for overload protection.

Hot spot temperature measurement in each limb of the transformer along with indication as well as alarm and trip contacts will be provided.

c) Power Thyristor Convertor

Type Fully controlled three phase, full wave bridge type facilitating fast and high ceiling performance. Suitable to ensure trouble free service of the cells under all fault conditions. The convertor has redundancy features as mentioned in clause "Equipment Design & Sizing Criteria".

Protection The thyristors will be selectively protected against over- loads by ultra high speed fuses. Suitable lamps indication will also be provided to indicate the defective 'thyristors'.

Location To be installed in air conditioned room near turbine floor.

d) Gate Firing Circuit

The firing circuit will have the following essential features:

- It produces a gate pulse for every thyristor once in a cycle.
- It is able to shift the gate pulse in the time over a range of about 150 electrical degrees under a signal from the regulator.
- It provides a linear relationship between the regulating inputs volts and rectifier output.
- The firing circuit has negligible time lag. e) It shall fire the thyristors correctly for any situation of input voltage, depression or unbalance coupled with high or low field currents

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[30]	25.09.2014

e) Pulse Transformer

There will be a pulse transformer between the individual gates of the parallel connected thyristors and between the main current circuit and the control circuit. Their amplitudes will depend upon the trigger characteristics, approximately +3 to +20V peak against cathode.

f) Field Flashing

The initial field flashing will be taken from station's 415 V AC auxiliary supply. Suitable rectifier filters, etc. required for converting this ac supply to the required DC supply will be housed in the excitation system cubicle. Suitable protection interlock with desired time delay will be provided so that when the AC terminal voltage of the generator is built up to the required level for the main excitation rectifier system to take over, the field flashing circuit is switched off. In case the main excitation system fails to take over after a predetermined time of field flashing, the field breaker will trip automatically. An annunciation for field flashing failure/main field breaker trip due to field flashing failure will be incorporated. All the components of field flashing system will be continuously rated irrespective of its short time duty requirement so as to guard against any failure in case of its prolonged mal-operation.

g) Field Application & Suppression Arrangement

- The generator field breaker will be of DC, double pole / single pole air break type, suitable for operation from local panel as well as from UCB. The breaker has arc quenching arrangement for the discharge contacts. Breaker will be designed to carry currents for continuous as well as short time duty of the excitation system. Breaking current capacity of the breaker will match with the fault level at the output DC bus. Discharge contacts will be rated to discharge the field energy corresponding to the highest field current which may come during its entire operating range. The breaker completes with control switches, indication lamps, local/remote selector switch, etc.
- Non-inductive for quick discharge of inductive energy and thereby controlling the voltage across the field.
- Separate breaker for field application and suppression is not applicable.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[31]	25.09.2014

- Suitable interlock will be provided to prevent closing of the field breaker unless the regulator reference signal is at/near the minimum setting and minimum machine speed of 95% is attained. Adequate number of normally open and normally closed field circuit breaker auxiliary contact for remote position indication and interlocking with generator and field flashing circuit will be provided. The static excitation panels will be located near turbine floor in an air conditioned room.

1.6.5 Brushless Excitation System (If Applicable)

A complete generator Brushless excitation and automatic voltage regulating system will be furnished with the generator comprising of the following:

- a. One (1) Pilot Exciter consists of Permanent Magnet Generator (PMG).
- b. One Main AC Exciter consisting of brushless synchronous generator with rotating armature.
- c. One Rotating Rectifier.
- d. Field Discharging Resistors.
- e. One Automatic Voltage Regulators with associated complete instrumentation and protection system.

A. Permanent Magnet Generator (PMG)

The pilot exciter shall be revolving field, salient pole, permanent magnet high frequency type. The armature shall be stationary 3 phases feeding current to static rectifier assembly and excitation control equipment. The rotor shall be magnetized and stabilized by the Manufacturer to give stable magnetization characteristic during operation.

The stator winding shall be of Thermal Class 155 (F) insulation or better, suitable for operation at ambient temperature. The machine shall be fitted with fans for self ventilation.

B. Convertor Assembly

Converter assembly of pilot excitation system, thyristor gate firing system & pulse transformer shall have 2x100% redundancy.

One (1) Thyristor-controlled dual channel digital automatic voltage regulator.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[32]	25.09.2014

Necessary interface circuits for galvanic separation of exchanged signals including signals exchanged with DDCMIS/MMI system.

Protection and logic systems.

C. Brushless Main Exciter

Armature: This shall be of rotating armature, 3-phases, star connected, feeding current to the rotating diodes mounted on the exciter shaft.

Armature core: The armature core shall be made from silicon sheet lamination to reduce eddy losses and shall be suitably varnished on both sides.

Exciter enclosure and Support: The exciter shall be totally enclosed, self ventilated, frame supported on the generator foundation having journal bearings.

D. Rotating Rectifier Assembly

The rectifier assembly made of silicon diodes shall be arranged as two distinct Rings with opposite polarity diodes on respective rings.

The diodes shall be connected in a conventional three arm full wave rectifier bridge. Rectifier assembly shall have one complete bridge as redundant. Alternatively a single three phase rectifier bridge having at least one redundant parallel branch in each of the six arms of the bridge may also be considered. Rectifier assembly shall have same requirements as regards the component features and rating as detailed out for the thyristor assembly.

Diodes shall be cooled by forced air circulation by means of fans mounted on the main exciter.

Each diode shall be provided with a fuse together with visual indication in the event of diode failure.

The output from the rectifier shall be fed to the generator field through the bore of the rotor shaft and necessary plug in type of shaft connection. The axial copper connector shall be designed such that it shall be possible to disconnect this connector at the point where the exciter shaft couples to the generator so that, if necessary, the generator and exciter can be tested individually.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[33]	25.09.2014

E. Instrumentation and Protection

The system will generally include, but not be limited to, the following:

- Suitable twin resistance temperature detectors for measuring hot and cold air temperature of exciter with necessary provisions for protection tripping/interlocks.
- Dial type thermometer for measuring the inlet and outlet temperature of water to the air coolers.
- Pressure gauges at the inlet and outlet of water to air coolers.
- Instruments and devices for the measurement of rotor winding temperature measurement and monitoring (using quadrature axis coil for brush excitation system).
- Stroboscope or suitable alternative device for detection of faulty rotating diode element.
- Suitable arrangement for exciter field suppression.
- A pair of auxiliary slip rings will be provided to give access to the rotor circuit allowing an earth fault detector circuit to be connected.
- For all alarms in the system, contact will be taken from the pressure switches temperature switches etc. provided at suitable points. The system will be provided with transmitters for the above indicators/ recorders.
- For unit interlock and protection system two out of three protection systems will be adopted. To comply with this Contractor will furnish two or three separate sets of sensors/switches etc. for parameters associated with unit interlock and protection will be provided.

1.7 Tests on Generator and Excitation System

- a. The turbine generator and accessories covered against this specification will be subjected to tests by the contractor during manufacture, as also during erection and commissioning. The successful passing of any such test will not, however, prejudice the right of the purchaser to reject the plant if it does not comply with the specification when erected or give complete satisfaction in service. The cost of all tests, packing, freight and insurance charges of any transportation including any repeat tests will be borne by the contractor. This also applies to tests and inspections carried out at the Sub-vendor's works.
- b. Before any equipment/plant is packed or dispatched from the vendor's work's all tests called for will be carried out in the presence

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[34]	25.09.2014

of the purchaser's representative.

- c. Adequate notice, to be mutually agreed upon, will be given when the equipment/plant is ready for inspection or test and every facility will be provided by the contractor and his Sub-vendors to enable the purchaser's representative to carry out the necessary inspection and witness the test at the works.
- d. The works tests will include electrical, mechanical and hydraulic tests in accordance with relevant standards as well as the regulations of the purchaser's and in addition any test called for by the purchaser's representative to ensure that the plant being supplied fulfils the requirements of the specification. For plants not covered by the relevant standards, the tests are to be agreed upon with the purchaser's representative. If considered necessary by the purchaser, any multipart assemblies are not to be fully erected at the works prior to packing and dispatching to site.

1.7.1

Tests on Generator

a. General

The tests listed below are to be carried out on each and every generator to be supplied against this specification. If possible, running trials are to be conducted for the generator, exciter and automatic voltage regulator equipment combined as a unit on the test bed, and the contractor will clearly indicate/confirm these requirements.

The data recorded during the electrical tests, the result noted, and the calculations made are to be included in a test report which will include, inter-alia description of the test method, equipment used and any limitations of the test plant.

b. Shop Tests

1) Routine electrical tests to be performed on each generator :

- Measurement of insulation resistance of the following before high voltage test
 - * Terminal Bushing
 - * Stator windings including tan delta measurement.
 - * Rotor windings.
 - * Embedded resistance thermometers.
 - * Exciter side bearings and oil pipe connections

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[35]	25.09.2014

- Measurement of polarisation index for stator windings.
- Partial discharge test on stator windings
- Measurement of the DC resistance of the following :
 - * Stator winding
 - * Rotor winding
 - * Embedded resistance thermometers.
- Determination of generator open circuit characteristics.
- Stator phase sequence checking.
- Measurement of mechanical losses.
- Determination of short circuit characteristics.
- Measurement of core losses at the rated voltage and frequency.
- Determination of direct axis synchronous reactance.
- Determination of short circuit ratio.
- Determination of potier reactance.
- Equivalent heat runs to determine temperature rises comprising an open circuit run at 100% of the rated stator voltage (however, while taking OCC, voltage will be varied up to 110% of rated voltage) followed by a short circuit run at the rated stator current. A zero excitation heat run may be conducted at the contractor's option but in the absence of such a test no correction for the inclusion of zero excitation losses in both the open circuit and short circuit heat runs will be allowed in the calculation of temperature rises of the stator and rotor windings.
- Determination of generator efficiency by the separation of losses at 100%, 80% and 60% load.
- AC high voltage test of stator winding and stator terminal bushings after heat run test.
- Measurement of rotor winding impedance with the rotor revolving at 3000 rpm and also with the stationary rotor. This is to be done during balancing of rotor and in assembled condition also at works as well as at site.
- AC high voltage testing of the field windings after the heat run test.
- High voltage testing of resistance temperature detectors after the heat run test.
- Measurement of the insulation resistance of the items listed under (i) above after the high voltage test.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[36]	25.09.2014

- Calculation of the temperature rise of the stator and the rotor.
- Measurement of shaft voltage.
- Measurement of individual phase to earth and all three phase to earth capacitance of the stator and calculation of the equivalent generator capacitance as viewed from the generator terminals ; also the measurement of the capacitance between the complete winding and the body and the dissipation factor.
- Waveform analysis on no load and Harmonic analysis of line and phase voltage, balanced and residual TIF, THF.
- Hydrogen leakage test.
- Type test on one generator ("Type test certificates for the following type tests carried out on identical generator will be furnished") :
- Sudden 3-phase short circuit withstand test at 50% of the rated voltage and measurement of all reactances and time constants, SCR and synchronous reactance.
- A single phase short circuit test at reduced excitation to determine the zero and negative phase reactances.
- Telephone influence factor and harmonic analysis of the voltage wave form.
- Impulse withstand voltage test on the terminal bushings (Type test certificate will be furnished).
- Mechanical tests on each generator :
 - Mechanical inspection
 - Measurement of bearing vibrations.
 - Over speed test.
 - Hydraulic tests on coolers.
 - Hydraulic tests on machine housings.
 - Rotor balance
 - Air leakage test on hydrogen cooled stator frame.
 - Resistance temperature detector test.
 - Flow continuity for armature winding.
 - GD 2 value determination.
 - Noise measurement.

c. Site Tests On Each Generator

The site tests to be conducted will include but not be limited to those listed below. Any other test considered necessary by the purchaser will also be carried out.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[37]	25.09.2014

i) Electrical

- Measurement of the insulation resistance of the stator and rotor windings to the frame and between phases, after drying out the machine, and measurement of the polarisation index.
- Measurement of the DC resistance of all windings and embedded temperature detectors.
- High voltage test at 80% rated voltage.
- Measurement of the insulation resistance of bearings & bearing pedestal.
- Capacitance measurement and dissipation factor between the winding and body.
- Phase sequence & shaft voltage measurement.
- Open circuit and short circuit tests.
- Measurement of temperature rise at the rated load.
- Performance capability of the machine.
- Line charging capacity.
- Short circuit test on the generator HV end and the generator transformer HV end to check the stability and operation of the generator and the overall (i.e. generator and generator transformer) differential protections and negative phase sequence protection.
- Operational tests on auxiliary seal oil & Hydrogen gas system.
- Operational tests on all interlocks protection & alarms.
- During Generator short circuit testing at site, suitable external power supply will be arranged by the contractor for feeding the Excitation Transformer(if applicable)
- Measurement of rotor winding impedance

ii. Mechanical

- Hydrogen leakage test
- Vibration test.
- Over speed test measurement of vibration levels before and after over speed test.
- Hydraulic tests on coolers.
- Bearing and shaft current test.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[38]	25.09.2014

- iii. Load throw - off test

1.7.2 Tests on AVR

a Electrical Tests On AVR

- i) The tests to be conducted, at manufacturer's works on the AVR will include, but not be limited, to those listed below.
- ii) Accuracy test.
- iii) Sensitivity test.
- iv) Response ratio test
- v) High voltage test
- vi) Performance test at reduced supply voltage
- vii) Performance test of all limiters
- viii) Impulse input response test
- ix) Manual channel followed by auto channel test
- x) Range of voltage adjustment test for both auto and manual channels
- xi) Output test
- xii) IR test.

b Site tests on AVR

All the tests listed above at works will also be carried out at site.

c Electrical Tests On Excitation Equipment

All components of the excitation system will be tested in accordance with the relevant standards and type and routine test certificates will be furnished. The tests have been listed for different equipment in electrical column.

1.8 Drawings, Data and Manuals

The following minimum Drawings, data & manuals for the Generator and its auxiliaries shall be submitted as indicated below:

- a) [Dimensional GA drawing of generator and excitation system.
- b) Data sheets of generator and excitation system.
- c) Generator capability curves.
- d) Typical calculation for arriving at the size of conductor and the insulator spacing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[39]	25.09.2014

- e) Type test report (short circuit, temperature rise test) for similar rating of equipment manufactured by the proposed manufacturer.*
- f) The bidder may note that the drawings, data and manuals listed are minimum requirement only. The bidder shall ensure that all other necessary write-ups, curves and information required to fully describe the equipment offered are submitted with his bid.]*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[40]	25.09.2014

2. GENERATOR PROTECTION PANEL & METERING PANEL

2.1 General

This specification is intended to cover the *[design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning]* of Generator , GT and UT Protection and Metering panel complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

2.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

Code	Name of Standard
IS 3231	Electrical relays for power system protection
IS 8686	Specification for static protective relays
C37.102-1995 (R2001)	IEEE Guide for AC Generator Protection
C37.91-2000	IEEE Guide for Protective Relay Applications to Power Transformers
C37.101-1993 (R2000)	IEEE Guide for Generator Ground Protection
IS: 13947	Degree of Protection
CEA	CEA regulations and standards

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed

2.3 Design Criteria

- a) Protection & Metering panel shall covers protection and metering of Generator, Generator Transformer and Unit Transformer. Number of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[41]	25.09.2014

panels shall be decided depends on space requirement or as per manufacturer design.

b) [Protection and metering of Station Transformer is covered under Electrical Balance of plant package (eBOP) and hence same is not covered in the scope of this specification].

c) All protection and metering panels shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%.

d) All equipments shall be suitable for following voltage & frequency variations as follows:

a Voltage Variation : (±) 10%

b Frequency Variation : (+) 3% to (-)5%

c Combined Variation of Voltage & Frequency : 10% (absolute sum)

e) Relay and metering panel shall be floor mounted, free standing with degree of protection of IP 54.

2.4 Specific Requirements

2.4.1 Protection Philosophy

a) Protective relay system shall be provided to protect the electrical equipments from faults, overloading and abnormal conditions.

b) The protection of Generator and Transformers shall be divided into two main protection groups as per the protection listed out elsewhere in the specification. Complete protection of the respective equipment shall be fully available even if either of the groups is not available. Hence, both of them shall be mechanically, physically and electrically separated into two separate and independent systems i.e. mounted in two separate panels. These two groups shall derive DC supply from two separate feeders. However, the relays in both groups shall be tripping the respective circuit breaker through both trip coils.

c) Two numbers of dc supplies shall be arranged for the relay panel. Auto changer over and dc supply supervision relay shall be considered. Normally, group-1 & 2 protection systems will be fed by source 1 & 2 respectively and the common services from any one of the sources. In case of failure of any one source (say source 1), supply shall be change over to source 2 (i.e. healthy source) automatically. White colour supervision lamps of clustered LED type shall be provided on Relay panel to indicate availability of DC supply.

d) Each protection system shall be utilizing separate DC source, separate CT/VT cores, separate cables and hand reset lock out relays to obtain 100% reliability.

e) Each group of protection shall be of different make.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[42]	25.09.2014

- f) Trip or lock out relays for each group of protection shall be separate and shall have sufficient number of contacts for all functions.

2.4.2 Generator Protections

Two numbers of identical numerical relays shall be provided for generator protection. They shall receive all AC signals from two different sources. Each of the generator protection relays shall comprise of the following minimum protections unless noted otherwise. If any other protection deemed necessary by manufacturer, same shall be considered.

- a. Generator differential protection (87G)
- b. 100% Generator stator earth fault protection(64G1)
- c. 95% Generator stator earth fault protection(64G2)
- d. Generator back-up stator earth fault protection (64G3)
- e. Rotor earth fault protection (2 stages)
 - First Stage (64F1) for alarm.
 - Second stage (64F2) for trip.
- f. Generator negative phase sequence protection (46G1 and 46G2)
- g. Generator reverse power protection (Preferably 3 phase power relay) (32G1 and 32G2)
- h. Generator loss of excitation protection (40G).
- i. Generator pole slipping protection (98G)
- j. Generator under frequency protection (81G1 and 81G2) (one alarm stage and two trip stages)
- k. Generator over-voltage protection (59G1 and 59G2) (One instantaneous stage and one definite time stage)
- l. Generator backup impedance protection (21G)
- m. Generator Voltage balance scheme for blocking voltage dependent protection in case of VT fuse failure (60G)
- n. Inadvertent energization (27/50)
- o. Generator over-fluxing protection (99G)
- p. Generator field over-voltage protection (can be a part of excitation system) (59F)
- q. Generator definite time over current Protection (51 G1)
- r. Generator Low Forward Power.(37 G1 & 37G2)
- s. Overheating (winding and or bearing) for alarm.
- t. Inter turn fault protection (where spilt winding in stator is provided) if six neutral terminals are available (87TG).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[43]	25.09.2014

In case of digital multifunctional generator protection system (MGPS) is provided, the protections shall be duplicated. Each MGPS shall be preferably provided with individual inputs from CTs and VTs and connected to the independent set of hand reset trip relays, such that one set is always available in case of testing and mal operation of other set. Any protection which is not part of MGPS, separate discrete protection shall be provided as per the above protection list. The MGPS shall preferably have continuous self monitoring and testing facilities.

2.4.3 Generator Transformer Protections

The Generator Transformer shall be provided with the following protections

- a. Overall differential protection covering GT, UT and Generator (87OA)
- b. Generator transformer differential protection (87GT).
- c. Generator transformer HV side IDMT phase over current protection (51GT).
- d. IDMT type back-up non-directional over current protection in all 3 phases (51GT).
- e. Generator transformer restricted earth fault protection (64GT).
- f. Generator transformer backup earth fault protection (51NGT).
- g. GT over fluxing protection (99GT).
- h. Buchholz protection (63) for alarm and trip.
- i. Winding temperature high (49T) for alarm and trip
- j. Oil temperature high (49Q) for alarm and trip.
- k. OLTC oil surge relay
- l. Pressure relief valve trip (PRV)
- m. Pole discrepancy protection of breaker (EHV) if single pole breakers are used (Covered in eBoP package under chapter of switchyard) (162).
- n. Breaker (EHV) back up protection (Protection against breaker failure) (Covered in eBoP package under chapter of switchyard) (50Z)

2.4.4 Unit Transformer Protections

The Unit Transformer shall be provided with the following protections

- a. Unit transformer differential protection (87UT).
- b. Unit transformer restricted earth fault protection (if applicable) (64UT).
- c. Unit transformer HV side instantaneous over current protection (50UT).
- d. Unit transformer HV side IDMT phase over current protection (51UT).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[44]	25.09.2014

- e. Unit transformer backup earth fault protection for low/high resistance grounding (LV side)(51NUT).
- f. Buchholz protection (63) for alarm and trip.
- g. Winding temperature high(49T) for alarm and trip
- h. Oil temperature high (49Q) for alarm and trip.
- i. Pressure relief valve trip(PRV)

2.4.5

Metering

- a. Each metering panel shall house the following meters. The construction of these panels shall be similar to that of the relay panel and shall be as per details given in this specification.
 - Generator : 3 phase current, 3 phase voltage, MW, MVAR, MWH, MVARH, power factor and frequency and also exciter field voltage and exciter field current meters
 - Unit Transformers : MWH, MW, MVARH
 - Station Transformer: MWH, MW, MVARH
- b. The meters shall be suitable for flush mounting or semi-flush mounting on vertical panels. Watt-hour and var-hour measurements shall be suitable for un-balanced loads. The meters shall comply with the following requirements
 - Accuracy class 0.2S
 - Suitable for operation with 1A/5A CT secondary and 110V VT supply.
 - EMC compliant.
 - Shall have RS-485 communication port suitable for MODBUS protocol.
 - LCD display.
 - Degree of protection IP-52.
 - Non-volatile memory
- c. The energy meters mentioned above shall be used for energy accounting and audit purposes and shall be located at a point after the generator stator terminals and before the tap off to UTs and shall comply with the requirements of CEA regulations on Metering.
- d. All Meters shall be of flush mounted type, direct reading, back connected, dust proof and switchboard type, having removable transparent dust tight window cover. The enclosed cases shall be finished in dull black. They shall be fitted with non-reflecting glass and anti parallax scales.
- e. The meters cases shall be flush mounted and draw out type. This draw out feature shall permit the meters to be withdrawn from the cases

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[45]	25.09.2014

without opening current transformer secondary circuits, disturbing service or requiring disconnection of leads.

- f. The digital power demand meters shall have a minimum life of 10 years. The meters shall be shock resistant, dust protected and weather proof. The display character shall be minimum 5 mm wide and 8 mm high. The resolution shall be minimum 0.1 %.
- g. All meters and instruments shall be calibrated for 50 Hz operation and according to the CT & PT ratio and accuracy ratings. All meters shall indicate the test calibration values used for full scale deflection.
- h. The maximum current and voltage of the meters and instruments shall match the rated extended secondary current and voltage of the relevant instrument transformers.
- i. The nominal current and voltage ratings of meters and instruments (used with CTs and PTs) shall be 1A or 5A.
- j. All meters and instruments (including the associated circuitry) shall be capable of withstanding the following overloads:
 - Long duration overloads up to 120% of the rated electrical input quantity without affecting calibration. The duration of each overload shall be per applicable IEC or ANSI standards.
 - In case of wattmeters and varmeters, this continuous overload up to 120% of the rated input quantities, that is current and voltage shall however be applied sequentially; the other value being maintained at its rated value.
 - All meters and instruments shall also withstand overloads of short duration per applicable IEC or ANSI standards.

2.4.6 Relay

- a. Relays shall be furnished in rectangular /square dust tight, draw out or rugged plug in type, flush /semi flush mounting cases.
- b. The hardware design for protection and associated equipment shall use latest state-of-the-art technology and shall generally be integrated numerical/digital, modular in nature. Where design is based on microprocessor technology, adequate self testing/monitoring/diagnostic facilities shall be provided.
- c. All protective relays shall be in draw out or plug-in type / modular cases with proper testing facilities. Necessary test plugs / test handles shall be supplied loose and shall be included in contractor's scope of supply.
- d. All AC operated relays shall be suitable for operation at 50 Hz. AC voltage operated relays shall be suitable for 110 Volts VT secondary and current operated relays for 1 A/5A CT secondary. All DC operated relays and timers shall be designed for the DC voltage specified, and shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[46]	25.09.2014

operate satisfactorily between 80% and 110% of rated voltage. Voltage operated relays shall have adequate thermal capacity for continuous operation.

- e. All protection relays shall be numerical type with communication interface compliant to IEC-61850 protocol. It is proposed to fully utilize the metering, protection and control features of the numerical relays. They shall have programmable logic facility with built-in timers. Apart from the status of operation of the protection functions inbuilt in the relay, it is proposed to utilize the binary inputs of the relay for taking the operation of other non communicable relays (if any) in the protection panel to DDCMIS. The numerical relays shall be selected with suitable number of binary/analog inputs and outputs. Static relays have to be provided for any other protections not adequately afforded by the multifunction numerical relays.
- f. The protective relays shall be suitable for efficient and reliable operation of the protection scheme described in the specification. Necessary auxiliary relays and timers required for interlocking schemes for multiplying of contacts suiting contact duties of protective relays and monitoring of control supplies and circuits, lockout relay monitoring circuits etc. also required for the complete protection schemes described in the specification shall be provided. All protective relays shall be provided with at least two pairs of potential free isolated output contacts. Auxiliary relays and timers shall have pairs of contacts as required to complete the scheme. Contacts shall be silver faced with spring action. Relay case shall have adequate number of terminals for making potential free external connections to the relay coils and contacts, including spare contacts.
- g. Timers shall be of solid state type. Time delay in terms of milliseconds obtained by the external capacitor resistor combination is not preferred and shall be avoided.
- h. Provision shall be made for easy isolation of trip circuits of each relay for the purpose of testing and maintenance.
- i. All protective relays and alarm relays shall be provided with one extra isolated pair of contacts wired to terminals exclusively for future use.
- j. Any alternative / additional protections or relays considered necessary for providing complete effective and reliable protection shall also be offered separately. The acceptance of this alternative / additional equipment shall lie with the purchaser.
- k. The design of the integrated generator protection shall be based on numerical techniques. 2x100% integrated numerical protection along with other standard protections shall be provided. All the analogue

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[47]	25.09.2014

signals will be converted into digital data, using analogue-to- digital conversion circuit. The data will be processed by a microprocessor, which will perform digital signal processing and executes various protection algorithms.

- l. The relay shall be provided with one number Laptop-PC of latest generation, for user interfaces, monitoring, testing facility etc. In addition to above a unitized PC based with 21" colour monitor shall be provided for configuration and diagnostics of all the numerical relays.
- m. Such Station shall be complete with licensed version of all software for analysis and retrieval of disturbances occurred in the system/equipment. Data/signal from numerical relays will go to station DDCMIS through communication protocol and shall be time synchronized through the same.
- n. The relay shall be designed to perform satisfactorily under highly noisy electrical environment. Sufficient degree of high frequency disturbance immunity and impulse voltage withstand capacity shall be built into electronic designs as stipulated in relevant standards.
- o. Relay characteristics shall be coordinated for proper functioning in conjunction with associated relays. The Contractor shall co ordinate the characteristics of all relays to suit the system and equipment parameters. Relay ranges and settings shall be selected accordingly. Some of the relays for generator protection may be back-up for switchyard relays and the settings of these relays shall be properly coordinated with the settings of the later.
- p. The relays shall function satisfactorily being located in non AC physical environment.
- q. All protections shall be furnished compete with necessary auxiliary, supervisory, lock out etc, relays. Suitably separate sets of single phase auxiliary C.T with multiple taps shall be provided with relay whenever required.
- r. Visual and audible alarm annunciation shall be initiated in the event of operation of protective/supervisory relay.
- s. D.C circuits shall be supervised by relays.
- t. Tripping shall be done through high speed lock out relays.
- u. Tripping relays shall be offered with sufficient redundancy. Operating of these relays shall be continuously monitored through supervising relays.
- v. The generator protection system relays shall be classified into three categories viz., class-A trip [Generator Faults). Class- B trip [Turbine Faults] and Class C trip (Grid faults].Accordingly all the relays shall be divided into these three modes of tripping.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[48]	25.09.2014

- w. All protective relays and meters shall be provided with test terminal blocks for secondary injection testing of protection relays and meters.
- x. Relay shall be provided with self reset contacts except trip, lock out relays and interlock relays which shall be manual reset type.
- y. High speed trip relays: Adequate number of high speed trip relays for each category tripping for both the groups will be provided for the protection of the unit. The quantity of the trip relays will also consider the requirement due to the following:
 - Contact requirements from these relays to various systems covered under the scope of this contract.
 - Contacts from each category of tripping relay for annunciation, data acquisition, sequential event recorder and fault disturbance recorder.
 - Contacts for control, protection and interlock in system viz. [400kV] circuit breakers/transfer breaker tripping / close permissive, [6.6] kV aux. Supply breakers trip / close permissive, transformer cooler circuit interlocks, LBB protection etc.
 - 10% spare contacts (both NO and NC).
- z. All protective relays and meters shall be provided with test terminal blocks for secondary injection testing of protection relays and meters.
- aa. All alarm and trip conditions of Generator Transformer and Unit Transformer shall be made available in the DDCMIS.

2.4.7

Panel

- a. The Relay Panels shall be totally enclosed, floor mounted, free standing, dead front assemblies conforming to IP-54 degree of protection.
- b. Design, material selection, and workmanship shall be such as to present a neat appearance outside and inside with no welds, rivets, screws or bolt heads apparent from the exterior surface of the Boards. The boards shall have a smooth and uniform matt finish, free from scratches, dents and other imperfections.
- c. The panels shall be liberally sized so as to provide spacious layout of equipment and devices with sufficient working space in between.
- d. Each board may consist of a number of panels mounted side-by-side, in which case, these shall be bolted together to form a compact unit. Where two panels meet, the joints shall be smooth and close-fitting.
- e. The boards shall be of folded sheet steel construction, assembled on channel/angle base plates with ant vibration mountings.
- f. The boards shall be fabricated of minimum 2 mm thick sheet steel, free from all surface defects. The boards shall have sufficient structural

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[49]	25.09.2014

reinforcement to ensure a plane surface, to limit vibration, and to provide rigidity during shipment and installation.

- g. All doors and removable covers shall be provided with neoprene gaskets all around and latches sufficiently strong to hold them in alignment when closed. The door operating handle shall have locking arrangement.
- h. All panels shall have rear door with concealed type hinges and pad locking arrangement. Doors shall be grounded by flexible copper braid.
- i. The boards shall be complete with vibration damping pads, stainless steel kick plates, floor channel sills, anchor bolts, and other necessary hardware for mounting.
- j. Cable entries to the panels shall be from the bottom. Cable gland plate fitted on the bottom of the panel shall be connected to earthing of the panel / station through a flexible braided copper conductor rigidly.
- k. The panels shall be provided with removable gland plates with glands made of brass suitable for armoured cables. Cable glands shall be double compression type. Cable gland support plate shall be 3 mm thick and mounted not less than 200 mm above floor level
- l. The panels shall have provision of cable entry from the bottom. Bottom plate shall be provided to make entry dust-tight.

2.4.8

Panel Internal Wiring

- a. All wiring shall be carried out with 650/1100 V grade, single core, and stranded copper conductor wires with FRLS PVC insulation and shall be vermin, rodent proof. The minimum size of the stranded copper conductor used for panel wiring shall be as follows
 - All circuits except CT & PT circuits : 2.5 mm² per lead
 - CT & PT circuits : 4 mm² per lead
- b. All devices and terminal blocks shall be identified by symbols corresponding to those used in applicable schematic or wiring diagram. Each wire shall be identified, at both ends, with interlocking type permanent markers bearing wire numbers as per Bidder's Wiring Diagrams. AC / DC wiring shall have separate colour-coding.
- c. Wire termination shall be made with crimping type connectors with insulating sleeves. Wires shall not be spliced between terminals.
- d. Contractor shall be solely responsible for the completeness and correctness of the internal wiring and for the proper functioning of the connected equipments.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[50]	25.09.2014

2.4.9 Terminal Block

- a. Terminals shall be box clamps and clip-on type, suitable for terminating up to two wires of 4 sq. mm. cross section and provided with marking strips. Terminals for CT secondary leads shall have built-in disconnecting links with facility for shorting. Terminals for CT leads should have adequate cross section for terminating associated CT leads.
- b. Not more than two wires shall be connected to one terminal. If necessary, a number of terminals shall be shorted together to provide wiring points.
- c. Each terminal shall be identified with designation as per approved schematic. At least 20% of the total number of active terminals shall be furnished as spare in each panel.
- d. The wiring shall be so arranged that individual wires of an external cable can be connected to consecutive terminals.
- e. The terminal blocks shall be located to allow easy access and also to suit floor openings for cable entry.
- f. Terminal blocks shall generally be mounted vertically with adequate spacing (not less than 100 mm) between adjacent rows.
- g. The bottom of the terminal blocks shall be at least 200 mm above the incoming cable gland plate.
- h. There shall be a minimum clearness of 250mm between the first row of terminal blocks and the associated cable gland plate or panel side wall. Also the clearances between two rows of terminal blocks edges shall be minimum of 150mm.
- i. The number and sizes of the Owner's multi core incoming external cables will be furnished to the Contractor after placement of the order. All necessary cable terminating accessories such as gland plates, supporting clamps & brackets, wiring troughs and gutters etc. (except glands & lugs) for external cables shall be included the scope of supply.

2.4.10 Equipment Mounting

- a. All instruments, relays, switches, etc. mounted on the front face of the panels shall be flush or semi flush type.
- b. No equipment shall be mounted on panel door.
- c. All equipment shall be so mounted that removal and replacement may be accomplished individually without interruption of service to others.
- d. All equipment inside the panels shall be so located that their terminals and adjustments are readily accessible for inspection or maintenance.
- e. In case cut-outs are provided on any panel for future mounting of equipment, the same shall be properly blanked off.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[51]	25.09.2014

- f. All equipment on and in panels shall be mounted and completely wired to the terminal blocks ready for external connections.
- g. The Contractor shall carry out cut out, mounting and wiring of the free issue items supplied by others which are to be mounted in his panel in accordance with the corresponding equipment manufacturer's drawing.
- h. The centre lines of switches, push buttons and indicating lamps shall be not less than 750mm from the bottom of the panel. The centre lines of relays, meters and recorders shall be no less than 450mm from the bottom of the panel.
- i. The centre lines of switches, push buttons and indicating lamps shall be matched to give a neat and uniform appearance. Like wise the top lines of all meters, relays and recorders etc. shall be matched.

2.4.11 Illumination, Space Heating and Receptacles

- a. Each panel shall be provided with interior fluorescent tube with door switch, space heater with thermostat and switch and 240V, 5A, 3 pin receptacles with plug. Third pin of the socket shall be effectively grounded through the metallic structure.
- b. Lamp, heater and receptacle circuits shall be suitable for available 240V A.C. supply and furnished with individual ON-OFF switch.
- c. The tube shall be located at the ceiling and guarded with protective cage. Space heater shall be located near the floor so as not to pose any hazard to service personnel.

2.4.12 AC/DC Power Supply

- a. Necessary A.C and D.C supplies to each panel as required for control and service shall be arranged by the Contractor. Single feeder shall be arranged for A.C supply but redundant feeders shall be arranged for D.C supply by purchaser.
- b. Indication lamps and audible alarms shall be provided to annunciate failure of main incoming D.C supplies in each panel. Flag relay shall be provided for A.C. supply failure.
- c. MCCB/MCB shall be provided for the incoming AC/DC power supplies. Bus wires shall be run for power distribution to different panels. Power supply isolation switches shall be 4-pole, single throw, for A.C. (considering single feeder) and 2-pole, double throw with OFF, for D.C.

2.4.13 Name Plate

- a. Nameplates shall be provided on each panel and on each instrument or device mounted in the panel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[52]	25.09.2014

- b. The material of the nameplates shall be plastic, 3 mm thick, with white letters on black background.
- c. The nameplates shall be held by self tapping screws. The size of nameplate shall be approx. 20 mm x 75 mm for equipment and 40 mm x 150 mm for panels.
- d. Nameplates for panels shall be provided both on the front and the rear. Nameplates for all devices shall be located below the respective devices.
- e. Instrument and devices mounted on the face of the control boards shall also be identified on the rear with the instrument or device number. The number may be painted on or adjacent to the instrument or device case.
- f. All relays and other devices shall be clearly marked with manufacturer's name, manufacturer's type, serial number and electrical rating data.

2.4.14

Grounding

- a. Tinned copper ground bus of adequate size shall be provided in each panel, extending along the entire length of the assembly.
- b. Location of earth bus shall ensure no radiation interference for earth systems under various switching conditions of isolators and breakers.
- c. When several panels are mounted adjoining each other, the earth bus shall be made continuous and necessary connectors and clamps for this purpose shall be included in the scope of supply of Contractors. Provision shall be made for extending the earth bus bars to future adjoining panels on either side.
- d. Provision shall be made on each bus bar of the end panels for connecting Substation earthing gird. Necessary terminal clams and connectors for this purpose shall be included in the scope of supply of Contractors.
- e. Looping of earth connections which would result in loss of earth connection to other devices when the loop is broken, shall not be permitted. Earthing may be done in such a manner that no circulating current shall flow in the panel.
- f. VT and CT secondary neutral or common lead shall be earthed at one place only at the terminal blocks where they enter the panel. Such earthing shall be made through links so that earthing may be removed from one group without disturbing continuity of earthing system for other groups.
- g. An electrostatic discharge point shall be provided in each panel connected to earth bus via 1 Mega Ohm resistor.
- h. The ground bus shall have two-bolt drilling with GI bolts and nuts at each end and shall be suitable for connection to 50 x 6 mm G.S. flat.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[53]	25.09.2014

- i. The ground bus shall be bolted to the panel structure and effectively ground the entire assembly. The cases of meters, relays and switching devices shall be grounded through the steel structure.
- j. Whenever a circuit is grounded, a single wire from the circuit shall be run independently to the ground bus and connected to it.

2.5

Tests

I) Type Test

For each type of relays and equipments, Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the switchgear similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

The minimum tests shall be conducted at manufacturer work/site are as follows:

- a) Wiring continuity tests
- b) Insulation tests before and after high voltage test
- c) Functional tests to ensure operation of the control/protection/metering schemes and individual equipment.
- d) All switches, meters, relays and other devices shall be tested and calibrated in accordance with relevant IEC/IS standards.
- e) HV test on control circuits
- f) Secondary injection of all protection relays by using service settings and simulation of all protection functions.
- g) Secondary injection of all metering circuits.
- h) Functional tests to demonstrate the specified control and interlocks

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[54]	25.09.2014

the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates:

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

2.6 Drawing & Documents

Drawings, data & manuals for the Protection panel and metering panel shall be submitted as indicated below

- a) [General Arrangement drawings and cross-section showing constructional features & cable entry with bottom view with opening of panels.
- b) Bill of Materials.
- c) Technical Data sheet and Catalogue.
- d) Heat loss of panels
- e) Foundation drawing details with bottom view of Panels.
- f) Descriptive write-ups and literature for the main equipment offered i.e relays, meters, etc.
- g) Control Schematics & Wiring diagram.
- h) Inspection and Test Plan (ITP).
- i) Suggestive list of protective relays.
- j) Transport/shipping dimensions and weights].

2.7 Ratings & Requirements

Protection relay panels and meters shall comply with the particulars indicated in the following tables.

S. No.	Technical Particulars	Unit	Parameters
1.0	General		
1.1	Type (simplex / duplex / panel cum desk)		Simplex type
1.2	Make		[By bidder]

3. ISOLATED PHASE BUS DUCT

3.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning] of Isolated Phase Bus duct (IBPD), Surge Protection and VT (SPVT) cubicle complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

3.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

Code	Name of Standard
IS 2099	Bushings for alternating voltage above 1000V.
IS 2544	Porcelain post insulator for voltages above 1000V.
IS 2633	Method of testing uniformity of coating on zinc coated articles.
IS 2705	Current Transformer
IS 3070	Lightning Arresters
IS 3156	Voltage Transformers
IS 8084	Interconnecting Bus bar for AC Voltage above 1kV up to and Including 36kV
IS 9431	Specifications for indoor post insulators of organic material for systems with nominal voltages greater than 1000 volts up to including 300kV.
IEEE C37.23	IEEE Standard for Metal-Enclosed Bus.
ANSI/IEEE C37.20	Switchgear assemblies including metal enclosed bus.
ANSI/IEEE C37.24	Guide for Evaluating the Effect of Solar Radiation on Outdoor Metal Enclosed Switchgear.
IEC 60947	Low Voltage Switchgear and Control gear.
IEC 60439	Low-voltage switchgear and control gear assemblies.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[61]	25.09.2014

BS 159:1957	Bus bar and Bus bar connection
CEA	CEA regulations and standards

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

3.3

Design Criteria

- a) The main run of IPBD shall connect generator phase side terminals to Generator Transformer (GT) LV terminals. Tap off bus ducts from IPBD for Unit Transformer (UT) and Static Excitation Transformer (SET) shall be provided. The neutral side bus duct shall be terminated at the Neutral Grounding (NG) cubicle after formation of the neutral point, which shall house a neutral grounding transformer and loading resistor.
- b) Busduct shall be isolated phase, continuous bonded type and shall be installed indoor/Outdoor in a hot, humid and tropical atmosphere. It shall be natural cooled and positive pressure type.
- c) Cubicle for neutral grounding, Voltage transformers and surge protection equipments shall be installed indoor.
- d) Bus duct, associated equipment and wiring shall be provided with tropical finish to prevent fungus growth. All ventilation openings shall be screened and drains shall be filtered to prevent entrance of dust and insects.
- e) The portion of bus duct at the transformer/generator end will be subject to vibration normally prevalent for this type of installation in a power generating station. Suitable means shall be provided to isolate the transformer/Generator vibration from rest of the bus structure / bus duct.
- f) The busduct shall be of a Manufacturer's proven design and shall meet or exceed the requirements of this specification in all respects.
- g) The busduct shall be designed to operate and perform satisfactorily at all service conditions without exceeding the hot spot temperature limits specified in relevant standards.
- h) The busduct shall be an integrally designed assembly of rigid busbar conductors, insulators, bus conductor supports, associated connections,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[62]	25.09.2014

joints and wall frames and all other accessory items necessary to assure a complete coordinated design.

- i) The continuous rating of the Isolated phase bus duct (generator bus ducts) main run shall be arrived considering the maximum continuous output of the Generator at the rated power factor and minimum operating voltage and rounded off to the next Standard rating. The generator busduct shall be such that the continuous rating can be delivered at site ambient conditions without exceeding the allowable temperatures considering site ambient and duly considering the effect of solar radiation.
- j) The continuous rating of the Isolated phase bus duct (generator bus ducts) tap-off shall be arrived considering the rating of Unit transformer.
- k) The main run of the busduct shall be designed to withstand the maximum fault current from following at least for 1 second.
 - i) Fault current contribution from the Generator and from the motors through Unit transformer (as applicable) OR
 - ii) Fault current contribution from the Grid system and from the motors through Unit Transformer (UT).
- l) The tap off run of the busduct to UT shall be designed to withstand at least for 1 second, the total fault current contribution from Generator, grid system and from motors via UT.
- m) Bidder shall provide the IPBD between Generator and GT LV side, tap off to UT and SET & Generator neutral busduct.
- n) Bus duct and auxiliary equipment shall be capable of withstanding the mechanical forces and thermal stresses of the short-circuit currents.
- o) The bus ducts and supporting structures shall be designed & constructed so as to withstand without damage the horizontal / vertical ground accelerations due to earthquake.
- p) Wall frame assembly for IPBD if required and floor frame assembly for IPB tapping wherever it penetrates the floor shall be provided.
- q) Air pressurizing system, air compressor, drier, piping, valves etc. for pressurizing the IPB section if required shall be provided.
- r) Required supporting galvanized steel structures and necessary hardware need to be provided.
- s) Following calculation to be furnished
 - i. Temperature rise calculation at rated current considering solar radiation

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[63]	25.09.2014

- ii. Calculation for conductor size
- iii. Calculation of enclosure size
- iv. Guaranteed kW losses
- v. Short circuit withstand current & force capability for specified time duration
- vi. Supporting span
- vii. Dynamic and static forces transmitted to TG foundation
- t) For generator busduct, adapter box of aluminium sheets with seal-off bushing near Generator ends (both Phase and Neutral) and wherever required shall be provided. All contact surfaces shall be silver-plated to ensure an efficient and trouble free connection.
- u) The busduct shall be designed to withstand the internal or external forces resulting from the following:
 - 1. Normal operating condition
 - 2. Momentary short circuit currents
 - 3. Rigorous / adverse weather conditions as detailed in the technical specification.
- v) Isolated phase busduct shall be supplied in maximum practical lengths easily transportable to site, to suit layout and minimize number of field joints. The standard shipping section length should be of the order of 6 meters for IPBD's.
- w) Equipments shall be arranged to ensure same phase disposition throughout the run of the bus duct. Phase cross over units, if required, shall also be provided.
- x) Isolated phase busduct terminations shall be complete with flexible connectors of copper for all connected equipments along with flanges, gaskets, bolts, nuts and washers and adequate supports, as required. These shall be able to absorb movement of equipment terminals.
- y) The spacing of the bus support insulators shall be considered by giving due factor of safety to withstand the forces due to the momentary short circuit assigned for the bus duct.
- z) For the portion of the bus duct installed outdoor and exposed to direct sun-rays, the effect of the solar heat shall be considered in the determination of the design ambient temperature. In addition, the outdoor section shall also withstand the wind loading.
- aa) Generator transformers and unit transformers shall be placed on the rail track. The busduct and supporting structure shall be designed in such a

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[64]	25.09.2014

way so as to permit transformer removal, after opening the terminations, but without dismantling busduct run or supporting structure.

- bb) The bus duct near the generator terminals shall allow for removal of the generator bushing current transformers without extensive disassembly of the bus structure or any welding during re-assembly.

3.4 Specific Requirements

3.4.1 General

- a) Isolated phase busduct shall have continuous bonded non-magnetic metallic enclosure and rated for the highest possible system voltage / continuous terminal voltage of the generator (if used as Generator busduct). The Bus ducts shall be naturally cooled, dust tight and weather proof type, provided with positive pressurization arrangement using clean air. The leakage rate of air shall not exceed 5% of the total volume per hour after installation.
- b) Busduct shall be isolated phase, continuous bonded type and shall be installed indoor/Outdoor in a hot, humid and tropical atmosphere. It shall be natural cooled and positive pressure type.
- c) All parts and accessories shall have appropriate match mark and part numbers for easy identification and installation at site.
- d) All supporting steel structures shall be hot dip galvanized.
- e) Wall frame assembly and seal off bushing shall be provided whenever busduct passing through the wall.
- f) For the purpose of protection and metering of the UTs, required current transformers shall be provided along the tap off run of the IPBD on the phase side if CT is not considered on the Bushing of UT.

3.4.2 Bus Conductor

- a) The material of the conductor shall be high conductivity, aluminium alloy. The bus conductor shall be designed to carry the rated current under normal site operating conditions without exceeding the temperature rise as stipulated in IS 8084
- b) The temperature rise of conductor shall be as per IS: 8084. Also the temperature of the bus shall not exceed 250°C while carrying the specified short circuit current for one second when a fault occurs at the operating temperature.
- c) The bus conductor shall be given a coat of matt black paint to facilitate heat dissipation. The bare conductor with above painting shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[65]	25.09.2014

designed to carry the normal rated current without exceeding temperature rise as specified in IS: 8084. However, the sizing of the bus conductor shall consider the conductor as bare.

- d) The section of the bus conductors used may be rectangular, tubular, hollow square, hollow rectangular, double channel or hollow hexagonal/octagonal type. However, tubular shape is preferred.
- e) The bus conductor shall be designed for welded connections except at equipment terminations and bolted disconnect links.
- f) Flexible braided copper connections shall be provided at the terminals of generator, GT, UT, SET, SPVT and neutral earthing cubicle. Bimetallic connectors shall be provided between the bus-bars and the copper flexible. The flexible connectors shall comprise a number of small braids woven out of copper wires in order to obtain flexibility in all the directions
- g) The bus conductors shall be designed to carry rated current under normal site operating conditions without exceeding hot spot temperature.
- h) Flexible connections shall be provided between bus sections to allow expansion and contraction of the conductor. Flexible connection shall also be provided at all equipment terminations.
- i) All contact surfaces shall be silver plated to ensure an efficient and trouble free connection. All connection hardware shall be non-magnetic and shall have high corrosion resistance.
- j) The bus conductors and their support insulators shall be designed to withstand, without damage, the forces developed while carrying the short circuit current.

3.4.3 Enclosures

- a) The bus enclosure shall be of continuous bonded type. The cross section of the bus enclosure shall be circular. The material of bus enclosure shall be of aluminum alloy grade [63401] as per IS-5082. The entire bus duct shall be designed for indoor/outdoor installation, with dust, vermin and weather-proof construction. The degree of protection shall be IP-55 and shall meet the requirements of water and air tightness test specified in IS 8084.
- b) Each phase shall be enclosed in a weather-proof, dust-tight, non-magnetic metal (aluminum alloy) enclosure.
- c) The inside of the bus enclosure shall be given a matt finish of black colour paint to facilitate heat dissipation. The paint shall not deteriorate

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[66]	25.09.2014

at specified maximum temperature of the bus conductor and enclosure. The outside of the bus enclosure shall be painted with RAL [5012].

- d) The outdoor portion of the bus duct shall be provided with rain hood. This hood shall be mounted on the bus duct supporting structures or on the busduct and all hardware and accessories required for mounting the hood shall be furnished by the bidder.
- e) For continuous type of design, successive sections of enclosures shall be connected by providing circular bonding enclosures with adequate overlap and welding the same to the main enclosure at site. All gaskets used shall be of EPDM / Neoprene rubber with good ageing, compression and oil resistance characteristics suitable for busduct application.
- f) The enclosure cross-section, connecting members between enclosure section, flexible and rigid joints and shorting links between phase enclosures shall be adequate to allow the flow of longitudinal current required for the rated continuous currents of the bus without overheating.
- g) The enclosure shall be insulated at the connections to the generator, transformers and other equipment so that the longitudinal current will not flow through or be transmitted to any connecting equipment.
- h) The bus enclosure shall have extended bellows or equivalent means to allow for temperature changes and vibrations. Flexible joints shall be provided in enclosures at all points where the bus duct terminates at equipment to withstand vibration, expansion/ contraction and at suitable intervals in any straight run of the bus duct where expansion and contraction would otherwise result in stresses in the supporting structures.
- i) Inspection opening/split covers shall be provided to allow easy access for installation, inspection, replacement or repairs of the insulators, disconnects, bus connections and terminations. The inspection/split covers shall have reliable sealing arrangements with neoprene/rubber gaskets in grooves.
- j) Seal-off bushings complete with wall-frame and support plates shall be provided where the bus duct penetrates the building wall. The seal is to prevent exchange of air between indoor and outdoor portions of the busduct.
- k) The enclosure shall be furnished with suitable connections for a dry air pressurization system, to prevent / remove condensation. Filtered drains

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[67]	25.09.2014

for drainage of condensate shall be provided at the lowest points and at such locations where accumulation of condensate can be expected.

- l) The enclosures of all three phases shall be rigidly supported by cross members to maintain parallel alignment.
- m) Shipping length of the bus duct shall be as long as practicable within transport limitation to reduce field assembly work.
- n) The enclosure design shall ensure grounding continuity capable of carrying the rated momentary current of the bus throughout the length of each run.
- o) Phase enclosure shorting links rated for continuous current shall be provided at bus duct termination on generator, generator transformer, and unit tap off. All such links shall be same material as of bus bar.
- p) Drain plugs shall be installed at low points along the run of the bus duct. The drain plugs shall be fitted with porous filter elements. The filter elements shall be easily removable for cleaning purposes.

3.4.4 Disconnect Link

- a) Disconnecting links with rating same as that of the bus conductor shall be provided in the run of the bus duct to facilitate disconnection of the bus conductor during maintenance.
- b) The separation between the bus conductors sections with the bolted links removed shall be sufficient to withstand the rated voltage of the bus duct.
- c) Disconnect link shall consist of a removable section of conductor and shall be so constructed as to permit easy removal or reinsertion without alignment difficulties.
- d) The bus on both sides of the link shall be rigidly supported so that the disconnect link is equal in mechanical strength to any other section of the bus.
- e) A minimum clearance of 300 mm. (12") shall be provided between the disconnected bus sections with the link removed.
- f) Disconnect links shall be plainly marked to be removable only when bus is de-energized.

3.4.5 Insulators

- a) Within the bus duct the bus shall be mounted and supported on insulators. The insulators shall be mounted on resilient pads provided in the bus enclosure. The insulators shall be either porcelain or resin cast.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[68]	25.09.2014

- b) Bus support insulators shall be interchangeable, high creep, high strength, wet process, fine glazed porcelain. Alternatively good quality cast resin insulators may be offered.
- c) Insulator shall be mounted in such a way so as to permit easy removal or replacement without disassembly of the bus. The insulator mounting plate shall be designed for cantilever loading to withstand the short circuit.
- d) The conductor shall be fastened on the insulator through fixed and slip joints so as to allow conductor expansion or contraction without straining the insulator. The conductor shall be fastened on the set of 3 insulators, 120° apart.
- e) All ferrous metal part of the insulator shall be hot-dipped galvanized.
- f) Additional insulators shall be provided at bends, tap-off etc.

3.4.6 Wall Frame Assembly

Wherever the bus duct passes through the plant building wall, from indoors to outdoors, a wall frame assembly with seal-off bushings shall be provided to prevent any leakage of rain water, infiltration of dust and air temperature variations from indoors to outdoors. The wall frame shall be fabricated out of aluminium angles and sheet and shall be suitable for grouting in the wall. It shall be provided with flanges on both sides to receive the bus duct flanges. A suitable size breather shall be provided for the two sections of the busduct separated by the wall frame assembly.

3.4.7 Seal-off Bushings

- a) The bus duct shall be equipped wherever necessary with seal-off bushings to prevent interchange of air at different temperatures. The seal-off bushings shall be flanged type.
- b) The seal-off bushings shall be made of porcelain / cast epoxy. The mechanical and electrical properties of the bushings shall be as specified for bus support insulators.
- c) Seal off bushings shall be provided at the following locations:
 - i. Entry of tap-off bus duct to the static excitation transformer, neutral grounding cubicle, etc.
 - ii. Between indoor and outdoor portions of the bus duct on turbine building outer wall.
 - iii. At GT and UTs.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[69]	25.09.2014

- iv. One set of seal-off bushings shall be provided in the bus duct after the generator bushings to prevent hydrogen leakage into the bus duct. Arrangement shall be provided to vent the trapped hydrogen in the portion between generator bushings and seal-off bushings.
- d) The insulator for wall frame assembly and seal-off bushings shall be of porcelain. Also the bushings shall be designed for thermal expansion/contraction due to temperature differential for outdoor/indoor use.

3.4.8 Air Pressurization system for IPBD

- a) The entire bus duct shall be kept constantly pressurized while in service, for the purpose of dehumidification after the installation of bus duct is complete in all respects. For this purpose the Bidder shall make available dry instrument air provided by purchaser at indoor location inside the TG building near the bus ducts. From this point, the Bidder shall supply all necessary equipment to maintain the pressure inside the entire bus duct. The equipment supplied shall include all necessary piping including delivery, exhaust and interconnecting piping, pressure reducing device, all necessary valves and associated instrumentation to maintain pressures and scavenging rates as specified. A pressure relief valve shall be provided to relieve the excess pressure in case the pressure goes beyond the pre set value. Air pressurization system shall be 2x 100% redundancy.
- b) A wall mounted control cabinet shall be provided to house the pressure reducing device. The control cabinet shall also have indicating lamps for low pressure and high pressure inside bus duct, inlet air supply failure and system fault indications. Degree of Protection of control panel shall be IP 52.
- c) Two potential free shall be provided for remote annunciation of each of the following conditions:
 - i. Low pressure inside bus duct
 - ii. High pressure inside bus duct
 - iii. Inlet air supply failure
 - iv. System fault.
- d) At least one RTD shall be provided for temperature measurement of ambient air inside each of the bus duct. The same shall be hooked up to Distributed Control System (DDCMIS) by the Bidder.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[70]	25.09.2014

3.4.9 Hot air blowing system for IPBD

- a) Facilities shall also be provided to blow out the busbars with dry filtered air and so facilitate rapid cleaning and drying of the installation following maintenance or a period of shutdown.
- b) It shall be of portable type. System shall have the capability to blow out the entire length of the bus duct within 2 hours. Necessary opening shall be provided on IPBD at different locations.

3.4.10 Connections & Terminations

- a) All matching flanges/adaptor boxes, seal-off bushings, gaskets, fittings, hardware and supports required for termination of the Busduct at the Generator, transformers and other equipment shall be furnished.
- b) In this connection the bidder is required to coordinate with the Generator and transformers manufacturer with regard to connection details, mechanical and thermal stresses.
- c) Flexible connections both for conductor and enclosure shall be furnished at all equipment termination to provide for misalignment up to 25 mm in all directions.
- d) The equipment terminal connections shall be readily accessible and shall provide sufficient air gap for safe isolation of equipment during testing.
- e) If the material of bus conductor and that of the equipment terminal connectors are different then suitable bimetallic connectors shall be furnished.

3.4.11 Shorting Link

- a) Pre-fabricated shorting links rated same as the continuous amperage of bus duct main run shall be furnished complete with all hardware for connections.
- b) The links shall be suitable for shorting bus conductors-enclosures of three (3) phases after generator phase current transformers.
- c) The links shall be so designed with flexible connections that the bus insulators will not be unduly stressed due to expansion/ contraction during dry out or short circuit tests.

3.4.12 Grounding

- a) The electrically continuous bus enclosure shall be used as the ground bus. All parts of the bus enclosure, supporting structures and equipment frames shall be grounded.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[71]	25.09.2014

- b) Grounding system design shall meet the requirements of ANSI/IEEE C37.23, Sections 7.2 and 7.3. Reliance on the air gaps only between the bus and equipment enclosures for avoiding the circulating currents is not acceptable. An isolating bellows shall be provided; e.g., between the generator terminal enclosure and the bus enclosure; such that electrical clearance between equipment and bus enclosures shall not be less than two (2) and in no way shall thermal expansion and/or movement compromise the isolation between generator terminal enclosure and bus enclosure.
- c) The ground circuit shall be capable of carrying two times the line-to-ground fault current for 1 second, without exceeding temperature limitations.
- d) Duplicate bolted type ground pads shall be provided to accommodate galvanized steel flats, wherever isolated phase busduct terminates.
- e) The metal enclosure of the bus shall be grounded at only one end of the bus run. All gasketed connections shall be bridged by grounding conductor. The contact assemblies shall be sized for the ground fault current.

3.4.13 Supporting Structures

- a) All supporting structures required for hanging and/or supporting the complete bus duct shall be furnished. These include all members, indoor/outdoor posts, bolts, shims, base plates, beams, hangers, brackets, bracings and hardware.
- b) Indoor portion of the bus duct may be supported from the floor or ceiling beams. Outdoor portion of the bus duct shall be supported from ground below on suitable foundation in the ground. The foundations and structures in outdoor area shall clear the transformers, transformer foundations, cable trenches.
- c) All buses shall be adequately supported and braced to successfully withstand normal operation, vibration, thermal expansion, short circuit forces and all specified design loads including wind & earthquake forces.
- d) Support shall be designed to provide tolerance of ± 12 mm in the horizontal and vertical directions.
- e) All steel members shall be hot-dip galvanized after fabrication. All hardware shall be of high strength steel with weather resistant finish.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[72]	25.09.2014

- f) The mounting arrangement of Busduct on the supporting structure shall be designed to allow movement of the Busduct during expansion and contraction.
- g) All structure shall be self supporting and in no case rely for support on equipment to which the busbars are connected.

3.4.14 Current Transformers (if applicable)

- a) The current transformers shall be cast-resin, ring type confirming to IS 2705, mounted within the busduct enclosures and suitable for operation at an ambient temperature equal to rated busbar temperature.
- b) The bus design shall permit removal or replacement of C.T.s without dismantling the bus run or supports.
- c) The C.T.s shall have polarity markings indelibly marked on them.
- d) C.T. secondary leads will be brought out to separate terminal box mounted on or adjacent to C.T. enclosure. From phase terminal boxes, C.T. secondary leads shall be brought out through non- magnetic metallic conduits to a master terminal box for field cable connections.
- e) The terminal boxes shall be dust-tight, weather-proof, fabricated from aluminium alloy and complete with screwed cover for access to terminals and removable cable gland plate.

3.4.15 Surge Protection and Voltage Transformer (SPVT) Cubicles

- a) The V.T. & S.P. cubicles, one for each phase, shall be metal-clad, dust and vermin proof, free standing dead front assemblies.
- b) Each phase cubicle shall house three (3) voltage transformers, one (1) lightning arrestor and one (1) surge capacitor, in separate compartments. Seal-off bushings shall be used between the bus tap and cubicle and between compartments.
- c) Lightning arrestor shall be station class, hermetically sealed type, connected between line and ground, specifically suitable for generator protection.
- d) The characteristic of the lightning arrestor shall be carefully chosen to provide a low protective ratio for generator BIL.
- e) A discharge counter shall be provided for each lightning arrestor. The discharge counter register shall be visible without having to open the compartment door.
- f) The surge capacitor shall be non-inflammable and non-toxic type, single pole, connected between line to ground.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[73]	25.09.2014

- g) The voltage transformer shall be cast-resin type, suitable for nominal operation connected from line to ground, and for 1.73 times rated line to ground voltage under sustained emergency condition.
- h) The voltage transformer shall be mounted on draw out type carriage. Suitable guide slots and stops shall be provided to ensure easy withdrawal and positioning.
- i) In the disconnected position, the voltage transformer primary and secondary circuits shall be automatically disconnected and the primary fuse shall be visibly grounded. The draw out frame shall be grounded at all times.
- j) The high voltage winding of the voltage transformer shall be protected by current limiting fuse mounted on top of the primary bushing. The fuse will be accessible only in fully drawn out position.
- k) The secondary leads from the voltage transformer shall be extended to a fuse/MCB and terminal cabinet flush mounted on the compartment.
- l) From phase cabinets the V.T. secondary leads shall be brought to a marshalling box having sufficient number of terminals to accommodate all V.T. leads, facility for making star points and removable plates with knockouts for cable connections.

3.4.16 Cubicle and Control Panel / Cabinet

- a) All cubicles, control panels and control cabinets shall be fabricated from sheet steel of minimum 2 mm thickness suitably reinforced to ensure structural rigidity.
- b) The degree of protection for all indoor cubicles shall be IP 54.
- c) Each cubicle shall be equipped with space heater, internal illumination lamp and ground bus.
- d) Space heater and lamp shall be provided with individual ON-OFF switches. The space heater shall be provided with thermostat.
- e) The ground bus shall have provision for receiving field ground connections two numbers [65 x 10] galvanized steel flats.

3.4.17 Wiring

- a) All wiring shall be done with insulated stranded copper conductor of not less than 2.5 Sq.mm cross-section. Each wire shall be identified at both ends with wire designation as per contractor's wiring diagram and shall be brought out to a terminal box outside the bus duct.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[74]	25.09.2014

- b) Terminal blocks shall be box-clamp type suitable for minimum 10 sq.mm with marking strips.
- c) At least 20% spare terminals shall be furnished in the terminal block.
- d) Heat resistant type wires suitable to withstand specified bus duct inside temperature shall be used for wiring between CT secondary terminals to the terminal box.
- e) Terminal for C.T. secondary leads shall have provision for shorting and grounding.

3.4.18 Name plate

Name plates shall be furnished at each disconnect link, voltage transformer compartment, surge protection compartment and fuse block etc.

Materials for name plate shall be plastic, 3 mm thick, using white letters on black background.

3.4.19 Painting and Finish

- f) All surfaces to be painted including interior and enclosures and other metal parts shall be shot or sand blasted or chemically treated to remove all rust, scale, grease and other adhering foreign matters as far as possible shall be painted with not less than two (2) coats of Acid and corrosion resistant paint
- g) Steel surfaces, exposed to weather shall be given two (2) coats of zinc chromate and two (2) coats of an 'approved' Manufacturer's paint of 'approved' colour.
- h) All metal parts not accessible for painting shall be made of corrosion resistant materials. All machine finished or bright surfaces shall be coated with a suitable rust preventive compound and wrapped or otherwise protected.
- i) Inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The shade of exterior surface finish shall be [RAL 5012].
- j) The interior surface finish shall be as per manufacturer's standard.
- k) Pretreatment consisting of degreasing, de-rusting etc. shall be done on all fabricated parts before painting or galvanizing.
- l) Paints shall be carefully selected to withstand heat and weather conditions. The paint shall not scale-off or crinkle or get removed by abrasion due to normal handling.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B	[75]	25.09.2014

- m) Sufficient quantities of all paints and preservatives required for touching up at sites shall be furnished.
- n) The paint shade shall be subject to owner's approval.

3.5 Tests

V) Type Test

For each type & rating of Isolated phase bus duct, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the Busduct similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

VI) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

Some of the specific tests required are listed below.

- a) Visual inspection and verification of dimensions
- b) Dry power frequency voltage withstand for 1-minute
- c) Milli-volt drop test & Water tightness test
- d) Insulation resistance measurement.

3.6 Drawings, Data and Manuals

Drawings, data & manuals for the Isolated phase bud duct shall be submitted as indicated below:

- g) *Dimensional GA drawing*
- h) *Data sheets*
- i) *Typical calculation for arriving at the size of conductor and the insulator spacing.*
- j) *SPVT cubicle GA and Wiring drawing*
- k) *Type test report (short circuit, temperature rise test) for similar bus duct manufactured by the proposed manufacturer.*
- l) *The bidder may note that the drawings, data and manuals listed are minimum requirement only. The bidder shall ensure that all other*

necessary write-ups, curves and information required to fully describe the equipment offered are submitted with his bid.]

3.7

Ratings & Requirements

Major technical parameters of Isolated Phase Bus Duct are listed below.

S. No.	Technical Particulars	Unit	Parameters	Remarks
1.0	General			
1.1	System nominal voltage	kV	[15kV or As Generator Voltage]	All values are given as per 15kV. However same shall be suitable modified.
1.2	System maximum voltage	kV	[17.5]	
1.3	Number of phases		3	
1.4	Rated Frequency	Hz	50	
1.5	Neutral Grounding		High resistance grounded for generator	
1.6	Insulation level			
a	1 min power frequency withstand voltage	kV	[38]	
b	Impulse withstand voltage	kVp	[95]	
1.7	Short Circuit Level			
a	Symmetrical short circuit capacity	kA	As per Clause 1.3(k). [As per requirement]	
b	Dynamic capacity	kAp	[By bidder]	
1.8	Auxiliary Voltage			
a	Air Pressurization/Hot Air blowing	V	415V + /-10%, 50Hz + 3% to -5%, 3phase, 4 wire.	
b	Space heating voltage	V	240V ± 10%, 1ph, 50 Hz, 2 wires.	
1.9	Reference standard		IS 8084/ IEEE C37.23

1.0 MOTOR

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Electric Motor complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes & Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

IS : 325	:	Specification for three phase induction motor.
IS : 900	:	Code of Practice for installation and maintenance of induction motors
IS : 996	:	Single phase AC motors

LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[2]	25.09.2014

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All motors shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The motors shall be suitable for operation in a highly polluted environment.
- b. AC Motors shall be of [constant speed, squirrel cage, three/ single phase, induction type.] Motors shall be rated for [continuous duty/intermittent duty]. They shall also be suitable for long period of inactivity. They shall also be suitable for direct online starting (DOL starting).
- c. DC motors provided for emergency service shall be shunt / compound wound type. Motor shall be sized for operation with fixed resistance starter for maximum reliability.
- d. Power supply for AC motors shall be as follows:

Table: 2.0

1.	[Below 0.22 kW]	:	240V, 1 Phase, 50Hz
2.	[From 0.22 kW up to & including 160 kW]	:	415V, 3 Phase, 50Hz
3.	[Above 160 kW]	:	6.6kV, 3 Phase, 50Hz

- e. All AC motors shall be suited for the following range of frequency and voltage variations:

- i. Voltage Variation : +/-10%
- ii. Frequency Variation : 50Hz (+)3% to (-)5%
- iii. Combined Variation of Voltage & Frequency : 10% (absolute sum)

- f. DC motors shall be rated for 220V DC supply with voltage variation of -15% to +10%.
- g. The motor characteristics shall match the requirements of the driven equipment so that adequate starting, accelerating, pull up, break down and full load torques are available for the intended service.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[3]	25.09.2014

- h. Moreover, motors shall be so designed that maximum inrush currents and locked rotor and pullout torque developed by them at extreme voltage and frequency variations do not endanger the motor and driven equipment.
- i. Motors shall be capable of developing the rated full load torque even if the supply drops to 70% of the rated voltage.
- j. For 6.6kV motors, locked rotor current not to exceed [600%] of full load current, including positive tolerance, except for BFP. For BFP the starting current shall be [450%] of FLC. For 415 V motors Locked rotor current not to exceed [600%] of full load current with IS tolerance.]
- k. For DC motors, the starters shall be provided to limit the starting current to [2] times of the full load current.
- l. Maximum continuous motor ratings shall be at least [10%] above the maximum load demand of the driven equipment under entire operating range including voltage and frequency variations.
- m. Accelerating torque at any speed with the lowest permissible starting voltage shall be at least [10%] motor full load torque. Pull out torque at rated voltage shall not be less than 205% of full load torque. It shall be 275% for crane duty motors.
- n. The motors shall be suitable for bus transfer schemes provided on the 6.6kV and 415V systems without any injurious effect on its life. If motors are connected to an automatic bus transfer system, they may be subjected to 150% of the nominal voltage during changeover of buses due to the phase difference between the incoming voltage and motor residual voltage. In such cases, motors shall be capable of restarting under full load after momentary loss of voltage.
- o. Motors shall be of [energy efficient of type Eff-2] as per IS: 12615/equivalent IEC/ International Standards.
- p. Motor shall be designed to keep torsional and rotational natural frequencies of vibration of the motor and driven equipment at least 25% above the motor operating speed range.

1.3.1 System Grounding

Table: 3.0

(a)	6.6 kV	:	Low Resistance Grounded to limit the earth fault current to [300 Amps]

1.4 Specific Requirements

1.4.1 Locked Rotor Withstand Time

- The starting time of the motor shall be at the minimum permissible voltage.
- For motors with starting time up to 20 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[6]	25.09.2014

condition at highest voltage limit shall be at least 2.5 second more than starting time.

- c) For motors with starting time more than 20 second and up to 45 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot condition at highest voltage limit shall be at least 5 second more than starting time.
- d) For motors with starting time more than 45 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot condition at highest voltage limit shall be more than starting time by at least 10% of the starting time.
- e) Speed switches mounted on the motor shaft shall be provided in cases where above requirements are not met.

1.4.2 Starting Voltage Requirement

I.	All motors (except mill motors):
a)	[85% of rated voltage for motors up to 4000 kW]
b)	[75% of voltage for motors above 4000 kW]

II.	For mill motors:
a)	[85% of rated voltage for motors above 1000 kW]
b)	[90% of rated voltage for motors below 1000 kW]

The motor shall be capable of withstanding the stresses imposed if started at 110% rated voltage.

Pump motor subject to reverse rotation shall be designed to withstand the stresses encountered when starting with non-energized shaft rotating at [125%] rated speed in reverse direction.

The motor may be subjected to sudden application of 150% rated voltage during bus transfer, due to the phase difference between the incoming voltage and motor residual voltage.

1.4.3 Winding and Insulation

a)	6.6 kV AC motors	:	Winding material shall be of copper. Insulation shall be of [Class F with winding temperature rise limited to Class B]. They shall withstand 1.2/50 microsecond switching surges of "4U + 5 KV" (U=Line voltage in KV). The coil inter-turn insulation shall be suitable for 0.3/3 micro second surge of 32 / 12 KV followed by 1 min
----	------------------	---	---

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[7]	25.09.2014

			power frequency high voltage test of appropriate voltage on inter turn insulation.
b)	415V AC & 220V DC motors	:	Winding material shall be of copper. Insulation shall be of [Class B with temperature rise limited to Class B.]
c)	Conveyor motors		Short circuit rings of conveyor motors shall be either joint less or welded type. Brazed joint is not acceptable.

1.4.4 Motor Control

a) For HV Motors

- i. Motors of rating above [160 kW] shall be suitable for 6.6 KV voltage
- ii. Frequent starting motors of rating above [160 kW] shall be suitable to be controlled by vacuum contactors

(b) For LV Motors

- i. Motors of rating less than [132 kW] shall be operated by Contactor from respective MCCs. Motors of rating up to [18.5 kW] shall be provided with MPCBs and Electronic overload relays. Motors of rating above [18.5 kW] and below [45 kW] shall be provided with MCCBs and Electronic overload relays. Motors of rating [45 kW] and above but less than [132 kW] shall be provided with MCCBs and CT operated Electronic over load relays.
- ii. Motors of rating [132 kW] and up to [160 kW] shall be suitable to be controlled by Air circuit breakers from switchgear, PMCCs and shall be provided with comprehensive numerical motor protection relays.
- iii. Only for firefighting system, motor rated [upto 200kW] shall be fed from 415V switch board.

1.4.5 Starting duty

Motors shall be suitable for [3 nos. consecutive Cold starts ups and 2 nos. consecutive Hot starts ups.] Motors shall be suitable for three equally spread starts per hour when the motor is under normal service condition.

1.4.6 Bearings

- a) Anti-friction type radial and thrust bearings (ball, roller) and sleeve bearing shall be rated for minimum standard life of 40,000 hours taking bearing and driven equipment loads (in case the drive is not having

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[8]	25.09.2014

separate thrust bearing) into account. If bearings are lubricated, loss of grease shall be scarce and it shall not creep along shaft into motor housing. Facility of removal of excess grease shall also be provided for grease lubricated bearings.

- b) Vertical shaft motors shall be provided with thrust and guide bearings. Thrust bearing of tilting pad type is preferred. However, if Anti-friction bearings can take vertical thrust, thrust & guide bearings are not required.
- c) Bearing shall be effectively sealed against dust ingress and shall be pressure grease gun lubricated. The bearing and housing shall be so designed that greasing shall be possible while the motor is running, without removal of covers.
- d) Where bearing supports are attached to the motor casing, adequate bracing shall be provided on these supports to reduce vibrations and ensure life of bearings.
- e) If the bearings are oil lubricated, a drain plug shall be provided for draining residual oil and oil level gauge shall be provided to show precisely oil level required under standstill and running conditions.
- f) Unless otherwise approved, bearing lubricating system shall be such that no external forced oil or water is necessary to maintain required oil supply to keep bearing temperature within design limits.
- g) Lubricants shall be selected for prolonged storage and normal use of motors in tropical climate and shall contain corrosion and oxidation inhibitors. Greases shall have suitable bleeding characteristics to minimize setting. The selected lubricants shall be indigenously available.
- h) Motors rated above 1000 kW shall have insulated bearings to prevent flow of shaft currents.

1.4.7 Temperature Rise

- a) For Air Cooled Motors, temperature rise of insulation should be limited to [70 °C] over ambient temperature by resistance method.
- b) For Water Cooled Motors, temperature rise of insulation should be limited to [80 °C] over inlet cooling water temperature mentioned elsewhere, by resistance method.

1.4.8 Cooling

[All motors shall be either Totally Enclosed Fan Cooled (TEFC) or Totally Enclosed Tube Ventilated (TETV) or Closed Air Circuit Air Cooled (CACA) type. However, motors rated 3000 kW or above can be Closed Air Circuit Water Cooled (CACW)]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[9]	25.09.2014

1.4.9 Enclosure

- a) All motor enclosures shall conform to the degree of protection of [IP54] for indoor and IPW-55 for outdoor installation unless otherwise specified. Motor for outdoor or semi outdoor service shall be of weather proof construction. Motors of large output rating located indoor could have screen protected drip proof (SPDP) enclosure conforming to [IP-23.]
- b) For motors located in outdoor & corrosive locations, FRP canopy shall be provided. In case steel canopy is provided, the same shall be epoxy painted to meet the surrounding atmosphere. Motors located in hazardous areas such as Hydrogen plant shall have flame proof enclosures of Group – IIB conforming to IS: 2148.
- c) For hazardous locations such as fuel oil facilities area, the enclosure of motor shall have flame proof construction conforming to IS 2148.

1.4.10 Noise Level and Vibration

Noise level shall be limited to 85 dB (A) at 1.5 meters from the motor. However the same shall be as per IS: 12065 unless otherwise specified. The peak amplitude of vibration shall be within the specified limits laid down in IS: 12075. Motors shall withstand vibrations produced by driven equipment. HV motor bearing housings shall have flats in both X and Y directions suitable for mounting 80mmX80mm vibration pads. Vibration pads with screwed holes for mounting vibration probes shall be provided at both DE and NDE.

1.4.11 Temperature Monitoring

[In HV motors, at least four numbers simplex/ two numbers duplex platinum resistance type temperature detectors shall be provided for each phase of stator winding]. Each bearing shall be provided with dial type thermometer with adjustable alarm contact and two numbers duplex Platinum resistance type temperature detector (3 wire, 100 ohm at zero °C). In case of CACA and CACW motors dial type temperature indicator shall be provided (one each for hot and cold air temperature monitoring for CACA and CACW and one each for inlet and outlet water temperature monitoring for CACW). If alarm and trip are required for cooling air temperature, temperature switch shall be provided. The contact rating shall be minimum 0.5A at 220V DC and 5A at 240V AC. Flow switches shall be provided for monitoring cooling water flow of CACW motor and oil flow of forced lubrication bearing. Low voltage motors rated 100 kW and above shall be provided with two PT100 RTDs per phase of winding.

1.4.12 Earthing

Motor body shall have two earthing points on opposite sides. Motor terminal boxes shall also have separate grounding terminals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[10]	25.09.2014

1.4.13 Termination

- a) HV motors can be offered with either Elastimold termination or dust tight phase segregated double walled (metallic as well as with insulated barrier) cable boxes. In case Elastimold terminations are offered, then protective cover and trifurcating sleeves shall also be provided. Removable gland plates of thickness 3 mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material for single core cables) shall be provided in case of cable boxes. The main cable box / terminal box shall withstand *[a fault current up to 40 kA for 0.25 seconds for HV motors and 50 kA for 0.25 seconds for LV motors]*. Separate terminal boxes shall be provided for space heaters and RTDs and NCT (if applicable).
- b) *[All terminal boxes shall be capable of being turned through 360 degrees in steps of 90 degrees unless otherwise specified.]*
- c) For HV motors the distance between gland plate and the terminal studs shall not be less than 500 mm.

1.4.14 Differential Protection

For motors rated 6.6kV, *[2000 KW & above,]* neutral current transformers of PS class shall be provided on each phase in a separate neutral terminal box for differential protection.

1.4.15 Tropical Protection

- (a) All motors shall have fungus protection involving special treatment of insulation and metal against fungus, insects and corrosion.
- (b) All fittings and hardware shall be corrosion resistant.
- (c) Space Heater
- (d) Suitable single phase space heaters operated at 240V, 50Hz, 1Phase AC supply shall be provided on motors rated for 30KW and above to maintain windings in dry condition when motor is standstill. Separate terminal box for space heaters & RTDs shall be provided.
- (e) The space heater shall be sized to maintain the motor internal temperature above dew point when the motor is in idle condition.

1.4.16 Rating Plate

Motor shall have Stainless steel nameplate(s) showing diagram of connections, all particulars as per IS: 325 / NEMA-MG-1 and following additional information:

- (a) Type of bearing and recommended lubricants along with location of insulated bearing.
- (b) Temperature rise under normal/abnormal conditions.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[11]	25.09.2014

(c) In addition to above, an arrow block shall be screwed on to the body of motor on the non-driving end to indicate normal direction of rotation of motor.

(d) Year of Manufacture

1.4.17 Drain Plug

Motor shall have drain plugs so located that they shall drain the water, resulting from the condensation or other causes from all pockets of the motor casing.

1.4.18 Dowel Pins

Motor shall be designed to permit easy access for drilling holes through motor feet or mounting flange for installation of dowel pins after assembling the motor and driven equipment.

1.4.19 Painting

The complete motor assembly including fan shall be painted with corrosion proof paints of approved class.

1.4.20 Lifting provision

Motor weighing 25 Kg or more shall be provided with eyebolt or other adequate provision of lifting.

1.4.21 Local Push Button Station (LPBS)

- a) Each motor shall be provided with push button station as per process requirement i.e. Start/Stop or Emergency Stop.
- b) The degree of protection of LPBs shall be IPW 55 for outdoor and IP 54 for indoor applications.
- c) All Push Buttons shall be push to actuate type and stop Push Button shall be lockable in off position as per the scheme requirement.
- d) The Emergency local stop push button of Stay put type shall be provided with Press to lock & turn to release keyless mechanism.
- e) All PBs shall be provided with 2 numbers NO and 2 numbers NC contacts for various interlocking purposes. One contact of stop PB shall be directly wired to switchgear module for direct tripping and another contact to control system.
- f) Terminals to be suitable for 2 cores of 2.5 Sq.mm. cable with 20% spare terminals.
- g) All LPBS shall be of Poly Carbonate /FRP / Die Cast Aluminium material.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[12]	25.09.2014

I) TestsType Test

For each type & rating of HV and LV motors of rating above [50 kW], the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last[five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The following shall constitute the type tests:

- (a) Visual and dimensional check
- (b) Winding resistance measurement
- (c) No load test
- (d) Mechanical vibration
- (e) Direction of rotation versus phase sequence
- (f) Insulation resistance measurement
- (g) High potential test
- (h) Locked rotor test
- (i) Speed/torque test
- (j) Over speed test
- (k) Temperature rise test
- (l) Determination of characteristic
- (m) Degree of protection test for the enclosure.
- (n) Noise level
- (o) Shaft current and bearing insulation test (Applicable for HV motors)

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

Document Number	Rev No.	Description	Page No.	Date of Issue

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.5 Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

Dimensional General Arrangement drawing

- a) [Motor sizing calculation
- b) Foundation Plan & Loading
- c) Cable end box details
- d) Space requirement for rotor removal
- e) Thermal withstand curves hot & cold
- f) Starting and speed torque characteristics at 80% & 100% voltage
- g) Complete motor data
- h) Erection & Maintenance Manual
- i) Test reports
- j) QAP]

1.6 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

S. No.	Technical Particulars	Unit	Parameters	Remarks

1.0 MOTORIZED ACTUATORS

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Motor Operated Actuator complete with all accessories for efficient and trouble-free operation of valves, dampers and gates for R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes & Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS : 325	Specification for three phase induction motor.
IS : 900	Code of Practice for installation and maintenance of induction motors
IS : 996	Single phase AC motors
IS : 1271	Thermal evaluation and classification of electrical insulation.
IS : 2223	Dimensions of flange mounted ac induction motors.
IS : 4029	Guide for testing three phase induction motors.
IS : 4691	Degree of protection for enclosures of rotating electrical machinery.
IS : 4722	Specification for rotating electrical machinery.
IS : 4728	Terminal marking and direction of rotation for rotating electrical machinery.
IS : 4889	Methods of determination of efficiency of rotating electrical machines.
IS : 5571	Guide for selection of electrical equipment for hazardous areas.
IS : 6362	Designation of Method of Cooling of Rotating electrical machines.

NEMA, MG-1	Motors and Generators

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- All motor operated actuators shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%.
- Depending on the required type of services, the rating of motor operated actuators shall be selected. For isolating service, the actuator shall be [rated for three successive open-close operations of the valve/ damper or 15 minutes continuous operation whichever is higher.] Whereas for regulating service, the actuator shall be suitably [time rated for required number of duty cycle or 150 start per hour whichever is higher].
- The actuator shall be accompanied with constant speed, squirrel cage, three/ single phase, induction motor. The motor shall be designed for high

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E2	[2]	25.09.2014

torque and reversing service. They shall also be suitable for direct online starting (DOL starting).

- d. Motors of actuators shall be suited for the following range of frequency and voltage variations:

- i. Voltage Variation : +/-10%
- ii. Frequency Variation : 50Hz (+)3% to (-)5%
- iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency

- e. The motor operated actuator shall be sized for performing open / close operation at rated speed against designed differential pressure at [90%] of rated voltage. The motor shall have [10%] design margin on the shaft design power.

The actuator shall meet the following performance requirements:

- i. Open & Close the valve completely and make leak tight valve closure without jamming.
- ii. Attain full speed of operation before valve load is encountered and impart an unseating blow to start the valve in motion (hammer blow effect).
- iii. The motor reduction gearing shall be sufficient to lock the shaft when the motor gets de energized and prevent drift from torque switch spring pressure.
- iv. The entire mechanism shall withstand shock resulting from closing with improper setting of limit switches or from lodging of foreign matter under the valve seat.
- v. The actuator shall be designed for mounting in any position without any lubricant leakage or operating difficulty.

1.4 Specific Requirements

1.4.1 Construction

- a) The actuator shall essentially comprise of drive motor, limit switches, gear train, clutch, hand wheel, position indicator/ transmitter, space heater and internal wiring.
- b) The actuator enclosure shall be totally enclosed, dust tight, weather proof with [IPW 55] degree of protection.
- c) All electrical equipment, accessories and wiring shall be provided with tropical finish to prevent fungus growth.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E2	[3]	25.09.2014

- d) Gear train shall be made of metal (fiber gears are not acceptable). Self locking feature shall be provided to prevent drift under torque switch (wherever applicable) spring pressure when motor is de energized.
- e) Manual wheel shall disengage automatically during motor operation.

1.4.2 Type

- a) The actuators shall have integral starters along with overload relays with built-in single phase preventer.
- b) A 415 V, 3 phase, 3 wire, 50 Hz power supply will be provided from power plant 415 V switchgear through MCCB. Control voltage of the starter circuit shall be 110 V AC or depending on manufacturer's practice. But the same shall be derived from incoming 415 V, 3 phase, 3 wire supply.

1.4.3 Motors

- a) Type: The drive motor shall be three phase, squirrel cage induction motor suitable for direct on line starting with starting current limited to six times the rated current
- b) Enclosure: The motor shall be totally enclosed, self ventilated with [IPW 65] degree of protection.
- c) Insulation: The motor winding shall be insulated with [Class – B] insulation having temperature rise limited to [Class – B].
- d) Bearing: The motor bearing shall be [double shielded, grease lubricated and antifriction type].
- e) Earthing: At least two earthing terminals shall be provided for the motor body. Separate earthing terminal should be provided for terminal box.
- f) Protection: The following electrical protections should be provided for the motor:
 - i. Single Phasing Protection
 - ii. Overload Protection
 - iii. Overheating Protection through thermostat
 - iv. Wrong Phase Sequence Protection
- g) Limit Switches: Each actuator shall be accompanied with following switches:
 - i. Four nos. positional limit switches (2 for open & 2 for close), each adjustable at any position from fully open to fully closed positions of the valve / damper.
 - ii. Two torque limit switches, one for each direction of travel, self blocking & adjustable torque type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E2	[4]	25.09.2014

- iii. Four nos. end travel limit switches, two for each direction of travel.
 - iv. A single shaft shall actuate all contacts of limit switches at each position.
- h) Interface: Open/close command termination logic with position and torque limit switches, positioned circuit shall be suitably built in the PCB inside the actuator.
 - i. For binary drive, open/close command and status thereof and disturbance monitoring signal (common contact for overload, thermostat, control supply failure, L/R selector switch at local, other protections operated) shall be provided. Interface with the control system shall be through hardwired signal only. Interposing relays provided (with coil burden 2.5 VA) in the DCS shall be energized to initiate opening and closing, by 24V DC signal from the external control system. Potential free contact provided by the IPR shall be utilized in the control circuit of the contactor of motorized actuators.
 - ii. For modulating drive, the command to actuator shall be in form of 4- 20mA signal. The necessary positioning circuit and motor protection shall be provided.
 - iii. Open/close command termination logic shall be suitably built inside actuator.
- i) Hand Wheel: Each actuator shall be provided with a hand wheel for emergency manual operation. The hand wheel shall disengage automatically when the motor is energized.
- j) Position Indicator / Transmitter: The actuator shall have
 - i. One built in local position indicator for 0 – 100% travel.
 - ii. One position transmitter of modulating / inching type for remote indication suitable to stabilize 4-20mA signal and operated with [24V DC].
- k) Space Heater: Space heater of suitable rating shall be provided. The power supply shall be derived from main power supply available in the actuator.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E2	[5]	25.09.2014

- l) Wiring: All electrical devices shall be wired up to and terminated in a terminal box. The internal wiring shall be done with [2.5 sqmm] copper wires. All wiring shall be well identified at both ends with ferrules.
- m) Terminal Box:
 - i. The terminal box shall be weather proof with removable front cover and cable glands suitable for cable connection. The terminals shall be suitable for connection of [2.5 sq.mm copper] conductor.
 - ii. Necessary double compression cable glands with nickel coating and tinned copper lugs for cables shall be provided.
 - iii. The terminal block shall be suitable for 650V grade power cable.
- n) Rating Plate : Motor and actuator shall have Stainless steel nameplate(s) showing all particulars as per relevant IS/ IEC and following additional information:
 - i. Type of bearing and recommended lubricants.
 - ii. Temperature rise under normal/abnormal conditions.
 - iii. Degree of Protection
 - iv. In addition to above, an arrow block shall be screwed on to the body of motor on the non-driving end to indicate normal direction of rotation of motor.
 - v. Year of Manufacture

1.5 Tests

The actuator and all components thereof shall be subject to routine factory tests as per relevant IS standards. In addition, if any special test is called for in equipment specification, the same shall be performed.

1.5.1 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum [7] days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc.]

1.5.2 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished with requisite no. of copies for approval of the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E2	[6]	25.09.2014

- b) The equipment shall be dispatched from works only after receipt of owner's written approval of shop test reports.

1.6 Drawings Data and Manuals

The drawings, data & manuals for the motorized actuators shall be submitted as indicated below:

1. [Actuator Data Sheet]
2. General arrangement drawing
3. Internal wiring Diagram and Control Schematic.
4. Torque switch and Limit switch contacts development.
5. QAP for Test Reports
6. Manufacturer's Catalogue.
7. Instruction manuals on Installation methods.]

1.7 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

S. NO.	DESCRIPTION	UNIT	DATA
1.	Type		Integral
2.	Application		[As per project specific]
3.	Motor type		Squirrel Cage
4.	Supply voltage	V	415 V, 3 ph, 3 wire.
5.	Phase, frequency	Hz	3ph, 50 Hz
6.	Motor rated voltage	V	415V/230 V
7.	Control Voltage	V	[110 V AC]
8.	Voltage and its variation	V	± 10%
9.	Frequency and its variation	Hz	+ 3 to -5%

ANNEXURES-E3

1.0 LV TRANSFORMER (DRY TYPE/OIL TYPE)

1.1 General

This specification is intended to cover [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of LV Transformers (Dry type/Oil type) complete with all accessories for efficient and trouble free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

CODE	NAME OF STANDARD

CODE	NAME OF STANDARD
NEMA ST 20	Dry Type Transformers for General Applications
CEA	CEA Regulations
CEA	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) The transformers shall be dry type (AN) for indoor location and shall be oil type (ONAN) for outdoor location.
- b) The oil type transformer shall be installed in hot, humid and tropical atmosphere with ambient temperature equal to 50°C. All equipment, accessories and wiring shall be provided with tropical finish to prevent fungus growth.
- c) The transformer shall be capable of continuous operation at specified rating under the following condition:
 - i) Voltage variation - $\pm 10\%$
 - ii) Frequency variation - $[+3\%, -5\%]$
 - iii) Combined voltage and frequency variation (absolute sum) - $[10\%]$
- d) The transformer shall be capable of withstanding the short circuit stresses due to a terminal fault on one winding with full voltage maintained on the other winding for minimum period of two (2) seconds.
- e) The noise level shall be limited to the value specified by NEMA Standard Publication No. TR-1-1993 when measured in accordance with conditions outlines in ANSI/IEEE C57.12.90-1999/IS13964/CBIP publication.
- f) The design shall be such as not to cause any undesirable interference with radio or communication circuits.
- g) Transformers shall accept without injurious heating, combined voltage and frequency variation which produce an over fluxing condition of 120% for one (1) minute.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[3]	25.09.2014

- h) Each transformer shall be sized based on actual load with 10% margin and considering voltage regulation factor. It shall be sized by considering 100% load connected on the bus considering other transformer outage. An appropriate load factor of 0.9 for continuous and 0.2 for intermittent shall be considered.
- i) The impedance of the transformers shall be chosen such that the fault level on the LV switchgear does not exceed 50kA including the motor contributions and also voltage dip while starting the motor does not exceed 15% at motor terminal.

1.4 Specific Requirements of Transformers

1.4.1 Enclosure (for dry type)

- a) The encapsulated cast resin transformer shall be housed in naturally ventilated floor mounted cold rolled sheet steel cubicle with louvers backed by fine brass wire mesh. The enclosure shall be of bolted type fabrication and degree of protection shall be at least IP32. The minimum sheet steel thickness shall be 2 mm.
- b) Enclosure shall be provided with lifting lugs and grounding terminals at both ends. Further the enclosure door shall have pad locking provision.
- c) The enclosure door shall be interlocked with service transformer incoming breaker such that.
 - The door can be opened only when the service transformer HV side circuit breaker is in Test/Isolated position.
 - [6.6] kV side circuit breaker can be closed only when the doors are closed.
- d) Necessary illumination with controls shall be provided in the enclosure.
- e) Thermostatically controlled space heater inside the enclosure of suitable rating shall be provided if necessary.

1.4.2 Tank (for oil type)

- a) For LV transformers, the tank shall be of conventional type.
- b) Tank shall be made from good commercial grade low carbon steel and shall be of welded construction.
- c) Tank shall be designed to permit lifting, by crane or jacks of the complete transformer assembly filled with oil. Suitable lugs and bosses shall be provided for this purpose.
- d) Tank together with radiators, coolers, conservator, bushings vessel and other fittings, shall be designed to withstand full vacuum without permanent distortion.
- e) The transformer top shall be provided with a detachable tank cover with a bolted flanged gasket joint. Lifting lugs shall be provided for removing the cover. The surface of the cover shall be suitably sloped so that it does not retain rain water.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[4]	25.09.2014

- f) The material used for gaskets shall be cork-neoprene or approved equivalent. Gasketed joints for tank and manhole covers, bushings and other bolted attachments shall be so designed that the gasket will not be exposed to the weather. Spare gaskets shall be provided for all openings as shipping gaskets will not be reused.
- g) Tank shall be provided with all necessary valves.
- h) Tank shall be provided with a pressure release device which shall operate at a pressure below the test pressure for the tank and radiators. This device shall be of sufficient size for rapid release of any pressure that may be generated in the tank and which may result in damage to the equipment. The device shall be rain proof after blowing and shall be provided with a device visible from ground to indicate operation. An equaliser pipe connecting the pressure relief device to the conservator shall be supplied. This device shall be provided for all transformers. Pressure relief device shall be equipped with remote monitoring/alarm contacts

1.4.3 Core

- a) The transformers shall be three phase core type. The core shall be built up with high grade, non-ageing, low loss, high permeability grain oriented cold rolled silicon steel laminations especially suitable for core material. Laminations shall be annealed in a non-oxidizing atmosphere to relieve stresses and restore the original magnetic properties of CRGO sheets after the cutting and punching operations.
- b) CRGO sheets shall be coated with insulation varnish. Insulation shall be able to withstand the curing temperature and shall reduce eddy current to minimum. The core shall be protected from corrosion with a rust-resistant coating.
- c) The core clamping brackets shall be designed to provide an even distribution of clamping forces to the core, yokes and legs and shall be rigidly braced to reduce sound levels and losses.

1.4.4 Winding

- a) The coils shall be manufactured from electrolytic copper conductor with sufficient number of radial supports and fully insulated for rated voltage.
- b) The insulating material shall conform to Class F. Coils shall be so insulated that impulse and power frequency voltage stresses are minimum and shall withstand even the severest of temperature fluctuations.
- c) Coil assembly shall be suitably supported between adjacent sections by insulating spacers and barriers. The windings shall be arranged to ensure a free circulation of the air and to reduce the hot spots in the winding.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[5]	25.09.2014

- d) All leads from the windings to the terminal board and bushings shall be rigidly supported to prevent injury from vibration or short circuit stresses. Guide tube shall be used where practicable.
- e) The core and coil assembly shall be securely fixed in position so that no shifting or deformation occurs during movement of transformer, under short circuit stresses, switching or other transients.
- f) All coils rated 1200V or higher shall be subjected to partial discharge tests to ensure a properly cured and void free casting.

1.4.5 Encapsulation (for dry type)

- a) HV and LV coils shall be separately cast under vacuum in fibre glass reinforced epoxy resin compound. The insulation shall be fire resistant, non-inflammable, non-hygroscopic and resistant to temperature fluctuations.
- b) The epoxy shall contain filler material providing characteristics superior to unfilled epoxy including higher temperature rating, better heat conductivity, better arc resistance and adhesion to the conductor, plus a coefficient of expansion closer to that of the conductor material. The epoxy resin shall be self extinguishing.
- c) Encapsulated winding shall be free of internal voids, surface irregularities, etc. No surface finishing of encapsulated winding shall be undertaken after the process of encapsulation.

1.4.6 Insulating Oil (for oil type)

- a) The transformer shall be filled with mineral insulating oil suitably inhibited to prevent sludging.
- b) The quality of oil to be supplied for the transformer shall conform to the parameter specified in IS: 335 with latest amendments. No inhibitors shall be used in oil. Prior to filling oil shall be tested as per IS: 335 for tan delta, specific resistivity, breakdown voltage, moisture content etc.
- c) Transformer shall be dispatched oil filled. 10% excess oil for topping up shall be supplied in non-returnable container suitable for outdoor storage.
- d) Oil preservation shall be by means of conservator tank complete with silica gel breather and oil seal.
- e) Oil preservation shall be by means of bellows/ diaphragm sealed conservator tank with silica gel breather to avoid direct connection between atmosphere and transformer oil. It shall be complete with level gauges, pipes, drain valve etc. The level gauges shall be so placed that same can be readable standing from ground.
- f) Necessary device shall be kept to provide annunciation in the event of rupturing of bellow.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[6]	25.09.2014

1.4.7 Tappings (OCTC)

- a) Off-circuit taps as specified shall be provided on the high voltage winding.
- b) The transformer shall be capable of operation at its rated KVA on any tap provided the voltage does not vary by more than $\pm 10\%$ of the rated voltage corresponding to the tap.
- c) The winding including the tapping arrangement shall be designed to maintain electromagnetic balance between HV and LV windings at all voltage ratios.
- d) A warning plate indicating that switch shall be operated only when the transformer is de-energized shall be provided.
- e) Off circuit tap changer switch where provided shall be 3 phase, hand operated, by an external handle with position markings and pad locking facility and mechanical stops to prevent over cranking beyond extreme positions.
- f) Arrangement shall be such that switch can be operated at standing height from ground level.
- g) The operating handle can be padlocked at any tap position. The design shall be such that the lock cannot be inserted unless the contacts are correctly engaged. The mechanism shall be provided with a mechanical tap position indicator with pad locking facility.

1.4.8 Fittings and Accessories:

The following fittings and accessories shall be provided :

- a) Earthing pads: Two earthing pads of copper or other non-corrodible material shall be welded at the bottom corners of the transformer tank and supplied with clamp type terminals suitable for the purchaser's earthing conductors. Suitable earthing terminals on cable boxes shall also be provided.
- b) Terminal marking and rating plates shall be as per the specified standard.
- c) In case of oil type, the conservator shall be of sufficient volume to maintain the oil seal from the minimum ambient temperature of -5°C up to an oil temperature of 100°C , with oil level varying within the minimum and maximum visible levels with necessary accessories.
- d) In case of oil filled type, Valves shall be supplied on the transformer tank and radiators.
- e) Pressure relief device: Pressure relief device shall be provided for transformers rated 2 MVA and above which shall be of sufficient size for rapid release of any pressure that may be generated within the tank and which may result in damage of the equipment
- f) Gas and Oil Actuated Relay (Magnetic Reed Type Gas & Oil Relay):

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[7]	25.09.2014

A double float type magnetic reed type gas and oil relay as per applicable standard shall be provided for all oil filled transformers. All gas evolved in the transformer shall collect in this relay. The relay shall be provided with a test cock suitable for a flexible pipe connection for checking its operation. The device shall be provided with two electrically independent ungrounded contacts, one for alarm on gas accumulation and the other for tripping on sudden rise of pressure. These contacts shall be wired up to the transformer marshalling box. The relay shall be provided with shut off valves on the conservator side as well as the tank side.

g) Temperature Indicators

i Oil temperature indicator (OTI)

All oil type transformers shall be provided with a 150 mm dial type thermometer for top oil temperature indication. The thermometer shall have adjustable, electrically independent ungrounded alarm and trip contacts, maximum reading pointer and resetting device. The contacts shall be rated minimum 0.5A making and 0.2A breaking at 220V DC.

ii Winding Temperature Indicator (WTI):

A device for measuring the hot spot temperature of the winding shall be provided. The accuracy class of winding temperature indicator shall be $\pm 20^{\circ}\text{C}$ or better.

iii Oil Level Indicator:

A magnetic type oil level indicator shall be provided to indicate oil level in the tank.

iv RTD/transducers for remote annunciation:

In addition to the above mentioned indicators, the Oil and winding temperature measurement, RTDs / transducers shall be provided for remote indication in the DCS. RTDs shall be duplex platinum type with nominal resistance of 100 ohms at zero degree centigrade.

h) Bushing Current Transformers for stand by earth fault protection shall be provided in the neutral bushing and lead shall be brought to Marshalling box.

i) Radiator (oil filled type): Tank mounted radiators banks shall have bolted flanged connections and pipe extensions to permit withdrawal of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[8]	25.09.2014

transformer tank without disturbing the radiators. Flexible joints shall be provided in the interconnecting pipes (unless otherwise approved) to facilitate erection and dismantling and reduce transfer of vibrations from tank to radiator. The interconnecting pipes shall be provided with drain plug and air release vents.

- j) Conservator (For oil filled type): The transformers rated below 7.5MVA shall be provided with conventional single compartment conservator with dry air filling the space above the oil.

1.4.9 Bushings

- a) The bushing shall conform to the requirements of IS:2099 and IS:3347.
b) All transformer bushings shall be of porcelain (for oil filled)/ epoxy (for dry type).
c) The neutral terminal of 433V winding shall be brought out on a bushing along with the 433V phase terminal to form a 4 wire system for the 433V. Neutral CTs shall be located in the lead coming out of the winding and location of these CTs shall not be inside the tank.
d) The neutral terminal of secondary shall be brought out through an outdoor. Further this neutral terminal shall be connected by a copper flat of size [50 mm x 6] mm, which shall be brought down upto 100 mm above ground. The copper flat shall be insulated and supported from the tank body.

1.4.10 Terminal arrangement

- a) Cable boxes
i. Wherever cable connections are specified, suitable cable boxes shall be provided and shall be air insulated.
ii. Cable boxes shall have drilled gland plate of adequate size to receive cables and to allow easy termination.
iii. Removable drilled gland planes shall be provided in the cable boxes.
iv. The additional supports for the cable boxes shall be galvanised iron.
v. The contractor shall provide earthing terminals on the cable box, to suit [50mmx6] mm GI flat.
b) Bus duct
i. Wherever Bus duct termination is specified a flanged throat or equivalent connection shall be provided for termination of bus duct enclosure. The winding termination shall be outdoor type bushing. The material of the bus duct termination arrangement of the transformer shall be nonmagnetic. The bus duct may be either phase-segregated or non-segregated.

LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[9]	25.09.2014

- ii. Tolerance permissible for the height of terminals and bus duct flange location specified for bus duct termination over ground level is $\pm 5\text{mm}$. Contractor has to ensure that radiator, conservator and explosion vent do not obstruct the path of the bus-ducts.

1.4.11 Marshalling box

- a) A sheet steel weather, vermin and dust proof marshalling box shall be furnished. The sheet steel used shall be at least 2.0 mm (CRCA) thick. The box shall be free standing floor mounted/tank mounted type and have a sloping roof. The degree of protection shall be IP-55 in accordance with IS:2147.
- b) The marshalling box shall have a glazed door of suitable size for convenience of temperature indicators reading.
- c) All incoming cables shall enter the marshalling box from the bottom.

1.4.12 Wiring

- a) All control, alarm and indication devices provided with the transformer shall be wired up to the terminal blocks.
- b) Wiring shall be done with 650V PVC wires in conduit or PVC armored cable. *[Minimum wire size shall be 1.5 sq.mm stranded copper. Not more than two wires shall be connected to a terminal. 20% spare terminals shall be provided.]*
- c) Multi-way terminal block complete with mounting channel, binding screws and washers for wire connections and marking strip for circuit identification shall be provided for terminating the panel wiring. *[Terminals shall be stud type, suitable for terminating 2 nos. 2.5 mm2 stranded copper conductor and provided with acrylic insulating cover.]*
- d) All devices and terminal blocks shall be identified by symbols corresponding to those used in applicable schematic or wiring diagram. Each wire shall be identified, at both ends, with interlocking type permanent markers bearing wire numbers as per Bidder's Wiring Diagrams. AC / DC wiring shall have separate colour-coding.
- e) Wire termination shall be made with crimping type connectors with insulating sleeves. Wires shall not be spliced between terminals.

1.4.13 Painting

- a) All steel surfaces shall be thoroughly cleaned by sand blasting and / or by chemical agents, as required to produce a smooth surface free of scales, grease and rust.
- b) The external surfaces, after cleaning, shall be given a coat of high quality red oxide or yellow chromate primer followed by filler coats.
- c) The transformer finished with two coats of epoxy based powder coated paint. The paints shall be carefully selected to withstand tropical heat,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[10]	25.09.2014

rain etc. The paint shall not scale off or crinkle or be removed by abrasion due to normal handling.

- d) Painting shade shall be subject to owner's approval.
- e) Sufficient quantity of touch-up paint shall be furnished for application at site.

1.4.14 Name Plate

Nameplates of approved design shall be furnished at each cubicle (one no. each at front as well as at backside of cubicle) and at each instruments & device mounted on or inside the cubicle. The material shall be lamicaid or approved equal, 3 mm thick with white letter on black background. Self-tapping screws shall hold the nameplate. *[Nameplate size shall be minimum 20 x 75mm for instrument/device and 40 x 150mm for panels. Caution notice on suitable metal plate shall be affixed at the back of terminal Box.]*

1.5 Tests

1.5.1 Type Tests

For each type & rating of LV Transformers, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within *[last five]* years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within *[last five]* years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The following shall constitute the type tests:

- a) Temperature rise test
- b) Dielectric test

1.5.2 Routine Tests

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

The following tests shall be performed on each transformer as a minimum:

- a) After assembly, each core shall be pressure tested for one minute at 2KV (r.m.s.) A.C. between all bolts, side plates, structural steel works and the core.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[11]	25.09.2014

- b) The wiring for auxiliary power and control circuitry shall be subjected to withstand one minute power frequency test with 2.0KV (r.m.s.) to earth
- c) Measurement of winding resistance
- d) Measurement of voltage ratio and check of phase displacement
- e) Measurement of short circuit impedance and load loss
- f) Measurement of no load loss and current
- g) Dielectric routine tests
- h) Excitation loss and current measurements shall be made at 90%, 100% and 110% of the rated voltage as routine test.
- i) Partial discharge test
- j) Tan delta test

1.5.3 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

1.5.4 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings/ Data and Manuals

Drawings, data, and manuals for the transformers shall be submitted as indicated below:

- a) *[General Arrangement Drawing]*
- b) *Dimensioned general arrangement drawing showing enclosure, core coil assembly, terminal arrangement, marshalling box and various fittings.*
- c) *Transport/shipping dimensions with weights, wheel base detail etc.*
- d) *Foundation plan & loading.*
- e) *Bus duct/cable termination arrangement.*
- f) *Control schematics and wiring diagrams.*
- g) *Test reports and QAP*
- h) *Any other relevant drawing or data necessary for satisfactory installation, operation and maintenance.*
- i) *Instruction manuals on Transformer and its various fittings The manual shall clearly indicate method of installation, checkups and tests to be carried out before commissioning of the equipment.]*

SECTION-II, PART-B, ANNEXURE-E4

**TECHNICAL SPECIFICATION FOR 415V SWITCHGEAR,
MCC & DBs**

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E4**1.0 415V SWITCHGEAR, MCC AND DB****1.1 General**

This specification is intended to cover the *[design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning]* of 415V Switchgear MCC and DBs, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

Codes	Name of Standard
IS : 1248	Direct acting indicating analogue electrical measuring instruments and their accessories
IS: 2551	Danger notice plates
IS :2705	Current transformers-specification
IS :3156	Voltage transformer specification
IS :3231	Specification for electrical relays for power system protection
IS: 8084	Specification for interconnection busbars for AC voltages above 1kV up to and including 36kV.
IS :8623	Specification for low-voltage switchgear and control gear assemblies
IS :8686	Specification for static protective relays
IS :10118	Code-of practice for selection installation and maintenance of switchgear and control gear
IS :12021	Specification for control transformers for switchgear and control gear for voltages not exceeding 1000 v ac
IS : 13947 (Part 1)	Specification for low-voltage switchgear and control gear
IS : 13947 (Part 2)	Specification for low-voltage switchgear and control gear –part 2: circuit breakers
IS : 13947 (Part 4)	Specification for low-voltage switchgear and control gear -part 4 : contactors and motor feeders

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[1]	25.09.2014

Codes	Name of Standard
IS : 13947 (Part 5)	Low-voltage switchgear and control gear specification Part 5 : control circuit devices and switching elements
IEC 61439	Low voltage switchgear and control gear assemblies.
CEA	CEA regulations for installation and operation of meters 2006.
CEA	Standard technical specifications for main plant package

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- All 415V Switchgear, MCC and DB shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The Switchgear shall be suitable for operation in a highly polluted environment.
- All 415V Switchgear, MCC and DB shall be suitable for following voltage & frequency variations as follows:

Voltage Variation	:	(±) 10%
Frequency Variation	:	(+) 3% to (-) 5%
Combined Variation of Voltage & Frequency	:	10% (absolute sum)
For DC system	:	-15% to +10%

- 415 V switchgear & MCCs shall be of indoor /outdoor, double front/single front [Preferably single front] and fully draw out type. ACB feeder may be of single tier/two tier configuration depending upon rating. DBs (ACDB / DCDB) shall be of single / double front [Preferably single front] and fixed type. These shall be CRCA sheet metal enclosed and assembled to form a rigid, free-standing floor mounted structure. Vertical units shall be assembled to form a continuous line up of panels. Compartmentalized multi-tier configuration shall be provided.
- All AC motor starters shall be suitable for Direct on Line (DOL) starting. Motors rated below [132]kW shall be provided with combination starters consists of MCCB/MPCB, contactors and electronic over load relay and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[2]	25.09.2014

the motor starter shall comply with Type – 2 coordination conforming to relevant code and standards. Motors rated [132] kW and above shall be breaker controlled and shall be provided with comprehensive motor protection relay. Motors rated above [160]kW shall be fed from MV Switchgear [Only for firefighting system Motor rated up to 200kW shall be fed from 415V switch board].

- e) For 415 V switchgear & MCCs Feeders rated [630A] and above shall be equipped with Air Circuit Breaker (ACB). Outgoing/Incoming feeders rating below [630] A shall be MCCBs.
- f) For DBs Incomer rated 630A and above shall be ACB. Incomer below 630A shall be MCCB. Outgoing feeder may be MCCB/MCB depending upon the bus fault level.
- g) All ACB shall be draw out type & should have Service, test and disconnected positions with positive indications for service & test positions. It shall be possible to charge the springs manually, if, required
- h) Local/remote selection shall be provided for all incoming/Outgoing ACB module. Incoming/Outgoing breaker shall be closed at service position from remote (DCS) and at test position from Local(Switchgear).
- i) Two out of three breaker logic shall be considered for switchgear/MCC. However mechanical interlock shall be considered for income of MCCB operated DBs.
- j) Also, Local/remote selection switch shall be provided for all motor modules for control from Remote(DCS). Also for breaker operated motor, breaker shall be closed in Test position from local(Switchgear).
- k) All motors shall be provided with Emergency stop push button.
- l) Control circuits shall operate at suitable voltage of 110V AC or 220V DC. Necessary control supply transformers having primary and secondary MCCB/MCB shall be provided for each MCC, 2 x 100% per section. However breaker shall operate on 220V DC. The auxiliary bus bars for control supply shall be segregated from bus bars. This control supplies shall be monitored.
- m) All the numerical relays shall have communication on two ports, local front port communication to laptop and a second port with [IEC 61850 protocol] to communicate with DCS.

1.4 Specific Requirements

1.4.1 Construction

All 415V switchgear, MCC and DBs shall have following minimum features.

- a) All 415V switchgear, MCC and DBs shall be metal enclosed, indoor, floor mounted and free standing type. The panels shall be suitable for cable entry at bottom and busduct connection at top.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[3]	25.09.2014

- b) Between 415V Switchgear and dry type transformers, non segregated phase bus duct is considered. Hence switchgear shall be suitable for this connection and necessary flange connection and co ordination with busduct manufacturer in this regards is covered in this specification.
- c) All frames and load bearing members shall be fabricated using mild steel structural sections or pressed and shaped cold rolled sheet steel of thickness not less than 2 mm.
- d) Frame shall be enclosed in cold rolled sheet steel of thickness not less than 2 mm. Doors and covers shall also be of cold rolled sheet steel of thickness not less than 1.6 mm. Removable gland plates of thickness 3mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material)shall be provided for all panels. Suitable removable type lifting hooks and / or jacking pad shall be provided on each panel or shipping section for ease of lifting of switchgear. These hooks when removed shall not leave any opening in the panels
- e) Each breaker shall be housed in a separate cubicle, complete with an individual front access door. Each vertical section shall have a removable back cover.
- f) The switchgear enclosure shall confirm to the degree of protection IP-54 (for outdoor). For indoor, enclosure shall confirm to IP52, however for Busbar chamber of switchboards rated above 1600A, degree of protection shall be IP-42.
- g) Paint shade for complete panels excluding end covers shall be [RAL 9002] and [RAL 5012] for extreme end covers for all board.
- h) The switchgear assembly shall comprise a continuous, line-up of single / multi tier cubicles. The installations of circuit breakers however shall be limited to the bottom two tiers only. Working height shall be limited to [250 mm to 1800 mm] from the floor level.
- i) Metallic barriers shall be provided between vertical sections and also between adjacent modules to ensure prevention of accidental contact with live parts during routine inspection/maintenance of functional units or cable terminations of one or more functional units when working on those of adjacent units. These barriers shall have insulating inserts as necessary for taking the interconnections etc
- j) A nameplate with switchgear designation shall be fixed at the top of the central panel. A separate nameplate giving feeder details shall be provided for each compartment. A separate nameplate giving details of bus section shall also be provided for switchgears having more than one bus section.
- k) Name plate shall be provided for each equipment (lamps, push buttons, switches, relays, auxiliary contactor, etc) mounted on the switchboard. Special warning plates one each on each feeder of a shipping section shall be provided on removable covers of doors giving access to cable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[4]	25.09.2014

terminals and busbars. Name plate size shall be minimum of 20x75 mm for Instruments/devices and 40x50 mm for panels. Thickness shall be minimum 3 mm.

- l) For MCC/DB a full height vertical cable chamber with cable supports shall be provided in each section to facilitate unit wiring.
- m) 2x100%, 415V/110V AC control transformer shall be provided for control, Indication and annunciation supply for contactor operated motor feeder. All the necessary auxiliary and main contactor shall be provided suitable for this control supply.
- n) Two 220V DC feeders shall be provided for control, Indication and annunciation of breaker operated module.
- o) Compartment door shall be interlocked with main power isolating device for safety with provision for defeating it by authorized person.
- p) Supplier shall provide total 20% or minimum one (1) no. spare feeder of each type & rating with respect to total requirement of the switchgear.
- q) Motors of rating 30 kW and above shall be provided with anti-condensation heaters. Necessary provision for supply of motor space heating shall be considered in the switchgear.
- r) The incoming connection to transformer of more than 1000kVA and inter-connecting sections between switchboards shall preferably be of bus ducts.
- s) It should be possible to carryout maintenance on a feeder with adjacent feeders alive.

1.4.2

Bus and Bus taps

- a) The main buses and connections shall be of high [conductivity Aluminum / Copper] alloy sized for specified current ratings with temperature rise limited [to 40°C over ambient temperature of 50°C].
- b) Silver plating shall be done on copper bar wherever copper to copper and copper to aluminum contacts are envisaged. All connection hardware shall be non-magnetic and shall have high corrosion resistance. Adequate contact pressure shall be ensured by means of two bolts connection with plain & spring washers and locknuts. Temperature rise shall not exceed 105 degree for silver plated joints over an ambient temperature of 50 degree.
- c) Bus bars and connections shall be fully insulated for working voltage with adequate phase / ground clearances. Insulating sleeves for bus bars and shrouds for joints shall be provided.
- d) Bus insulators shall be flame-retardant, track resistant type with high creepage surface. All buses and connections shall be supported and braced to withstand the stresses due to maximum short-circuit current and also to take care of thermal expansion.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[5]	25.09.2014

- e) Bus bars shall be color coded for easy identification and so located that the sequence R-Y-B shall be from left to right, top to bottom or front to rear, when viewed from the front to switchgear assembly.
- f) Power shall be distributed to each module or compartment by a set of vertical bus bars. The vertical bus bars shall run behind the modules. Necessary tee off connectors shall be used for distributing auxiliary supply to each vertical panel. Rubber grommets shall be used for all wire entries to make the entries dust and vermin proof.
- g) The clearance between the individual bare phase power bus bars and between the phase and earth bus bars in air shall be not less than [25.4] mm.
- h) Three phase, neutral (with at least [50] % rating of main Bus bar and continuous earth bus shall be provided. Bus bar and tapping shall be provided with color coded PVC sleeves.

1.4.3

Air Circuit Breaker

- a) All Circuit Breakers for incoming feeders and Bus couplers shall be [four] poles; single throw, motor operated and air break type. Circuit breaker for outgoing feeders shall be triple pole, single throw and air break type. However for supply feeders it shall be [four] pole.
- b) Circuit Breakers shall be [draw out type] having Service, Test & Disconnected positions with positive indication for each position.
- c) Circuit breakers of identical rating shall be physically and electrically interchangeable.
- d) Bolted disconnected links shall be provided for all outgoing feeders for isolation of neutral, if necessary.
- e) For motor wound mechanism, spring charging shall take place automatically after each breaker closing operation. One open – close – open operation of the circuit breaker shall be possible after failure of power supply to the motor when the spring is charged after a closing operation.
- f) Mechanical safety interlock shall be provided to prevent the circuit breaker from being racked in or out of the service position when the breaker is closed.
- g) Automatic safety shutters shall be provided to fully cover the female primary disconnects when the breaker is withdrawn.
- h) Each breaker shall be provided with an emergency manual trip, mechanical ON-OFF indicator, an operational counter and mechanism to indicate spring charge / discharge condition.
- i) In addition to the auxiliary contacts required for normal breaker operation and indication, each breaker shall be provided with followings for interlocking purpose:-
 - i. Position / cell switch with 4 No + 4 NC contacts.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[6]	25.09.2014

- ii. Limit / auxiliary switches shall be convertible type that is facility for changing N.O. contact to N.C. and vice-versa.
- iii. Mechanical stopper to prevent accidental falling while withdrawing.
- j) Breaker cannot be racked in from 'isolated' to 'test' position with the door open together with provision for defeat of this interlocking, however, the door can be closed only when the breaker is brought back to 'isolated' position. Insertion of breaker into 'Service' position not possible if the shutters are not free.
- k) Door can be opened only when breaker is OFF and is in 'Isolated' position. Remote closing of breaker not permitted with door open.
- l) Anti pumping relay / device to ensure that there can be only one closing operation for each closing command.
- m) Suitable trolley arrangement shall be provided for breaker/starter modules. Two trolleys per switchgear room shall be provided so that top most breaker module of all types, sizes and rating can be withdrawn on trolley and lowered for maintenance purpose.
- n) Closing and tripping coil shall operate satisfactorily under the following conditions.
 - i. Closing Coil: 85% to 110% of rated voltage.
 - ii. Tripping Coil : 70% to 110% of rated voltage.

1.4.4 Contactors, MCCB and MPCB

- a) Incomers for MCCs and DBs rated below 630A shall be MCCB.
- b) Incomer and bus coupler rated below 630A shall be mechanically Interlocked.
- c) Motor starter contactors shall be of air break, electromagnetic type. Suitable for DOL starting of motor, and shall be of utilization category AC-3 for ordinary and AC-4 for reversing starters. DC contactor shall be of DC-3 utilization category.
- d) The contactors shall be three pole, air break type designed for [duty class III category A.C. –3 with non-bouncing silver / silver alloy.]
- e) Each contactor shall be provided with two (2) normally open and two (2) normally closed auxiliary contacts unless otherwise specifically stated. Rating shall be decided by the bidder.
- f) Reversing contacts shall be electrically and mechanically interlocked.
- g) Contactors with delayed dropout feature shall be provided for some essential auxiliaries. These contactors shall not dropout on power failure if the voltage is restored within 3 seconds.

1.4.5 Electronic over load relays

- a) Electronic overload relays shall conform to IEC:292-1 and shall be triple pole, ambient temperature compensated with adjustable setting, inverse time lag, built in single phase preventer and hand/auto reset type

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[7]	25.09.2014

provided as per requirement along with necessary command, feedback cable, coupling relays etc.

- b) Provided with 1 NO and 1NC contact of rating same as the auxiliary contact of the contactors.
- c) The relay shall be able to withstand prospective short circuit current without damage or injurious heating till the motor protection MCCB/MPCB clears the fault.
- d) Relays may be direct acting or CT operated, depending on current rating. CTs shall be included in the scope of supply.

1.4.6 Bus Transfer scheme:

Each switchgear of two incomer and bus coupler shall be provided with the following provisions.

- i) Dead bus closing.
- ii) Manual live change over (Momentary paralleling)
- iii) Automatic bus transfer scheme.

1.4.7 Current Transformer

- a) Current Transformers shall be cast-resin type. All secondary connections shall be brought out to terminal blocks where wye or delta connection shall be made.
- b) CTs shall have polarity makings indelibly marked on each transformer at the lead terminations and at the associated terminal block. Facility shall be provided for short circuiting and grounding the CT secondary at the terminal blocks. Secondary terminals shall be provided with protective cap.
- c) CT terminal block shall be disconnecting type and suitable for round type lugs with facility for testing and short circuiting of individual CT.
- d) All CTs shall be provided with supports independent of busbars / busbar supports. The CTs shall be located in such a way that they can be easily approached for maintenance without necessitating shutdown of adjacent feeders.
- e) CTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.8 Voltage Transformer

- a) Voltage transformers(VT) shall be cast-resin type with an accuracy class of 1.0 for metering and 3P for protection.
- b) VTs shall be of the single-phase type. VTs shall be protected on their primary side by MCCBs with interrupting ratings corresponding to breaker rating and by MCB (with auxiliary contacts) on the secondary sides.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[8]	25.09.2014

- c) VTs shall have continuous over voltage factor of 1.2 and short time over voltage factor of 1.5 for 30 seconds for effectively earthed system
- d) It shall be possible to replace VTs without having to de-energise the main busbars.
- e) VTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.9 Transducer

For all the incoming and the outgoing of 415V Switchgear / MCC/ DB Feeders requiring remote metering and/or current monitoring shall be provided with multi-functional transducers. The output shall be 4-20 mA DC which shall correspond to the normal range.

1.4.10 Secondary Wiring

- a) The switchgear shall be fully wired at the factory to ensure proper functioning of control, protection and interlocking schemes.
- b) Fuse /MCB and links shall be provided to permit individual circuit isolation from bus wires without disturbing other circuits. All spare contacts of relays, switches and other devices shall be wired up to terminal blocks.
- c) Secondary wiring within the switchgear shall be carried out in a neat and systematic manner and securely held in position (either loomed or run in conduit / trunking). Wherever wiring passes through compartment, it shall be run in conduit / trunking, if metallic shall be bonded to the main earth busbar.
- d) Wiring shall be done with flexible, 1.1/0.650kV grade, PVC insulated switchboard wires with [stranded copper conductors of 2.5 mm² for CT & PT circuits and 1.5mm² for control circuit wiring.]
- e) Each wire shall be identified, at both ends, with permanent markers bearing wire numbers as per bidder's wiring diagrams. Wire terminations shall be made with crimping type connectors with insulating sleeves, wire shall not be spliced between terminals.

1.4.11 Terminal Blocks

- a) Terminal blocks shall be 660V grade box-clamp type with marking strips, similar to 10 mm² or equal. Terminals for C.T. secondary leads shall have provision for shorting.
- b) Not more than two wires shall be connected to any terminal. If more than two wires at one terminal are required, separate terminals with function wise shorting links shall be provided. [Spare terminal equal in number to 20% of active terminals shall be furnished.]
- c) Terminal blocks shall be located to allow easy access. Wiring shall be so arranged so that individual wires of an external cable can be connected to consecutive terminals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[9]	25.09.2014

1.4.12 Ground bus

- a) A ground bus, rated to carry maximum fault current, shall extend full length of the switchgear. The ground bus shall be provided with two-bolt drilling with G.I. bolts and nuts at each end to for connection to the grounding conductor / flat.
- b) Each unit shall be connected directly to the ground bus. The frame of each circuit breaker and draw out V.T. unit shall be grounded through heavy multiple contacts at all times except when the primary disconnecting devices are separated by a safe distance.
- c) C.T. & V.T. secondary neutrals shall be earthed through removable links so that earth of one circuit may be removed without disturbing others. All hinged doors shall be earthed by flexible copper bride.

1.4.13 Space Heater

- a) Each vertical section shall be provided with thermostat controlled space heater 5A, 3 pin socket plug.
- b) In addition, motor feeders rated [30 KW and above] shall be wired up for feeding the motor space heater through suitably rated breaker auxiliary NC contact and/or contactor.
- c) Cubicle heater, Motor heater, and Plug socket circuit shall have individual switch fuse units/MCB.

1.4.14 AC Distribution Boards (ACDBs)

- a) AC Distribution Boards shall have MCCB/MCB at incomer depending upon the short circuit rating. Distribution Boards may be fed from switchgear and shall have two incomers. AC distribution Boards shall be of two types - one with 415V, 4-wire, triple pole and neutral (TPN) outgoing feeders and the other with 240V, 2-wire, single pole and neutral (SPN) outgoing feeders.
- b) For small loads, MCB boards with TPN MCB as incomer and TPN/SP MCBs for outgoing may be considered. The feeder rating and quantity shall be as per requirement.
- c) Board shall be single/double front [preferably single front], metal clad, front matched, dust and vermin proof, fixed type, compartmentalized and extensible on both sides.
- d) Bus bars shall have same cross section throughout the length. Rating of the neutral bus bar shall be 50% of the main bus bar. Earth bus bar shall run in bottom chamber throughout the length of the Board.

1.4.15 DC Distribution Boards

DCDBs shall have two incomers and a bus coupler. Incomers and outgoing feeders of DCDBs shall be MCB/MCCB modules. They shall be fixed type and floor mounted. Other constructional features shall be similar to ACDB.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[10]	25.09.2014

The feeder rating and quantity shall be as per requirement.

1.4.16 Control & Indication

The circuit breaker shall be wired up for local & remote operation. Each breaker cubicle shall be equipped with following:

- a) Remote selector switch with pistol grip handle and key interlock for breakers with motor wound spring charging mechanism. In Remote position, the breaker can be operated in service position with all interlock and protections. In switchgear position, the breaker shall be operated from switchgear only in test position with only protection (no interlock).
- b) Two (2) heavy duty, oil-tight, push buttons for Trip & Close.
- c) Circuit breaker shall be indicated electrically. The following indication colour shall be used.

Breaker open - GREEN

Breaker closed - RED

Spring Charged - WHITE

Breaker Auto Trip- AMBER

- d) However, any other indication shall be provided as per owner's requirement.
- e) Lamps shall be LED type with resistance for voltage protection. Lamp and lens shall be replaceable from the front.
- f) For all MCCB feeders, trip indication lamp shall be provided on front of the compartment.
- g) For all starters, ON, OFF and trip indication lamps shall be provided on front of the compartment.

1.4.17 Relays, Protection & Metering

- a) The hardware design for protection and associated equipment shall use latest state-of-the-art technology and shall generally be integrated numerical/digital, modular in nature. Where design is based on numerical technology, adequate self testing/monitoring/diagnostic facilities shall be provided.
- b) All numerical relays, auxiliary relays and devices shall be of types, proven for the application; satisfying requirements specified elsewhere and shall be subject to Purchaser's approval. Numerical Relays shall have appropriate setting ranges, accuracy, resetting ratio, transient overreach and other characteristics to provide required sensitivity to the satisfaction of the Owner.
- c) All protective relays shall be in draw out or plug-in type / modular cases with proper testing facilities. Necessary test plugs / test handles shall be supplied loose and shall be included in supplier's scope of supply.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[11]	25.09.2014

- d) All AC operated relays shall be suitable for operation at 50 Hz. AC voltage operated relays shall be suitable for 110 Volts VT secondary and current operated relays for [1 or 5] amp CT secondary. All relays and timers shall be rated for control supply voltage as mentioned elsewhere under parameters and shall be capable of satisfactory continuous operation between 80-120% of the rated voltage. Voltage operated relays shall have adequate thermal capacity for continuous operation.
- e) Energy meters shall be provided for incomer of 415V Switchgear and MCC and shall be able to communicate with DCS. These meters shall be as per CEA regulation 2006 "Installation and operation of meters". Accuracy class shall not be less than 1.0S.
- f) Provision shall be made for easy isolation of trip circuits of each relay for the purpose of testing and maintenance.
- g) All protective relays and alarm relays shall be provided with one extra isolated pair of contacts wired to terminals exclusively for future use.
- h) The relay shall be designed to perform satisfactorily under highly noisy electrical environment. Sufficient degree of high frequency disturbance immunity and impulse voltage withstand capacity shall be built into electronic designs as stipulated in relevant standards.
- i) All protections shall be furnished complete with necessary auxiliary, supervisory, lock out relays. Suitably separate sets of single phase auxiliary C.T with multiple taps shall be provided with relay whenever required.
- j) Visual and audible alarm annunciation shall be initiated in the event of operation of protective/supervisory relay.
- k) D.C supply shall be supervised by DC supervision relays.
- l) Trip circuit shall be supervised by Trip circuit supervision.
- m) Tripping shall be done through high speed lock out relays.
- n) All meters/ instrument shall be flush mounted on front panel, at least 96mm² size with 90° linear scales and accuracy class of 2.0.
- o) Interposing relays for ON/OFF command or any other command shall be as per system requirement.
- p) For alarm and Indication at DCS end necessary contacts shall be provided at switchgear end.
- q) Metering and protection shall be as per below table

a)	Incomers	
	Protections	Metering
i	Time graded short circuit protection	Local Current (single phase) indication and remote indication through transducer.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[12]	25.09.2014

ii	Over current protection	Voltage Measurement for all three phases and remote indication through transducer.
iii	Earth fault protection	KW, Kwhr
b)	Bus coupler	
	Protections	Metering
i	Over current protection(51)	Local Current (single phase) indication.
ii	IDMT Earth fault protection(51N)	
c)	Contactor controlled motor feeders [90kW and above motor only]	
	Protections	Metering
i	Time graded short circuit protection	Local Current indication and remote indication through transducer.
ii	Over current protection	
c)	[Motor Feeders [of 132KW and above only]]	
	Protections	Metering
	Composite motor protection to cover a minimum of protections such as over current, short circuit, earth fault, locked rotor, Negative phase sequence, thermal overload etc.	Local Current indication and remote indication through transducer.
[Other feeders]		
a)	Bus PT / Line PT Modules	
	Protections	Metering
	Under voltage protection	[Voltage – phase to phase,]
	Fuse failure protection	
b)	Motor feeders (MPCB/MCCB with Contractors)	
	Protections	Metering
	Electronic Overload relay (with single phase preventor), short circuit protection (through fuse/MCCB/MPCB as specified)	
c)	Incoming feeders for ACDB/DCDB	
	Protections	Metering

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[13]	25.09.2014

	Short circuit protection (if MCCB)	[Voltage (single phase and, Phase Current (1 Phase))] Local indication only.
d)	Outgoing feeders of ACDB/DCDB	
	Protections	Metering
	Short circuit protection (through fuse/MCCB)	

1.5

Tests

I) Type Test

For each type & rating of 415V Switchgear, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the switchgear similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

The minimum tests shall be conducted are as follows:

- Measurement of insulation resistance of Circuit Breaker in closed and open positions.
- Measurement of milli-volt drop across Circuit Breaker main contacts and other joints.
- Measurement of Circuit Breaker/Contactor operating time for close & open at nominal voltage and 80% of rated voltage.
- Measurement of resistance, IR value and drop-off/pick-up voltage of close and trip coils.
- Healthiness of limit switch contacts.
- Spring charging motor functional checks.
- Verification of phase sequence and checking of clearances of busbars between phase to phase and phase to earth.
- Measurement of milli-volt drop across busbar joints

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[14]	25.09.2014

- i) Torque tightness test.
- j) High voltage test on busbar.
- k) Measurement of CT/PT polarity, ratio and knee point voltage.
- l) Electrical and mechanical interlock checks.
- m) Secondary injection of all protection relays by using service settings and simulation of all protection functions.
- n) Secondary injection of all metering circuits.
- o) Functional tests to demonstrate the specified control and interlocks

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates:

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawing & Documents

Drawings, data & manuals for the motors shall be submitted as indicated below

- a) [General Arrangement drawings and cross-section showing constructional features & cable entry with bottom view with opening.
- b) Bill of Materials.
- c) Technical Data sheet and Catalogue.
- d) Foundation drawing details with bottom view of switchgear.
- e) Descriptive write-ups and literature for the main equipment offered including relays, meters, etc.
- f) Control Schematics & Wiring diagram.
- g) Inspection and Test Plan (ITP).
- h) Suggestive list of protective relays.
- i) Transport/shipping dimensions and weights].

1.7 Ratings & Requirements

415V switchgears, MCC and DB shall comply with the particulars indicated in the following tables.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[15]	25.09.2014

Table- 2.0

S. No.	DESCRIPTION	UNIT	DATA
1.0	General		
1.1	Name of Manufacturer		
1.2	Place & Country of manufacture		
1.3	Specifications and Standards		
2.0	Switchgear Details		
2.1	Rated voltage, phases & frequency		415 Volts, 3 Phase, 4 wire 50 Hz.
2.2	System neutral earthing		Solidly earthed
2.3	Voltage & frequency variation	%	+/-10%, -5%to +3% Hz.
2.4	Rated frequency	Hz	50Hz
2.4	One minute power frequency Voltage a) For power Circuits b) For Control Circuits		a) 2.5kV b) 1.5kV
2.5	Continuous current rating of busbars under site reference ambient temp.		[As per Project requirement]
2.6	Reference ambient temperature		50°C
2.7	Maximum temperature of bus bars and droppers/connectors under site conditions specified		90°C for busbars having non-silver plated joints 105°C for busbars having silver plated joints
2.8	Short circuit current withstand for busbars and droppers		
a	Short time	kA (rms)	50
b	Dynamic Rating	kA (peak)	105
2.9	Whether busbars have been insulated	Yes	Required
2.10	Type of insulation		[By Bidder]
2.11	Material of bus bar supports		[By Bidder]

**TECHNICAL SPECIFICATION FOR 415V NON
SEGREGATED PHASE BUS DUCTS**

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E5**1.0 415V NON SEGREGATED PHASE BUS DUCT****1.1 General**

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of 415V Non Segregated Phase Busduct, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

IS 8084	Interconnecting Bus bar for AC Voltage above 1KV up to and Including 36kV
IEC 60947	Low Voltage Switchgear and Control gear
ANSI/IEEE C37.20	Metal-Clad and Station-Type Cubicle Switchgear
ANSI/IEEE C37.24	Guide for Evaluating the Effect of Solar Radiation on Outdoor Metal Enclosed Switchgear
IEC 60439	Low-voltage switchgear and control gear assemblies.
BS 159:1957	Bus bar and Bus bar connection
CEA	CEA regulations and standards

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3 Design Criteria

- a) The 415V Non-segregated phase bus duct shall serve as an interconnection between the 415V Switchgear and 11/0.433kV LV Transformer. The Non-segregated phase bus duct shall be installed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[1]	25.09.2014

indoor/Outdoor in a hot, humid and tropical atmosphere. All panels associated with Non-segregated phase bus duct shall be located indoors/Outdoors.

- b) Bus duct, associated equipment and wiring shall be provided with tropical finish to prevent fungus growth. All ventilation openings shall be screened and drains shall be filtered to prevent entrance of dust and insects.
- c) For continuous operation at specified ratings, temperature rise of the bus duct and auxiliary equipment shall be as specified in Clause 1.7 Rating and requirements.
- d) Bus duct and auxiliary equipment shall be capable of withstanding the mechanical forces and thermal stresses of the required short-circuit currents.
- e) The bus ducts and supporting structures shall be designed & constructed so as to withstand without damage the horizontal / vertical ground accelerations due to earthquake.
- f) The bus ducts shall be self cooled and shall not be equipped with blower or any other type of forced ventilation.
- g) The equipment rating shall be based on an ambient temperature. Same phase disposition shall be maintained throughout the run of the bus duct. Phase crossover units, if required, shall also be provided inside the Busduct itself.
- h) Bus ducts shall be suitable for continuous operation at maximum system voltage and shall be adequately sized to withstand short circuit current.

1.4 Specific Requirements

1.4.1 General

- a) 415V Non Segregated Phase Busduct is provided for connection between low voltage side of 11/0.433kV cast resin dry type /oil type transformers and associated 415V Switchgears shall be of TPN (3 phase and neutral) along with necessary bends, flexible at both transformer & switchgear ends, flanges, phase crossover chambers (if required), support structures & accessories including terminations at the equipment ends.
- b) The 415V bus duct shall be metal enclosed, non-phase segregated enclosure type, self cooled and insulated for 1.1kV voltage. The cooling medium inside the duct shall be air.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[2]	25.09.2014

- c) All parts and accessories shall have appropriate match mark and part numbers for easy identification and installation at site.
- d) The 415V non-segregated phase bus duct will be installed indoor or partially indoor & outdoor depending upon the location of equipment being interconnected in a hot, humid and tropical atmosphere. All panels associated with LV non-segregated phase bus duct will be located indoors.
- e) The continuous current rating and momentary peak withstand current rating of the Busduct between transformers & their associated switchgears shall be same as that of the associated switchgears and as indicated in the specification.
- f) All supporting steel structures shall be hot dip galvanized.
- g) The bus ducts shall be provided with space heaters to control moisture. Slicagel breather if required same shall be provided.

1.4.2 Enclosures

- a) The enclosure shall be rectangular and shall be made of [aluminium alloy/Mild steel] of grade [19000H2] as per IS-5082. The entire bus duct shall be designed with dust, weather and vermin-proof construction. The inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The bare enclosure with above painting shall be designed so as not to exceed the temperature specified in IS: 8084.
- b) *[Phases shall be enclosed in a weather-proof, dust-tight, non-magnetic metal (aluminum alloy) of 3mm for bus rating including and above 3000A whereas enclosures for normal bus current rating (<3000 A) shall be sheet steel fabricated type of 2.5mm thick].*
- c) Enclosures shall be provided with flange ends with drilled dimensions to suit the flanges at the switchgear and transformer ends.
- d) Circumferential neoprene rubber gaskets shall be provided for dust tight joints with adjacent enclosure section.
- h) The bus enclosure shall have extended bellows or equivalent means to allow for temperature changes and vibrations. Flexible joints shall be provided in enclosures at all points where the bus duct terminates at equipment to withstand vibration, expansion / contraction and at suitable intervals in any straight run of the bus duct where expansion and contraction would otherwise result in stresses in the supporting structures.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[3]	25.09.2014

- i) All outdoor bus-enclosures shall be so designed & constructed as to prevent accumulation of rain water on top sheet. Similarly all Gasketed flanged joints shall be suitably protected against direct splashing of rain water in case of outdoor runs. The connection flanges shall be sufficiently stiffened so as not to bend while tightening the bolts.
- j) Outdoor portions of the bus duct, if any, shall have continuous rain hood of non magnetic material or with suitable arrangement for rainwater prevention.
- k) Suitable inspection openings shall be provided for access to support insulators, bus joints, transformer terminals, switch gear terminals etc. All inspection openings shall have reliable sealing arrangement with neoprene gaskets.
- l) Seal-off bushings complete with wall-frame and support plates shall be provided where the bus duct penetrates the building wall. The seal is to prevent free exchange of air between indoor and outdoor portions of the bus duct.
- m) In case, the bus duct penetrates the firewall, the wall frame assembly and the seal shall be designed for the same fire rating as the firewall.
- n) Silica-gel breather shall be provided on both indoor and outdoor portions of the bus duct. Space Heaters shall be provided in the bus duct.
- o) Filtered drains for drainage of condensate shall be provided at the lowest points and at such locations where accumulation of condensate can be expected.
- p) Shipping length of the Busduct shall be not more than three (3) meters in length.
- q) Minimum Degree of protection of Busduct enclosure shall be IP-52 for indoor and IPW-55 for outdoor section of the Busduct.

1.4.3 Bus Conductor

- a) The bus conductor shall be of high conductivity, [Aluminium alloy / Aluminium].
- b) The bus conductors shall be given a coat of matt black paint to facilitate heat dissipation. However the sizing of the bus conductor shall consider the conductor as bare.
- c) The bus conductor shall be designed for bolted connections throughout the run.
- d) Flexible connection shall ensure an efficient and trouble-free connection.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[4]	25.09.2014

- e) Silver plating shall be done on copper bar wherever copper to copper and copper to aluminium contacts are envisaged. All connection hardware shall be non-magnetic and shall have high corrosion resistance.
- f) The bus conductors and their support insulators shall be designed to withstand, without damage, the forces developed while carrying the short circuit current.
- g) The bus bar shall be sleeved with FRLS heat shrinkable, colour coded PVC sleeves at intermittent points for phase identification.
- h) The material of the conductor shall be aluminium alloy of grade [63401WP] as per IS: 5082. The temperature rise of conductor shall be 40 degree over design ambient temperature of 50 degree. Also, the temperature of the bus shall not exceed 250°C while carrying the specified short circuit current for one second when a fault occurs at the operating temperature.

1.4.4 Disconnect Link

- a) Removable bolted disconnected link shall be provided in the bus for the purpose of isolation.
- b) Disconnect link shall consist of a removable section of conductor and shall be so constructed as to permit easy removal or reinsertion without alignment difficulties.
- c) The bus on both sides of the link shall be rigidly supported so that the disconnect link is equal in mechanical strength to any other section of the bus.
- d) A minimum clearance of [300 mm. (12")] shall be provided between the disconnected bus sections with the link removed.

1.4.5 Insulators

- a) The bus conductor supporting insulators shall be flame retardant, non-hygroscopic, high impact and high dielectric strength material with an anti tracking contour.
- b) Material of insulator shall be [Epoxy SMC moulded /FRP].
- c) Spacing of the bus support insulators shall be considered by giving due factor of safety to withstand the forces due to the short circuit current assigned to the bus duct.
- d) Bus support insulators shall be interchangeable, high creepage, high strength, wet process, fine glazed porcelain. Alternatively good quality cast resin insulators may be offered.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[5]	25.09.2014

- e) Insulator shall be mounted in such a way so as to permit easy removal or replacement without disassembly of the bus. The insulator mounting plate shall be designed for cantilever loading to withstand the short circuit.
- f) The conductor shall be fastened on the insulator through fixed and slip joints so as to allow conductor expansion or contraction without straining the insulator.
- g) Space heater shall be provided preferably located near to each insulator to avoid moisture condensation within bus duct.

1.4.6 Connections & Terminations

- a) All matching flanges, seal-off bushings, gaskets, fittings, hardware and supports required for termination of the Busduct at the switchgear, transformers and other equipment shall be furnished.
- b) In this connection the bidder is required to coordinate with the switchgear and auxiliary transformers manufacturer with regard to connection details, mechanical and thermal stresses.
- c) Flexible connections both for conductor and enclosure shall be furnished at all equipment termination to provide for misalignment up to 25 mm in all directions.
- d) The equipment terminal connections shall be readily accessible and shall provide sufficient air gap for safe isolation of equipment during testing.

1.4.7 Supporting Structures

- a) All supporting structures required for hanging and/or supporting the complete bus duct shall be furnished. These include all members, indoor/outdoor posts, bolts, shims, base plates, beams, hangers, brackets, bracings and hardware.
- b) All buses shall be adequately supported and braced to successfully withstand normal operation, vibration, thermal expansion, short circuit forces and all specified design loads including wind & earthquake forces.
- c) Support shall be designed to provide tolerance of ± 12 mm in the horizontal and vertical directions.
- d) All steel members shall be hot-dip galvanized after fabrication. All hardware shall be of high strength steel with weather resistant finish.
- e) The mounting arrangement of Busduct on the supporting structure shall be designed to allow movement of the Busduct during expansion and contraction.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[6]	25.09.2014

- f) All structure shall be self supporting and in no case rely for support on equipment to which the busbars are connected.

1.4.8 Ground bus

- a) The ground bus of two numbers of separately run [50x10 mm] minimum GS flat shall be provided along the run of the bus duct. All parts of the bus enclosure, supporting structures and equipment frames shall be bonded to above ground bus.
- b) Ground bus shall be finally to connected to power plant earth grid at one end.

1.4.9 Wiring

All wiring for space heaters shall be done with insulated stranded copper conductor of not less than [2.5 mm² cross-section]. Each wire shall be identified at both ends with wire designation as per bidder's wiring diagram and shall be brought out to a terminal box outside the bus duct.

Terminal blocks shall be box-clamp type minimum 10 mm² with marking strips.

At [least 20% spare terminals] shall be furnished in the terminal block.

1.4.10 Name Plate

Suitable name plate shall be furnished with each piece of equipment.

[Materials for name plate shall be plastic / lamicoid, 3 mm thick, using white letters on black background.]

1.4.11 Space Heater

Thermostatically controlled Space heaters shall be provided in the bus ducts, wherever the manufacturer considers them necessary and recommends their provision for preventing harmful moisture condensation. At least one number space heater with thermostat shall be provided at each transformer and switchgear end.

The space heaters shall be suitable for continuous operation on single phase supply, and shall be automatically controlled by thermostats. Necessary wiring up to junction boxes mounted on bus duct and from junction boxes to switchboards shall be provided.

1.4.12 Painting and Finish

- a) All surfaces to be painted including interior and enclosures and other metal parts shall be shot or sand blasted or chemically treated to remove all rust, scale, grease and other adhering foreign matters as far as

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[7]	25.09.2014

possible shall be painted with not less than two (2) coats of Acid and corrosion resistant paint

- b) Steel surfaces, exposed to weather shall be given two (2) coats of zinc chromate and two (2) coats of an 'approved' Manufacturer's paint of 'approved' colour.
- c) All metal parts not accessible for painting shall be made of corrosion resistant materials. All machine finished or bright surfaces shall be coated with a suitable rust preventive compound and wrapped or otherwise protected.
- d) Inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The shade of exterior surface finish shall be [RAL 5012].
- e) The interior surface finish shall be as per manufacturer's standard.
- f) Pretreatment consisting of degreasing, de-rusting etc. shall be done on all fabricated parts before painting or galvanizing.
- g) Paints shall be carefully selected to withstand heat and weather conditions. The paint shall not scale-off or crinkle or get removed by abrasion due to normal handling.
- h) Sufficient quantities of all paints and preservatives required for touching up at sites shall be furnished.
- i) The paint shade shall be subject to owner's approval.

1.5 Tests

l) Type Test

For each type & rating of 415V Non segregated phase bus duct, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the Busduct similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[8]	25.09.2014

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

Some of the specific tests required are listed below.

- a) Visual inspection and verification of dimensions
- b) Dry power frequency voltage withstand for 1-minute
- c) Milli-volt drop test & Water tightness test

1.6 Drawings and Documents

Drawings, data & manuals for the 415V Non segregated phase bus duct shall be submitted as indicated below:

- a) [Dimensional GA drawing
- b) Data sheets
- c) Typical calculation for arriving at the size of conductor and the insulator spacing.
- d) Type test report (short circuit, temperature rise test) for similar bus duct manufactured by the proposed manufacturer.
- e) Foundation layout and requirements
- f) The bidder may note that the drawings, data and manuals listed are minimum requirement only. The bidder shall ensure that all other necessary write-ups, curves and information required to fully describe the equipment offered are submitted with his bid.]

1.7 Ratings and Requirements

Major technical parameters of 415V non segregated Bus Duct are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

Table: 2.0

S. No.	Technical Particulars	Unit	Parameters	Remarks
1.	Type of bus duct		Non segregated phase bus duct

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity (IE) Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) 220 V DC Systems shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The system shall be suitable for operation in a highly polluted environment.
- b) The permissible voltage variation for 220V battery shall be from -15% to +10%.
- c) The battery shall be of storage type [Lead Acid Plante Positive Plate/Ni-Cd] Type. The Battery shall be of high discharge performance type. The plates shall be designed for maximum durability during all service conditions including high rate of discharge & rapid fluctuation of load.
- d) While estimating the battery size, temperature correction factor [based on lowest expected temperature 5 Deg C], margin on capacity [10%] and aging factor [1.0 for Lead Acid Plante and 1.2 for Ni-Cd] shall be considered.
- e) Cell Voltages for Lead Acid batteries:

i.	Nominal Discharge Voltage/cell	2.0 V
ii.	Float Voltage/cell	2.2 V
iii.	Boost Voltage/cell	2.7 V
iv.	Capacity for ten(10) hour rate at 27°C any time during the entire duty	1.85 V/Cell

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[4]	25.09.2014

	cycle	
--	-------	--

f) Cell Voltages for Ni-Cd Batteries

i.	Nominal Discharge Voltage/cell	1.2 V
ii.	Float Voltage/cell	1.42 V
iii.	Boost Voltage/cell	1.7 V
iv.	Capacity for five(5) hour rate at 27°C any time during the entire duty cycle	1.14 V/ Cell

- g) 2x100% sets, 220V of either Lead-Acid Plante Type or Nickel-Cadmium battery banks with 2 x100% float cum boost charger catering to 100% of unit as well as station loads shall be provided.
- h) Permissible voltage variation for 220V battery shall be from 190V to 240V.
- i) The Ampere-Hour capacity of DC Storage Battery shall be based on [Three] hours' continuous DC supply at rated voltage to essential auxiliaries.
- j) Batteries shall be suitable for being boost charged to fully charged condition from fully discharged condition within 10 hours.
- k) Lead acid batteries shall be boost charged at about 2.7 volts per cell maximum and float charged at about 2.2V/cell.
- l) Ni-Cd batteries shall be boost charged at about 1.54 to 1.7 volts per cell maximum and float charged at about 1.42V/cell.
- m) The float-cum-boost charger shall be rated to cater to the following:
- Trickle charging current of the battery
 - Equalizing charging of the Battery
 - Boost charging of the Battery
 - Continuous load on the DC system
 - 25% spare capacity over above loads.

1.4 Specific Requirements

1.4.1 Constructional requirements of battery

a) Containers

Container shall be made of transparent glass for lead acid and polypropylene for Ni-Cd batteries. It shall be robust, heat resistance, leak

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[5]	25.09.2014

proof, non-absorbent, acid resistant, non-bulging type and free from flaws, such as wrinkles, cracks, blisters, pin holes etc. Electrolyte level lines shall be marked on container. The marking for the electrolyte level should be for the upper and lower limits. Container shall be closed / sealed lid type.

The pole sealing arrangement should be such that no acid particle gets entrapped due to acid creep as a result of capillary action and it should be possible to remove and refix the sealing to carry out the maintenance.

b) Vent Plugs

Vent plug shall be provided in each cell. They shall be anti-splash type, having more than one exit hole shall allow the gases to escape freely but shall prevent acid from coming out. The design shall be such that the water loss due to evaporation is kept to minimum. In addition the ventilator shall be easily removed for topping up the cells and of such dimensions that the spring type hydrometer can be inserted into the vent to take electrolyte sample.

c) Plates

The plates shall be designed for maximum durability during all service conditions including high rate of discharge and rapid fluctuation of load. The construction of plates shall conform to latest revisions of standards as applicable for type of battery.

The separators shall maintain the electrical insulation between the plates and shall allow the electrolyte to flow freely. Separators should be suitable for continuous immersion in the electrolyte without distortion. The positive and negative posts shall be clearly marked.

The plante positive plates shall be supported from the ledges of the SAN container. They should not be supported at the bottom of container. Sufficient space shall allowed to allow the creepage of the plates.

d) Sediment Space

Sufficient sediment space shall be provided so that the cells shall not have to be cleaned out during normal life and prevent shorts within the cells.

e) Cell Insulators

Each cell shall be separately supported on PVC / Porcelain / Hard rubber insulators fixed on the racks with adequate clearances between adjacent cells. Minimum distance between adjacent cell shall be more than the bulge allowed for two cells in accordance with relevant IS standard.

f) Electrolyte

The electrolyte shall be prepared from battery grade sulphuric acid conforming to IS: 266 and distilled water conforming to IS: 1069 for lead

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[6]	25.09.2014

acid batteries and battery grade potassium hydroxide for Ni-Cd batteries. The cells shall be shipped dry uncharged. The electrolyte shall be supplied separately in a separate non-returnable container. 10% extra electrolyte shall be furnished to cover spillage in transit or during erection.

g) Connectors and Fasteners

Lead or Lead coated copper connectors (For Lead acid Plante Type batteries) and Nickel coated copper connectors (for Ni-Cd batteries) shall be used for connecting up adjacent cells and rows. Bolts, nuts and washers shall be effectively lead coated/Nickel coated to prevent corrosion. The thickness of lead coating of connectors should not be less than 0.025 mm. All the terminals and cells inter-connectors shall be fully insulated or have insulated shrouds. End take-off connections from positive and negative poles of battery shall be made by single core cables having stranded aluminum conductors and XLPE insulation. Necessary supports and lugs for termination of these cables on battery shall also be supplied. All connectors and lugs shall be capable of continuously carrying the 30 minutes discharge current of the respective battery and through fault short circuit current which the battery can produce and withstand for the period declared. Suitable number of inter rack connectors shall be supplied by the bidder to suit the battery room layout during the detail engineering.

h) Battery Racks

Steel racks with anti-corrosive epoxy paint for all the battery shall be provided. They shall be free standing type mounted on porcelain / hard rubber / PVC pads insulators. Battery shall be located in the single tier arrangement. However battery having a complete cell weight of lower than 50 Kg could be located in the double tier arrangement. The battery rack and support for cable termination shall be coated with three (3) coats of anti-acid paint of approved shade. Numbering tags, resistant to acid, for each cell shall be attached on to the necessary racks. The bottom tier of the stand shall not be less than 150 mm above the floor.

Wherever racks are transported in dismantled condition, suitable match markings shall be provided to facilitate easy assembly.

i) Manufacturer's Identification Systems

The following information shall be indelibly marked on outside of each cell:

- i. Manufacturer's name and trade marks
- ii. Country and year of manufacture
- iii. Manufacturer type of designation
- iv. AH capacity at 10 hour discharge rate
- v. Serial number

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[7]	25.09.2014

1.4.2 Constructional Requirements of battery charger

- a) The Charger shall be indoor, floor mounted, self supporting sheet metal enclosed cubicle type. All necessary base frames, anchor bolts and hardware shall be supplied. The charger shall be fabricated using cold rolled sheet steel shall not less than 1.6 mm and shall have folded type of construction. The panel frame shall be fabricated using cold rolled sheet steel of thickness not less than 2.0 mm. Removable undrilled gland plates of at least 3.0 mm sheet steel and lugs for all cables shall be supplied. The lugs for cables shall be made of electrolytic copper with tin coat. The chargers shall be tropicalised and vermin proof. Ventilation louvers shall be backed with fine brass wire mesh. All doors and covers shall be fitted with synthetic rubber gaskets. The chargers shall have hinged double leaf doors provided on front / or backside for adequate access to the charger internals. All the charger cubicle doors shall be properly earthed. The degree of protection of charger enclosure shall be at least IP-42.
- b) All indicating instruments, control and selector switches and indicating lamps shall be mounted on the front side of the charger.
- c) Electronic equipments shall be of modular design consisting of plug in modules in standard 19 inches metallic racks with metallic card guides. The cards should be provided with proper handles. Card to card wiring should be preferably through a motherboard. Unplanned jumpering and track modifications are not permitted and track modifications are not permitted. Mechanical interlocks to prevent wrong insertion of cards should be provided. Each card shall have its junction and test points identified. Maintenance aids such as extension printed wiring boards and jumper leads shall be provided.
- d) The layout of charger equipment shall be such that their heat losses do not give rise to excessive temperature within the charger panel surface. Location of the electronic modules shall be such that temperature rises of the location, in no case, shall exceed 10°C over ambient air temperature outside the charger.
- e) Printed Circuit Boards (PCB)
PCB shall be made of glass epoxy of 1.6 mm thick, fire resistant, bonded with 99.8% pure copper foil, free of wrinkles, blisters, scratches and pinholes. The contact surface of the edge connectors of the PCBs shall be plated with hard gold to a minimum thickness of 5 microns. Component identification shall be printed on PCB by silk screen method. All PCBs shall be tropicalised and masked.
- f) Contactors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[8]	25.09.2014

All battery chargers shall have an AC contactor on the input side. It shall be of air break type and suitable for continuous duty. The operating coil shall be rated for 415 Volts AC.

g) Thermal Overload Relay

A thermal overload relay incorporating a distinct single phase protection (using differential movement of bimetal strips) shall also be provided for the AC input. The relay shall trip the above contactor.

h) Rectifier-Transformer and Chokes

The rectifier-transformer and chokes shall be dry and air cooled (AN) type. The rating of the rectifier transformers and chokes shall correspond to the rating of the associated rectifier assembly. The rectifier-transformers and chokes shall have class-B insulation with temperature rise limited to class A insulation value.

i) Rectifier Assembly

The rectifier assembly shall be full wave bridge type and designed to meet the duty as required by the respective charger. The rectifier cells shall be provided with their own heat dissipation arrangement with natural air cooling. The rectifier shall utilize diodes / thyristors and heat sinks rated to carry 200% of the load current continuously and the temperature of the heat sink shall not be permitted to exceed 85 °C absolute duly considering the maximum charger panel inside temperature. Calculations to show what maximum junction temperature shall be and what the heat sink temperature shall be when operating at 200% and 100% load current continuously duly considering the maximum surrounding air temperature of 50°C outside the panel have to be submitted. Necessary surge protection devices and rectifier type fast acting fuses shall be provided in each arm of the rectifier connections.

1.4.3 System Concept for 220 V DC system

- a) First float cum boost charger shall be normally ON in float mode, supplying the D.C. load and at the same time trickle charging the battery and shall (a) provide occasional equalizing charge (b) boost charge the battery up to 2.7/1.7 Volts per cell as required.
- b) The characteristics shall be such that if load is high and exceeds the charger capacity, the excess load shall be supplied by the battery.
- c) The second float-cum-boost charger shall be normally in stand-by (auto float/charge) mode and shall come into the circuit automatically (a) to take over the functions of first float cum boost charger in case of its failure (b) to provide occasional equalizing charge as required, (c) boosting charge the battery up to 2.7/1.7 Volts per cell.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[9]	25.09.2014

- d) The float-cum-boost charger shall also have provision for float, equalizing, and boost charging the battery through manual selection. On failure of station A.C. supply, float-cum-boost charger shall go out of service and battery shall take over to supply emergency loads.

1.4.4 Operational requirements of charger

- a) The float-cum-boost charger shall be sized to restore the fully discharged battery to full charge condition in ten (10) hours with 10% margin over maximum charging rate and also to operate as a float charger.
- b) The batteries & chargers shall be so designed that the maximum fault level on DC DB is limited to 15KA (Indicative only; the actual value shall be decided by the contractor after substantiating the same by calculation.)
- c) The battery shall be trickle charged at 2.15 to 2.25 V per cell and 1.4 to 1.42V per cell for lead acid and Ni-Cd battery respectively. All chargers shall also be capable of boost charging the associated battery at 2.0 to 2.7 V per cell for lead acid and 1.53 to 1.7V for Ni Cd at the desired rate. The chargers shall be designed to operate, as mentioned above, at an ambient air temperature of 50 °C.
- d) Necessary interlocks shall also be provided to avoid accidental boost mode operation when loads are connected to the bus.
- e) The battery chargers as well as their automatic regulators shall be of static type. Battery chargers shall be capable of continuous operation at the respective rated load in trickle mode i.e. trickle charging the associated lead acid battery/Ni-Cd battery while supplying the DC loads.
- f) Battery chargers shall have a selector switch for selecting the battery charging mode i.e. whether trickle / float or Boost charging.
- g) All battery chargers shall be provided with facility both automatic and manual control of output voltage and current. A selector switch shall be provided for selecting the mode of output voltage / current control, whether automatic or manual. Means shall be provided to avoid current / voltage surges of harmful magnitude/ nature which may arise during changeover from Auto to Manual mode or vice versa under normal operating condition.
- h) Soft start feature shall be provided to build up the voltage to the set value slowly within fifteen (15) seconds. The chargers shall have load limiters which shall cause, when the voltage control is in automatic mode, a gradual lowering of the output voltage when the DC load current exceeds the load limiter setting of the charger. The load limiter characteristic shall be such that any sustained overload or short circuit in DC system shall neither damage the charger nor shall it cause blowing of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[10]	25.09.2014

any of the charger fuses. The charger shall not trip on overload or external short circuit. After clearance of fault, the charger voltage shall build up automatically when working in automatic mode.

- i) When on automatic control mode, during trickle / float charging, the charger output voltage shall remain within (\pm) 1% of the set value for AC input voltage variation of (\pm) 10%, frequency variation of (+) 3 / (-) 5%, a combined voltage and frequency variation of 10% (absolute sum) and a continuous DC load variation from zero to full load. Uniform and step less adjustment of voltage setting (in both manual and automatic modes) shall be provided on the front of the charger panel covering the entire trickle / float charging output range specified. Step less adjustment of the load limiter setting shall be possible from 80% to 100% of the rated output current for trickle / float charging mode.
- j) During boost charging, the battery chargers shall operate on constant current mode (when automatic voltage regulator is in service). It shall be possible to adjust the boost charging current continuously over a range of 50% to 100% of the rated output current for Boost charging mode. The charger output voltage shall automatically go on rising, when it is operating on boost mode, as the battery charges up. For limiting the output voltage of the charger, a potentiometer shall be provided on the front of the panel, whereby it shall be possible to set the upper limit of this voltage anywhere in the output range specified for boost charging mode. All voltage and current setting potentiometers shall be vernier type.
- k) Energizing the chargers with fully charged battery connected plus 10% load shall not result in output voltage greater than 110% of the voltage setting. Time taken to stabilize, to within the specified limits as mentioned elsewhere shall be less than fifteen (15) seconds.
- l) Momentary output voltage of the charger, with the battery connected shall be within 94% to 106% of the voltage setting during sudden load change from 100% to 20% of full load or vice versa. Output voltage shall return to, and remain, within the limits specified as mentioned elsewhere in less than 2 seconds after the above mentioned change.
- m) The charger manufacturer may offer an arrangement in which the voltage setting device for trickle/ float charging mode is also used as output voltage limit setting device for Boost charging mode, and the load limiter of the trickle / float charging mode is also used as Boost charging current setting device.
- n) Suitable filter circuits shall be provided in all the chargers to limit the ripple content (peak to peak) in the output voltage to 1% irrespective of the DC load, even when they are not connected to a battery.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[11]	25.09.2014

1.4.5 Auxiliary Equipment

- a) DC Voltmeter, DC ammeter and AC voltmeter in 96 mm square shall be provided for each charger. The instruments shall be 240 scale, antiglare glass, flush mounted type, dust proof and moisture resistant. The instrument shall have easily accessible means from zero adjustments. The instruments shall be of 1.5 accuracy class.
- b) In addition to above, following metering provision shall be given for remote metering / recording at PLC/DCS
 - i. Battery Voltage
 - ii. DC voltage of float & Boost charger
 - iii. DC current of float & Boost charger
 - iv. DC load voltage
 - v. DC load current
 - vi. DC Voltage and Current at FCBC
 - vii. Centre Zero Ammeter with Shunt to read Discharge/Charge current
 - viii. Ammeter for Battery Trickle Charge current
 - ix. DC Bus Voltmeter indicating - +ve to Earth, -ve to Earth and +ve to -ve with Selector switch.

The following indications shall be provided

- i. AC Supply – R,Y,B Healthy
- ii. DC supply – Available
- iii. Charger in Float Mode
- iv. Charger in Equalising mode
- v. Charger in Boost mode
- vi. Charger tripped on fault
- vii. D.C Earth fault sensing & alarm

Suitable soft link to be provided for interfacing with DDCMIS.

c) Air Break Switches

All chargers shall have AC input and DC output switches of air break, single throw, load break and fault make type. The contacts of the switches shall open and close with a snap action. Switches shall be rated for 120% of maximum continuous load. 'ON' and 'OFF' position of the switch shall be clearly indicated.

d) Control and Selector Switches

Control and selector switches shall be rotary, stay put type with escutcheon plates showing the functions and positions. The switches shall be of sturdy construction and suitable for mounting on panel front. Switches with shrouding of live parts and sealing of contacts against dust ingress shall be preferred. The contact ratings shall be at least the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[12]	25.09.2014

- i. Make and carry continuously - 10 Amps
- ii. Breaking current at 220V DC - 0.5 Amp (inductive)
- iii. Breaking current at 240V AC - 5 Amp. at 0.3 p.f.

e) Fuses

Fuses shall be of HRC cartridge fuse link type. Fuses shall be mounted on fuse carriers which are mounted on fuse bases. Wherever it is not possible to mount fuses on fuse carriers, fuses shall be directly mounted on plug in type bases. In such cases one insulated fuse pulling handle shall be supplied for each charger. Kick-off fuses (trip fuses) with alarm contacts shall be provided for all DC fuses.

f) Indicating Lamps

Three (3) indicating lamps shall be provided to indicate AC supply availability. The indicating lamp shall be of panel mounting, LEDs and capable of clear status indication under the normal room illumination. The lamps shall be replaceable from front. The lamp covers shall be preferably screwed type, unbreakable and moulded from heat resistant material.

g) Blocking Diode

Blocking diode shall be provided in the output circuit of each charger to prevent current flow from the Battery into the charger.

h) Annunciation System

Following annunciation shall be provided for local and remote indications in all chargers(List is indicative only)

- i. AC supply failure
- ii. Rectifier fuse failure
- iii. Surge circuit fuse failure
- iv. Filter capacitor fuse failure
- v. Load limiter operated
- vi. Charger fail / trip
- vii. Battery on Boost
- viii. Battery on Trickle
- ix. DC output fuse failure
- x. Positive grounded
- xi. Negative grounded
- xii. Battery fully discharged
- xiii. AC input under voltage
- xiv. DC voltage low
- xv. DC voltage high
- xvi. DC system earth fault

The annunciation system shall have audio-visual arrangement and shall incorporate acknowledge, reset and test push buttons. On occurrence of fault, the corresponding window lights up and shall stay in lighted

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[13]	25.09.2014

condition till the fault is cleared and the reset push button is pressed. At least 20% spare annunciation windows with accessories shall be provided.

i) Lamp / Space Heaters / Receptacles

The charger panels shall be provided with:

- i. Internal illumination lamp with door switch.
- ii. Space heater with thermostat control.
- iii. 3-pin 5A receptacle with plug.
- iv. Lamp, heater and receptacle circuits shall have individual switch fuse units/MCB.

1.4.6 Battery Accessories

Each battery shall be furnished complete with following:

- a) First charge of electrolyte plus 10% extra.
- b) Teak wood racks with 3 coats of anti-acid paints.
- c) Stand insulators 5% extra.
- d) Cell inter-connectors 5% extra and one extra end take-off.
- e) Lead-coated connection hardware 5% extra
- f) Cell numbering tag with fixing arrangements
- g) Insulated cable clamps with hardware
- h) Six (6) extra cell with all accessories but without acid
- i) In addition to the above each battery shall be furnished with a set of following accessories.
- j) One (1) Interconnector bolt wrench
- k) One (1) Hydrometer syringe
- l) One (1) Thermometer with specific gravity correction scale.
- m) One (1) Cell testing voltmeter with leads.
- n) One (1) Pocket thermometer
- o) One (1) set of Acid resisting funnels
- p) One (1) set of Acid resisting jugs of adequate capacity
- q) One (1) set of Rubber aprons
- r) One (1) set of Rubber gloves
- s) PVC spill trays under the battery cells
- t) Spanner for cells

Catalogues and Instruction manuals of battery and battery charger to be furnished.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[14]	25.09.2014

1.4.7 Painting

- a) All surfaces shall be sand blasted, pickled and grounded as required to produce a smooth, clean surface free of scale, grease and rust.
- b) After cleaning, the surfaces shall be given a phosphate coating followed by 2 coats of high quality lead oxide primer and stoved after each coat.
- c) The equipment shall be finished in Siemens Gray RAL: 9002 color with two coats of epoxy based powder coated paint except end covers and RAL 5012 for end covers. The coating shall be done electro statically followed by stoving.
- d) Sufficient quantity of touch-up paint shall be furnished for application at site.

1.4.8 Installation

- a) The battery room floor shall be acid resistant type and walls shall have acid resistant tiles up to a suitable height. Alternatively acid resistant paints are also acceptable. Adequate ventilation shall be provided in the battery room for the removal of hydrogen.
- b) The Battery charger along with D.C. distribution board shall be located in separate rooms.
- c) After erection and connection of the Battery Charger, the contractor shall complete the charging discharging cycles recommended by the manufacturer. The contractor shall rig up a suitable discharge resistor for this purpose.
- d) Connection from Battery terminals shall be made by means of cables. Lead coated terminal connector shall be furnished for this purpose.

1.5 Tests

1) Type Test

For each type of Battery and battery charger, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[15]	25.09.2014

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

All Battery, Battery chargers, Inverters and its components thereof shall be subject to shop tests as per relevant IS/IEC standards. The tests on Battery chargers shall include but not limited to the following:

- a) Voltage regulation check from 0 to 100% loads with $\pm 10\%$ input voltage variation.
- b) Ripple content measurement.
- c) D.C short circuit test to prove ability of current limit.
- d) Measurements of transient overshoot/undershoot during switching ON/load throw-off.
- e) Current limiter operation.
- f) Special tests for electrical equipment, when specified in relevant Indian / International standard shall be carried out on at least one item of each rating.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports. Drawings, Data & Manuals:

1.6

Drawings, Data & Manuals

1. Following drawings/ data and Manuals to be submitted for approval:

- a) [Dimensional battery layout diagram and plan & section.
- b) Connection details of take-off terminals.
- c) Dimensional general arrangement drawings of battery charger clearly showing device dispositions, cable entry, space requirement, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E6	[16]	25.09.2014

- d) Sectional views of battery charger.
- e) Charger foundation plan and loading.
- f) Charger schematics and wiring diagrams.
- g) Test reports
- h) Detailed bill of materials
- i) Any other relevant drawing or data necessary for satisfactory installation, operation and maintenance.
- j) Instruction manuals of battery and battery Charger. The manual shall clearly indicate method of installation, check-ups, and tests to be carried out before commissioning of the equipment.
- k) Bidders shall note that the drawings, data and manuals listed herein are minimum requirements only. The Bidders shall ensure that other necessary write-ups, curves and information required to fully describe the equipment are submitted with their bids].

TECHNICAL SPECIFICATION FOR HV CABLES

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E7

1.0 HV CABLEs

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of HV cables complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified or supplemented by this specification.

Table: 1.0

IS: 2982	:	Copper conductor in insulated cables and cords.
IS: 3961	:	Recommended current ratings for cables.
IS: 3975	:	Mild steel wires, strips and tapes for armouring cables
IS: 5609	:	Specification for low frequency wirers and cables with PVC insulation and PVC sheath
IS:5831	:	PVC insulation and sheath of electric cables
IS: 6380	:	Specification of elastomeric insulation of sheath of electric cables.
IS:7098(Part II)	:	XLPE insulated PVC sheathed cables for working voltage from 3.3kV up to and including 33kV
IS: 8130	:	Conductors for insulated electric cables and flexible cords
IEC: 60	:	High voltage test techniques
IEC: 230	:	Impulse tests on cables and their accessories
IEC: 287	:	Calculation of the continuous current rating of the

		cables(100% load factor).
IEC: 288	:	Nominal cross sectional area and composition of conductor of insulated cables.
IEC-331	:	Fire resisting characteristics of electric cables
IEC: 332-1	:	Test on electric cables under fire conditions.
IEEE: 383	:	Standard for type test for class IE electric cables, filled splices and connection for nuclear power generation station.
IEC: 502	:	Extruded solid dielectric insulated power cables for rated voltages from 1kV upto 30kV.
IEC: 540	:	The methods for insulations and sheath of electric cables and cords(elastomeric and thermoplastic compounds)
IEC-754-I	:	Test method for acid gas generation
NEMA-WC-5	:	Thermoplastic insulated wires and cables for transmission and distribution of electrical energy.
ASTM-D-2843	:	Standard test method for density of smoke from burning/decomposition of plastics.
ASTM-D-2863	:	Test for determination of oxygen index.
CEA	:	CEA Regulations
CEA	:	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended upto date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[2]	25.09.2014

1.3 Design Criteria

- a) The cables shall be installed in hot, humid tropical atmosphere with ambient temperature of 50°C.
- b) All HV cables shall be suitable for operation under the following voltage & frequency variations:

Voltage Variation : (±) 10%

Frequency Variation : (+) 3% to (-)5%

Combined Variation of Voltage & Frequency : 10% (absolute sum)

- c) The HV power cables shall be 6600V unearthed grade, single/multi core stranded Aluminum conductor, extruded XLPE insulated with extruded PVC inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-2). These cables shall conform to IS 7098 (Part II).
- d) The continuous and short time current carrying capacity of XLPE insulated cables shall be based on maximum operating temperature of 90°C and 250°C respectively.
- e) HV power cables shall be sized taking into account the following derating factors:
 - i. Max Ambient air temperature
 - ii. Max Ambient ground temperature
 - iii. Grouping of cables/Method of laying
 - iv. Depth of laying for cable buried in ground.
 - v. Soil thermal resistivity for cable buried in ground.
- f) HV cables shall be chosen taking into account the following factors:
 - i. System Fault level.
 - ii. Maximum time for fault clearance (i.e, operating time of the backup protection relays plus the time of operation of the circuit breakers).
 - iii. Full load current of the circuit.
 - iv. Short circuit current and duration (for breaker protected cables)
 - v. Installation conditions.
 - vi. Voltage drop under normal running and starting condition
 - vii. Voltage drop at motor terminals shall be within permissible limit during starting & normal running. i.e 5% during steady state and 15% during transient or starting at motor terminal.
 - viii. The cable should withstand the maximum fault current corresponding to the particular voltage level for the minimum time before the fault is cleared.
 - ix. Consideration shall also be given to limit the cable to the nearest standard sizes instead of using too many types.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[3]	25.09.2014

1.4 Specific Requirements

1.4.1 Type of Cable

- a) HV cables shall be 6600V unearthed grade, heavy duty, stranded aluminium conductor, XLPE insulated, extruded black FRLS PVC inner sheathed, armoured and overall FRLS extruded black PVC outer sheathed (Type ST-2) cables conforming to IS: 7098 part II.

1.4.2 Conductor

The cable conductor shall be made from standard Aluminum to form compact conductor having a resistance within the limits specified.

1.4.3 Conductor Shield

The conductor having a semi-conducting screen shall ensure perfectly smooth profile and avoid stress concentration. The conductor screen shall be provided over the conductor by applying non metallic semi conducting tape or by extrusion of semi conducting tape or by extrusion of semi-conducting compound or a combination of the two. The semi conducting polymer shall be cross linked for XLPE cables.

1.4.4 Insulation

The insulation of the HV cables shall be XLPE type. It shall be designed and manufactured for the specified system voltage. The manufacturing process shall ensure that insulation shall be free from voids. The insulation shall withstand mechanical and thermal stresses under steady state and transient operating conditions. The extrusion method should give a very smooth interface between semi conducting screen and insulation. The insulation of the cables shall be of high standard quality.

1.4.5 Insulation Shield

A non magnetic semi conducting shield shall be put over the insulation to confine electrical field to the insulation. The XLPE cable insulation shield shall be strippable.

The metallic layer of the insulation shield shall be grounded at least at one location in the cable's run. In the case of single conductor cable, care should be taken with regard to ampacity when grounding at more than one point.

For all the cables having insulation shield, it shall have some form of stress relief measure at every splice at termination. This can be stress cones, moulded devices, heat shrink or cold shrink kits. All kits must be suitable for the voltage class and cable size.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[4]	25.09.2014

1.4.6 Inner Sheath

The sheath shall be suitable to withstand the site conditions and the desired temperature. It shall be of adequate thickness and applied by a continuous process to produce a sheath of consistent quality free from all defects. PVC sheath shall be extruded with FRLS properties.

1.4.7 Armour

HV cables shall be provided with galvanized steel wire/strip armouring. The hard drawn aluminium wire for armour shall be of H4 grade, as per IS-8130 (having tensile strength above 150 N/mm²). The diameter of the aluminium wire shall be as per the table for the dimensions of the galvanized steel wire armour given in the relevant standard.

1.4.8 Outer sheath

Outer sheath shall be extruded layer of FRLS PVC compound (ST-1). Sheath shall be resistant to water, Ultra Violet radiations, fungus, termites and rodent attacks. The color of the sheath shall be black.

1.4.9 Packing

[Cables shall be supplied in non-returnable drums]. Drum lengths shall be such so that cable joints are totally avoided. The drums shall be of heavy construction. *[All wooden parts shall be manufactured from seasoned wood.]* All ferrous parts used shall be treated with suitable rust preventive finish or coating to avoid rusting during transit or storage. *[Wooden cable drum shall be treated by immersing in copper-nitrate solution.]*

The ends of each cable length shall be sealed before shipment. Heat shrinkable cable cap shall be used for this purpose.

[A label shall be securely attached to each end of the reel indicating the Purchaser's order number, Owner's identification mark, length, type, voltage grade, conductor size and number of cores of the cable.] A tag containing the same information shall be attached to the leadings end of the cable inside. An arrow and necessary instructions shall be marked on the drum indicating the direction in which it should be rolled. Drum numbers are to be indicated on the cable drums. Drum length shall not be less than 500m or as per required length.

1.4.10 Identification of cores:

HV power cables shall be identified by color code.

1.4.11 Constructional Requirements

- a) Cable shall have suitable filters laid up with the conductors to provide a substantially circular cross section before the sheath is applied. Fillers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[5]	25.09.2014

shall be suitable for the operating temperature of the cable and compatible with the insulating material. All materials shall be new, unused and of finest quality.

b) Workmanship shall be neat, clean and of the highest grade.

c) Special Properties:

All the above cables shall be conforming to the relevant Indian/IEC standard in general, with the following special properties:

- i. Oxygen Index of the outer sheath shall not be less than 29, when tested as per ASTM-D-2863.
- ii. Temperature Index of the outer sheath shall not be less than 250 °C, when tested as per ASTM-D-2863.
- iii. Halogen acid contents in outer sheath shall not be more than 20%, when tested as per IEC-60754.
- iv. The maximum smoke density in percent light absorption should not exceed 60% in case of PVC compound and 20% in case of fire survival cables, when tested as per ASTM-D-2843.
- v. Swedish chimney test as per SS-4241475 class F3 and ladder test for flammability as per IEEE-383.
- vi. The cables shall be tested for resistance to Ultraviolet radiation. The retention values of tensile strength and ultimate elongation after test shall be minimum 60% of tensile strength.
- vii. Outer sheath of cable shall be subject to tests for water absorption. The methodology shall be as per IS 10810 part 33.

1.4.12 Joints and Terminations

Materials of construction for a joint/termination shall perfectly match with the dielectric chemical and physical characteristics of the associated cables. The material and design concepts shall incorporate a high degree of operating compatibility between the cable and joints. The protective outer covering (jacket) used on the joints/terminations shall have the same qualities as that of the cable outer sheath in terms of ambient/operating temperature withstand capability and resistance to hazardous environments and corrosive elements. No joints shall be allowed unless the cable drawn length is exceeded.

1.4.13 Cable Identification

Cable identification shall be provided by embossing the following on the outer sheath:

- a. [Manufacturer's name or trade mark]
- b. Voltage grade
- c. Year of manufacture
- d. Type of insulation.
- e. Type of outer sheath e.g. "FRLS" etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[6]	25.09.2014

f. ISI marks

g. Nominal cross sectional area of the conductor & no of cores

h. Sequential marking

i. Owner's identification mark]

1.4.14 Fire Proof sealing system

i) General

- a) Fire proof sealing system shall consist of Fire-stops/fire-seals for sealing of cable/cable tray and conduit/pipe penetrations, both horizontal and vertical, through brick or RCC walls/floors, to prevent the spread of fire from one area, which is separated from others by fire-resistant barriers.
- b) 'Fire-breaks' provided on long runs of cable racks/trays to prevent the propagation of fire along the cable rack, within a single fire-area or fire- zone.
- c) The FPS system shall also include all the necessary accessories and equipment required for supporting, holding in position, fixing and installation of the fire-stop/fire-break.
- d) The FPS system shall comply in all respects with the requirements of the codes and standards listed below

IEEE-634 ASTM-E-814

ANSI-IEEE-383 IEC-331 IEC-332

ii) Fire stop/ seal

The FPS system adopted for cables or cable trays penetrating through walls and floor constitute a openings, or cables passing through embedded conduits / pipes / pipe- sleeves, fire stop / seal', which is meant to prevent spreading of fire between areas separated by fire-resistant barriers.

iii) Fire Break

The fire proofing system, other than fire-stops, adopted to retard flame propagation long runs of horizontal or vertical cable trays in the same fire zone or area, in an event of a fire, shall constitute a 'fire-break' and shall be provided by applying a suitable fire –resistance coating on cables and cable trays for the required length, with or without a fire resistant panel, at the point of the fire break to obtain the fire-rating specified.

iv) Application of fire proof sealing system

Fire stops shall be provided for cable penetration openings listed below

The passage of cables/cable trays pipe sleeves/embedded conduits through walls / floors.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[7]	25.09.2014

Vertical raceways, which carry cables between successive floors, through openings provided in the RCC floor slab, shall be sealed by fire stops at each floor level.

Cable entry through openings in floor slabs below HT/LT switchgear, MCCs, various Control and relay panels and other bottom entry panels, shall be effectively sealed by fire stop

Location of fire breaks

Firebreaks shall be provided on both cable rack and trenches at all cable tray Intersections and tee-offs.

On linear runs of cable trays between fire stops or fire breaks, fire breaks shall be provided at intervals of 15 metres on horizontal cable runs and 5 m on vertical cable runs.

Fire breaks in linear runs of cable trenches between intersections and tee-offs shall be provided at intervals of 30 metres.

Bidder shall furnish the test certificates for the fire stops and fire breaks after award of contract for Owner/Owner's Representative review. If the certificates are not satisfactory all the tests shall be conducted free of cost. The offered system i.e. fire stops and fire breaks shall be identical (or better) with the system which is successfully type tested for the specified rating i.e. the composition density of the material, thickness of coating in case of fire breaks and any other properties of the material / system offered shall be identical or better than the tested system and shall be subject to Owner / Owner's Representative.

v) Test on fire stops

The fire stops shall be subjected to the following type tests:

- a. Fire Rating Test
- b. Hose Stream Test

Type tests shall be conducted on different fire stop test specimens described above as per IEEE-634. The sizes of the fire stop test specimens shall be similar to the largest of the sizes being used in the plant.

Preconditioning of fire stop test specimens before conducting the fire rating and hose stream tests, each test specimen shall be preconditioned for thermal ageing, water immersion and vibration.

Test on Fire Stops

During the fire rating test, the transmission of heat through the cable penetration fire stop shall not raise the temperature on its unexposed surface above the self ignition temperature of the outer cable covering, the cable penetration fire stop material, or material in contact with the cable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[8]	25.09.2014

penetration fire stop, with a maximum temperature limit on the unexposed surface of 200°C.

Tests on fire breaks

Firebreaks shall undergo the following tests as per ANSI-IEEE-383:

- Ampacity test
- Flame test

1.5 Tests

1.5.1 Type Test

For each type & rating of HV cables, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The list of type tests are as follows:

- a) Tests on conductor:
 - i. Annealing test (for copper)
 - ii. Tensile test (for aluminum)
 - iii. Wrapping test (for aluminum)
 - iv. Conductor resistance test.
- b) Test for armouring wires/strips
- c) Test for thickness of insulation and sheath
- d) Physical tests for insulation and outer sheath:
 - i. Tensile strength and elongation at break
 - ii. Ageing in air oven
 - iii. Shrinkage test
 - iv. Hot deformation
 - v. Loss of mass in air oven
 - vi. Heat shock test
 - vii. Thermal Stability
- e) Insulation resistance test
- f) High voltage test (water immersion test)
- g) High voltage test at room temperature
- h) Flammability test

LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[9]	25.09.2014

1.5.2 Routine Test

Cables shall be subject to acceptance and routine tests as per IS codes. Acceptance tests and FRLS test as specified earlier shall be conducted on cables and the same shall be witnessed by purchaser.

The FRLS test shall be carried out on one cable of each batch of compound used. Other acceptance tests shall be carried out on drums selected as per sampling plan as indicated in IS. Test certificates for routine acceptance and special tests shall be furnished by the Bidder for review and approval of purchaser.

1.6 Drawings, Data and Manuals

The following drawings/documents and calculation as listed below but not limited to shall be furnished along with the bid for review

- [Cable datasheets and cross sectional drawings]
- [Cable sizing calculation]
- [QAPs & Test Reports]
- [Relevant catalogues]
- [Estimated weight of cable and cable drum]

The electrical installation shall meet the requirements of Indian Electricity Rules as amended upto date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) The cables shall be installed in hot, humid tropical atmosphere with ambient temperature of 50°C.
- b) All LV cables shall be suitable for operation under the following voltage & frequency variations:

Voltage Variation : (±) 10%

Frequency Variation : (+) 3% to (-)5%

Combined Variation of Voltage & Frequency : 10% (absolute sum)

- c) The LV power cables shall be 1100V grade, single/multi core stranded Aluminum conductor, extruded XLPE/PVC insulated with extruded PVC inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-1). These cables shall conform to IS 7098 (Part I) for XLPE and 1554(part 1) for PVC insulation.
- d) The control cables shall be 1100 V grade, multi core, stranded annealed high conductivity copper with extruded PVC insulated inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-1).
- e) The continuous and short time current carrying capacity of XLPE insulated cables shall be based on maximum operating temperature of 90°C and 250°C respectively.
- f) The continuous and short time current carrying capacity of PVC insulated cables shall be based on maximum operating temperature of 70°C and 160°C respectively.
- g) LV power cables shall be sized taking into account the following derating factors:
 - i. Max Ambient air temperature
 - ii. Max Ambient ground temperature
 - iii. Grouping of cables/Method of laying
 - iv. Depth of laying for cable buried in ground.
 - v. Soil thermal resistivity for cable buried in ground.
- h) Power cables shall be chosen taking into account the following factors:
 - i. System Fault level.
 - ii. Maximum time for fault clearance (i.e, operating time of the backup protection relays plus the time of operation of the circuit breakers).
 - iii. Full load current of the circuit.
 - iv. Short circuit current and duration (for breaker protected cables)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[3]	25.09.2014

- v. Installation conditions.
- vi. Voltage drop under normal running and starting condition
- vii. Voltage drop at motor terminals shall be within permissible limit during starting & normal running. i.e 5% during steady state and 15% during transient or starting at motor terminal.
- viii. The cable should withstand the maximum fault current corresponding to the particular voltage level for the minimum time before the fault is cleared.
- ix. Consideration shall also be given to limit the cable to the nearest standard sizes instead of using too many types.
- x. The minimum size of cables to be used shall be as follow :
 - Aluminium conductor : 6 Sq. mm.
 - Copper conductor : 2.5 Sq. mm

1.4 Specific Requirements

1.4.1 Type of Cable

- a) LV power cables shall be 1100V grade, heavy duty, stranded aluminium conductor, XLPE/ PVC insulated, extruded black FRLS PVC inner sheathed, armoured and overall FRLS extruded black PVC outer sheathed (Type ST-1) cables conforming to IS: 1554(Part 1) for PVC insulation and IS 7098(Part 1) for XLPE insulation.
- b) Control Cables shall be 1100 V grade, heavy duty with annealed high conductivity stranded copper conductor, PVC insulated, FRLS PVC inner sheathed, armoured and FRLS extruded black PVC outer sheathed (Type ST-1) cables conforming to IS : 1554.
- c) LV power cables of size above 35 sq. mm may be provided with XLPE insulation. Bidder shall clearly indicate the type of insulation provided in the technical bid.

1.4.2 Conductor

The cable conductor shall be made from standard Aluminum for LV Power cables and Copper for control cables to form compact conductor having a resistance within the limits specified. All the cables of size 25mm² and above shall have sector shaped conductors.

1.4.3 Insulation

The insulation of the LV power and control cables shall be [XLPE/PVC] type. It shall be designed and manufactured for the specified system voltage. The manufacturing process shall ensure that insulation shall be free from voids. The insulation shall withstand mechanical and thermal stresses under steady state and transient operating conditions. The extrusion method should give a very smooth interface between semi conducting screen and insulation. The insulation of the cables shall be of high standard quality.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[4]	25.09.2014

1.4.4 Inner Sheath

The sheath shall be suitable to withstand the site conditions and the desired temperature. It shall be of adequate thickness and applied by a continuous process to produce a sheath of consistent quality free from all defects. PVC sheath shall be extruded with FRLS properties.

1.4.5 Armour

LV power and control cables shall be provided with galvanized steel wire/strip armouring. The hard drawn aluminium wire for armour shall be of H4 grade, as per IS-8130 (having tensile strength above 150 N/mm²). The diameter of the aluminium wire shall be as per the table for the dimensions of the galvanized steel wire armour given in the relevant standard.

1.4.6 Outer sheath

Outer sheath shall be extruded layer of FRLS PVC compound (ST-1). Sheath shall be resistant to water, Ultra Violet radiations, fungus, termites and rodent attacks. The color of the sheath shall be black.

1.4.7 Packing

[Cables shall be supplied in non-returnable drums]. Drum lengths shall be such so that cable joints are totally avoided. The drums shall be of heavy construction. *[All wooden parts shall be manufactured from seasoned wood.]* All ferrous parts used shall be treated with suitable rust preventive finish or coating to avoid rusting during transit or storage. *[Wooden cable drum shall be treated by immersing in copper-nitrate solution.]*

The ends of each cable length shall be sealed before shipment. Heat shrinkable cable cap shall be used for this purpose.

[A label shall be securely attached to each end of the reel indicating the Purchaser's order number, Owner's identification mark, length, type, voltage grade, conductor size and number of cores of the cable.] A tag containing the same information shall be attached to the leadings end of the cable inside. An arrow and necessary instructions shall be marked on the drum indicating the direction in which it should be rolled. Drum numbers are to be indicated on the cable drums. Drum length shall not be less than the following:

- a) Power cables: 500m
- b) Control cables: 1000m

1.4.8 Identification of cores and spares:

LV power cables shall be identified by color code. However LV control cables shall be identified by the number of its cores.

[Multi-core control cables shall have 20% spare core, minimum one spare.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[5]	25.09.2014

1.4.9 Constructional Requirements

- a) Cable shall have suitable filters laid up with the conductors to provide a substantially circular cross section before the sheath is applied. Fillers shall be suitable for the operating temperature of the cable and compatible with the insulating material. All materials shall be new, unused and of finest quality.
- b) Workmanship shall be neat, clean and of the highest grade.
- c) Special Properties:
All the above cables shall be conforming to the relevant Indian/IEC standard in general, with the following special properties:
 - i. Oxygen Index of the outer sheath shall not be less than 29, when tested as per ASTM-D-2863.
 - ii. Temperature Index of the outer sheath shall not be less than 250 °C, when tested as per ASTM-D-2863.
 - iii. Halogen acid contents in outer sheath shall not be more than 20%, when tested as per IEC-60754.
 - iv. The maximum smoke density in percent light absorption should not exceed 60% in case of PVC compound and 20% in case of fire survival cables, when tested as per ASTM-D-2843.
 - v. Swedish chimney test as per SS-4241475 class F3 and ladder test for flammability as per IEEE-383.
 - vi. The cables shall be tested for resistance to Ultraviolet radiation. The retention values of tensile strength and ultimate elongation after test shall be minimum 60% of tensile strength.
 - vii. Outer sheath of cable shall be subject to tests for water absorption. The methodology shall be as per IS 10810 part 33.

1.4.10 Joints and Terminations

Materials of construction for a joint/termination shall perfectly match with the dielectric chemical and physical characteristics of the associated cables. The material and design concepts shall incorporate a high degree of operating compatibility between the cable and joints. The protective outer covering (jacket) used on the joints/terminations shall have the same qualities as that of the cable outer sheath in terms of ambient/operating temperature withstand capability and resistance to hazardous environments and corrosive elements. No joints shall be allowed unless the cable drawn length is exceeded.

1.4.11 Cable Identification

Cable identification shall be provided by embossing the following on the outer sheath:

- a. [Manufacturer's name or trade mark]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[6]	25.09.2014

- b. Voltage grade
- c. Year of manufacture
- d. Type of insulation.
- e. Type of outer sheath e.g. "FRLS" etc.
- f. ISI marks
- g. Nominal cross sectional area of the conductor & no of cores
- h. Sequential marking
- i. Owner's identification mark]

1.5 Tests

1.5.1 Type Test

For each type & rating of LV power and control cables, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The list of type tests are as follows:

- a) Tests on conductor:
 - i. Annealing test (for copper)
 - ii. Tensile test (for aluminum)
 - iii. Wrapping test (for aluminum)
 - iv. Conductor resistance test.
- b) Test for armouring wires/strips
- c) Test for thickness of insulation and sheath
- d) Physical tests for insulation and outer sheath:
 - i. Tensile strength and elongation at break
 - ii. Ageing in air oven
 - iii. Shrinkage test
 - iv. Hot deformation
 - v. Loss of mass in air oven
 - vi. Heat shock test
 - vii. Thermal Stability
- e) Insulation resistance test
- f) High voltage test (water immersion test)
- g) High voltage test at room temperature
- h) Flammability test

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[7]	25.09.2014

1.5.2 Routine Test

Cables shall be subject to acceptance and routine tests as per IS codes. Acceptance tests and FRLS test as specified earlier shall be conducted on cables and the same shall be witnessed by purchaser.

The FRLS test shall be carried out on one cable of each batch of compound used. Other acceptance tests shall be carried out on drums selected as per sampling plan as indicated in IS. Test certificates for routine acceptance and special tests shall be furnished by the Bidder for review and approval of purchaser.

1.6 Drawings, Data and Manuals

The following drawings/documents and calculation as listed below but not limited to shall be furnished along with the bid for review

- [Cable datasheets and cross sectional drawings]
- [Cable sizing calculation]
- [QAPs & Test Reports]
- [Relevant catalogues]
- [Estimated weight of cable and cable drum]

1.7 Ratings and Requirements

1.7.1 L.V. Power and control cables, 1100 V grade

Table: 2.0

S.No.	Technical Particulars	Unit	Parameters	Remarks
1.	System voltage		415 V	
2.	Voltage Grade		1.1 kV	
3.	Ambient Temperature		50°C	
4.	Maximum conductor temperature for continuous operation for XLPE/PVC cables		For XLPE: 90°C For PVC: 70°C	
5.	Maximum conductor temperature for		For XLPE: 250°C For PVC: 160°C

TECHNICAL SPECIFICATION FOR ILLUMINATION SYSTEM

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E9

1.0 ILLUMINATION SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Illumination System complete with luminaries and all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

Code		Name of Standard
IS 1913	:	Electrical lighting fittings- General and safety requirements
IS 2418 - Part I	:	Tubular fluorescent Lamp
IS 3480	:	Flexible steel conduits for electrical wiring
IS 3646 (Part I to III)	:	Code of Practice For Interior Illumination
IS 4012	:	Dust proof electric lighting fittings
IS4013	:	Flame proof enclosure
IS 6665	:	Code of practice for industrial lighting
IS 5077	:	Decorative light fittings
IS 9537 - Part II	:	Rigid steel conduits for electrical installations

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[1]	25.09.2014

IS 9583	:	Emergency lighting units
IS 9900	:	High pressure mercury vapor lamp
IS 9974	:	High pressure sodium vapor lamp
IS 10322	:	Luminaries for street lighting
CBIP Manual	:	Substation Equipment, Illumination and Layouts
IES (Illuminating Engineering Society of North America)	:	Application and Reference Volume
IEC 60598	:	Luminaries
CEA	:	CEA regulations and standard technical specification.

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All illumination systems shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The illumination systems shall be suitable for operation in a highly polluted environment.
- b. Lighting fixtures shall be suited for the following range of frequency and voltage variations:
 - i. Voltage Variation : $\pm 10\%$
 - ii. Frequency Variation : 50Hz (+)3% to (-)5%
 - iii. Combined Variation of Voltage & Frequency : 10% (absolute sum)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[2]	25.09.2014

- c. All emergency DC lighting systems shall be suited for voltage variation from -15% to + 10% of rated voltage.
- d. The design of the lighting systems shall be such that it shall ensure average lux levels specified for different areas.
- e. The illumination system shall comprise of the following:
 - i. Normal AC lighting
 - ii. Normal cum emergency lighting system
 - iii. 220V DC Emergency lighting system
 - iv. Maintenance 24V AC lighting system
 - v. Portable emergency lights with self contained battery packs.

1.4 Specific Requirements

1.4.1 Scope of work

The scope of work shall include design, preparation of Lighting design and manufacture, supply, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with Lighting system for following areas Listed below but not limited to the following:

[Note: With reference to particular package, scope of work shall be modified.]

a) TG Area:

- i) TG Platforms.
- ii) TG area Grade Levels Maintenance area.
- iii) Switchgear room and cable gallery.
- iv) All roads within battery limit.
- v) Perimeter and boundary illumination of the above premises.
- vi) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.

b) Boiler Area:

- i) Boiler Platforms
- ii) Boiler Grade Levels covering coal mill and Maintenance area.
- iii) ESP Platforms
- iv) ESP/FOPH switchgear room and cable gallery.
- v) FOPH area.
- vi) Transfer towers & Conveyor galleries.
- vii) All roads within battery limit.
- viii) Perimeter and boundary illumination of the above premises.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[3]	25.09.2014

- ix) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- c) Balance of plant Area:
 - i) Lighting system for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- d) CHP Area:
 - i) Switchgear rooms
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- e) AHP Area:
 - i) Switchgear rooms.
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard control room
 - ii) GIS building (if applicable)
 - iii) Transformer area
 - iv) All roads within battery limit.
 - v) Perimeter and boundary illumination of the above premises.
 - vi) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.

1.4.2 Illumination System Description

The plant illumination system shall comprise of the following categories:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[4]	25.09.2014

a. Normal AC lighting

In this system, the lighting circuits shall be fed by the 3 phase, 4 wire normal AC supply from the normal lighting distribution boards (LDB). All the lighting fixtures connected to this system shall be available as long as the 415V station / unit auxiliary service supply is available.

b. Normal cum emergency lighting system

Certain lighting fixtures considered essential shall be connected to this system. In this system the lighting circuits shall be fed from lighting distribution board connected to 415V Normal cum Emergency Switchgear. The lighting fixtures connected to this system shall be available whenever normal supply is available in the plant and also whenever DG set supplies the power to 415V Normal emergency switchgear.

These lighting fixtures will go off for a few seconds when normal supply fails but will be automatically restored when the emergency AC bus is re-energized by automatic transfer to standby DG supply.

[20% of the total fittings shall be fed from Emergency lighting for areas such as Switchgear room and control rooms etc.]

c. Emergency 220 V D.C. Lighting

The Emergency DC Lighting System shall be located strategically in critical operating areas and at emergency exits. Emergency DC lighting shall also be provided in the Control rooms, Switchgear/ MCC rooms and other strategically important areas. These fixtures shall be fed from respective Emergency DC Lighting Panels. The Emergency DC Lighting Panels (DC ELLP) shall be fed from 220V DC Distribution Boards (DCDB).

These lights shall remain normally OFF but on failure of AC supply these lights shall be automatically ON. Tube lights with Electronic choke suitable for 230 V, AC / DC operation or other Energy Efficient Lamps may be used for DC emergency lighting.

d. Maintenance 24 V AC Lighting System

For lighting facilities comprising portable hand lamps and/or connection of portable hand tools etc., required during the routine maintenance work, 24V single phase 3 pin sockets with switches shall be provided at selected points in the areas listed below. Such sockets for routine maintenance shall be clearly identified by colour coding in order to distinguish them from the normal 240V power outlets. Necessary outlets shall be made on the inside walls of the building near equipments.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[5]	25.09.2014

- i. Boiler area: Near inspection manholes on the boiler platforms and near boiler drum at different levels on all four sides.
- ii. TG building: Near HP & LP heaters, turbine flash tank, blow down tank, near condenser water box and near bus duct termination of generator end.
- iii. ESP columns: Near inspection manholes
- iv. Near de-aerator.
- v. Cable galleries.

Any other areas considered necessary identified during detailed engineering.

e. Portable Emergency Lights

This system shall be provided by portable self-contained battery / automatic charger / inverter fed compact fluorescent lamps in isolated buildings / areas where station D.C. supply is not available. These portable emergency light units shall be switched on automatically on loss of normal AC supply. *[Battery packs for portable emergency lights shall be rated for minimum 3 hours duty and the battery shall be of Ni-Cd.]*

f. Exit lights

Emergency escape signs shall be provided at the exit doors, escape routes, intersection corridors, at different floor levels/directions, windowless rooms, toilets, firefighting equipment, lifts, control rooms, switchgear rooms and the areas considered necessary by bidder. *[9W CFL]* lamp shall be used for exit lamps.

The contractor shall design emergency exit lighting system based on plant layouts and install escape lights at suitable locations considering the various escape routes. Emergency exit lights will be fed from normal-cum-emergency lighting panel, wherever available, *[and will be with in-built battery (Ni-Cd) back up of 3 hours operation.]*

1.4.3

Illumination Calculation

- a. Standard Lumen method shall be adopted for interior and exterior lighting in order to determine the number of lighting fixtures for obtaining the desired average level of illumination.
- b. The coefficient of utilization shall be considered to take care of Lumen loss due to:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[6]	25.09.2014

- i. Effect of room dimensions.
 - ii. Absorption of light in luminaries.
 - iii. Absorption of light at various room surfaces i.e. ceiling wall etc.
 - iv. Floor cavity, ceiling cavity.
 - v. Mounting height.
- c. Moreover a maintenance factor shall also be considered to account for the fall of illumination due to aging, pollution like dust deposits etc.
 - d. Voltage drop at the fixture terminals from the MLDB shall [not exceed 3%]. Circuit loading of each lighting Panel shall be done in such a way that almost balanced loading in all the phases i.e. R, Y and B is achieved. At least two sub circuits shall be used for illumination of a particular area. Sub circuit loading of each lighting panel shall be restricted to 2000 Watts.
 - e. Design of lighting system shall be such that the average lux level as specified is achieved. The Bidder shall submit illumination calculation/layout for the purchaser's review.

1.4.4 Lighting Distribution System

- a. Separate lighting transformers shall be provided inside the lighting distribution boards located at required location. Lighting distribution system shall be distinct and separate from the LV main distribution. Lighting transformers shall be encapsulated cast resin dry type.
- b. AC lighting panels shall have 240V single-phase, 2 wire incomer controlled by earth leakage circuit breaker and number of single phase outgoing circuits controlled by MCBs. The lights connected to a circuit or few circuits shall be 'ON' automatically through photocell for outdoor lighting. Provision shall be made for switching 'ON' the rest of the lights. Lighting fixtures in indoor areas shall be controlled from the respective lighting panels
- c. Normal 240 V AC Lighting System
For this system, lighting points shall be supplied at 240 V AC through 415 V, 3-phase, 4-wire, 50 Hz, LDB. The supply shall be derived from 415 V, 3-phase, 4-wire, 50 Hz switchgear through delta/star lighting transformer. The secondary of lighting transformer shall be connected to respective 415 V, 3-phase, 4-wire AC lighting distribution board (LDB). The LDBs shall be provided with number of outgoing circuits controlled by double pole MCBs to feed the lighting panels distributed in and around the plant. Different circuits shall be used from different source. The whole lighting network shall be balanced as far as possible.
- d. Normal/Emergency 240V AC System
For these systems, the distribution shall be by 415V, 3-phase, 4-wire, 50 Hz supply. This supply shall be derived from 415 V, 3-phase, 4-wire, 50

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[7]	25.09.2014

Hz normal emergency switchgear for NE & lighting through delta/star lighting transformer. The secondary of lighting transformer shall be connected to respective 415 V, 3-phase, 4-wire AC lighting distribution board (LDB). The LDBs shall be provided with number of outgoing circuits controlled by double pole MCBs to feed the lighting panels distributed in and around the plant.

e. Emergency 220 V DC Lighting System

The power supply shall be obtained from the nearest 220 V DC switchboard. DC lighting panel will have one (1) incomer controlled by double pole MCB, Outgoing circuits will be controlled by DP MCB. Upon failure of the normal-cum-emergency AC supply, emergency DC lighting fixtures will be made automatically ON. The change over in the reverse direction shall also be automatic.

f. Maintenance 24V AC Lighting System

24 V AC supply for maintenance purposes (for hand lamps and/or hand operated tools) shall be supplied from 24 V AC distribution panel, which receives 240 V power supply from 415 V/240V transformer modules of N/E switchgear. 24 V AC distribution panel consists of one incomer controlled by MCB, one 240/26.5 V dry type transformer of adequate rating and number of outgoing circuits controlled by MCB.

1.4.5 Illumination levels and choice of lighting fixtures

The area-wise distribution of average illumination levels and type of luminaries shall be as indicated below:

[Note: These are indicative only. However as per specific Existing project, Bidder may refer section I of this specification for exact details of type of fixtures.]

Table 2.0

Sl. No.	Area/Structure	Average Illumination Level in Lux	Type of Fixture	Type of Luminaries
A - TURBINE GENERATOR BUILDING				
1.1	General (auxiliary equipment areas)	200	Industrial well glass fixture, dust & jet proof, die cast aluminium body, stove enamel finish, vitreous enamel reflector integral mounted control gear/industrial bulk head with integral mounted control gear.	1x70 W/ 1x150 W HPSV lamp

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[8]	25.09.2014

Sl. No.	Area/Structure	Average Illumination Level in Lux	Type of Fixture	Type of Luminaries
1.2	Cable vault	100	Industrial type FTL with vitreous enamel reflector	Energy Efficient FTL
1.3	All switchgear room area (including off-site building control room)	250	Industrial type with vitreous enamel reflector	Energy Efficient FTL
1.4	TG Building operating floor	250	Industrial high bay with anodized aluminium reflector with all accessories including control gear	1x400 W Metal Halide lamp
1.5	Unit control room and Switchyard control room	400	Decorative recessed with wide angle mirror optic antiglare type	Energy Efficient FTL
1.6	Battery rooms	150	Corrosion-proof	Energy Efficient FTL
1.7	TG building ground, mezzanine floor and misc. floors	200	Industrial well glass with integral control gear	1x150 W/ 1x250W Metal Halide lamp
1.8	Air washer room and A/C plant room	200	Totally enclosed vapor proof with clear acrylic cover	Energy Efficient FTL
1.9	Unloading and maintenance bay	300	Industrial high bay with anodised aluminium reflector	250 W HPSV lamp (for mounting height > 9m)

LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[11]	25.09.2014

Sl. No.	Area/Structure	Average Illumination Level in Lux	Type of Fixture	Type of Luminaries
1.1	Control room	400	Energy Efficient 2x40W FTL industrial type of vitreous enamel finish and with Electronic choke suitable for 220V DC operation	CFL lamp
1.2	Other areas	250	Energy Efficient 2x40W FTL industrial type of vitreous enamel finish and with Electronic choke suitable for 220V DC operation	CFL lamp

1.4.6 Area wise distribution of Lighting system in plant

Area wise lighting distribution shall be as below:

Table: 3.0

Area/building	Percentage Distribution of Lighting		
	Normal	Normal & Emergency	220V DC
Turbine Generator Building (all the bays)	80%	20%	10%
Control rooms	80%	20%	10%
Boiler Area (Grade level & Platforms)	80%	20%	5%
Service building	90%	10%	5%
Various pump houses and electrical switchgear rooms such as AHP, CHP, FOPH switchgear room, etc.	90%	10%	5%
Electro static precipitator	90%	10%	5%
Switchyard and Transformer yard	80%	20%	5%

1.4.7 Lighting System Design

The lighting system design shall comply with the acceptable norms and the best engineering practices. The system design shall consider principles of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[12]	25.09.2014

lighting specified in following paragraph. The lighting layout shall be designed to provide uniform illumination with minimum glare. The layout design shall meet all the statutory requirement, local rules etc.

a. Indoor Lighting

The recommended values of illumination level for various areas in the plant are indicated in the table above. Lighting layouts shall be designed such that the ratio of minimum to average illumination shall not be less than [0.6]. Following factors shall be considered while arriving at the utilization factor to determine the number of fixtures for each area/buildings in the plant.

i. Maintenance Factor:

- Air conditioned clean interiors like office rooms, Laboratories, Auditoriums : 0.8
- Air conditioned clean interiors like office rooms, Laboratories, Auditoriums : 0.8
- Industrial areas with normal interiors such as workshops, stores : 0.7
- Industrial areas with dusty interiors : 0.6
- Industrial areas with very dusty interiors such a crusher house and junction towers : 0.5

ii. Reflection factor for wall/ceiling

- White and very light colors : 0.7
- Light colors : 0.5
- Middle tints : 0.3
- Dark colors : 0.1

iii. The working plane shall be considered at 0.85 m from the floor level.

iv. The value of the ratio of spacing (S) to mounting height (H) shall be commensurate with the type of fittings selected and uniformity of illumination. The suspension height for suspended fixtures shall not exceed 1 meter.

b. Outdoor Lighting

- i) The recommended illumination levels for outdoor areas are indicated in the above table.
- ii) Mounting height, spacing of flood lights shall be based on lamp wattage, uniformity of illumination and vertical angles. Ratio of minimum to average illumination shall not be less than 0.3 and for minimum to maximum shall not be less than 0.05.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[13]	25.09.2014

- iii) Maintenance factor shall be generally 0.6 under average conditions.
- iv) Flood lights for area lighting shall be mounted on building structures. For outdoor lighting i.e. around the power plant building and transformer yard provision to be made with 400W outdoor type lamps mounted on wall/structures.
- v) Automatic switching ON/OFF shall be shall be provided through timers/photo cells.
- vi) For road illumination inside the boundary limit lighting poles shall be provided and the distance between the poles shall not exceed 30m.
- vii) Aviation obstruction lights shall be provided on tall installations (Chimney, Cooling Towers etc) as per Airports Authority and international standards. Aviation warning lights shall be high intensity type-A flashing LED type with varying intensity for day and night.
- viii) In an area, the lighting fixtures shall be arranged in different phase / LPs such that even in case one lighting panel is faulty complete lighting is not affected. In any location the lighting shall be arranged from two phases.
- c. The circuit loading on each circuit shall be restricted to 80% of the MCB rating.
- d. The voltage drop from LDB and any fixture shall not exceed 3%.
- e. All lighting design calculations, layouts, conduit wiring diagrams, LDBs and LPs drawings and technical data sheets etc shall be furnished for Owner/ Owner's consultant's approval.

1.4.8 Lighting system equipment

- a. Lighting Distribution Boards (LDB) & Lighting Panels (LP)
 - i. The Lighting Distribution board shall be fed through 415V/433V lighting transformers with off circuit taps $\pm 5\%$ in steps of 2.5%. The lighting transformer shall be cast resin dry type , vector group of [Dy1], class F insulation with temperature rise limited to class F and shall be housed in a suitable enclosure. In general, the transformers shall conform to the specification covered under 'Service transformers. The lighting distribution boards shall consist of MCCB incomer and required number of double pole MCB controlled out going feeders to LPs. The LDB shall be designed for the required short circuit level of [20] kA. All the distribution boards shall be sheet steel clad, dust and vermin proof, cubicle type with degree of protection conforming to IP-52. Outdoor panels shall be weather proof type with IPW-55 protection. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[14]	25.09.2014

thickness of sheet steel enclosures shall be CRCA, 2 mm minimum for load bearing and 1.6 mm for other members.

- ii. Number of outgoing feeders in each LDB shall be provided as per requirement including the minimum 3 nos spare feeders for "Purchaser use". Each outgoing MCB in LDB's shall be of 15 A, but load to be limited to 2 kW or maximum 10 nos. fittings to be connected to one MCB
- iii. Individual control in office buildings shall be through single pole flush type switches/MCBs. In those areas where group controls are required, rotary switches shall be provided
- iv. External area lighting shall be fed from separate boards located at suitable places. Automatic switching ON/OFF of these circuits shall be done through timers/photo cell.
- v. In high bays, walkway shall be provided for maintaining light fittings. At other places suitable ladder / platform / approach shall be provided for maintaining / replacement of light fittings.
- vi. Each of the LDBs shall be provided with voltmeter and ammeter along with selector switches, "SUPPLY ON" indicating lamps, etc. The switch boxes, receptacle boxes etc. shall be made up of 18 SWG sheet steel.
- vii. Two ground pads with bolts and nuts shall be provided on each board for connection to 50x6/25x3 mm GS flat.

b. Lighting Fixtures and Lamps

- i) Fluorescent fixtures with electronic ballast shall be generally provided for a room height upto 5m. Type of fixture shall be industrial type with gasket, clear acrylic cover and enamelled reflector or decorative type to suit the aesthetics. For areas with false ceiling, recessed mounted decorative fixtures with mirror optic louvres shall be used. In control room / computer rooms, decorative mirror optic fluorescent light fittings with antiglare features shall be provided. The surface finish shall be smooth, unobtrusive and scratch resistant.
- ii) Reflector shall be of sheet steel or aluminium, minimum 20 SWG thick and securely fixed by fastening device of captive type.
- iii) Fixture shall be suitable for 19 mm conduit entry and 16 SWG GI earth wire connection.
- iv) Fixture shall be furnished complete with lamps and integrally mounted accessories. These shall include holders, ballast, capacitor, starter, ignitors (separate type) etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[15]	25.09.2014

- v) For corrosive areas, corrosion proof lighting fixture shall be provided. For hazardous areas, light fittings, conduits, junction boxes etc. shall have to meet the corresponding area classification requirement.
- vi) Medium bay or high bay type of lighting fixtures with HPMV/HPSV lamps shall be used depending on the mounting heights for indoor areas having room height more than 5m. Medium/ High bay fixtures shall be provided with vibration damper wherever required.
- vii) For areas like boiler and outdoor areas such as roads, street, transformer areas and open yards, weatherproof HPSV flood/ street lighting fixtures shall be used. For areas like boiler platforms, weatherproof well glass type HPSV fixtures with wire guards shall be used.
- viii) All type of fluorescent lamps including Compact Fluorescent Lamp (CFL) shall be bi-pin rotary type and either cool daylight or white.
- ix) Mercury / Sodium vapour lamp shall be colour corrected type with screwed cap.
- x) Lamps shall be suitable for use in position and capable of withstanding small vibrations.
- xi) Ballasts shall be of heavy duty, low loss and polyester-filled type with copper winding.
- xii) Ballasts for Mercury / Sodium vapour lamps shall be provided with suitable tappings to set the voltage within range specified.
- xiii) Ballasts shall be free from hum. Ballasts which produce humming sound shall be replaced, free of cost.
- xiv) In multi-lamp fixture, each lamp shall be provided with individual ballast.

c. Switches, Receptacles

- i. In the plant areas, the lighting circuits shall be controlled directly from the MCBs in the lighting panels. Wherever the lighting panel is not in the same area, separate switches shall be provided. For cabins, rooms, etc., separate switches shall be provided for each point. Similarly for entrances, building periphery lighting separate switches shall be provided
- ii. 240V, 50 Hz, 3 pin Power Receptacles (5A, 15A) shall be provided in all building/areas of the plant. Inside a building, receptacles shall be provided at interval of 30m or part thereof for hand tools, water coolers, exhaust fans etc. Inside each cabins at

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[16]	25.09.2014

least two receptacles shall be provided and the same shall be indoor/outdoor/flameproof as per the location. Minimum 2 nos of 5A and 1 no 15A receptacles shall be provided in each room. Receptacles shall be heavy duty, complete with individual plug and switch as described below:

Table: 4.0

S.No.	Type	Description
1	RA	5A, 240V, 2 Pole, 3 Pin with third pin earthed - Suitable for flush mounting in office areas and control room. The switch shall also be flush mounting piano type.
2	RB	15A, 240V, 2 Pole, 3 Pin with third pin earthed - Wall/column mounted, metal clad gasketed construction, suitable for 19 mm conduit entry, screwed metal cover tied with metal chain, weatherproof construction suitable for indoor/outdoor installation. This shall be provided at an interval of 30m, or minimum one in each room.
3	RC	63A, 415V, 3 Phase, 5 pin interlocked plug and switch with fifth pin earthed. Wall/column mounted, metal clad gasketed construction weather proof, suitable for loop in/ loop out connection of 4 Core 35 sq.mm AYWY cable. These receptacles shall be provided at an interval of 50m throughout the Plant Area.
4	RD	100A, 415V, 3 phase, 5 Pin interlocked plug and switch with fifth pin earthed Wall/column mounted metal clad gasketed construction weather proof, suitable for loop in/ loop out connection of 3.5 Core, 95 sq.mm AYWY cable.

d. Cables and Wiring

- i. Wiring from lighting DBs/panels to individual fixtures, plug points, fans, etc. shall be of single core, 2.5sq.mm, 1100 V grade PVC stranded copper conductors through surface mounted or concealed medium duty GI conduits confirming to IS 1239 with earth wire. The wires in the conduits shall not exceed 60% of the conduit area.
- ii. 1100V grade stranded copper conductor, PVC insulated, colour coded, wires laid in GI conduits shall be used for lighting in non-hazardous area. In the hazardous area, outdoor areas like transformer yard and road lighting, cabling shall be adopted. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[17]	25.09.2014

specification of cable shall conform to the details indicated in "Cabling System" section.

- iii. Minimum size of wires in case of conduit wiring shall be 2.5sq.mm copper in case of lighting and 4sq.mm copper in case of receptacle wiring
- iv. Wires of different phases shall be run in separate conduits. However, wires of same phase but having different circuit nos. can be run in same conduit. Wires of lighting and power receptacles shall be carried out in separate conduits and on separate circuits. Wires of AC and DC lighting system shall be carried out in separate conduits
- v. For outdoor lighting, the cable shall be buried at a minimum depth of 750 mm from ground level or run in cable trays. The buried cables shall have suitable bedding, protective covers and markers
- vi. Material used for saddles, clamps, JBs, etc. shall be galvanized
- vii. Office buildings, laboratory buildings shall have concealed wiring with 2.5sq.mm wires using PVC conduits. In heat zones, i.e. in the areas where ambient temperature is 600 C and above, heat resistant control cables shall be used in hot dip galvanised rigid steel surface mounted conduits

e. Fans and Regulators

- i. The fans shall have three well balanced blades, double ball bearings and shall be reasonably free from noise. Fan motor shall be totally enclosed type with copper winding and class-E insulation. Sweep shall be given as 1200 /1400 mm.
- ii. Regulators shall have minimum five steps. Electronic Regulators with smooth control shall be provided.

f. Flame-Proof Equipment

- i. The enclosure of all flameproof equipment for use in hazardous areas where gases/vapors of Group I, IIA, IIB are present, shall be of cast iron/cast aluminum, stove enamel finished. Chemical corrosion resistant epoxy finish shall be provided in corrosive areas. The construction shall comply with relevant applicable standards
- ii. If the enclosures are additionally required to be weather proof, neoprene gaskets shall be provided to make the enclosure dust and weather proof providing a degree of protection of IPW 55.
- iii. All ferrous parts, exposed to atmosphere shall be suitably plated/galvanized

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[18]	25.09.2014

- iv. All internal wiring shall be connected to terminal blocks provided in terminal enclosure on incoming side.
- v. Flameproof cable gland entries shall be provided suitable for the cable sizes. The number of required cable entries for junction/terminal boxes as required for branching, terminating of cables for lighting distribution shall be provided. All unused cable entries shall be closed by flameproof plugs.
- vi. Flameproof receptacle unit (socket with associated switch/MCB and plug) shall have interlocking feature such that plug cannot be inserted or taken out with switch/MCB in "ON" position.
- vii. Adequate mounting lugs with necessary hardware shall be provided for mounting the equipment on wall/structure.
- viii. These enclosures shall have inscription warning against opening the enclosure unless the circuit is isolated. Equipment rating and ON/OFF positions of switches/MCBs shall also be designated.
- ix. The BIDDER shall indicate that the enclosures have been tested and certified by relevant statutory authorities for use in hazardous areas.

g. Lighting poles and towers

- i. Lighting poles for street lights and flood lights shall be of swaged and welded steel, pole of height 9M/11M and shall conform to relevant standard. Poles shall be hot dip galvanized internally and externally after fabrication as per IS 2629 / IS 2633 / IS 4759 standards. The Poles shall be designed to withstand the maximum wind speed as per IS 875. The steel sheet used to manufacture steel poles shall be of minimum thickness of 3 mm and shall conform to relevant standard . Junction boxes shall be provided with weather proof flush doors and locking facility. Bidder shall design and furnish the foundation drawings for the poles to withstand basic wind speed of minimum [50]meter/sec.
- ii. The supply of poles/Towers shall be complete with base plate, foundation bolts, hot dip galvanized brackets / necessary pipe reducer for fixing the fitting and also include the necessary associated pole mounted junction boxes.
- iii. Towers for mounting flood lights shall be e of continuously tapered poly gonol cross section and shall be supplied with all acesssories. Steel structure for towers shall be made of hot dip galvanized steel. A steel ladder and platform at the top shall be provided. The length of each step of the ladder shall be at least

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[19]	25.09.2014

300 mm and spacing between two adjacent steps not more than 300 mm. The structure shall be suitable for mounting the required number of flood lights, weights of maintenance crew and specified wind pressure. The factor of safety shall be [2] for each part and section. The Contractor's structural design drawings shall be approved by the Purchaser before fabrication.

1.4.9 Name Plate

Name plates shall be furnished for identification of devices and circuits. All switches, controls and indications shall be permanently and legibly marked in English regarding the functions.

1.4.10 Painting

All surfaces shall be sand blasted, pickled and grounded as required to produce a smooth, clean surface free of scale, grease and rust.

After cleaning, the surfaces shall be given a phosphate coating followed by 2 coats of high quality primer and stoved after each coat.

The equipment shall be finished in approved color shade by owner with two coats of epoxy based powder coated paint. The coating shall be done electro statically followed by stoving.

Sufficient quantity of touch-up paint shall be furnished for application at site.

1.5 Tests

I) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant /purchaser or his representative.

Tests on Lighting Distribution Boards / Panels shall include:

- a. Wiring continuity tests.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[20]	25.09.2014

- b. High voltage and insulation tests.
- c. Operational tests.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6

Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *Lighting panels & distribution boards.*
- b) *Receptacles & Junction boxes.*
- c) *Street light poles & towers.*
- d) *Lighting fixture complete with lamps and accessories.*
- e) *Non-integral/separate type control gear box for lighting fixtures, as applicable.*
- f) *Lux level calculations for each area.*
- g) *Data sheets for lighting fixture, lamps, accessories with light distribution curves, co-efficient of utilization charts etc. Type and routine test certificates of transformer and cables.*
- h) *Control schematic and wiring diagram of 415V AC/220V DC lighting panel with automatic changeover from AC to DC and vice-versa, 415V normal AC Street/area lighting panel with automatic ON/OFF feature.*
- i) *Technical leaflets and data sheet on each piece of equipment/ device such as MCB, switch, fuse, receptacle etc. Type and routine test certificates of transformer and cables.*
- j) *QAP and relevant test certificates*

R&M CONTRACTORS**

**TURBO GENERATOR & AUXILIARIES
(PACKAGE NUMBER: R&M-SP-02)
VOLUME-II
SECTION-II, PART-B, ANNEXURE-E10
TECHNICAL SPECIFICATION FOR CABLE CARRIER
SYSTEM**

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E10**1.0 CABLE CARRIER SYSTEM****1.1 General**

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Cable Carrier system complete with all accessories for efficient and trouble free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS 800	Code of Practice for structural Steel
IS 1646	Code of Practice for Fire Safety of buildings
IS2667	Fittings for Rigid steel Conduits
IS 3419	Fittings for Rigid Non – Metallic Conduits
IS 3837	Accessories for Rigid Steel Conduits
IS 4649	Adaptors for Flexible Steel Conduits
IS 5216	Guide for Safety Procedures and Practices in electrical Work

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[1]	25.09.2014

1.3 Design Criteria

- a) Cable and cable trays shall be installed in an ambient temperature of 50 °C and relative humidity of 95%.
- b) The cable carrier system shall be designed considering the following:
 1. Facility for easy laying of cables.
 2. Access to maintenance.
 3. Neat and aesthetic appearance.
 4. Safety of equipment & personnel.
 5. Ground water seepage.
- c) Cables shall be laid in prefabricated ladder/perforated type trays and in conduits. Direct burial of cable shall be mostly avoided.
- d) Upper cable trays and all vertical cable trays shall be provided with tray covers.
- e) Cable filling in the trays or racks shall not exceed 80%. Conduits if used, the wires in the conduits shall not exceed 40% of the conduit area.
- f) Different voltage grade cables shall be laid in separate trays when trays are arranged in tiers. H.V cables shall be laid in top trays and cables of subsequent voltage grade in lower tier of trays. Instrumentation cables shall be laid at bottom most tray.
- g) At least 300mm clearance shall be provided between HV and LV cables & LV and control/Instrumentation cables.
- h) Support system for cables shall be prefabricated type.
- i) Single core cables shall be laid in trefoil touching formation. Trefoil clamp shall be provided in a staggered manner.
- j) 1100V grade power cables of [120] mm² size and above shall normally be laid in single layer in trays/on racks.
- k) 1100V grade power cables below [120] mm² may be run in double layers in case of space restrictions.
- l) Control and instrumentation cables can be laid up to a maximum of three layers in each tray/rack.

1.4 Specific Requirements

1.4.1 Scope of work:

The scope of work shall include Design, Preparation of Cable Tray, Trench/Duct bank/Conduit Layout, supply of Cable tray and its Accessories, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with the Cable Carrier System

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[2]	25.09.2014

for following package. The below list indicates area where cable carrier system to be provided but not limited to:

[Note: With reference to particular package, scope of work shall be modified.]

a) TG Area:

- i) TG Platforms.
- ii) TG area Grade Levels Maintenance area.
- iii) Preparation of Cable schedules and Inter Connection schedules/Diagram.
- iv) Laying and Termination of power & control cables for all the equipments of TG package.

b) Boiler Area:

- i) Boiler Platforms
- ii) Boiler Grade Levels covering coal mill and Maintenance area.
- iii) ESP Platforms
- iv) ESP/FOPH switchgear room.
- v) FOPH area.
- vi) Preparation of Cable schedules and Inter Connection schedules/Diagram.
- vii) Laying and Termination of power & control cables for all the equipments of Boiler package.

c) Balance of Plant Area:

- i) Cable Carrier System for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, Transformer area, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
- ii) Laying and Termination of power & control cables for all the equipments of BOP package.

d) CHP Area:

- i) CHP Switchgear room
- ii) Conveyor.
- iii) Crusher House
- iv) Stacker and Reclaimer
- v) Any other area covered in this package.
- vi) Laying and Termination of power & control cables for all the equipments of CHP package.

e) AHP Area:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[3]	25.09.2014

- i) AHP Switchgear room.
- ii) Silo Area.
- iii) Any other area covered in this package.
- iv) Laying and Termination of power & control cables for all the equipments of AHP package.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard
 - ii) Transformer yard
 - iii) Inter plant cabling.
 - iv) Any other area covered in this package.
 - v) Laying and Termination of power & control cables for all the equipments of eBOP package.
- g) All civil and structural works necessary for successful installation and commercial operation of all electrical equipment to be erected under this specification. Supply of cement, sand, stone etc. required for the execution of the contract shall be the responsibility of the Bidder.
- h) All other ancillary works in connection with the items of work described above which are not specifically mentioned but are necessary to complete the work.
- i) For Terminal Points and Exclusions of Cable Carrier system and Specific scope of work Bidder may refer section I of this specification.

1.4.2 General Installation Requirements:

- a) Cable trays shall be fabricated from 14 gauge mild steel sheets. Cable trays shall be of hot dip galvanized Steel of ladder/perforated type, complete with all necessary coupler plates, elbows, tees, bends, reducers, stiffeners and other accessories and hardware as detailed in the relevant drawings to be submitted by Bidder. All hardware (i.e. bolts, nuts, screws, washers, etc.) shall be hot dip galvanized.
- b) Constructional details, supporting arrangement and installation details for cable trays shall be furnished by Bidder.
- c) Each 2.5 meter section of all types of cable trays and all elbows, tees, crosses, etc. shall be provided with two side coupler plates and associated bolts, nuts and washers.
- d) Cable tray covers shall be fabricated from 16 gauge MS sheets. Cable tray covers shall be hot dip galvanized and same shall be provided for all outdoor cable trays and vertical raceways/trays. Covers for vertical raceways shall be in individual, easily removable sections to facilitate cable maintenance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[4]	25.09.2014

- e) Cable Tray of Standard width of 600mm shall be followed. However, trays with 450, and 300, 150 mm width may be used in some places considering the requirement and space restrictions. For instrumentation and control purpose, some perforated type cable trays of width 150 mm may be used particularly in Boiler Platform area, and 600, 450, 300 mm perforated trays may be used depending on site requirement.
- f) Cable trays shall be ladder type with maximum rung spacing 250 mm depth 100 mm and rung width not less than 50 mm.
- g) Cable trays in areas subjected to excessive coal dust, or mechanical damage shall have hot-dip galvanized sheet metal tray cover installed on front tray in vertical run and inverted 'V' type on upper tray in horizontal run. Where covers are used on trays containing power cables, consideration should be given to ventilation requirements. Areas where corrosive chemicals are likely to be handled, cable tray and covers shall be epoxy painted.
- h) Suitable embedded steel inserts shall be provided on wall/floor/ ceiling surfaces for welding of cable tray bracket in order to make the cable tray system withstand horizontal / vertical accelerations due to seismic forces for indoor trays and also wind load for outdoor trays such as on Boiler platforms in addition to normal tray cable loadings.
- i) Cable installation work shall mean erection of cable trays/racks, supports, hangers, junction boxes, conduits, laying of cables either in ground or on trays inside trenches tunnels/overhead trays in conduits etc. dressing and clamping, jointing and termination inclusive of supply of necessary jointing/termination kits, lugs, glands, ferrules, tapes etc. and other accessories, grounding of cable armor. In case of direct laying in ground, all excavation work, necessary back-filling, supply of bricks and protective concrete slabs, removal of excess earth shall be part of the installation work.
- j) Erection of cabling work shall be executed keeping in view all necessities and requirements of fire fighting codes for Generating Stations having an adverse industrial environment.

1.4.3 Cable Routing/Laying

- a) Cables shall generally be laid on ladder type cable trays either in trenches or overhead supported from building steel/structures except in some

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[5]	25.09.2014

cases cables may have to be laid underground and for short runs in conduits for protection while crossing roads and other facilities.

- b) For interplant connections, the cables may be routed through an overhead cable bridge or cable trenches/tunnels selection being dependent on site constraints.
- c) For underground crossing of railways, roads etc. hume pipes shall be used and shall be laid at a depth of minimum 1000 mm such that cables shall not be damaged.
- d) In boiler area, trench shall be avoided as far as practicable. The cable racks shall be supported from Boiler structure in vertical configuration with suitable cover to avoid deposition of coal dust as far as practicable.
- e) Different voltage grade cables shall be laid in separate trays when trays are arranged in tiers. Power cables shall be on top trays and Control/Instrumentation cables on bottom trays, and it is recommended that trays for cables of different voltage levels be stacked in descending order with higher voltage level above.
- f) Cables for redundant equipment/system shall be run in separate trays in separate route.
- g) Cables from two different services viz. supply from station board and supply from unit board shall be fully segregated to prevent simultaneous damage due to fire in one of the services.
- h) Low level signal cables and other special Instrumentation and Control cables shall run in separate trays. In general, a minimum of 1500 mm clearance shall be maintained between these cables and noise generating equipment (large motors, generators, transformers etc.).
- i) The cable spreaders of each unit shall be compartmentalized by provision of fire proof partition wall and fire proof doors.
- j) The floor of the cable spreader rooms shall have to be made water proof so that water does not percolate to lower levels in the event of fire fighting operations. Adequate arrangement for efficient drainage of water shall be provided. The cable raceways should also be suitably planned to avoid water entry through this place.
- k) Cables shall generally be laid on cable trays either in concrete trenches or overhead supported from building steel/structures. Cables shall be run in concrete trenches in those electrical rooms at ground level, which are without any spreader room below. In mechanical equipment areas (Indoor), overhead cable trays shall generally be used.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[6]	25.09.2014

- l) For inter plant connections, the cables shall be routed through an overhead cable bridge pipe cum Cable Bridge. For isolated but long outdoor cable route with very few cables of 3/4 nos., the cables may be directly buried with prior permission from the purchaser.

1.4.4 Installation of Cables

- a) The Bidder shall install, terminate and connect up all cables and conduits with supporting arrangements as per drawings, cable schedules and interconnection chart/drawings.
- b) The HV power cables of 6.6kV shall be laid in trays or racks as follows:
- In single layer only.
 - 3 core cables to be laid in touching formation.
 - Cables in trefoil groups of the same circuit shall be laid as indicated below so as to ensure balanced current distribution:

Y Y Y Y

R B B R R B B R and so on.

- c) 1100V grade power cables shall be laid in single layer in trays depends on size of cables. Cable of up to 120 sqmm shall be laid in two layers. Beyond this size single layer will be followed.
- d) Control and Instrumentation cables can be laid up to a maximum of three layers in each tray.
- e) The trays shall be run with a vertical spacing of 300 mm for overhead cable trays as well as inside cable trenches. A minimum of 225 mm clearance shall be provided between the top of tray and beams, cold piping, 500 mm clearance for hot piping/object to facilitate installation of cables in tray.
- f) Adequate pull boxes shall be provided in conduit run to facilitate cable pulling in long runs and also to ensure that there shall not be more than 2 nos. 90 Deg. Bends between pull points.
- g) Cable tray/conduit system shall be installed to accommodate cable manufacturer's recommended maximum pulling tension, minimum bending radius and no. of bends.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[7]	25.09.2014

- h) All openings in the floor and wall for cable access shall be sealed after installation of the cable system with non-inflammable materials, as follows :
- Fire stop/Penetration seal shall be installed in the cable spreaders and cable raceways.
 - Similarly in the trenches fire stop/penetration seals shall be provided at suitable interval to avoid spread of fire.
 - For all HV, LV, Relay and Control panels, Control desk, instrumentation panels, battery charger, D.C. Dist. boards and other miscellaneous panels, fire-stops should be provided below base plate.
- i) All floor/wall openings for cable entry to the electrical equipment and accessories shall be sealed with non-inflammable materials, after completion of cable installation. Thickness of such materials shall be equal to the thickness of floor/wall unless specified otherwise.
- j) The portion of galvanized steel, which, if required, undergoes any welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.

1.4.5 Cable Termination and Joints (if applicable and not covered in cable specification)

- a) The Bidder shall supply cable termination and jointing kits in requisite quantity for HV. Power Cables, LV. Power, Control Cables, etc. along with all accessories & consumables required for making termination and joints complete . All the materials and components of the termination/joints shall be suitable and compatible with the type of cables for which the terminals/joints are intended.
- b) The straight through joints of HV. cables shall be heat shrinkable and pre moulded push on type. The end termination kits for HV. cables shall be of {Raychem/3M/Elastimold} type. Cable joint or end terminations on Electrical equipment shall be suitable for Indoor & Outdoor use, as the case may be.
- c) Glands and lugs required for termination of HV, LV. shall be supplied by the Bidder in required quantity.
- d) Cable glands shall be tinned brass gland, double compression type complete with necessary armour clamp and tapered washer etc. Cable glands shall match with the sizes of different HV/LV/Control cables.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[8]	25.09.2014

- e) Cable lugs shall be suitable for termination of different cross-sections of L.V./Control cables and shall be of following types:
 - i. Aluminium tubular terminal end for solderless crimping to aluminium conductors.
 - ii. Copper tubular terminal end for solderless crimping to copper conductors.
 - iii. Solderless crimping of terminals shall be done by using corrosion inhibiting compound. The cable lugs shall suit the type of terminals provided on the equipment. Lugs for control/instrumentation cables shall be PVC insulated/sleeved type.
 - iv. Cable lugs for control cable termination shall be insulated. These lugs shall be pin type/flat type/ring type/U type to suit the terminals provided in the panels.
 - v. The terminations shall with tinned copper only.
 - vi. For mill area, the cable shall be routed through GI pipes embedded in Ground.
 - vii. In heat zone areas as far as possible the cables shall be taken away from the area to avoid heat. If cabling in the heat zones can not be avoided, the cables shall be terminated in junction box of IP 67 protection class away from the heat zones and small length of cables may be laid from junction box to the respective equipment to facilitate easier replacement in case of fire. Bunching of cables in the heat zones and boiler areas shall be avoided and laid in separate groups.

1.4.6 Identification

- a) The complete cabling system shall be properly identified. Methods for identification of cabling system will be furnished to the Bidder and the Bidder shall strictly adhere to the said methods.
- b) Each cable and conduit run shall be tagged with numbers that appear in the cable and conduit schedule.
- c) Location of cables laid directly underground shall be clearly indicated with cable marker made of galvanized iron plate, projected above ground level.
- d) Cable tags shall be provided on all cables at each end (just before entering the equipment enclosure), on both sides of a wall or floor crossing, on each duct/conduit entry, at each bend and at every thirty (30) meters in cable tray/trench runs. Cable tags shall also be provided

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[9]	25.09.2014

inside the switchgear, MCC, control & relay panels etc. wherever required for cable identification, such as where a number of cables enter together through a gland plate.

1.5 Tests

I) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant / purchaser or his representative.

- a) Checking of continuity / phasing and IR values for all the cables before and after HV test
- b) Checking of continuity / phasing and IR values for all the cables before and after HV test.
- c) HV test and measurement of leakage current after termination of cable kits (for HT cables).
- d) Checking of earth continuity for armour.
- e) Check for mechanical protection of cables.
- f) Check for identification (tag number system) distance placement of cable marker, cable joint etc. as per the cable layout drawing.
- g) Check earthing of cable structures.
- h) Check safe head room in gallery area
- i) Check clearance from ventilation duct and light fittings for cable structures.
- j) Check proper fixing of cable structures.
- k) Check for proper drainage and removal of water (if any).

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors –Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[10]	25.09.2014

obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) [General arrangement drawing Cable Tray]
- b) [Cable Tray Accessories like Tee, Cross, Bends, Coupler, Reducer etc]
- c) [Cable Tray support materials]
- d) [Technical Data sheets for cable carrier system].

1.7 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

ANNEXURES-E11

1.0 EARTHING AND LIGHTNING PROTECTION SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Earthing and Lightning Protection System complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS:2309	Code of Practice for the protection of building and allied structures against lightning.
IS:2629	Recommended practice for hot dip galvanizing of iron & steel
IS:2633	Method for testing uniformity of coating on zinc coated articles.
IS:3043	Code of practice for Earthing
IS:9537	Conduits for electrical installation.
IEEE:80	IEEE guide for safety in AC substation grounding
IEEE:142	Grounding of Industrial & commercial power systems
CEA	CEA Regulations and standard technical specification for main plant package.

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[1]	25.09.2014

1.3 Design Criteria

- a) Earthing system design shall consist of earth grids and electrodes buried in soil in the whole plant area, embedded in concrete inside all the buildings to which all the electrical equipment, metallic structures are connected to have earth continuity for safety reasons.
- b) The main objectives of earthing system is to:
 1. Provide safety to personnel from contact of dangerous potential caused by ground fault.
 2. Ensure sufficient grounding current for effective relaying.
 3. Stabilize circuit potential with respect to ground.
- c) The earthing conductor shall be designed for fault current of [50 kA] for duration of 1 second.
- d) It is the responsibility of the Bidder to undertake the soil resistivity measurements at site and select suitable size of conductor based on the soil resistivity.
- e) Ground conductor shall be of galvanized steel for above ground and mild steel for embedded and below ground earthing.
- f) Main earth grid conductor shall be mild steel (MS) of [40] mm dia.
- g) Suitable corrosion allowance shall be considered over ground conductor size depends upon soil resistivity.
- h) The main purposes of lightning protection system are to :
 1. Provide protection to structures from lightning strokes.
 2. Provide a low resistance-conducting path to lightning discharge.
 3. Lightning protection shall be provided as per IS: 2309 for Boiler area and other tall structures within the battery limit.

1.4 Specific requirements

1.4.1 Scope of Work

The scope of work shall include Design, Preparation of Earthing and Lightning Layout, supply, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with the safety earthing and Lightning Protection system for following areas Listed below but not limited to the following:

[Note: With reference to particular package, scope of work shall be modified.]

- a) TG Area:
 - i) TG Platforms.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[2]	25.09.2014

- ii) TG area Grade Levels Maintenance area.
- iii) All equipments, structures etc of TG package.
- iv) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- b) Boiler Area:
 - i) Boiler Platforms
 - ii) Boiler Grade Levels covering coal mill and Maintenance area.
 - iii) ESP Platforms
 - iv) ESP/FOPH switchgear room.
 - v) FOPH area.
 - vi) All equipments, structures etc of Boiler package.
 - vii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- c) Balance of plant Area:
 - i) Earthing and lightning protection system for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, Transformer area, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
 - ii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- d) CHP Area:
 - i) Switchgear rooms
 - ii) All equipments, structures etc of Boiler package.
 - iii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- e) AHP Area:
 - i) Switchgear rooms
 - ii) All equipments, structures etc of Boiler package.
 - iii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard, Transformer yard and BTG area are provided with earth mat of [40] mm dia MS Rod conductor buried below 600mm from ground level. Areas like AHP, CHP, Boiler and TG, and all other

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[3]	25.09.2014

BOP area below grounding system are covered in this eBOP package and above ground earthing for AHP, CHP, Boiler, TG and Mechanical BOP are covered in respective package itself. System Neutrals are earthed through Treated Earth Pit. All areas of power plant are interconnected to form an integrated single earthing system. Lightning system for above ground are covered in respective packages and below ground is covered in this eBOP package in same way as earthing system.

1.4.2 Earthing system

- a) Earthing system shall be designed in accordance with IS 3043 and Indian Electricity Rules and Acts.
- b) Fault current for the earthing system shall be designed for [50] KA for duration of 1 sec.
- c) All electrical equipment, non-current carrying metal parts, structures, building steel, lightning protection system, transformer neutrals shall be connected to station ground grid.
- d) Treated earth pits including riser shall be provided for transformer neutral earthing.
- e) Connection between the equipment earth lead and the grid conductor shall be welded. For rust protection, the welds shall be treated with zinc chromate primer and coated with zinc rich paint.
- f) Entire erection of grounding work shall be carried out in such a way as to be capable of withstanding the intended services of carrying full short circuit level currents to ground mat without any damage/deformation.
- g) All off site area of AHP , CHP etc shall be provide with peripheral earthing with at least two connection to main station earth grid through treated earth pit.

1.4.3 Ground Grid Conductor

- a) Ground grid conductor of mild steel rod shall be used.
- b) *[The minimum conductor section is determined on the basis of ground fault current. This section is then increased by an allowance to account for the soil corrosion loss of 0.12 mm (on diameter of conductor) per year over the design life of 40 years.]*
- c) However bidder shall consider as per CBIP norms “ Manual on Earth mat design” the corrosion allowance as below:
 - For soil resistivity greater than 100 ohm-meter: No allowance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[4]	25.09.2014

- For soil resistivity greater than 25- 100 ohm-meter: 15% allowance.
- For soil resistivity less than 25 ohm-meter: 30% allowance.

1.4.4 Underground Grid

- The ground grid mesh is designed to keep the touch and step voltages within safe limits as per recommendation of IEEE 80.
- [The ground grid conductors shall be buried in earth at a depth of 600 mm]. The length of ground conductors below earth shall be sufficient to ensure a ground resistance less than one (1) ohm.
- The ground grid conductor shall be so laid as to provide short and direct connection to building steel and major electrical equipment.
- Ground rods shall be provided at the points where system neutrals/lightning protections are connected to the ground grid.
- All ground grid conductor connections shall be welded type.
- Ground grid shall be interconnected with the ground grid of neighboring areas at least at two (2) points for further reducing the ground grid resistance.
- Suitable pigtails shall be provided and shown in the [layout drawing] for connection with ground grid of neighboring areas.
- A minimum earth coverage of [300] mm shall be provided between the ground grid conductor and the bottom of trenches, tunnels, underground pipes, foundations, railway tracks etc. The ground grid conductor shall be re-routed in case it fouls with equipment foundations.
- In some cases, it may happen that the construction work of cable trench, foundation and laying of underground pipes are being taken up after the grounding mat has been laid. It may be required to cut a portion of grounding conductor to avoid fouling with cable trench, equipment foundations, underground pipes etc. In this case, the ground conductor shall be properly rerouted and rejoined/reconnected with the main grounding mat during the construction/laying of above underground objects and good electrical continuity of grounding conductor shall be ensured.
- Grounding conductors crossing the road may have to be laid at greater depth to suit the site conditions.
- Grounding conductor around the building shall be buried in earth at a minimum distance of [1200] mm from the outer boundary of the building.
- The Bidder shall carryout the grounding of all electrical equipments and connection to main earth grid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[5]	25.09.2014

1.4.5 Ground Electrode

Ground electrodes shall be [40] mm dia. and [3] metre long M.S. rod. These are to be fabricated and driven into the ground by the side of mat conductors. All connections to the conductors shall be done by arc welding process.

1.4.6 Above Ground Connections

- Galvanized steel flats shall be used for all connections above earth.
- Inside building, ground conductors shall be run for each floor supported on building steel and/or cable trays. These ground conductors in turn shall be connected to the station ground grid through riser (at least two) coming up along building columns/cable shafts.
- Two separate and distinct ground connections shall be provided for each electrical equipment in compliance with I.E. Rules.
- All steel columns and structures shall be connected to the earth mat through earth leads.

All connections above ground shall be welded type except connection to equipment/structures which shall be bolted type.

1.4.7 Risers

Risers are required for connecting the equipment and structures with the ground mat. Risers are to be provided from underground mat to above ground levels where the ends shall be left free for connecting to the equipment. Each riser shall be 1 No. [40] mm dia. M.S. rod and shall project above grade level/concrete floor level by minimum 300 mm. They are to be clamped or supported along the outer edge of the concrete foundation. Connection to the ground mat shall be done by arc welding.

1.4.8 Equipment Ground Lead

- Equipment ground connections shall be sized to carry the ground fault current. Considerations shall also be given to mechanical ruggedness of the connections and to limit the number of sizes.
- The minimum ground conductor sizes for various equipment and structures are given in below.

Table 2.0

DESCRIPTION	SIZE	MATERIAL
a) Main Grounding Grid Conductor	[40] mm dia Rod	Mild Steel
b) Riser/Pigtail From Grounding Grid/Mat	[40] 40 mm dia Rod	- Do -

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[6]	25.09.2014

DESCRIPTION	SIZE	MATERIAL
c) Electrode	[40] mm dia, [3000] mm long Rod	- Do -
d) Conductor used for connection of various equipment/structures as listed below		
HV motors, Earthing ring, Earthing lead to earth pits etc.	[50 x 10] mm	Galvanised steel
Structures, Control Panels, Cable Trays etc.	[50 x 10] mm Flat	- Do -
415V Power Control Centres, Motor Control Centres, Distribution Boards etc.	[50 x 10] mm Flat	- Do -
Local Panels, Lighting Panels	[25 x 6] mm Flat	- Do -
Motors :		
Above 90 kW	[50 x 10] mm Flat	Galvanised steel
Above 30 kW Upto 90 kW	[25 x 6] mm Flat	- Do -
Above 5 kW Upto 30 kW	[25 x 3] mm Flat	- Do -
Upto 5 kW	[8] SWG	- Do -
Miscellaneous Items, viz. Push Button Station, Junction Boxes etc	[8] SWG	- Do -

{The Above size of Earth flat is indicative only. Bidder shall refer Volume II Section I for size of earth flat used for existing plant or as per design.}

1.4.9

Jointing and Connection

- All ground conductor connections below ground level shall be done by electric arc welding with low hydrogen content electrode. The contact surfaces shall be thoroughly cleaned to provide good electrical continuity.
- The bending of the large diameter ground conductor where necessary shall be done by gas heating.
- The projected portion of riser/pigtail above ground shall be coated with two coats of bitumen paints (anti-corrosive paints) with a minimum thickness of 1 mm after connection.
- The connections between the riser/pigtail and earthing conductors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[7]	25.09.2014

(galvanized steel flats) and between the earthing conductors above ground level shall be made by electric arc welding.

- e) The portion of galvanized steel flats, which undergoes welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.
- f) The earthing connections to equipment grounding pads/terminals and some removable structures shall be bolted type with GI bolts and nuts. The contact surfaces shall be thoroughly cleaned (to free from scale, paint, enamel, grease, rust) before connection to ensure good electrical contact.
- g) Equipment/structures ground connections shall be coated with weather resistant paints/cold galvanizing paints after proper checking / testing.
- h) Whether specifically shown or not, all conduits, trays, cable armour and cable end box, electrical equipment such as motors, switchboards, panels, cabinets, junction boxes, lockout switches, fittings, fixtures, etc. shall be effectively grounded.

1.4.10 Earthing system installation

- a) The spacing between two electrodes shall be at least equivalent to twice the length of the electrode.
- b) Earthing conductor running exposed on column, walls, etc., shall be supported by suitable cleating, at intervals of 750 mm.
- c) The earthing conductor crossing the road / track shall be laid in hume pipe or laid at a greater depth to avoid damage.
- d) When earth conductor passes through floors, walls, etc suitable pipe sleeves shall be provided and the same shall be sealed after installation.
- e) The connection between earthing pads / terminal to the earth grid shall be made short and direct and shall be free from kinks & splices.
- f) Metallic conduits and pipes shall not be used as earth continuity conductor.
- g) Street lighting poles, flood light poles & towers, their junction boxes shall be connected to the earthing conductor to be run along with supply cable. This earth conductor shall be in turn connected to earth grid at two extreme points.
- h) The steel columns, metallic stairs, hand-rail etc. of the building where electrical equipment are located shall be connected to the nearby ground mat by earthing conductor. Electrical continuity shall be ensured by bonding the different sections of handrails and metallic stairs.
- i) Fence within the ground grid shall be bonded to the plant ground system at regular interval not exceeding ten [10] metres. Fence gate shall be separately grounded with flexible connection to permit movement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[8]	25.09.2014

- j) [50 x 10] mm galvanized steel flats(minimum size) shall be run as main earthing conductors above ground along building columns, walls, steel structure, etc. for equipment and other structures earthing. These earthing conductors shall be interconnected between them and to the main ground grid through risers/pigtail. The connection between earthing conductor and riser shall be made above ground. Earthing conductors can be embedded in concrete floor of the building wherever necessary without having direct contact with the reinforcement rods. At the crossing of building walls, floors etc. the earthing conductor shall be passed through galvanised conduit sleeves. Both ends of the sleeve shall be sealed to prevent the passage of water through the sleeves.
- k) All indoor and outdoor electrical equipment and associated non-current carrying metal works, supporting structures, building/ boiler columns, fence, system neutrals, lightning masts/arresters shall be connected to the plant ground system.
- l) Miscellaneous devices such as junction boxes, pull boxes, pushbutton stations, lockout switches, cable end boxes, lighting fixtures, receptacles, switches etc. shall be effectively grounded whether specifically shown or not.
- m) Metallic conduits and pipes shall not be used as earth continuity conductor. These shall be grounded at both ends.
- n) A continuous [50 x 10] mm (minimum size) G.S. flat earthing conductor shall run along the cable trays and supporting structure of all cable routes. This earthing conductor shall be attached to each section of cable tray/trays through [50 x 10] mm G.S. flats. The earthing conductor shall be securely connected to the earth mat at both ends.
- o) Flexible earth conductors shall be provided at expansion joints for earthing the gates, operating handles, etc.
- p) Equipment bolted connection after being checked and tested shall be painted with anti-corrosive paint / compound.
- q) Connection between the equipment earth lead and the grid conductor shall be welded. For rust protection, the welds shall be treated with zinc chromate primer and coated with zinc rich paint.
- r) The cable sheaths, screens armour shall be earthed at both ends for multi-core cables. For single core cables the same shall be done at one end (switchgear end) only.
- s) All bimetallic connections shall be treated with suitable compound to prevent moisture ingress.
- t) Main plant earth grid and switchyard earth grid shall be interconnected each other by minimum two numbers of leads.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[9]	25.09.2014

1.4.11 Lightning Protection System Design

- a) Lightning protection design and installation work shall be provided on the basis of IS 2309 Code of Practice.
- b) Lightning protection system shall consist of vertical air termination rods, horizontal roof conductors, down conductors and pipe electrodes.
- c) The need for providing the lightning protection system shall be established by calculating risk index value for each building structure, etc., as per procedure given in IS-2309 and any building whose risk index is more than value specified in IS shall be provided with lightning protection. However, Boiler areas, station building, switchyard building shall be provided with lightning protection irrespective of the arrived risk index.
- d) Shielding angle for one vertical air termination shall be 45 degrees. For more than one rod, shielding angle between the rods shall be taken as 60 Degrees.
- e) Down conductors shall run along the outer surfaces of the building and shall have a test joint about 1500 mm above ground.
- f) A Lightning electrode shall be provided at the connection point of the down conductor with the station ground.
- g) Galvanized steel rods and flats shall be generally used for air termination and connections. All connections shall be welded type.

1.4.12 Air Terminations

- a) The vertical air terminal rods shall be installed at the roof of Turbo generator building, Boiler and chimney etc to protect these objects from lightning strokes.
- b) The projected length of the Air termination rod shall be as required to protect the object (on which the rod is fixed) from lightning stroke.
- c) The air terminal rod shall be properly fixed on the top of the building/structure to withstand very high wind pressure. In case the air terminal rod is embedded at the top of roof of building, the portion embedded inside the concrete shall not touch the reinforcement bars and shall be duly insulated from them.
- d) All the vertical air terminal rods shall be electrically connected together by means of horizontal conductors of size [50 x 6] mm galvanized steel flats.
- e) For chimney air termination, rods interconnected by circumferential conductors will be provided at the apex of flue and also upon outer shell of the chimney. The air termination system will be formed by lead coated copper conductors to prevent melting and corrosion of conductors due to flue gas.
- f) For cooling towers, air termination system will comprise of horizontal

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[10]	25.09.2014

circumferential conductors at the top

1.4.13 Down Conductors

- a) Galvanized steel down conductors of suitable size [25 x 6] shall be connected with air terminal rod/horizontal conductor at the top of roof/structure and other end connected to the nearest 40 mm dia. mild steel rod riser from ground electrode.
- b) Each down conductor shall have an independent earth termination. In no case conductors of the lightning protection system shall be connected with the conductor of grounding system above ground level.
- c) The connection between each down conductor and rod electrode (by means of 40 mm mild steel rod riser) shall be made by others. However Bringing down comer with test link at a level of 1500mm approximately from above ground level shall be boiler contractor scope of work.
- d) The down conductor shall be laid straight and sharp bends shall be avoided as far as practicable. These shall be cleared on outside of the building wall and column/structure at about 750 mm intervals unless stated otherwise in the drawing.
- e) At all supports for down conductor along the column/wall of the buildings etc. the portion embedded inside the building concrete should not touch the reinforcement bars.
- f) All exposed metallic parts of the buildings shall be bonded to the down conductors. Such parts shall include ladders, balconies, conduits etc.
- g) The down conductors shall be protected at the ground level against mechanical injury by means of non-metallic pipes, viz. PVC pipes filled with bituminous compound.

1.4.14 Switchyard Lightning protection

- a) For switchyard lightning protection shall be provided by lightning masts and/or shield wires.
- b) In case of lightning protection by shield wire, the shield wires provided shall be of GS wire strung across the pinnacles of the gantry tower structures. The size of shield wire shall be based on the lightning impulse current expected and the time duration for which it is likely to flow. Allowance shall be given in the final size to account for corrosion of the shield wire during service at rate of [0.03] mm per annum. However, minimum size of the shield wire shall not be less than [70]sq.mm. The zone of coverage for the shield wire shall be considered as 60 deg between the two shield wires and 45 deg for end shield wires. The down conductors from shield wires shall be run along the towers and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[11]	25.09.2014

connected to rod/pipe electrodes.

- c) In case of lightning protection by lightning protection masts, the down conductors from the masts/peaks/shield wires shall be run along the tower and connected to the test links mounted on the towers at 1500m from the ground level. Conductors from the test links shall be connected to the rod/pipe electrodes which in turn are connected to the main earth grid in the switchyard. Calculations for sizing and determining topography and number of lightning masts shall be furnished for approval.

1.4.15 Electrodes (for Lightning Protection)

The electrodes shall be [40 mm] diameter [3000 mm] long mild steel rod. These shall be driven into the ground.

All the electrodes shall be interconnected by means of one (1) [40 mm] dia mild steel rod which shall be laid under ground at a minimum depth of [600 mm] below finished grade level unless stated otherwise. This ground mats/electrode in turn shall be connected to main grounding grid.

1.4.16 Riser (for Lightning Protection)

All risers connected to grounding mat shall be [40 mm] mild steel rods and shall be projected 300 mm above grade level unless stated otherwise.

1.4.17 Jointing & Connection

- a) All ground conductor connections below ground level shall be done by electric arc welding with low hydrogen content electrode.
- b) The projected portion of riser above ground shall be coated with two (2) coats of bitumen paints (anti-corrosive paints) with a minimum thickness of 1 mm after connection.
- c) The joints in the lightning conductors shall be kept to a minimum and there shall be no joint in the underground portions of conductors.
- d) All the joints shall be done by arc welding process overlapping of the conductors at straight joints shall not be less than 150 mm. The contact surfaces shall be cleaned properly before jointing.
- e) The portion of galvanized steel flats, which undergoes welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.
- f) The bolted joint of the test link shall be covered with thick coating of bitumen paint after successful testing.
- g) The air terminal rods and shielding mast shall be coated with weather resistant anti-corrosive paint (zinc chromate followed by two coats of aluminium paint).
- h) The steel to copper connection shall be brazed type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[12]	25.09.2014

- i) The lightning protection of inflammable liquid storage tanks wherever required, shall be provided with horizontal conductors strung between tall poles covering the entire zones or with air terminal rods mounted on top of poles/structure. These horizontal conductors/vertical air terminal rods shall be connected to rod electrodes, which in turn shall be connected to station ground mat.
- j) The sizes and materials of earthing conductors to be used in lightning protection system are listed below :
- k) Note: The above sizes are indicative only. Actual size shall be as per Bidder design or as per existing plant details as provided in Section I in case of replacement work as called for.

Table 3.0

DESCRIPTION	SIZE	MATERIAL
a) Vertical Air Termination	[20] mm dia Rod	Galvanised steel
b) Horizontal Conductor	[50 x 6] mm flat [25 x 6] mm Flat	-----do-----
c) Down Conductors	[25 x 6] mm Flat	-----do-----
d) Ground electrode / riser	[40] mm dia Rod	Mild Steel
e) Interconnection with earth mat	[40] mm dia Rod	Mild Steel

1.5

Tests

1) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[13]	25.09.2014

Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant /purchaser or his representative.

The following test shall be conducted:

- a) Measurement of earth resistance for each electrode.
- b) Measurement of total earth resistance.
- c) Measurement of earth loop resistance for E/F path of biggest LV drive.
- d) Check tightness of all earth connections
- e) Check earthing of all metallic equipments, cable trays, bus bar supporting structures, building column (if steel all elect equipments, pipe lines etc. as per the drawing / specification)

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6

Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *[Earthing Material like conductor , flat , welding description etc]*
- b) *[Air termination rod and its accessories etc]*
- c) *[Technical Data sheets for Earthing and Lightning system].*

Document Number	Rev No.	Description	Page No.	Date of Issue

SECTION-II, PART-B, ANNEXURE-E12

TECHNICAL SPECIFICATION FOR 6.6kV SWITCHGEAR

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E12

1.1 General

This specification is intended to cover the [design, engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning] of 6.6 Switchgear, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] Of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

Codes	Name of Standard
IS : 226	Structural steel (standard quality)
IS : 375	Switchgear bus bars, main connections and auxiliary wiring, marking and arrangement
IS : 722	AC electricity meters
IS : 728	Galvanized steel structures
IS : 2099	Specification for bushings for alternating voltages above 1 000 volts
IS : 2147	Degree of protection
IS : 2516	Alternating current circuit breakers
IS : 2544	Specification for porcelain post insulators for systems with nominab l voltages greater than 1 000 volts
IS : 2705	Current transformer specification
IS : 3043	Code of practice for earthing
IS : 3156	voltage transformers specification
IS : 3231	specification for electrical relays for power system protection
IS : 3427	A.C. metal enclosed switchgear and control gear for rated voltages above 1 kV and upto to and including 52 kV.
IS : 4710	Switches and switch isolators above 1000 V but not exceeding 11000 v.
IS : 5082	Specification for wrought aluminum and aluminum alloy bars, rods, tubes and selections for electrical purposes.
IS : 6875	Control switches push buttons

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[1]	25.09.2014

Codes	Name of Standard
IS : 8084	Specification for interconnecting bus-bars for ac voltage above 1 kV up to and including 36 kV
IS : 8686	Specification for static protective relays
IS : 9046	Specification for ac contactors for voltages above 1000 v up to and including 11 000 v
IS : 9224	Low voltage fuses
IS : 9385	HV fuses
IS : 9431	Specification for indoor post insulators of organic material for system with nominal voltages greater than 1000 volts upto and including 300 kV
IS : 9921	Alternating current disconnectors (isolators) and earthing switches for voltages above 1 000 v
IS : 10601	Dimensions of terminals of high voltage switchgear and control gear
IS : 11353	Guide for uniform system of marking and identification of Conductors and apparatus terminals.
IS : 13118	Specification for high voltage ac circuit breakers
IEC 6044-1	Current transformer
IEC 6044-2	Voltage transformer
IEC 6056	High voltage alternating current circuit breakers
IEC-60099-1	Non-linear resistor type gapped arrestor for AC systems
IEC-60099-4	Metal oxide surge arrestor without gap for AC system
IEC 60129	A.C disconnectors and earthing switches
IEC 60255	Electrical Relays
IEC-60298	High voltage metal enclosed switchgear and control gear.
IEC 60529	Degrees of protection provided by enclosures
IEC-62271-100	High voltage alternating current circuit breakers.
CEA	CEA regulations
CEA	Standard technical specifications for main plant package

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[2]	25.09.2014

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All 6.6kV Switchgear shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The Switchgear shall be suitable for operation in a highly polluted environment.
- b. All 6.6kV Switchgear shall be suitable for following voltage & frequency variations as follows:

Voltage Variation	:	(±) 10%
Frequency Variation	:	(+) 3% to (-)5%
Combined Variation of Voltage & Frequency	:	10% (absolute sum)
For DC System	:	(+)10% to (-)15%

- c. All motors rated above 160kW shall be feed from 6.6kV switchgear.
- d. Motor rated [160-600kW] shall be provided with [vacuum contactor/vacuum circuit breaker] and motor rated above [600kW] shall be provided shall be provided with vacuum circuit breakers.
- e. 6.6kV switchgear shall be Indoor, metal clad, floor mounted, Single front and fully draw out type. Design and construction shall be such as to allow extension at either end. These shall be CRCA sheet metal enclosed and assembled to form a rigid, free-standing floor mounted structure. Vertical units shall be assembled to form a continuous line up of panels
- f. All 6.6 kV Circuit breaker shall be draw out type & should have Service, Test and Disconnected positions with positive indications for service & test positions. It shall be possible to charge the springs manually, if, required
- g. Local/remote selection shall be provided for all incoming/Outgoing Circuit Breaker modules. Incoming/Outgoing breaker shall be closed at service position from remote (DCS) and at test position from Local (Switchgear).
- h. Two out of three Incomer logic for 6.6kV Switchgear shall be provided. For Unit and station board one Incomer shall be there from Unit Transformer and Station Transformer respectively. Tie feeder shall be provided between Unit and station switchgear such that in case of loss of supplies to unit switchgear from UAT, the same shall be restored from respective station switchgear. In order to achieve the same, fast bus transfer shall be provided at Unit switchgear.
- i. All motors shall be provided with Emergency Stop Push buttons.
- j. Control and Indication voltage level shall be 220V DC.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[3]	25.09.2014

- k. Maximum system fault level at 6.6kV bus including initial motor contribution shall be 40kA for 1 sec.
- l. 6.6kV System shall be earthed through resistance to limit fault current to 300A.
- m. Surge arrestor shall be provided for each motor feeder/Transformer feeder.
- n. The switchgear will be located in a clean but hot humid and tropical atmosphere.
- o. Duty involves direct-on-line starting of large induction motors with motor starting current varying 6 times the full load current. For BFP starting current varying 4.5 times of full load current.
- p. For continuous operation at specified ratings, temperature rise of the various switchgear components shall be limited to the permissible values stipulated in the relevant standards and this specification.
- q. The switchgear and components thereof shall be capable of withstanding the mechanical forces and thermal stresses of the short circuit current without any damage or deterioration of material.
- r. All the numerical relays shall have communication on two ports, local front port communication to laptop and a second port with [IEC 61850 protocol] to communicate with DCS.

1.4 Specific Requirements

1.4.1 Construction

All 6.6 kV switchgear shall have following minimum features.

- a. 6.6 kV switchgear shall be of indoor, metal clad, single front, single tier, floor mounted, horizontal drawout type with vacuum circuit breaker and free standing type. The Panels shall be suitable for cable entry at bottom and bus duct connection at top.
- b. Between 6.6kV Switchgear Incomer and transformer, segregated phase bus duct is considered. Hence switchgear shall be suitable for this connection and necessary flange connection and co ordination with bus duct manufacturer in this regards is covered in this specification.
- c. All frames and load bearing members shall be fabricated using mild steel structural sections or pressed and shaped cold rolled sheet steel of thickness not less than 2 mm.
- d. Frame shall be enclosed in cold rolled sheet steel of thickness not less than 2 mm. Doors and Covers shall also be of cold rolled sheet steel of thickness not less than 1.6 mm. Removable gland plates of thickness 3mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material)shall be provided for all panels. Suitable removable type lifting hooks and / or jacking pad shall be provided on each panel or shipping section for ease of lifting of switchgear. These hooks when removed shall not leave any opening in the panels.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[4]	25.09.2014

- e. Each breaker shall be housed in a separate cubicle, complete with an individual front access door. Each vertical section shall have a removable back cover.
- f. The switchgear enclosure shall confirm to the degree of Protection of the [IP4X] for indoor installation. However degree of protection of LV chamber shall be [IP-52]. No louvers/Opening shall be provided on the top of panel. All the other louvers if provided shall have very fine brash or GI mesh screen.
- g. Paint shade for complete panels shall be [RAL 5012] for extreme end covers for all board.
- h. The working zone shall be restricted to [750mm to 1800mm] from floor level. Total height of the switchgear panels shall not exceed [2600 mm].
- i. Metallic barriers shall be provided between vertical sections and also between adjacent modules to ensure prevention of accidental contact with live parts during routine inspection/maintenance of functional units or cable terminations of one or more functional units when working on those of adjacent units. These barriers shall have insulating inserts as necessary for taking the interconnections etc.
- j. A nameplate with switchgear designation shall be fixed at the top of the central panel. A separate nameplate giving feeder details shall be provided for each compartment. A separate nameplate giving details of bus section shall also be provided for switchgear having more than one bus section.
- k. Name plate shall be provided for each equipment (lamps, push buttons, switches, relays, auxiliary contactor, etc) mounted on the switchboard. Special warning plates one each on each feeder of a shipping section shall be provided on removable covers of doors giving access to cable terminals and busbars. Name plate size shall be minimum of 20x75 mm for Instruments/devices and 40x50 mm for panels. Thickness shall be minimum 3 mm.
- l. Two 220V DC feeders shall be provided for control, Indication and annunciation of breaker operated module at any one cubicle. Further distribution to all verticals shall be in the scope of bidder.
- m. Compartment door shall be interlocked with main power isolating device for safety with provision for defeating it by authorized person.
- n. Supplier shall provide total 10% or minimum one (1) no. spare feeder of each type & rating with respect to total requirement of the switchgear.
- o. Switchgear shall have provision to receive 415V, 3ph, 4wire supply. Single phase 240V balanced supply shall be derived from 415V, 3ph, 4 wire supply. Each cubicle shall be provided with thermostat controlled space heaters suitable for operation from 240 V \pm 10%, single phase, 50 Hz, + 3% - 5% supply and 5A, 240V AC, 3 pin plug socket and cubicle lamp. The space heaters shall be located at the bottom of the switchboards. Cubicle heater, plug/socket/lamp circuits shall have individual switch fuse units. Motors shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[5]	25.09.2014

be provided with anti- condensation heaters at 240V.Necessary provision for supply of motor space heating shall be considered in the switchgear.

- p. All relays, meters, switches and lamps shall be flush mounted on the respective cubicle door or on control cabinet built on the front of the cubicle.
- q. Controls and interlocks as required for the safe switching, operation and maintenance of the switchgear shall be provided. Mechanical interlocks shall be provided in addition to electrical wherever possible.
- r. It should be possible to carryout maintenance on a feeder with adjacent feeders alive.
- s. The Fast Bus Transfer (FBT) panel shall be totally enclosed, floor mounted panel conforming to degree of protection IP-42. The minimum thickness of cold rolled sheet steel used shall be 2.0 mm. The ABT panel shall consist of a lineup of control boards, with cable entry provisions from bottom of panel. The height of FBT panel inclusive of mounting channel, anti-vibration pads etc. shall be restricted to [2400 mm].
- t. The switchgear shall be [natural cooled].
- u. The circuit breakers, contactors, bus VTs shall be mounted on withdrawable truck which shall roll out horizontally from service position to isolated position.

1.4.2

Bus and Bus Taps

- a. The main buses and connections shall be of high conductivity [aluminum / aluminum alloy].Control and auxiliary buses shall be of electrolytic copper/copper wires.
- b. Bus bars and connections shall be fully insulated for working voltage with adequate phase / ground clearances. Insulating sleeves for bus bars and shrouds for joints shall be provided.
- c. Bus insulator shall be flame-retardant, non-hygroscopic, track resistant type with high creepage surface. This shall be of non-carbonizing material such as epoxy bonded fiberglass. Bus bars shall be color coded for easy identification.
- d. The bus bar supports shall be able to withstand stresses due to maximum short circuit and also take care of any thermal expansion.
- e. Bus bars shall be color coded for easy identification and so located that the sequence R-Y-B shall be from left to right, top to bottom or front to rear, when viewed from the front to switchgear assembly.
- f. The continuous rating of the main bus bars shall be same as that of the incomer circuit breaker and shall carry this continuous current without exceeding the temperature of [90 °C]. For silver plated joints maximum temperature shall be limited to [105 °C].

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[6]	25.09.2014

- g. The busbar chamber shall be provided with inter panel barrier with epoxy cast seal off bushings through which the buses will pass through so as to prevent fire from one panel to another.

1.4.3

Circuit Breaker

- a. The circuit breaker shall be of vacuum type.
- b. The circuit breakers shall be fully draw-out type, having service, test and disconnected positions with positive indicators for service & test positions.
- c. The breakers shall have motor operated spring charged mechanism. It shall be possible to charge the springs manually, if, required. Breakers shall be trip free and shall have an anti-pumping device. The operating duty cycle shall be 0 -3 min.-CO-3 min.-CO.
- d. For motor, spring charging shall take place automatically after each breaker closing operation. One 'open-close-open' operation of the circuit breaker shall be possible after failure of power supply to the motor.
- e. Automatic safety shutters shall be provided to ensure the inaccessibility of live parts after the breaker is drawn out. There shall be distinct overall door for the breaker compartment and shall be lockable.
- f. Truck shall have distinct service, Test and Isolated positions. It shall be possible to close the breaker compartment door in isolated position also. The truck and breaker frame shall get earthed while the truck is being inserted in the panel and positive earthing of the truck and breaker frame shall be maintained in all positions.
- g. Outgoing breakers shall be suitable for switching transformers and motors at any load. Motor feeders shall be suitable for frequent direct on-line starting of motor.
- h. Mechanical safety interlocks shall be provided to prevent
 - i. The circuit breaker from being racked in or out of the service position when the breaker is closed.
 - ii. Racking in the circuit breaker unless the control plug is fully engaged
- i. Breakers shall be adequately de-rated to account for design ambient temperature and temperature inside the cubicle.
- j. Equipment and component rating and quantities shall be suitably selected according to the requirements with adequate margin.
- k. Closing and tripping coil shall operate satisfactorily under the following conditions.
 - i. Closing Coil: 85% to 110% of rated voltage.
 - ii. Tripping Coil : 70% to 110% of rated voltage

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[7]	25.09.2014

1.4.4 Contactor

High voltage contactor shall be of AC-3 utilization category and shall be of vacuum type. Fuse and contactor shall be mounted on withdrawable truck. The contactor shall be latched type and shall be complete with mechanical trip indicator, anti pumping relay, surge suppresser, single phasing preventor etc.

1.4.5 Bus Transfer scheme:

The 6.6kV Unit Switchgear shall be connected to their respective unit auxiliary transformer through bus duct. These buses of unit switchgear shall also be connected to 6.6kV buses of station switchgear through tie feeders and breakers located at the unit and station end. Automatic Fast bus transfer scheme shall be provided between 6.6kV unit and station switchgear such that in case of loss of supplies to unit switchgear from UT, the same shall be restored from respective station switchgear. The automatic bus transfer system shall consist of fast, slow etc. transfer in Auto/ Manual mode.

In addition to above, each switchgear shall be provided with the following provisions-

- Dead bus closing
- Manual live change over (Momentary paralleling)
- Automatic slow bus transfer.

1.4.6 Current Transformers

- a. Current Transformers shall be cast-resin type. All secondary connections shall be brought out to terminal blocks where wye or delta connection shall be made. They shall have sufficient thermal and mechanical capacity to withstand the maximum momentary current rating of the breakers.
- b. CTs shall have polarity makings indelibly marked on each transformer at the lead terminations and at the associated terminal block. Facility shall be provided for short circuiting and grounding the CT secondary at the terminal blocks. Secondary terminals shall be provided with protective cap.
- c. CT terminal block shall be disconnecting type and suitable for round type lugs with facility for testing and short circuiting of individual CT.
- d. All CTs shall be provided with supports independent of busbars / busbar supports. The CTs shall be located in such a way that they can be easily approached for maintenance without necessitating shutdown of adjacent feeders.
- e. CTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.
- f. Accuracy class of CT shall be 5P20 for protection, PX for differential protection and 0.5 for metering.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[8]	25.09.2014

1.4.7 Voltage Transformer

- a. Voltage transformers (VT) shall be cast-resin type with an accuracy class of 1.0 for metering and 3P for protection.
- b. VTs shall be of the single-phase type. VTs shall be protected on their primary side by fuse and by MCB (with auxiliary contacts) on the secondary sides.
- c. VTs shall have continuous over voltage factor of 1.2 and short time over voltage factor of 1.5 for 30 seconds for effectively earthed system
- d. It shall be possible to replace VTs without having to de-energise the main busbars.
- e. VTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.8 Transducer

For Incoming and outgoing feeders remote metering transducer shall be provided. The output shall be 4-20 mA DC which shall correspond to the normal range. All the transducer shall be dual output type.

1.4.9 Secondary wiring

- a. The switchgear shall be fully wired at the factory to ensure proper functioning of control, protection and interlocking schemes.
- b. Fuse and links shall be provided to permit individual circuit isolation from bus wires without disturbing other circuits. All spare contacts of relays, switches and other devices shall be wired up to terminal blocks.
- c. Secondary wiring within the switchgear shall be carried out in a neat and systematic manner and securely held in position (either loomed or run in conduit / trunking). Wherever wiring passes through compartment, it shall be run in conduit / trunking, if metallic shall be bonded to the main earth busbar.
- d. Wiring shall be done with flexible, 1.1/0.650kV grade, PVC insulated switchboard wires with *[stranded copper conductors of 2.5 mm² for CT & PT circuits and 1.5mm² for control circuit wiring (applicable for internal panel wiring).]*
- e. Each wire shall be identified, at both ends, with permanent markers bearing wire numbers as per bidder's wiring diagrams. Wire terminations shall be made with crimping type connectors with insulating sleeves, wire shall not be spliced between terminals.

1.4.10 Terminal blocks

- a. Terminal blocks shall be of 1100 V grade, stud type with marking strips. Terminals for CT secondary leads shall have provision for easy shorting, earthing and shall be suitable for connecting 2 cables of 2.5 mm² copper.
- b. Sufficient terminals shall be provided on each terminal block to ensure that

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[9]	25.09.2014

not more than two outgoing wires are connected per terminal. All spare contacts of auxiliary relays, timers etc. shall be wired up to the terminals. [20%] spare terminals shall be provided on each terminal block.

- c. Terminal blocks shall be located to allow easy access. Wiring shall be grouped such that the individual wires of a cable can be connected to consecutive terminals.

1.4.11 Ground bus

- a. A ground bus, rated to carry maximum fault current, shall extend full length of the switchgear. The ground bus shall be provided with two-bolt drilling with G.I. bolts and nuts at each end to for connection to the grounding conductor / flat.
- b. Each unit shall be connected directly to the ground bus. The frame of each circuit breaker and draw out V.T. unit shall be grounded through heavy multiple contacts at all times except when the primary disconnecting devices are separated by a safe distance.
- c. C.T. & V.T. secondary neutrals shall be earthed through removable links so that earth of one circuit may be removed without disturbing others. All hinged doors shall be earthed by flexible copper bride.

1.4.12 Control & Indication

- a. The circuit breaker shall be wired up for local & remote operation. Each breaker shall be equipped with following:
- b. Remote selector switch with pistol grip handle and key interlock for breakers with motor wound spring charging mechanism. In Remote position, the breaker can be operated in service position with all interlock and protections. In Local position, the breaker shall be operated from switchgear only in test position.
- c. Each cubicle shall be provided with Auto/ Manual Switch. Trip selection switch and Trip-Neutral- Close (TNC) switch.
- d. Circuit breaker shall be indicated electrically. The following indication color shall be used.
Breaker closed – Red
Breaker opened – Green
Spring Charged – White
Breaker Auto trip – Amber
- e. However any other indication shall be provided as per owner's requirements.
- f. Lamps shall be LED type with resistance for voltage protection. Lamp and lens shall be replaceable from the front.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[10]	25.09.2014

- g. Breakers shall be controlled locally and/or remotely as per plant operational requirement. Necessary Interposing relays & feedback signal shall be provided based on the DCS IO list.
- h. Breaker control supply shall be of 220 V DC. Breaker spring charging motor shall be suitable for 220 V DC.

1.4.13 Cable termination

Switchgear shall be designed for cable entry from the bottom. Sufficient space shall be provided for ease of termination and connection.

1.4.14 Bus duct connection

Bus duct connection shall be generally from top of the switchgear.

All connection bus work shall have the same continuous rating as associated switchgear bus and shall be fully braced for the short circuit current mentioned in specification.

All provision such as matching flange and other accessories shall be furnished for connection to bus duct.

1.4.15 Painting

All sheet steel surfaces shall be chemically cleaned, degreased and pickled in acid to produce a smooth, clean surface free of scale, grease and rust. After cleaning, the surface shall be given a phosphate coating followed by a coat of high quality primer and baking in the oven.

The paint shade shall be subject to owner's approval. Sufficient quantity of touch up paint shall be furnished for application at site.

1.4.16 Relays, Protection & Metering

- a. The hardware design for protection and associated equipment shall use latest state-of-the-art technology and shall generally be integrated numerical/digital, modular in nature. Where design is based on numerical technology, adequate self testing/monitoring/ diagnostic facilities shall be provided.
- b. All numerical relays, auxiliary relays and devices shall be of types, proven for the application; satisfying requirements specified elsewhere and shall be subject to Purchaser's approval. Numerical Relays shall have appropriate setting ranges, accuracy, resetting ratio, transient overreach and other characteristics to provide required sensitivity to the satisfaction of the Owner. All numerical relays shall be compatible with IEC 61850.
- c. All protective relays shall be in draw out or plug-in type / modular cases with proper testing facilities. Necessary test plugs / test handles shall be supplied loose and shall be included in supplier's scope of supply.
- d. All AC operated relays shall be suitable for operation at 50 Hz. AC voltage

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[11]	25.09.2014

operated relays shall be suitable for 110 Volts VT secondary and current operated relays for [1 or 5] amp CT secondary. All relays and timers shall be rated for control supply voltage as mentioned elsewhere under parameters and shall be capable of satisfactory continuous operation between 80-120% of the rated voltage. Voltage operated relays shall have adequate thermal capacity for continuous operation.

- e. Energy meters shall be provided for incomer of 6.6kV Switchgear and shall be able to communicate with DCS. These meters shall be as per CEA regulation 2006 "Installation and operation of meters". Accuracy class shall not be less than [0.2S]. The accuracy class of CT and VT for energy metering shall have accuracy class of [0.5]
 - f. Provision shall be made for easy isolation of trip circuits of each relay for the purpose of testing and maintenance.
 - g. All protective relays and alarm relays shall be provided with one extra isolated pair of contacts wired to terminals exclusively for future use.
 - h. The relay shall be designed to perform satisfactorily under highly noisy electrical environment. Sufficient degree of high frequency disturbance immunity and impulse voltage withstand capacity shall be built into electronic designs as stipulated in relevant standards.
 - i. All protections shall be furnished complete with necessary auxiliary, supervisory, lock out relays. Suitably separate sets of single phase auxiliary C.T with multiple taps shall be provided with relay whenever required.
 - j. Visual and audible alarm annunciation shall be initiated in the event of operation of protective/supervisory relay.
 - k. D.C supply shall be supervised by DC supervision relays.
 - l. Trip circuit shall be supervised by Trip circuit supervision.
 - m. Tripping shall be done through high speed lock out relays.
 - n. All meters/ instrument shall be flush mounted on front panel, at least 96 mm² size with 90 degree linear scales and accuracy class of [2.0.]
 - o. Interposing relays for ON/OFF command or any other command shall be as per system requirement.
 - p. For alarm and Indication at DCS end necessary contacts shall be provided at switchgear end.
 - q. Interposing relays for ON/OFF command or any other command shall be as per system requirement.
- For alarm and Indication at DCS end necessary contacts shall be provided at switchgear end.
- r. Metering and protection shall be as per below table

1.5 Tests

I. Type Test:

For each type & rating of 6.6kV Switchgear, the Bidder shall submit the reports

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E12	[14]	25.09.2014

of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening for Owner's approval. These reports should be for the tests conducted on the switchgear similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II. Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative. However the following minimum routine tests shall be conduct.

- Power-frequency voltage tests on the main circuit
- Dielectric tests on auxiliary and control circuits
- Measurement of the resistance of the main circuit
- Partial discharge measurement
- Mechanical operation tests
- Heat Run test
- Pressure tests of gas-filled compartments
- Tests of auxiliary electrical, pneumatic and hydraulic devices
- Verification of correct wiring

III. Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV. Test Certificates:

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

Document Number	Rev No.	Description	Page No.	Date of Issue

1.6 Drawing & Documents

Drawings, data & manuals for the motors shall be submitted as indicated below.

- a. [General Arrangement drawings and cross-section showing constructional features & cable entry with bottom view with opening]
- b. Bill of Materials.
- c. Technical Data sheet and Catalogue.
- d. Foundation drawing details with bottom view of switchgear.
- e. Descriptive write-ups and literature for the main equipment offered including relays, meters, etc.
- f. Control Schematics & Wiring diagram.
- g. Inspection and Test Plan (ITP).
- h. Suggestive list of protective relays.
- i. Transport/shipping dimensions and weights].

1.7 Ratings & Requirements

6.6kV Switchgear shall comply with the particulars indicated in the following tables.

Table 2.0

S. No.	DESCRIPTION	UNIT	DATA
1.0	General		
1.1	Name of Manufacturer		[By Bidder]
1.2	Place & Country of manufacture		[By Bidder]
1.3	Specifications and Standards		As per Table 1.0
2.0	Switchgear Details		
2.1	Rated voltage(Nom/Max), phases & frequency		6.6 kV/7.2 kV, 3 Phase, 3 wire, 50 Hz.
2.2	System neutral earthing		Non Effectively earthed (Fault current Limited to 300A by neutral grounding resistor)
2.3	Voltage & frequency variation	%	+/-10%, -5%to +3% Hz.
2.4	Rated frequency	Hz	50Hz

ANNEXURES-E13

1.0 VARIABLE FREQUENCY DRIVE

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Variable Frequency Drives complete with all accessories for efficient and trouble-free operation of of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS-3700	:	Essential ratings and characteristic of semi-conductor devices
IS-3715	:	Letter symbols for semi-conducting devices
IS-4411	:	Code of designation of semi-conducting devices
IS-5001	:	Guide for preparation of drawings for semi-conductor devices
IS-5469	:	Code of practice for the use of semi-conductor junction devices
IS-5621	:	Hollow Insulators for use in electrical equipment
IS-6209	:	Methods for partial discharge measurement.
IS-6297	:	Transformers and indicators for electronic equipment
IS-8789	:	Performance parameters for motors
IS-12729	:	Switchgear and control gear for voltages exceeding

DIN 41488	:	Electrical engineering dimensions
-----------	---	-----------------------------------

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3 Design Criteria

- a) All VFDs shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The VFDs shall be suitable for operation in a highly polluted environment.
- b) All VFDs shall be suited for uninterrupted operation under the following variations in bus voltage and frequency:
 - i. Voltage Variation : +/-10%
 - ii. Frequency Variation : 50Hz (+)3% to (-)5%
 - iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency
- c) The VFD shall be of modern design for similar applications in power plants. The system shall be commutated inverter type with minimum [six] pulse design, [IGBT based] and PWM controlled or better control system.
- d) VFD shall consist of Input section (rectifier and filter), control section and output section (PWM module, base drive circuits).
- e) VFD shall include an input filter for limitation of the harmonic current. General requirements of VFD shall conform to IEC 61800-2 and IEEE-519.
- f) VFD shall follow EMC directives as specified in IEC-61000.
- g) VFD model shall be suitably selected based on actual cable length from VFD to motor terminals. Shielded cables suitable for VFD applications shall be provided by the bidder.
- h) For [12 pulse] VFD, required 3 winding transformer and necessary cabling shall be provided by the bidder.
- i) Bidder shall provide inverter duty motor to withstand voltage stresses produced by PWM action

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[3]	25.09.2014

1.3.1 Performance requirements:

- a) The system shall be energy efficient, designed as standard product and shall provide very high reliability, high power factor, low harmonic distortion and low vibration / wear / noise.
- b) The system shall be suitable for the load characteristics and the operational duty of the driven equipment.
- c) The drive system shall be designed to operate in one or more of the following operating modes as to suit characteristics of the driven equipment:
 - i. Variable torque changing as a function of speed i.e. speed squared.
 - ii. Constant torque over a specific speed range.
 - iii. Constant power over a specific speed range where the torque decreases when speed increases.
- d) The drive controller shall be equipped with microprocessor based digital regulator with programmable functions. The system shall be designed for linear continuous speed control from [10% to 100%] of driven equipment's rated speed and shall be of a modern proven design.
- e) The total harmonic distortion (THD) of the voltage and current at inverter output shall be as per IEC 61800-4 and it shall be considered in the design of the motor.
- f) Unless otherwise specified, the overload capacity of the controller shall be 150% of rated current of motor for one minute for constant torque applications, and 115% of rated current for one minute for variable torque applications at rated voltage. If the motor load exceeds the limit, the drive shall automatically reduce the frequency and voltage to the motor to guard against overload. If load demands exceed the current limit for more than one minute, the drive shall shut down to prevent over heating of the motor and damage to the drive.
- g) During operation, the system shall be capable of developing sufficient torque under all load conditions to respond to a 20% alteration in speed set point within a time limit up to 60 seconds.
- h) The integrator action of the speed set point alteration shall be independently adjustable for both an upward and a downward alteration. The minimum time interval between set point adjustments by the distributed control system shall be considered as 10 seconds.
- i) The drive shall trip in case the speed exceeds 105% of the maximum operational speed or reduces to 95 % of the minimum operational speed for more than 10 seconds.
- j) Maximum noise level of motor shall be measured as per relevant IS standard.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[4]	25.09.2014

- k) Variable frequency drive shall be arranged so that it can be operated in an open circuit mode, disconnected from the motor for startup adjustments and troubleshooting/ maintenance.
- l) Voltage at motor neutral shall be maintained at ground potential for the total operating condition.

The drive system shall ensure following:

- i. VFD induced torque pulsation are limited to maximum 1% (even at low speed) so there is minimal stress to the equipment
- ii. Motor is protected from dv/dt stresses.
- iii. No appreciable increase in motor audible noise.

1.3.2 Control requirement:

- a) The VFD and motor characteristics shall be suitable for load specific torque-speed characteristics.
- b) Short time voltage dips up to 20% of nominal voltage (e.g. in case of a large motor start up connected to the same bus as VFD) shall not cause the control system to stop functioning and shall not trip the drive system.
- c) The system shall also be equipped with a facility which shall restart the system in case of voltage dip over 20% or power interruptions for less than 2 seconds, with recovery of the voltage to its nominal value. The drive shall have the facility to block this feature, if required by the operator. Upon restart the converter shall be capable of synchronizing on to a rotating motor and develop full acceleration torque within 10 seconds.
- d) The power controller shall be controlled to always start the motor in the forward direction. Logic shall be provided to prevent the motor from being started in the reverse direction.
- e) The drive motor shall be speed controlled corresponding to 4-20 mA reference input signal unless otherwise specified upon complete loss of the user's speed reference signal, the drive shall automatically run at constant speed at the last speed reference available prior to the loss of signal.
- f) It shall be possible to vary the speed of the drive in either manual or auto mode. Auto/manual selection shall be from VFD panel unless otherwise specified.
 - i. With the selector switch in "manual" mode, the operator shall be able to set the speed through keypad, mounted on front of the drive panel or from speed increase/decrease push buttons from the field. Motor operated potentiometer shall be provided as a speed set point device.
 - ii. With the selector switch in "auto" mode, speed of the motor shall be controlled from a 4-20 mA signal, from owner's DCS (Process Control) system. Necessary equipment required for interfacing with DCS shall also be provided in the drive panel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[5]	25.09.2014

- g) The required provision for the interface with remote I/O *(as per requirement)* shall be through hardwired connection (with potential free contacts and transducers)
- h) Drive system shall have provision for interface with upper level automation such as electrical control system.
- i) The closed loop control feedback for the drive system having output transformer shall be tapped from the secondary side of the output transformer.
- j) Bypass Feature
 - i. Bypass breaker / contactor-HRC fuse complete with protection, annunciation and metering shall be provided.
 - ii. All Variable frequency drives (VFD) having bypass feature shall have motor protection relay along with necessary control and metering etc. Switching scheme shall be such that in case of drive mal-operation, the motor could be taken on bypass control manually, while the drive could be attended by opening its isolation devices.
 - iii. Safety interlock between inverter and bypass breaker/contactors shall be provided such that closing of healthy device is inhibited in case of external fault.

1.4 Specific Requirements

1.4.1 Constructional Requirements

- a) Panel Construction
 - i. The panel shall include suitable semi conducting power devices (Diodes / IGBT) modules with protective devices, reactors (if required), filters (if required), control circuit, control accessories, indication and annunciation etc. The construction of the panel shall provide effective protection against electromagnetic emissions and shall meet the design requirement of integrated standards.
 - ii. Upstream breaker include suitable semi conducting power devices (Diodes / IGBT) modules will be provided on the front door.
 - iii. Safety Interlock shall be provided so that power cabinet cannot be opened unless the upstream breaker is disconnected, safety-grounding switch is closed and DC link capacitor is discharged. Power source breaker can only be closed once the earthing switch is open and panel door is closed with lock defeat facility.
 - iv. The drive shall be suitably housed in sheet steel panels fabricated with 2 mm thick cold rolled sheet steel. The panel shall be suitable for indoor installation, if not otherwise specified. The panel shall be free standing with degree of enclosure protection as IP-31. The maximum and minimum operating height shall be 1800 mm and 400 mm respectively.

LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[6]	25.09.2014

- v. Bolted un-drilled gland plate shall be provided at bottom. Clamp type terminals shall be used for connection of all wires up to 10 mm² and terminal for higher sizes shall be bolted type suitable for cable lugs. Minimum space for power cable termination shall be 600 mm clear from bottom of the cable gland plate.
- vi. Bus bars shall be of electrolytic copper, color coded separately for AC and DC system. All the live parts shall be sleeved / shrouded to ensure complete safety to personnel intending to carry out routine inspection by opening the panel doors. All the equipment inside the panel and on the doors shall be provided with suitable nameplate.
- vii. All the switches component and accessories which are essential for normal and emergency operation shall be mounted on the door and shall be operable externally. Digital meters shall be preferred. Analogue instruments, where provided, shall be switchboard type, back connected, 72x72mm. Scale shall have red mark indicating maximum permissible operating rating.
- viii. All panels shall be of same height so as to form a uniform line-up, to give good aesthetic appearance.
- ix. All the control wiring shall be enclosed in plastic/ metal channel. Each wire shall be identified at both ends by self-sticking wire marker tapes or PVC ferrules. Power and control wiring inside the panel shall be done with PVC insulated, fire retardant, copper conductor wire. 1.5 mm² size wire shall be used for control circuits, 2.5 sq.mm for CT/PT circuits and 0.75 mm² for electronic circuits. The control fuse rating is 10 Amps or less and 2.5mm² size for control fuse rating above 16A for electrical circuits and 0.7 mm² for electronic circuits. All wires shall be ferruled and terminals shall be properly numbered. Minimum 20% spare terminals shall be provided.
- x. All electronic modules and components shall be accessible from front of panel only. Modular assemblies for both the system control electronic equipment and power electronic equipments shall be used.
- xi. All low voltage compartment and cabling shall be electrically and physically separated from the high voltage compartment.
- xii. DC link capacitor and pre charging and discharging circuit shall be preferably mounted in the rear of the panel. Suitable removable type hooks shall be provided for lifting the panel.
- xiii. Drive keypad, operator control panel required for control, monitoring and measurements shall be supplied and installed outside the panel on the front door. It shall be accessible for operation without opening the front door and shall be non-removable type.
- xiv. All equipment shall be complete with double compression glands, lugs etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[7]	25.09.2014

b) Cooling

- i. The drive panel shall be naturally cooled or water cooled type as per manufacturer's standards. However it is preferred to have natural air cooled system. If unavoidable, forced type-cooling system shall be provided. Cooling system shall include well-dimensioned panel, adequate cooling airflow path, module cooling fan and if necessary, panel cooling fan or water-cooling system shall be considered. Bidder shall ensure that the panel dimensions and flow paths have been designed for continuous running at the specified ambient without overheating. For fan cooled drives, redundant ventilating fans (N + 1) shall be provided.
- ii. Necessary starters shall be provided within the VFD panels for the ventilation fans, any other auxiliary motor etc.
- iii. The system provided shall be interfaced with drive starting and shut down such that safety interlocks such as start permit from cooling system to drive and trip signal from cooling system to drive in case of cooling system failure etc., shall be incorporated in the overall sequence logic.
- iv. MCB for motor space heater, auxiliary power supply if required for local panel, drive panel space heater etc. shall be included and mounted in easily accessible location.

1.4.2 Motor

The motor shall be designed, constructed and tested in accordance with the Specification for high Voltage Induction / Synchronous Motor, in addition to the following requirements:

- a) The motor shall be suitable for VFD control.
- b) The motor shall be suitable for the current waveforms produced by the power supply including the harmonics generated by the drive.
- c) The motor shall be designed to operate continuously at any speed in the operating range for the driven equipment (ie; ID fan / Coal feeder).
- d) The permitted voltage variation shall take into account the voltage drop across the AC drive and all other system components upstream the motor.
- e) Motors required to be transferred to DOL by-pass mode shall be rated for specified variations in system line voltage and frequency. Starting current of motor in DOL bypass mode shall be limited to value specified in motor specifications.
- f) The motor shall be constructed to withstand torque pulsations resulting from harmonics generated by the solid-state power supply.
- g) The motor insulation shall be designed to accept the applied voltage waveform, within the Vpeak and dv/dt limits as per IEC-61800-4.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[8]	25.09.2014

- h) The drive manufacturer shall be solely responsible for proper selection of the motor for the given load application and the output characteristics of the drive.

1.4.3 Static Power Converter

- a) The static power converter shall consist of a line side converter for operation as a rectifier and a load side power converter for operation as a fully controller inverter. Power converter shall be fast switching, most efficient and low loss type.
- b) The converter shall be co-ordinated with the transformers. The converter shall be able to withstand a three phase short circuit current until interrupted by normal breaker operation.
- c) Adequate short circuit and over voltage protection shall be provided for the converter and inverter system.
- d) All power converter devices shall include protective devices, snubber networks and dv/dt networks as required.
- e) The current rating of the converters semi-conductor components shall not be less than 120% of the nominal current flowing through the elements at full load of the VFD through the whole speed range. If the parallel connection of semi conductor is applied, the above current rating shall not be less than 140% of the above values.
- f) All power diodes shall be of silicon type with minimum V_{BO} rating at 2.5 times the rated operating voltage.
- g) The power converter circuit shall be designed so that motor can be powered at its full nameplate rating continuously without exceeding its rated temperature rise nor reducing its service factor due to harmonic currents generated by the inverter operation.
- h) The conversion devices and associated heat sinks shall be assembled such that individual devices can be replaced without requiring the use of any special precautions / tools.
- i) The cooling system of the electronic components, if provided, shall be monitored and necessary alarms shall be provided to prevent any consequential damage to the power control devices.

1.4.4 Converter Transformer

- a) The converter transformer, if provided, shall be copper wound dry type. Insulation class of dry type transformer shall be H with temperature rise of body limited to 75°C. Dry type transformer shall preferably be mounted inside the drive system panel. The impedances of converter input transformers with more than one secondary winding for minimum 18 pulse systems shall be selected to ensure equal load / current sharing

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[9]	25.09.2014

between the secondary windings, the converters and the motor windings under all operational conditions including starting and restarting.

- b) The transformation ratio, impedances, taps and secondary voltage shall be chosen by the drive vendor to optimize system performance.

1.4.5 DC link reactor

- a) Smoothing reactors for the DC link shall be designed to sufficiently decouple the rectifier and inverter portion of the converter and to limit fault currents in this circuit.
- b) Unless otherwise specified, the reactor shall be dry type, air cored, air-cooled or fan cooled type located within the panel.
- c) Reactor shall be suitable for withstanding earth fault continuously and for operation with the non-sinusoidal current wave shapes and DC components under all operational conditions of the system without exceeding its temperature limits.
- d) Noise level shall not exceed value specified in NEMA TR-1

1.4.6 Output filter

- a) VFD output current waveform should be inherently sinusoidal at all speeds, with harmonic limits as specified in this specification. Output filter shall be provided if required. Output filter capacitors shall be provided with discharge circuits to ensure that all residual stored charge is reduced to less than 50 V DC within 300 seconds after a loss of AC voltage. All capacitor shall be maintenance free and self-healing type.
- b) The VFD system shall inherently protect motor from high voltage dv/dt stress, independent of cable length to motor. Output filter shall be an integral part of the VFD system and included within the VFD enclosure.

1.4.7 Protection, Control, Metering, Indication and Annunciation

- a) The Bidder shall provide all the necessary system control, protection, alarm equipment and metering for the entire drive system and its auxiliary equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[10]	25.09.2014

- b) Automatic sequence control shall include start-up of cooling system, auxiliary system of the motor, interlock checking, automatic start and run-up of drive, planned and emergency shutdown. The same shall be processed through microprocessor-based system.
- c) Protective Relays:
For details on protective relays used, refer to Technical Specifications on MV Switchgear
- d) Operator Control Panel
- i. Each drive shall be equipped with a front mounted operator control panel consisting of a backlit alphanumeric display and a keypad with keys for parameterization and adjusting parameter which shall not be limited to start/Stop, Local/Remote, auto/manual, Increase/Decrease, menu navigation and protection and measurement parameter selection, etc.
 - ii. All parameter names, fault messages, warnings and other information shall be displayed in complete English words or standard English abbreviations to allow the user to understand what is being displayed without the use of a manual or cross-reference table. This shall also be used for the modification of all electrical values, configuration parameters, drive menu parameters, application and activity function access, faults, local control, adjustment storage, self test and diagnostics. Keypad shall be operable with password for changing the protection setting, safety interlock etc. However the parameters such as measurements, setting, mode of drive etc. shall be allowed to be viewed without any password.
 - iii. Operator console shall have facility /port to connect external hardware such as Lap-Top etc. Console shall have facility for upload and download of all parameter settings from one drive to another identical drive for start up and operation.
 - iv. Drive system control shall also have facility to receive tripping signal from upstream breaker for tripping and also provision for closing up stream breaker after all required process parameters are achieved.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[11]	25.09.2014

- v. User-friendly software for operation and fault diagnostic shall be loaded in the drive system panel before commissioning.
 - vi. Suitable interface with DCS to be provided for control and status signals of VFD.
- e) Local Motor Control Station
- i. The local motor control station shall be installed near the motor. Components and accessories that are required in the local motor control station may be mounted on the local field mounted panel envisaged for the driven equipment.
 - ii. Meters in the local control station shall be suitable for 4-20mA transducer outputs and shall be calibrated for the actual motor current. Further, for drives with bypass facility, the meters shall be capable of reading bypass full load and starting currents, as well as the drive current.
 - iii. Requirement of controls and indications required in the Local Control Station shall be as specified in the data sheet.
- f) Protective Features:
- The system offered shall incorporate adequate protective features, properly coordinated for the drive control and for motor but not limited to the following:
- i. Incoming line surge protection
 - ii. Under / Over voltage protection
 - iii. Phase loss, phase reversal protection.
 - iv. Programmable Over current protection and under load protection.
 - v. Motor differential protection for motor rated above 1000 kW
 - vi. Inverter Fault.
 - vii. Over frequency operation.
 - viii. Ventilation loss,
 - ix. Over temperature of equipment.
 - x. Over speed of motor.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[12]	25.09.2014

- xi. Specific motor protection, including motor winding, bearing temperatures, over-current, overload, negative phase sequence, locked rotor and earth fault protections etc.
- xii. System Earth fault protection.
- xiii. Excitation system protection for synchronous motor
- xiv. Over and under frequency, rotor earth fault, field failure protection for synchronous motor
- xv. Additional protection for drive system

g) Control features

The following controls shall be provided as a part of the Operator Control Panel or through separate switches.

- i. Start/Stop
- ii. Speed control (Raise/lower)
- iii. Forward/Reverse(if Specified)
- iv. Auto/Manual /test mode
- v. Local/remote
- vi. Emergency stop
- vii. Start/stop for by pass starter (where specified)
- viii. Trip-Remote Breaker
- ix. Excitation control system for synchronous motors
- x. Sequential switching of filters

h) Metering

Digital display of the following parameters shall be as a part of the Operator Control Panel, selectable by the operator.

- i. Input AC Current
- ii. Input AC voltage
- iii. Input AC frequency
- iv. Output voltage
- v. Output current VFD / Bypass
- vi. Output frequency
- vii. Motor thermal state

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[13]	25.09.2014

- viii. Drive thermal state
- ix. Motor speed
- x. Motor energy meter
- xi. DC Link voltage
- xii. Hour Run
- xiii. Voltage and current meter for excitation system for synchronous motor.
- xiv. KVAR, power factor meter for synchronous motors
- xv. Necessary transducer shall be provided with 4-20mA output for indicating motor speed and motor current in DCS unless otherwise specified for other parameters.

i) Indications

Bidder shall provide indications as required for normal operation and for easy maintenance, which shall not be limited to the following indications both at local and at plant DCS.

- i. Motor running
- ii. Motor stopped
- iii. VFD System Fault
- iv. System ready to start
- v. AC mains ON
- vi. Motor over speed
- vii. Rectifier output 'ON'
- viii. Motor zero speed
- ix. Remote breaker trip
- x. Excitation system healthy for synchronous motors

Above indications may be provided as a part of the operator control panel, i.e., door mounted keypad or through hardwired indicating lamps/LEDS.

Potential free contacts of items i- iv shall be wired separately for remote indications in DCS.

j) Audio-visual annunciations

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[14]	25.09.2014

- i. The system shall incorporate audio-visual annunciations for protection, for various fault conditions, for the Drive motor, Supply cables, DC Reactor and the Converter, output transformer etc.
- ii. Alarms shall also be included for the failure of various auxiliaries together with identification of the failing unit, loss of cooling system, various protection devices provided for converter transformer etc.
- iii. Audio-visual window annunciations shall be provided on the front of the panel All annunciations as required for normal and satisfactorily operation of the drive system shall be included as per Bidder standards. These annunciations can be part of operator console panel or separately mounted type.
- iv. Bidder shall include audio-visual alarm as required for normal operation and maintenance of the system but not be limited to the following,
 - Rectifier fuse failure
 - Main AC failure
 - Inverter fuse failure
 - Inverter overload
 - Inverter high temperature
 - Cooling system failure
 - Motor failed to start
 - Transformer failure
 - Excitation system failure for synchronous motor
 - Battery monitoring healthiness
 - Communication and measurement system un healthy
 - Motor temperature high
 - Harmonic filters monitoring
- i. Common potential free contacts shall be provided for above annunciations and these shall be wired up to terminals of DCS I/O panels for remote alarm and monitoring.

k) Fault Diagnostic

Fault diagnostic shall be built into the system to supervise the operation and failure of the system. The information regarding failure of any of the system including shut down of the system shall be available for a period of minimum 4 days (96 hours) after a shut down even though no supply

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[15]	25.09.2014

would be available to the system. The system may be totally de-energized for maintenance or otherwise. It shall be possible to retrieve the record of events prior to tripping of the system or de-energisation. Auxiliary supply to the system components or to the electronics (firmware) for the diagnostics / display shall be taken care by the manufacturer for this purpose.

1.4.8 External Power supply for auxiliary and Control Circuit

Auxiliary power supply for devices external to VFD module, space heater supply for Motor, VFD panel space heater, auxiliary power supply for transformers, cubicle lamps (CFL) etc. shall operate on 240 volts single phase AC.

All control circuit shall operate at voltage of 110V AC or 220V DC.

Bidder shall include supply of all control transformers, protective devices, required accessories etc. and any other control supply voltage as required for the system.

1.4.9 Maintenance features

The controller design shall incorporate the following maintenance features:

- a) Modular construction
- b) All components shall be easily accessible.
- c) Standard diagnostics to aid maintenance personnel. These shall include LED or alphanumeric displays, test or measurement points.

1.4.10 Painting

- a) All metal surfaces shall be thoroughly cleaned and de-greased to remove mill scale, rust, grease and dirt. Fabricated structures shall be pickled and then rinsed to remove any trace of acid. The under-surface shall be prepared by applying a coat of phosphate paint and a coat of yellow zinc chromate primer. The under-surface shall be made free from all imperfections before undertaking the finishing coat.
- b) After preparation of the under surface, the panel shall be provided with epoxy based powder coating. The color shade of the final paint shall be as per manufacturer's standard, unless otherwise specified. Panel finish shall be free from imperfections like pinholes, orange peels, runoff paint, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[16]	25.09.2014

- c) All unpainted steel parts shall be zinc passivated, cadmium plated or suitably treated to prevent rust and corrosion. If these parts are moving elements, then these shall be greased.

Final paint shade shall be light gray and dove gray 631 and 632 as per IS-5 for indoor and outdoor equipment respectively unless otherwise specified

1.5 Tests

The Routine and Type Tests to be performed on the drive system in the presence of the purchaser of consultant shall be as follows:

1.5.1 Type Tests

For each rating and type of VFD, the Bidder shall submit for Owner's approval, the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

All type tests shall be conducted as per relevant standards and test certificates of similar panels conducted within last 5 years shall be furnished.

1.5.2 Routine tests

- a) Visual Inspection
- b) It involves checking of the various equipments/components fault diagnostic unit, Wiring, Terminals, earthing ratings etc.in line with the approved drawings and visual inspection shall not be limited to the following:
- c) Insulation Test
- d) Light Load and Functional Test
- e) Load characteristics test
- f) Load duty test
- g) Checking of Auxiliary Devices
- h) Checking the properties of the control equipment

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[17]	25.09.2014

- i) Checking the Protective Devices
- j) Checking of control and functional requirements
- k) High voltage test
- l) Leakage and pressure test for cooling water system where provided
- m) Shaft current/bearing insulation
- n) Automatic restart/re-acceleration

Additional tests on switchgears and dry type transformers shall be carried out based on the requirement defined in the technical specification.

1.5.3 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

1.5.4 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings, Data and Manuals

The engineering services scope and the documentation to be issued with the bid are described hereafter. The list shows the minimum requirements for the documentation, so that any additional documentation considered as necessary will be added to this.

- a) Engineering, manufacturing, delivering and test schedule
- b) Sub-Supplier lists.
- c) General arrangement drawings(plan, elevation, section view) with dimensions
- d) Foundation drawing including loading data.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors Turbo Generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[18]	25.09.2014

- e) Technical Data sheets.
- f) Electrical and control wiring diagram.
- g) Terminal arrangement drawing, interconnection wiring diagram.
- h) Cross sectional drawing.
- i) Inspection and test plan.
- j) Manufacturing Quality Plan.

1.7 Ratings and requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

ANNEXURES-E14**1.0 6.6kV SEGREGATED PHASE BUS DUCT****1.1 General**

This specification is intended to cover the *[design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, erection, site testing and commissioning]* of [6.6]kV Segregated Phase Bus duct, complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

Code	Name of Standard
IS 8084	Interconnecting Bus bar for AC Voltage above 1kV up to and Including 36kV
IEEE C37.23	IEEE Standard for Metal-Enclosed Bus.
ANSI/IEEE C37.20	Switchgear assemblies including metal enclosed bus
ANSI/IEEE C37.24	Guide for Evaluating the Effect of Solar Radiation on Outdoor Metal Enclosed Switchgear
IEC 60947	Low Voltage Switchgear and Control gear
IEC 60439	Low-voltage switchgear and control gear assemblies.
BS 159:1957	Bus bar and Bus bar connection
CEA	CEA regulations and standards

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E14	[2]	25.09.2014

1.3 Design Criteria

- a) The segregated phase bus duct will serve as interconnection between the 6.6kV Indoor Switchgear and outdoor Unit/Station transformer LV terminals and also as inter-connection between Unit and Station switchgears.
- b) Busduct shall be phase segregated and shall be installed indoor/Outdoor in a hot, humid and tropical atmosphere.
- c) Bus duct, associated equipment and wiring shall be provided with tropical finish to prevent fungus growth. All ventilation openings shall be screened and drains shall be filtered to prevent entrance of dust and insects.
- d) The portion of bus duct at the transformer/switchgear end will be subject to vibration normally prevalent for this type of installation in a power generating station. Suitable means shall be provided to isolate the transformer/switchgear vibration from rest of the bus structure / bus duct.
- e) For continuous operation at specified ratings, temperature rise of the bus duct and auxiliary equipment shall be as specified in Clause 1.7 Rating and requirements.
- f) Bus duct and auxiliary equipment shall be capable of withstanding the mechanical forces and thermal stresses of the required short-circuit currents.
- g) The bus ducts and supporting structures shall be designed & constructed so as to withstand without damage the horizontal / vertical ground accelerations due to earthquake.
- h) The bus ducts shall be self cooled and shall not be equipped with blower or any other type of forced ventilation.
- i) The equipment rating shall be based on an ambient temperature. Same phase disposition shall be maintained throughout the run of the bus duct. Phase crossover units, if required, shall also be provided inside the Busduct itself.
- j) Bus ducts shall be suitable for continuous operation at maximum system voltage and shall be adequately sized to withstand short circuit current.
- k) Any phase cross over if required, same shall be covered in the busduct itself.

1.4 Specific Requirements

1.4.1 General

- a) 6.6kV SPBD is provided for connection between low voltage side of Unit Auxiliary Transformer/ Station Transformer to respective 6.6kV Unit and Station Switchgear along with necessary bends, flexible at both transformer & switchgear ends, flanges, phase crossover chambers (if

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E14	[3]	25.09.2014

required), support structures & accessories including terminations at the equipment ends.

- b) The SPBD shall be metal enclosed, phase segregated type and natural air-cooled. The cooling medium inside the duct shall be air.
- c) All parts and accessories shall have appropriate match mark and part numbers for easy identification and installation at site.
- d) The continuous current rating and momentary peak withstand current rating of the Busduct between transformers & their associated switchgear shall be same as that of the associated switchgear and as indicated in the specification.
- e) All supporting steel structures shall be hot dip galvanized.
- f) The bus ducts shall be provided with space heaters to control moisture. Slicagel breather, if required shall be provided.
- g) Wall frame assembly and seal off bushing shall be provided whenever busduct passing through the wall.

1.4.2

Bus Conductor:

- a) The material of the conductor shall be of high conductivity aluminium alloy. The grade of aluminium alloy shall be indicated by the bidder in his Bid.
- b) The temperature rise of conductor shall be as per IS:8084. Also the temperature of the bus shall not exceed 250°C while carrying the specified short circuit current for one second when a fault occurs at the operating temperature.
- c) The bus conductor shall be given a coat of matt black paint to facilitate heat dissipation. However, the sizing of the bus conductor shall consider the conductor as bare and shall be designed to carry the normal rated current without exceeding temperature rise as specified in IS: 8084.
- d) The bus conductor shall be designed for bolted connections throughout the run. Flexible connection shall also be provided at all equipment terminations.
- e) All contact surfaces shall be silver plated to ensure an efficient and trouble-free connection. All connection hardware shall be non-magnetic and shall have high corrosion resistance.
- f) The bus conductors and their support insulators shall be designed to withstand, without damage, the forces developed while carrying the short circuit current.

1.4.3

Enclosures

- a) The enclosure shall be made of aluminium alloy. The grade of aluminium alloy shall be grade [63401] as per IS-5082. Thickness of the enclosure shall be minimum 3mm.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E14	[4]	25.09.2014

- b) The entire bus duct shall be designed for indoor/outdoor installation with a dust and vermin-proof construction. The degree of protection shall be IP-55 confirming to water tightness and air leakage test. Outdoor portion of bus duct shall be provided with rain hood or suitably sloped enclosure to prevent accumulation of water.
- c) The inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The bare enclosure with above painting shall be designed so as not to exceed the temperature specified in IS: 8084.
- d) The enclosure shall be rectangular in size and shall be of phase segregated type. Phase barriers shall be provided in the bus ducts for phase segregation. Minimum thickness shall be 2 mm. In case of segregated phase bus duct, the phase segregation shall be of aluminum alloy or non-hygroscopic insulating material like fibre glass.
- e) Circumferential neoprene rubber gaskets shall be provided for dust tight joints with adjacent enclosure section.
- f) The bus enclosure shall have extended bellows or equivalent means to allow for temperature changes and vibrations. Flexible joints shall be provided in enclosures at all points where the bus duct terminates at equipment to withstand vibration, expansion / contraction and at suitable intervals in any straight run of the bus duct where expansion and contraction would otherwise result in stresses in the supporting structures.
- g) Suitable inspection openings shall be provided for access to support insulators, bus joints, transformer terminals, switch gear terminals etc. All inspection openings shall have reliable sealing arrangement with neoprene gaskets.
- h) Seal-off bushings complete with wall-frame and support plates shall be provided where the bus duct penetrates the building wall. The seal is to prevent free exchange of air between indoor and outdoor portions of the bus duct. In case, the bus duct penetrates the firewall, the wall frame assembly and the seal shall be designed for the same fire rating as the firewall.
- i) Silica-gel breather shall be provided on both indoor and outdoor portions of the bus duct.
- j) Filtered drains for drainage of condensate shall be provided at the lowest points and at such locations where accumulation of condensate can be expected.
- k) Space Heaters shall be provided in the bus duct.
- l) Shipping length of the busduct shall be not more than three (3) meters in length.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E14	[5]	25.09.2014

1.4.4 Disconnect Link

- a) Removable bolted disconnected link shall be provided in the bus for the purpose of isolation.
- b) Disconnect link shall consist of a removable section of conductor and shall be so constructed as to permit easy removal or reinsertion without alignment difficulties.
- c) The bus on both sides of the link shall be rigidly supported so that the disconnect link is equal in mechanical strength to any other section of the bus.
- d) A minimum clearance of 300 mm. (12") shall be provided between the disconnected bus sections with the link removed.

1.4.5 Insulators

- a) Within the bus duct the bus shall be mounted and supported on insulators. The insulators shall be mounted on resilient pads provided in the bus enclosure. The insulators shall be either porcelain or resin cast.
- b) Bus support insulators shall be interchangeable, high creep, high strength, wet process, fine glazed porcelain. Alternatively good quality cast resin insulators may be offered.
- c) Insulator shall be mounted in such a way so as to permit easy removal or replacement without disassembly of the bus. The insulator mounting plate shall be designed for cantilever loading to withstand the short circuit.
- d) The conductor shall be fastened on the insulator through fixed and slip joints so as to allow conductor expansion or contraction without straining the insulator.
- e) All bolts, nuts and lock washers used in the bus assembly shall be high tensile steel, plated for corrosion resistance. Spring washers or equivalent means shall be used for ensuring good contact pressure under all operating conditions. All bolts shall be tightened using properly calibrated torque spanner by applying the recommended torque.
- f) Space heater shall be provided preferably located near to each insulator to avoid moisture condensation within bus duct.

1.4.6 Wall Frame Assembly

Wherever the bus duct passes through the plant building wall, from indoors to outdoors, a wall frame assembly with seal-off bushings shall be provided to prevent any leakage of rain water, infiltration of dust and air temperature variations from indoors to outdoors. The wall frame shall be fabricated out of aluminium angles and sheet and shall be suitable for grouting in the wall. It shall be provided with flanges on both sides to receive the bus duct flanges. A suitable size breather shall be provided for the two sections of the busduct separated by the wall frame assembly.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E14	[6]	25.09.2014

1.4.7 Seal-off Bushings

The bus duct shall be equipped wherever necessary with seal-off bushings to prevent interchange of air at different temperatures. The seal-off bushings shall be flanged type.

The insulator for wall frame assembly and seal-off bushings shall be of porcelain. Also the bushings shall be designed for thermal expansion/contraction due to temperature differential for outdoor/indoor use.

1.4.8 Bellows

Joints consisting of metallic expansion bellows shall be provided on the bus enclosure at following points:

- (a) At terminations of transformers
- (b) At terminations of switchgear cubicles
- (c) In the run of the bus duct in case of long lengths as required by design.

1.4.9 Inspection Covers

Provision shall be made for periodic inspection of insulators by means of inspection covers. The inspection covers shall be provided at the bottom with quick-acting stainless steel clamps and shall have gaskets. There shall be no joints or fixing bolts on the top surface through which water could seep through.

1.4.10 Connections & Terminations

- a) All matching flanges, seal-off bushings, gaskets, fittings, hardware and supports required for termination of the Busduct at the switchgear, transformers and other equipment shall be furnished.
- b) In this connection the bidder is required to coordinate with the switchgear and auxiliary transformers manufacturer with regard to connection details, mechanical and thermal stresses.
- c) Flexible connections both for conductor and enclosure shall be furnished at all equipment termination to provide for misalignment up to 25 mm in all directions.
- d) The equipment terminal connections shall be readily accessible and shall provide sufficient air gap for safe isolation of equipment during testing.
- e) If the material of bus conductor and that of the equipment terminal connectors are different then suitable bimetallic connectors shall be furnished.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E14	[7]	25.09.2014

1.4.11 Grounding

- a) A separately run [50X10] mm G.S. flat suitably clamped along the enclosure shall be used as the ground bus. All parts of the bus enclosure, supporting structures and equipment frames shall be bonded to above ground bus.
- b) Ground pad shall be bolted type to accommodate galvanized steel flats of suitable size complete with suitable tapped holes, bolts and washers.
- c) The earthing termination shall be identified by measures of the sign marked in legible and indelible manner on or adjacent to the terminals.

1.4.12 Supporting Structures

- a) All supporting structures required for hanging and/or supporting the complete bus duct shall be furnished. These include all members, indoor/outdoor posts, bolts, shims, base plates, beams, hangers, brackets, bracings and hardware.
- b) Indoor portion of the bus duct may be supported from the floor or ceiling beams. Outdoor portion of the bus duct shall be supported from ground below on suitable foundation in the ground. The foundations and structures in outdoor area shall clear the transformers, transformer foundations, cable trenches.
- c) All buses shall be adequately supported and braced to successfully withstand normal operation, vibration, thermal expansion, short circuit forces and all specified design loads including wind & earthquake forces.
- d) Support shall be designed to provide tolerance of ± 12 mm in the horizontal and vertical directions.
- e) All steel members shall be hot-dip galvanized after fabrication. All hardware shall be of high strength steel with weather resistant finish.
- f) The mounting arrangement of Busduct on the supporting structure shall be designed to allow movement of the Busduct during expansion and contraction.
- g) All structure shall be self supporting and in no case rely for support on equipment to which the busbars are connected.

1.4.13 Wiring

All wiring for space heaters shall be done with insulated stranded copper conductor of not less than 2.5 mm² cross-section. Each wire shall be identified at both ends with wire designation as per contractor's wiring diagram and shall be brought out to a terminal box outside the bus duct.

Terminal blocks shall be box-clamp type minimum 10 sq.mm with marking strips.

At least 20% spare terminals shall be furnished in the terminal block.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E14	[8]	25.09.2014

1.4.14 Name Plate

Suitable name plate shall be furnished with each piece of equipment.

Materials for name plate shall be plastic / lamicaid, 3 mm thick, using white letters on black background.

1.4.15 Space Heater

- a) Thermostatically controlled Space heaters shall be provided in the bus ducts, wherever the manufacturer considers them necessary and recommends their provision for preventing harmful moisture condensation. At least one number space heater with thermostat shall be provided at each transformer and switchgear end.
- b) The space heaters and thermostats shall be wired up to terminals in suitably located terminal boxes to be provided by the contractor. The space heater wiring inside the busduct enclosure shall be done with high temp. resistant cables as the ambient temperature existing inside the busduct enclosure may vary.
- c) The minimum conductor size of space heater wiring shall be 2.5 sq.mm. A separate ON/OFF switch shall be provided for controlling the space heaters of each busduct in the marshalling box located at convenient height. One number single phase 240V power supply at the marshalling box for complete run of every busduct shall be provided. All cabling between space heaters/thermostats and marshalling box in the run of busduct shall be supplied and erected by the contractor. Cable entry points to the busduct shall be sealed properly by providing suitable glands.

1.4.16 Painting and Finish

- a) All surfaces to be painted including interior and enclosures and other metal parts shall be shot or sand blasted or chemically treated to remove all rust, scale, grease and other adhering foreign matters as far as possible shall be painted with not less than two (2) coats of Acid and corrosion resistant paint
- b) Steel surfaces, exposed to weather shall be given two (2) coats of zinc chromate and two (2) coats of an 'approved' Manufacturer's paint of 'approved' colour.
- c) All metal parts not accessible for painting shall be made of corrosion resistant materials. All machine finished or bright surfaces shall be coated with a suitable rust preventive compound and wrapped or otherwise protected.
- d) Inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The shade of exterior surface finish shall be [RAL 5012].

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo generator & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E14	[9]	25.09.2014

- e) The interior surface finish shall be as per manufacturer's standard.
- f) Pretreatment consisting of degreasing, de-rusting etc. shall be done on all fabricated parts before painting or galvanizing.
- g) Paints shall be carefully selected to withstand heat and weather conditions. The paint shall not scale-off or crinkle or get removed by abrasion due to normal handling.
- h) Sufficient quantities of all paints and preservatives required for touching up at sites shall be furnished.
- i) The paint shade shall be subject to owner's approval.

1.5

Tests

I) Type Test

For each type & rating of 6.6kV segregated phase bus duct, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the Busduct similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

Some of the specific tests required are listed below.

- a) Visual inspection and verification of dimensions
- b) Dry power frequency voltage withstand for 1-minute
- c) Milli-volt drop test & Water tightness test

1.6

Drawings, Data and Manuals

Drawings, data & manuals for the 6.6kV segregated phase bud duct shall be submitted as indicated below:

- a) [Dimensional GA drawing
- b) Data sheets
- c) Typical calculation for arriving at the size of conductor and the insulator spacing.
- d) Type test report (short circuit, temperature rise test) for similar bus duct

Document Number	Rev No.	Description	Page No.	Date of Issue

manufactured by the proposed manufacturer.

e) The bidder may note that the drawings, data and manuals listed are minimum requirement only. The bidder shall ensure that all other necessary write-ups, curves and information required to fully describe the equipment offered are submitted with his bid.]

1.7

Ratings and Requirements

Major technical parameters of 6.6kV segregated Bus Duct are listed below..

S. No.	Technical Particulars	Unit	Parameters	Remarks
1.0	General			
1.1	System nominal voltage	kV	6.6	
1.2	System maximum voltage	kV	7.2	
1.3	Number of phases		3	
1.4	Rated Frequency	Hz	50	
1.5	Neutral Grounding		Medium resistance grounded for earth fault current limited to [300 A for 10 secs.]	
1.6	Insulation level			
a	1 min power frequency withstand voltage	kV	20	
b	Impulse withstand voltage	kVp	60	
1.7	Short Circuit Level			
a	Symmetrical short circuit capacity	kA	40kA	
b	Dynamic capacity	kAp	100	
1.8	Space heating voltage	V	240V \pm 10%, 1ph, 50 Hz, 2 wire.	
1.9	Reference standard		IS 8084/ IEEE C37.23	
2.0	Busduct			
2.1	Make

1 GENERAL

This specification is intended to provide the technical guidelines for the fully coordinated Control & Instrumentation (C & I) system for the Renovation & Modernisation of Steam Turbine, Generator, Station C&I and its Auxiliaries of Thermal Power Plant of Unit No. [..] of [Name of the Power Plant] at [District], [State]. The renovated Turbo Generator shall be capable of producing the output of [210/215/220/250] MW. DCS & other common system/items procured under SG package shall be deleted from TG package.

The Control and Instrumentation system of a plant shall be designed to ensure safe, efficient and reliable operation of the plant under all regimes of operation namely start up, shutdown, normal operation, part load operation and under emergency conditions resulting in cost effective power generation with optimum fuel consumption and reduced steam requirement.

The technical specification shall serve as the guide specification for the proprietary controls of Steam Turbine Generator Integral controls (like Turbo supervisory Instruments, Turbine Run-up System (ATRS), Turbine Protection System, Electro Hydraulic Governing System (EHG) etc.) Station C&I and STG Auxiliaries, equipment packages, as also various stand alone system controls included as part of sub-packages, as in case of plant auxiliaries.

It is to be noted that where equipment or system for the Steam Turbine Generator system and its auxiliaries are described, it shall be understood that the quantities described are per unit basis, i.e., identical sets to be furnished for each of the units (If plant have multiple units). Where equipment or systems for common facilities are described, it shall be understood that the quantities described are the total quantities required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[1]	02.09.2015

2**SYSTEM DESCRIPTION**

The plant C&I system is envisaged to be configured by interfacing main plant control system namely Plant DCS interfaced with other different plant control systems namely, TG Integral control system and other utility and auxiliary plant control systems (both unit specific and plant common systems) and provided with different special plant monitoring and analysis systems to provide supervisory and reporting facilities to plant personnel and management.

The plant C&I system is envisaged to permit centralized operation and monitoring of the power plant from the central control room (CCR). The system shall consist of a functionally distributed microprocessor based system (DCS) with facility for VDU (Video Display Unit) / Keyboard & Large Video Screen based operation, control and monitoring.

The control requirements of the main power plant comprising TG with associated auxiliaries (except for TG Integral control systems) to be implemented in microprocessor based Distributed Control.

TG Integral control system shall include TG Governing Control, Turbine protection system and Turbo Supervisory Instrumentation shall be an independent microprocessor based control system. Turbine Protection system shall be a fail-safe type system.

TG Integral Control System (For TG Governing Control & Turbine Protection) shall be interfaced with plant DCS through redundant bi-directional OPC link with Ethernet based TCP-I/P protocol. However for time critical signals hardwired interfacing is envisaged.

Following PLC based systems shall be interfaced with plant DCS through redundant unidirectional OPC link with Ethernet based TCP-I/P protocol.

- Plant Common Hydrogen plant (if applicable)
- Unit Specific Online tube cleaning system

CCR operation / monitoring of equipment/systems under TG Integral control systems shall be through plant DCS system OS /LCD.

Turbo Supervisory System shall be interfaced with respective unit plant DCS.

A common time synchronization system is envisaged for time synchronizing of all programmable control systems like TG Integral control system, SG Integral control system plant DCS, PLC control systems etc. for the whole station.

Operation and Monitoring of Plant Electrical 11 kV, 6.6 kV and Downstream System shall be performed through Plant DCS. Additionally, DCS shall have a redundant Software link with Substation Automation System (SAS) for monitoring of 400 KV & 220 KV switchyard systems. Switch yard system equipments shall be primarily operated from CCR (Operator stations shall be

3 DESIGN PHILOSOPHY

This section covers the design philosophy which shall be used for all control & instrumentation system for steam turbine generator & its auxiliaries.

1. Pressure indicators shall be used wherever indicating type Pressure transmitters are not envisaged. The applications include:
 - a) Suction and discharge lines of pumps, including header section, if two or more pumps are employed for the same service.
 - b) All input and output lines of process equipments.
 - c) Inlets and outlets of heat exchangers (both the fluid media).
2. Pressure Switches shall be avoided as far as possible and in place, smart pressure transmitters with soft limit value monitoring in Plant DCS shall be used. The applications shall include the following:
 - a) On all process lines / Equipments where parameter abnormality / status including pre trips alarms to be communicated to the operator in control room.
 - b) For all permissive and protection conditions governed by safety operation of the equipments. e.g. pressure adequate, pressure very high / very low conditions.
 - c) For all interlock conditions, governing starting of standby equipment or subsequent equipments for safety operation of the system.
 - d) Inlet and outlet of filters / strainers.
3. Differential Pressure Switches (indicating type) shall be used across filters/strainers for remote monitoring.
4. Smart Pressure Transmitter shall be used for all control applications and as demand by the process. Pressure stubs with isolating valves shall be used.
5. Differential Pressure Transmitter shall be used for all the requirements of differential pressure, flow, level measurement. Pressure stubs with isolating valves shall be used.
6. Temperature indicators (Thermometers) shall be used for following applications:
 - a) On all process lines where local indication is warranted by the system either for monitoring or testing.
 - b) On the inlet/outlet of equipments such as Heat Exchangers & Coolers for both the fluid media.
 - c) Differential temperature indicator shall be used across BFP suction and discharge service.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[4]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

7. Temperature Elements: Thermocouples / RTDs shall be used for casing metal temperature monitoring and bearing temperature monitoring of HT drives/motors.
 - a) The elements shall be duplex type with integral thermowell (except for metal thermocouples). K Type Thermocouples shall be used for all temperature measurements wherever possible. Both the elements of duplex temperature sensors shall be brought to junction boxes.
 - b) Compensating cable shall be used with all thermocouples for terminating to the control system eg. Plant DCS.
 - c) Six nos. (2 nos. per phase) Resistance temperature detectors (RTD's) shall be used for all HT motors, for winding temperature monitoring. Each element shall be 3-wire type, duplex with thermowell assembly. RTDs shall be terminated in the external terminal box, for connection to Plant DCS system.
 - d) 1 no. duplex PRT-100 type RTD shall be used for each bearing of HT equipment and its driving equipment (motor).
 - e) All RTDs shall be PRT-100 type with each element being 3-wire type, duplex with thermowell assembly. RTDs shall be terminated in the external terminal box, for connection to Plant DCS system.
 - f) For process temperature up to 200 degree C, RTD shall be used. Beyond 200 *C temperature thermocouple to be used.
 - g) Temperature measurement shall have upscale / down scale protection features not to cause major process upset in case of sensor failure.
8. Level gauges shall be used on all tanks and the maximum length of one gauge glass shall not exceed 1 meter. The gauge glasses shall be stacked to cover the complete height of the tanks including over flow level. There shall be an overlap of minimum 100mm, when more than one level gauge is required.
9. Level switches: The instrument shall be used for the following applications:
 - a) On all equipments (storage vessel) where parameter abnormality/status has to be communicated to the operator in the control room.
 - b) All permissive, interlock and protection conditions governed by the safe operation of the equipment.
 - c) Conductivity type level switches shall be used for all heaters and drain pots.
10. Level Transmitters Stubs with impulse pipes, root valves for mounting Level transmitters shall be used on process equipments where continuous remote monitoring and/or control of level is envisaged. Wherever necessary standpipes or float chambers and also makeup line shall be used for filling up the constant level vessel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[5]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- a) The instrument shall be displacement type for all low pressure and vacuum applications involving two phase media viz: condenser, hotwell and LP heaters level measurements. Optionally, guided wave radar type shall be used.
 - b) The instrument shall be differential pressure type or torque tube type for other applications.
11. Flow Glasses shall be used at the outlet of the pipe lines and shall be employed under the following conditions:
- a) Coolers
 - b) The instrument shall be rotary type with glass mounted for indication
 - c) Up to 6 inch on-line flow glasses shall be supplied and above 6 inch bypass type flow glasses shall be used. Sight flow and variable flow indicators shall be used for low pressure and low temperature applications.
12. Microprocessor based speed switches shall be used for zero speed detection, chain cut detection, locked rotor protection etc. Microprocessor based reverse rotation switch shall be used for pump protections such as BFP, CEP etc.
13. Pneumatically Operated Control Valves shall be used for all control application. If the process demands any other control, then control valves shall be used for those applications also. Where a single control valve cannot meet the turn down ratio as dictated by the process, control valves with split range application shall be used.
- a) All bypass valves of control valves shall be motor operated valves suitable for inching operation provided with position transmitters.
 - b) All integrated bypass valves shall be motor operated. Electro-pneumatic positioners shall be used for all pneumatic control valves.
 - c) Pressure test points & drains shall be used across each control valve
14. The pneumatically operated control valves shall be used with Smart Positioners, diagnostics and HART compatibility. Control Valve diagnostics shall be transmitted through this HART Protocol to Plant DCS.
15. Solenoid Valves shall be used for all pneumatic control valves hooked up with process interlock requirements and where direct tripping is involved. All solenoid valves shall be uniformly rated for 24V DC or 220V DC. The number of ways for solenoid valve shall be used as indicated below :
- a) On line two (2) way solenoid valves shall be used, where process line of less than 2 inch with low pressure & temperature application is involved.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[6]	02.09.2015

- b) Three (3) way solenoid valves shall be used commonly, where the pressure is admitted or exhausted from a diaphragm valve or single acting cylinder. E.g.: Pneumatic operated spray water block valve.
 - c) Four (4) way solenoid valves shall be used for operating double acting cylinders (If applicable). E.g.: Pneumatically operated on-off type dampers.
 - d) Dual coil, latch, unlatch type Solenoid valves shall be supplied for equipment trips/critical applications.
16. Position Transmitters shall be used for all motorized inching valves. Position transmitters shall be 24 V DC, 2 wire, non-contact type.
17. Electro-Pneumatic positioners shall be used for all pneumatically operated control valves, power cylinders etc., for converting controller output of 4-20 mA to appropriate pneumatic signal
18. Air Filter Regulators along with gauges shall be used in each of the:
- a) Air supply line to valve positioners /power cylinders
 - b) Air supply line to pneumatic interlocked block valves
19. Interposing relay (To be mounted in Control room cabinet) for interface to the following:
- a) Solenoid valve (if output module cannot directly drive SOV) - Relays with contact rating of minimum 2 Amps.
 - b) DC Starter ((if output module cannot directly drive) - Relays with contact rating of minimum 0.2 Amps.
 - c) Hardwired signal exchange – as required.
20. For all HT rotating equipment bearings provision for mounting vibration probes shall be used.
21. Junction Boxes/Field termination cabinet: All JBs /FTCs shall be SS. Junction Boxes shall be used for:
- a) Termination of all sensors located equipment wise.
 - b) Termination of Duplex Thermocouples / RTDS
 - c) Termination of limit switch, torque switch, position transmitter and control demand, independently for each valve.
 - d) Area wise or Elevation wise bunching of cables.
22. Instrumentation & control cables and Prefabricated Cables with Anti-Rodent treatment shall be used to:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[7]	02.09.2015

- a) Connect field instruments to field junction boxes/Local Panels. For switches, both the SPDT contacts of switches shall be wired up to the J.B.
 - b) Connect limit switches, torque switches and position transmitters to their respective field junction boxes.
 - c) Compensating cable shall be supplied for connection between the element and the respective junction boxes / system cabinets as per guidelines.
 - d) Prefabricated cable for connecting between system cabinets, marshalling cabinet to system cabinet, system cabinet to Relay Rack, system cabinets to engineering work stations etc.
 - e) Entire I&C cable within the battery limits.
23. All field instruments including electronics located outside control room areas shall be tropicalized and shall be designed to work in site specific atmosphere/climatic conditions and enclosed in dust tight, waterproof and weatherproof enclosures. In general, transmitters and switches installed at outdoor location shall be mounted in closed type transmitter enclosure. For other areas (indoor), open type racks may be used for installation of transmitters and process switches.
24. All alarm shall be displayed in the Plant DCS HMI/LCD. However where local panels are used for local operation/monitoring, PLC/ DCS driven alarm annunciation system with LED type lamps for local panel shall be used.
25. Pressure, temperature and flow test points shall be used in line with latest performance test code requirements.
- In general, pressure and temperature test points shall be used for the following services:
- a) At the discharge of all pumps and fans
 - b) At the inlet and outlet of the heat exchangers for the fluid media involved
 - c) Adequate number at the Combustor at different zones
 - d) At the inlet and outlet of each control valve
26. The ranges of the instruments shall be selected based on the following philosophy:
- a) For pressure and draft measurements, the maximum operating pressure shall be within 70 to 80% of the maximum scale range.
 - b) For temperature measurement, the maximum operating temperature shall be within 80 to 90% of the maximum scale range.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[8]	02.09.2015

- c) For pressure switches and temperature switches, the set points shall fall within 40% to 70% of the scale range selected.
 - d) For level measurement, the maximum of the range shall cover the overflow point or six inches from the top of the vessel and the minimum of the range shall be six inches above the bottom of the vessel. Also, the gauge glasses shall be stacked with overlap to cover permissive, alarm and trip levels.
 - e) For flow measurement, the maximum range shall be fixed at about 10 to 15% above the maximum operating flow
 - f) For electro-chemical measurements (conductivity, pH, dissolved O₂, Silica etc.), the maximum range shall be around 10 to 15% higher than the recommended alarm settings.
- 27.Spring-loaded/ Cage clamp type terminals shall be used for termination of instrumentation cables at field JBs, FTCs and local panels.
- 28.Signal Exchange Between different systems and Plant DCS System shall be as follows:
- a) All the signals required for interlock / alarm / SER purpose (to be implemented in the Plant DCS) shall be hardwired.
 - b) All binary outputs provided to local panels/sensors for connection from Plant DCS shall be potential free contacts with a rating of 0.2 amps at 220 V DC or 2 amps at 24 V DC or 5 amps at 240 V AC. All check backs to Plant DCS shall only be potential free contacts.
 - c) All analog outputs provided to local panels/sensors for connection from Plant DCS shall be isolated 4-20 mA DC.
 - d) Command outputs from Plant DCS to motorized valve actuator shall be logic level signal (24 V DC) and necessary interposing relays suitable to accept 24 V DC logic level command signal shall be used in MCC module for MOV actuator.
 - e) Push buttons station/panel for safe emergency shutdown of the plant shall be provided.
- 29.Flow elements for measurements of steam or water flow shall be used along with 3 (three) tapping's for measurement & Control and one tapping for test purpose.
- 30.All indication lamps shall be LED type.
- 31.All interposing relays shall be Plug in type with screw type base & LED for status indication. Relay modules/boards etc. are not acceptable.
- 32.All Limit Switch shall be Non-Contact type. If there is constraints because of process conditions/space, mechanical lever actuated Limit switch may be used.

4 DESIGN CRITERIA

This section covers the general design criteria to be adopted in designing the Control & Instrumentation system for the TG Package.

4.1 General Requirements

Ambient Conditions

Instruments, devices and equipment for location in outdoor / indoor / air-conditioned areas shall be designed to suit the environmental conditions indicated below and shall be suitable for continuous operation in the operating environment of a coal fired Power plant and also during periods of air conditioning failure without any loss of function, or departure from the specification requirements covered under this specification.

Table 4.1
Protection Class Requirement

Ambient Temperature (outside temperature)	Pressure	Relative Humidity	Atmosphere	Required Protection class of panels /cabinets /desks
Outdoor Location				
55 oC max	Atmosphere	100%Max	Air (dirty)	IP 65
4 oC min	Atmosphere	5 % Min	Air (dirty)	IP 65
Indoor Location				
55 °C max	Atmosphere	95 % Max	Air	IP 54
4 °C min.	Atmosphere	5 % Min	Air	IP 54
Air-conditioned Area				
24 +/- 2 °C normal	Atmosphere	95 % Max	Air	IP 44
50 °C Max.	Atmosphere	5 % Min	Air	IP 44
a) For Ventilated enclosures, protection class shall be IP 42. b) For hazardous areas the protection class shall be in accordance with the requirements of the relevant NEC code for the location. c) For PCs, OWS, EWS, Servers, Printers and other peripherals, maximum temperature limit shall be 35 °C, For LCD the same shall be 25 °C & for UPS the same shall be 40 °C.

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[10]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

4.2 Codes & Standards

All equipment, system and service covered under this specification shall comply with the requirements of the latest statutes regulations and safety codes as applicable in the locality where the equipment/systems shall be installed.

The equipment, systems and services furnished as per this specification shall conform to the latest edition of codes and standards mentioned in this section. However in the event of any conflict between the requirements of two standards or between the requirements of any standard and this specification, the more stringent requirements shall apply unless confirmed otherwise by the owner/owner's engineer in writing. The decision of the owner shall be final & binding in all such cases.

All equipments supplied under this specification shall be given tropical treatment for the climatic conditions prevailing at site as described under project data. Tropical protection shall conform to IS-3202 (Climate proofing of electrical equipments) or any other applicable international standard for protection of Electrical power equipments against climatic conditions.

Reference Codes and Standards

The design, manufacture, inspection, testing, site calibration and installation of all equipment and systems covered under this specification shall conform to the latest editions of codes and standards mentioned below and all other applicable ANSI, ASME, IEEE, NEC, NEMA, ISA, DIN, VDE and Indian Standards and their equivalents.

Temperature Measurement

- Instrument and apparatus for temperature measurement ASME PTC 19.3
- Temperature measurement - Thermocouples ANSI-MC 96.1
- Temperature measurement by electrical resistance thermometers – IS: 2806.
- Thermometer-element-platinum resistance-IS-2848 / DIN 43760/ IEC 751

Pressure Measurement

- Instrument and apparatus for pressure measurement - ASME PTC 19.2
- Bourdon tube pressure and vacuum gauges - IS 3624

Flow Measurement

- Instrument and apparatus for Flow measurement – ASME PTC 19.5 Interim supplement, Part-II
- Measurements of Fluid flow in closed conduit – BS 1042 / ISO 5167.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[11]	02.09.2015

Electronic measuring Instruments & Control hardware

- Automatic null balancing electrical measuring instruments - ANSI C 39.4
- Safety requirements for electrical and electronic measuring and controlling instrumentation - ANSI C 39.5.
- Compatibility of analog signals for electronic industrial process instruments - ISA-S 50.1: ANSI MC 12.1.
- Dynamic response testing of process control instrumentation - ANSI MC 4.1 : ISA-S26.
- Surge withstand capability (SWC) tests - ANSI C 37.90a IEEE Std. 472. IEC - 254.1.
- Printed circuit boards - IPC TM-650, IEC 326 C
- General requirements and tests for printed wiring boards - IS 7405 (Part-I)
- Edge socket connectors - IEC 130-11.
- Requirements and methods of testing of wire wrap terminations DIN 41611 Part-2.
- Dimensions of attachment plugs & receptacles ANSI C73.
- Direct acting Electrical Indicating Instruments: IS-1248.

Electronic Cards, Subassemblies & Components

- a) Unpackaged
 - Vibration IEC 68.2.26
 - Shock IEC 68.2.27
 - Drop & Topple IEC 68.2.31
- b) Packaged
 - Vibration, Drop & Static Compression – NSTA
- c) Electromagnetic Compatibility
 - Electrical Fast Transient – IEC 801.4
 - Surge Withstand – IEC 255.4
 - Radiated Electromagnetic Field – IEC 801.3
 - Electrostatic Discharge – IEC 801.2
 - Electromagnetic Emissions – VDE 0871, Class B

Instrument Switches and Contacts

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[12]	02.09.2015

- Contact rating - AC services NEMA ICS Part-2 125, A600
- Contact rating - DC services NEMA ICS Part-2-125, N600.

Enclosures

- Types of enclosures - NEMA Std. ICS-6-110.15 through 110.22 (Type 4 to 13).
- Racks, panels, and associated equipment - EIA: RS-310-B (ANSI C83.9)
- Protection Class for Enclosure, Cabinets, Control Panels and Desks - IS-13947 & IEC 529.

Apparatus, enclosures and installation practices in hazardous areas

- Classification of hazardous area - NFPA Art. 500, Vol.70.
- Electrical Instruments in hazardous dust locations - ISA-RP 12.11
- Intrinsically safe apparatus - NFPA Art.493 Vol.4
- Purged and pressurized enclosure for electrical equipment in hazardous location - NFPA Art. 496.

Sampling System

- Stainless steel material of tubing and valves for sampling system - ASTM A269-82 Gr. TP316.
- Submerged helical coil heat exchangers for sample coolers ASTM D 11-92.
- Water and Steam in power cycle - ASME PTC 19.11.
- Standard methods of sampling system - ASTM D 1066-69.
- The system shall be based on established Standard & Codes of Practice, such as GDCD 234 / 164 / 163, CEGB, UK.
- Sample Cooler shall be IBR approved.

Annunciator

- Specifications and guides for the use of general purpose annunciator - ISA RP 19.1.
- Surge withstand capability tests - ANSI C.37.90a and IEEE std. 472

Interlocks, Protections

- Relays and relay system associated with electric power apparatus - IEEE std.3.13.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[13]	02.09.2015

- Surges withstand capability tests - ANSI C.37.90a and IEEE Std. 472.
- General requirements & tests for switching devices for control and auxiliary circuits including contactor relays - IS-6875 (Part-I).
- Boiler safety interlocks - NFPA Section 85B, 85D, 85E, 85F, 85G.

Control Valves

- Flow Equation for Sizing Control Valves – ISA S39.2
- Control Valve Seat Leakage – ANSI / FCI 70.2
- Face to face Dimensions of Control Valves – ANSI B16.10, ISA – S75.03 & ISA – S75.16
- Steel Pipe, Flanges & Flanged Fittings – ANSI B16.34
- Control Valve Capacity Test Procedure – ISA – S75.02
- Industrial Process Control Valves - IEC 534

Process Connection and Piping

- Codes for pressure piping power piping ANSI B31.1
- Seamless carbon steel pipe ASTM A-106.
- Forged and Rolled Alloy steel pipe flanges, forged fittings, valves and parts - ASTM A-182.
- Material for socket welded fittings - ASTM A-105.
- Seamless Ferritic alloy steel pipe - ASTM A-335.
- Pipe fittings of wrought carbon steel and alloy steel - ASTM A-234.
- Composition bronze or metal castings - ASTM B-62.
- Seamless copper tube, bright annealed ASTM B-168.
- Seamless copper tube - ASTM B-75.
- Dimensions of fittings - ANSI B-16.11
- Valves flanged and butt welding ends - ANSI B16.34.
- Nomenclature for Instrument tube fittings ISA-RP-42.1.

Instrument Tubing

- Seamless carbon steel pipe - ASTM - A106.
- Material for socket welds fittings - ASTM - A105.
- Dimensions of fittings - ANSI B16.11

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[14]	02.09.2015

- Code for pressure piping, welding, hydrostatic testing - ANSI B31.1.
- Nomenclature for Instrument Tube Fittings – ISA RP 42.1
- Seamless Stainless Steel Tubes ASTM A 312 TP 304

Cables

- Thermocouple extension wires/cables - ANSI C 96.1.
- Colour coding of single or multi-pair cables - ICEA S-61- 402. (Third edition) NEMA WCS.
- Guide for design and installation of cable systems in power generating stations (insulation, jacket materials) - IEEE Std. 422.
- Requirements of vertical tray flame test - IEEE 383.
- Standard specification for tinned soft or annealed copper wire for electrical purpose - ASTM B-33 - 81.
- Oxygen index and temperature index test - ASTM D-2863.
- Smoke generation test - ASTM D-2843 and ASTM E-662.
- Acid gas generation test - IEC-754-1.
- Swedish chimney test - SEN - 4241475 (F3)
- Instrumentation cables and internal wiring IS-1554 (Part-I) and IS: 5831.
- Mono-mode Fibre – ITU-T G.652 for Optical Fibre Cable
- IEEE 1138 / IEC 1089 / EIA-455 B for Optical Fibre Cable

Cable Trays, Conduits

- Guide for the design and installation of cable systems in power generating station (cable trays, support systems, conduits) - IEEE Std. 422, NFPA-70.
- Guide for the design and installation of cable systems in power generating station (Cable trays, support systems, conduits) Test Standards, NEMA VE-1.
- Galvanizing of Carbon steel cable trays - ASTM A-386-78.

4.3 Power Supply

1. Electric:

- 230 volts AC, 50 hertz, single-phase for low torque drives with guaranteed satisfactory operation when equipment is continuously energized at any voltage from 216VAC to 264VAC.
- 24V DC for PLC & DCS.
- 24 VDC, 110VAC or 230 VAC for Field Instruments.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[15]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

2. Pneumatic:

Clean, dry, and oil free instrument air at 4.2 to 8.6 bars gauge. All necessary pressure reducing controls, where required, shall be furnished by the equipment supplier as specified at some other place under air compressors section.

4.4 Standard Ranges of Analog Signals

The ranges of analog signals shall normally be as follows:

1. Electric -- 4 to 20 mA DC.
2. Pneumatic -- 0.2 to 1.0 kg/cm².

The use of any signal range other than the above shall not be acceptable.

4.5 Contact Ratings

The ratings of all instrument contacts used for alarms and interlocks shall be as follows:

Table 4.2
Contact Ratings

Voltage Rating (volts)	Continuous Rating	Switching Rating (break)
a) 240 AC	480 volt-amperes	1200 volt-amperes
b) 220 DC	60 watts	200 watts
c) 24 DC	12 watts	25 watts

The ratings of all microprocessor-based controller or programmable controller output contacts shall be as required by the controlled devices. Where necessary for higher current ratings or isolation, interposing relays shall be used.

4.6 Reliability and Availability

1. Each component and system shall be of established reliability. The minimum target reliability of each piece of equipment like each electronic module/card, power supply, peripheral etc. shall be established by considering its failure rate/mean time between failures (MTBF), meantime to repair (MTTR), such that the availability of the complete C&I system is assured for 99.7%.
2. Detailed reliability calculations shall be used for each system/ equipment (with the help of a schematic of various sub-system connected in series or in parallel as the case may be and MTBF & MTTR values for the various equipments). Availability calculation shall be as per IEEE Standard-P1046 or equivalent.
3. When more than one device uses the same measurement or control signal, the transmitter and other components/ module shall be fully equipped to provide all signal requirements. The system shall be arranged so that the failure of any monitoring device or control components or spurious intermediate grounding in the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[16]	02.09.2015

signal path shall not open the signal loop nor cause the loss or malfunction of signal to other devices using the same signal.

4. To ensure availability, adequate redundancy in system design shall be used at hardware, software and sensor level to satisfy the availability criteria. For the protection system, independent sensing device shall be used to ensure adequate safety of plant equipment.

4.7 Standardization & Uniformity of Hardware

To ensure smooth and optimal maintenance, easy interchange ability efficient spare parts management of various C&I instruments, ensure that all instruments/devices (Processor modules, input/output modules, power supply modules etc.) are of the same family of hardware. For example, all 4-20 mA electronic transducers, control hardware, control valves, actuators instruments/ local devices etc. being furnished shall be boiler manufacturer specific. Take special care towards selection of SG Integral Control system.

4.8 Redundancy

1. Reliability of the Control System shall be established by judicious incorporation of redundancy. In general all critical parts shall have hot standby feature to render the system immune to any single failure.
2. Measurement system (MS), Closed Loop Control System (CLCS) and Open Loop Control System (OLCS) shall all be configured with redundancy at processor modules, communication modules, data bus and power supply modules.
3. Both CLCS & OLCS shall be configured with I/O channels redundancy for each sensor/signals. Where redundant sensors are provided redundant I/O channels shall be used for each sensors/signals.
4. Two out of three measurements philosophy shall be adopted for the control of all closed and critical open loop variables for reliability of operation. The control system shall select the median value for the normal control purpose.

4.9 Operability & Maintainability

1. The design of the control systems and related equipments shall adhere to the principle of 'Fail Safe' operation wherever safety of personnel / plant equipment is involved. 'Fail Safe' operation signifies that the loss of signal or failure of any component shall not cause a hazardous condition. However, it shall also be ensured that occurrence of false trips are avoided / minimized.
2. The types of failure which shall be taken into account for ensuring operability of the plant shall include but not be limited to:
 - a) Failure of sensor or transmitter,
 - b) Failure of main and/or redundant controller/other modules,
 - c) Loss of motive power to final control element,
 - d) Loss of control power.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[17]	02.09.2015

- e) Loss of instrument air
- 3. The choice of hardware shall also take into account sound maintainability principles and techniques. The same shall include but shall not be limited to the following:
 - a) Standardization of parts.
 - b) Grouping of functions.
 - c) Interchangeability.
 - d) Malfunction identification facility/self surveillance facility.
 - e) Easy modular replacement.
 - f) Fool proof design providing proper identification and other features to preclude improper mounting and installation.
 - g) Appropriate derating of electronic components and parts.

4.10 Metering Bases of Units

The following system of units shall be followed throughout the specification unless otherwise mentioned.

Table 4.3
Metering Bases of Units

S.No	Parameter	Unit
1	Pressure	Kg/sq. cm
2	Differential pressure	mm of H ₂ O column or Kg/sq. cm
3	Draught	mm of H ₂ O column
4	Vacuum	mm of Hg
5	Temperature	Degree Celsius
6	Flow (Steam / Feedwater)	Tonnes / hr or Kg/hr
7	Flow (Air / Gas)	Tonnes / hr or N. Cu. M /hr
8	Flow (Oil)	Tonnes / hr or Kg/hr
9	Density	gm / c.cm
10	Level	mm or M
11	Conductivity	Micro-mho/cm

4.11 Grounding System

All panels, desks, cabinets shall be used with a continuous bare copper ground bus. The ground bus shall be bolted to the panel structure on bottom on both sides. The bolts shall face inside of panels.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[18]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

The system ground shall be isolated from the panel ground with suitable isolators. All internal component grounds or common shall be connected to the system ground, which shall be fabricated of copper flat (size 25 mm x 6 mm min, length as applicable).

Shield on instrumentation cables shall be grounded on panel side. When shielding termination is required in cabinets furnished under this specification, suitable terminals shall be furnished on copper flat forming system ground. System and shield ground shall be connected to earthing strip at 0.0 meter level using suitable size of cable.

4.12

Flow Element Selection

Table 4.4
Flow Element Selection

S. No	Type of Flow meter	Fluid medium	Process Parameter	Pipe sizes suitable for FE	Application	Type of connection
1	Orifice Plate	Water (DM Water)	As per process requirement	For all sizes Except very large diameter pipe	DM Water Flow To CST	Flange
2	Orifice Plate	Steam	For any condition	< 3"	Soot blowing steam flow	BW
3	Flow nozzle(AISI Type31 6L)	Water	As per process requirement	For all pipe sizes except very large diameter Pipe	(i) FW Flow to boiler drum (ii) SH/RH Spray water flow	BW
4	Flow nozzle(AISI Type31 6L)	Steam	As per process requirement		AUX. Steam flow	BW
6	Any Other Services required	Subject to approval.				

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[19]	02.09.2015

4.13 Drive Control Philosophy

The Drive control & measurement philosophy for the project is detailed in this section.

1. Bi-directional drives (inching or open/close)

- (a) All bi-directional drives shall be operable from Remote i.e. from CCR.
- (b) Remote manual operation of all drives shall be carried out from OWS.
- (c) Remote Open/Close commands, generated in control system shall be issued to MCC module through interposing relays located in respective MCC module in the MCC room. Latching of commands shall be used in control system logic which shall be reset by Limit/Torque switch feedback. The Limit/Torque switch feedback from drive shall be directly wired to Control System.
- (d) Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
- (e) Following signal exchange shall be envisaged between Drive & Control system:
 - Open Limit Switch (Both NO & NC contacts)
 - Close Limit Switch (Both NO & NC contacts)
 - Open Torque Actuation
 - Close Torque Actuation
 - Position feedback (4-20 mA, two wire electronic type) for inching drive
- (f) Following signal exchange shall be envisaged between MCC & Control system (Remote I/O cabinet of control system located in/near MCC room):
 - Switchgear available
 - Switchgear disturbance
 - Open Command
 - Close Command

2. Unidirectional LT drives

- (a) Unidirectional LT drives shall be operable only from Remote i.e. from CCR. In addition, Local pushbutton shall be used only for emergency stopping of drive. Local start operation of the drive is not envisaged.
- (b) Remote manual operation of all drives shall be carried out from OWS.
- (c) Remote Start/Stop commands shall be generated in Control system & shall be issued to MCC module through interposing relays located in respective MCC modules.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[20]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- (d) Emergency stop of the drive shall be envisaged from the local pushbutton provided near the drive. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to MCC.
 - (e) Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
 - (f) Current transducer with 4-20 mA type outputs shall be used in the MCC for monitoring the current in Control System for all Drives greater than 90 KW. Auxiliary power supply to these transducers shall be from the control supply of the respective MCC modules.
 - (g) Following signal exchange shall be envisaged between MCC & Control system(Remote I/O cabinet of control system located in MCC room):
 - Switchgear available
 - Switchgear disturbance
 - On Feedback
 - Off Feedback
 - Start Command
 - Stop Command
 - (h) All Numerical relays/Intelligent controllers for LT drives shall be interfaced to Control System through IEC 61850 protocol.
3. Solenoid Operated drives
- (a) Solenoid operated drives shall be operable only from Remote i.e. from CCR.
 - (b) Remote manual operation of all drives shall be carried out from OWS.
 - (c) Remote Open/Close commands shall be generated in Control system & shall be issued to the Solenoid through interposing relays, located in Relay Panel.
 - (d) Necessary process interlocks shall be realized in Control system.
 - (e) Following signal exchange shall be envisaged between solenoid drive & Control system:
 - Open Limit Position
 - Close Limit Position
 - Open Command
 - Close Command

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[21]	02.09.2015

4.14 HT drives

1. HT drives shall be operable only from Remote i.e. from CCR. In addition, Local pushbutton shall be used only for emergency stopping of drive. Local start operation of the drive is not envisaged.
2. Remote manual operation of all drives shall be carried out from OWS.
3. Remote Start/Stop commands shall be generated in Control system & shall be issued to MCC module through interposing relays located in respective MCC modules.
4. Emergency stop of the drive shall be envisaged from the local pushbutton provided near the drive. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to MCC.
5. Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
6. Current transducer with 4-20 mA type outputs shall be used in the MCC for monitoring the current in Control System for all Drives. Auxiliary power supply to these transducers shall be from the control supply of the respective MCC modules
7. Following signal exchange shall be envisaged between MCC & Control system(Remote I/O cabinet of control system located in MCC room):
 - a) Switchgear available
 - b) Switchgear disturbance
 - c) Master Trip relay Operated
 - d) On Feedback
 - e) Off Feedback
 - f) Trip Feedback
 - g) Emergency stop feedback
 - h) Start Command
 - i) Stop Command
 - j) Current Feedback
8. All Numerical relays/Intelligent Controllers for HT drives shall be interfaced to Control System through IEC 61850 protocol.

4.15 Variable Frequency Drives (VFD)

1. VFD shall be operable from Remote i.e. from CCR & from VFD Local Display unit. In addition, Local pushbutton shall be used only for emergency stopping of drive.
2. Remote manual operation of VFD shall be carried out from OWS.
3. Remote Start/Stop commands shall be generated in Control system & shall be issued to VFD Panel through interposing relays located in VFD Panel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[22]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

4. Emergency stop of the drive shall be envisaged from the local pushbutton provided in the field. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to VFD panel.
5. Necessary Electrical protections shall be realized at VFD module whereas process interlocks & protections shall be realized in Control system.
6. Following signal exchange shall be envisaged between VFD & Control system:
 - a) Switchgear available
 - b) Switchgear disturbance
 - c) On Feedback
 - d) Off Feedback
 - e) Trip Feedback
 - f) Emergency stop feedback
 - g) Start Command
 - h) Stop Command
 - i) Current Feedback
 - j) Speed feedback
 - k) Speed Setpoint
7. The VFD shall also be interfaced with control system via Modbus soft link.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[23]	02.09.2015

5 TG INTEGRAL CONTROL SYSTEM

The microprocessor based Control System shall be provided for the safe and efficient operation of Steam Turbine Generator Protection in all regimes of operation. The control, monitoring, interlock and protection schemes consists of Steam Turbine Generator including Turbine Protection System, Turbine Electro-hydraulic Governing System with Free Governor operation in the interconnected grid (FGMO & RGM0), Turbine Stress Control System, Automatic turbine Testing, Automatic Turbine Run-Up System etc.

For all the CLCS for TG and auxiliaries like Heaters Level Control, Condenser hotwell Level Control, Deaerator Level, Pressure & Temperature Control, etc. & OLCS like BFP, CEP, etc. Interfacing strategy between TG control system & Plant DCS is required for controlling the final output generation of unit as per standard design practice.

5.1 Control System Requirements

1. The TG Integral control system shall consists of the following System controls:
 - a) Turbine Protection system
 - b) Turbine Electro-Hydraulic Governing System
 - c) Turbine Automatic Run-Up System
 - d) Turbine Automatic Testing System
 - e) Turbine Stress Control System
 - f) Turbine Supervisory Instrumentation
2. The Control System shall function reliably under the environmental conditions as specified in Design Criteria/Philosophy. It shall be immune from the interference resulting from disturbance in power supply feeders, signal lines, inputs, outputs, etc. as experienced in a Power station.
3. The Control System shall have on-line simulation and testing facility. Further, it shall be possible to on-line configure and tune controllers through engineering workstation.
4. The system shall have the flexibility to easily reconfigure any controller at any time without requiring additional hardware or system wiring changes and without disabling other devices from their normal operation mode. Modifications shall not require switching off power to any part of the system.
5. Power supply to individual functional group shall be from redundant 24 V DC feeders with diode auctioneering and further sub-distribution.
6. Independent and dedicated controllers (main and its 100% hot standby) shall be provided for each of the System except for TG protection system where triple redundant controllers are to be used. All the 100% hot / redundant backup

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[24]	02.09.2015

controllers shall be identical in hardware and software implementation to their corresponding main controllers and shall be able to perform all its tasks. The backup controller shall track its corresponding main controller. There shall be an automatic and bumpless switchover from the main controller to its corresponding backup controller in case of main controller failure and vice versa without resulting in any change in control status. In case of switchover from main controller to the 100% hot backup controller, the back-up controller shall work as the main controller. Facility shall also be provided for manual switchover from main to 100% hot back-up controller and vice versa from the Engineer's Work Station.

7. The control system hardware design shall be such that it is able to withstand power line disturbances.
8. The loop / logic reaction time shall be suitable to match actual process requirements, subject to minimum requirement wherever specified.

5.1.1 Turbine Protection system (TPS)

1. Fully proven microprocessor based system, based on hardware and software specifically designed for Turbine protection application meeting the Provenness criteria and Triple Modular Redundancy shall be provided to achieve the turbine protection action.
2. The system design shall be such that safety function of the total system must not be jeopardized on occurrence of fault. Any single fault in primary sensor, input/ output modules, controller modules etc. shall in no way jeopardize the safety of the turbine. All modules to be used in this system shall be of failsafe design.
3. The Turbine Protection System shall also be implemented in 2 out of 3 voting logic. Three independent trip channels each having its own and dedicated processing modules, controllers, Input/output modules etc. shall be provided to achieve 2 out of 3 voting logic. The outputs of the three channels shall be used to implement 2 out of 3 voting logic in two relay units, the output of which shall be fed to the two turbine trip relays.
4. The independent channels or any of the triple redundant sensors is faulty, the same shall be alarmed and the balance two channels/sensors shall operate in one out of two mode.
5. All the input signals (trip signals etc. from the field devices) shall be fed in parallel to all the three redundant channels of protection system as mentioned above via signal conditioning cards designed for such application. Further, the computation of field input voting logics i.e. 2 out of 3 etc. shall also be performed in the controllers of all the three channels of protection system which shall then perform the computation of 2 out of 3 voting logic independently. Additional signal for each trip input shall be made available to 1ms resolution

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[25]	02.09.2015

SOE System at the input level itself, without any processing, so as to enable analysis in SOE list, the exact cause of trip.

6. All the required primary sensors etc. required for protection system shall be provided as per standard and proven practices of manufacturer. All trip signal inputs required for the safety of the turbine shall be based on 2 out of 3 logics.
7. The system shall include turbine lock-out relays, redundant turbine trip solenoids and necessary hardware required for testing.
8. The tripping devices shall be designed to operate on DC supply. The trip coils shall be monitored continuously for healthiness and failure shall be alarmed.

5.1.2 Turbine Electro-Hydraulic Governing System

Following two alternatives for the Turbine Governing System shall be acceptable and shall be proven as per standard practices.

Alternative - I

In this alternative, the turbine generator unit shall be equipped with electro-hydraulic governing system backed-up by mechanical hydraulic control system. The system shall be designed such that the governing of the steam turbine shall be automatically and safely transferred to mechanical hydraulic control system during operation, in the event of a fault developing in electro-hydraulic control system.

Alternative - II

In this alternative, the EHG system shall be provided with 100% hot redundancy i.e. the system shall consist of two independent channels right from sensors, transmitters, other field mounted devices, input modules, controller modules, output devices etc. of the Electro hydraulic converter. Further, each of these channels shall be fed from independent power supplies.

Both the above mentioned alternatives shall meet the following functional requirements.

1. All transducers shall be electronic type. The acquisitioned signals shall be processed electronically and processed signal shall be given to Electro-Hydraulic Converter, which converts the electronic signal to hydraulic Signal. Hydraulic signal before application to Control Valve Servomotors shall be suitably amplified.
2. The controls covered in this system shall basically consist of speed controller, load controller, valve-lift controller, inlet steam pressure controller and output frequency droop characteristic controller. The speed controller shall ensure controlled acceleration of the turbine generator and shall prevent over-speed without tripping of the unit under any operating condition or in the event of full load throw-off.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[26]	02.09.2015

3. The speed controller shall limit the over-speed of the turbine on loss of full load to a value less than 8% of rated speed. The governing system shall be equipped with speed/load changer to control the speed or power output of the steam turbine within the limits. The speed/load changer provided shall be capable of adjusting the speed of the turbo set to any value in the range of 94% to 106% of rated speed for manual/auto synchronization of the generator with the bus. It shall be capable of varying the load on the machine from no load to full load.
4. For remote control, suitable motor drive shall be provided. Indication of the speed/load changer position shall be provided on the OWS and console panel insert.
5. The turbine governing control system shall be equipped with the logics and signals for starting the steam turbine from turning gear speed to rated speed, accelerating safely at the preselected rates, selectable from OWS in conjunction with Turbine Stress Control System. The control system shall provide the loading and unloading of steam turbine after synchronization in conjunction with TSCS and coordinated master control implemented in plant DCS. Loading/ unloading rate shall be selected from OWS. It shall be facilitated with on-load testing of all steam admission valves individually and sequentially on a periodic basis.
6. The speed governing system shall be capable of controlling with stability the speed of the turbine at all power outputs between zero and specified maximum power output, when the unit is operating isolated or in parallel with other units.
7. The governing system in association with the over speed protection devices shall limit the speed of the unit to a value less than the trip setting in case of a full load trip out.
8. The steady state speed regulation shall be within the range of not less than 3.5% and not more than 5% when the speed changer specified herein is set to give rated speed with rated power output and shall be capable of adjustment between 2.5% and 7%, inclusive, at this setting, in steps not exceeding 0.5%. The dead band at rated speed and at any power output within the rated power output shall not exceed 0.06% of rated speed.
9. The steam turbine shall be equipped with independent safety devices in the form of duplicate emergency over speed governor(s). These shall be mounted on the steam turbine shaft and shall be arranged to actuate a tripping device at a predetermined speed which shall rapidly close the emergency stop, & control valves and reheat stop & control valves and also by Plant DCS the non return valves in the extraction lines for speeds of about 110 % of the rated speed.
10. System shall be capable of being reset by operator when the speed is reduced to approximately normal thus permitting the machine to be synchronized with other units. The emergency over speed governor shall be provided with mean for testing its operation when the machine is on load without exceeding rated speed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[27]	02.09.2015

of the unit. A duplicate governing system shall be provided so that the emergency valve remains active during the test. In addition to the above, as a third safety element to protect the turbo generator in the event of failure of over speed limiter or turbine stop valve close, a trip shall be provided in the form of trip signal generated from the speed measuring element of the governing system to close the motorized boiler stop valves

11. Free Governor Operation in the interconnected grid (FGMO & RGMO).

5.1.3 Automatic Turbine Run-Up System (ATRS)

ATRS shall run the turbine automatically from zero speed to synchronizing speed and then load the machine up to block loading and continuously check the operation up to 100% MCR without impairing the life of the turbine.

The automatic run up system shall be designed to provide the following functions:

1. Automatic start up / shut down sequence
2. Stress / temperature margin controlled acceleration as per the pre selected mode i.e. slow, normal and fast.
3. Stress / temperature margin controlled loading / unloading
4. Automatic synchronization and loading up to 100% MCR.
5. Unloading and shut down of the machine.

The functional group turbine shall include sequence control, interlock and protection of all valves, drives, equipment / devices related to turbine drains, gland steam supply, turbine run up / shut down, auto synchronizer etc. Similarly, functional group lube oil supply shall include all the above-mentioned functional features for all equipment / auxiliaries related to lube oil system and turning gear.

5.1.4 Automatic On-Line Turbine Testing System (ATT)

The ATT system shall be provided for on load testing of turbine protective equipment automatically in a sequential manner without disturbing normal operation and keeping all protective functions operative during the test. The ATT facility shall include but not be limited to the following.

1. Opening and closing of Emergency stop and control valves reheat stop and interceptor valve.
2. Over speed trips.
3. Low vacuum trip.
4. Thrust bearing trip.
5. Electrical remote trip.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[28]	02.09.2015

ATT mentioned with item 2, 3, 4 & 5 above shall be possible to be carried out on 100% load.

5.1.5 Turbine Stress Control System (TSCS)

A proven Turbine Stress Control System shall be provided which shall work in conjunction with turbine governing system and ATRS and achieve the following functional requirements.

1. Continuous on-line monitoring of thermal stress levels in all critical parts of the turbine such as main stop valves, control valves, HP casing, HP shaft and IP shaft etc.
2. Continuous on line computation of stress margins available for the above-mentioned critical components of the turbine during various regimes of operation i.e. run-up, synchronization, loading, load maneuvering, normal operation, run backs, unloading, shutdown etc.
3. Computation of the limits of speed and load changes allowable at any particular instant before synchronization and after synchronization respectively. The system shall be designed to inhibit further operation like speed/steam temperature raising or lowering wherever upper and lower temperature margins are not available (during periods prior to synchronization) and load/steam temperature raising or lowering whenever upper/lower load/temperature margins are not available (after synchronization) within allowable limits.
4. Carry out a fatigue analysis for all affected components of the turbine and also to compute the percentage service life consumption of the turbine.
5. Display the stress margins etc. on a separate dedicated color VDU/Printer as well as on OWS for operator guidance and storage of necessary data such as percentage service life consumption etc.
6. Store long term data & carry out Residual Life Analysis.

The system shall be complete including measuring transducers for generator load and wall temperature, measured value processing modules, microprocessor based controllers for stress calculations and turbine life calculations etc., dedicated color CRT monitor etc.

5.1.6 Turbine Supervisory Instrumentation System (TSI)

1. Vital parameters of the steam turbine shall be continuously supervised and monitored in order to provide information related to the operational conditions of the turbine during various stages of the operation like start-up, loading, load changes and shutdown.
2. The measurement system shall include all necessary adapters / mounting pads, sensors mounted on the turbine, sensor housings, flexible leads for connection to junction boxes, circuitries for processing the sensor signal along with power supply monitoring, signal level monitor, test circuits, trip relays etc. to generate information about the following parameters, as minimum

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[29]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- a) Absolute as well as relative shaft vibration measurement, of each bearing in both X & Y direction (both for Turbine & Generator bearing)
 - b) Differential expansion of rotor & cylinder for HPT, IPT & LPT.
 - c) Overall expansion of HPT & IPT.
 - d) Absolute bearing vibration measurement of each bearing in both X &
 - e) Y directions (both for Turbine & Generator bearings)Stator winding
 - f) Vibration measurement in radial & tangential directions.
 - g) Axial shift of the rotor (3 Sensors)
 - h) Turbine speed (3 Sensors)
 - i) Emergency stop and control valve position
 - j) Main Steam and hot reheat steam inlet temperature and pressure
 - k) Turbine bearing and casing metal temperature
 - l) In case of vibration, shaft mounted reference detectors and required supervisory instrument circuitry shall also be provided.
 - m) Any other measurement recommended by the Turbine manufacturer or required for the safe & reliable operation.
3. For all vibration measurements indicated above viz. bearing vibration and shaft vibrations, computer based system shall be provided to achieve the following functions:
 - a) Online spectrum / harmonic analysis.
 - b) Identification of the exact nature of failure resulting in increase in bearing vibration and direct message on the TFT indicating the exact nature of fault e.g. mal-alignment, shaft crack, bearing looseness etc. through use of intelligent software packages.
 - c) Storage and comparative analysis of vibrations.
 - d) Generation / Analysis of Bode Plot / Orbit Plot and time waveform / Nyquist plot etc.
 4. All the vibration parameters as well as turbine supervisory parameters shall also be fed to the Plant DCS through hardwiring as well as soft link so that all these parameters are suitably displayed on the OWS/LCD. All required I/O cards and software interface modules shall be provided for this purpose.
 5. Test calibration jigs for site calibration of all sensors of TSI System shall be provided. Telephone jacks shall be incorporated in all the cubicles for communication during site calibration etc.
 6. The system shall be adequate for providing necessary information for balancing various sections of the TG, shall be from the latest proven range of reputed manufacturer with proven experience in similar application, shall have suitable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[30]	02.09.2015

interface with Plant DCS for integrated data archiving and display. Brief specifications are as follows:

a) Bearing Vibrations

- The seismic type pickup shall be mounted on the bearing pedestal.
- The measurement of shaft vibration shall be carried out in a contact less manner according to the eddy current method.
- The measurement system shall be designed to operate satisfactorily over the frequency range and shall measure the amplitude of displacement. Failure of sensor and field cables shall be annunciated.

b) Absolute Shaft Vibrations

Measurement of absolute shaft vibration shall be done by the measuring the relative shaft vibration with respect to the bearing pedestal and by adding the bearing vibration to it.

c) Axial Shaft Position of the Rotor

- The measurement shall continuously monitor the position of the shaft in the thrust bearing and on wear of the bearing, as axial shift beyond permissible limits would lead to mechanical interference and surface rubbing.
- The measuring principle shall be carried out in a contact less manner based on eddy current principle.

d) Relative Expansion

Relative expansion of HP, IP and LP turbines shall be monitored by contact less measurement for relative displacement between casings and rotors of the turbine due to their different thermal inertia particularly during start up and in case of major load changes.

e) Absolute Expansion

- This measurement shall be carried out at the front pedestal as well as at the middle-bearing pedestal.
- The displacement sensor shall be mounted on the foundation and connected to the casing.

f) Valve Position

The measurement shall be carried out for both the HP and IP control valves and stop valves with the help of (non-contact) displacement sensors.

5.1.7 Steam Turbine Water Induction Prevention (TWIP) Logic

The turbine water induction prevention logic detects the presence of potential water admission sources, disposes of accumulated water, and isolates the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[31]	02.09.2015

turbine from the water source as required. The turbine water induction prevention logic shall be designed in accordance with ASME Standard TDP-1.

The TWIP logic so developed shall:

1. Prevent water accumulations by inhibiting the use of attemperation sprays at low loads.
2. Prevent the carry-over of water from sources such as the boiler and Deaerator.
3. Dispose accumulation of water in low point drains by forcing drain valves open during low load operations and prior to turbine startup.
4. Isolate heaters on High level resulting water ingress inclusion of gland seal condenser.

The TWIP logic shall be implemented in the Turbine Protection system. The logic shall be implemented in three trains, with each train receiving process status information through separate input cards. In addition, process status information shall be transmitted to the Plant DCS via the data highway. The Turbine Protection System outputs which act to trip the steam turbine via its proprietary control system shall also be from separate cards and shall be configured in a 2-out-of-2 de-energize to trip scheme.

5.1.8 HP/LP Bypass System

5.1.8.1 HP Bypass Control System

HPBypass System shall consist of integral type pressure reducing and de-superheating stations (PRDS) along with integral type de-super heater, the integral type de-super heater getting spray water from Boiler Feed Pump discharge.

The system shall consist of steam pressure control loop & steam temperature control loop. HP Bypass system shall be implemented through a set of redundant controller modules, I/O modules, primary sensors etc. & suitably interface with other SG C&I controls like BMS.

Pressure and temperature measurements for control of HPBP system shall be in 2/3 voting circuit.

Spray Control valves for HP Bypass system shall be pneumatically operated.

The system shall have control provision from CCR and shall have necessary control oil unit, pressure gauges, temperature elements and transmitters.

5.1.8.2 LP Bypass Control System

LP Bypass System shall consist of integral type pressure reducing and de-superheating stations (PRDS) along with de-super heater, de-super heater getting spray water from Condensate Extraction Pump discharge.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[32]	02.09.2015

The LP Bypass control system shall consists of steam pressure control loop and steam temperature control loop. LP Bypass system shall be implemented through a set of redundant controller modules, I/O modules, primary sensors etc. & suitably interface with other SG C&I controls like BMS.. Further condenser exhaust hood spray valve shall be interlocked to open whenever LP Bypass comes into operation.

Pressure and temperature measurements for control of LPBP and Auxiliary steam system shall be in 2/3 voting circuit.

Spray Control valves for LP Bypass system shall be pneumatically operated.

The system shall have control provision from CCR and shall have necessary control oil unit, pressure gauges, temperature elements and transmitters.

5.2 General Requirements of Generator Auxiliaries

5.2.1 Generator Auxiliary Control

Generator auxiliary control shall be done from the TG control system & operation shall be from Operator's Console assigned for TG in CCR. The console shall be utilized to perform operation of complete system including excitation, automatic synchronization, generator circuit breaker operation, seal oil system, Hydrogen cooling system including hydrogen drier, Generator cooling system, load control etc. with required indication & metering of active power, reactive power, power factor, energy meter & annunciation. Complete field instruments comprising of transmitters, switches, local gauges, analyzers, local panels, duplex temperature sensors etc. shall be provided for complete system.

In general three sensors shall be provided for protection.

5.2.2 Generator Gas System

1. Generator Gas System should have:

Control cubicle / panel for gas system to house all the instruments and control valve required to fill and empty the generator casing and to monitor the normal operation of the gas system. A suitable regulator shall be provided within the cubicle to maintain the casing gas pressure at the required value and to take care of any leakage with hydrogen gas from the gas cylinders connected to manifold. The cubicle shall also include a three range explosion proof gas analyzers, indicators for indicating gas temperature, H₂ and CO₂ manifold pressure, moisture content meter, casing gas pressure and the differential pressure across the generator fans. Signals shall also be provided to Plant DCS operator console for remote monitoring.

a) Moisture in Hydrogen measurement shall be of sampling type. A sample handing system provided with flow and pressure control device, flow

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[33]	02.09.2015

chamber and drain valve for oil draining in presence of oil shall be provided. Use of direct insertion type probe shall be avoided.

- b) The system shall include adequate number of pressure, temperature and differential pressure switches, liquid leakage detectors etc. for various alarms and interlocks.
 - c) Explosion proof gas pressure transmitters for H₂ pressure in the casing and manifold for remote indication.
 - d) All instruments, controls etc. to be supplied with H₂ system shall be of explosion proof design.
2. In addition to the above following instrumentation shall also be considered:
- a) Pressure indicator for the pressure of hydrogen in the hydrogen manifold.
 - b) Pressure indicator / local gauge for gas pressure inside the generator.
 - c) Gas purity indicator
 - d) Temperature indicator for hot and cold hydrogen inside casing
 - e) Dew point indicator for casing hydrogen across drier inlet and outlet lines
3. Following alarms & annunciation shall be provided in Plant DCS operator consoles:
- a) Hydrogen pressure in generator casing Low/High.
 - b) Hydrogen pressure in hydrogen cylinders-Low
 - c) Pressure of cooling water hydrogen coolers Low/High
 - d) Purity of hydrogen in generator casing-Low
 - e) Liquid level in the generator casing – High
 - f) Temperature of cold/hot gas in the generator - High.
 - g) Dew point level, in hydrogen gas across the drier inlet and outlet lines– High.
 - h) Hydrogen leakage into cooling water

5.2.3 Generator Seal Oil System

1. Generator Seal Oil System should have:
- a) Dial type mercury in steel thermometers for measuring the temperature of cooling water, seal oil.
 - b) Twin resistance temperature detectors for measuring and recording the temperature of seal oil.
 - c) Pressure gauges at the outlet of each pump, Cooling water pressure at inlet to oil coolers, hydrogen side and air side seal oil pressure at inlet to seals.
 - d) Differential pressure indicators and differential pressure switches across the strainers to check their performance and for annunciation of choking. Flow

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[34]	02.09.2015

indicators to measure seal airflow through seals and cooling water flow through oil coolers.

- e) Adequate number of pressure, temperature and differential pressure, and level switches and transmitters shall be provided for alarms interlocks and monitoring of parameters at Plant DCS.
 - f) Adequate number of sensors / transmitters shall be provided for unit interlock and protection requirement.
 - g) Adequate number of liquid detectors at the bottom of the generator tank to detect any liquid leakage into the seal oil. The detector shall have potential free contact rated for 0.5 amps at 220 V DC for alarm purpose at high liquid level.
 - h) A water detector with sight glass and drain valves shall be mounted adjacent to the gas manifolds at the end of a pipe connected to the bottom of the generator casing.
 - i) Oil level indicator shall be provided in the different tanks for visual checking of oil level and level switches shall be provided for tank level low, high alarm.
 - j) A local H₂ and seal oil signaling panel with necessary indicators, controls switches and status indication lamps, together with necessary annunciators system shall be furnished. The panel shall be cubical type and shall be provided with suitably rated indirect strip heaters. The instruments mounted on the front of the panel shall include H₂ pressure indicators for gas pressure in the manifold, casing hydrogen purity indicator, indicator for gas temperature leaving the generator gas coolers, seal oil pressure indicator, hydrogen seal oil differential pressure indicator, etc.
 - k) 4-20 mA DC signal for remote indication shall be provided for hydrogen and seal oil differential pressure, hydrogen pressure and hydrogen purity.
 - l) All the local annunciators shall be repeated in the Plant DCS operator consoles in CCR.
 - m) Facility for starting & stopping of drives and monitoring of status at plant DCS.
2. In addition to the above following instruments shall be included in the system:
- a) Pump discharge pressure transmitters.
 - b) Indicators for seal oil pressure at the seal (for both hydrogen and air side stream)
 - c) Indicators for seal oil-hydrogen differential pressure
 - d) Indicators for temp. of seal oil at the seals
 - e) Indicators for thrust oil pressure.
 - f) Temperature elements for measurement of Differential temperature of oil & water across seal oil cooler.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[35]	02.09.2015

g) Level transmitters at Seal oil storage tanks and seal oil tank etc

3. Following alarms & annunciation shall be used in Plant DCS operator consoles:

- a) Pressure of seal oil-Low
- b) Pressure of thrust oil-Low
- c) Oil level in hydraulic seal-High
- d) Oil level in hydraulic seal-Low
- e) Automatic switching on of AC standby oil pump
- f) Automatic switching on of DC emergency oil pump.
- g) Differential pressure between oil and hydrogen-High.
- h) Differential pressure between oil and hydrogen-Low
- i) Seal oil temperature -high

5.2.4 Generator Hydrogen Cooling System

The system has adequate nos. of pressure, temperature and differential pressure switches, liquid leakage detector etc. for a various alarms and interlocks. All signals shall be interfaced with Plant DCS for remote monitoring. All instruments, controls etc. for H₂ system shall be of explosion-proof design.

In addition to the above recommended instruments following instruments shall also be considered for remote monitoring:

1. Pressure transmitters on DM water line at I/L & O/L of H₂ and Exciter cooler.
2. Temperature measurements on DM water line at I/L & O/L of H₂ and Exciter cooler.

5.2.5 Generator Stator Water Cooling System

1. Generator Stator Water Cooling System shall have:

- a) A local stator water cooling system, Signaling panel with necessary indicators, controls switches and status indication lamps, together with necessary annunciations system. The panel shall be cubical type and have suitably rated indirect strip heaters. The instruments mounted on the front of the panel shall include:
 - Indicator for primary water flow in the stator winding
 - Indicators for primary water conductivity at the inlet of winding and after the demineraliser.
 - Indicator for stator winding differential pressure
 - Indicators for primary water temp. at the inlet and outlet of stator winding
 - Indicator for primary water pressure at the inlet of stator winding
- b) All the local annunciations shall be repeated in the Plant DCS operator consoles in CCR.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[36]	02.09.2015

- c) Adequate number of conductivity meters in the main water circuit and after the demineraliser. Also pH meter shall be provided to monitor the pH of the cooling water.
 - d) Set of flow switches (at least two nos.) to monitor low distillate condition and flow transmitters/meters for primary water to stator winding and main bushing, make up water etc.
 - e) Sets of pressure gauges at the inlet and outlet of stator water filters, differential pressure switches for the filters, differential pressure gauge across stator winding and pressure transmitters as required.
 - f) Set of resistance temperature detectors, local indicators for primary water before and after the generator winding, bushing and cooler. Vapour filled temperature detectors shall also be provided to give signals for high temperatures.
 - g) Set of dial type thermometers for cooling water at the inlet and outlet of the cooler.
 - h) Water level gauge, transmitters, level switches for high and low level alarms and other accessories for primary water tank.
2. Following alarms & annunciation shall be provided in Plant DCS operator consoles:
- a) Water level in the primary water tank- low/high
 - b) Temp. of primary cooling water at the outlet of stator winding – high
 - c) Temp. of primary cooling water at the inlet of stator winding – high
 - d) Flow of primary cooling water to the stator winding – Low/very low
 - e) Conductivity of primary cooling water at the winding inlet – high
 - f) Conductivity of primary cooling water at the winding outlet-high
 - g) Pressure of primary cooling at the inlet of winding – Low
 - h) Differential pressure across the primary water strainer – high
 - i) Stator water cooling pumps tripped
 - j) Differential pressure across stator winding - high.
 - k) Leakage of hydrogen into primary water
 - l) Primary stator bar water temperature – high

5.2.6 Generator Excitation & Voltage Regulating System

1. The Generator excitation & Voltage Regulating system shall be provided with necessary interface equipment for interfacing through suitable protocol with TG integral control system (Turbine Automatic Run up system and Electro-Hydraulic Governing System).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[37]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

2. Necessary hardwiring shall be done for signal exchange with TG Integral control system and also with Plant DCS for SOE & alarm logging annunciation etc.
3. Facility shall be provided for operation from Plant DCS OWS/LCD.
4. Facility shall also be provided in Plant DCS OWS/LCD to view Generator capability curve at various operating regions showing actual operating point & MW/MVAR of the generator corresponding to actual situation

5.2.7 Generator Protection & Synchronizing System

1. The Generator Protection & Synchronizing system shall be provided with necessary interface equipment for interfacing through suitable protocol with TG integral control system
2. Necessary hardwiring shall be done for signal exchange with TG Integral control system and also with Plant DCS for SOE & alarm logging annunciation etc.
3. Facility shall also be provided for operation from Plant DCS OWS/LCD.
4. The Status of following shall be provided at Plant DCS OWS/LCD.
 - a) All generator Protection Protective relays
 - b) All alarms from Protection & synchronizing panel.

5.3 Boiler Feed Pumps

Boiler feed pumps shall include:

1. Pneumatic actuators for hydraulic coupling system with all mounting accessories. Standard 4-20 mA DC Signal for I-to-P converter and position transmitter signal interface.
2. Pump and motor bearing vibrations, axial play, speed both at local and remote and key phasor for complete machine monitoring & protection. The system shall be a part of the Vibration Monitoring System with required signal exchange with Plant DCS. Pump and motor bearings temperatures shall also be used for monitoring, interlocks and protective functions.
3. All pressure and temperature stubs, thermo-wells, root valves, impulse lines, gauges, manometers, thermometers, analyzers, sample retrieval system and other instruments for performance guarantee test measurements. Stubs and take-off points for performance guarantee test measurement shall be separate and shall not be shared with online measuring instruments.
4. Pressure and temperature gauges and switches for lube oil, working oil, cooling water, heat exchangers and other important systems and auxiliaries related to basic system performance and safety and for the purpose of monitoring critical parameters.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[38]	02.09.2015

5. All level switches, gauge glasses, flow switches, pressure & flow transmitters, RTDs, Thermocouples for complete system with all accessories, for equipment performance and safety.
6. Local gauges board for individual BFP; housing following local gauges & instruments:
 - a) Oil supply pressure and drain oil temperature gauges of each bearing.
 - b) Differential pressure across feed water suction strainers, Discharge pressure of Main and Booster pump, Suction Pressure of the Booster pump, Balance leak-off pressure.
 - c) Lube oil and cooling water temperature at inlet and outlet of coolers.
 - d) Inlet and outlet temperature of seal water and its cooling water.
 - e) Suction and discharge temperature of Feed Water pump.
 - f) Pressure switches for main and booster pump suction and discharge, balance leak-off, lube oil-permissive & trip, Auxiliary Oil Pump cut-in and cut-out etc.
7. Local start-stop facility for feed pump, auxiliary oil pumps, open & close operation facility of cooling water discharge valves, feed water discharge valve, re-circulation valve.
8. Duplex RTDs / Thermocouples for Motor winding and bearing temperature, Thrust bearing of Main and Booster pumps. Journal bearing of Main and Booster pumps, Suction and discharge of Main and Booster Pumps and differential temperature, Bearing drain oil temperature, Bearing temperature of driven and non-driven end of pumps & motors, Seal water outlet temperature at driven and non-driven end.
9. In addition following instruments shall be provided for remote monitoring of parameters at Plant DCS.
 - a) Pump re-circulation flow and Balance leak off pressure & flow.
 - b) Lube oil tank level.
 - c) Lube oil temperature and pressure at strainer outlet.
 - d) DP across lube oil and working oil strainer and feed pump suction strainer.
 - e) Differential temperature across pump suction and discharge.
 - f) Seal water inlet and outlet pressure.
 - g) Cooling water pressure at inlet and outlet of lube oil cooler, working oil cooler and motor amateur cooler.
 - h) Cooling water and lube oil flow at outlet of lube oil cooler.
 - i) All bearing oil pressure and temperature.
 - j) Lube oil temperature at inlet and outlet of Lube oil cooler.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[39]	02.09.2015

- k) Open and close indication of all manual isolating valves related to feed water, seal water, DM cooling water.
 - l) Cooling water flow at outlet of motor armature cooler.
 - m) Lube oil temperature at inlet and outlet of working oil cooler etc.
10. Flow elements and transmitters for lube oil, cooling water, working oil or any other auxiliary system as required. Turbine type flow meter may also be used for cooling water and Coriolis type flow meter for oil flow measurement. Flow nozzle for feed water flow measurement may be envisaged.
 11. Feed pump re-circulation valves of suitable size and capacity and having proven background for BFP re-circulation flow service for similar operating condition with pneumatic (0.2-1kg/cm² full stroke) actuators.
 12. Signal cables exposed to high temperature area shall be Teflon coated.
 13. All primary sensors shall be terminated to one master junction box for each pump in accessible vibration free location and all associated cables, conduits, fixtures and raceways from the sensors to the master junction box shall be provided. Termination box for sensors on bearing pedestals is not acceptable.
 14. All stubs for pressure and temperature measurement, root valves, protruding well beyond thermal insulation, level chamber isolating valves, expanders / reducers for impulse pipe connection, take-off nipple pieces up to accessible terminal points, stand pipes, drain and vent valves for level chambers, connecting pipes between the main vessel and level chambers and stand pipes, sampling take off points with isolating valves, matching flanges for instruments with blank flanges, float chambers with isolating, drain & vent valves for level switches, matching flanges for flange-ended control valves, strainers essential for in-line instruments, all trays and raceways for instrument cabling work and all other interfaces for instrumentation. Necessary supports with access shall also be provided.

5.4 Condenser & Air Extraction System

Following instruments shall be provided as a minimum (level instruments shall be mounted on stand pipes with isolation & drain/vent Valves for isolation of instruments):

1. Direct level Gauge for Hotwell level indication.
2. Level transmitters for Hotwell level measurement and control in 2-out- of-3 mode.
3. Direct reading manometer type instrument for local indication of condenser vacuum.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[40]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

4. Level transmitters at Hotwell for alarm and safety interlock. 2-out- of-3 logic shall be implemented for safety interlock. Safety interlock shall be configured in separate electronic units.
5. Pressure transmitters for remote indication / recording of condenser pressure in Plant DCS.
6. Conductivity measurement in both sides of the Hotwell. Necessary tapping for insertion type Conductivity probes shall include analyzer probe.
7. Temperature gauge and temperature element for monitoring condensate temperature on CEP suction.
8. CEP minimum Re-circulation control valve.
9. CEP discharge flow and pressure transmitters shall be provided with 1 –out-of-2 voting philosophy.
10. Direct level gauge, level switch, pressure and temperature gauge for gland steam condenser.
11. Measurement of CEP motor winding and bearing temperature at Plant DCS. Necessary duplex RTDs / Thermocouples shall be provided.
12. Flow integrator for measurement of make-up water consumption at DCS.
13. Start, Stop and Status monitoring of pumps at Plant DCS.
14. Start permissive and Trip logic shall be configured in Plant DCS. Critical parameters for trip interlocks shall be configured in 2 out of 3 voting philosophy.
15. Remote & Local monitoring of DP across suction strainer shall be provided.
16. Open and Close indication of suction valves at Plant DCS.
17. Flow transmitters at ejector for monitoring of ejected air flow at Plant DCS.
18. Ejector steam pressure control.
19. Condensate Extraction pumps to HP valve sealing water pressure and
20. Open and Close position indication of respective valves for monitoring at Plant DCS.
21. Open and Close position indication of condensate I/L and O/L bypass valves of gland steam cooler and ejectors for monitoring at Plant DCS.

5.5 Feed Water & Deaerator System

Following instruments shall be provided:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[41]	02.09.2015

1. Field instruments viz. pressure gauge, temperature gauge, direct gauge glass, level switches for process and safety interlocks and alarms shall be provided on Deaerator.
2. Temperature gauge and duplex type temperature elements shall be provided at the inlet and outlet of all heaters for both coolant and cooling medium.
3. Pressure transmitters, level transmitters and temperature elements shall be provided for remote monitoring and control of Deaerator parameters in Plant DCS.
4. On LP and HP heaters, level transmitters shall be provided for process alarms and safety interlocks. 2 out of 3 logic shall be implemented for safety interlocks. Each switch used for safety interlock shall be configured in separate electronic unit.
5. Level gauge shall be provided on feed water heaters and Deaerator.
6. Level transmitters shall be provided for remote monitoring and control parameters related to heaters viz. normal and emergency level control.
7. All level transmitters on Deaerator shall be implemented on 2 out of 3 logic for safety interlocks.
8. Open and Close position indication of all manual isolating and vent valves related to Deaerator for monitoring at Plant DCS.
9. Shell temperature measurements for HP and LP heaters.

5.6 Other TG Auxiliary Systems

1. Complete and independent PLC based Control and Instrumentation system with all accessories & associated equipments and cables shall be used for the safe, efficient and reliable operation of the following plant auxiliary systems.
 - a) Condenser Online Tube cleaning system
2. All instruments and control equipments like primary and secondary instruments etc. shall meet the requirements specified in sub-section on Measuring Instruments. In addition, all electrical instrument devices like switches/transmitters/ controllers/ analyzers/ solenoid valves which are located in the field/hazardous locations shall be provided with explosion proof enclosure suitable for hazardous areas described in National Electric Code (USA), Article 500, Class-I, Division-I. All field wiring should be through conduits. All fittings, cable glands etc. shall be strictly as per NEC recommendation article, 500 to 503.
3. ON/OFF control, indication, annunciation of incomers and bus-coupler are also to be performed from respective control system for each of the above system as applicable.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[42]	02.09.2015

4. The control system shall be able to operate in non-air conditioned area.

5.6.1 On-line Condenser Tube Cleaning System (OLCTCS)

PLC based system is envisaged for OLCTCS. The PLC & Complete instrumentation system required for this shall be designed for safe & trouble free operation. The PLC shall be linked to plant DCS via soft link for monitoring of the operation of OLCTCS.

Operation of the condenser on-line tube cleaning system & debris filter with necessary audio visual alarm/indications shall be implemented in PLC based Local Control Panel. The system shall be controlled either in manual or Auto mode. Provision for manual override of any automatic operation shall be made available in control panel. Potential free contacts shall be provided for interfacing with MCC & other systems.

1. Start-up of the cleaning system after manually feeding the requisite number of balls into the collector. The above operation shall be achieved by setting the control switch in Auto mode & pressing the System 'ON' Pushbutton. Other steps shall follow sequentially viz. tilting of the screens in the strainers to ball circulating position, starting the recirculation pumps, turning the ball catching Flap in the collector to ball circulation position, etc. In case of manual, all steps shall be achieved manually by pressing the respective pushbuttons.
2. Automatic shutdown of cleaning system either automatically or as required by operator by pressing the stop pushbutton from the local control panel. Under Auto mode, pushing the 'OFF' pushbutton shall initiate the above operation through steps like turning the ball catching flap in the collector to ball catching position, stopping the recirculation pump after a set period.
3. Monitoring of strainer section screen fouling by differential pressure measuring systems.
4. Following indicators minimum shall be provided on Local Control Panel:
 - a) Tube cleaning system 'ON' & 'OFF' status
 - b) Recirculation pump 'ON' & 'OFF' status
 - c) Screen in operation
 - d) DP high & normal status
 - e) MOV open & close status
 - f) Various equipments failure indications
5. Following Alarms minimum shall be provided on Local Control Panel:
 - a) Recirculation Pump Tripped
 - b) DP high/ very high

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[43]	02.09.2015

c) MOV fail to Open or Close

d) Screen actuator failure

5.6.2 Analog Controls/Close Loop Control System (CLCS) Functions

1. The CLCS shall continuously act on valves or other mechanical modulating devices such as hydraulic coupling etc., which alter the plant operation conditions. The system shall be designed to give stable control action in steady state condition and for load changes in step / ramp over the load range of 60% to 100% MCR with variation or parameters within permissible limits.
2. The controller capability shall, as a minimum, include (i) P, PI, PD and PID control functions and their variations (ii) cascade control (iii) feed forward control (iv) state-variable based predictive control (v) on-off control, (vi) ratio and bias control, (vii) logical operation etc. The loop reaction time (from change of output of the sensor of the transmitter/temperature element to the corresponding control command output) shall be within 250ms. However, for faster loops such as feed water flow control loop the same shall be based on actual process requirement.
3. The loop response time, for conventional I/Os, is the cumulative response time inclusive of input scan time, Controller Execution time and output card throughput time (in other words loop response is the time taken by the system to read a change in field signal at the input card terminal, process the controller task associated with the input and to make the required change in the control output at the output terminal of the output card)
4. The control system shall be bumpless transferred to manual on the conditions such as Control power supply failure, failure of redundant controllers, field input signal not available, analog input exceeding preset value, etc as minimum conditions.
5. Any switch over from auto to manual, manual to auto and switchover from TFT operation to auto manual station operation and vice versa shall be bumpless and without resulting in any change in the plant regulations and the same shall be reported to the operator.
6. Buffered analog output (positioning signal) of 4-20mA DC shall be used from CLCS to the respective E/P converters. For electrical actuators, pulse type output (bound less control) shall be preferred. CLCS shall also provide all the necessary outputs for indicators & recorders with output loop resistance of 500 ohms for each channel of the output module.
7. The system being supplied shall be such that when permissible limits are exceeded, an automatic switchover from an operation governed by maximum efficiency, to an operation governed by safety and availability is affected.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[44]	02.09.2015

8. For safety reasons, switchover logics associated with the modulating control loops shall be performed within the closed loop control equipment.
9. Time supervision facility shall be used to monitor the final control element.
10. It shall be possible to block the controller output on a pre-programmed basis.
11. All controllers shall be freely configurable with respect to requisite control algorithms.
12. Whenever, alternate measurement is available for a control input the alternate measurement value shall be automatically substituted in the control loop in case of loss of control input. All necessary software for switching and reconfiguration shall be used. In addition, such substitution shall be balance less and bumpless and shall be reported to the operator.

5.6.3 Binary Controls/Open Loop Control System (OLCS) Functions

1. The OLCS shall include sequence control, interlock & protection for various plant auxiliaries/valves / drives etc. The sequence control shall provide safe and automatic start up and shut down of plant and of plant items associated with a plant group. The interlock and protection system shall ensure safe operation of plant/plant items at all times and shall automatically shut down plant/plants items when unsafe conditions arise.
2. The OLCS shall be arranged in the hierarchical control structure consisting of unit level, group level, subgroup level and drive level (as applicable).
3. It shall be possible to perform automatic unit start up and shutdown by issuing minimum number of command from OWS / LCD. Thus, the unit level shall control all the Control System Blocks and issue appropriate start up and shutdown commands to various blocks of Control System.
4. The group level shall control a set of functional sub-groups of drives. Appropriate start-up and shut down commands shall be issued to the sub-group control and various check-backs shall be received from sub-groups of drives. Each sub-group shall execute the sequential start-up and shut down programs of a set of inter-related drives along with system interlocks and protections related to individual drive falling under that sub-group. The drive level shall accept commands from the sub-groups, push buttons (wherever provided) etc., and transmit them to the respective drive, after taking into account various interlocks and protections and the safety of that particular drive. For HT drive, first-up logic shall be incorporated to indicate the cause of protection / trip.
5. Sequence Control
 - a) A sequence shall be used to move a set of groups and sub-groups from an initial steady state (for instance 'OFF') to a final steady state (for instance

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[45]	02.09.2015

'ON'). The sequence initiating command for the unit and group level shall be issued from OWS/LCD.

- b) A sequence shall be made of steps. The steps shall be executed in predetermined order according to logic criteria and monitoring time consisting of the interlock & protection requirements and check back of previous step which shall act as pre-conditions before the sequence control can execute the command for that step.
- c) Each step shall have a "waiting time" implying that the subsequent step would not be executed unless the specified time elapses. A monitoring time shall also be defined as the maximum time required in executing the commands of any step and the time required for appearance of check back signals. In case, this is not completed within the specified time, a message shall be displayed and programme shall not proceed further.
- d) Manual intervention shall be possible at any stage of operation and the sequence control shall be able to continue at the correct point in the programme on return to automatic control. Protection commands shall have priority over manual commands, and manual commands shall prevail over auto commands.
- e) Open or close priority shall be selectable for each drive.
- f) The sequence start up mode shall be of the following types:

- **Automatic Mode**

In this mode of operation, the sequence shall progress without involving any action from the operator. The sequence start / stop command shall be issued from the OWS / LCD.

- **Semi-Automatic Mode**

In this mode of operation, once the sequence is initialized, the step progressing shall be displayed on the OWS / LCD. But the step execution command shall be prevented and shall be sent by the operator via the keyboards. It shall be possible to bypass and / or simulate one or more criteria to enable the program to proceed. This facility shall allow the program to be executed even if some criteria are not fulfilled because of defective switching devices, etc., while the plant condition is satisfactory. All the criteria bypassed shall be logged and displayed. It shall be possible to put the system on the Auto-mode after operating it on semi-automatic mode for some steps or vice-versa, without disturbance to the sequence operation.

- **Operator Guide Mode / Test Mode**

It shall be possible to use the sequential control in operator guide mode / test mode i.e. the complete system runs and receives input from the plant and the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[46]	02.09.2015

individual push button stations (where provided) / keyboards but its command output is blocked. The whole programme, in this case shall run in manual mode. This mode shall allow the operator to practice manual operation using step and criteria indications. The actual protection should remain valid during this mode of operation also.

6. The sequence shall be started by putting the sequence on 'auto' and on receipt of 'start' command from the OWS / LCD or from a higher-level group / protection action as defined. The sequence shall then progress as per the defined logics. It should be possible to select alternative operation in the same sequence depending on certain process / equipment condition. Some step can be automatically bypassed also based on certain process / equipment condition. When the expected results of the sequence are reached the sequence is considered as "END". If during sequence initialization or sequence progressing or during normal running of the drive, a shutdown criterion is present, the sequence shall be stopped and the shut down sequence initiated.
7. For the drives, the command shall be used through O/P module to MCC / SWGR / Actuator as applicable and input (status, SWGR and process) shall be acquired through input modules. The drive logic shall be implemented in the redundant controller. The status for the HT drives and some other important drives shall also be wired in parallel to redundant input modules so that on failure of the single input modules, the information regarding the status of the affected drive remains available in OLCS.
8. The output modules shall have the feature that ensures that in case of failure, all the outputs are driven to zero. The 24V DC command outputs to drives for ON / OPEN, OFF / CLOSE shall be separate and independent and the inverted outputs shall not be employed. For inching type of drives, position transmitter shall be used.
9. The termination for ON / OPEN, OFF / CLOSE command for the drive actuator shall be performed. These commands to the drives under OLCS shall be given through interposing relays in MCC/ SWGR. However ON/OPEN feedback, OFF/CLOSE feedback, Switch gear disturbance feed back as a minimum shall be monitored in OLCS.
10. The drive function i.e. basic interlocks and protection logic of the drive shall be implemented in redundant controllers. The drive function shall ensure that protection signals for the safety of the drive shall be effective under all conditions and under all modes of operation. The different commands shall be performed according to the priority of protection 'OFF', protection 'ON', manual and automatic. The standard functions like running time monitoring, status signaling, alarm / drive annunciation, etc. shall be performed in drive function. The drive function shall prevent hunting of the actuator in the presence of both

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[47]	02.09.2015

open and close commands for actuators of the valves and dampers. The drive function shall be implemented in dedicated standard software functional block

5.7 General TG Control System Requirements

The requirements for Control System for TG integral control are indicated on functional basis in this section. It is not the intent or purpose of this specification to specify all individual system components.

The control and automation system and the field instruments and actuators as well as its support systems, power supplies and data networks shall be immune to the electromagnetic interference and shall conform to the internationally accepted standards.

5.7.1 System Configuration

The TG integral control system shall basically consist of:

1. Distributed Processing units (Controllers) for TG Protection, EHGS ATRS, ATT, TSCS.
2. I/O modules
3. Data communication system
4. System Programming & Documentation facility (Engineering Work Station)
5. Interfacing with plant DCS
6. Integrated Annunciation functions

5.7.2 System Expandability

Modular System design shall be adopted for TG control system in order to facilitate easy system expansion. The capability and facility for expansion through the addition of controller modules, I/O cards etc shall be provided. The system shall have the capability to add any new control loops, groups / subgroups in control system, while the existing system is fully operational. The future expansion shall be expandable to allow at least 50% only by addition of extra modules without removing or modifying any existing hardware.

5.7.3 Online Maintenance

It shall be possible to remove / replace modules online (like I/O module, interface modules etc.) from its slot for maintenance purpose without switching off power supply to the corresponding rack. System design shall ensure that while doing so, undefined signaling and releases do not occur and controller operation is not affected in any way (including any control loop trip to manual, etc) except that information related to remove module is not available to controller. Further, it

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[48]	02.09.2015

shall also be possible to remove / replace any of the redundant controller modules without switching off the power to the corresponding rack and this shall not result in system disturbance or loss of any controller function for the other controller. The on-line removal / insertion of controller, I/O modules etc. shall in no way jeopardize safety of plant and personnel.

5.7.4 Fault Diagnostic

The control system shall include on-line self-surveillance, monitoring and diagnostic facility so that a failure / malfunction can be diagnosed automatically down to the level of individual channels of modules giving the details of the fault on the Engineers Work Station (EWS) monitor and printers. The faults to be reported shall also include faults in main and standby power supplies, sensor fault, Controller fault, any channel fault in 2V3 channels, failure of links to other systems. These faults shall be identified by local indication on the faulty channel / module and on respective rack / cubicle. The diagnostic system shall ensure that the faults are detected before any significant change in any controller output has taken place.

5.7.5 Fault Tolerance & Controllability

1. The control system shall provide safe operation under all plant disturbances and on component failure so that under no condition the safety of plant, personnel or equipment is jeopardized. Control System shall be designed to prevent abnormal swings due to loss of control system power supply, failure of any control system component, open circuits, instrument air supply failure etc. On any of these failures the control system output shall either remain in last position before failure or shall come to fully open / close or on / off state as required for the safety of plant / personnel / equipment. System shall be designed such that there shall be no upset when Power is restored.
2. No single failure either of equipment or power source shall be capable of rendering any part / system / sub-system of control system inoperative to any degree or loss of generation.
3. No single failure, whatsoever in any part of Control system result in loss of communication.
4. The controlled variable response rate and controllability shall be limited by the characteristics of main equipment, which is being controlled, and control system shall not impose any limitations in the response rate or controllability. Controlled process variables shall return to normal values in a stable manner and without control loop interactions or cycling of generation when generation matches with load demand.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[49]	02.09.2015

5.7.6 Signal Exchange

1. All the signal exchange between various functional groups of each control group shall be implemented through redundant main system bus and local system bus within a subsystem as per standard practice. It shall be ensured that any single failure in electronics involved for such communication e.g. communication controllers, bus interface modules, physical communication media, etc. does not result in loss of such signal exchange and there is no deterioration in specified system response and system parametric requirements. In case a controller utilizes some inputs generated / processed by any other controllers / functional group and the requirement of controller response time as specified is not met due to inadequate communication rate / procedure, then it shall provide hardwired signal exchange for such inputs.
2. However critical signal exchanges are found required shall be hardwired. Control and Protection signal exchange between control system of TG and Plant DCS shall be hardwired only. Protection signals shall necessarily be hardwired even for exchange between the same sub-systems.

5.7.7 Redundancy

The Following shall be completely redundant:

- All the parallel & serial communication buses
 - All the communication devices
 - All the Process controllers
 - Servers (if Server based system)
 - All the Power Packs
 - Critical drives related I/O Modules.
1. The redundant communication buses between the process stations and the operator supervision stations shall follow different paths. The redundant processor shall be connected to the same I/O's of the processor that it is associated to and shall be able to carry out all the operations assigned to this processor. In the case of a processor failure, the redundant processor shall become operative within the cycle time, without causing any loss of data or the interruption of the process control. The switch between the processor being utilized and the reserve processor shall be bump less and shall be within 20 ms which shall not cause any interruptions or stopping of the station functions. Furthermore, this switch must also be signalled by a high priority alarm.
 2. The operator station shall be able to guarantee, from any work station. The operator station electronic units shall be in dual configuration and independently connected to the system buses. In case of an operator stations failure, the station shall remain operative without the operator having to carry out any type of action. Each operator electronic unit and each process station shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[50]	02.09.2015

powered by redundant power packs those are able to power the entire load. In case of a failure, the switch between the power packs shall not cause stops or interruption in the carrying out of the station functions. The switch between the power packs shall be signalled by a high priority alarm.

3. In order to establish a high degree of system availability, the various control systems which comprise the overall unit control system shall be configured such that no single component failure can cause a failure or mal-operation of critical automatic or manual control functions. The failure of a redundant component shall be alarmed to the operator to allow on-line removal/replacement or at the first shutdown opportunity. The system's redundancy schemes shall be designed such that the transfer from any critical element to its redundant backup shall occur without upset to normal process control or to system displays, data collection, or other normal DCS functions within 50 m sec.
4. The signal distribution from sensors which are shared due to process restrictions between control loops, logics, monitoring purposes shall be as follows:-
 - a) In the case of multiple inputs to a card, input cards used shall be restricted to a maximum of 16 inputs per card for analog input and 32 for digital inputs.
 - b) In case there is either process redundancy (Left, Right) or transmitter or switches redundancy, the inputs shall be routed through independent input cards.
 - c) No two control loops/interlock loop shall share the inputs (either binary or analog) wide input cards if process signals are independently available.
 - d) Protective inputs for two drives shall not be allotted to the same input card.
 - e) Output cards shall be independent for each control loop.
 - f) For outputs to HT and LT motors, the following shall be adopted :
 - g) Each HT motor and unidirectional drives shall have dedicated output cards. No other drive shall be combined with HT motor drive output card. However indication outputs can be driven from this output card for the concerned logic loop.
 - h) Not more than two bidirectional drives shall share one output card.
 - i) For unidirectional drives, not more than one drive shall be allotted to one output card.
 - j) For signal distribution or fan-out, suitable electronic cards (opto couplers) shall be used.
 - k) The processors shall contain the logic required to group individual process and system alarms into common groups as well as the annunciation sequence logic.
5. Redundant components and equipment within given systems shall be distributed among processors and I/O cards to the extent practical.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[51]	02.09.2015

6. Critical inputs shall be supplied with redundant sensors/transmitters with each input connected to different input cards. Where redundant inputs exist, the DCS shall be configured to automatically reject erroneous data. Where required, one-of-two, two-of-two, two-of-three, or median select schemes shall be utilized to ensure the integrity of critical inputs.
7. The use of redundant outputs driving the same final element or equipment shall generally be avoided in favour of failsafe design and redundancy of the plant equipment.
8. The operator stations shall be identical in capability and independently linked to the system. Although these stations shall be normally dedicated to a specific function, any station can replace the function of any other station at any time.
9. All power source and power conditioning equipment in the system shall be redundant.

5.7.8 System Spare Capacity

Philosophy shall be followed for the spare capacity of the TG and Auxiliaries Control system (refer Subsequent section 6.2.7).

1. Following philosophy shall be followed for the spare capacity of the TG and Auxiliaries Control system:
 - a) Twenty (20) percent spare channels in each of the functional groups for each type of input/output modules fully wired up to marshalling / field termination cabinet TBs.
 - b) Ten percent (10%) installed spare I/O modules which may be capable of hot swapping.
 - c) Wired-in "usable" space for 20% modules in each of the system cabinets for mounting electronic modules shall be provided for future use. Empty slots between individual modules / group or group of modules, kept for ease in maintenance or for heat dissipation requirement as per standard practice, shall not be considered as wired-in 'usable' space for I/O modules. Field Terminal assemblies, PCB / Connectors, corresponding to the I/O modules shall be provided for above mentioned 20% blank space, distributed proportionally to main population.
 - d) Each controller shall have 40% spare functional capacity to implement additional function blocks, over and above implemented logic / loops. Further, each controller shall have spare capacity to handle minimum 40% additional inputs / outputs of each type, over and above implemented capacity. Under worst loading condition, Controller should not be loaded beyond 60%. Each of the corresponding communication controllers shall also have same spare capacity as that of controller.
 - e) The data communication system (including main system Bus and other bus system) shall have the capacity to handle the additions mentioned above.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[52]	02.09.2015

- f) Each Communication Network Switch shall have 20% spare ports.
 - g) Twenty (20) percent spare relays of each type and rating mounted and wired in relay cabinets. All contacts of relays shall be terminated in terminal blocks of relay cabinets. In each of the relay cabinets 20% spare terminal blocks shall be provided so that additional relays can be mounted and wired.
 - h) For power distribution board 20% spare feeder fully wired ready for use with MCBs fuses, TBs etc. Other hardware such as signal distribution isolation, trip amplifiers etc. shall be provided with 20% spares wired ready for use.
2. Sufficient and additional software capacity shall be available in the system to take care of spares requirement as specified above to meet all functional requirements. The calculation for processor power and memory for all nodes should be furnished. Also, the dynamic processor load for all nodes either in terms of idling time or percentage load shall be available in VDU.
 3. The spare capacity as specified above shall be uniformly distributed throughout all functional groups. The system design shall ensure that above mentioned additions shall not require any additional controller / processor / peripheral drivers / cabinets in the system delivered at site. Further, these additions shall not deteriorate the system parametric requirement like response time / duty cycle etc. from those stipulated under this specification and shall meet other redundancy / functional requirement.

5.7.9 System Programming & Documentation facility

1. Programming facility (Engineering Workstation) shall be provided for Control system and system documentation.
2. The programming tools shall have in-built safety features that shall protect the system against inadvertent and unauthorized use of these tools. Necessary hard key locks and software locks, etc. shall be used for this. During on line programming, external plant / equipment should not be affected.
3. The system shall also have facility to permit the programmer to add text information at the beginning and end of each program, wherein programmer shall list out his name, time, date of change which has been made, name of the person who has authorized the change, etc.
4. Any modification done in Control System shall be suitably logged so that it can be traced to the user log-in ID and time of change
5. Structuring / configuring and tuning facilities shall be provided for structuring / modification, storing / loading, testing, tuning, monitoring, etc. of all the microprocessor based controllers of the control system. The configuration and tuning unit shall be hooked up with the system bus. In case different hardware is employed for different parts of control systems and it is not possible to provide structuring/ configuration and tuning of these from the same station.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[53]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

6. It shall be possible to configure the system with ease without any special knowledge of programming or high level languages. Control strategy shall be implemented using familiar and conventional automation function blocks (software implemented). Whenever any change in configuration is done, it shall be recorded and modified configurations shall be available for printing and documentation and shall be stored in non-volatile memory. The entire system configuration, tuning / fixed parameters shall be documented and printed in form of function diagrams and lists respectively.
7. On-line tuning of the control loops shall be possible without causing any disturbance in the execution of the control loops. Provision to store and retrieve on immediate and long term basis the system configuration, data base etc. on some device such as DVD shall be included. Facility shall be used to reload / down-load the system or controller module from the already stored data, on-line.

Table 5.1
Specifications for Engineering Work Station

S.No.	Features	Minimum Requirements
1	Processor	Intel i5 series or better
2	Configuration	Tower
3	Internal Clock	3.2 GHz
4	Architecture	64 Bit
5	Video Card	PCI
6	System Memory	4 GB or better
7	Hard Drive	1 TB
8	Cache	2 MB
9	CD Drive	52X DVD R/RW
10	Audio Controller	16 bit
11	Operating System	WIN NT or higher
12	Graphic Accelerator	8 MB (minimum)
13	Monitor	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[54]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Features	Minimum Requirements
a	Type	TFT Color Monitor
b	Screen Diagonal	21"
c	Display	XGA or better
d	Resolution	1280 X 1024 32 bit color support
e	Degree of Protection	IP-30
f	Power supply	230 V, 50 Hz
g	Ambient Temperature	0-50 *C
h	Humidity	95% non condensable

5.7.10 Data Communication System

1. The Data Communication System shall include a redundant System Bus for major subsystems with hot back-up. The data highway shall be high speed digital links of speed preferable 10/100 M baud. Bus protocols at control levels shall conform to OPC compliant ISO-7 layer protocol in master less, token ring or token bus (as per IEEE 802) or any standard proven and acceptable protocol in deterministic mode. Extensive error checking (CRC-16/12) or error correcting codes shall be used in these levels to improve the reliability of communication.
2. Redundant communication controllers shall be used to handle the communication between each functional group of controllers of Control System and the System Bus. The design shall be such as to minimize interruption of signals. It shall ensure that a single failure anywhere in the media shall cause no more than a single message to be disrupted and that message shall automatically be retransmitted. Any failure or physical removal of any station / module connected to the system bus shall not result in loss of any communication function to and from any other station / module.

5.7.11 Sequence of Event Recording System

1. The DCS system shall perform the SOE functions like stamping of SOE inputs / points with 1 ms resolution. The SOE function shall be built-in function of DCS.
2. SOE shall be capable of accepting minimum 512 inputs per unit including 10% spare channels (included in total 512 inputs).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[55]	02.09.2015

3. The system shall monitor SOE inputs with a resolution of one millisecond at all times for all inputs including spare inputs. That is, all SOE points entering status change shall be reported and time tagged within 1 (one) millisecond of their occurrence. Input card shall be equipped with digital filters with filter delay shall be such that it should meet SOE time resolution of 1 msec (identical for all points) to eliminate contact bounce such that field contact which is changing state must remain in the new state for stipulated time to be reported as one event. The start of data collection for SOE report shall be reported to OWS within 1 sec of SOE data collection initiation.
4. SOE shall be envisaged as an integral part of DCS with 1 millisecond time resolution. The SOE data base shall be an integral part of the DCS database and same shall be made available at all the OWS / EWS resident on the network. Operator can access the SOE on activation of SOE alarm page. All SOE inputs shall have real time "time-stamping" following any tripping of major equipment, or sub-system or the plant as a whole.
5. The SOE system of Plant DCS shall collect process and report SOE inputs of TG control system for a consolidated master SOE system. Necessary communication with required hardware & software at TG control system end and engineering co-ordination with Plant DCS supplier shall be done for successful implementation of a consolidated master SOE system. Consolidated master SOE system shall be used by the Plant DCS supplier.
6. The system shall have provision of rejection of chattering inputs.
7. The system shall have the facility for adding a field adjustable software delay on as per point basis.
8. The system shall also include provision for historical storage and retrieval of SOE reports for 3 months period.
9. The SOE report collection shall begin on occurrence of change of status of any SOE point and shall be printed after an operator selectable time interval of 1 to 3 min. or 100 status changes have taken place after the first event. Adequate numbers of buffers shall be provided to prevent loss of data before transferring to HSR.
10. SOE reports shall include a list of major equipment trip in chronological order and include the points that initiated SOE collection. The inputs for SOE shall include
 - a) Hardwired inputs in input cards and
 - b) Calculated points / generated points of Control System.
11. All the operator initiated actions such as trip inactivation (bypass) & trip activation (inline) shall form input to SER.
12. All the SOE inputs shall also be available for interlock / protection functions.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[56]	02.09.2015

13.SOE of other systems (SG/TG integral control systems) shall also be integrated in this system. The SOE system shall collect process & report SOE inputs of SG & TG control system for a consolidated master SOE system. Necessary communication with required hardware & software and necessary engineering co-ordination with SG & TG Supplier shall be done for successful implementation of a consolidated master SOE list.

14.SOE time stamping shall occur at I/O level.

15.Self Diagnostic Features like scanner test (a periodic test for communication between several levels), functional test by simulating abnormal Conditions shall be provided.

16.One (1) no dedicated SOE viewing station with SOE Log printer shall be provided.

5.7.12 Historical Storage & Retrieval System

The HSRS of Plant DCS will collect store and process system data from TG control system for a consolidated master HSRS system. Necessary communication with required hardware & software at TG control system end and engineering co-ordination with Plant DCS supplier shall be done for successful implementation of a consolidated master HSRS system.

5.7.13 Master & Slave Clock System

A Global Positioning Satellite (GPS) based Master Clock System will be provided by the Plant DCS supplier. Necessary signal output for time synchronization from Master Clock System will be made available to the TG control system to have common time reference.

5.7.14 Power Supply & Grounding

1. Redundant UPS power feeder for all 230VAC equipments and/or redundant feeders for 24 V DC are required for TG control system requirements.
2. Make suitable arrangements with redundant distribution boards for each system with proper auto change over scheme to change the load from one feeder to other, in case of one feeder failure.
3. All panels, desks, cabinets shall be used with a continuous bare copper ground bus. The ground bus shall be bolted/ welded to the panel structure and shall efficiently ground the entire structure. All individual cabinet grounds shall be connected to separate earthing riser to be provided for C&I system signal grounding. The grounding requirements of various parts of the C&I system shall be properly co-ordinated with design of plant earthing system.

5.7.15 System Cabinets/Panels

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[57]	02.09.2015

1. All Control system modules, power supply components, other control devices which are required for completeness of the system shall be housed in cabinets. All equipment and dedicated cabinets required for termination, marshalling and proper interface within system and also with other systems shall also be provided.
2. The cabinet mounted equipments shall be fully assembled, installed in mounting racks, wired and fully tested as per specification requirements and approved drawings in the manufacturing works of a qualified manufacturer prior to shipment to the project site. It shall be ensure that the cabinets are complete and ready for installation before dispatch from manufacturing works. The installation work at project site for these cabinets should only involve connections through multi pair cables from marshalling cabinets (wherever provided) to system cabinets and inter-cabinet.
3. The Control system cabinets shall be grouped into physically separate cabinets as follows:
 - a) Control System Cabinets
 - b) Marshalling Cabinets
 - c) Relay Cabinets

However, in case the system design requires the termination cabinet independent from system cabinet, the marshalling cabinets can be combined with the termination cabinet. In case, the termination arrangement is part of the system cabinet, independent marshalling cabinets shall be provided.
4. A special note shall be indicated that in case termination of field cables directly to control system cabinet is not acceptable.
5. The Control system cabinets shall house all types of modules / hardware to achieve all functions of Control System including signal conditioning modules, controller modules, I/O modules, communication controller modules and all other requisite hardware for a complete system.

5.7.16 System Software Requirement

1. The system shall be provided with all licensed software packages with media required by the system for meeting the intent, functional / parametric requirements and performance requirements of the specification.
2. The system shall utilize a readily upgradeable, public domain software platform proven for real-time operation environment at the control and monitoring level overlaid with a relational database program. The desirable features are indicated below:
 - a) The software system shall be fully modular.
 - b) The software shall meet the following general requirements:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[58]	02.09.2015

- Simple, easy-to-learn editing language for editing and on-line operation.
 - Wide range of standard and non-standard peripheral support capability by modular controllers / supervisors.
 - Effective task scheduling and support of multiple priority structure including event based interrupt etc.
 - Effective debugging.
 - Provision for on-line editing and program development without interrupting on-line functions.
 - Self-diagnostic routines.
 - Efficient memory management and effective utilization of system time.
 - Quick start-up and loading.
 - Support of multiprogramming and multi-user operation.
3. Industry standard operating system like UNIX/WINDOWS NT etc. to ensure openness and connectivity with other system in industry standard protocols (TCP / IP etc.) shall be provided. The system shall have user oriented programming language & graphic user interface.
 4. All system related software including Real Time Operating System, File management software, screen editor, database management software, On line diagnostics / debug software, peripheral drivers software shall be provided. Latest versions of standard PC-based software for database handling, word-processing, spread sheet, Anti-virus etc. and latest WINDOWS based packages etc. and any other standard language offered shall be furnished as a minimum. Systems having program development environments like EWS, Station LAN Server shall have high level programming support like Microsoft Visual Studio, Oracle, RDBMS etc.
 5. The programming language shall support Relational Data Base Management in a global and truly distributed Client-Server environment and shall have the following minimum features:
 - a) Modern high-level block structures type
 - b) Powerful, compact syntax
 - c) Logical organization that facilitates documentation, modification and maintenance of programs
 - d) Early detection of errors at compiles and run time
 - e) Fast debugging
 - f) Improved program reliability
 - g) Clearly defined data structure complemented by flexible user-declared data types
 - h) Fast execution.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[59]	02.09.2015

6. All application software for control system functioning like input scanning, acquisition, conditioning, processing & control along with communication among various Control System functional blocks shall be provided.
7. The system shall be provided with software locks and passwords to engineers at site for all operating & application software in order to prevent unauthorized access and only authorized engineers are able to do modifications at site.
8. Two sets of all final / latest software on non-rewritable/non-editable media shall be provided as back-up.
9. **Software License**
 - a) The system shall be provided with software license for all software being used in the DCS system. The software licenses shall be provided for the project (e.g. organization or site license) and shall not be hardware / machine-specific. That is, if any hardware / machine is upgraded or changed, the same license shall hold good / renew license due to up-gradation / change of hardware / machine in control system at site. All licenses shall be valid for the continuous service life of the plant.
 - b) In case the s/w license is dependent on no. of points, then quantity to be considered is 30% above the finally implemented points.

10. Software Upgrades

The system software's installed in the plant DCS shall be periodically upgraded with the new releases, that would be taking place after the system is commissioned.

5.7.17 Measurement Functions Of Control System

All the signals coming into / going out of the Control System shall be routed through marshalling cabinets. The input / output modules employed in the Controls System shall be separated from controller hardware.

5.7.17.1 Analog Signal Conditioning & Processing

1. The conditioning and processing functions to be performed as a minimum for the analog input coming for control and information purpose are:
 - a) Galvanic isolation of input signals for which power supply source is other than the measurement system of the control system.
 - b) Transmitter power supply with per point fuse protection or current limiting and power supply monitoring.
 - c) Transducer / transmitter signal output limit check
 - d) Implementation of multiple measurement schemes
 - e) Square root extraction
 - f) Pressure and temperature compensation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[60]	02.09.2015

- g) On-line ADC gain and drift monitoring and correction at periodic intervals.
 - h) Linearization of temperature signals (from thermocouples and RTD through temperature transmitters).
 - i) Reasonability checks for all analog inputs.
 - j) Monitor sensor wire break / open circuit / short circuit and take suitable actions in logic / loop. (This shall include blocking of trip signals in case of RTD failure).
 - k) Rate of rise / fall calculation
 - l) LVM generation.
2. All analog signals for control purpose shall be acquired, validated, processed and their respective Controller data base updated at a maximum interval of 250 ms except for some fast-acting control loops for which the above referred time shall be as per process requirement. The validated analog inputs shall be converted into engineering units on per point basis. Analog input processing (scanning to alarm checking) shall be performed once every scan cycle.
 3. The analog 4-20 mA input cards shall have input loop resistance ≥ 250 ohm for interfacing transmitters / analyzers giving 4-20 mA DC signals along with superimposed HART interface signals. 4-20 mA DC signal shall only be used for control purpose and superimposed HART signal shall be used for configuration, maintenance, diagnostic and record keeping facility for electronic transmitters and Analysers etc.
 4. Triple measurement scheme for analog inputs employing three independent transmitters connected to separate tapping points shall be employed for the most critical measurements. The three signals shall be auctioneered to determine the median / average value, which shall be used for control purpose. In case one transmitter fails or shows excessive deviation with respect to others, it shall be removed from computation of median / average value and the average of the other two transmitter outputs shall be used for controls. The control loop shall trip to manual when any two of the three transmitter signals fail. The outputs of the transmitters shall be continuously monitored for excessive deviation which shall be displayed, logged and alarmed.
 5. Dual measurement scheme for analog inputs employing two independent transmitters connected to separate tapping points / temperature element shall be employed for the remaining measurements used for analog control functions. The output of the redundant transmitters shall be continuously monitored for excessive deviation. In case the deviation is within limits, the mean value shall be used for the control loop. If the deviation becomes high (with both transmitters remaining healthy), the loop shall be automatically transferred to manual. However, if one transmitter fails and other transmitter remain healthy, then the output of the healthy transmitter shall be used for control. If the other transmitter also fails, loop shall trip to manual. The outputs of the transmitters

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[61]	02.09.2015

shall be continuously monitored for excessive deviation which shall be displayed, logged and alarmed.

6. Individual transmitter signal, their value and selected value for control/measurement shall be available in OWS.

5.7.17.2 Binary Signal Conditioning & Processing

1. The changeover type contacts (i.e. 'NC' + 'NO' together) shall be wired to the controller system for all the binary inputs required for control purposes, except for inputs from MCC / SWGR. The binary inputs required for information purposes only shall be wired to control system in the form of non-changeover type contacts.
2. The conditioning and processing functions to be performed as a minimum for the binary inputs coming for control and information purposes are:
 - a) 24 VDC power supply for contact interrogation for all potential free contacts with per point fuse protection or suitable current limit feature / isolation through optocoupler.
 - b) Contact bounce filtering delay time of 15ms. However for SOE inputs, it shall be 4ms.
 - c) Facility for automatic pegging of the binary signal to logic one / zero or last correct value in case of failure of binary input module.
 - d) Binary signal distribution to different user shall be in such a way so as to ensures that a short / ground fault on one user is not reflected to the other user.
 - e) Implementation of multiple measurement schemes for signals for control purpose.
 - f) All binary signals shall be acquired, validated, processed, alarm checked and their data base updated within one second. In addition to this requirement, binary signals required for SOE shall have resolution of 1 millisecond.
 - g) Checking for excessive number of status changes for all binary / contact inputs and making it off-scan, if the total no. of changes exceeds a limit within pre-defined time.
 - h) The non-coincidence monitoring shall be used for binary inputs for all changeover signals.

5.7.18 Wiring Scheme for Inputs to Control System

1. Each of the triple redundant binary and analog inputs shall be wired to three separate input modules. In addition, for functions employing 2V3 controllers (e.g. BMS protection), each of the redundant binary and analog signals shall be wired to separate input modules associated with each controller. Similarly each of the dual redundant binary and analog inputs shall be wired to two separate input modules. These redundant modules shall be placed in different racks, which shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[62]	02.09.2015

have separately fused power supply distribution. Implementation of multiple measurement schemes of these inputs shall be performed in the redundant hardware. Loss of one input module shall not affect the signal to other modules. Other channels of these modules can be used by other inputs of the same functional group.

2. No single failure in any component of the control system shall lead to unavailability of more than one of dual / triple redundant input signals to control system. Similarly, no single failure in any component of the control system shall lead to unavailability of more than one of dual / triple redundant output signal from the control system.
3. The single (i.e. non-redundant) binary and analog signal required for control purpose shall be wired as follows:
 - a) The on-off status of HT drives and Breakers with synchronization provision shall be wired to two input modules in parallel.
 - b) All analog and binary inputs including the limit switches of valves / dampers / MCC / SWGR, check-backs of all drives, SOE and information related signals should be wired to single input modules.
4. It is envisaged to use remote I/O modules in plant areas where it is required from location point of view. The remote I/O signals shall be connected to the respective functional groups through redundant extended I/O bus. The hardware independence of functional groups shall be applicable for remote I/O as well. The remote input / output modules shall be located in cubicles in respective areas. Remote input / output modules shall be designed in such a way to work continuously under the harsh environment expected to be encountered in these areas (high temp, dust level, humidity etc.). It shall be ensured that extending of I/O bus of functional group in field does not result in false signalling / noise pickups. Further, it shall in no way deteriorate the performance of that functional group and Control System.
5. Power supply arrangement for these cubicles shall be similar to DCS System cabinets
6. The measurement system of control system should be capable of acquiring data from various equipment and system in digital form through serial port, field bus/ Profibus, Ethernet connection using industry standard protocols. The control system shall include requisite modules for accepting such signals.
7. The maximum number of inputs/outputs to be connected to each type of modules shall be as follows:

a) Analog input module	16
b) Analog output module	08
c) Binary input module	32
d) Binary output module	32

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[63]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

8. The following requirements shall be met for analog/binary input / output modules as applicable:
 - a) Input filters to attenuate noise shall be used
 - b) All analog / binary inputs and outputs shall be capable of withstanding 500V DC common mode and 500V AC peak to peak between analog and digital parts. All analog outputs shall be short circuit proof.
9. Any single sensor / transducer / transmitter failure alarm shall be used on Engineer's Station monitors for all sensors / transducers / transmitters. Similarly sensor break alarm for thermocouples etc. shall also be logged and displayed.

5.7.19 Redundancy in Measurement

Minimum redundancy requirement (1 out of 2 or 2 out of 3) of measurements and controls including are given below. For critical Closed Loop controls 2 out of 3 sensors / transmitters shall be provided including 2 out of 3 signals for compensation signals.

Table 5.2
Redundancy Requirements

Parameter	Input Redundancy
Steam Pressure at Turbine Inlet	2 out of 3
HP & LP Heaters Level	2 out of 3
BFP Discharge header Pressure	1 out of 2
Hot well level control	2 out of 3
Deaerator level control	2 out of 3
Gland seal steam pressure control	1 out of 2
Deaerator pressure control	2 out of 3
CEP discharge flow	1 out of 2
CEP discharge pressure	1 out of 2
BFP Suction temperature	2 out of 3
BFP discharge temperature	2 out of 3
BFP recirculation flow	1 out of 2
Turbine lube oil pressure	2 out of 3
Turbine control oil pressure	2 out of 3
Feedwater Flow	2 out of 3

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[64]	02.09.2015

6 DISTRIBUTED CONTROL SYSTEM (DCS)*{TO BE DELETED, IF ALREADY PROCURED UNDER SG PACKAGE.}***6.1 General Requirements**

1. The requirements for Distributed Control System are indicated on functional basis in this specification. The System shall be state of the art microprocessor based & of proven design, the performance & high availability having adequately demonstrated over a substantial period of successful operation.
2. The system shall have distributed intelligence architecture and shall comprise independent multifunction processors for execution of open loop and closed loop control and data acquisition functions.
3. If DCS & other common system/items (CMMS, STMS, Station LAN, SWAS, Master Clock System etc.) have been procured under SG package, then chapter-6 for DCS, and other common system/items shall be deleted from TG package.
4. The microprocessor based Distributed Control System shall have following capabilities:
 - a) Scan, acquire, validate, time-tag, process, store, update, archive, retrieve and display all analog and digital data and parameter.
 - b) Monitor real and calculated variables for multi-level alarm conditions.
 - c) Accept and execute operator's commands and pre-programmed routines and run-times.
 - d) Perform all open and closed loop control functions.
 - e) Display plant mimics, bar-graphs, control templates, point description, trend graphs (real time & history) in interactive mode with the operator.
 - f) Prepare and print logs and reports.
 - g) Perform performance calculation based on real-time and manually entered data.
 - h) Dynamically reconfigure itself on command from engineering station.
 - i) Run its own diagnostics, watch dogs, system checks and consequent fallback routines.
 - j) All system information and diagnostic alarm like failure of I/O channel, I/O card, Multifunction controller, communication modules, node failure, CPU loading, Network loading, workstation diagnostic etc. shall be annunciated and displayed at any workstation.
 - k) Dynamic data exchange (DDE) for communication with other computers
5. When more than one device utilizes the same signal for measurement and control, signal splitting shall be performed in such a way that disconnecting, shorting or failure of one receiver device shall not cause any upset at any other consumer point or cause any change in transmitter calibration.
6. Comprehensive self-diagnostic features shall be provided to facilities easy fault location and detection of failure without individually checking each module. On-

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[65]	02.09.2015

line testing facility of control system while the unit is in operation shall be provided with suitable indication for easy identification of faulty module.

7. DCS offered shall have 'open' system architecture with open connectivity for viewing at remote locations without virus infection to control network and employing non-proprietary hardware/software. Latest hardware models & software versions shall be offered.
8. DCS shall be of distributed architecture type with VDU based operation. The entire system shall be bus organized and the plant operator shall run the plant through console consisting of LCD screens, Mouse and Keyboards. All the screens and key boards for ease of operation shall be of same design and shall enable the operator to view process data, control outputs, shut down status and to change all parameters necessary to control the plant.
9. The system software shall be governed by the operating system running in a real time mode. It shall meet all functional requirements specified in this specification as a minimum. The latest version of software at the time of SAT shall be supplied even if it is introduced after Contract finalisation.
10. All the inputs shall be galvanically isolated, provided with suitable noise filter and routed through individual fuse. Isolation shall also be provided between operator console and related sub-systems connected to it. The digital outputs shall be routed through interposing relays. Each output shall be short circuit proof and protected by fuse.
11. The system shall be capable to detect open, short and earth fault conditions. The open sensor reading shall be either upscale or downscale and it shall depend on field requirement and shall be programmable from engineering station.

6.2 Design Requirements

6.2.1 System Expandability

Modular System design shall be adopted to facilitate easy system expansion. The system shall have the capability and facility for expansion through the addition of controller modules, I/O cards etc. The system shall have the capability to add any new control loops, groups / subgroups in control system, while the existing system is fully operational. The system shall be expandable to allow at least 50% future expansion only by addition of extra modules without removing or modifying any existing hardware.

6.2.2 Online Maintenance

It shall be possible to remove / replace modules online (like I/O module, interface modules etc.) from its slot for maintenance purpose without switching off power supply to the corresponding rack. System design shall ensure that while doing so, undefined signalling and releases do not occur and controller operation is not affected in any way (including any control loop trip to manual, etc) except that information related to remove module is not available to controller. Further, it

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[66]	02.09.2015

shall also be possible to remove / replace any of the redundant controller modules without switching off the power to the corresponding rack and this shall not result in system disturbance or loss of any controller function for the other controller. The on-line removal / insertion of controller, I/O modules etc. shall in no way jeopardize safety of plant and personnel.

6.2.3 Fault Diagnostic

The control system shall include on-line self-surveillance, monitoring and diagnostic facility so that a failure / malfunction can be diagnosed automatically down to the level of individual channels of modules giving the details of the fault on the Engineers Work Station (EWS) monitor and printers. The faults to be reported shall also include faults in main and standby power supplies, sensor fault, Controller fault, any channel fault in 2V3 channels, failure of links to other systems. These faults shall be identified by local indication on the faulty channel / module and on respective rack / cubicle. The diagnostic system shall ensure that the faults are detected before any significant change in any controller output has taken place.

6.2.4 Fault Tolerance & Controllability

1. The control system shall provide safe operation under all plant disturbances and on component failure so that under no condition the safety of plant, personnel or equipment is jeopardized. Control System shall be designed to prevent abnormal swings due to loss of control system power supply, failure of any control system component, open circuits, instrument air supply failure etc. On any of these failures the control system output shall either remain in last position before failure or shall come to fully open / close or on / off state as required for the safety of plant / personnel / equipment. System shall be designed such that there shall be no upset when Power is restored.
2. No single failure either of equipment or power source shall be capable of rendering any part / system / sub-system of control system inoperative to any degree or loss of generation.
3. The system design shall ensure that no single failure, whatsoever in any part of Control system result in loss of communication.
4. The controlled variable response rate and controllability shall be limited by the characteristics of main equipment, which is being controlled, and control system shall not impose any limitations in the response rate or controllability. Controlled process variables shall return to normal values in a stable manner and without control loop interactions or cycling of generation when generation matches with load demand.

6.2.5 Signal Exchange

1. All the signal exchange between various functional groups of each control group

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[67]	02.09.2015

shall be implemented through redundant main system bus and local system bus within a subsystem as per standard practice. It shall be ensured that any single failure in electronics involved for such communication e.g. communication controllers, bus interface modules, physical communication media, etc. does not result in loss of such signal exchange and there is no deterioration in specified system response and system parametric requirements. In case a controller utilizes some inputs generated / processed by any other controllers / functional group and the requirement of controller response time as specified is not met due to inadequate communication rate / procedure, then the it shall provide hardwired signal exchange for such inputs.

2. However critical signal exchanges are found required shall be hardwired. Control and Protection signal exchange between control system of SG/TG and Plant DCS shall be hardwired only. Protection signals shall necessarily be hardwired even for exchange between the same sub-systems.

6.2.6 Redundancy

The Following shall be completely redundant:

- All the parallel & serial communication buses
 - All the communication devices
 - All the Process controllers
 - Servers (if Server based system)
 - All the Power Packs
 - Critical drives related I/O Modules.
1. The redundant communication buses between the process stations and the operator supervision stations shall follow different paths. The redundant processor shall be connected to the same I/O's of the processor that it is associated to and shall be able to carry out all the operations assigned to this processor. In the case of a processor failure, the redundant processor shall become operative within the cycle time, without causing any loss of data or the interruption of the process control. The switch between the processor being utilized and the reserve processor shall be bump less and shall be within 20 ms which shall not cause any interruptions or stopping of the station functions. Furthermore, this switch must also be signalled by a high priority alarm.
 2. The operator station shall be able to guarantee, from any work station, the complete control of the plant. The operator station electronic units shall be in dual configuration and independently connected to the system buses. In case of an operator stations failure, the station shall remain operative without the operator having to carry out any type of action. Each operator electronic unit and each process station shall be powered by redundant power packs those are able to power the entire load. In case of a failure, the switch between the power packs shall not cause stops or interruption in the carrying out of the station

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[68]	02.09.2015

functions. The switch between the power packs shall be signalled by a high priority alarm.

3. In order to establish a high degree of system availability, the various control systems which comprise the overall unit control system shall be configured such that no single component failure can cause a failure or mal-operation of critical automatic or manual control functions. The failure of a redundant component shall be alarmed to the operator to allow on-line removal/replacement or at the first shutdown opportunity. The system's redundancy schemes shall be designed such that the transfer from any critical element to its redundant backup shall occur without upset to normal process control or to system displays, data collection, or other normal DCS functions within 50 m sec.
4. The signal distribution from sensors which are shared due to process restrictions between control loops, logics, monitoring purposes shall be as follows:-
 - a) In the case of multiple inputs to a card, input cards used shall be restricted to a maximum of 16 inputs per card for analog input and 32 for digital inputs.
 - b) In case there is either process redundancy (Left, Right) or transmitter or switches redundancy, the inputs shall be routed through independent input cards.
 - c) No two control loops/interlock loop shall share the inputs (either binary or analog) wide input cards if process signals are independently available.
 - d) Protective inputs for two drives shall not be allotted to the same input card.
 - e) Output cards shall be independent for each control loop.
 - f) For outputs to HT and LT motors, the following shall be adopted :
 - g) Each HT motor and unidirectional drives shall have dedicated output cards. No other drive shall be combined with HT motor drive output card. However indication outputs can be driven from this output card for the concerned logic loop.
 - h) Not more than two bidirectional drives shall share one output card.
 - i) For unidirectional drives, not more than one drive shall be allotted to one output card.
 - j) For signal distribution or fan-out, suitable electronic cards (opto couplers) shall be used.
 - k) The processors shall contain the logic required to group individual process and system alarms into common groups as well as the annunciation sequence logic.
5. Redundant components and equipment within given systems shall be distributed among processors and I/O cards to the extent practical.
6. Critical inputs shall be supplied with redundant sensors/transmitters with each input connected to different input cards. Where redundant inputs exist, the DCS shall be configured to automatically reject erroneous data. Where required, one-of-two, two-of-two, two-of-three, or median select schemes shall be utilized to ensure the integrity of critical inputs.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[69]	02.09.2015

7. The use of redundant outputs driving the same final element or equipment shall generally be avoided in favour of failsafe design and redundancy of the plant equipment.
8. The operator stations shall be identical in capability and independently linked to the system. Although these stations shall be normally dedicated to a specific function, any station can replace the function of any other station at any time.
9. All power source and power conditioning equipment in the system shall be redundant

6.2.7 System Spare Capacity

1. Following philosophy shall be followed for the spare capacity of the Distributed Control system:
 - a) Twenty (20) percent spare channels in each of the functional groups for each type of input/output modules fully wired up to marshalling / field termination cabinet TBs.
 - b) Ten percent (10%) installed spare I/O modules which may be capable of hot swapping.
 - c) Wired-in "usable" space for 20% modules in each of the system cabinets for mounting electronic modules shall be provided for future use. Empty slots between individual modules / group or group of modules, kept for ease in maintenance or for heat dissipation requirement as per standard practice, shall not be considered as wired-in 'usable' space for I/O modules. Field Terminal assemblies, PCB / Connectors, corresponding to the I/O modules shall be provided for above mentioned 20% blank space, distributed proportionally to main population.
 - d) Each controller shall have 40% spare functional capacity to implement additional function blocks, over and above implemented logic / loops. Further, each controller shall have spare capacity to handle minimum 40% additional inputs / outputs of each type, over and above implemented capacity. Under worst loading condition, Controller should not be loaded beyond 60%. Each of the corresponding communication controllers shall also have same spare capacity as that of controller.
 - e) The data communication system (including main system Bus and other bus system) shall have the capacity to handle the additions mentioned above.
 - f) Each Communication Network Switch shall have 20% spare ports.
 - g) Twenty (20) percent spare relays of each type and rating mounted and wired in relay cabinets. All contacts of relays shall be terminated in terminal blocks of relay cabinets. In each of the relay cabinets 20% spare terminal blocks shall be provided so that additional relays can be mounted and wired.
 - h) For power distribution board 20% spare feeder fully wired ready for use with MCBs fuses, TBs etc. Other hardware such as signal distribution isolation, trip amplifiers etc. shall be provided with 20% spares wired ready for use.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[70]	02.09.2015

2. Sufficient and additional software capacity shall be available in the system to take care of spares requirement as specified above to meet all functional requirements. The calculation for processor power and memory for all nodes should be furnished. Also, the dynamic processor load for all nodes either in terms of idling time or percentage load shall be available in VDU.
3. The spare capacity as specified above shall be uniformly distributed throughout all functional groups. The system design shall ensure that above mentioned additions shall not require any additional controller / processor / peripheral drivers / cabinets in the system delivered at site. Further, these additions shall not deteriorate the system parametric requirement like response time / duty cycle etc. from those stipulated under this specification and shall meet other redundancy / functional requirement.

6.3 System Configuration

The Distributed Control System shall basically consist of the following:

- Control system including Auto Controls & Interlocks, Protection & Sequential control system.
- Measurement system
- Data Communication Bus system for control & communication with Process
- Man-Machine Interfacing System
- Maintenance Engineers System (Engineering Station)
- Software

The basic configuration of Distributed Control System shall be as indicated in the Drawings.

DCS system shall be independent yet connected at network level so that, even when system for any unit is not in service (in case of long term shutdown of a unit) or non- functional, the functioning of other unit or plant common systems shall not be disturbed.

6.3.1 Control System Requirements

The control system shall be broadly divided into SG - C&I, TG - C&I and BOP - C&I.

1. The SG- C&I part of DCS system shall perform the following function as minimum but not limited to:
 - a) Burner management system (BMS) including control & protection of coal mills, fuel oil system etc.
 - b) Analog control functions pertaining to secondary air damper control etc.
 - c) Soot blower control.
2. The TG- C&I part of DCS system shall perform the following functions:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[71]	02.09.2015

- a) Turbine protection system function (TPS)
 - b) Turbine governing system for main turbine
 - c) Turbine stress control system (TSCS)
 - d) Automatic turbine testing (ATT)
 - e) Automatic turbine run up system. (ATRS)
 - f) HP&LP bypass control system
 - g) Turbine generator control system
 - h) EHG, interlock & protection for turbine driven BFP
3. The BOP- C&I system shall perform the following functions:
- a) Analog control functions, other than those covered in SG-C&I and TG-C&I, like co-ordinated master control, furnace draft control, SH/RH steam temperature control, FW flow control, heaters/deaerator/condenser level control, Auxiliary PRDS pressure & temperature control etc.
 - b) Binary control functions pertaining to main plant auxiliaries like FD/ID/PA fans, APH, BFP etc., Generator auxiliary systems and electrical breakers etc.
4. **Close Loop Control System (CLCS):** Modulating control functions for SG/TG/BOP system includes the CLCS SADC Control, Air/Fuel oil flow control Drum Level Control, FW Flow Control, SH/RH Temperature Control, Furnace pressure, wind box air damper, Auxiliary PRDS Coordinated Master Control, De-aerator Pressure & Level Control, HP/LP Bypass control, Hotwell Level Control, HP/LP heaters Level Control, BFP Scoop control, BFP & CEP minimum Recirculation Control & individual control and operation of modulating drives.
5. **Open Loop Control System (OLCS):** Binary control functions pertaining to SG control system such as Sequence/ Interlock/ Protection of SG Auxiliaries includes the OLCS for FD Fan, ID Fan, APH, Soot Blowers etc. This includes controls of all HT drives, LT drives, motor operated valve, solenoid valves, Soot blower protection & auto-standby of HT & LT drives.
- However the binary control functions pertaining to TG & BOP control system such as Sequence/ Interlock/ Protection of TG Auxiliaries includes the OLCS for the BFP, CEP, CW, ACW, ECW Drain & Vent Valves etc. and individual control & protection of Binary drives. This includes controls of all HT drives, LT drives, motor operated valve, solenoid valves, Electrical breaker, auto-standby of HT & LT drives.
6. Time stamping of SOE inputs/points, Integration of BOP PLC's etc.
7. Other Miscellaneous controls, signal processing etc.
8. For each of the Functional Groups (FG), separate sets of controllers, I/O modules, communication controllers, power packs / modules, etc. shall be provided. Mixing of hardware of two or more FG's shall not be acceptable. However, splitting of any functional group in more than one FG's due to any

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[72]	02.09.2015

limitation in system (e.g. limitation in handling number of inputs /outputs including spare capacity, limitation in implementation of number of functional blocks including, spare blocks etc.) shall be acceptable, subject to Consultant's approval. It may be noted that after splitting of the functional groups, each FG must have its own set of controllers, I/O modules, communication controllers, power packs / modules etc. It shall be ensured that failure of any set(s) of hardware of any FG does not affect other FG(s) and data communication between other FG(s) and MMI.

9. The minimum functions to be realized in the Control System shall be as per requirements specified under subsequent clause of this specification. The system shall provided with all hardware /software, whether or not specifically indicated in this specification to fully meet operational / maintenance / safety requirement as well as statutory /international standards and proven practices.
10. The Control System shall function reliably under the environmental conditions as specified in design philosophy & in design criteria of this specification. It shall be immune from the interference resulting from disturbance in power supply feeders, signal lines, inputs, outputs, etc. as experienced in a power station.
11. The Control System shall have on-line simulation and testing facility. Further, it shall be possible to on-line configure and tune controllers through Engineering Station.
12. The system shall have the flexibility to easily reconfigure any controller at any time without requiring additional hardware or system wiring changes and without disabling other devices from their normal operation mode. Modifications shall not require switching off power to any part of the system.
13. Power supply to individual functional group shall be from redundant 24 V feeders with diode auctioneering and further sub-distribution.
14. The assignment of I/O channels for inputs / outputs, arrangement of modules within cabinet etc shall be identical for both units except those inputs / outputs which are common for both units. Further uniformity should be maintained for redundant stream of process equipment within a unit.
15. The application programs for the functional controllers shall be software based which shall be maintained even during power supply failure. The application program shall be alterable through the configuration and tuning station for all configuration and strategy changes, etc. and through the operator's console for set points / bias changes, device selection, etc. Parts replacement or parts removal shall not be required in order to accomplish changes in application programs including system tuning.
16. Independent and dedicated controllers (main and its 100% standby) shall be provided for each of the functional group (FG) of Control System. All the 100% hot / redundant backup controllers shall be identical in hardware and software implementation to their corresponding main controllers and shall be able to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[73]	02.09.2015

perform all its tasks. The backup controller shall track its corresponding main controller. There shall be an automatic and bumpless switchover from the main controller to its corresponding backup controller in case of main controller failure and vice versa without resulting in any change in control status. In case of switchover from main controller to the 100% hot backup controller, the back-up controller shall work as the main controller. Facility shall also be provided for manual switchover from main to 100% hot back-up controller and vice versa from the Engineering Work Station.

17. The loop / logic reaction time shall be suitable to match actual process requirements, subject to minimum requirement wherever specified.

6.3.1.1 Binary Controls/ Open Loop Control System (OLCS) Functions

- These clauses are applicable for all the Binary controls of Systems for the systems of SG & TG which are to be implemented in Plant.
- The OLCS shall include sequence control, interlock & protection for various plant auxiliaries/valves /dampers/drives etc. The sequence control shall provide safe and automatic start up and shut down of plant and of plant items associated with a plant group. The interlock and protection system shall ensure safe operation of plant/plant items at all times and shall automatically shut down plant/plant items when unsafe conditions arise.
- The OLCS shall be arranged in the hierarchical control structure consisting of unit level, group level, subgroup level and drive level (as applicable).
- It shall be possible to perform automatic unit start up and shutdown by issuing minimum number of command from OWS / LCD. Thus, the unit level shall control all the Control System Blocks and issue appropriate start up and shutdown commands to various blocks of Control System.
- The group level shall control a set of functional sub-groups of drives. Appropriate start-up and shut down commands shall be issued to the sub-group control and various check-backs shall be received from sub-groups of drives. Each sub-group shall execute the sequential start-up and shut down programs of a set of inter-related drives along with system interlocks and protections related to individual drive falling under that sub-group. The drive level shall accept commands from the sub-groups, push buttons (wherever provided) etc., and transmit them to the respective drive, after taking into account various interlocks and protections and the safety of that particular drive. For HT drive, first-up logic shall be incorporated to indicate the cause of protection / trip.
- A sequence shall be used to move a set of groups and sub-groups from an initial steady state (for instance 'OFF') to a final steady state (for instance 'ON'). The sequence initiating command for the unit and group level shall be issued from OWS/LCD.
- A sequence shall be made of steps. The steps shall be executed in predetermined order according to logic criteria and monitoring time consisting of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[74]	02.09.2015

the interlock & protection requirements and check back of previous step which shall act as pre-conditions before the sequence control can execute the command for that step.

8. Each step shall have a "waiting time" implying that the subsequent step would not be executed unless the specified time elapses. A monitoring time shall also be defined as the maximum time required in executing the commands of any step and the time required for appearance of check back signals. In case, this is not completed within the specified time, a message shall be displayed and programme shall not proceed further.
9. Manual intervention shall be possible at any stage of operation and the sequence control shall be able to continue at the correct point in the programme on return to automatic control. Protection commands shall have priority over manual commands, and manual commands shall prevail over auto commands.
10. Open or close priority shall be selectable for each drive.
11. The sequence start up mode shall be of the following types:

a) Automatic Mode

In this mode of operation, the sequence shall progress without involving any action from the operator. The sequence start / stop command shall be issued from the OWS / LCD.

b) Semi-Automatic Mode

In this mode of operation, once the sequence is initialized, the step progressing shall be displayed on the OWS / LCD. But the step execution command shall be prevented and shall be sent by the operator via the keyboards. It shall be possible to bypass and / or simulate one or more criteria to enable the program to proceed. This facility shall allow the program to be executed even if some criteria are not fulfilled because of defective switching devices, etc., while the plant condition is satisfactory. All the criteria bypassed shall be logged and displayed. It shall be possible to put the system on the Auto-mode after operating it on semi-automatic mode for some steps or vice-versa, without disturbance to the sequence operation.

c) Operator Guide Mode / Test Mode

It shall be possible to use the sequential control in operator guide mode / test mode i.e. the complete system runs and receives input from the plant and the individual push button stations (where provided) / keyboards but its command output is blocked. The whole programme, in this case shall run in manual mode. This mode shall allow the operator to practice manual operation using step and criteria indications. The actual protection should remain valid during this mode of operation also.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[75]	02.09.2015

12. The sequence shall be started by putting the sequence on 'auto' and on receipt of 'start' command from the OWS / LCD or from a higher-level group / protection action as defined. The sequence shall then progress as per the defined logics. It should be possible to select alternative operation in the same sequence depending on certain process / equipment condition. Some step can be automatically bypassed also based on certain process / equipment condition. When the expected results of the sequence are reached the sequence is considered as "END". If during sequence initialization or sequence progressing or during normal running of the drive, a shutdown criterion is present, the sequence shall be stopped and the shut down sequence initiated.
13. For the drives, the command shall be provided through O/P module to MCC / SWGR / Actuator as applicable and input (status, SWGR and process) shall be acquired through input modules. The drive logic shall be implemented in the redundant controller. The status for the 11 KV, 3.3 KV drives and some other important drives shall also be wired in parallel to redundant input modules so that on failure of the single input modules, the information regarding the status of the affected drive remains available in OLCS.
14. The output modules shall have the feature that ensures that in case of failure, all the outputs are driven to zero. The 24V DC command outputs to drives for ON / OPEN, OFF / CLOSE shall be separate and independent and the inverted outputs shall not be employed. For inching type of drives, position transmitter shall be provided.
15. The termination for ON / OPEN, OFF / CLOSE command for the drive actuator shall be performed as specified in Chapter-4 Clause-4.13. However ON/OPEN feedback, OFF/CLOSE feedback, Switch gear disturbance feed back as a minimum shall be monitored in OLCS.
16. The drive function i.e. basic interlocks and protection logic of the drive shall be implemented in redundant controllers. The drive function shall ensure that protection signals for the safety of the drive shall be effective under all conditions and under all modes of operation. The different commands shall be performed according to the priority of protection 'OFF', protection 'ON', manual and automatic. The standard functions like running time monitoring, status signaling, alarm / drive annunciation, etc. shall be performed in drive function. The drive function shall prevent hunting of the actuator in the presence of both open and close commands for actuators of the valves and dampers. The drive function shall be implemented in dedicated standard software functional block.

6.3.1.2 Analog Controls/ Close Loop Control System (CLCS) Functions

1. These clauses are applicable for all the Analog controls of Systems included in for the systems of SG & TG which are to be implemented in Plant.
2. The CLCS shall continuously act on valves, dampers or other mechanical modulating devices such as hydraulic coupling etc., which alter the plant

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[76]	02.09.2015

operation conditions. The system shall be designed to give stable control action in steady state condition and for load changes in step / ramp over the load range of 60% to 100% MCR with variation or parameters within permissible limits.

3. The controller capability shall, as a minimum, include (i) P, PI, PD and PID control functions and their variations (ii) cascade control (iii) feed forward control (iv) state-variable based predictive control for SH/RH temperature control (v) on-off control, (vi) ratio and bias control, (vii) logical operation etc. The loop reaction time (from change of output of the sensor of the transmitter/temperature element to the corresponding control command output) shall be within 250 ms. However, for faster loops such as feed water, furnace draft, PA header pressure control loop etc. the same shall be based on actual process requirement.
4. The loop response time, for conventional I/Os, is the cumulative response time inclusive of input scan time, Controller Execution time and output card throughput time (in other words loop response is the time taken by the system to read a change in field signal at the input card terminal, process the controller task associated with the input and to make the required change in the control output at the output terminal of the output card)
5. The control system shall be bumpless transferred to manual. Control power supply failure, failure of redundant controllers, field input signal not available, analog input exceeding preset value, etc.
6. Any switch over from auto to manual, manual to auto and vice versa shall be bumpless and without resulting in any change in the plant regulations and the same shall be reported to the operator and recorded automatically.
7. Buffered analog output (positioning signal) of 4-20mA DC shall be provided from CLCS to the respective E/P converters. For electrical actuators, pulse type output (bound less control) shall be preferred. CLCS shall also provide all the necessary outputs for indicators & recorders with output loop resistance of 500 ohms for each channel of the output module.
8. The system being supplied shall be such that when permissible limits are exceeded, an automatic switchover from an operation governed by maximum efficiency, to an operation governed by safety and availability is affected.
9. For safety reasons, switchover logics associated with the modulating control loops shall be performed within the closed loop control equipment.
10. Time supervision facility shall be provided to monitor the final control element.
11. It shall be possible to block the controller output on a pre-programmed basis.
12. All controllers shall be freely configurable with respect to requisite control algorithms.
13. Whenever, alternate measurement is available for a control input the alternate measurement value shall be automatically substituted in the control loop in case of loss of control input. All necessary software for switching and reconfiguration

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[77]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

shall be provided. In addition, such substitution shall be balance less and bumpless and shall be reported to the operator.

Table 6.1A
Specifications for Controller

S.No.	Features	Minimum Requirements
1	Type	Microprocessor based, multi loop, multi function, dual redundant configuration.
2	No. of Loops	40 (maximum/per controller)
3	Word Length	32 bits
4	Register add cycle time	1 microsecond (typical)
5	Instruction Cycle time	75 microseconds (maximum)
6	I/O address capability	256 points (minimum)
7	Memory	RAM 12 MB (minimum) with battery backup
8	Redundancy Supported	Yes
9	Fall back transparent	Yes
10	Power Supply	24V, 5V DC
11	Mounting	Sub-rack

6.3.1.3 Guidelines for Functional Grouping of Plant DCS Controllers

The guidelines for functional grouping of controllers in Plant DCS shall be as described in this clause.

1. Stream wise process redundancy is to be maintained in Plant DCS. That is, if there is more than one main equipment in a process block, these are to be allocated in different functional groups. For example, ID fan – A & B shall be allocated to two different functional groups, BFP- A, B & C shall be allocated to three different functional groups, etc. In the functional groups thus obtained, main equipment of similar stream shall be allocated. For example, if one functional group caters to Stream-A main equipments, all main equipments of Stream – A of the same block should be put together e.g. FD fan-A, ID fan-A should be put together. Further the auxiliaries of main equipment shall be allocated in the same functional group where corresponding main equipment is allocated e.g. Lube oil pump-A & Lube oil pump- B of FD fan –A should be allocated with FD fan-A.
2. For different streams of process blocks defined below, separate sets of functional groups shall be provided. Where different streams of process blocks are not defined, separate sets functional groups shall be provided for the process blocks. The functions of two streams/process blocks should not be mixed in any case.
3. The information signals of respective process areas shall be kept along with the main equipment.
4. Electrical system of unit shall be a separate process block.
5. The Plant DCS shall be divided into following major sub-systems:
 - a) BOP – SG
 - b) BOP – TG
 - c) Common System
 - d) Electrical system

For each of the above major sub-systems, the process blocks, along with major equipments/control loops in each block shall be as follows:

A. BOP - SG

- **Air Block:** ID Fans- A & B, FD Fans-A & B, SA Fans– A & B, Primary APH –A & B along with flue gas temperature control/fire detection, stack path, Furnace draft control, Secondary SCAPH – A & B, Air Flow Control etc.
- **Steam & Water Block:** SG vents & drains, Main Steam/RH/SH valves along with temperature control, ECW Pumps- A & B along with DP control, Chemical Dosing, Feed water valves, SG misc. Drives, Coordinated Master Control, Feed Water Control, Group Control, RH Protection, SWAS, BCWP - A, B & C, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[79]	02.09.2015

- **Mills & feeder Block:** Mills/feeder – A, B, C, D, E, F, G & H controls for outlet temperature, Primary APH – A & B along with fire detection & temperature control, Primary SCAPH – A & B, etc.

B. BOP - TG

The BOP- TG shall include the following major equipments/controls:

- BFP – A, B & C
- CEP – A, B & C along with recirculation controls
- ACWP – A, B & C
- HP Heaters valves & Level control (all HP heaters should be kept in same Functional group)
- LP Heaters valves & Level control (all LP heaters should be kept in same Functional group)
- Hotwell level control
- ECW Pumps- A & B along with DP control
- TG misc. Valves/drives controls etc.

C. Common system

The Common systems shall include the following major equipments/controls:

- Compressed Air System block
- CW pumps – A, B & C (CW pumps shall be allocated to three different functional groups)
- LDO/HFO handling system block.

D. Electrical system

All Electrical breakers, bus couplers etc. shall be covered in this sub-system.

6. The major aspects to be considered shall be as follows:

- a) Hardware capacity, including spare capacity.
- b) Software capacity, including spare capacity.
- c) Response time/signal acquisition time requirement of Plant DCS.
- d) Parametric Requirement of Plant DCS.
- e) Tentative Functional grouping as described in Table 6.1A.

7. The equipments, logics, controls indicated in the functional grouping are tentative & shall be dependent on the design, recommended logics & controls of the SG & TG Vendors.

6.3.2 Measurement System Requirements

All the signals coming into / going out of the Control System shall be routed through marshalling cabinets. The input / output modules employed in the Control System shall be separated from controller hardware.

6.3.2.1 Analog Signal Conditioning & Processing

1. The conditioning and processing functions to be performed as a minimum for the analog input coming for control and information purpose are:
 - a) Galvanic isolation of input signals for which power supply source is other than the measurement system of the control system.
 - b) Transmitter power supply with per point fuse protection or current limiting and power supply monitoring.
 - c) Transducer / transmitter signal output limit check

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[82]	02.09.2015

- d) Implementation of multiple measurement schemes
 - e) Square root extraction
 - f) Pressure and temperature compensation.
 - g) On-line ADC gain and drift monitoring and correction at periodic intervals.
 - h) Linearization of temperature signals (from thermocouples and RTD through temperature transmitters).
 - i) Reasonability checks for all analog inputs.
 - j) Monitor sensor wire break / open circuit / short circuit and take suitable actions in logic / loop. (This shall include blocking of trip signals in case of RTD failure).
 - k) Rate of rise / fall calculation
 - l) LVM generation.
2. All analog signals for control purpose shall be acquired, validated, processed and their respective Controller data base updated at a maximum interval of 250 ms except for some fast-acting control loops for which the above referred time shall be as per process requirement. The validated analog inputs shall be converted into engineering units on per point basis. Analog input processing (scanning to alarm checking) shall be performed once every scan cycle.
 3. The analog 4-20 mA input cards shall have input loop resistance ≥ 250 ohm for interfacing transmitters / analyzers giving 4-20 mA DC signals along with superimposed HART interface signals. 4-20 mA DC signal shall only be used for control purpose and superimposed HART signal shall be used for configuration, maintenance, diagnostic and record keeping facility for electronic transmitters and Analysers etc.
 4. Triple measurement scheme for analog inputs employing three independent transmitters connected to separate tapping points shall be employed for the most critical measurements. The three signals shall be auctioneered to determine the median / average value, which shall be used for control purpose. In case one transmitter fails or shows excessive deviation with respect to others, it shall be removed from computation of median / average value and the average of the other two transmitter outputs shall be used for controls. The control loop shall trip to manual when any two of the three transmitter signals fail. The outputs of the transmitters shall be continuously monitored for excessive deviation which shall be displayed, logged and alarmed.
 5. Dual measurement scheme for analog inputs employing two independent transmitters connected to separate tapping points / temperature element shall be employed for the remaining measurements used for analog control functions. The output of the redundant transmitters shall be continuously monitored for excessive deviation. In case the deviation is within limits, the mean value shall be used for the control loop. If the deviation becomes high (with both

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[83]	02.09.2015

transmitters remaining healthy), the loop shall be automatically transferred to manual. However, if one transmitter fails and other transmitter remain healthy, then the output of the healthy transmitter shall be used for control. If the other transmitter also fails, loop shall trip to manual. The outputs of the transmitters shall be continuously monitored for excessive deviation which shall be displayed, logged and alarmed.

6. Individual transmitter signal, their value and selected value for control/measurement shall be available in OWS.

6.3.2.2 Binary Signal Conditioning & Processing

1. The changeover type contacts (i.e. 'NC' + 'NO' together) shall be wired to the controller system for all the binary inputs required for control purposes. The binary inputs required for information purposes only shall be wired to control system in the form of non-changeover type contacts.
2. The conditioning and processing functions to be performed as a minimum for the binary inputs coming for control and information purposes are:
 - a) 24 V DC power supply for contact interrogation for all potential free contacts with per point fuse protection or suitable current limit feature / isolation through opto-coupler.
 - b) Contact bounce filtering delay time of 15 ms. However for SOE inputs, it shall be such that it should meet SOE time resolution of 1 ms.
 - c) Facility for automatic pegging of the binary signal to logic one / zero or last correct value in case of failure of binary input module.
 - d) Binary signal distribution to different user shall be in such a way so as to ensures that a short / ground fault on one user is not reflected to the other user.
 - e) Implementation of multiple measurement schemes for signals for control purpose.
 - f) All binary signals shall be acquired, validated, processed, alarm checked and their data base updated within one second. In addition to this requirement, binary signals required for SOE shall have resolution of 1 millisecond.
 - g) Checking for excessive number of status changes for all binary / contact inputs and making it off-scan, if the total no. of changes exceeds a limit within pre-defined time.
 - h) The non-coincidence monitoring shall be provided for binary inputs for all changeover signals.

6.3.2.3 Wiring Scheme for Inputs to Control System

1. Each of the triple redundant binary and analog inputs shall be wired to three separate input modules. In addition, for functions employing 2V3 controllers, each of the redundant binary and analog signals shall be wired to separate input

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[84]	02.09.2015

modules associated with each controller. Similarly each of the dual redundant binary and analog inputs shall be wired to two separate input modules. These redundant modules shall be placed in different racks, which shall have separately fused power supply distribution. Implementation of multiple measurement schemes of these inputs shall be performed in the redundant hardware. Loss of one input module shall not affect the signal to other modules. Other channels of these modules can be used by other inputs of the same functional group.

2. No single failure in any component of the control system shall lead to unavailability of more than one of dual / triple redundant input signals to control system. Similarly, no single failure in any component of the control system shall lead to unavailability of more than one of dual / triple redundant output signal from the control system.
3. The single (i.e. non-redundant) binary and analog signal required for control purpose shall be wired as follows:
 - a) The on-off status of HT drives and Breakers with synchronization provision shall be wired to two input modules in parallel.
 - b) All analog and binary inputs including the limit switches of valves / dampers / MCC / SWGR, check-backs of all drives, SOE and information related signals should be wired to single input modules.
4. It is envisaged to use remote I/O modules in plant areas where it is required from location point of view. The remote I/O signals shall be connected to the respective functional groups through redundant extended I/O bus. The hardware independence of functional groups shall be applicable for remote I/O as well. The remote input / output modules shall be located in cubicles in respective areas. Remote input / output modules shall be designed in such a way to work continuously under the harsh environment expected to be encountered in these areas (high temp, dust level, humidity etc.). It shall be ensured that extending of I/O bus of functional group in field does not result in false signalling / noise pickups. Further, it shall in no way deteriorate the performance of that functional group and Control System.
5. Power supply arrangement for these cubicles shall be similar to DCS System cabinets
6. The measurement system of control system should be capable of acquiring data from various equipment and system in digital form through serial port, Field bus/ Profibus, Ethernet connection using industry standard protocols. The control system shall include requisite modules for accepting such signals.
7. The maximum number of inputs/outputs to be connected to each type of modules shall be as follows:

a) Analog input module	16
b) Analog output module	08

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[85]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- c) Binary input module 32
- d) Binary output module 32
8. The following requirements shall be met for analog/binary input / output modules as applicable:
- a) Input filters to attenuate noise shall be provided
- b) All analog / binary inputs and outputs shall be capable of withstanding 500V DC common mode and 500V AC peak to peak between analog and digital parts. All analog outputs shall be short circuit proof.
9. Any single sensor / transducer / transmitter failure alarm shall be provided on Engineer's Station monitors for all sensors / transducers / transmitters. Similarly sensor break alarm for thermocouples etc. shall also be logged and displayed.

6.3.3 Data Communication Bus System Requirements

The System offered shall be an open system and shall conform to Open Industry Standard (IEEE). A redundant 10 / 100 MBPS Ethernet based high speed switched fault tolerant Data Communication System shall be deployed that provides for multiple simultaneous bi-directional communications. Communication shall be full duplex and with TCP-IP protocol. All interfaces links of controllers, gateways, MMI stations, switches and all other communication devices on the network shall be dual so that a single point failure shall not lead to system shutdown. Network shall be capable of handshaking with any third party system following standard protocol. The primary objective shall be centralized monitoring, presentation & report of data for information and analysis of entire plant. All the functional groups shall be connected to a common high-speed data network for global distribution and peer-to-peer data communication. Any data shall be available at any point on the network as and when required. The control system shall be modular, expandable and flexible so the expansion of the system is possible by adding extra stations on the data communication bus. Comprehensive self-diagnostic features have been envisaged to facilitate easy fault location and detection of hardware and software while the unit is in operation. It shall be able to direct intelligent routing of messages without the drawbacks of traffic jamming etc.

The Data Communication System shall include a Redundant System Bus for major subsystems with hot back-up. The data highway shall be high speed digital links of speed preferable 10/100 MBPS. Bus protocols at control levels shall conform to OPC compliant ISO-7 layer protocol in master less, token ring or token bus (as per IEEE 802) or any standard proven and acceptable protocol in deterministic mode. Extensive error checking (CRC-16/12) or error correcting codes shall be used in these levels to improve the reliability of communication.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[89]	02.09.2015

The Data Communication System shall have following minimum features:

1. Redundant communication controllers shall be provided to handle the communication between each functional group of controllers of Control System and the System Bus. The design shall be such as to minimize interruption of signals. It shall ensure that a single failure anywhere in the media shall cause no more than a single message to be disrupted and that message shall automatically be retransmitted. Any failure or physical removal of any station / module connected to the system bus shall not result in loss of any communication function to and from any other station / module.
2. If the system bus requires a master bus controller philosophy, it shall employ redundant master bus controller with automatic switchover facility.
3. Built-in diagnostics shall be provided for easy fault detection. Communication error detection and correction facility shall be provided at all levels of communication. Failure of one bus and changeover to the standby system bus shall be automatic and completely bumpless and the same shall be suitably alarmed / logged. The above changeover shall not result in any data loss.
4. The design and installation of the system bus shall take care of the environmental conditions and hazardous area classification as applicable to similar services.
5. Data transmitting speed shall be sufficient to meet the responses of the system in terms of displays, control etc. plus 50% spare capacity shall be available for future expansion.
6. Passive coaxial cables or fibre optic cables shall be employed for System Bus. It may proposed with other type of cables as per their standard also which shall be subject to Consultant's approval. However the following buses shall be fibre-optic only.
 - a) System bus connections between Control Room & Control Equipment Room.
 - b) System bus from locally mounted control system cabinets / OWS to central location.
 - c) I/O Bus from remote I/Os to centrally located system cabinets. The redundant buses shall be physically separate and shall be routed separately.
7. If UTP / STP cables are used, then it shall routed with flexible conduit.
8. In case of any distance or other limitation in the Data Communication System, then it shall be provide with special type of cables like optical fibres with repeaters as required to make the system fully operational.
9. Serial device interface module shall be capable of providing communication interface with serial devices. The Modbus interface shall support MODBUS RTU protocol and use EIA-422/485 multi loop configuration by establishing direct digital communication. The nominal capacity of a link shall not be less than 5000 digital and 200 analog inputs. The acquired & transmitted data shall integrate

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[90]	02.09.2015

seamlessly with DCS database. The physical medium of communication can be twisted wire, coaxial or fibre optic cable, depending on transmission distance and surrounding electrical interference.

10. In redundant network, the communication cables of each network shall be uniquely colour coded.

6.3.3.1 DCS System Interfacing Requirements

Following Interfacing facility shall be provided for DCS System.

1. One (1) no. independent Redundant Bi-directional OPC/ Soft Link, for monitoring, operation & effective control of the system (without time delay), with Ethernet based TCP-IP protocol for SG integral Control System.
2. One (1) no. independent Redundant Bi-directional OPC/Soft Link, for monitoring, operation & effective control of the system (without time delay), with Ethernet based TCP-IP protocol for TG integral Control System.
3. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Coal Handling Plant Control System.
4. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Ash Handling Plant Control System.
5. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Water Treatment & Effluent Treatment Plant Control System.
6. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Raw Water Intake Pump house Control System.
7. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Hydrogen Generation Plant Control System.
8. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Substation Automation System.
9. One (1) no. Independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the ESP Control System.
10. One (1) no. Independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for Water Lance System.
11. One (1) no. independent Redundant Bi-directional OPC/Soft Link with Ethernet based TCP-IP protocol for the Emergency DG Control System.
12. One (1) no. Independent Redundant Uni-directional OPC Link with Ethernet based TCP-IP protocol for Turbine Supervisory Instrumentation (TSI) System.
13. One (1) no. Independent Redundant Uni-directional OPC Link with Ethernet based TCP-IP protocol for Online Tube Cleaning System.
14. One (1) no. Independent Redundant Uni-directional OPC Link with Ethernet based TCP-IP protocol for Turbine Lube Oil Purification System.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[91]	02.09.2015

15. One (1) no. independent Redundant Uni-directional OPC/Soft Link with Ethernet based TCP-IP protocol for AC & Ventilation Control System.
16. One (1) no. independent Redundant Uni-directional OPC/Soft Link with Ethernet based TCP-IP protocol for Fire Detection & Protection System.
17. One (1) no. independent Redundant Uni-directional OPC Link with Ethernet based TCP-IP protocol for MIS system.
18. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for Computerized Maintenance Management System (CMMS).
19. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for PADO system.
20. One (1) no. independent Redundant Bi-directional Communication Link with Ethernet based TCP-IP protocol for Vibration Monitoring & Analysis System.
21. One (1) no. independent Redundant Uni-directional Communication Link with RS-485 Modbus Protocol for interfacing with SWAS.
22. One (1) no. independent Redundant Uni-directional Communication Link with RS-485 Modbus Protocol for interfacing with CEMS.
23. One (1) no. independent Redundant Uni-directional Communication Link with RS-485 Modbus Protocol for interfacing with Instrument & Service Air Compressors (NTA-1 Package).
24. Uni-directional Communication Link with IEC 61850 Protocol for interfacing with Numerical Protection relays.
25. Redundant Bi-Directional Communication Link with RS-485 Modbus Protocol for interfacing with Variable Frequency Drives.
26. Any other Communication Link as required for proper functioning of Complete System.
27. Two (2) nos. Redundant Bi-directional communication OPC Link with Ethernet based TCP-IP protocol as spare provision.
28. Two (2) nos. Redundant Uni-directional communication OPC Link with Ethernet based TCP-IP protocol as spare provision.
29. Two (2) nos. Uni-directional Communication Link with RS-485 Modbus Protocol as Spare Provision.
30. Four (4) nos. Uni-directional Communication Link with IEC 61850 Protocol as Spare Provision.

6.3.4 Man-Machine Interfacing System

1. Man-Machine interface system shall be designed and engineered for safe, efficient, reliable and convenient operation. MMI shall employ high performance, non-priority open system architecture to ensure fast access and response time and compatibility with other system and portability of third party software. MMI System shall be used primarily for the following functions:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[92]	02.09.2015

- a) As operator interface for control operation for the plant for accepting data from and issuing commands to control system etc.
- b) To perform plant supervisory, monitoring and information functions.
- 2. No single failure in MMI System shall lead to non-availability of more than one OWS or one LCD or one printer. In such an event i.e. single failure leading to non-availability of any OWS / LCD, it shall be possible to operate the entire plant in all regimes of operation including emergency conditions from each of the other available OWS / LCD.
- 3. The Plant data pertaining to one unit shall be available in the MMI of the respective unit. Data from common system shall be available in the MMI of both units. Further, suitable displays with selection facility shall be provided for common system drives so that all common system drives can be controlled from any of the unit.

6.3.4.1 Operator Interface Requirements

- 1. The Operator interface of the MMI system shall consist of TFT Monitor, Mouse, Keyboards of OWS, LCD, Printers, etc. as follows:
 - a) Six (6) Nos. OWS with 21" TFT Monitors, Optical Mouse, Keyboard etc. for Unit Operation.
 - b) Two (2) Nos. OWS with 21" TFT Monitors, Optical Mouse, Keyboard etc. for Common system Operation
 - c) Two (2) Nos. OWS with 21" TFT Monitors, Optical Mouse, Keyboard etc. for Shift In Charge Engineer.
 - d) Two (2) Nos. 65" LCD with work station for display control and all other accessories, for Operation & Monitoring.
 - e) One (1) No. 65" LCD with work station for display control and all other accessories, for Operation & Monitoring of Plant Common System.
 - f) One (1) No. 65" LCD with work station for display control and all other accessories, for Operation & Monitoring of Plant Electrical System.
 - g) Two (2) Nos. Dot Matrix Printer (A3 size) for Alarm Printing.
 - h) Two (2) Nos. Dot Matrix Printer (A3 size) for Log Printing.
 - i) Two (2) Nos. Color Laser Jet Printer (A3 size) for Hard Copy Printing.
 - j) One (1) No. Color Laser Jet Printer (A4 size) for Shift In charge Station.
- 2. All OWS / LCD of the MMI System shall be fully interchangeable i.e. all operator functions including control, monitoring and operation of any plant area shall be possible from any of the OWS / LCD at any point of time without the necessity of any action like downloading of additional files. Each OWS / LCD shall be able to access all control information related data under all operating conditions including a single processor / computer failure in the MMI System. Further, simultaneous operation of at least two drives of control system shall be possible

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[93]	02.09.2015

from a single display without calling additional display for multiple drive operation.

3. The operator functions for each OWS / LCD shall as a minimum include control system operation (A/M selection, raise / lower, set point / bias change, on / off, open / close operation, mode / device selection, bypassing criteria, sequence auto, start / stop selection, drive auto selection, local-remote / other multi-position selection etc.), alarm acknowledge, call all kind of displays, logs, summaries, calculation results etc., printing of logs and reports, retrieval of historical data and any other functions required for smooth operation, control and management of information.
4. All frequently called important functions including major displays shall be assigned to dedicated function keys on a soft keyboard for the convenience of the operator for quick access to displays and other operator functions.
5. The display selection process shall be optimized so that the desired display can be selected with the minimum number of operations. Navigation from one display to any other should be possible efficiently through paging soft keys as well as through targets defined on the displays. There should be no limitation on number of such targets.
6. The system shall have built-in safety features that shall allow certain functions and entry fields with a function to be under password control to protect against inadvertent and unauthorised use of these functions. Assignment of allowable functions and entry field shall be on the basis of user profile. The system security shall contain various user levels with specific rights, which shall be changeable by the programmer.
7. Set points and other entries made shall be automatically checked for validity of range.
8. In addition to the OWS & LCD, minimum amount of conventional instrumentation (i.e. Push button Stations etc.) shall be provided as per standard practice for safe shut-down of the unit.

6.3.4.2 MMI System Functional Requirement

The MMI System shall be designed as an on-line system which shall process, display and store Information to provide the operator, either automatically or on demand. The Following functions shall be performed by MMI system as a minimum:

1. Plant Control Displays

Various displays on the OWS / LCD shall as a minimum include P&ID displays or mimic, bar chart displays, X-Y and X-T plot (trend) displays, operator guidance message displays, group displays, plant start-up / shut-down message displays, system status displays etc. Number of displays and the exact functionality shall be on as required basis.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[94]	02.09.2015

Minimum contents and functionality of various types of displays shall be as under:-

a) Mimic Display

These displays shall depict the process in graphical form and shall cover all the drives operable from DCS and all process areas being monitored therein. There shall be two types of mimic display, broadly, i.e. Overview displays and sub-area / individual displays. Operation of sequences and drives shall generally be carried out through the sub-area / individual displays.

Facility of adding a user specific symbol to the standard library shall be possible. It shall be possible to go to a predefined trend display on selecting a field on any analog point on the displays.

b) Control Tile Display

In this display the drives of a loop shall be displayed with related parameters such as process value, set point, deviation for the loop along with facility for any selections (like A/M selection, valve selector etc.) and the command output, disturbance status and the position feedback signals, for each drive. It shall be possible to call this display as a Pop-up window from the controlled drives in main mimics.

c) Trend Display (X-T Plots)

These displays shall show the trend of analog points with respect to time. These displays shall be continuous curve plot and not point plots. Time spans of displays shall have operator selectable intervals of 5, 10, 15, 30, 60 minutes, 8, 24 and 72 hours. In addition, zoom in / out, stretching facilities etc. shall be provided. Sufficient buffer space shall be provided to store data for minimum 500 points at MMI system scan rate for 72 hours.

d) X-Y Plot Display

There shall be fifteen number of such X-Y plot displays each of one page, pre-programmed in the system. At any instant of time, this page shall include up to 3 independent X-Y point Plots (values of X and Y variables) of up to three equipment typically in the form of a cross 'X'. Operating curves shall be superimposed over the X-Y plot. Alphanumeric information shall be overlaid to indicate X and Y scales, point identification, current operation point value with engineering units, etc. Two or three pairs of X and Y variables having common operating curves shall be displayed on one display page only. In such cases distinct symbols shall be used to show operating point for each. The balance shall be programmable at site.

e) X-Y Plot Display using stored data

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[95]	02.09.2015

This type of display shall show the analog trend of X-axis variable with Y-axis variable with facility to select time period. Ten numbers of such displays, each of one page shall be pre-programmed in the system.

f) Sequence Display

Sequence chain displays for each group and sub-group shall be used to trace the sequence of a control chain as well as to facilitate the operator interventions and enable mode changes / auto selection. Sequence chain display shall present complete sequence chain, in functional blocks, steps being carried out, criteria, running time, monitoring time, waiting time, operating mode, various parameters with associated engineering units for each step and criteria. It shall be possible to display a list of missing criteria for each sequence chain on Operator's demand. The sequence chain display shall automatically move forward when the auto sequence is in operation.

g) Drive Level Display

For each drive (both binary & modulating) a drive level display shall be provided which shall indicate the value / status of drive related inputs / outputs, permissive and protection conditions, the drive level logic and other drive related information including individual drive faults and disturbance criteria. It should be possible to call these displays as pop-up displays.

h) CLCS Display

The loop schematic for each loop shall be available in a display form which shall show the individual analog and binary values (input / output and intermediate) and the loop tuning parameters also.

i) Group Display

The group display shall present point information including point ID, description, current value, range, function group, quality tag and engineering unit of a group of points. (Number of points in a page shall be minimum 20).

j) Bar Graph Display

Horizontal and vertical bar charts shall be provided for the display of related points. Number of bars in a display shall be limited only due to visibility and resolution and no restriction shall be there in the numbers otherwise.

k) Alarm/Fault Analysis Display

In order to guide the operator in case of a process fault / alarm, a fault analysis display shall be provided so that the cause of the alarm, is presented to the operator. For each alarm, various reasons for the cause of the alarm shall be displayed.

l) Alarm Querying facility

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[96]	02.09.2015

On each display, one icon shall be provided. Clicking this icon shall lead to a display indicating all the lamp boxes and list of alarms in each box along with its status. Clicking on the alarm text of a lamp box shall give detailed list along with status of the individual alarm if it is a group alarm.

m) Point Detail Display

From any display, i.e. mimic alarm or any other group display, facility shall be provided to select any point for point detail display. This display shall include all the database attributes of the point. For field I/Os, the termination and interconnection details up to field sensors shall additionally be available. In the point detail display of calculated point, by simple clicking of point or through soft key it shall be possible to display the calculation used and to get further details of any other calculated points used in the calculation.

n) LCD Display

In addition, top area of the LCD (around 300mm), shall be reserved for display of soft replica of Conventional annunciation fascia (for permanent viewing i.e., not operator changeable). LCD based overview display shall be provided, which shall be overlaid across all LCD for viewing as video wall.

2. Log/ Summaries/ Reports

The system shall generate three basic types of reports / logs i.e., Event activated, Time activated and Operator demand log and summaries. The system shall have the facility for viewing of the logs / summaries on the OWS / LCD as well as for their copying in formats compatible to be used with MS-Office or similar tools.

The system shall be designed for automatic printing of all the reports / logs with a provision of inhibition of the print function for each log separately, with selectable duration and selectable page / group of each log. Manual printing of time-actuated log shall also be possible.

Automatic switching of any log function from a pre-selected primary printer to a pre-selected secondary printer (defined on a per log basis) shall be possible. However, change in the assignment of the printers shall be possible through OWS/EWS.

a) Event Activated Logs

Event activated logs shall as a minimum include alarm log, trip analysis log, start-up log, control related logs and operator action log. All operator actions, modification in database etc. shall be logged (with historical storage) along with the username responsible for that action.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[97]	02.09.2015

The trip analysis log shall record 30-100 pre-trip and 30-100 post-trip readings, operator selectable at site for the pre-defined parameters (not less than 250 points), sub-divided in to 25 groups. The data collection rate shall be of scan rate 2 minutes (operator selectable at site).

The system shall be capable of generating and printing TG start-up logs, the functionality of which shall be similar to the trip analysis log.

b) Time Activated Logs

Time activated logs shall include shift log and daily log as a minimum. Each of these shall provide hourly record of a minimum 250 points sub divided into 25 groups

c) Operator Demand Logs

Operator demand logs shall include, as a minimum, digital trend log, maintenance data log. Summary log, performance logs and some special logs.

The system shall be capable of generating and printing trend log for a minimum of 80 groups of 15 points each.

Maintenance Data Log (MDL) shall provide schedule of preventive maintenance and routine equipment inspection for 100 numbers of equipment per unit and for auxiliary plant. The data in MDL shall include current status, total running time, running time since last maintenance, running time in current financial year, loss due to downtime etc.

Performance log shall provide results of performance calculations.

d) Various Summaries

Various summaries shall include off scan summary, constants summary, point quality summary, substituted values summary, peripheral status summary, alarm annunciation group summary, etc. These summaries shall also be available process area or sub-area wise, as well as based on any other data base criterion like functional group number, cabinet number, type of signal etc.

e) Generated Reports

It shall be possible to generate certain reports in some of the PC's on the station LAN, which shall constitute partly off-line data entered there-in and on-line information collected from the system. There shall be provision of generation of minimum ten (10) such reports per PC on the LAN.

f) Log Generation Utility

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[98]	02.09.2015

The system shall have a log generation utility to generate a log / report having following facilities as a minimum:

- Define format of the log like header information, time, date etc.
- Selection of any point (scanned and calculated) from the data base and assign it to a log group.
- Selection of log data collection process initiating event, collection intervals (1, 2, 3, 5, 10, 30 & 60 minutes) for each point of a particular log group. Facility shall also be provided for selection of 100 points at a collection interval of 1, 2, 3, 5, 10 and 30 seconds.
- Assignment of log printout initiation on event or time including selection of the printing interval for particular log group and time of printing. (For time initiated logs).
- Assignment of number of samples to be collected for each point.
- Select points for which minimum, maximum accumulation over a selected period, average, etc., values can be printed. Also facility shall be provided to tag the time at which the parameter passed through maximum / minimum.

It shall be possible to define 100 log groups of 15 points each. Any log group can have any point from the database. One log shall include at the maximum 10 such groups.

3. Alarm Monitoring & Reporting

- a) The system shall display history of alarms in chronological order on any of the OWS. The MMI system shall have the capability to store a minimum of 1000 alarms each with paging features allowing the operator to view any page. The system shall have all alarm functions and related function keys like alarm acknowledge, reset, paging, summaries etc. Other design features like set point / dead band adjustments, provision of alarm priority, manual inhibition and automatic inhibition based on predefined logic etc., shall be provided. The alarm display / report format shall be subject to approval.
- b) Facility of audio annunciation including voice audio shall be provided in OWS upon the occurrence of alarms irrespective of whether alarms are displayed or not. Facility to disable the audio annunciation per OWS shall be provided under the security level of Maintenance or Administrator.
- c) At least four levels of alarm priority shall be available which shall be displayed in different colour. It shall be possible to display and print alarms of any of the four levels only on a per OWS basis.
- d) Alarm boxes shall be provided in each display to alert the operator about an alarm when he is viewing some other picture. Number of alarm boxes shall be for each process area and with priority therein.
- e) Features viz. root cause analysis, alarm filtering, alarm cut out and display of alarms on LCD shall be provided.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[99]	02.09.2015

4. Calculations

- a) All the algebraic / logical calculations related to analog points e.g. sum / difference / average / maximum / minimum / integration, selection of one analog point out of two based on status of digital point, duration for which an analog point is above / below a threshold, digital point (e.g. AND / OR / COMPARE etc.), transformations , like running average, periodic average, weighted average, hourly / daily maximum / minimum (or for a specified duration) and time of maximum / minimum, flow calculations, time projection or rate of change calculations, duration in alarm (or duration in a band), number of transgression of a point in a band etc. shall be provided. All the calculated values of the plant shall be available in the database and can be assigned to all functions just like any scanned point. It should be possible to add new algorithm for basic calculations to the standard library.
- b) Using one hour average data of process parameters, the system shall have the capability to calculate present value, expected value and deviations for parameters like plant heat rate (net and gross), boiler efficiency, major drives efficiency calculation, auxiliary power consumption. The performance calculation package shall be based on latest codes & standards as applicable like ASME, BS & HEI.
- c) Provision shall be made, including all required custom programmed software, for performing the calculations described in this clause. All calculations shall use a high level language. Calculations shall be made using floating point arithmetic. These equations shall be changeable on line at the job site.
- d) An extensive set of steam property subroutines based on the latest ASME steam tables shall be included. The calculation results shall automatically be quality coded according to the worst quality of any of the inputs to each calculation. The results of these calculations shall be available through the data base, for appropriate logs and operator displays.
- e) Calculation for monitoring the performance of the unit shall be performed. These calculations are categorized into two classes.
 - I. Class I calculations include those calculations that are made every scan cycle, generally for the purpose of detecting and alarming unit malfunctions. The following class I calculations shall be included:
 - Cold reheat steam approach to saturation temperature
 - Drum Water Saturation Temperature rate of change
 - First stage superheat outlet temperature approach to saturation temperature
 - Turbine steam metal temperature differences
 - Turbine metal temperature rates of change
 - Feed water individual heater terminal temperature difference.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[100]	02.09.2015

- Excess air deviation from standard.
 - Feed water leaving each heater temperatures deviation from standard
 - Metal Temperature differences for SH'Y' , RH 'Y' region and any specific location.
 - Turbine steam supply accounting.
- II. Class II calculations include those calculations that are made to determine the performance of individual items of equipment and the overall unit. Class II calculations shall be performed on-line using averaged data which is accumulated over a period of time. This time period shall be selectively adjustable from 10 to 30 minutes. The system shall also collect this averaged data. The operator shall be able to input coal analysis data into the computer for the class II calculations.

Class II turbine performance calculations shall comply with the recommendations of ASME Performance Test Code Report PTC 6S latest as applicable, simplified procedure for Routine Performance Test of Steam Turbines. The vendor shall be responsible for altering his standard performance programme to comply with this specification and to conform to the cycle of these units.

Boiler efficiency shall be computed by the heat loss method and the input-output method. Percentage deviation between the two methods shall be calculated as recommended in the ASME Test Code PTC 4.1-latest, Steam Generating Units. If the test codes require measured data that is not actually available in the process, manually substituted values shall be used.

The following Class II calculations shall be performed.

- Unit heat rate
- Boiler Efficiency
- Operating Hours
- Air Heater Performance
- Economizer Performance
- Deaerator Performance
- HP & LP turbine enthalpy drop efficiency
- LP turbine enthalpy drop efficiency (using dry exhaust)
- Turbine heat rate
- Feed water heater performance
- Condenser performance
- Plant Load/Availability Factors
- Unit Availability Calculations

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[101]	02.09.2015

- Deviations from Expected Values for Each Calculations

5. Quality Tags

- The system shall identify and tag the quality of all data (scanned and calculated points) in a way that makes all users (control, calculations, logs, display, etc.) aware of its quality. Quality of data other than 'good' shall be clearly identified in all printouts and displays by appending quality character to the value / status of point. The quality tagging shall include good, bad, substitute, doubtful, missing, etc.
- Typically 'Good' shall designate variable that satisfies all tests for quality, 'Substitute' designating a value that has been manually substituted, 'missing' and 'bad' designating an open circuit, transducer limit violation on both upper & lower side, etc. for analog inputs & open fuses, excessive number of chattering etc for digital inputs

6. Database

- The database shall be organized in such a way that searching / querying & sorting of any field shall be possible. There shall be minimum 10 process areas and each database point shall have various attributes.
- Based on these attributes & its combinations, the sorting / searching of the data shall be done.
- The attributes shall include as a minimum single point ID, additional tag number, description, current value, quality tag, engineering unit (if applicable), alarm limits, dead band, alarm cut out point identifier, variable limit point identifier, conversion constants, electrical signal value & unit, alarm status, scan status, historical / long term storage frequency, plant area / sub area hardware details, reference of logic / loop diagram number & page etc.
- All the points i.e. I/O's, OLCS/CLCS, generated signals, computed signals of calculations, OPC tags, shall be identified by unique tag throughout the networked DCS system/ sub-systems including station LAN.

7. Messaging System

It shall be possible to send pre-defined messages either periodically or on occurrence of certain events in the form of:

- Operator guidance message to OWS / LCD.
- E-mail messages to various clients on the station LAN.
- Messages to pre selected Mobile numbers

Adequate safety in the system shall be built up to avoid any unauthorized access to DCS system. All necessary Hardware & Software shall be provided to achieve the same.

6.3.4.3 MMI System Hardware Requirements

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[102]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

1. The MMI system shall be based on latest state of the art Workstations and Servers and technology suitable for industrial application & power plant environment.
2. The Workstation / Servers employed for HMIPIS implementation shall be based on industry standard hardware and software, which shall ensure easy connectivity with other systems and third party software.
3. Power Fail auto Restart facility with automatic time update shall be provided.
4. Necessary hardware and software for quick backup and restore shall be provided.
5. Minimum amount of conventional mosaic compatible hardware devices mounted on draw out portion of Control Desks.
6. All the peripherals shall conform to the following minimum requirement but the exact make & model shall be subject to approval.

A) Operator Workstation

Table 6.9
Specifications for Operator Workstations

S.No.	Features	Minimum Requirements
1	Processor	Intel i5 or better /64 bit latest generation
2	Memory	4 GB RAM expandable to 6 GB
3	Hard Disk	1 TB
4	Monitor Support	Dual
5	CD Drive	52X Read/Write
6	Power Supply	230 V 50 HZ
7	Keyboard	ASCII
8	Pointing Device	Optical Mouse
9	Monitor	Min 21" TFT Flat Monitor with resolution of 1600 x 1200 non-interlaced refresh rate min. 85 Hz

B) Servers

Table 6.10
Specifications for Servers

S.No.	Features	Minimum Requirements
1	Processor	64 bit latest generation

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[103]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Features	Minimum Requirements
2	Memory	4 GB RAM expandable to 6 GB
3	Hard Disk	3 X1 TB ultra wide SCSI/7200 RPM, Hot swappable
4	RAID	SCSI-channels, hardware RAID level 5 implemented
5	Monitor Support	Dual
6	CD Drive	52X Read/Write
7	Power Supply	Redundant Hot swappable, 230 V 50Hz 1-phase
8	Removable Bulk storage Drive	1 TB minimum
9	No. of Removable bulk storage media for above	10 nos.
10	Keyboard	ASCII
11	Pointing Device	Optical Mouse
12	Monitor	Min 21" TFT Flat Monitor with resolution of 1600 x 1200 non-interlaced refresh rate min. 85 Hz

C) LCD Screen

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[104]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

LCD display complete with control units & associated accessories shall be supplied as per the following specifications.

Table 6.11
Specifications for LCD

S.No.	Features	Minimum Requirements
1	Viewable Picture Area	65 inch measured diagonally
2	Resolution	1920 X 1080
3	Aspect Ratio	16:9
4	Display Colors	16.9 million colors
5	LCD Panel	Active matrix TFT LCD
6	Contrast Ratio	800:1
7	Brightness	500 cd/m2, Anti-glare
8	Viewing Angle	178° Horizontal & Vertical both
9	Computer Interface	VGA, DVI-D, HDMI,
10	Cabinet Material	ABS
11	Finish	Black
12	Mounting	Fixed Wall Mounting
13	Power supply	230 V, 50 Hz, 1-phase
14	Accessories	Universal Tilt wall mount stand, IR Remote, Power cord

Other Features of LCD

1. LCD shall be designed for continuous viewing (24 hours in a day) under normal room ambient lighting without any need to darken the room. Suitable darkening of the projection screen for light absorption shall be provided for this purpose.
2. The screen should be flicker free and there shall not be any screen burn-in due to display of same information for a long time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[105]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

3. Auto brightness adjustment between each screen shall be provided.
4. The control unit shall interface with the unit LAN. The control units shall have dual Ethernet connection with the respective Unit LANs and shall be located in the LCD panel.
5. Suitable facility shall be provided to the Operator for transferring the screens, without any need of changing of hardware / wiring or software.
6. Master control unit shall be capable of projecting MMI displays over a part of screen to multiple screens. Any communication of windows shall be possible. Facility for overlays shall be provided.
7. The LCD Screens shall have additional features to work in association with multiple numbers of plant cameras also to be supplied under this package.

D) Printers

Table 6.12
Specifications for Dot Matrix Printer

S.No.	Features	Minimum Requirements
1	Type	Heavy duty (at least 50000 pages/month)
2	No. of Needles	24 pin
3	Printing Speed	300 characters per second/ 1000 Lines per minute
4	Character dimension	9 x 8
5	Buffer	80 KB (minimum)
6	Local Memory	RAM with battery backup
7	Communication Port	Ethernet/RS-232/parallel
8	Power supply	230 V, 50 Hz, 1-phase
9	Paper size	132 column continuous fan fold type/A4/A3
10	Paper input capacity	continuous
11	Character sets	ASCII, IBM, Italics,
12	Transfer distance	200 mtrs. Minimum
13	Print features	Graphic print, Emphasized, double width, underlined, subscript, superscript, double

Document Number	Rev No.	Description	Page No.	Date of Issue

S.N	Features	Minimum Requirements
9	Print media	Plain paper, Transparency, Thick stock, Glossy stock, Envelopes
10	Communication Port	Ethernet port/ Parallel port
11	Paper input capacity	500 pages
12	Others	Auto duplex function

6.3.5 Maintenance Engineer Station (Engineering Work Station)

- The system shall be provided with programming facility (Engineering Workstation) for Control system and system documentation. Three (3) Nos. of EWS shall be provided on per unit basis placed in Engineering Room. The system shall be complete with monitor, keyboard & Optical mouse.
- The system shall be also provide minimum Two (2) Nos. of Laptop computers with latest hardware configuration and loaded with suitable operating & application program as a backup portable programming and configuration station.
- Each station shall be equipped with DVD writer for archiving of the configuration.
- EWS shall have all the features of OWS and in addition shall have the following capabilities as a minimum:
 - To generate control software through logic diagrams without any programming knowledge
 - To generate graphic display and control displays, facility to change/enter all the attributes of analog and digital I/O points, calculated and Boolean variables and constants like scan rate, process range
 - To test, configure/reconfigure process interface modules/cards
 - CLCS tuning
 - To accumulate I&C faults to analyse downtimes and time to repair
 - To run offline system diagnostic programmes
 - On- line fault detection through diagnostics
 - Other maintenance Engineer's functions.
- Online modification/addition of loops without hampering of smooth operation of plant. In case of errors in programming at engineering station, same shall be notified along with suggested corrections by the system itself, before loading.
- The programming tools shall have in-built safety features that shall protect the system against inadvertent and unauthorized use of these tools. Necessary hard key locks and software locks, etc. shall be provided for this. During on line programming, external plant / equipment should not be affected.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[108]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

7. The system shall also have facility to permit the programmer to add text information at the beginning and end of each program, wherein programmer shall list out his name, time, date of change which has been made, name of the person who has authorized the change, etc.
8. Any modification done in Control System shall be suitably logged so that it can be traced to the user log-in ID and time of change. Facility for modifications shall be user friendly
9. Structuring / configuring and tuning facilities shall be provided for structuring / modification, storing / loading, testing, tuning, monitoring, etc. of all the microprocessor based controllers of the control system. The configuration and tuning unit shall be hooked up with the system bus. In case different hardware is employed for different parts of control systems and it is not possible to provide structuring/ configuration and tuning of these from the same station, then the system shall be provided with necessary number of stations for the purpose.
10. It shall be possible to configure the system with ease without any special knowledge of programming or high level languages. Control strategy shall be implemented using familiar and conventional automation function blocks (software implemented). Whenever any change in configuration is done, it shall be recorded and modified configurations shall be available for printing and documentation and shall be stored in non-volatile memory. The entire system configuration, tuning / fixed parameters shall be documented and printed in form of function diagrams and lists respectively.
11. On-line tuning of the control loops shall be possible without causing any disturbance in the execution of the control loops. Provision to store and retrieve on immediate and long term basis the system configuration, data base etc. on some device such as DVD shall be included. Facility shall be provided to reload / down-load the system or controller module from the already stored data, on-line.
12. The Engineering station shall be equipped with system/software to calculate the tuning constants i.e. P, I & D values of control loops automatically. Facility shall be provided to conduct open loop tests (i.e. controller in manual mode) and close loop tests (i.e. controller in auto mode) on control loops through GUI based user interface. It shall be possible for the user to adjust the step size of disturbance, sample time and duration of test. Facility shall be provided to choose the type of process to be tuned i.e. PI, PID etc., controller type i.e. regulating or tracking and the type of process being controlled i.e. Integrating, non-integrating etc. Further it shall also be possible to calculate the tuning constants by capturing the process changes during normal process disturbance (without conducting any test). The calculation of tuning constants shall follow internationally accepted tuning procedures.
13. Online system shall be provided for programmed development / modification to achieve various functions including development, modification and testing of software of MMI, generation and modification of graphics, logs, and HSRS

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[109]	02.09.2015

--	--------------------------

functions in an interactive manner, MMI Database modification / creations, down loading the software with associated data base from the console and other features necessary for system maintenance. Also facility shall be provided to print system fault as detected by the online self-diagnostic routine.

14. The system shall have the facility to generate the associated documentation for both the Control System & MMI. The document, to be generated by the system shall include P&ID drawings, control loop drawings, sequence drawings, signal distribution list / drawings, system interconnection drawings, cabinets general arrangement drawings, measurement list, drive schedule, alarm schedule, system hardware and functional configuration drawings for displays, logs, trends, graphics etc. The system shall also include all required software and hardware tools for creating, modifying and printing CAD drawings to achieve paperless documentation for DCS.

Table 6.14
Specifications for Engineering Workstations

S.No.	Features	Minimum Requirements
1	Processor	64 bit latest generation
2	Memory	4 GB RAM expandable to 6 GB
3	Hard Disk	1 TB
4	CD Drive	52X DVD Read/Write
5	Power Supply	230 V 50 HZ 1-phase
6	Keyboard	ASCII
7	Pointing Device	Optical Mouse

---	-------------------

Table 6.15
Specifications for Engineering Laptop

S.No.	Features	Minimum Requirements
1	Processor	Intel i5 or better latest generation
2	Memory	4 GB DDR3 SDRAM expandable to 6 GB
3	Hard Disk	SATA2/ 1 TB/7200 RPM
4	CD Drive	52X combo CD/DVD Read/Write
5	Power Supply	230 V, 50 HZ, 1-Phase
6	Communication Ports	2 Nos. USB 1 No. Ethernet 2 Nos. Serial Port 1 Nos. Parallel port
7	Screen	15.4" TFT LCD screen
8	Battery	6-cell, LI-Ion Battery

6.3.6 Software Requirements

1. The system shall be provided with all licensed software packages with media required by the system for meeting the intent, functional / parametric requirements and performance requirements of the specification.
2. The system shall utilize a readily upgradeable, public domain software platform proven for real-time operation environment at the control and monitoring level overlaid with a relational database program. The desirable features are indicated below:
 - a) The software system shall be fully modular.
 - b) The software shall meet the following general requirements:
 - Simple, easy-to-learn editing language for editing and on-line operation.
 - Wide range of standard and non-standard peripheral support capability by modular controllers / supervisors.
 - Effective task scheduling and support of multiple priority structure including event based interrupt etc.
 - Effective debugging.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[111]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- Provision for on-line editing and program development without interrupting on-line functions.
 - Self-diagnostic routines.
 - Efficient memory management and effective utilization of system time.
 - Quick start-up and loading.
 - Support of multiprogramming and multi-user operation.
3. Industry standard operating system like UNIX/WINDOWS NT etc. to ensure openness and connectivity with other system in industry standard protocols (TCP / IP etc.) shall be provided. The system shall have user oriented programming language & graphic user interface.
 4. All system related software including Real Time Operating System, File management software, screen editor, database management software, On line diagnostics / debug software, peripheral drivers software shall be provided. Latest versions of standard PC-based software for database handling, word-processing, spread sheet, Anti-virus etc. and latest WINDOWS based packages etc. and any other standard language offered shall be furnished as a minimum. Systems having program development environments like EWS, Station LAN Server shall have high level programming support like Microsoft Visual Studio, Oracle, RDBMS etc.
 5. The programming language shall support Relational Data Base Management in a global and truly distributed Client-Server environment and shall have the following minimum features:
 - a) Modern high-level block structures type
 - b) Powerful, compact syntax
 - c) Logical organization that facilitates documentation, modification and maintenance of programs
 - d) Early detection of errors at compiles and run time
 - e) Fast debugging
 - f) Improved program reliability
 - g) Clearly defined data structure complemented by flexible user-declared data types
 - h) Fast execution.
 6. All application software for control system functioning like input scanning, acquisition, conditioning, processing & control along with communication among various Control System functional blocks shall be provided.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[112]	02.09.2015

7. The system shall be provided with software locks and passwords to engineers at site for all operating & application software in order to prevent unauthorized access and only authorized engineers are able to do modifications at site.
8. Two sets of all final / latest software on non-rewritable/non-editable media shall be provided as back-up.

9. Software License

- a) The system shall be provided with software license for all software being used in the DCS system. The software licenses shall be provided for the project (e.g. organization or site license) and shall not be hardware / machine-specific. That is, if any hardware / machine is upgraded or changed, the same license shall hold good / renew license due to up-gradation / change of hardware / machine in control system at site. All licenses shall be valid for the continuous service life of the plant.
- b) In case the s/w license is dependent on no. of points, then quantity to be considered is 30% above the finally implemented points.

10. Software Upgrades

The system software's installed in the plant DCS, shall be periodically upgrades with the new releases, that would be taking place after the system is commissioned.

6.4 DCS Sub-Systems

The DCS shall consist of the following broad sub-systems, functionally independent of each other except for mutual signal exchange.

- Sequence of Event Recording System (SOE)
- Integrated Annunciation system
- Historical storage & Retrieval system (HSRS)
- Plant Performance Analysis, Diagnostic & Optimization system (PADO)
- Management Information System (MIS)

6.4.1 Sequence Of Event Recording System

1. The DCS system shall also perform the SOE functions like stamping of SOE inputs / points with 1 ms resolution. The SOE function shall be built-in function of DCS.
2. SOE shall be capable of accepting minimum 512 inputs per unit including 10% spare channels (included in total 512 inputs).
3. The system shall monitor SOE inputs with a resolution of one millisecond at all times for all inputs including spare inputs. That is, all SOE points entering status change shall be reported and time tagged within 1 (one) millisecond of their occurrence. Input card shall be equipped with digital filters with filter delay such

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[113]	02.09.2015

that it should meet SOE time resolution of 1msec (identical for all points) to eliminate contact bounce such that field contact which is changing state must remain in the new state for stipulated time to be reported as one event. The start of data collection for SOE report shall be reported to OWS within 1 sec of SOE data collection initiation.

4. SER is envisaged as an integral part of DCS with 1 millisecond time resolution. The SER data base shall be an integral part of the DCS database and same shall be made available at all the OWS / EWS resident on the network. Operator can access the SER on activation of SER alarm page. All SER inputs shall have real time "time-stamping" following any tripping of major equipment, or sub-system or the plant as a whole.
5. The system shall also have provision of rejection of chattering inputs.
6. In addition to above, facility for adding a field adjustable software delay on a per point basis shall be provided.
7. The system shall also include provision for historical storage and retrieval of SOE reports for 3 months period.
8. The SOE report collection shall begin on occurrence of change of status of any SOE point and shall be printed after an operator selectable time interval of 1 to 3 min. or 100 status changes have taken place after the first event. Adequate numbers of buffers shall be provided to prevent loss of data before transferring to HSR.
9. The SOE reports shall also include a list of major equipment trip in chronological order and include the points that initiated SOE collection. The inputs for SOE shall include
 - a) Hardwired inputs in input cards and
 - b) Calculated points / generated points of Control System.
10. Further, all the operator initiated actions such as trip inactivation (bypass) & trip activation (inline) shall form input to SER.
11. All the SOE inputs shall also be available for interlock / protection functions.
12. SOE of other systems (SG/TG integral control systems) shall also be integrated in this system. The SOE system shall collect process & report SOE inputs of SG & TG control system for a consolidated master SOE system. Necessary communication with required hardware & software and necessary engineering co-ordination with SG & TG Supplier shall be done for successful implementation of a consolidated master SOE list.
13. SOE time stamping shall occur at I/O level.
14. Self Diagnostic Features like scanner test (a periodic test for communication between several levels), functional test by simulating abnormal Conditions shall be provided.

S.No.	Features	Minimum Requirements
		Table top receiving station Interface cable Paper tear box Ribbon

6.4.2 Annunciation System

- The LCD annunciation shall emulate salient features of conventional hardware annunciations while presenting more flexibility.
- The annunciation system shall be implemented as an in built function of DCS. The field contacts shall be acquired through DCS only. The annunciation points shall be presented on topmost area of LCD screens. The annunciation area shall be divided into multiple "alarm bands". There shall be 3 nos. of alarm bands in each LCD screens.
- The annunciation functionality shall be implemented through the LCD as described below as a minimum:
 - There shall be one alarm for each alarm window. Group alarms shall be provided only for pre-defined system/field faults. The alarm text is to be displayed only when alarm is present. A top up window shall be associated with each alarm window which shall show tag no. of alarm point when cursor is brought over the alarm window.
 - Hooters/speakers (not PC Speakers) of different frequencies shall be available for reporting new alarms & resetting of alarms etc. All flashing windows shall flash together (synchronized) in any LCD screen. Suitable means shall be provided to distinguish between new alarms & return to normal message.
 - Annunciation points shall be distributed on various LCD screens based on process area.
 - No fixed space shall be fixed for any alarm band. Once a particular alarm band is full the new alarm on this band shall be reported by shifting old alarm on left side band one by one on FIFO basis. A scroll bar shall be provided to view older alarms.
 - The hooter alarms sound shall be different for both units.
 - Facility shall be provided by which the operator can view details of the alarms, acknowledge the alarm, acknowledge the hooter etc. by clicking on the pop up window options.
- The above annunciation features shall also be replicated on all OWS.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[117]	02.09.2015

6.4.3 Historical Storage & Retrieval System(HSRS)

1. Historical storage and retrieval facility shall allow collect and store data and parameters including trends, alarms and events from DCS data base periodically and automatically to removable data storage devices once every 24 hour for long term storage and retrieval.
2. HSRS of other systems (TG integral control systems) shall also be integrated in this system. The HSR system shall collect, process & report HSR inputs of TG control system for a Consolidated master HSR system. Necessary communication with required hardware & software and necessary engineering co-ordination with TG Supplier shall be done for successful implementation of a consolidated master HSRS.
3. Provision shall be made to notify the operator when the disk is certain percentage full.
4. The data to be stored in the system shall include alarm & event list, periodic plant data, selected logs/trends/reports etc.
5. Historical storage should permit trending of all analog inputs with time scale selectable as 1 sec., 10 sec., 30 sec., 1 min., 5 min., 30 min., 1 hour, 8 hours & 24 hours. Vertical Range (parameter range) shall be freely programmable. It shall be possible to map real time & history trend on the same trend group display. History data shall be for minimum 30 days & after expiry shall automatically/manually transferred to the external storage device such as DVD writer or external hard disk.
6. The system shall provide user-friendly operator functions to retrieve the data from historical storage. It shall be possible to retrieve the selected data on OWS / LCD or printer in form of trend / report by specifying date, time & period through point IDs / group of points. Further, suitable index files / directories shall also be provided to facilitate the same.
7. The System shall store following data as a minimum:

a) Periodic Plant Data

- 1000 analog points with 1 sec rate
- 1000 analog points with 5 sec rate
- Balance analog points with 30 sec rate
- Binary points on status change (with suitable protection against excessive status change)

b) Logs & Reports

- All hourly, shift, daily, monthly, yearly logs
- All alarm logs
- All control related logs

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[118]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- All event based logs
- Pre-Trip & Post-trip logs
- Start up logs
- SOE Reports
- Maintenance data log

Apart from this other logs comprised of computed data such as running hour logs of drives, fuel consumption log, water consumption log, Auxiliary power consumption log, metal temperature logs or calculated values like efficiency etc.

8. Dedicated Redundant workstation with dot matrix & Laser jet printer shall be provided (per unit) for historical storage & retrieval system.
9. Provision for export of data to Excel spreadsheet package shall be available.

Table 6.18

6.4.4 Plant Performance Analysis, Diagnostic & Optimization System

6.4.4.1 General

1. PADO system shall provide critical analysis of the plant performance and guidance for optimisation on continuous on-line basis. The system shall analyse dynamically the status of the process and the equipment of the power generating units and shall automatically generate the operator guidance instructions for remedial actions for maintaining the process and the system / equipment in the plant to their optimum performance.
2. PADO shall incorporate the complete thermal design model of the plant and shall use the measured data from the plant DCS acquired through a suitable interface.
3. The system to be provided shall include all necessary hardware, software, firmware and interfaces required for implementing a fully functional PADO system. PADO shall include but not limited to the details specified in subsequent paragraphs.
4. PADO system shall be independent.

6.4.4.2 Functional Requirements

PADO system shall provide following functional requirements:

- Performance analysis and monitoring of systems and components
- System and performance diagnosis
- System and performance Optimisation
- Emission analysis and monitoring
- Boiler performance optimisation
- Boiler Stress Condition Analysis
- Regenerative cycle performance Optimisation
- Interactive water and steam chemistry management system

1. Performance Analysis & Monitoring of Systems & Components

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[120]	02.09.2015

Performance analysis and monitoring of systems and components shall involve and facilitate the following:

- a) Computation of thermal performance status of the plant and efficiency of generation.
- b) Computation of all the key system performance indicators at system level such as heat rate, plant and equipment efficiency, generator output and controllable losses.
- c) Computation of all the key system performance indicators at major component. This shall include the following:
 - Assessment of boiler operation based on efficiency, excess air and cleanliness factors of super heater, re heater and economiser.
 - Turbine performance evaluation considering efficiency, enthalpies, steam flow and gland leakage flow estimation.
 - Air Pre-heater performance involving efficiency and pressure losses.
 - Condenser performance based on heat duty and heat transfer co-efficient and cleanliness factors.
 - Performance of re-generative heaters by computing extraction flows, drain flows, terminal temperature difference and drain cooling approach.
- d) Analyse the impact of individual component performance on overall losses or gains in total unit generation along with computation and display of cost of individual loss/gain.
- e) Performing detailed analysis of each component including computation of key performance indicators such as efficiency, heat transfer co-efficient, TTD, DCA and fouling factor.
- f) Visualisation of individual component efficiencies & performances and display of the same.
- g) Visualisation of impact of incremental change of the major process parameters including but not limited to the following on boiler efficiency, turbine heat rate and unit heat rate etc. through 'What If' query facility for operator:
 - Main Steam pressure
 - Super heater Spray flow
 - Re heater Spray flow
 - Economiser Inlet Temperature
 - Excess Air
 - Coal Analysis
 - Surface effective for super heater, re heater and economiser

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[121]	02.09.2015

- h) Performance computations to be carried out at specified intervals based on time averaged data during steady state operating conditions.
- i) Computations to be based on process signals, equipment status, design criteria and manual input data (where ever needed). Raw measured value for process signals shall be reconciled before usage.

2. Systems & Performance Diagnosis

- a) System and performance diagnosis shall involve detection of the abnormalities and diagnosis of system and component performance degradation up to component level to pin-pointing root cause of abnormalities existing in the process and guiding the operating personnel to attend to the same.
- b) Diagnosis function involves the following:
 - Equipment health diagnosis for high/ low pressure, temperature, level & vibration etc.
 - Plant performance diagnosis for boiler, turbine, condenser, feed water and regenerative heating system
 - Identifying degradation of measuring instrument for important parameters using data validation checks.
- c) Diagnosis based on expert system in the form of "Fault Trees" / Neural and Bayesian belief networks etc. Expert systems shall draw inferences based on knowledge base, on-line measured data and computed performance indices.
- d) Diagnosis system shall be capable to provide following helps:
 - Avoiding a possible trip
 - Maintaining process parameters within safe limits thereby enhancing the life of the equipment
 - Drawing the operator's attention to the degradation of the equipment and instruments

3. Systems & Performance Optimization

System and performance optimisation involves optimisation of set points for controllable parameters by recommending to the operator the optimum set points for optimising the given process or activity at the measured operating condition using state of the art optimisation techniques.

4. Emission Analysis & Optimization

Emission analysis and monitoring functions involves the following:

- a) Monitoring, tracking and analysing plant emissions such as SO₂, NO_x, CO, CO₂ etc. in real time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[122]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- b) Monitor and analyse ESP & Stack conditions such as temperature, humidity, gas flow rate and opacity.
- c) Facilitate obtaining lowest emissions by recommending optimal damper position to minimise the NOX level measured at the stack while maintaining the CO value and unburnt carbon below desired permissible limits.
- d) Facilitate obtaining lowest emissions while maintaining combustion efficiency.
- e) Facilitate to set alarms to highlight conditions that violate pre-defined conditions

5. **Boiler Performance Optimization System (BPOS)**

BPOS shall enable operating personnel to improve boiler performance and optimise fuel consumption including optimised operation of Soot Blowing system. This system shall have following features:

- a) Incorporates the complete thermal design model of the boiler capable of both forward and backward computation of complete boiler thermal performance.
- b) Boiler thermal design model calibrated to made "Site- specific" based on series of field trials of thermal performance of the boiler during start up and prior to trial operation.
- c) BPOS to function continuously taking into consideration the performance of furnace, super heater, economiser, air heater and pulveriser based on the continuous on-line measurement of the including but not limited to the following parameters:
 - Flue gas temperature at ECO I/L
 - Flue gas oxygen content
 - Other fluid temperature(s) entering and exiting various heat transfer surfaces
 - Coal Characteristics
- d) BPOS shall be capable for continuous on-line calculation of the thermal performance of the boiler for the operating conditions indicating performance prediction zonal absorption, metal temperature and shall have the following features:
 - Fuel switching capability
 - "What If" query capability
 - Selective soot blowing of furnace/Super heater based on trends of zonal absorption.
- e) Expert system diagnostics for quick identification of the Root Cause of deviations from the predicted parameters.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[123]	02.09.2015

6. Boiler Stress Condition Analysis (BSCA)

- a) BSCA monitors the thermal stresses and assess life exhaustion in thick walled components like super heater and re heater outlet headers by estimating the expended life due to low cycle fatigue and creep.
- b) BSCA shall guide the operator during start- up and shut down regarding controlling of rate of heating or cooling of metal within specified limits and also guides the margins available for the rate of steam generation (for fuel firing) during start-up.

7. Regenerative Cycle Performance Optimization System (RCPOS)

Regenerative cycle performance optimisation system shall involve the following:

- a) Analysis of deviation of performance of the turbine cycle by examining the deviation of important parameters of the turbine cycle.
- b) Analysis of actual efficiency of individual stages of turbine.
- c) Evaluation of LPH & HPH performance by comparing current values of TTD/ DCA to the reference values.
- d) Heater level evaluation

8. Interactive Steam & Water Chemistry Management System

- a) Interactive water and steam chemistry management system shall be capable of guiding the operator for appropriate chemical dosing to maintain the chemical balance, optimal blow down and carry out further investigation as advised by the system.
- b) The system shall have following features:
 - Monitoring of various steam and water parameters at certain pre-determined points in the flow cycle and warning the operator about any distinct aberration and guiding on precautionary as well as corrective actions to be taken.
 - The system shall use "Decision Trees" and "Fault Trees" or other suitable methods for each parameter to diagnose deviations in controlled parameters in order to find the root cause and advise corrective actions.
- c) The system shall provide following benefit to the user/operator:
 - Minimisation of makeup water consumption
 - Decrease in consumption of dosing chemicals
 - Prevention of carryover of impurities into the turbine
 - Decline in degradation of turbine components
 - Lessening of boiler tube scale formation
 - Reduction in energy consumption

6.4.4.3 Design Requirements

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[124]	02.09.2015

1. PADO system shall be based on Client- Server and expert system. The system shall operate on a commonly used hardware platform and network operating system.
2. System shall be suitable for simultaneous use by multiple users.
3. The system shall be suitable for a wide range of tagging systems and in particular KKS tagging system.
4. The system shall be password protected. It shall be possible to organise system users into groups and each group shall have a separate security profile. It shall be possible to provide additional personal security settings for individuals within a group.
5. The system shall be able to obtain requisite plant system / equipment and process data from the plant DCS. To meet the above requirement, PADO system shall be interfaced with Plant DCS through redundant bi-directional communication link.
6. The system shall have facility to store bulk data with facility for retrieval of the same. The system shall have facility to share all the data in the hard disk/back up media and provide user friendly utilities to retrieve and analyze stored data.
7. Each PADO system shall include all hardware and software as required for proper functioning of the system including:
 - a) One (1) No. Redundant Server (with monitor, keyboard, Mouse etc.) per unit
 - b) One (1) No. User Workstation (with monitor, keyboard, mouse, Colour Printer etc.) per unit.
 - c) PADO Software with required user License's
 - d) Bulk Data Storage & Retrieval facility
 - e) Redundant OPC communication Link with all necessary hardware & software.
8. All software licenses shall be valid for entire life of the plant. It shall be possible to upgrade the installed system with latest available version of the software model without any additional hardware/software requirements during entire life of the plant.

Table 6.21
Specifications for PADO Server

S.No.	Features	Minimum Requirements
1	Processor	Intel i5 or better /64 bit latest generation

6.4.5 Management Information System

1. An integrated Management Information System (MIS) shall be provided for the plant. System shall be able to provide information related to the following aspects to management personnel:
 - a) Plant Operation Information (Dynamic Mimics)
 - b) Plant Maintenance related Information

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[126]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- c) Environmental Information
- 2. MIS shall provide following plant information:
 - a) Environmental and hazard management
 - b) Equipment maintenance history
 - c) Fault cause analysis
 - d) On job information report
 - e) Plant Operation history
 - f) Plant performance details
 - g) Any other plant operation data/ details
- 3. MIS shall be based on client server & relational data base environment. The system shall operate on commonly used hardware platform & network operating system.
- 4. System shall be suitable for simultaneously used by multiple users. It should have at least 20 user licenses.
- 5. The system shall be password protected. It shall be possible to organize system users into groups and each group shall have a separate security profile. It shall be possible to provide additional personal security settings for individuals within a group.
- 6. MIS processing shall be carried out in an independent server interfaced with plant DCS, All BOP & offsite plant PLC control systems, Plant Performance Analysis, diagnostics & optimization system (PADO), Computerized Maintenance management system (CMMS) for polling of plant operational and performance data, and maintenance details. Plant environmental data shall be obtained from DCS. The MIS system server shall be connected with station LAN and all user PCs shall be connected with the station LAN.
- 7. The system shall have facility to store bulk data with facility for retrieval of the same. The system shall have facility to share all the data in the hard disk/back up media and provide user friendly utilities to retrieve and analyze stored data.
- 8. MIS shall include all hardware and software as required for proper functioning of the system including
 - a) One (1) No. Redundant Server (with monitor, keyboard, Mouse, colour printer etc.) per unit
 - b) Twenty (20) Nos. (to be finalized by purchaser during detail engineering) User Workstation (with monitor, keyboard, mouse, etc.)

Document Number	Rev No.	Description	Page No.	Date of Issue

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- c) 42" LCD Monitor for display in different areas of plant such as Conference Room, station Entrance etc. These display boards shall include the following minimum parameters along with engineering units:
- Unit MW
 - Unit frequency
 - Unit auxiliary power consumption
 - Station-Total MW (common)
 - Station-Total auxiliary power consumption (common).
- d) MIS Software with minimum 50 nos. user License's
- e) Bulk Data Storage & Retrieval facility
- f) Redundant OPC communication Link with all necessary hardware & software.
- g) Servers & user PC's operating licenses
9. All software licenses shall be valid for entire life of the plant. It shall be possible to upgrade the installed system with latest available version of the software model without any additional hardware/software requirements during entire life of the plant.

S.No.	Features	Minimum Requirements
2	Resolution	1920 X 1080
3	Aspect Ratio	16:9
4	Display Colors	16.9 million colors
5	LCD Panel	Active matrix TFT LCD
6	Contrast Ratio	800:1
7	Brightness	500 cd/m2, Anti-glare
8	Viewing Angle	178° Horizontal & Vertical both
9	Computer Interface	VGA, DVI-D, HDMI,
10	Cabinet Material	ABS
11	Finish	Black
12	Mounting	Fixed Wall Mounting
13	Power supply	230 V, 50 Hz, 1-phase
14	Accessories	Universal Tilt wall mount stand, IR Remote, Power cord

6.5 DCS Power Supply Requirements

1. Redundant UPS power feeder shall be provided for all 230VAC equipments and/or redundant feeders for 24 V DC for DCS requirements. The necessary cabling & termination at both ends for receiving the power supply shall be furnished as per the contact requirement.
2. The DCS shall work on 24 V DC Power supply & Computers and peripherals shall work on single phase AC supply from UPS.
3. All power supply in the System cabinets shall be redundant and shall have auto change over facility or diode auctioneering. Power supply monitoring shall be provided in the DCS.
4. The power supply shall be provided with suitable arrangements with redundant distribution boards for each system with proper auto change over scheme to change the load from one feeder to other, in case of one feeder failure.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[129]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

5. Redundant DC feeders (One each from DCDB) shall supply each of the connected loads. However, 25% spare feeders (minimum 1 no.) of each rating shall be provided in each DCDB.
6. Redundant AC UPS feeders (One each from UPS ACDB) shall supply each of the connected loads. However, 25% spare feeders (minimum 1 no.) of each rating shall be provided in each UPS ACDB.

6.6 DCS System Cabinets/Panels

1. All Control system modules, power supply components, other control devices which are required for completeness of the system shall be housed in cabinets. All equipment and dedicated cabinets required for termination, marshalling and proper interface within system and also with other systems shall also be provided.
2. The cabinet mounted equipments shall be fully assembled, installed in mounting racks, wired and fully tested as per specification requirements and approved drawings in the manufacturing works of a qualified manufacturer prior to shipment to the project site. It shall be ensure that the cabinets are complete and ready for installation before dispatch from manufacturing works. The installation work at project site for these cabinets should only involve connections through multi pair cables from marshalling cabinets (wherever provided) to system cabinets and inter-cabinet.
3. The Control system cabinets shall be grouped into physically separate cabinets as follows:
 - a) Control System Cabinets
 - b) Marshalling Cabinets
 - c) Relay Cabinets

However, in case the system design requires the termination cabinet independent from system cabinet, the marshalling cabinets can be combined with the termination cabinet. In case, the termination arrangement is part of the system cabinet, independent marshalling cabinets shall be provided.

4. A special note shall be indicated that in case termination of field cables directly to control system cabinet is not acceptable.
5. The Control system cabinets shall house all types of modules / hardware to achieve all functions of Control System including signal conditioning modules, controller modules, I/O modules, communication controller modules and all other requisite hardware for a complete system.

6.7 DCS System Response Requirements

DCS System response requirement (Under worst loading conditions) shall be as follows:

Table 6.29
DCS System Response Requirements

S.No.	Parameter/Function	Requirement
1	Scanning rate of Analog Signals	Maximum 1 sec for measurement
2	Scanning rate of digital signals	Maximum. 100 ms
3	Scanning rate of pulse signals	Maximum 100 ms
4	Loop execution time for CLCS	Maximum 250 ms (For all Loops)
5	Loop execution time for OLCS	Maximum 100 ms (For all Loops)
6	Controller output update for CLCS	Every 250 ms (For all CLCS Loops)
7	Controller output update for OLCS	Every 100 ms (For all OLCS Loops)
8	Updating rate of Analog display	Maximum 2 seconds (for measurement)
9	Updating rate of Analog display	Maximum 1 second for OLCS/CLCS
10	Updating rate of Digital value display	Maximum 4 seconds (for measurement)
11	Updating rate of Digital value display	Maximum 1 second for OLCS/CLCS
12	Time for display in CRT screen	Maximum 1-2 seconds on demand
13	Keyboard command execution time	Maximum 1 sec
14	Controller Loading	Maximum 60 %
15	Data Bus Loading	Maximum 50 %

Table 6.30
DCS System Display Response Requirements

S.No.	Parameter/Function	Requirement
1	All control related displays	1-2 seconds
2	Point details display (single point)	1-2 seconds
3	Bar chart display (20 points, current display)	2-3 seconds
4	Plant mimic display of fair complexity with a minimum of 120 nos. of dynamic data items	2-3 seconds
5	Group review display (20 points, current values)	2-3 seconds
6	X-Y Plot display (2 X-Y Plot & single display requiring both history as well current data)	2-3 seconds

Notes:

1. Sufficient time shall be allowed as setting period between conducting the tests.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[132]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

2. Plant operating condition, i.e. main equipment status, availability of auxiliaries, operational and equipment constraints, which can influence the test, shall also be recorded.
3. Control system shall be running in the coordinated master control (CMC) mode i.e. boiler master, fuel flow, air flow, feed water and turbine load control shall be in automatic mode. Load set point, maximum and minimum load set point, rate of raise / lower of load shall be set through the TFT, keyboard/conventional console.
4. The the control system shall be responsive and stable and shall maintain the deviation of controlled variables from set point within the limits specified so that the equipment being controlled shall operate as specified over the range required. The controls shall operate automatically, with no assistance from the operator. The controller shall successfully demonstrate the performance of Closed Loop Control Systems before acceptance and taking over of this system.
5. Applicable for Drum type boiler.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[133]	02.09.2015

7. PROGRAMMABLE LOGIC CONTROL (PLC)**7.1 General Technical & Design Requirements**

Programmable Logic Controller (PLC) shall be microprocessor-based system. The PLC shall be versatile, expandable, user friendly and latest state of art technology. The system shall be envisaged for the purpose of sequential operation, protection and interlock, data acquisition system, alarm functions, closed loop control and data archiving for fully automatic operation. Logic controller shall be used with adequate and reliable protection safeguard for various equipments and to assist the operator for easy safe and efficient starting and stopping of various drives in the process. The system shall be designed by selecting high-grade components of proven quality and proper design of system electronics. The system shall be able to operate satisfactorily with reference to the specified environmental conditions as indicated in the specification.

1. The system shall be modular in construction and expandable in future by adding additional electronic modules, which shall be easily accessible for maintenance and repair. The modules shall preferably be Rack/Rail mounted. The types of modules shall be kept to minimum possible in order to have interchangeability and spares inventory.
2. The system shall have extensive self-diagnostic hardware and software features for easy and fast maintenance of the PLC. Safety barriers shall be used for intrinsically safe input / output circuits.
3. The PLC shall have very high noise immunity in order to ensure safe and reliable operation when subjected to electrical radio frequency interference and electromagnetic disturbances expected in a power plant.
4. The system shall be programmed as per the logic requirements required for the functioning of the systems and equipment.
5. Operation of the PLC shall be completely unaffected by a momentary power loss of the order of 20 milliseconds.
6. On-line replacement of any module shall be possible in such a way that the removal and addition of the module shall be possible without de-energizing the system or causing any interruption in the system while replacing a faulty module except for the inputs /outputs which are being handled by that module. However, in case of triple modular redundant or dual PLC configurations, there shall not be any process upset while replacement.
7. PLC shall be used with 20% hard wired installed spare I/O Channels.
8. The system shall be capable of handling the long-term storage of data for 15 days and retrieval.
9. The system shall be used with programming and diagnostic facility. Each PLC shall be used with one no. Laptop of latest configuration with programming software & communication cable.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[134]	02.09.2015

7.2 PLC System Configuration

PLC shall consist of following sub systems:

7.2.1 Input/output Sub system

1. I/O subsystem shall be suitable for accepting discrete inputs, BCD inputs and analog inputs. The I/O modules shall be mounted in the I/O racks.
2. Each I/O shall be electrically isolated from external control circuit by suitable means. The minimum isolation level between I/O and logic circuit shall be 500 V DC.
3. Each module shall have LED for each digital I/O channel to indicate the status of each input / output. Redundancy in I/O level shall be maintained as per the process requirement.
4. PLC inputs shall be used with potential free dry contacts. All the inputs shall be double ended i.e., two wires per input and not common return for all inputs. The contact interrogation voltage for input contacts shall be 24V DC minimum. Each input channel shall be protected by separate fuse.
5. Output contacts from the PLC shall be potential free dry contacts. Each output shall be short-circuit proof and protected by fuse.
6. Visual indication of fuse blown must be provided for each input and output channel.
7. There shall be at least 20% spare capacity available on input & output modules, over and above the system requirement.
8. All input/output cards shall have quick disconnect terminations allowing for card replacement without disconnection of external wiring and without switching of power supply.
9. PLC shall have the following monitoring features:
 - a) Power supply monitoring.
 - b) Contact Bounce filtering.
 - c) Optical isolation between input and output signals with the internal circuits.
 - d) In case of power supply failure or hardware fault, the critical outputs shall be automatically switched to the fail-safe mode.
 - e) Further, keying-in of individual wire connectors shall be used to ensure that only the correct card is plugged on the I/O module. It shall be possible to remove I/O module without disconnecting wiring from field inputs or outputs.

7.2.2 Processor Sub system

1. The processor sub system shall include CPU, memory, power supply, communication interface etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[135]	02.09.2015

2. Dedicated PLC's shall be envisaged for each Auxiliary system. The processor shall have capability to implement all the control functions required. The processor shall have sufficient memory for storage of the program instructions as applicable to the logic requirements. CPU shall be of 32/64 bit or upgraded version of microprocessor.
3. Memory shall be non-volatile, preferably EEPROM type. However, in case volatile memory is provided, battery backup shall be used for a minimum of three months to keep the stored program intact. A battery drain indication shall be used at least one week before the battery gets drained. Memory shall be used with adequate capacity with 40% spare capacity under worst loading condition.
4. The healthiness of processor hardware and software shall be continuously monitored by watchdog timer.
5. PLC's shall be used as a minimum with dual redundant processor subsystem including CPU, memory and power supply. Redundancy shall be used such that, in case of failure of the main processor, the standby processor shall take over automatically and vice - versa. The changeover shall be bumpless and shall not result any process or system upset.
6. In case of failure of complete processor system i.e., both processors, outputs shall take fail safe state automatically.
7. The scan time of programmable controller shall be of the order of 100 milliseconds or better. Scan time of PLC is defined as the cycle time taken by the system to read input, process input executing logic and update control output for all the logics configured within the system. Other activities like diagnostic routines, output / dump of data to peripherals, or any other activity which consume processor time shall also be accounted while computing scan time.

7.2.3 Communication Sub system

1. The communication subsystem shall provide reliable and high speed data transfer between the processor subsystem, I/O subsystem, PLC console and other devices connected to the system.
2. Redundancy in communication subsystem shall be used, such that on the failure of the active device, communication link or bus, the redundant device communication link or bus shall take-over automatically without interrupting the system operation. The communication bus shall be of coaxial / Fiber optic type.
3. Information about the failed device shall be displayed locally as well as on the PLC console. It shall be possible to manually switch-over the communication from main bus device to redundant bus device without interrupting the PLC functions.
4. The PLC shall have provisions of communication interface facility with Plant DCS system in order to make the entire system operational from CCR. Bi-directional,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[136]	02.09.2015

Redundant soft links shall be used in the PLC for the connectivity with the Plant DCS.

5. Following are also included in the system:
 - a) Cables required for interfacing with DCS.
 - b) Implementation of Tags and establishing the Link.
 - c) Any other software/hardware required.

7.2.4 System Power Supply

1. For PLC system, redundant 24 V DC power supply shall be used. The required power supply cable shall be used from the UPS DCDB & ACDB for SG integral control system
2. For separately mounted I/O racks, separate power supplies shall be used. Power supply module shall be of ample capacity to supply all modules. In addition 20% spare capacity for future shall be used. All the drives shall be switched ON/OFF through 24V DC coupling relays to be provided in HT/LT SWGR panels.
3. For the Operator Stations and Engineering Station the power supply shall be from the 230 VAC UPS system.

7.2.5 PLC Console

1. PLC Console or operating panel/display panel shall be used as operator Interface station for control and monitoring of the plant. This shall be done through dynamic mimic displays and control displays.
2. PLC console shall also be used for program storage, display, fault diagnostic and alarm monitoring. It shall be possible to modify, add or delete the application program on-line without affecting the outputs. It should be possible to modify or create new displays from PLC Console.
3. Isolation shall be used between programming terminal and related subsystems, if there is any possibility of high voltage from TFT being transmitted to other subsystems.
4. The PLC system shall have provision to shift the Operator Station/ Engineering Station to the CCR in future with third party interactive communication facility.

7.2.6 Displays

The system shall be capable of reading the status of equipments, acquiring the analog signals, displaying the status in the form of mimic diagram, video trend, bar graph, periodic display, alarm display, alarm overview display, logs such as hourly/shift/daily logs, alarm logs etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[137]	02.09.2015

Displays include plant mimic diagrams, which shall include the complete auxiliary plant system indicating each major components of the system and the operating status of individual equipment and devices

7.2.7 Alarms

1. The system shall display history of alarms in chronological order of occurrence on the Operator Station TFT. At least three (3) levels of alarm priority shall be available which shall be displayed in different color. It should be possible to display and print alarms. System shall have all alarm related functional keys like acknowledge, reset etc. Other design features like set point / dead band adjustment, alarm priority, manual and automatic inhibition based on predefined logic etc. shall be used.
2. The alarm display shall be built bottom up with the most recent alarm at the top of the list. When a point returns to normal, the associated alarm line shall change color suitably and on acknowledgement, the line shall be blanked out.
3. The alarms below the blank lines shall move upward to fill the empty lines. If the capacity of the OWS display page is exceeded, alarm history shall be stored in memory to accept the over- flow. This alarm history shall be displayed upon operator demand.
4. When a point goes into an alarm state and appears on the alarm screen, the time of alarm shall flash until acknowledged by the operator. Acknowledgement by the operator shall cause the time to stop flashing. All alarm initiations and return to normal, shall be logged on a printer.

7.2.8 System Software

1. Complete licensed software for PLC based system including the communication software system shall be supplied and implemented to meet completely the specification requirements.
2. Application software shall be built based on approved logic diagram, graphics etc and shall include controls, graphics, logs, trends, history, report generation etc.
3. The system software shall include all programs for the PLC and PLC console which are required to perform all the PLC functions including communication and self-diagnostics.
4. Diagnostic software shall have the capability to provide information about the failed module / system either in the form of a system configuration display or provide information in the form of a statement.
5. The software's shall not be machine specific. All software licenses shall be valid for the continuous service life of the plant and equipment.
6. Password security shall be used in order to ensure security level to the plant operation.

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[138]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

7.2.9 Peripherals

Following Peripherals shall be used for PLC:

1. VDU/ TFT shall be multi-sync, 21" color monitor with intelligent terminal and key board. TFT shall be used with graphic and mimic capabilities with minimum 64 distinct colors. The graphic resolution shall be 600x 1280 dots minimum with 0.25 mm dot pixel and refresh rate shall be 85 Hz or better
2. Suitable optical filter for minimum secondary glare shall be used.
3. One number black & white laser printer shall be used for printing A4 size paper. Printing speed shall be minimum 24 ppm. The printer shall be heavy-duty type with minimum 50,000 pages/month printing capability, 600 dpi resolution, 128 MB memory and 3000 sheet input capability.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[139]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

8. COMPUTERIZED MAINTENANCE MANAGEMENT SYSTEM (CMMS)

{TO BE DELETED, IF ALREADY PROCURED UNDER SG PACKAGE.}

8.1 General

1. A completely integrated computerised maintenance management system (CMMS) with relevant data base completely populated and system customised for power plant application shall be used. The system includes all necessary hardware, software, firmware and interfaces required for implementing a fully functional CMMS system suitable for integrated maintenance management function for a modern power generation utility.
2. CMMS system shall be common for the equipment/systems for the whole plant including all the units and the plant common systems.
3. If CMMS is procured under TG Package then it shall be deleted from SG package.

8.2 Functional Requirement

CMMS shall meet following functional requirements:

8.2.1 Asset Management & Asset Register Function

1. Asset management function shall facilitate the creation of an asset register which shall hold the comprehensive details of each asset/ equipment. It shall have following features:
 - a) Building the location details and it's hierarchy
 - b) Building the equipment, it's hierarchy and specification details including drawings.
 - c) Creating hierarchies identifying operating locations as a part of multiple systems.
 - d) Defining relationship between equipment, location and system.
 - e) Building spare parts and sub-assembly catalogues of the asset/equipment.
 - f) Tracking the equipment, movements, associated costs, histories of planned and un-planned maintenance & failures.
 - g) Facility to launch condition based preventive maintenance work orders based on preset equipment- wise upper and lower limits.
 - h) Links to inventory management and purchase functions.
2. The asset management facility shall be capable of performing the following:
 - a) Control the company's list of maintainable assets through an asset register.
 - b) Control the accounting of assets, purchase price, depreciation rates etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[140]	02.09.2015

- c) Control maintenance inventory (stores management, requisition and purchasing).

8.2.2 Inventory Management Function

Inventory management function shall have following features:

1. Specifying attributes and then ability to search by attribute for items, equipment and locations
2. Tracking of stocked and non-stocked items through multiple stores.
3. Tracking of items, costs and balances by bin, lot and storeroom.
4. Stock replenishment when inventory falls below minimum levels
5. Automatic reorder of items through “ lights out replenishment”
6. Tracking of items by last cost, average cost or user definable standard cost.
7. Usage of ABC analysis to assign inventory item prioritising.
8. Employing just in time methodologies to generate purchase orders.
9. Identifying out of stock items and making substitutions with alternate parts, vendor and location tracking capabilities.
10. View of work order reservations for inventory items
11. Linked up with asset register.

8.2.3 Work Order Function

Work order function shall have following features:

1. Viewing comprehensive and detailed planning information such as following:
 - a) Work Plans
 - b) Schedules (Target and scheduled date tracking)
 - c) Costs
 - d) Labour, materials, Skill set / crafts, Special tools requirement etc.
 - e) Equipment
 - f) Failure analysis
2. Recording of maintenance work and closure of work orders.
3. Scheduling of work orders based on real time criticality and logistics.
4. Sequencing of work orders for multiple equipment based on location and / or equipment.
5. Comparison of real time budgets or estimates with actual and historical data.
6. Tracking of equipment down time.
7. Tracking of equipment failure history with cause and remedy. Facility for generation of micro-level failure/ cause stratification diagram.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[141]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

8.2.4 Job Planning Function

Job planning function shall have following features:

1. Tracking of costs by operation or job plan
2. Linking job plans sequentially, each with it's own parts, labour and tool estimates.
3. Duplicate job plans for modification and use as templates

8.2.5 Resource Planning Function

Resource function shall allow to maintain detailed resource information to plan and analyze maintenance work related to company, service contract, tools etc.

8.2.6 Schedule Planning Function

Scheduling function shall enable to forecast future preventive maintenance dates for resource planning.

8.2.7 Preventive Maintenance Function

1. Preventive maintenance schedule shall be capable of performing the following:
 - a) Allows each asset / equipment to have a defined maintenance profile
 - b) Helps to schedule planned preventive maintenance routines
 - c) Control preventive maintenance procedures
 - d) Control the issue and documentation of planned and un-planned maintenance work.
2. Preventive maintenance function shall have following features:
 - a) Generation of preventive maintenance work-orders on demand, batched or automatically.
 - b) Generation of preventive maintenance work-orders for planned shut downs.
 - c) Sequence multiple job plans and consolidate multiple procedures on one preventive maintenance schedule.
 - d) Facilitates clustering of PM work orders for various departments / divisions to take reduced planned equipment downtime.
 - e) Capable of generating PM work orders on the basis of fixed frequency intervals or run hours.
 - f) Reservation of inventory for scheduled PM works.

8.2.8 Purchasing Function

Purchasing function shall have following features:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[142]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

1. Creation of purchase requisitions or purchase orders either from scratch or from the inventory or work order modules
2. Create RFQs for multiple vendor bids
3. Automatic release of agreement Purchase orders
4. Creation of special orders for parts not stocked in inventory.
5. Elimination of costly "Maverick Buying" by establishment of approved vendors.
6. Direct issue of purchase orders and issue parts and services directly to work orders for the expense off items.
7. Analyzing of vendor performance before ordering of parts
8. Use of invoice matching
9. Defining multiple tax rates to budget for interstate and international purchasing
10. Auto re-orders PR/PO generation for the spares, when stock falls below re-order level.
11. PR to PO consolidation to group PRs by vendor into single purchase order.
12. Line item /Purchase order status generation-Initiated (Unapproved), Approved, Partial receipt, Completion of receipt, Invoice matched, Cancelled etc.

8.2.9 Personnel Function

Personnel function shall have following features:

1. Creation of employee details including employment and personnel information tracked.
2. Assignment details like department, preferred staff and available weekly work hours tracked.
3. Craft / salary rates-employees can be expensed to work orders by an average craft rate or actual hourly rates.
4. Training / certifications of employees tracked by the system.
5. Security levels-each employee can be assigned access security levels for each of the functional areas in the system.

8.2.10 Financial Function

Financial function shall have following features:

1. Facility for supporting double entry accounting for integration with any financial system.
2. Creation of user defined financial calendars to correlate directly with accounting periods.

8.2.11 Other Functions

Other facilities required are as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[143]	02.09.2015

1. Interface to MS project/Primavera to permit planning of work carried out in CMMS system to MS project/Primavera for scheduling. Work progress can then be tracked in CMMS and used to update the project.
2. CAD / Image viewing capability to enable users to store, mark up and view drawings, scanned images, word documents etc.
3. Account code or project budgeting to enable users to set up periodical project budgets. The system shall then be able to track actual and committed costs against budgeted costs
4. Interfacing with existing On Line Integrated Material Management System (OLIMMS)

8.2.12 Reporting Functions

Reporting facilities required are as follows:

1. Standard Reports-Generation of standard reports on work orders, safety plans, inventory values and other critical points about maintenance operations.
2. Report types- Capabilities shall include columnar reports, forms, Bar Charts, Pie Charts, Cross tabs etc.
3. Report generation- Crystal reports.
4. Data export capability via crystal reports to Text, Excel, Word documents, E-mail, HTML & ODBC etc.

8.3 Design Requirements

1. CMMS shall be based on client server & relational data base environment. The system shall operate on commonly used hardware platform & network operating system.
2. System shall be suitable for simultaneously used by multiple users. It should have at least 20 user licenses.
3. The system shall be password protected. It shall be possible to organize system users into groups and each group shall have a separate security profile. It shall be possible to provide additional personal security settings for individuals within a group.
4. CMMS processing shall be carried out in an independent server interfaced with plant DCS, All BOP & offsite plant PLC control systems. Further CMMS system shall be interfaced with MIS system server for transmission of maintenance related details for usage with MIS. To meet the above requirements CMMS system shall be interfaced with all control systems through redundant communication links. The CMMS system server shall be connected with station LAN and all user PCs shall be connected to CMMS server through station LAN.
5. The system shall have facility to store bulk data with facility for retrieval of the same. The system shall have facility to share all the data in the hard disk/back up media and provide user friendly utilities to retrieve and analyze stored data.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[144]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

6. Wherever required same user workstations shall be used for CMMS & MIS systems. Together with MIS system total 50 nos. user workstations shall be provided.
7. All software licenses shall be valid for entire life of the plant. It shall be possible to upgrade the installed system with latest available version of the software model without any additional hardware/software requirements during entire life of the plant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[145]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

9. SMART TRANSMITTER MAINTENANCE STATION (STMS)

{TO BE DELETED, IF ALREADY PROCURED UNDER SG PACKAGE.}

9.1 General

A dedicated standalone PC based Smart Transmitter Maintenance Station (STMS) shall be provided for centralized configuration, maintenance, diagnostic and record keeping of all electronic smart transmitters, smart positioners & Analyzers. Transmitter signals shall be wired parallel to DCS and HART modules of STMS, which shall be connected to PC through suitable communication modules. Complete diagnostic, record keeping, calibration and configuration, event and log reports, historical data base records of all transmitters shall be possible from the STMS.

9.2 Design Requirements

1. The signals from each of the transmitter shall be wired in parallel to DCS and to HART interface modules. The DCS shall necessarily use 4-20 mA analog signals and superimposed digital signal shall be used in HART interface modules.
2. The multiplexed signal from HART interface modules shall be hooked up to a PC through associated communication modules, converters, etc. The communication module shall provide data on RS-485 link at a minimum speed of 19.2 K baud. If HART interface modules has integral communication module to provide RS-485 link, the same shall also be acceptable. In all HART interface modules, provision for connecting at least 30% extra transmitters over and above the engineered quantity shall be kept for future additions.
3. An RS-485 to RS-232 Converter shall be provided for interfacing HART data of transmitters to PC station. This converter shall also provide proper isolation to ensure data integrity.
4. Any failure / short / open-circuit and / or removal of any of the cards /devices / cables in this centralized configuration, maintenance, diagnostics and record keeping system, including failure / removal of HART interface modules, communication modules, converter, etc. shall, in no way, affect the 4-20mA analog signals being used in DCS. Further, the HART interface modules shall be organized in such way that separate cards are used for signals going to different DCS cabinets.
5. Suitable redundant & diode auctioneered 24V power supply packs / modules and redundant feeders shall be provided to feed all modules / devices. These power supply packs / modules shall be fed from redundant feeders of UPS system or from 24V DC power supply system.
6. All modules / cards / power supplies shall be mounted in cabinets to be located in Control Equipment Room. The PC station and printer shall be located in Engineering Room.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[146]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

9.3 Functional Requirements

The system shall have following functionalities as a minimum:

1. Constant scanning to monitor faults or changes to instrument configuration.
2. Purchaser-defined and standard calibration and configuration procedures for all transmitters.
3. Constant signal data collection facilities to maintain continuously updated records.
4. Automatic tracking of configuration changes made in the field, such as may be introduced by hand-held communicator. All configuration function associated with hand-held communicators shall be available in the system.
5. Event and log reports on screen as well as on printer.
6. Any addition / deletion of transmitter shall be reported on printer and logged in hard disk

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[147]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

10. STATION WIDE LOCAL AREA NETWORK

{TO BE DELETED, IF ALREADY PROCURED UNDER SG PACKAGE.}

10.1 General

1. A plant wide Local Area Network (LAN) encompassing the different plant buildings shall be provided. The Station LAN shall interconnect the buildings together and shall facilitate the smooth transfer of Data from one building to the other.
2. A plant wide Fibre Optic high speed (100/1000 MBPS) back bone & work groups is envisaged. This network is used by different users for viewing selective plant graphics & data on real time basis, historical data & trends, MIS reports & CMMS data.
3. The MMI of unit & common system, all BOP & offsite PLC's, PADO, CMMS, MIS, CCTV etc. Shall be connected to station wide redundant Ethernet LAN. The interface with these systems shall be through OPC client-server architecture. PC stations shall also be connected to this LAN to monitor data.
4. For achieving this, the above requirement all necessary hardware & interfaces such as the Station LAN Server, LAN Switches (main & secondary) with suitable number of ports, electric / optic and optic / electric converters / trans-receivers etc., software and data communication cables shall be provided. The redundant unit LANs of the each unit shall be connected through the station LAN switch and server. It shall be ensured that failure of this network component(s) shall in no way affect individual unit operation & monitoring function in any way.
5. The Station LAN shall connect following buildings:
 - a) Station Building- Central Control Room
 - b) Service Building
 - c) Coal Handling Plant
 - d) Ash Handling Plant
 - e) ESP Control Room
 - f) CW Pump House
 - g) Water Treatment & effluent Treatment Plant
 - h) Air Compressor House
 - i) Hydrogen Generation Plant (if applicable)
 - j) Workshop
 - k) Stores

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[148]	02.09.2015

l) Switchyard Control Building

m) Any other plant area/ building where Station LAN needs to be provided for the purpose of CMMS, MIS or for Plant security/ surveillance system.

6. The LAN network to be provided for all user points in all the rooms in the buildings.
7. The various buildings shall be interconnected through the use of minimum 4 Core single mode fibre and shall be connected to the main switch in the CCR in a STAR topology.
8. Each building shall be provided with a 12.U high wall-mountable communications cabinet complete with glass door, 6 way power distribution unit, shelves and force ventilation. All units are to be supplied with cage nuts and bolts to house LAN switches.
9. Inter building wiring shall be a minimum of Category 5E STP cable manufactured, tested and verified to ISO11801 EIA/TIA standard. Internal building wiring shall be of the structured cabling type and shall incorporate patch panels on every floor or as required.
10. A minimum of two RJ-45 ports shall be provided for each specified location. Category 5E shuttered modules shall be used in pre-assembled faceplates to save installation time. Modules shall include a slide label system.
11. If Station Wide LAN is procured under TG package, then it shall be deleted from SG package.

10.2 Design & Functional Requirements

1. The station LAN shall be achieved through the station LAN Server and High capacity Ethernet switch (station LAN switch). The Station LAN server shall have the hardware and shall maintain a combined plant database (complete database from each unit MMI updated at 1 sec.) and data from other systems through industry standard protocols and formats, on an Open standard RDBMS package like Oracle Enterprise version or equivalent, for open access to the same from any PC station in the plant running a suitable client software. This server shall function as a database server for the Plant Wide LAN.
2. The LAN shall be of the Gigabit type (1000 MBPS) and shall utilize standard IEEE 806.3 protocols such as Ethernet.
3. The Station LAN Switch shall be a layer-III switch & shall have hot pluggable redundant power supply, Gigabit back plane (switch fabric) capability, 1000 MBPS per port minimum data speed, fibre optic and UTP cable connectivity and Gigabit ports and shall support expandability / Stackability through a dedicated high speed expansion port. It shall support minimum Four numbers virtual LANs as a minimum and shall be routable, remotely manageable and configurable. The switch shall have extensive self diagnostic and logging facilities and shall use

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[149]	02.09.2015

structured cabling facilities. The Station LAN switch shall be suitably sized to provide additional ports for connecting Servers / PC-stations etc. In future and fibre optic ports for connectivity and DCS TCP/IP ports for interconnection to standard third party sub-systems.

4. Network Monitoring & Management tool shall be provided so that loading etc. on the LAN switch can be ascertained.
5. The station wide LAN shall connected to IT LAN, through which the CMMS server data shall be made available to existing Online Integrated Maintenance Management System (OLIMMS). Also the PC stations for various plant personnel shall be connected to station LAN for monitoring data of all units as well as that of common systems & offsite systems. These Connections shall be through Firewall.
6. Redundant Hardware Firewalls in failover mode with intrusion prevention system (IPS) features shall be provided to ensure security of network & prevent unauthorised access.
7. Firewall shall have minimum three zones. One inside (DCS network), one outside (IT LAN/ OLIMMS network) & the De-militarized zone (DMZ). Station LAN Servers shall be placed in DMZ zone. Data required for intranet (plant PC Network) & for OLIMMS shall be made available to the redundant station LAN Servers.
8. Station LAN switch shall be provided with a network based intrusion detection system (IDS) of a make different from IPS provided with Firewall to achieve a multi layered defence mechanism against intrusion as well as to guard against possible misuse/attack from within LAN.

10.3 Security Features Requirements

1. Firewall

- a) Firewall appliance should facilitate multi-vendor, multi-application environment and should support third-party products on open alliance. It should support Active-Active configuration.
- b) The firewall should contain following features:
 - Stateful inspection of packets.
 - NAT functionality, including dynamic and static NAT translations
 - Latest version of SNMP
- c) The firewall must send log information to a separate log server via an encrypted connection. Firewall logging must not impact firewall performance.
- d) Remote network access to the firewall should only be possible through the administration interface.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[150]	02.09.2015

- e) The firewall administration station must be capable of pushing firewall security policies and configurations to individual or multiple firewalls through a secure, encrypted connection to the firewall administration interfaces.
- f) Graphical User Interface (GUI) and a Command Line Interface (CLI) for making changes to the firewall rules set should be provided. (Access to the firewalls via the GUI or the CLI must be through a secure encrypted channel).
- g) Any changes or commands issued by an authenticated user should be logged to a database configured on any of the machines in the LAN. The administration station must allow for a hierarchical architecture for rules set administration and viewing of firewall configurations Management.
- h) Firewall should also meet the following requirements.
 - The firewall must not support any unencrypted means of access to the firewall.
 - It should Monitor ALL network traffic-traffic at Firewalls (Internet and external networks) and detects known threat through deep packet inspection.
 - Detects unknown threats via anomaly scanning.
 - Detect unknown threats via behaviour pattern to protect from zero day attacks.
 - Keeps up-to-date on new threats and vulnerabilities.

2. Intrusion detection system (IDS) & Intrusion Protection System (IPS)

In order to inspect all inbound and outbound network activity and identify suspicious patterns that may indicate a network or system attack from someone attempting to break into or compromise a system on the Station LAN Network, the recommended IDS/IPS should contain the following features as a minimum:

- a) Able to analyze, detect and report on security related events.
- b) Able to inspect traffic and to drop malicious traffic based on the configuration of security policy.
- c) Able to inspect the content of network packets for unique Sequences/signatures.
- d) Able to detect and prevent known types of attacks such as worm or Trojan infections and hacks.
- e) Able to prevent denial of service (DOS) and Distributed Denial of Service attacks.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[151]	02.09.2015

- f) Able to prevent abnormal behaviours by monitoring and learning normal network behaviours.
- g) Keeps up-to-date on new threats and vulnerabilities.
- h) Should provide user friendly interface to queries and reports on threats and event data so that security administrators can gain a better understanding of their ability to protect their network.
- i) Should provide detailed activity logs for auditing.
- j) Able to detect known threats via deep-packet inspection.
- k) Able to detect unknown threats via anomaly scanning.
- l) Able to detect unknown threats via behaviour pattern to protect from zero day attacks.

10.4 Network Monitoring & Management Requirements

The network monitoring & management software should contain the following features as a minimum:

1. Graphical user interface (GUI) management.
2. Automated discovery and display of Ethernet topology and devices.
3. Real-Time SNMP Support
4. Monitor traffic flow through the device
5. View a device image indicating which ports are active and which modules are installed. If a particular network device is down, it should give the tools like ping/telnet options in the same screen to further diagnose the problem.
6. Real-time activity and utilization statistics and graphical trends.
7. Facility of providing pre-defined actions like e-mail, SMS etc. upon any event generated in the network.
8. Facility of viewing logical graphs of devices like routers, web servers, according to the needs.
9. The following parameters should be monitored.
 - a) Device status
 - b) Port Status
 - c) CPU utilization
 - d) Memory Utilization
 - e) All port utilization including uplink ports.

Table - 10.1

11. STEAM & WATER ANALYSIS SYSTEM (SWAS)

{TO BE DELETED, IF ALREADY PROCURED UNDER SG PACKAGE.}

11.1 General Requirements

1. The steam and water analysis system shall be designed to monitor the chemistry of the steam and water cycle to ensure the desired quality. The online chemical analysis for pH, Conductivity, hydrazine, sodium ion, Silica, dissolved oxygen, chloride, phosphate etc. Shall be carried out in the plant cycle at strategic points. Information from the analyser shall be used to control the high pressure and low pressure dosing system. Long term monitoring and trending of essential elements shall be carried out, to provide an indication of the general condition of the mechanical plant.
2. The sample points, their location, type of chemical analysis to be carried out for each sample, measurement ranges etc., shall be as per plant standards. The SWAS as a composite system includes sample probes, sample piping, safety valves, ball valves, relief valves, grab sample collection facility, pressure, temperature, level, flow indications, coolers, on line analysers etc. The SWAS shall include the following:
 - a) Sample conditioning panel with all accessories.
 - b) Analyzer Panel housing cells, analyzers, monitors etc.
 - c) The sample conditioning and analyser panels shall be physically separated from each other. Analyser panel shall be located in a separate air-conditioned room. Sample conditioning panel shall be walk in corridor type/open rack type. All SWAS panels shall be designed for ready access of components for easy maintenance.
 - d) PC based station for display of information & alarms to the operator, to be located in SWAS room (connected to station LAN)
3. The SWAS system should be unitised and located at the ground floor of TG building.

11.2 Design Requirements

1. Design criteria for continuous on line analytical measurements of important plant media such as water, steam shall be based on microprocessor based instruments only.
2. Separate Steam and Water Analysis System shall be furnished for continuous monitoring and control of water and steam purity in the plant cycle of Unit and at other important points as specified in this specification.
3. The sampling system shall obtain samples from steam and water system, which shall be adequately conditioned and fed to analyzers for continuous analysis and provide parallel facility for grab sampling as specified.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[154]	02.09.2015

4. The system shall be designed in accordance with the recommendations in ASME PTC 19.11 Part II, Water and Steam in Power Cycle, ASTM standards - 31 water and ASTM D1066-69 standard method of sampling steam.
5. The equipment shall be constructed to operate accurately and safely under the operating conditions described or implied in this specification, without undue heating, vibration, wear, corrosion or other operating troubles.
6. All parts subject to high pressure or temperature or other severe duty shall be of materials suitable for the service.
7. All piping, tubing, fittings and other wetted parts in the sampling and analyzing system shall be of SS 316 or other suitable material for the service. No plastics or rubber shall be permitted except within analyzers as furnished by the manufacturer.
8. All SWAS system components and accessories shall be from the latest proven product range of qualified manufacturers.
9. To ensure operation under adverse conditions the equipments mounted outside the Sampling and Analysis Room shall be designed for outdoor conditions.
10. Sample room located instruments and electronic hardware shall be required to operate normally in an air-conditioned area.
11. However, they shall also be able to operate indefinitely with ambient room temperature between + 5°C to + 55°C and relative humidity up to 95%, during air conditioning failure.

11.3

Sample stream Requirements

SWAS shall be provided in accordance with the following guidelines:

Table 11.1

11.4 Sample Conditioning System

1. The sample conditioning system shall provide samples at 250C or a preset temperature required by the analyzer with in tolerance of +/- 1 0C, at a pressure of about 2 Kg/cm2 and at a flow rate as required by individual Analyzer/stream.
2. Sample conditioning system shall be designed and constructed to receive and condition all samples as required by the respective analyzers connected to the sample streams. This shall include all conditioning equipment mentioned herein and covers the following:
 - a) Primary Sample Cooling in the field
 - b) High Pressure reduction in the field
 - c) Two (2) nos. racks shall be provided per unit for mounting primary coolers & high pressure reducing elements in the field.
 - d) Sample filtering
 - e) Secondary sample cooling & temperature control
 - f) Pressure reduction & control as required

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[156]	02.09.2015

g) Flow rate control & measurement

h) Other treatment as required by individual analyzers or mentioned herein

3. Sample line to analyzers shall incorporate an anti-siphon design to prevent possibility of running dry because of a broken or plugged sample line.

11.4.1 Primary Sample Cooling

1. Primary cooling of all samples having temperature in excess of 45 °C shall be accomplished by passing each sample through one or more individual sample coolers of shell and tube heat exchanger type.
2. The primary coolers shall use plant auxiliary cooling water.
3. The overall capacity (flow rate and heat transfer capacity) for both sides of cooler/ coolers in cascade shall be adequate to cool all samples to within ± 5 °C of the cooling water inlet temperature for the combined flows of each required analyzer sample plus a manual grab sample flow rate of 500 CC/Min.
4. Provision shall be kept for adjustment of the temperature of each sample line individually to an optimum value.
5. Sample coolers shall be of submerged helical coil type of shell and tube design with removable shell meeting the intent of ASTM D1192-64 (Equipment for Sampling Industrial Water and Steam). Sample tubing and coils in the coolers shall be continuous and shall extend through the cooling jacket. The sample tubing shall be of seamless type with no welded or other joints inside the cooling jacket. Unions shall be provided to facilitate removal of coils.
6. All sample tubing, fittings and other components wetted by the samples shall be constructed of SS 316.
7. Primary cooler/s shall be removable without disturbing the sample coil connections.
8. Primary cooler shall be protected on the cooling water side by relief valve on the water header. The cooling water header is provided with pressure gauge and isolating valves.
9. Provision shall be made for draining the heat exchanger shell. The drain line shall be valved and piped to waste drain header.

11.4.2 High Pressure Reducing Element

1. Pressure reduction of samples above 40 kg/cm² shall be accomplished by means of a "variable rod-in-tube capillary" or equivalent capable of discharging low flow at low pressure into a sample stream as per the requirements of all samples/analyzers under all operating conditions.
2. The device shall be designed for inlet pressure of 350 kg/cm² operating temperatures of 65 °C and flow rate of not less than 2000 milliliters per minute. The device shall be sized for maximum required sample flow rate under all operating conditions (i.e. from 25% of rated operating pressure onwards to accommodate starting conditions).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[157]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

11.4.3 Sample Filtering

Sample particulate removal shall be accomplished by passing samples through cartridge type filters with 316 stainless steel body or Y-Strainer. The filter elements shall be capable of retaining particulates of 40 microns and larger. The filter elements shall be installed immediately after the sample shut off valve.

11.4.4 Temperature Switch & Solenoid Valve

Thermostat and Solenoid Valves shall be provided in the sample line downstream of sample filter and upstream of the Secondary Cooler. The thermostat shall be a bimetallic sensor to operate a micro-switch when a preset temperature is reached. This shall close the Solenoid Valve through logic, when sample temperature is above preset value (60 °C).

11.4.5 Secondary Sample Cooling

1. Secondary Cooler shall be employed to cool the sample from approximately 45 OC to 25 OC +/-1 OC. The secondary coolers shall also be of submerged helical coil type of shell and tube design. The secondary cooler shall use chilled water at 20 OC. Chilled water for secondary cooler shall be provided by packaged refrigeration unit (chillers). Secondary cooler shall be protected by a relief valve on the cooling water jacket of each cooler in addition to a relief valve at the cooling water header. Provision shall be made for heat exchanger shell drain duly valved and piped to waste drain header.
2. Alternatively, secondary cooling may also be proposed with field proven isothermal bath.

11.4.6 Chilled Water System

1. Each chiller unit shall be designed with sufficient refrigeration capacity to ensure each sample stream temperature to 25 OC \pm 1 OC when all streams are simultaneously at maximum flow rate and maximum temperature. The chiller capacity shall have a provision of 25% spare capacity for future samples.
2. Suitable temperature monitoring and control systems shall be provided for maintaining the chilled water temperature at chiller outlet at 20 OC or at a designed preset value and within the desired band.
3. The compressor shall be readily accessible for service and shall include low noise hermetically sealed motors. Compressor assembly shall also include crank case heaters, suction and discharge valves, oil sight glasses, forced feed lubrication system and an integrated motor protection system along with the necessary instruments.
4. The condenser shall be water cooled, cleanable shell and tube with water regulating valve. The cooling water shall be supplied from closed cooling water system at a maximum temperature of 40°C and a maximum flow rate of 100 litres per minute.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[158]	02.09.2015

5. Chiller shall be of the direct expansion type with refrigerant tubes inside a shell, completely insulated and to be constructed in accordance with the ASME code for unfired pressure vessels.
6. Refrigerant circuit shall be complete with a thermostatic expansion valve, liquid line solenoid valve, sight glasses, filter-dryer, refrigerant shut-off and charging valves.
7. The chiller water pump shall be of the centrifugal type, close coupled, bronze fitted construction, complete with motor. Pump & motor shall be designed for continuous operation.
8. Vibration dampeners shall be mounted between the packaged chiller and the channel base.
9. Cooling water and chilled water piping shall be provided with block valves.
10. The chiller system shall be provided with 100% redundant chilled water pumps with suction and discharge pressure gauges and temperature gauges; Chilled water circulation pump with 100% standby facility; Storage tank automatic water make up with manual by-pass facility, temperature indicator, level gauge and drain and overflow connection, in addition to any other instruments/equipments required for smooth, convenient operation of the system.

11.4.7 Sample Pressure Conditioning

1. Pressure reduction of samples above 40 kg/cm² shall be accomplished by using high pressure reducing element.
2. All samples below 40 kg/cm² pressure shall be provided with back-pressure (upstream pressure) regulating valves (PCV).
3. Each sample line shall have Pressure Indicator and Temperature Indicator upstream of pressure reducer. The gauge shall be 100 mm dial with suitable stainless steel wetted parts. Casing shall be stainless steel construction.
4. Each sample line shall include a safety relief valve set at about 3 kg/cm²g, upstream of the rate set valve, having stainless steel wetted parts.

11.4.8 Flow Restricting Element

Flow Restricting Element located at grab sample line tapped from common samples to analyzers shall be provided for all samples, to maintain constant sample flow at a preset sample inlet pressure.

11.4.9 Other Requirement

The Steam and Water Analysis system shall be provided with the sample shut off valves, blow down valves, solenoid actuated valves, pressure reducing valves, safety relief valves, back pressure regulating valves, high pressure reducing valves etc. The requirements of the important valves are specified as under:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[159]	02.09.2015

1. The sample shut off valves, blow down valves and pressure reducing valves shall have stellite spindle tip and shall be suitable for an operating pressure of 400 bars and an operating temperature of 400°C.
2. The back pressure regulating valve shall be globe type and shall be suitable for a pressure range of 0 - 50 psi. The back pressure regulating valve shall consist of a range spring and a diaphragm assembly. The back pressure of the regulating valve is adjusted to the required set point by the range spring. In case of any excess pressure the diaphragm shall be lifted to release the excess pressure to maintain back pressure equal to the set value.

11.5 Sample Pumps

1. Two (2) nos. of sample pumps for each generating unit, along with necessary pipes, valves, etc. shall be provided for condenser cooling water samples. Sampling pump motor shall be adequately rated for continuous service duty and shall meet the requirement for drive motors as per international codes and standards.
2. Pump start/stop shall be done from local. All necessary accessories including power supply, wiring and grounding for control and safe operation of the pumping system. Pump shall be of make and model whose performance and reliability has been established

11.6 Sample Patch Board

1. A quick disconnect patch board area shall be furnished on the SWAS panel. The patch board shall allow sample to be routed to any analyzer through quick disconnect valve at patch board on the sample conditioning panel. The area shall consist of a patch board with bulk head tube fittings with double end shut-off and hose inserts. Body protector plugs shall be provided for each bulkhead tube fittings.
2. The plugs shall be of type 316 SS construction. Sufficient length of 6mm ID, 9.5mm OD tygon tubing shall be provided for complete spanning of the patch board area for interconnection of the bulkhead tube fittings. Each connection shall be provided with a Phenolic name plate engraved with a legend.

11.7 Grab Sample

Grab sample valves on the SWAS panel front shall be furnished to allow grab sample flow to be directed to either a drain header or through grab sample nozzles to the sample trough. Approximately 300 mm of flexible tubing shall be furnished for each sample to allow grab sample collection and prevent splashing. Valve body and trim shall be of SS-316.

11.8 Sample Sink

A continuous sink, located at the place of grab sample analysis, shall be provided. The sink shall be of 316 stainlesssteel, 14 gauge minimum. The

--	--------------------------

sample sink shall be connected to waste drain header. Sample sink shall contain an integral stainless steel ledge to accommodate sample container. DM water connection shall be provided for cleaning of sample containers.

11.9

Analyzers

All Analyzers shall be of microprocessor-based design. The general technical specification of the analyzers is provided in this section. Each analyzer shall be indicated with the sample flow requirement and the total quantity of cooling water required for the system.

Specifications for Hydrazine Analyzer

S.No.	Features	Minimum Requirements
1	Type	Continuous Electrochemical
2	Operating Range	0-50, 0-100, 0-200 ppb
3	Output	4-20 mA DC linear and 1-5 volts
4	Readout	Digital Indicating Meter, linear read-out
5	Accuracy	+/- 4% of FSD or better
6	Reproducibility	2% of FSD or better
7	Drift	2ppm/month or better
8	Temperature Compensation	Automatic up to 120° C
9	Operating Temperature Ambient	0-60° C (maximum)
10	Response Time	2 minutes or better
11	Mounting	Flush panel
12	Pressure rating	0 - 5 Kg/Sq. cm
13	Power Supply	230 V 50 Hz, 1 Phase
14	Alarm Facility	2 HI and 2 LO, Independently adjustable over span.
15	Preferred Feature	<ul style="list-style-type: none"> HI and LO alarm LED visible from front Power supply on/failure LED visible from front All chemical reagents for 12 months operation etc. Phenolic nameplate etc. High sensitivity Self cleaning electrode

Table 11.7
Specifications for Dissolved Oxygen Analyzer

S.No.	Features	Minimum Requirements
1	Type	Continuous Flow through Sample Electro-chemical, Microprocessor based
2	Range	0-0.1, 0-1.0, 0-10.0 ppb manually selectable range
3	Enclosure	IP-55 or better
4	Output	4-20mA DC isolated to load of 600 ohms (minimum)
5	Temperature Compensation	Automatic up to 650 C
6	Ambient Temp.	0-600 C
7	Readout	Digital indicating meter
8	Accuracy	Better than + 5% of full scale for Transmitter
9	Sensor Response Time	Automatic up to 60 OC
10	Mounting	Flush Panel
11	Readable Distance	3 meter (minimum)
12	Power Supply	230V AC, Single Phase, 50Hz
13	Sample	Flow rate approx. 500 ml/minute
14	Alarm facility	2 HI & 2 LO independently adjustable over entire span Contact rating, 5A, 230 V AC/0.5A, 220V DC
15	Preferred Feature	<ul style="list-style-type: none"> • HI and LO Alarm LEED visible from front. • Power supply on/failure LED visible from front. • In-built calibration facility
16	Accessories	<ul style="list-style-type: none"> • Phenolic nameplate giving tag no., service etc. • reagent Cabinet (if applicable) • Reagent Reservoir (if applicable) • Other as per requirement including piping etc.

11.10 SWAS Panels

1. The SWAS Panels shall have two sections namely sample conditioning section and analyzer section. The first section shall be the wet section of SWAS panels which shall be called as the "Sample Table". The second section shall be the dry section housing the analytical transmitters, signal conditioning devices and other requisite accessories.
2. All monitoring instruments and controls for sampling system shall be located on the front panel and shall be grouped accordingly to function in a logical and orderly fashion. There shall be a general progression of flow from top-to-bottom and left-to-right to minimize sample line length, purge times and material exposed to sample. Similarly, the conditioning components for each stream shall be grouped together wherever possible.
3. Indicating instruments such as pressure, temperature and flow shall be arranged in a vertical line directly above the grab sample valve. Sufficient clearance shall be maintained between instruments banks of adjacent sample points so that there is no confusion in reading these instruments.
4. Sample conditioning & analyzer panels shall be designed for ready access of components. Panel design shall ensure that:-
 - a) Parts subject to wear, corrosion or other deteriorations or requiring adjustments, inspection or repair are readily accessible and capable of convenient removal, when required.
 - b) Individual components or groups of components mounted on sub-panels can be removed for replacement or repair without the need of prior removal of components of other healthy streams.
 - c) Flow meters, pressure gauges and temperature indicators can be removed for repair or replacement from the front of the panel without disturbing any piping.
 - d) Filter elements and pressure reducing elements can be easily disassembled for periodic cleaning.
5. SWAS panels shall be designed based on human engineering considerations fully keeping in view the convenience of operation and maintenance personnel.
6. Each sample inlet shall be provided with bulkhead type tubing connection and an isolation valve or block valve suitable for sample operating conditions. A blow down connection and suitable blow down valve shall be furnished upstream of each isolating valve. Blow down valves shall be manifolded into a suitable blow down header. Strainers, filters, relief valves etc. shall be provided as specified and as required to properly protect the coolers, valves, analyzer elements etc.
7. All drains shall be piped into two separate drain headers. One header shall be called "Waste Drain Header" and shall receive all drains which contain

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[172]	02.09.2015

substances not wanted in the plant heat cycle water. The other header shall be called "recoverable drain header" and shall receive all other drains not containing unwanted substances. All drains shall be headered as indicated above. Vendor shall pipe the waste drain header to the building drain system.

11.11 Constructional Features

1. The SWAS panel (wet panel) shall be constructed of 3 mm thick steel plates except for the extreme top of the Sample Table and Analyzer Panel (Dry Panel) which shall be of 2 mm sheet steel. The counter top, sample sink and front section above the counter top shall be 2.5 mm type 304 or 316 stainless steel.
2. The sample table shall be of free standing, open rack whereas the Dry Panel shall be of free standing, totally enclosed construction with back doors.
3. All SWAS panels shall be furnished with 100 mm base angle for bolting to 100 mm high concrete curb.
4. Following panels are to be provided:
 - a) Sample conditioning panel : 5000 (W) x 2300 (H) x 2400 (D) mm
(Wet Panel)
 - b) Analyzer Panel : 3000 (W) x 2300 (H) x 2400 (D) mm
(Dry Panel)

The dimensions given above are tentative only.

5. Panel sections shall be reinforced to ensure true surfaces and adequate support for instruments and equipment. All equipment and piping shall be firmly anchored and supported from within the respective panel section to ensure vibration free operation.
6. Doors and equipment arrangement shall be such that all items are readily accessible for maintenance and repair. Doors shall have concealed type hinges and three point type latches to assure tight closing. Doors shall have turned back edges and additional bracing where required to assure rigidity.
7. All surfaces shall be free from waves, bellies, or other imperfections. All stainless steel surfaces shall have uniform finish. All exterior steel surfaces shall be sand blasted, ground smooth, filled, primed, sanded and finished with smooth backed enamel.

11.12 Piping, Tubing & Accessories

11.12.1 Internal Piping & Tubing

1. All internal piping, tubing and system components required for making the system complete shall be shop installed and tested as per applicable codes, prior to shipment to project site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[173]	02.09.2015

2. All tubing and wiring shall be located behind the face of the panel with projections allowed only for indicator faces, valve handles, manual grab sample lines etc. The physical arrangement of the tubing and wiring shall, in all cases, be so as to permit easy access for maintenance of all items of equipments.
3. All piping and tubing materials, fabrication, erection and application of piping materials shall be in accordance with the latest applicable requirements of the code for pressure piping (ANSI B 31.1,B36.19) and all other applicable regulations.
4. Unless otherwise specified, fittings used with pipe 50 mm and smaller shall be socket welding type, and fittings used with larger pipe shall be butt-welding type. All fittings shall be constructed of materials equivalent to the pipe with which they are used.
5. All piping and tubing shall be neatly installed and securely braced to ensure adequate mechanical rigidity. Routing and support of tubing shall be such that expansion and contraction of tubing or equipment mounted in the sample table do not impose any excessive stress on the tubing.
6. Special tools shall be used for all bending and forming operations. Bends in tubing shall be based on the requirement of the code for Pressure Piping (ANSI B 31.1), concerning tube thinning at the bends. Tubing shall be carefully handled to avoid flat spots, kinks and short bends. Any tubing so damaged shall not be used in this sample table.
7. All piping and tubing shall be blown with oil free compressed air after installation and before attachment to equipment at either end.
8. All piping and tubing terminal connections shall be suitably capped after completion of installation and tests to prevent entry of foreign materials during transit, storage etc.
9. All piping and tubing shall be installed so as to ensure easy accessibility for any maintenance or repair that may be required. High density tubing runs shall not interfere with accessibility to any system component and shall not impair system function.

11.12.2 Sample Piping

1. This shall include piping, fittings, valves and accessories from tapping point's up to SWAS conditioning panel located in SWAS rooms on as required basis. All sample piping shall be 3/4" NB seamless type of material ASTM A213 TP 316 H, conforming to ANSI B36.19. The schedule number shall be suitable for the particular application.
2. All fittings shall be socket welding type and of material ASTMA182 F316H conforming to ANSI B 16.11.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[174]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

3. Single and multi tubes shall run with the minimum number of changes in direction. Suitable identification tags shall be provided for easy check up and for proper connections.
4. The valves to be used in sample piping shall be of globe type, forged construction and stainless steel conforming to ASTM A182. The pressure temperature ratings shall be as per ANSI B16.34. The valve design shall be such that the seats can be reconditioned and stem and disc can be replaced without removing valve body from the line.

11.12.3 Material Specification for Piping

The material for piping to be furnished and installed for SWAS shall be as indicated below:-

Table 11.10
Specifications for Piping Material

S.No.	Piping System	Material Requirement
1	Piping from the sample inlet bulk-head fittings the shut-off valve for low pressure samples	Stainless Steel, ASTM A-213 Type 304 or 316, 16 BWG tubing
2	Piping from the sample inlet bulk-head fittings to the pressure reducing valves for high pressure samples and sample blow down piping	Stainless Steel, ASTM A-213 Type 304 or 316, 14 BWG tubing
3	Blow down header	Stainless Steel, ASTM A-312 Type 304 or 316, Sch. 160
4	Miscellaneous drains receiver header	Stainless Steel, ASTM A-312 Type 304 or 316, 16 BWG tubing
5	Piping from the shut-off valves for low pressure samples and from the pressure reducing valves for high pressure samples to the terminal points including branch piping	Stainless Steel, ASTM A-312 Type 304 or 316, 16 BWG tubing
6	Closed cooling water piping except grab sample	Carbon Steel, ASTM A-53 Gr. A, Sch. 40
7	Sample through drain piping and waste header piping	Carbon Steel, ASTM A-53 Gr. A, Sch. 40

11.13 Wiring

1. All control and instrumentation wiring used within the SWAS panel sections shall conform to NEC and NEMA standards. All measurement and control circuits shall be factory wired and tested by energizing at operating voltage.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[175]	02.09.2015

2. All electric connections shall be made between devices within the SWAS panel sections and shall be made to suitable terminal blocks, if devices are to be connected to equipment outside the SWAS panel.
3. All electrical connections shall enter and leave through the top or bottom of the panels.
4. High impedance circuits shall be connected using shielded or co-axial wire suitable for the service. Terminals shall be furnished for termination of shield.
5. Wiring in the sampling section shall be routed in covered metallic trays located as distant as is practicable from sampling lines and drains with due care taken to isolate electric wiring, termination etc. from liquid areas.

11.14 Power Supply & Grounding

Power supply to all instruments and control systems shall be through UPS and separately fused, it should be possible to disconnect any instrument without interrupting power supply to any other equipment/device.

11.15 Lighting & Receptacles

1. Sample table and analyzer section shall be provided with rapid start, low noise, fluorescent strip fixtures installed in a continuous row along the top of each section.
2. The panel shall have a ceiling mounted fluorescent illumination. Light switches shall be provided within the panel sections at suitable locations.
3. Three receptacles shall be provided on the front of the sample table below the work surface. These shall be equally spaced. Two more receptacles shall be provided inside the sample table and one receptacle shall be installed inside the panel.
4. Wiring for lighting and receptacles shall be run in flexible metallic conduits.

11.16 Control & Monitoring System

All alarm shall be available on the panel for the entire SWAS system, with repeat facility for each alarm in DCS in the Control Room.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[176]	02.09.2015

12. VIBRATION MONITORING SYSTEM**12.1 General**

1. The vibration monitoring system shall provide health of rotating machines on continuous on-line basis and shall guide the plant maintenance personnel regarding the nature of fault and the maintenance action required.
2. The system to be provided shall include all necessary hardware, software, firmware and interfaces, all special and field signal cabling required for implementing a fully functional system. System shall include but not limited to the details specified in subsequent paragraphs/Clauses.
3. Vibration monitoring system shall be independent.

12.2 Design & Functional Requirements

1. The vibration monitoring system shall provide condition monitoring the bearings of all critical machines, equipments with HT drives and their driven equipment. These shall include but not limited to the following:
 - a) Boiler Feed Pumps
 - b) Condenser Extraction Pumps
 - c) Any other device with HT motor
2. The vibration monitoring system shall be complete with vibration sensors, Key Phasor sensors, signal conditioning cards, amplifiers, special cables, vibration monitor (if required) etc. together with all necessary equipment and accessories.
3. Vibration sensors shall be provided for measurement in both X (horizontal) and Y (vertical) axis at 90° angle to each other for each bearing.
4. For bearings of high speed machines (= / >1500 rpm) accelerometer type sensor and for low speed machines (<1500 rpm) velocity type sensor shall be provided.
5. Necessary, one or two stage integrators for obtaining vibration measurement in terms of displacement shall be provided in the system.
6. Vibration monitoring system shall provide the vibration measurement in the form of 4 - 20 mA DC signal to be directly connected by hardwired cable to plant DCS for monitoring. Limit value generation (soft) for alarm and protection applications for the auxiliaries and their drive equipment shall be carried out in DCS or applicable control system (PLC).
7. Vibration monitoring system shall be an independent microprocessor based system (PC based). The system shall be interfaced with Plant DCS system through redundant communication link in addition to hardwired signal exchange. The system shall interface with plant DCS for any process signals which may be required to perform condition monitoring functions through soft link.
8. The Vibration Monitoring system shall have Following minimum features:
 - a) Bar graph and point display indicating the set points.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[177]	02.09.2015

- b) Graphical plant and machine area representation with location of sensors and the current value.
 - c) Diagnostic of the system and sensors. Alarm to be retransmitted to DCS.
 - d) Current and history trend with resolution of 10 msec.
 - e) Spectral band and waveform plotting
 - f) Multiple trends display including process value for data correlation.
 - g) Orbit and time base plotting.
 - h) Shaft centreline plot indicating position of a machine rotor.
 - i) Bode and polar plot.
 - j) Date and Time stamped alarm list.
 - k) Log and Report generation.
 - l) Provision for beeping icon in case of appearance of alarm.
 - m) Export and import of DCS data. Both way redundant communication links with the DCS shall be provided.
 - n) Electronic documentation.
9. The system shall have facility to store bulk data for 5 years duration with facility for retrieval of the same. The system shall have facility to share all the data in the hard disk/ back up media and provide user friendly utilities to retrieve and analyze stored data.
10. Data collected in the system shall also be accessed by CMMS resident on the Station LAN for condition based maintenance.
11. The system shall be time synchronised with GPS based master clock.
12. The vibration transducers shall be installed in accordance with API-670 requirements.
13. Two nos. vibration monitoring cum programming stations shall be provided in Central Control Room.

12.3 Technical Requirements

12.3.1 Vibration Sensors

1. Inductance/ piezoelectric type transducers shall be used. The sensors shall be either velocity or accelerometer type. However, the sensor type shall be selected taking into consideration equipment manufacturer's recommendation. Vibration sensors as recommended by main equipment manufacturers shall be installed both in horizontal (X) and vertical (Y) directions at each bearing housing of pump and motor. One number key-phaser (proximity type) shall also be provided for each equipment i.e. Pump/ Fan.
2. The vibration sensors shall have wide frequency response to monitor the harmonics and be housed in stainless steel enclosure conforming to protection degree of IP-67. Sensor shall be provided with all accessories like mounting pad/

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

cube, Low noise cables & conduits, Extension cables, Junction boxes, Prefab connectors etc.

- Vibration transducers shall be complete with all required pre-amplifier / driver/charge amplifier as necessary for proper operation of the entire vibration monitoring system.

Table 12.1
Specifications for Vibration Sensor

S.N	Features	Minimum Requirements
1	Sensitivity	4 mv/mm/sec
2	Measurement range	0 to 25.4 mm/s pk
3	Frequency Range (+/- 10%)	3 – 1000 Hz
4	Resolution	0.1 mm/s pk
5	Linearity	+/- 1%
6	Temperature Range	0 – 60 °C
7	Sensing Element	Ceramic
8	Sensing Geometry	shear
9	Housing material	SS 316
10	Sealing	Welded hermetic
11	Electrical connection type/ position	Molded Integral cable / Top
12	Excitation Voltage	12 – 30 V DC
13	Cable type/length	Polyurethane/ 10 ft.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[179]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

Table 12.2
Specifications for Key Phasor Sensor

S.N	Features	Minimum Requirements
1	Type	Proximity non-contact type
2	Sensitivity	200 mv/mil
3	Measurement range	0 to 20 mil
4	Frequency Range	0 – 10 KHz
6	Linearity	+/- 1%
7	Temperature Range	0 – 60 °C
8	Probe tip material	Polyphenylene sulfide
9	Probe body material	SS 316
10	Electrical connection type/ position	Molded Integral cable 1 metre length with connector for extension / Top
11	Excitation Voltage	24 V DC from monitoring unit
12	Cable type	Polyurethane

12.3.2 Vibration Monitors/ Signal Conditioning Modules

1. The vibration monitors/ modules shall be micro-processor based with extensive self diagnostic facility. Monitoring module shall be fully software configurable.
2. One buffered 4-20 mA signal for connection to Plant DCS, and one buffered raw signal for use in vibration monitoring system shall be made available from each measuring point channel of monitor/ module. The signal shall be suitable for use as an input to DCS for analog monitoring, linear in proportion to vibration velocity as well as displacement. Monitor shall provide vibration indication calibrated in velocity units along with provisions of changing to displacement unit (field-programmable) for each measurement point in both horizontal & vertical planes.
3. Monitoring modules shall allow “hot” insertion or removal.
4. The maximum no. of channels per monitor/ module shall be four. The allocation of channels shall be such that loss of one monitor shall not affect more than one side of the bearing of one machine.
5. Sensor fault, monitor fault, power supply fault monitoring shall be provided. On sensor fault / wire break in the sensor circuit, the system shall have the feature of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[180]	02.09.2015

identifying the same through suitable means like the output being forced to a value less than 4 mA, to enable 'bad' signal detection. In case, such a feature is not available, then suitable contact shall be provided from the monitor for sensor fault/ wire break in sensor circuit.

6. Programmable high pass and low pass filtering facility shall be available to improve the frequency response.
7. All the calibration of the monitors/ modules and transducers shall be possible from the front panel.
8. All incoming and outgoing signals shall be connected through a terminal block or connection mounted at the back of the monitor.
9. In addition to the above, the monitor/ module shall contain all other required signal conditioning devices and accessories required for proper functioning.
10. Sensitivity of vibration monitoring module shall be 100 mV/mil or better
11. The Vibration monitoring system shall have an accuracy of +/- 1 % of Full Scale.
12. Input frequency shall be user programmable.

12.3.3 Power Supplies

1. System shall have provision to receive two numbers 230 V, 50 Hz feeders from purchaser UPS, further conversion and distribution shall be in done as per scope. If required, redundant external Power supply shall be provided to ensure that failure of one power supply shall not affect any monitoring function in the system. Also any power supply failure/ earth fault in any of the monitors shall be isolated without affecting other monitors/ common power supply. However, if any power supply modules internal to the monitors are envisaged, the failure of one such module should not affect more than one monitor.
2. Power supply monitoring feature with suitable indication and external alarms shall be provided.

12.3.4 Cables, Conduits & Junction box

1. Each transducer shall be furnished with low noise cable in flexible conduit, as indicated earlier, in actual length as required. Conduit fittings shall be furnished or connection to vibration transducer. The other end of the flexible conduit shall be connected to a suitable junction box. The flexible conduit shall not be directly terminated to the vibration transducer to avoid any damages due to vibration. Pre-wired plug-in- type connector shall be provided for connection of the low noise cable to the vibration transducer. Terminals shall be provided for terminating the low noise cable to the junction box.
2. Provision of suitable canopy on the JB and panels installed in open area shall be provided.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[181]	02.09.2015

Table 12.3
Specifications for Flexible Conduits

S.N	Features	Minimum Requirements
1	Type	Stainless steel flexible conduit
2	Material	AISI 304
3	Formation	Single overlapped/Square Locked
4	Minimum Bending Diameter	75 mm
5	Flexibility	Should not be permanently distorted when bent in complete turn round on a cylinder of 75 mm diameter.
6	Tensile strength	400 N or better
7	Diameter & length	As per requirement

12.3.5 Programming Functions

Suitable means shall be provided for programming the components of the system. This shall include range change, set point change, sensor fault detection/ monitoring related functions etc.

12.3.6 System Cabinet/ Monitor Racks

- The system mounting rack shall preferably be 19" EIA rack mount for monitor based systems. The system mounting rack shall house monitor modules, indicating units, power supplies. Rack shall be fully factory wired up to rear terminal block. The Internal arrangement shall take into consideration aspects of access/ ease of maintenance etc.
- Panel shall be provided with necessary Isolation transformers, MCBs, switch etc. Power and signal cable shall be routed in separate raceways.
- All necessary accessory items and electrical materials shall be installed in the monitoring panels as required for completeness of the panels. These shall include but not be limited to the following:
 - Terminal blocks with identification tags.
 - Terminal lugs and wire markers at both ends of all wires.
 - Panel hardware including vibration isolating devices
 - Grounding bus
- Incoming cables from the field shall be terminated in suitable terminal blocks in logical sequence.

--	--------------------------

5. Each vibration monitor and mounting rack shall have nameplate engraved to indicate the main equipment to which the module is catering and the bearing details.
6. In case of monitor based system, the front door shall be of glass, for the portion where the monitors are mounted to enable viewing of the same.

12.3.7 Wiring

1. All instrument wiring used within the panels shall conform to NEC and NEMA standards and shall be factory installed and tested at the works.
2. Signal circuit shields shall be grounded at the system cabinet end only or as recommended by manufacturer.
3. All internal wiring (except low level instrument wiring) shall be National Electric Code Type SIS, Polymeric / Elastomeric insulated, copper stranded conductor & switchboard wire.
4. Panel wiring shall have a flame resistant insulation with adequately sized copper conductor based on current carrying capacities as set forth by the National Electric Code.

12.3.8 Terminal Blocks

1. For all inputs to the system emanating from the field or “others” systems, the system shall be furnished with screw less cage clamp type terminals suitable for core size of 0.5/1.5 square mm. stranded conductor.
2. At least 20 per cent spare unused terminals shall be provided, for circuit modifications and for termination of all conductors in a multi conductor control cable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[183]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

13. FIELD INSTRUMENTS & FINAL CONTROL ELEMENTS

13.1 General Requirements

1. All instruments shall be of proven reliability, accuracy, repeatability requiring a minimum of maintenance. They shall comply with the acceptable international standards.
2. Every panel mounted instrument requiring power supply shall be used with a pair of easily replaceable glass cartridge fuses of suitable rating. Every instrument shall be used with a grounding terminal and shall be suitably connected to the panel grounding bus.
3. All local gauges as well as transmitters, sensors, and switches for parameters like pressure, temperature, level, flow etc. as required for the safe and efficient operation and maintenance as well as for operator and management information (including all computation) of equipment shall be used.
4. The necessary root valves, impulse piping, drain cocks, gauge-zeroing cocks, valve manifolds and all the other accessories required for mounting/erection of these local instruments shall be furnished, even if not specifically asked for, on as required basis. The contacts of equipment mounted instruments, sensors, switches etc. for external connection including spare contacts shall be wired out in flexible/rigid conduits, independently to suitably located common junction boxes. The proposal shall include the necessary cables, flexible conduits, junction boxes and accessories for the above purpose. Double root valves shall be used for all pressure tapings where the pressure exceeds 40 kg/sq cm.
5. For protection purposes, transmitters can be considered in place of switches.

13.2 Pressure / Differential Pressure / Flow / Level Transmitter

Table 13.1

Specifications for Pressure / Differential Pressure / Flow / Level Transmitter

S.N	Features	Minimum Requirements
1	Type	Microprocessor based 2 wire type, HART protocol compatible
2	Sensor Type	Capacitive/ Piezo-electric
3	Output Signal	4-20 mA signals superimposed with HART signal.
4	Signal Processing Unit	Microprocessor based
5	Overpressure	150% of max. operating pressure. For vacuum service, the element shall have

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[184]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.N	Features	Minimum Requirements
		under – range protection to full vacuum
6	Turn-down Ratio	10:1 for vacuum / very low pressure applications. 100:1 for other applications.
7	Stability	± 0.1% of calibrated span for six months up to 70 Kg/cm ² and ± 0.25% for range more than 70 Kg/cm ² (g).
8	Span and Zero drift	± 0.015% per deg. C at max span & 0.11% per deg. C at min. span.
9	Enclosure Class	Weather proof as per IP 67 with corrosion resistance coating. For hazardous area explosion proof enclosure as described in NEC article 500
10	Zero & span adjustability	Continuous, tamper proof, remote as well as manual from instrument with zero suppression and elevation facility.
11	Local Indicator	To be provided
12	Display	Digital LCD Integral Display (minimum 5 digit) Engineering Unit
13	Process connection	½ " NPT (F)
14	Electrical Connection	½ " NPT
15	MOC of Electrical Housing	Aluminum Alloy or better
16	Ambient Temperature	65 Deg. C
17	Operating Voltage	16 – 48 Volts DC
18	Load	600 Ohms (minimum) at 24 Volts DC
19	Accuracy	± 0.075% of span or better
20	Response Time	100 millisecond or better

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[185]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.N	Features	Minimum Requirements
21	Adjustment/ calibration/ maintenance	Port/provision for Centralised PC based system maintenance.
22	Diagnostic	Self Indicating feature
23	Accessories	Diaphragm seal, pulsation damper, siphon, 3-valve or 5valve manifolds.

1. All transmitters shall be equipped with all necessary accessories like valve manifolds, mounting bracket etc. Pulsation dampeners shall be used where the process media is unstable for measurement such as at the discharge of a pump. For absolute pressure transmitter, 2 valve manifold; for gauge / vacuum pressure transmitter, 3 valve manifolds and for DP / level / flow transmitter, 5-valve manifold shall be provided. In case if it becomes necessary to use a DP transmitter for pressure measurement then a 3 valve manifold shall be used in place of 2 valve manifold.
2. Pressure transmitter shall have easily accessible span, zero and time constant adjustments. A range suppression / elevation device shall be used wherever required.
3. For pressure / differential pressure transmitter, proof pressure shall be 200% of maximum static process pressure.
4. All transmitter cases shall be dust – tight and rugged. Weather – proof and explosion – proof cases shall be used in outdoor and hazardous areas respectively. Protection clause shall be of IP 67 or better.
5. Transmitters for pressure / DP measurements of liquid and steam shall always be installed below the sampling point, preferably with the connection at the top.
6. Transmitters for pressure / DP measurements for gases and air shall always be installed above the sampling point, preferably with the connection at the bottom.
7. Transmitters with diaphragm seal system shall be considered when
 - a) The process temperature is outside of the normal operating ranges of the transmitter and cannot be brought into those limits with impulse piping.
 - b) The process is corrosive and would require frequent transmitter replacement or unusual materials of construction or
 - c) The process contains suspended solids or is viscous and may plug the impulse piping or
 - d) There is a need to make density or interface measurements or
 - e) The process medium may freeze or solidify in transmitter or impulse piping.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[186]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

8. Diaphragm seal shall be either capillary type or direct mounted type depending upon the application. Parts below the diaphragm shall be removable for cleaning. The entire volume above the diaphragm shall be completely filled with an inert liquid suitable for the application.
9. Differential pressure type level transmitters shall be used for range above 1219 mm, for services requiring purge or where liquid might boil in external portions.
10. Differential pressure type level transmitters for use on corrosive service shall generally be diaphragm wafer with extended filled capillary type. Flush or extended diaphragm type DP transmitter shall be considered for special application. Diaphragm material shall normally be stainless steel or any other special alloy.
11. Differential pressure type flow transmitters shall have in-built square-root extractors.

13.3 Temperature Transmitter

Table 13.2

Specifications for Temperature Transmitter

S.N	Features	Minimum Requirements
1	Type	2-Wire, Smart (HART)
2	Output Signal	4-20 mA signals superimposed with HART signal.
3	Signal Processing Unit	Microprocessor based
4	Accuracy	± 0.075 % of span or better
5	Local Indicator	To be provided
6	Display	Digital LCD Integral Display (minimum 5 digit) Engineering Unit
7	Input	Ohm input from Pt-100 RTD/ mV signal from thermocouples
8	Stability	± 0.1 % of reading or 0.1° C, whichever is greater, for 24 months for RTDs. ± 0.1 % of reading or 0.1 °C, whichever is greater, for 12 months for thermocouples
9	Output	4-20 mA DC, linear

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[187]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.N	Features	Minimum Requirements
10	Load	600 Ohms (minimum) at 24 Volts DC
11	Power Supply	24 VDC, 2- Wire Loop Power
12	MOC of Electrical Housing	Aluminum Alloy or better
13	Enclosure Class	IP 67 with corrosion resistance coating. For hazardous area explosion proof enclosure as described in NEC article 500

- The temperature transmitter of following types (2-wire Loop Powered temperature transmitter) compatible with thermocouples and RTDs shall be used. Cold junction temperature compensation of the thermocouples shall be performed in the temperature transmitter itself.

Single Input DIN-rail mounted Temperature Transmitter

These shall be suitable for mounting on DIN-rails in Panels/JBs in air conditioned room. This temperature transmitter shall be the ones which are especially designed for DIN-rail mounting with IP 20 protection class. These shall have terminals for input/output provided on front side when mounted on DIN-rail. Head mounted temperature transmitter with clamps to make it suitable for DIN-rail mounting shall not be acceptable under this category.

Dual-input Temperature Transmitter with Indicator

These shall be suitable for mounting on pipes/ supports. Indicator shall be used with these transmitters. These transmitters shall have bump-less change over facility to second sensor in case first sensor fails .This changeover is to be alarmed. Protection class shall be IP67 minimum.

- Transmitters shall be used with following features:
 - Sensor drifts alarm for sensor failure prediction
 - Differential & average temperature measurement if required.
 - Automatic switch-over to back-up sensor on primary sensor failure.
 - Accepts any combination of two sensor types (RTDs, T/Cs, mV or ohms)
 - Ambient temperature compensation
 - Fault detection for electronics & sensors with fail-safe alarming.
 - Provision of built-in CJC
- Transmitters to be used for RTD sensors shall be used with RTD EMF correction features so that it shall detect and eliminate EMF errors which are the result of small voltage produced by RTD sensing elements.
- The product and make shall be selected so that with one make of transmitter all applications with respect to measuring range, temperature sensor (resistance

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[188]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

thermometer / thermocouple) and connection type (2/3/4) wire connection of resistance thermometers) shall be covered.

5. Transmitters shall be capable of communication with HART (Highway Addressable Remote Transducer) communicator. HART communicator shall be used with transmitters for tuning / configuring / diagnosing / maintenance of the transmitters. It shall meet the intrinsic safety requirement if required depending upon the application.
6. All transmitters' cases shall be dust-tight and rugged. Weather-proof and explosion-proof cases shall be used in outer and hazardous areas respectively.

13.4

Thermocouple

Table 13.3
Specifications for Thermocouple

S.N	Features		Minimum Requirements
1	Wire Gauge		16 AWG (for K type) 24 AWG (for R type)
2	Protective tube		O.D. 8 mm Material SS 316 seamless Filling – Compacted Magnesium Oxide (Purity above 99.4)
3	Loading		Shall be spring loaded to ensure positive contact with the well. Prevention of rotation of the insert with respect to head and resultant twisting of leads shall be ensured.
4	Accuracy		As per ANSI MC 96.1 / IEC 751 / IS-2054 / 2055.
5	Characteristic		Linear with respect to temperature within +/- ½ per cent of top range value.
6	Reference		For temperature vs. mV characteristics, following IS shall be applicable : Type K IS – 2054 Type R IS - 2055
7	Head	Type	IP-65 universal screwed type (Explosion proof for NEC class-1, division-1 area)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[189]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.N	Features		Minimum Requirements
		Material	Die-cast aluminium or better material painted with black enamel paint.
		Terminal Block	Brass screw type / silver plated on ceramic head.
		Cable Connection	½ " NPT gland & grommet
		Cover	Screwed cover with suitable gasket & SS Chain
8	Instrument connection to Well		½ " NPT
9	Accessories	a)	Adjustable nipple-union-nipple {1/2" Sch. 80 X1/2" NPT (M)} with thermowell connection
		b)	Compression fittings/union
		c)	Flanges etc. (For flanged connection only)
		d)	SS 316 forged/barstock thermowell as per ASME PTC code. Process connection M33X2 (M) in general or 1 ½ " Flanged for Flue gas/ Furnace air etc. application

- The following types of sensors shall be used for the different temperature ranges:
 - For measurement of temperatures of up to max. 1100 °C, rapid-responded sheathed thermocouples with insulated tip, 16 AWG wire, as Chromel-Alumel (NiCr-NiAl, ISA type K) measuring element, with admissible deviation of thermo voltage of half the values stated in IS-2054 or DIN 43710.
 - For measurement of temperature between 1100°C and 1300°C, 24 AWG, Platinum Rhodium (13%) – Platinum (ISA type R) measuring elements, with admissible deviation of thermo voltage of half the values stated in IS-2055 or DIN-43710.
- All thermocouples shall be duplex type with tip grounded. Thermoelectric properties and accuracy shall be as per ANSI MC 96.1 / IS-2054 / 2055.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[190]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

3. The design of thermocouple assemblies shall be such that replacement on line is possible.
4. Gas-tight ceramic sheaths partially reinforced with stainless steel sheath shall be used as protective tube for Pt Rh – Pt thermocouples. For other type of thermocouple stainless steel tubes shall be used as protective sheaths. For measuring temperature of high pressure process fluid, tapered protection sheath made from solid bar stock shall be used.
5. The time-constant of thermocouples shall suit the process requirement.
6. The thermocouples shall be supplied with factory tested and calibrated assemblies. The assemblies shall be complete with thermo well, sensing element, connection lead, duplex terminal block, extension nipple, compression fittings / unions /flanges etc. to meet all functional requirements. The thermocouples equipped with thermo well shall be spring loaded for positive contact with the well.
7. The duplex terminal block shall be constructed with high temperature ceramic base with brass screw type terminals.
8. Thermocouple shall be suitable for steam, water or any other liquid application. For air & flue gas service, suitable protection tubes shall be used for the thermocouples.
9. All thermocouples shall be terminated to the nearest junction boxes. The cold junction compensation shall be implemented within the measuring module level, no local/ field cold junction compensation box is allowed.

13.5 Resistance Temperature Detector (RTD)

Table 13.4

Specifications for RTD

S.No.	Features	Minimum Requirements
1	Type	3 / 4 wire , Pt-100 (100 ohm at 0 deg C) (as per DIN 43760)
2	No. of Element	Duplex
3	Housing/Head	IP-65/Diecast Aluminium. Plug in connectors are to be provided for external signal cable connection
4	Sheathing of RTD	Metal sheathed , mineral insulated, ceramic packed
5	Calibration and accuracy	As per DIN-43670 Class-A for RTD

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[191]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Features	Minimum Requirements
6	Stability	Zero & span drift within 0.1% of span for a 6 month period.
7	Characteristic	Linear with respect to temp, within $\pm 1/2$ percent of top range value
8	Standard	As per DIN-43670 for RTD & ASME PTC-19.3 for Thermowell
9	Accessories	a) Adjustable Nipple-Union-Nipple with thermo well connection / plug in connectors
		b) Compression fittings / unions
		c) Flanges etc.
		d) Thermowell as per requirement

1. RTDs shall be of duplex, platinum three / four wire type with a nominal resistance of 100 ohms at 0°C and conform to DIN 43760 / BS 1904.
2. Stability of RTD over full range shall be better than 0.05 ohms and the repeatability figure shall be better than 0.02 ohms. Accuracy shall be of the order of 0.15% or better and response time shall be less than 20 seconds with thermo well.
3. The protective-sheath material shall be SS 316, seamless tubes using compacted magnesium oxide packing for insulation. The insulation resistance at 540°C shall not be less than 5 mega-ohms.

13.6

Metal Temperature Thermocouple

Table 13.5

Specifications for Metal Temperature Thermocouple

S.No.	Features	Minimum Requirements
1	Measuring medium	Metal Temperature
2	Type	K-Type
3	Wire Gauge	16 AWG
4	No. of Element	Duplex with separate hot junctions, ungrounded type
5	Sheathing/Insulation/Dia.	Metal sheathed (SS 321) , mineral insulated (Magnesium oxide), ceramic packed, 8 mm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[192]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Features	Minimum Requirements
		Dia.
6	Bending Radius	30 mm (minimum)
7	Cold End Sealing	SS pot seal with color coded PTFE headed sleeve insulated flexible tails. Sealing compound – Epoxy Resin
8	Standard	ANSI MC 96.01
9	Thermocouple Length	30 Mtrs. (minimum)
10	Accessories	1/2" BSP SS sliding end connector, weld pad, weld on clamps of heat resistant steel SS310.

1. For metal temperature measurement, care shall be taken for proper contact with metal surface. The thermocouples sheath for metal temperature measurement shall have to be thermally insulated to avoid radiation / conduction / convection loss. Thermocouple assembly for metal temperature measurement shall suit the functional requirement.
2. The thermocouple shall be attached to the heater tube surface by being furnished with stainless steel welding pads or by the use of thermocouple attachment blocks. The multiple holes in these blocks shall allow for spare thermocouple element for quick replacement.
3. The differential temperature “inside / centre” of the wall shall be measured by means of sheathed thermocouples NiCr-Ni, dia 3.2 mm. For this special protective sleeve shall be used. Particular emphasis shall be put on compliance with the stipulated depth of the bores in the tube wall material.
4. For detection of leakage of various drain valves, drain pipe metal temperature thermocouples and for SH, RH metal temperature thermocouples shall be used.

13.7 Cold junction Compensation (CJC) Boxes

Table 13.6A

Cold Junction Compensation (CJC) Boxes

S.No.	Medium	MOC
1	Reference Temp	60°C (+/- 1.3°C) for type K thermocouple 60°C (+/- 2°C) for type R thermocouple
2	Effect of ambient temp. variation	+/- 0.1% per 10°C

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[193]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Medium	MOC
3	Material	4 mm thick fiberglass reinforced polyester with polyetherene paint and glazed finish
4	Protection class	IP 55
5	Cable entry	Bottom with gland plate suitable for cable used along with blanking facility.
6	Temp. Control	Automatic with remote temp. monitoring
7	Power supply	24VDC

13.8 Thermowell for Temperature Elements

1. The design of the thermo well shall take into consideration the temperature, pressure, medium and fluid velocity specified in the process in accordance with ASME Standard PTC 19.3.
2. Thermo wells shall, in general, be of SS 316 and shall be drilled from bar stock except for air and flue gas services. However, selection of thermo well material shall be as per following guideline.

Table 13.6B
Thermowell MOC Selection

S.No.	Medium	MOC
1	Steam lines	SS 316 and pipe material compatible for high temperature steam
2	Water lines	Low carbon steel/ SS316

3. Welded type thermo wells with 38 mm O.D. for welding & ½" NPT internal threads shall be used for pressure above 100 kg / sq cm or temperature above 400 deg C. Socket weld type thermo well with 34 mm O.D. for welding & ½" NPT internal thread, shall be used for pressure between 40-100 kg/cm2 and temperature up to 400°C. Screwed type thermo wells with ½" NPT internal threads & M33X2 (M) outer threads shall be used for pressure below 40 kg/cm2 and temperature below 400°C. For pipes having probability of prolonged vibration, seal welding may be done all around after tightening the thermo well within the base.
4. Thermo well manufacturing drawing covering material specification, dimensional details, details of special treatment, finish etc. as well as test procedure. Material certificate shall have to be furnished for each thermo well.
5. Wherever any approval is necessary from any recognized body / authority during manufacturing of high pressure wells.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[194]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

6. The thermo well immersion depth (U) shall be sufficient to eliminate conduction error. A general rule which may be followed is to use an immersion length equaling a minimum of 10 times the diameter of the protective tube or well. In general, immersion length of thermo wells for different line sizes shall be as follows:

Table 13.6C
Thermowell Immersion Length

S.No.	Line Size	Immersion Length
1	From 4" to 6"	65 mm
2	From 8" & onwards	140 mm
3	Vessels	400 mm

13.9

Pressure Gauge/ Differential Pressure Gauge/Draft Gauge

Table 13.7
Specification for Pressure Gauge/ DP Gauge/ Draft Gauge

S.No.	Feature	Minimum Requirement
1	Type	Bourdon / Bellows / Diaphragm
2	Sensing Element Material	AISI 316 SS
3	Movement Material	AISI 304 SS
4	Case Material / Protection Class	SS / IP 65
5	Dial Size	150 mm For Special application like drum pressure, Main Steam pressure etc. 250 mm shall be used
6	Scale	Black lettering on white background in 270 °C arc
7	Range Selection	Normally operate at 75% of its maximum pressure range. Instruments measuring varying pressures shall operate in a band of 60% of its maximum pressure range.
8	Over range Protection	150% of maximum range by internal stop. External stop below zero.
9	Adjustment	External Micrometer screw for zero adjustment. Internal micrometer screw for range adjustment.
10	Stop at Max. Reading	Shall be used
11	Element Connection	Argon welding
12	Process Connection	½" NPT(M) bottom connection for local mounting, back connection for panel mounting
13	Accuracy	+/- 1.0 % of full scale or better

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[195]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Feature	Minimum Requirement
14	Operating Ambient Temperature	50 °C (Max. continuous)
15	Safety Feature	Neoprene Safety Diaphragm (Blowout disc) at the back
16	Window	Shatter-proof glass
17	Chemical Seal Unit	SS 316 Flange and Diaphragm, PTFE coated / block, Silicon Oil filling fluid
18	Accessories	Snubber for pulsating fluid applications / 3-way gauge cock / 2-valve manifold / Pigtail / Siphon for steam service / Gauge Saver, if maximum or Design Pressure is very high than the Operating Pressure / Counter Flanges / Bolts, Nuts, Gaskets / SS Tag Plate

1. Directly connected pressure measuring instruments shall be diaphragm, bourdon or bellow type elements depending upon the services conditions. In general, diaphragm elements shall be used in the range of 0 to 1000 mm water column pressure, bellow type element for ranges of 0 to 1 Kg/cm² and bourdon type element for ranges greater than 1 Kg/cm².
2. Primary element material shall be corrosion resistant to process fluid or diaphragm seals shall be used for protection.
3. For draft measurement Teflon coated beryllium copper diaphragm shall be used.
4. Snubber shall be floating pin type, externally mounted and externally adjustable. It shall be used for all pulsating services.
5. Diaphragm seals, filled type or mechanical type shall be furnished where plugging of the element may occur or where suitable material is not available in highly corrosive services. When chemical seals are required, they shall be the clean out type with flushing connection.
6. Over-range protection shall be used to at least 150 % of range. For vacuum service, the element shall have under-range protection to full vacuum
7. Ranges of the gauges shall be so selected that the gauge normally operates in the middle third of the scale and conform to IS 3624 standard dials, wherever necessary.
8. The sensing elements for all gauges shall be properly aged and factory tested to remove all residual stresses and shall be SS 316 with forged socket and tip of the same material. Elements above 70 Kg/sq. cm range shall be bored instead of drawn.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[196]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

13.10 Temperature Gauge

Table 13.8
Specification for Temperature Gauge

S.No.	Feature	Minimum Requirement
1	Type	Mercury filled
2	Sensing Element material	Bourdon AISI 316 SS
3	Movement Materials	AISI 304 SS
4	Case Material/Protection class	SS / IP65
5	Capillary Armouring	SS Flexible
6	Capillary	SS 316 (5 mtr. Length for Local & 15 metre for panel Mounting)
7	Bulb/Stem Diameter	12 mm
8	Dial Size	150 mm
9	Window	Shatterproof glass
10	Scale	Black lettering on white background in 270 °C arc
11	Adjustment	Micrometer screw for zero adjustment. Internal micrometer screw for range adjustment.
12	Pointer	Externally Adjustable
13	Range Selection	Normal Process Temperature – approximately two third of Temperature range.
14	Stop at Max. Reading	Shall be used
15	Over range Protection	150% of FSD
16	Instrument Connection	Bottom connection for local mounting, back connection for panel mounting.
17	Process Connection	½" NPT with Thermowell
18	Performance :-	
a	Accuracy	+/-1.0% of full scale or better
b	Repeatability	Less than 0.5% of full range
c	Response Time	30 seconds (max.) with Thermowell and 15 seconds Bare.
19	Operating Ambient Temperature	50 °C (Max. continuous)
20	Accessories	Mounting brackets, Bolts, Nuts, Gaskets / SS Tag plate, SS Thermowell etc.

1. Temperature gauges shall be dial thermometers (liquid spring / steam pressure spring / metal expansion thermometer), either rigid stem or capillary tube depending upon application; if this is not possible for design reasons, industry type liquid – in – glass thermometers shall be used.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[197]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

2. Case shall have back or bottom connection with adjustable gland to permit adjustment of thermometer into the thermo well.
3. Thermometer stem adjustable gland with union connection and bushing shall be suitable for ½ inch NPT connection.
4. Bi-metallic type dial thermometer, if used, shall be hermetically sealed, back or bottom connection type, with 150 mm dial.
5. The gauges shall be used with automatic ambient temperature compensation.
6. Scale ranges shall be selected so that normal process temperature in middle two – third of full scale range.

13.11 Level Gauge

Table 13.9
Specification for Level Gauge

S.No.	Feature	Minimum Requirement
1	Sensing Element & material	Tempered toughened Borosilicate gauge glass steel Armored reflex or transparent type
2	Body Material	Forged carbon steel / 304 SS
3	End Connection	Process connection as per ASME PTC and drain / vent 15 NB
4	Accuracy	+ 2 %
5	Scale	Linear vertical
6	Range Selection	Cover 125 % of max. of scale
7	Over Range Test	Test pressure for the assembly shall be 1.5 to the Maximum design pressure at 38 degree C
8	Housing	CS / 304 SS leak - proof
9	Identification	Engraved with service legend or or laminated phenolic Name plate
10	Packing	PTFE Teflon

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[198]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Feature	Minimum Requirement
11	Illumination	220 V, 50 Hz, 25 / 40 Watts either with deflector or diffuser (for transparent type level gauge) / 220V , 50 Hz, 25 /40 Watts with red and green filter for bicolor gauge
12	Accessories	Gasket for all KEL – F shield for transparent type vent and drain valves of CS / SS as per requirement
13	Others	Anti – Frost extension for low temperature service. Heating / cooling arrangement

- Level gauges shall be steel armoured reflex or transparent or bi –colour type, top and bottom connection as per pressure vessel standard of ASME PTC code and 15 mm NB (1/2 inch NPT) Drain and Vent connection.
- Body material and cover material shall normally be forged carbon steel, 304 stainlesssteel or other superior material.
- Reflex type gauges shall be used for clean and colorless liquids and transparent type for other liquids.
- The gauge glass must have a rating equal to or more than the vessel design pressure and temperature.
- The maximum length of a single gauge glass shall not exceed 1400 mm. Where large range is required, multiple gauges of preferably equal lengths shall be used with 50 mm over – lapping in visibility.
- The visibility shall cover the operating level range and the maximum and minimum ranges expected considering start – up conditions as well as alarm and shut down points. Internal heating shall be used for viscous liquids. Integral illuminators shall be used for transparent gauges, if necessary.
- Stand – pipes shall be used for multi – gauge glass and level controller installation and on horizontal drum or exchanger with top and bottom connections to have visibility of the complete span. The stand pipe shall not be used with block valves.
- Primary isolation valves shall be used In addition to the gauge glass valves unless otherwise specified. When the process fluid may create lugging or leakage problem, gauge valves may be omitted. For low temperature liquid having high

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[199]	02.09.2015

--	--------------------------

vapor pressure at ambient temperature, isolation and gauge valves shall not be permissible. Safety valve shall be used at the vent connection of the gauge glass where isolation is required.

9. For high pressure service such as HP/LP Heaters etc., the gauge glass shall be multi – port illuminated type (Bi – colour type). Indication of water space shall be ‘green’ and indication of steam space shall be ‘red’.

10. Bi – colour level gauges shall have following features:

- Temperature equalizing column expansion bend and chain patterned hand – wheel
- Certification by Inspectorate of Boiler

13.12 Pressure/ Differential Pressure Switch

Table 13.10
Specification for Pressure/DP Switch

S.No.	Feature	Minimum Requirement
1	Type	Piston for high pressure application Bellow/Diaphragm for low pressure application
2	Sensing Element material	AISI 316 SS
3	Wetted Parts material	AISI 316 SS
4	Case Material	Epoxy coated Die Cast Aluminium
5	Setter Scale	Black graduation on white linear scale. Graduation 0 – 100% with red pointer for set points.
6	Over range for Pressure / Vacuum Switch	150% of maximum pressure
7	Set Point	Adjustable throughout switch operating range.
8	Static Pressure for Differential Pressure Switch	Maximum Line Pressure or Static Pressure on either side without permanent deformation or loss of accuracy.
9	Adjustments	Internal – set point Differential adjustable feature
10	Process Connection	½ " NPT(M) bottom connected

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[200]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Feature	Minimum Requirement
11	Switch Configuration	2 SPDT / 1 DPDT
12	Switch Rating	230 V, 5A AC / 220 V, 0.25 A DC/24 V, 2A DC
13	Switch Type	Snap acting, shock and vibration-proof
14	Cable Connection	½ " ET conduit connections or compression gland
15	Enclosure Class	Weather proof as per IP 65 with corrosion resistance coating.
16	Accuracy	1% of span up to 3Kg/cm2 0.5% of span for more than 3 Kg/cm2.
17	Repeatability	0.5% of span
18	Accessories	
a)		Snubber for pulsating fluid application.
b)		Tag Number, service engraved in SS tag plate
c)		Teflon back-up sheath protection, as required.
d)		i) Remote diaphragm seal with SS 316 armored capillary for typical application. MOC of seal material shall be as per process fluid requirement. ii) Silver coated diaphragm for corrosive services like chlorinated water.
e)		Retention ring and screws for surface mounting.
f)		3-way Gauge Cock (SS 316) for PS / 5-Valve Manifold (SS 316) for DPS.
g)		Mounting bracket / Clamp for 2 " pipe, bolt & nut.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[201]	02.09.2015

1. The pressure switches shall have sensing elements made of copper alloy or stainless steel sealed diaphragm and piston actuated for high pressure service and bellows for low pressure / vacuum service.
2. Low differential pressure switches for low static pressure ranges shall be diaphragm type with snap action switch elements.
3. Low differential pressure switches for high static pressure shall be elbows and torque tube type and snap – action switch elements and metric scale dial indicators.
4. For corrosive, viscous process fluids diaphragm sealed with completely filled inert liquid shall be used. Material of diaphragm and wetted parts shall be selected considering the nature of process fluid.
5. The sensing elements shall be properly aged and factory tested to remove all residual stresses. They shall be able to withstand at least 150 % the full scale pressure without any damage or permanent deformation.
6. Actuation set point, dead band shall be internally adjustable throughout the range with tamper proof facilities.
7. Electrical connection for the switch devices shall be suitable for plug in type connection.
8. Process connection shall be ½ inch NPT. Process piping connections shall include necessary union, nut, nipple, tail pipe, isolation valve and test connection to permit servicing, testing, calibration and removal of the instrument device.
9. Pressure switches shall be tested as per BS – 6134.

13.13 Conductivity Type Level Switch

Table 13.11
Specification for Conductivity Type Level Switch

S.No.	Feature	Minimum Requirement
1	Sensing elements	Conductivity type
2	Material	SS 316
3	Repeatability	± 0.5 % of full range or better
4	Accuracy	± 0.5 % of full scale or better
5	Working temperature	As per process requirement
6	Probe length	As per requirement
7	Mounting	Flanged- on external cage
8	No. of contact	2 NO. + 2 NC, SPDT, snap action type dry

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Feature	Minimum Requirement
		DC
11	Enclosure	IP 65
12	Hydro Test	Chamber – 100% at 1.5 times rated pressure or as per ANSI flange rating Float – 1.1 times of operating pressure
13	Electrical Connection	Plug-in socket
14	Accessories	All mounting accessories

1. Level Switch shall work on gland less magnetically coupled float or displacer operated mechanism having separate float chamber.
2. Float, stem and displacer shall be 316 stainless steel.
3. Level switch body, cage and process connections shall be designed to withstand the maximum pressure and temperature of the operating fluid.
4. A setting adjustment on the level set point of + / - 25 mm shall be used. The adjustment shall be made externally to the switch.
5. The accuracy & repeatability of the switch shall be within +/- 0.5 % of full-scale range. On – Off differential shall be adjustable.
6. Process connections of the cage shall be 25 NB male plain nipples connected through socket / welded isolation valves of adequate rating.
7. Level switch connections shall also include 15 NB test and drain connections to permit servicing, testing, calibration of the instrument.
8. The switching elements shall be snap-acting, shock-proof and vibration-proof. All switches shall have two electrically isolated SPDT contacts with provision of external adjustment of set points and dead bands. The contact ratings shall be 5 amps at 240 V AC 50 Hz or 0.25 amps at 220 V DC.
9. Switch enclosures shall be cast aluminium, weather-proof, NEMA -4X type with cable entry through compression type cable glands / ¾ "NPT conduit connections. Switches located in hazardous areas shall have dust-ignition-proof enclosure as per NEC article 500 provisions.

13.16 Ultrasonic Level Transmitter

Table 13.14
Specification for Ultrasonic Transmitter

S.No.	Feature	Minimum Requirement
1	Application	Level measurement in silos, sump water level etc.
2	Medium	Coarse, hard solid materials like ash etc. Materials may be slowly falling through the detection range.
3	Type	Non contact Microprocessor based 2 wire type, HART protocol compatible Ultrasonic Transmitter
4	Principle	Time of flight
4	Sensor Material	Corrosion resistant material to suit individual application requirement.
5	False signal tolerance	Transmitter shall be capable of ignoring false echoes from internal tank / sumps obstructions such as pipes, heating coils or agitator blades. Also transmitters shall have adjustable damping circuitry.
7	Range	Capable of covering the complete level span of tank/vessel taking care of blocking distance, frequency, attenuation due to surface, obstructions, vapours etc.
8	Output	4 – 20 mA DC with 600 ohms load with HART compatibility.
9	Display	minimum 4 characters display with Integral keypad, access protected by user code.
10	Diagnostics	Loss of echo alarm etc.
11	Resolution	+/- 0.1 % of range or better
12	Accuracy	+/- 2 mm or 0.2% of span
13	Repeatability	3 mm or better
14	Operating temperature	0 to 60° C
15	Power supply	24 V DC + / - 10 %

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[206]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Feature	Minimum Requirement
16	Mounting	Flanged connection at top of covers / side walls as per requirement.
17	Accessories	a) All weather canopies for protection from direct sunlight and direct rain.
		b) For hazardous areas, explosion proof enclosure as per NEC article 500 shall be used.
		c) All mounting hardware and accessories required for erection and commissioning. Mounting fittings material shall be SS 316.

1. The power and frequency of transmission for the transmitter shall be selected to assure a sufficient signal / noise ratio.
2. The transmitter shall be designed with an electronic circuit having the features such as temperature compensation, rejection of unnecessary echoes and noises and adjusting 'zero' and 'span'. It shall consist of sensors, electronic unit and accessories.

13.17

Guided Wave Radar Type Level Transmitter

Table 13.15
Specification for Guided Wave Radar Type Transmitter

S.No.	Feature	Minimum Requirement
1	Application	Level measurement of vessel under vacuum or low pressure application
3	Type	Guided wave radar
4	Principle	TDR (Time domain reflectometry)
5	Probe Material	SS 316
6	Accuracy	5 mm or better
7	Resolution	+/- 0.1 % of range or better
8	Signal Output	4 – 20 mA DC with 600 ohms load with HART compatibility
9	Power Supply	24 V DC + / - 10 %
10	Display	Integral

13.20 Sight Glass Indicator (Flow Glass)

Table 13.18
Specification for Flow Glass

S.No.	Feature	Minimum Requirement
1	Application	Online observation of fluid flow in Pipeline
2	Type	Double window for pressurized pipe with rotary wheel for installation in horizontal or vertical pipeline. Full view for non-pressurized pipeline.
3	Size	Double window up to 12" and 600 lbs rating. Full view up to 6" and 150 lbs rating.
3	Body Material	SS 316
4	Glass	Pyrex tempered glass
	Others	Rotor & wetted parts shall be bronze All accessories shall be SS316
5	Protection class	IP-65
6	Connection	Screwed up to 50 NB size Flanged ANSI 150 RF – above 50 NB size
7	Accessories	Name plates, mating flanges with gasket, bolts & nuts etc.

---	-------------------

13.21 Flow Element
a) Orifice Plate

Table 13.19 A
Specification for Orifice Plate

S.No.	Feature	Minimum Requirement
1	Type	Concentric as per ASME PTC – 19.5 (Part III); ISA RP – 3.2, 960; BS – 1042; ISO 5167
2	Material	SS 316
3	Thickness	3 mm for main pipe diameter up to 300 mm and 6 mm for main pipe dia above 300 mm.
3	Beta ratio	0.34 to 0.7
4	Tapping's	Flanged weld neck 3 pairs of tappings.
5	Material of Branch Pipe	Same as main pipe
6	Root Valve type	Globe
7	Root Valve material	SS 316
8	Root Valve size	1"
9	Accessories	Root valves, flanges, vent / drain hole (as required)

- Each orifice plate shall be used with a handle on which the orifice diameter, pipe diameter and pressure tap distances are stamped. This information shall be so located that it can be read without removing the orifice plate from pipe line.
- The standard primary element shall be thin plate, square-edge concentric orifice plate mounted between a pair of weld-neck type orifice flanges with flange taps. The minimum pressure rating of flanges shall be 300 pounds ANSI. The material of the orifice plates shall be SS 316 in general. Orifice plates shall be not less than 3 mm thick for nominal pipe diameters up to and including 300 mm, and not less than 6 mm thick above 300 mm NB pipe.
- Quadrant edge or quarter circle orifice plates shall be used for highly viscous liquids and for pipe Reynolds Number below 10,000. Conical entrance type of orifice plates shall preferably be used for very highly viscous liquids up to Reynolds Number below 250. Vent and drain holes shall be used wherever necessary.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[211]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

4. Orifice diameter shall be selected, so that d/D ratio is between 0.20 to 0.70 for gas and steam and up to 0.75 for liquids.
5. Metering orifices shall not be installed in lines less than 1 ½" (40 mm) the lines shall be blown to the 1 ½" (40 mm) size for the meter run, keeping the d/D ratio within limits.
6. Restriction orifices and integral orifice transmitters do not require upstream or downstream straight pipe runs.
7. The orifice plate shall be supplied and fitted in conformity with ISO. When the pipe diameter is larger than the value specified in ISO, the restriction ratio shall be decided by extending the specific curve externally.
8. The length of straight pipe run required for metering accuracy shall be in conformity with ISO. When it is extremely difficult to comply with the standard, a minimum straight length of 10D (D = pipe inner diameter) on the upper stream and a minimum length of 5D on the downstream shall be considered.
9. All orifice plates shall be supplied with matching flanges of material and pressure rating not less than the rating of the associated pipe system.
10. For pipeline sizes of 500 mm and less, the orifice plates shall be an integral unit comprising of carrier ring assembly, tapping arrangement on both upstream as well down stream side. For line sizes more than 500 mm, the orifice plate shall be disc type. For disc type orifice plate, suitable corner tapping arrangement on both upstream as well as downstream side shall be used. All tapping arrangements shall be complete with a piece of impulse pipe line and a shut – off valve suitable for specified line pressure.
11. For steam applications, orifice plate shall be supplied with a pair of steam condensation chambers suitable for specified line pressure.
12. Data sheets, sizing calculation, fabrication & sheets for the elements shall be submitted for approval and finalization.

b) Flow Nozzle

Table 13.19 B
Specification for Flow Nozzle

S.No.	Feature	Minimum Requirement
1	Type	Long Radius welded type ASME PTC 19.5 (Part III) or BS – 1042
2	Material	Same as Pipe material
3	Thickness	Suitable for intended application
3	Beta ratio	Around 0.7
4	Tapping's	D and D/2 (3 nos. tappings)
5	Material of Branch Pipe	Same as main pipe
6	Root Valve type	Globe
7	Root Valve material	SS 316
8	Root Valve size	1"
9	Accessories	Root Valves, Vent & Drain Hole

- The branch pipes for holding the flow nozzle shall also be furnished along with the flow nozzle.
- Flow nozzles in high pressure pipes shall be subject to a test according to DIN 50049, 3.1C, considering the technical guideline. The test of flow nozzles shall contain:
 - Check of drawings
 - X-ray testing of the circular bead or colour soaking or ultra-sonic testing
 - Test of sizes.
- Flow nozzle shall be used with a permanent mark indicating:
 - Measuring point number
 - Direction of flow
 - Plus and minus tapping
 - Material

Moreover, the actual inside pipe diameter "D" and the diameter of the flow nozzle shall be stated on the identification plate.

- The supplier shall provide the following documents:
 - Design drawings of the flow nozzle

--	--------------------------

- b) Calculation documents
 - c) Fabrication, assembly and installation drawings
 - d) Test reports.
5. For measurements of steam, balancing vessels shall be used. Balancing vessels shall be used for flow measurement in steam system based on the differential pressure method to ensure a defined water column. The balance vessels shall be arranged on the same geodetic level. If this is not possible for design reasons, the level difference shall be taken into account during calibration
- c) **Venturi**

Table 13.20
Specification for Venturi

S.No.	Feature	Minimum Requirement
1	Design standard	BS 1042/ISO5167
2	Material	SS 316
3	Type	Fabricated Machine Cast
4	Mounting	Flanged
5	Root Valve type	Ball
6	Root Valve material	SS 316
7	Root Valve size	1/2"
8	Accessories	All required mounting accessories & piezometric ring with 4 nos. tapping's for choke removal & screwed cap/plug on the ring

13.22 Control Valves

13.22.1 Introduction

The control valves and accessories equipment furnished by the Supplier shall be designed, constructed and tested in accordance with the latest applicable requirements of code for pressure piping ANSI B 31.1, the ASME Boiler & Pressure Vessel code, Indian Boiler Regulation (IBR) & ISA or acceptable equal standards.

13.22.2 Control Valve Design & Sizing

1. The design of all valve bodies shall meet the specification requirements and shall conform to the requirements of ANSI for dimensions, material thickness and material specification for their respective pressure classes.
2. The valve sizing shall be suitable for obtaining maximum flow conditions with valve opening at approximately 80% of total valve stem travel and minimum flow conditions with valve stem travel not less than 10% of total valve travel. All the valves shall be capable of handling at least 120% of the required maximum flow. Further, the valve stem travel range from minimum flow condition to maximum flow condition shall not be less than 50% of the total valve stem travel. The sizing shall be in accordance with the latest edition of ISA Handbook on control valves. While deciding the size of valves, Supplier shall ensure that valves outlet velocity does not exceed 8 m / sec. for liquid services, 150 m/sec. for steam services and 50% of sonic velocity for flashing services. Manufacturer shall furnish the sizing calculations clearly indicating the outlet velocity achieved with the valve size selected by him as well as noise calculations.
3. Control valves for steam and water applications shall be designed to prevent cavitations, wire drawing, flashing on the downstream side of valve and downstream piping. Thus for cavitations / flashing service, only valve with anti-cavitations trim shall be used. Detailed calculations to establish whether cavitations will occur or not for any given application shall be furnished.
4. Trim shall be multistage type having sufficient number of discrete pressure drop turns (stages) to ensure elimination of vibration, erosive – action, cavitations. Identify the number of pressure drop turns in the given equipment and shall also provide calculation demonstrating compliance to the trim exit velocity.
5. To prevent flow induced vibration and to protect the valve internals from foreign particles such as weld slag flow, direction shall be a flow to close (over the plug) configuration for liquid applications. To maximize noise attenuating benefits and to allow for constant fluid expansion, flow direction shall be under the plug for steam and gas applications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[215]	02.09.2015

6. Control valves for application such as Feedwater Flow control shall have permissible leakage rate as per leakage class V. All other control valves such as low and high range feed control valves etc shall have leakage rate as per leakage class IV.
7. The control valve induced noise shall be limited to 85 dBA at 1 meter from the valve surface under actual operating conditions. The noise abatement shall be achieved by valve body and trim design and not by use of silencers.
8. The characteristic of the control valves shall be determined based on the application / service.
9. On supply air or electrical failure for pneumatic / electrical drive, the valve shall remain full closed, open or stay – put position as per process safety requirement.

13.22.3 Valve Construction

1. Proper selection of valve type and material of construction to meet operating requirement.
2. All valves shall be of globe body design and straightaway pattern with single or double port unless otherwise recommended by the manufacturer to be of angle body type. Rotary valve may alternatively be offered when pressure or pressure drops permit.
3. Valves with high lift cage guided plugs & quick charge trims shall be supplied.
4. Cast iron valves are not acceptable.
5. Bonnet joints for all control valves shall be of the flanged and bolted type for easy dis – assembly. Bonnet joints of internal threaded or union type will not be acceptable.
6. Plug shall be of one – piece construction either cast, forged or machined from solid bar stock. Plug shall be screwed and pinned to valve stems or shall be integral with the valve stems.
7. All valves connected to vacuum on down stream side shall be used with packing suitable for vacuum applications (e.g. double vee type chevron packing).
8. Valve characteristic shall match with the process characteristics.
9. Extension bonnets shall be used when the maximum temperature of flowing fluid is greater than 280 degree Celsius.
10. Flanged valves shall be rated at not less than ANSI pressure class of 300 lbs.
11. Teflon shall be used for valve gland packing to suit process requirement.
12. The valve body shall be marked to show direction of flow.

13.22.4 Valve Materials

1. The control valve body material shall be
 - a) Carbon steel as per ASTM – A216 GR WCB for non – corrosive, non – flashing and non – cavitations services below 275 deg c temperature like

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[216]	02.09.2015

Auxiliary Steam flow to Deaerator, CRH flow to Deaerator, Condensate flow to Deaerator etc.

- b) Alloy steel as per ASTM – A217 GR WC 9 for severe flashing / cavitations services like low load and full load feed water control, HP and LP heaters emergency drains, Deaerator overflow drain to Hotwell etc.
 - c) Alloy steel as per ASTM A – 217 GR WC 6 for low flashing / cavitations services like HP heaters & LP heaters normal drain control, drain cooler normal level control, gland steam cooler minimum flow etc.
 - d) 316 SS for condensate service below 300 deg C like condensate normal and emergency make – up controls etc.
2. The control valve trim material shall be
- a) 17 – 4 PH SS for severe services listed under item D.1, 2nd point & 3rd point above
 - b) 316 SS for services listed at D.1, 4th point above and
 - c) 316 SS with stellite faced guide parts and bushings for remaining applications.

13.22.5 End Preparation

Valve body ends shall be either butt welded / socket welded, flanged or screwed. The welded ends wherever required shall be butt welded type as per ANSI B 16.25 for control valves of sizes 65 mm and above. For valves sizes 50 mm and below welded ends shall be socket welded as per ANSI B 16.11. Flanged ends wherever required shall be of ANSI pressure – temperature class equal to or greater than that of the control valve body.

13.22.6 Valve Actuator

1. The regulating control valves shall be furnished with pneumatic actuators. The supplier shall be responsible for proper selection and sizing of valve actuators in accordance with the pressure drop and maximum shut off pressure and leakage class requirements. The valve actuators shall be capable of operating at 60 °C continuously.
2. Valve actuators and stems shall be adequate to handle the unbalanced forces occurring under the specified flow conditions or the maximum differential pressure specified. An adequate allowance for stem force, at least 0.15 kg / cm² per linear millimeter of seating surface, shall be used in the selection of the actuator to ensure tight seating unless otherwise specified.
3. The travel time of the pneumatic actuators shall not exceed 10 seconds.
4. For quick opening / closing services (such as fuel oil shut – off valve), the actuator shall be pilot solenoid operated pneumatic drive; the rating of solenoid shall be 24 V DC.

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[217]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

5. Selection of actuator shall be such that it meets the requirements of thrust / torque, stroke length, angular movement, full scale travel time, repeatability & accurate positioning for successful operation of final control element.
6. All the actuators shall have also provision for manual operation during emergency / maintenance along with graduated local position indicator.

13.22.7 Control Valve Accessory Devices

All control valve accessories such as air locks, hand wheels / hand-jacks, limit switches, SMART positioners, diffusers, external volume chambers, reversible pilot for positioners, tubing and air sets, solenoid valves and junction boxes etc. shall be used as per the requirements.

Table 13.21(i)
Specification for E-to-P converter

S.N	Feature	Minimum Requirement
1	Air Supply	1.5 Kg/Sq. cm
2	Input Signal	4-20 mA DC
3	Output Signal	0.2 to 1.0 Kg/ Sq. cm
4	Linearity	0.5 % of span or better
5	Hysteresis	0.1 % of span or better
6	Ambient Temperature Effect (-20 to +60 *C)	<0.2 % of span per Degree centigrade
7	Mounting	Close to Actuator
8	Protection class	IP-65
9	Enclosure	Die cast Aluminium
10	Drift	+/- 2% of set point per hour

		water ingress	
18	Accessories	a)	Display with push buttons for configuration and Display on the positioner itself (Password Protected / Hardware Lock).
		b)	For Supply & Output Pressure, Filter Regulator and other accessories shall be used as on required basis for making system complete
		c)	Valves Mounting Assembly For Sliding Stem / Rotary / Single Acting / Double Acting on required basis

1. SMART positioner shall be a Double stage positioner. The first stage of the positioner shall be typically a flapper-nozzle that serves as a high-gain pre-amplifier. This sensitivity shall be maintained over a wide range of dynamic conditions. Second stage shall be a power amplifier that provides power to drive the actuator. Preferably this shall be a pneumatic relay. Spool Driven type SMART positioners are not preferred due to Higher Dead Band and Poor responsiveness. The SMART positioner shall have pressure sensors to measure the pneumatic outputs to the actuator.
2. The control algorithm for the positioner shall use feedback signal from the motion of the pneumatic relay beam instead of pressure feedback to minimize pneumatic related effects and for stable and smooth response of the control valve. The SMART positioner shall have user adjustable tuning sets to identify the optimum tuning for the total valve assembly. SMART Positioner with HART Communication facility shall communicate all the valve diagnostics to Plant DCS.

7	Power supply	24 V DC/ 8 V DC
8	Mounting	Flush mounting with check nut
9	Other Feature	Explosion proof enclosures shall be used wherever required by the application. Shock & Vibration proof.

13.22.8 Test & Examination

- All valves shall be tested in accordance with the quality assurance programme agreed which shall meet the requirement of IBR and other applicable codes.
- The tests shall include but not but limited to the following:
 - Non-destructive test as per ANSI B – 16.34.
 - Hydrostatic shell test in accordance with ANSI B16.34 prior to seal leakage test.
 - Valve closure test and seal leakage test in accordance with ANSI B16.34 and as per the leakage class indicated under clause no. B.6.
 - Functional test: The fully assembled valves including actuators control devices and accessories shall be functionally tested to demonstrate times from open to close position.

--	--------------------------

- e) All control valves shall be tested with the positioners for accuracy of positioning and reproducibility over the full range of travel.
 - f) CV Test: CV test shall be carried out as type test on each size, type and design of the valves as per AISA 75.02 standard.
 - g) Magnetic particle inspection shall be performed on all machined surfaces of valves having ASA rating of 1500 lbs ASA or greater. All carbon steel valves with 1500 lbs ASA or greater shall receive 100% radio graphic examination in accordance with ASTM – E71.
3. The certificate shall be in the prescribed forms III A & III C and shall be endorsed by an Inspection Authority recognized by the Indian Boiler Regulations.

13.22.9 Pneumatic Power Cylinder

Table 13.22
Specification for Pneumatic Power Cylinder

S.No.	Feature		Minimum Requirement
1	Applicable standard		ISO 6431

14. PROCESS CONNECTION PIPING

Installation and testing of all required material for completeness of impulse piping system, sample piping system and air piping system as per the requirements of this clause on as required basis for the connection of instruments and control equipment to the process and make the system complete.

Control and instrument piping & connections shall generally be designed in accordance with the following criteria and these criteria shall be closely co-ordinated with Mechanical Piping / Erector to fulfill the Mechanical Design Criteria also. This is a guideline for Piping design & selection.

1. Pressure connections and piping up to the root valves for all pressure indicators, pressure switches, pressure transmitters, etc., shall be as indicated for miscellaneous piping.
2. Temperature indicators, temperature controllers, temperature switches, temperature detectors, and test well connections shall be as follows:
 - a) Main steam -- 40 mm NPT.
 - b) Extraction steam -- 40 mm NPT.
 - c) Boiler feed water -- 32 mm NPT.
 - d) Reheat steam -- 40 mm NPT.
 - e) All others -- 19 mm NPT.
3. Draft pressure connections on steam generator walls and ducts shall be 50 mm pipe couplings.
4. Flow transmitter connections and piping up to the root valves shall be 25 mm for all piping except orifice flanges, where 15 mm piping and valves shall be used.
5. Level switch connections and piping up to root valves shall be 25mm.
6. Level controllers and level transmitters of the displacement type shall have connections and piping up to root valves of 50 mm.
7. Level controllers and level transmitters of the differential pressure type shall have connections and piping up to root valves of 25 mm.
8. Instrument columns at tanks and pressure vessels shall generally be 65 mm minimum.

14.1 Design Pressure and Temperature

Instrument primary piping design pressure and temperature shall be selected consistent with the requirements discussed in Mechanical Design Criteria of this specification, for the process pipe to which the instrument primary piping is connected. The following general criteria shall also apply:

Instrument primary piping for steam and other systems shall be designed for 1-½ times the maximum sustained process pressure and temperature (plus 20°C).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[228]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

14.2 Sizes of Instrument Primary Piping

Instrument primary piping shall not be smaller than the connection at the process pipe root valve and/or the following (metric sizes are nominal):-

1. 20 mm for pressure measurement piping with a design pressure equal to or less than 42.0 bar and a design temperature equal to or less than 400°C.
2. 25 mm for pressure measurement piping with a design pressure greater than 42.0 bars or a design temperature greater than 400°C.
3. Flow and level measurement by differential pressure shall also use primary piping conforming to the above requirements; however, flange tap connections may be of 13 mm size.
4. Float actuated level switch devices shall be supported on connecting piping not smaller than 25 mm.
5. Level controllers and transmitters of the displacement float type shall be supported on connecting piping not smaller than 50 mm.
6. Instrument columns for float actuated level switches and displacement float devices shall be piping of not less than 65 mm.
7. Primary piping internal diameter shall not be less than 8 mm between the process connection and instrument blow down valve.

14.3 Materials for Instrument Primary Piping

Material for instrument primary piping connecting to the root valve shall preferably be the same as that used in the process system to which it is connected. Higher strength materials may be substituted in the interest of standardization; however, welding procedures at the point of joining the instrument primary piping to the process piping must be appropriate to the combination of materials involved. Copper may be used only for compressed air services that use copper process piping.

14.4 Insulation of Instrument Primary Piping

Instrument primary piping connecting to high temperature systems, which might become hot enough to injure personnel during blow down of the instrument line, shall be insulated where such hazard exists. Insulation materials, exterior finish, and metal lagging shall conform to the standards adopted for the process piping.

All materials supplied shall be suitable for intended service, process operating conditions and type of instruments used and shall fully conform to the requirements of this specification.

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

14.5 Process Connection Size

Size of tapping point, stub no and size of Root valves for different type of measurements. These shall be as follows:

Table 14.1
Process Connection Stub & Root valve

S.No.	Quantity of root valves (Nos.)	Size of stub and root valves	Service condition
A. Pressure and Differential pressure measurement			
1	2	25NB	> = 62 bar or 425degree C
2	1	15NB	< 62 bar and 425 degree C
B. Level Gauge and Switch			
1	2	25 NB	> = 62 bar or 425 degree C
2	1	25NB	< 62 bar and 425 degree C
C. Level Transmitter (Displacement Type)			
1	2	40NB	> = 62 bar or 425degree C
2	1	40NB	< 62 bar and 425 degree C
D. Stand pipe for Level measuring instrument			
1	2	80 NB	> = 62 bar or 425degree C
2	1	80 NB	< 62 bar and 425 degree C
E. Flow measurement			
1	2	25NB	> = 62 bar or 425degree C
F. Level measurement			
1	1	25NB	< 62 bar and 425 degree C
G. Sampling system measurement (system and water service)

14.6 Impulse Piping, Tubing, Fitting, Valves & Valve Manifolds

All impulse pipes shall be of seamless type conforming to ANSI B36.10 for schedule numbers, sizes and dimensions etc. The material of the impulse pipe shall be same as that of main process pipe. For various applications specification of impulse pipe materials and associated fittings and valves shall be as given in Table –15.2 (Process Connection Piping).

Table 14.2
Process Connection piping

---	-------------------

S.No.	Service	Size		Impulse tube material	Impulse tube material	Impulse line fitting material	valves material
		Pipe	Tube			ANSI rating	ANSI Rating
			mm THK		(SS)	3000LBS	150LBS

Notes:-

1. Impulse pipe thickness shall be selected as per ANSI B 36.10. based on the schedule indicated against each service.
2. Wherever impulse tubes are provided, all the fittings required for these shall be SS316.

The following guidelines shall also be considered along with the Table 9.2 for size, material and rating for impulse line/tube fittings and accessories:

a) Impulse line / tube fittings and accessories

1. Nipple shall be used for root valve size more then ½ inch and the nipple size shall be same as the root valve size. Reducer / adapter shall be used to suit instrument connection, where nipple, root valve size is more then ½ inch.
2. Bulk head fitting socket welded type to be provided at instrument rack / enclosure.

b) Fittings

1. All fittings except the last fitting connecting to the instrument shall be socket welded. The size of the fittings shall be same as the impulse line size.
2. The fitting connecting to the instrument shall have a size and thread to suit the instrument connection.

c) Drain

Drain shall be used for all water / steam and non-inflammable / non-corrosive fluids only.

d) Drain Valve

1. Two numbers of globe drain valves shall be used for process conditions of 425 degree C or 62 bar and higher.
2. One number globe drain valve shall be used for process conditions of less than 425 degree C and 62 bar.
3. The valve size shall be same as impulse piping / tubing size.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[233]	02.09.2015

e) Funnel with drain header

1. This shall be used in the racks for blowing / draining out the process fluid in the impulse tubings.
2. The size of drain header shall be 1"
3. When instruments are mounted local to the tapping point and are not mounted in rack, or panel or enclosure. The drains shall be connected to the nearest floor level or plant drain.

f) Instrument Valves

1. Type of the valve shall be needle valve with built in drain valve.
2. Sizing of the valve shall be ½".

g) Right / left threaded fittings

1. This shall be used for installation / removal of instruments without disturbing the tubing / piping.
2. A suitable adapter shall be used to install the instruments on ½" right-left threaded fittings.

h) A ½" vent line with a ½" isolation valve shall be used in the instrument rack for air and compressible fluids or other wise if the installation call for eg., for liquid service where the transmitter is located at a higher elevation than the tapping point.

Stainless steel tube shall be used inside enclosures and racks from tee connection to valve manifold and then to instrument. For high pressure/temperature applications the material shall be ASTM A 213 TP 316H and for other applications material shall be ASTM A 213 TP 316L. The wall thickness of the tube shall be in accordance with the ANSI B31.1 standard.

All fittings shall be forged steel and shall conform to ANSI B16.11. The material of forged tube fittings for shaped application (e.g. tee, elbow etc.) shall be ASTM A182 Gr. 316 H for high pressure/ temperature applications (as defined above) and ASTM A182 Gr. 316L for other applications. The material for bar stock tube fitting (for straight application) shall be 316 SS. Metal thickness in the fittings shall be adequate to provide actual bursting strength equal to or greater than those of the impulse pipe or SS tube, with which they are to be used.

The disc and seat ring materials of carbon steel and alloy steel valves shall be ASTM A-105 and ASTM A-182, Gr. F22, hard faced with stellite (minimum hardness - 350 BHN.) The surface finish of 16 RMS or greater is required in the area of stem packing. The valve design shall be such that the seats can be re-conditioned and stem and disc may be replaced without removing the valve body from the line.

The valve manifolds shall be of 316 s Furnishing Recommended protection interlock logics stainless steel with pressure rating suitable for intended application. 2-valve manifold and 3 valve manifold shall be used for pressure measurements using pressure transmitters/ pressure switches and differential pressure transmitters/ switches respectively. 5-valve manifold shall be used for remaining applications like DP, flow and level measurements.

For Pressure/D.P gauges in fluid application two-way globe valve on each impulse line to the instrument and in air/flue gas application two way gate valve on each impulse line to the instrument shall be used near the instrument. These shall be in addition to the three way gauge cock provided along with the pressure/D.P gauges.

14.7 Air Supply Piping

1. All pneumatic piping, fittings, valves, air filter cum regulator and other accessories required for instrument air for the various pneumatic devices/ instruments shall be used.
2. This shall include as a minimum air supply to pneumatically operated control valves, actuators, instruments, continuous and intermittent purging requirements of Local Instrument Enclosures (LIE) etc.
3. For individual supply line and control signal line to control valve, 1/4 inch size light drawn tempered copper tubing conforming to ASTM B75 shall be used. The thickness of copper tubing shall not be less than 0.065 inch and shall be PVC coated. The fittings to be used with copper tubes shall be of cast brass, screwed type.
4. All other air supply lines of 1/2 inch to 2 inch shall be of carbon steel hot dipped galvanized inside and outside as per IS-1239, heavy duty with threaded ends. The threads shall be as per ASA B.2.1. Fittings material shall be of forged carbon steel A234 Gr. WPB galvanized inside and outside, screwed as per ASA B2.1. Dimensions of fittings shall be as per ASA B16.11 of rating 3000 lbs.
5. Instrument air filter cum regulator set with mounting accessories shall be used for each pneumatic device requiring air supply. The filter regulators shall be suitable for 10 kg/ sq.cm max. inlet pressure. The filter shall be of size 5 microns and of material sintered bronze. The air set shall have 2 inch size pressure gauge and built in filter housing blow down valve. The end connection shall be as per the requirement.
6. All the isolation valves in the air supply line shall be gate valves as per ASTM B62 inside screw rising stem, screwed female ends as per ASA B2.1. Valve bonnet shall be union type & trim material shall be stainless steel, body rating 150 pounds ASA. The valve sizes shall be 1/2 inch to 2 inch.
7. Purge Air Connection for Air and Flue Gas Applications
 - a) The continuous purging with instrument air shall be done, for all air and flue gas measurements excepting instrument air and service air instruments, at the process source connection end. Necessary arrangements required for

continuous purging shall be used inside all the air and flue gas local instrument enclosures.

- b) For intermittent purging with service air, necessary arrangements inside all the air and flue gas Local Instrument enclosures/racks shall be used. The SS three way valve provided in the SS tubing shall be used for isolating the transmitter and connecting the service air quick disconnect line.
- c) One air filter regulator, purge Rotameter and blow down device per instrument shall be used in the transmitter rack/enclosure.

15. INSTRUMENTATION CABLES & ACCESSORIES

15.1 Specifications of Instrumentation Cables

15.1.1 Common Requirements

Table 15.1
Specification of Instrumentation Cables- Common Requirement

S.No.	Property	Requirement
1	Voltage grade	1100 V (Peak Value)
2	Codes and Standard	All instrumentation cables shall comply with VDE 0815, VDE 0207, Part 4, Part 5, Part 6 , VDE 0816, VDE 0472, SEN 4241475, ANSI MC 96.1, IS-8784, IS-10810 (latest editions) and their amendments read along with this specification
3	Continuous operation suitability	At 70 deg. C for all types of cables, while 205 deg C for Type-C cables
4	Progressive automatic on-line sequential marking of length in meters.	To be provided at every one meter on outer sheath.
5	Marking to read 'FRLS'	To be provided at every 5 meters on outer sheath except for type-C cable.
6	Allowable Tolerance on overall diameter	+/- 2 mm (maximum) over the declared value in data sheet.
7	Variation in diameter	Not more than 1.0 mm throughout the length of cable.
8	Ovality at any cross-section	Not more than 1.0 mm
9	Others	a) Durable marking at intervals not exceeding 625 mm shall include manufacturer's name , insulation material, conductor's size, number of pairs, voltage rating, type of cable, year of manufacture to be provided. b) Cables shall be suitable for laying in conduits, duct, trenches, racks and underground-buried installation c) Repaired cables shall not be acceptable

15.1.1 Routine Test

To be carried out by supplier during various stages of manufacture.

1. Insulation & jackets: All tests as per IS – 5831 except insulation resistance, voltage & spark test shall be as per BS – 5308, Part II
2. Armor test as per IS – 3975
3. Conductor resistance
4. Cable capacitance and L/R ratio.

15.1.2 Acceptance Test

These following tests shall be carried out as acceptance test:

1. Continuity test
2. Voltage test as per BS – 5308 Part II
3. Conductor resistance and drain wire resistance
4. Cable capacitance and L/R ratio test.
5. Tests for uniformity of galvanization of armor as per IS – 2633
6. Oxygen and temperature index test as per ASTM D – 2863
7. Dimensional checks for overall diameter and under armour / over armour diameter.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[246]	02.09.2015

8. Checking of drum length & overall length tolerances.

Immediately after completion of electrical tests, the ends of the cable shall be sealed to prevent ingress of moisture with suitable PVC / Rubber caps

15.2 Specifications of Optical Fibre Cables (OFC)

1. OFC shall be installed on cable tray, duct bank, cable trench installation as necessary. For outdoor applications the cable shall be armoured with Poly Ethylene sheathing. In all cases cable shall be routed through suitable grade HDPE permanently lubricated protection pipe as per IS-4984, IS-12235 & TEC.G/CDS-08/01 of suitable size @ 53% fill factor.
2. The optical fibre core shall be of ultrapure fused silica glass coated with UV cured acrylate suitable to withstand temperature of about 80 deg. Centigrade continuously.
3. OFC shall be 4 / 8 / 12 core, galvanized corrugated steel taped armored, fully water blocked with dielectric central member for outdoor / indoor application so as to prevent any physical damage. The cable shall have multiple single-mode or multi-mode fibres on as required basis so as to avoid the usage of any repeaters. The outer sheath shall have Flame Retardant, UV resistant properties & to be identified with the manufacturer's name, year of manufacture, progressive automatic sequential on-line marking of length in meters at every meter on outer sheath.
4. The cable core shall have suitable characteristics and strengthening for prevention of damage during pulling viz. steel central member, Loose buffer tube design, 4 fibres per buffer tube (minimum), Interstices and buffer tubes duly filled with Thixotropic jelly or better material etc. The cable shall be suitable for maximum tensile force of 2000 N during installation, and once installed, a tensile 1000 N minimum. The compressive strength of cable shall be 3000N minimum & crush resistance 4000 N minimum. The operating temperature shall be -20 DegC to 70 DegC.
5. The splicing loss of any two fibres in any case shall not exceed 0.10 db/splice.
6. The total additional attenuation above the nominal attenuation due to regular splices, repair splices, connectors, temperature variation, ageing etc. shall be indicated.
7. Fibre coloring shall conform to EIA/TIA-598. The color-coding shall be permanent thus withstanding normal handling; e.g., during termination, testing, or cable relocation. Refer to EIA – 359 for color identification and coding.
8. Cables shall be designed & tested in accordance with ISO 11801, TIA-568 & ICEA 596 and Performance specifications shall be measured in accordance with the Fibre Optic test procedures(EIA/TIA -455 documents) test procedures of IEC-60793 & IEC-60794
9. The OFC shall generally conform to the following specifications.

15.3 Instrumentation Cable Interconnection & Termination Philosophy

The cable interconnection philosophy to be adopted shall be such that expensive grouping of signals by large scale use of field mounted Group Junction Boxes (JBs) at strategic locations. (Where large concentrations of signals are available, e.g. valves limit and torque switches, switchgear) is done and consequently cable with higher number of pairs are extensively used. The details of termination to be followed are mentioned in the following Table:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[250]	02.09.2015

Table 15.5
Instrumentation Cable Interconnection & Termination Philosophy

S.No.	Application		Type of Termination		Type of Cables
	From (A)	To (B)	End A	End B	
1.	Limit, Torque switches of valves / dampers / drives (integral junction box)	Marshalling cubicle / Marshalling cum Termination Cubicle / Local group JB	Plug-in connector	Posts mount cage clamp type	G
2.	Transmitters, E/P converters, process actuated switches mounted in LIE / LIR	Integral junction box of LIE / LIR	Plug-in connector	Cage clamp (rail mount)	F, G
3.	RTD heads	Local junction Box	Plug-in connector	Cage clamp (Rail mount) type	F
4.	Thermocouples	Junction Box	Plug in connector	Cage clamp (Rail mount) type	A, B, C *
5.	Other Field Mounted Instrument	Local JB / Group JB	Plug in connector	Screwed, Cage clamp (Rail mount) type	F (For analog signals) G (For Binary Signals)
6.	Junction Box (For Thermocouples for interlock and protection)	Marshalling Cubicle / Marshalling cum Termination Cabinet	Cage clamp (Rail mount) type	Screwed, Cage clamp (Rail mount) type	A, C *. These signals shall preferably through 6 pair cable
7.	Local junction box, Instrument Junction box of LIE / LIR / Group JB / MCC / SWGR	Group JB	Cage clamp (Rail mount) type	Cage clamp (Rail mount) type	F, G
8.	Local junction box,	Marshalling Cubical /	Cage clamp (Rail	Posts mount cage clamp	F, G

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[251]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Application		Type of Termination		Type of Cables
	From (A)	To (B)	End A	End B	
	Instrument Junction box of LIE / LIR / Group JB / MCC / SWGR	Marshalling cum termination Cabinet	mount) type	type	
9.	Marshalling Cubical / Termination Cabinet	Electronic system cabinet	Cage clamp post mounted type	Plug-in connector / Other System as per manufacturer's Standard	Internal Wiring

Notes:

1. Normally 10% spare cores shall be used when the numbers of pairs of cables are more than four pairs.
2. For analog signals, individual pair shielding & overall shielding & for binary signals only overall shielding of instrumentation cables shall be used.
3. * For high temperature applications only.
4. Instrument Cabling for instruments / equipment of specialized / proprietary Control System shall be as per manufacturer's standard.

15.4

Terminal Blocks

1. All terminal blocks shall be rail mounted/post mounted, cage clamp type with high quality non-flammable insulating material of melamine suitable for working temperature of 105 deg. C. The terminal blocks in field mounted junction boxes, temperature transmitters, instrument enclosures/racks, etc. shall be suitable for cage clamp connections. The terminal blocks in Control Equipment Room logic / termination / marshalling cubicles shall be suitable for the post mounted cage clamp connection at the field input end. The terminal blocks for SG integral control system Input/ Output connections from/to SWGR/MCC, shall be used with built in test and disconnect facilities complete with plug, slide clamp, test socket etc.
2. All the terminal blocks shall be used complete with all required accessories including assembly rail, locking pin and section, end brackets, partitions, small partitions, test plug bolts and test plug (as specified above for SWGR connections), transparent covers, support brackets, distance sleeves, warning label, marking , etc.
3. The marking on terminal strips shall correspond to the terminal numbering on wiring diagrams. At least 20% spare unused terminals shall be used everywhere including local junction boxes, instrument racks/enclosures,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[252]	02.09.2015

termination/marshalling cabinets, etc. All terminal blocks shall be numbered for identification and grouped according to the function. Engraved labels shall be used on the terminal blocks.

4. The terminal blocks shall be arranged with at least 100 mm clearance between two sets of terminal blocks and between terminal blocks and junction box walls.
5. Internal wiring in factory pre-wired electronic equipment cabinets may be installed according to the applicable standards as to wire size and method of termination or internal equipment. Terminal blocks for connection of external circuits into factory pre-wired electronic equipment cabinets shall meet all the requirements as specified above.

15.5 Internal Panels, Cabinets, System Cabinet Wiring Philosophy

1. Internal panel/cabinet wiring shall be of multi-stranded copper conductor with FRLS PVC insulation without shield and outer sheath meeting the requirements of VDE 0815.
2. Wiring to door mounted devices shall be done by 19 strand copper wire provided with adequate loop lengths of hinge wire so that multiple door opening shall not cause fatigue breaking of the conductor.
3. All internal wires shall be used with Tag identification of printed type (partex labels) at both ends. All wire directly connected to trip devices shall be distinguished by one additional red color.
4. All external connection shall be made with one wire per termination point. Wires shall not be tapped or spliced between terminal points.
5. All floor slots of desk/Panels/cabinets used for cable entrance shall be used with removable gasketed gland plates and sealing material. Split type grommets shall be used for prefabricated cables.
6. All the special tools as may be required for solder less connection.
7. Tag identification for internal wires shall be printed (partex labels)
8. Wire sizes to be utilized for internal wiring shall be as per following table.

Table 15.6

Wire Size for Internal Wiring

S.No.	Application	Wire Size
1	Current (4-20mA), low voltage signals (48 V)	0.5 Sq. mm
2	Ammeter/ Voltmeter circuit, control switches etc. for electrical system.	1.5 Sq. mm
3	Power supply and internal illumination.	2.5 Sq. mm minimum (shall be as per load requirement)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[253]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

15.6 Cable Installation & Routing

1. All cable assigned to a particular duct/conduit shall be grouped and pulled in simultaneously using cable grips and suitable lubricants. Cables removed from one duct/conduit shall not be reused.
2. Cables shall be segregated as per IEEE Std. 422. In vertically stacked trays, the higher voltage cable shall not be in higher position and instrumentation cable shall be in bottom tier of the tray stack. The distance between instrumentation cables and those of other system shall be as follows:
 - a) From 11KV/6.6KV/3.3KV tray system - 900 mm
 - b) From 415KV tray system - 600 mm
 - c) From control cable tray system - 300 mm
3. Cables shall terminate in the enclosures through cables glands. All cable glands shall be properly gasketed. Fire proof sealing (to prevent ingress of dust entry and propagation of fire) shall be used for all floor slots used for cable entrance. Compression cable glands (double for armored and single for other cables) shall be used.
4. All cables shall be identified by Tag. Nos. provided in approved format at both the ends as well as at an interval of 5 meters.
5. Line voltage drop due to high resistance splices, terminal contacts, insulation resistance at terminal block, very long transmission line etc. shall be reduced as far as practicable.
6. The cables emanating from redundant equipment/devices shall be routed through different paths. The above segregation of cables & wiring for redundant equipment / devices shall be in accordance with IEEE-Std-422

15.7 Cable Laying

1. Cable shall be laid strictly in line with cable schedule. In general, the cable routing from the local instrument to JB shall be such that the cable go away from the hot zone.
2. Identification tags for cables.
Indelible tags to be provided at all terminations, on both sides of wall or floor crossing, on each conduit/duct/pipe entry/exit, and every 20 m in cable trench / tray.
3. Cable tray numbering and marking.
To be provided at every 10m and at each end of cables way & branch connection.
4. Joints for less than 250 Meters runs of cable shall not be permitted.
5. Buried cable protection

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[254]	02.09.2015

With concrete slabs; Route markers at every 20 meters along the route & at every bend.

6. Road Crossings

Cables to pass through buried high density PE pipes encased in PCC. At least 300 mm clearance shall be used between.

- a) HT power & LT power cables,
- b) LT power & LT control cables,
- c) LT control & instrumentation cables,

Spacing between cables of same voltage grade shall be in accordance with the derating criteria adopted for cable sizing.

7. Segregation (physical isolation to prevent fire jumping)

- a) All cable associated with the unit shall be segregated from cables of other Units.
- b) Interplant cables of station auxiliaries and unit critical drives shall be segregated in such a way that not more than half of the drives are lost in case of single incident of fire.

8. Cable clamping

All cables laid on trays shall be neatly dressed up & suitably clamped/tied to the tray. For cables in trefoil formation, trefoil clamps shall be used.

9. Optical fibre cables inside conduits shall be laid on cable trays wherever available and feasible. In areas where the same are required to be buried, the same shall be buried in separate trench approx. 1.6 meter depth, to be laid in 2" GI/rodent proof HDPE conduits covered with sand, brick and soil along the pipe line route.

10. While crossing roads- to be laid in GI/rodent proof HDPE conduits with sand filling at bottom and sand, soil filling at top with cement concrete;

While crossing canals/river- to be laid in GI/rodent proof HDPE conduits within Hume pipe.

15.8 Cable Accessories

1. Cables, which terminate in cabinets or draw out sections, shall have sufficient cable coils in the bottom of the cabinet to permit full withdrawal of draw out sections without disconnecting the cables. When prefabricated cables with factory connectors on both ends are longer than required, the excess cable shall be coiled in the bottom of one or both termination cabinets.
2. No splices shall be made in conductors for instrument and control circuits except where required at connections to devices equipped with factory installed pigtailed. Such splices shall be made only in approved splicing boxes of fitting with

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[255]	02.09.2015

removable cover. The splices shall be made with sufficient slack left in the wire to permit withdrawal of the splice from the splicing boxes for ease of future disconnection of the splices. All exposed conductor or connector surfaces shall be covered with a minimum of three half-lapped layers of all weather vinyl plastic electrical tape. Taping shall extend a minimum of two cable diameters over the cable jacket and a similar distance over the other insulation or connections requiring insulation.

3. Proper grounding of all equipments shall be done. Further, proper termination of cable shield shall be verified and the grounding of the same shall be coordinated so as to achieve grounding of all instrumentation cable shields at same potential. This shall be completed prior to system tests.
4. Take full care while laying/installing cables as recommended by cable manufacturers regarding pulling tensions and cable bends.

15.9

Cable Conduits

1. Conduits shall be generally used for interconnecting cables from field instruments to Local JB's. All unarmoured cables shall be installed in conduit. All rigid conduits, couplings and elbows shall be hot dipped galvanized rigid mild steel in accordance with IS: 9537 Part-I and Part-II. The conduit interior and exterior surfaces shall have continuous zinc coating with an overcoat of transparent enamel lacquer or zinc chromate. Flexible metal conduit shall be heat resistant lead coated steel, water leak, fire and rust proof. The temperature rating of flexible conduit shall be suitable for actual applications. The flexible metal conduit shall be constructed with interlocked corrosion resistant steel & manufactured in accordance with UL1 & NEC Article 348.
2. All grounding bushings within all enclosures shall be wired together and connected internally to the enclosure grounding lug or grounding bus with 8 AWG bare copper conductors. Conduit runs to individually mounted equipment shall be grounded to the cable tray grounding conductor with 12 AWG bare copper conductors.
3. All rigid conduit fittings shall conform to the requirements of IS: 2667. Galvanized steel fitting shall be used with steel conduit. All flexible conduit fittings shall be liquid tight, galvanized steel. The end fittings shall be compatible with the flexible conduit supplied.
4. All individually mounted equipment and devices shall be connected to the supply conduit, using not more than one meter of flexible conduit adjacent to the equipment or device. Flexible conduit shall be installed in all conduit runs, which are supported by both building steel and structures subject to vibration or thermal expansion. This shall include locations where conduit supported by building steel or foundation becomes supported by steam generator framing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[256]	02.09.2015

5. Special areas, such as Control Rooms in which external noise is to be minimized, shall have flexible conduit in conduit runs where the runs cross from the main building framing to the Control Room framing.
6. Conduit supports shall be furnished and installed in accordance with these specifications. Support material shall comply with the requirements.
 - a) Hanger rods shall be 12 mm diameter galvanized threaded steel rods.
 - b) Single conduit support shall be one-hole cast straps and clamp backs. Multiple conduit bank supports shall be constructed of special galvanized support channels with associated conduit clips.
7. Conduit sealing, explosion proof, dust proof and other types of special fittings shall be used as required by these specifications and shall be consistent with the area and equipment with which they are installed. Fittings installed outdoors and in damp locations shall be sealed and gasketed. Hazardous area fittings and conduits sealing shall conform to NEC requirements for the area classification.
8. Double locknuts on all conduit terminations shall be used. Water tight conduit unions and rain tight conduit hubs shall be utilized for all the application which shall be exposed to weather. Moistures pockets shall be eliminated from conduits.
9. Conduits shall be securely fastened to all boxes and cabinets.

15.10 Cable Sub Trays & Support

1. The cable sub-trays and the supporting system, to be generally used between Local/Group JB's and the main cable trays. It is the assembly of section and associated fitting forming a rigid structural system used to support the cable from the equipment or instruction enclosure up to the main cable trays (trunk route). The material of cable tray shall be GI.
2. The covers on the cable sub-trays shall be used for protection of cables in areas where damage may occur from falling objects, welding spark, corrosive environment, etc. & shall be electrically continuous and solidly grounded. The cable trays shall not have sharp edges, burrs or projections injurious to the insulation or outer sheath of the cables.
3. The supporting arrangement of cable tray system shall be able to withstand the weight of the cable and cable tray system. The supporting interval shall not be more than the recommended span for the above loading for the type of cable tray selected. The tray shall not overhang by more than one meter from the support at the dead end. As far as practicable the cable sub-tray system shall be supported from one side only, in order to facilitate installation and maintenance of cables.
4. Install the estimated quantities and size of sub trays / troughs including all required fittings and adaptors on as required basis:

16. SYSTEM CABINETS, PANELS & JUNCTION BOX**16.1 General Requirements**

1. All control panels, system cabinets, local panels and local instrument enclosures, racks shall be furnished fully wired with necessary provision for convenience outlets, internal lighting, grounding, ventilation, space heating, anti-vibration pads and accessories as per IS:5039 as required for completeness of the system.
2. All panels & cabinets shall be free standing type and have bottom entry for cables unless otherwise specified. The bottom of panels, cabinets, enclosures shall be sealed with bottom plate, compression cable glands and fire proof sealing material to prevent ingress of dust and propagation of fire. The Cabinets shall be designed for front & back access to components, terminals and wiring.
3. The cabinets shall be used with bottom glanding plate which shall be removable from inside and shall be used with sufficient no. of knockouts. The details of knockouts shall be used during detail engineering. All knockouts shall be used with pluggable grommets.
4. The cabinets shall be of max. 2200mm height including base channel. The base channel shall be of 100 ISMC. All cabinets shall be of same height. Construction shall be modular.
5. System & non-system cabinets shall have "look alike" appearance.
6. All electronic system cabinets shall be designed for 50 deg C operating under maximum ambient temperature without air conditioning system in service. Further cabinets, panels shall be so designed that temperature rise due to heat load does not exceed 10 deg. C above ambient temperature under all operating conditions. Necessary louvers, fans, limited packing density, adequate spacing between instruments, devices etc. shall be used to maintain temperature rise within permissible limits.
7. Panels, cabinets enclosures wiring shall be arranged to enable the removal of modules/instruments and devices without unduly disturbing them.
8. All panels, cabinets, enclosures interiors shall be illuminated with rapid start fluorescent strip fixtures with door actuated switches. Door switch terminals shall be shrouded. All illuminated lights shall be used with isolation switch in addition to door switch for maintenance & switching off when not required. Illumination light shall be used on both front & back sides if both sides are provided with equipments/instruments/terminal blocks requiring maintenance.
9. Sufficient number of power receptacles with disconnect switches shall be installed within panels, enclosure and racks.
10. The local instrument enclosures/racks shall be used locally for mounting of electronic transmitters and switches, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[259]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- 11.Exterior steel surface shall be sand blasted, ground smooth, filed, primed, sanded and smooth enamel painted to give a good finish subject to minimum paint thickness of 65-75 microns for sheet thickness of 3 mm and 50 microns for sheet thickness of 2mm. Minimum 2 coats of primer and two sprays of final finish colour shall be applied to all surfaces.
- 12.The colour of the panel's interior shall be brilliant white. External colour of the panels shall be as RAL 7032 for LIE/ LIR and RAL 7035 for control room system cabinets.
- 13.All panels, enclosures, system cabinets, marshalling cabinets shall be used with a minimum of 20% spare terminations and system cabinets shall be used with spare space for 20% additional modules fully wired with connectors etc. in excess of the total requirement of the system design when the cabinets are delivered. The spare space capacity shall be distributed evenly throughout the cabinets.

16.2 System Cabinets

Table 16.1
Specifications for System Cabinets

S.No.	Features	Minimum Requirements
1	Application	For housing Signal conditioning cards, input/output cards, processor cards, power supply units etc.
2	Location	Indoor
3	Type	Free standing Vertical type
4	Protection class	IP-44
5	Material & Thickness	CRCA steel/ min. 2mm for panel sides & 3mm for gland plates
6	Doors	Double door with neoprene gasket, Lockable,
7	Cable entry	Bottom with fire proof compound thickness 50 mm for sealing
8	Anti vibration pad	Required, 15mm
9	Painting	Interior- Brilliant White Exterior- RAL 7035

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S.No.	Features	Minimum Requirements
10	Cabinet Dimension	To be decided during detail engineering
11	Grounding	M6 earthing stud shall be used
12	Ventilation	Fans & louvers with brass mesh required
13	Lighting	rapid start fluorescent strip fixtures with door actuated switches required
14	Lifting arrangement	Removable lifting eyebolts shall be used

1. Beacon Lamps shall be used in each cabinet to indicate panel having fault condition.
2. The racks in system cabinets shall have provision along with plug in sockets/back plane to house accommodate the spare slots/modules as specified elsewhere.
3. The system cabinets, racks in system cabinets, slots in the racks & the terminals shall have identification numbers. A stainless steel metal tag (plate) shall be fixed to the inside of the door & the layout of the racks, slots & details of the card type/service shall be inscribed on this metal tag.
4. Each cabinet shall be used with one each 3 pin receptacles for 230 V, 1P, 50 Hz and receptacles for 24V DC.
5. One of the doors shall be used with folder to keep the relevant engineering document of the cabinet.
6. All cabinets shall have common key for locks.
7. Door shall have concealed type of hinges with 120 degree swing.
8. Door latches shall be of the three-point type to ensure tight closing.
9. Separate Power & shield earthing bus shall be used at the front & rear side of the cabinets. The earthing bus shall be isolated from panel body by suitable insulation material.

16.3 Marshalling Cabinets

Table 16.2
Specifications for Marshalling Cabinets

S.No.	Features	Minimum Requirements
1	Application	For termination of all cables originating from field.
2	Location	Indoor
3	Type	Free standing Vertical type
4	Protection class	IP-44
5	Material & Thickness	CRCA steel/ min. 2mm for panel sides & 3mm for gland plates
6	Doors	Double door with neoprene gasket, Lockable,
7	Cable entry	Bottom with fire proof compound thickness 50 mm for sealing
8	Terminal Blocks	Rail mounted cage-clamp suitable for conductor size up to 2.5 mm ² & fused type with LED indication for power supply (24 VDC, 230 V AC, 110 V AC etc.) for instruments & equipments.
9	Anti vibration pad	Required, 15mm
10	Painting	Interior- Brilliant White Exterior- RAL 7035
11	Cabinet Dimension	To be decided during detail engineering
12	Grounding	M6 earthing stud shall be used
13	Ventilation	Fans & louvers with brass mesh required
14	Lighting	rapid start fluorescent strip fixtures with door actuated switches required
15	Lifting arrangement	Removable lifting eyebolts shall be used

1. Separate Marshalling cabinets for the system shall be supplied for terminating all cables originating from the field and for distributing the signals to different functional panels and cubicles.
2. The terminal blocks shall be cage clamp type. Fused terminal blocks hinged at one end to facilitate easy isolation shall be used wherever necessary. All cabinets shall be used with spare terminals for the spare inputs/outputs as specified elsewhere in the specification. The type of terminals for terminations from cabinets/panels shall match with the pre fabricated cables and pins supplied.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[262]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

3. The terminals for field cables shall be arranged in a logical order of equipment/system wise.
4. The marshalling cabinets, the terminal blocks, the terminals and the electronic hardware if any, shall have identification numbers.
5. Each cabinet shall be used with one each 3 pin receptacles for 230 V, 1P, 50 Hz and receptacles for 24V DC.
6. One of the doors shall be used with folder to keep the relevant engineering document of the cabinet.
7. All cabinets shall have common key for locks.
8. Door shall have concealed type of hinges with 120 degree swing.
9. Door latches shall be of the three-point type to ensure tight closing.
10. Separate Power & shield earthing bus shall be used at the front & rear side of the cabinets. The earthing bus shall be isolated from panel body by suitable insulation material

16.4 Local Instrument Enclosure & Racks

1. Transmitters and switches, devices, etc. mounted in the field shall be suitably grouped together and mounted in local instruments enclosures in case of open areas of the plant and in local instrument racks in case of covered areas. These local instrument enclosures and racks shall be furnished as per the project requirements.
2. The local instrument enclosures shall be constructed of 2 mm sheet plate and shall be of modular construction with one or more modules and two end assemblies bolted together to form an enclosure. Vibration dampeners shall be installed for supporting each enclosure. The internal layout shall be such that the impulse piping/ blow down lines are accessible from back doors of the enclosure and the transmitters etc. are accessible from front side for easy maintenance. Gaskets shall be used between all mating sections to achieve protection class of IP-65.
3. The local instrument racks shall be free standing type constructed of suitable 3 mm thick channel frame of steel and shall be used with a canopy to protect the equipment mounted in racks from falling objects, water etc. The canopy shall not be less than 3 mm thick steel, and extended beyond the ends of the rack. Bulk heads, especially designed to provide isolation from process line vibration shall be used. The junction box for racks also shall conform to IP 65 protection class.
4. Provision for continuous purging arrangement is to be made for all air and flue gas applications.
5. Each transmitter enclosure housing instruments i.e. for air and flue gas applications, requiring purge air for continuous air purging shall be used with common purge air header, air filter regulators of sufficient capacity, required

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

pressure gauges, valves, fittings, SS tubing and individual purge meters for each purge line etc. as required.

- The junction box of Local Instrument Enclosure & Racks shall be used with hinged type door, latch for locking & gland plates for cable entry. All terminals in junction box shall be of rail mounted cage clamp type suitable for conductor size up to 2.5 Sq. mm.

16.5 Local Junction Box

Table 16.3
Specifications for Junction Box

S.No.	Features	Minimum Requirements
1	No. of Ways	32 (2X16) with 20% spares terminals
2	Material & Thickness	3 mm thick Stainless steel
3	Protection class	IP-65 for outdoor/ IP 55 for Indoor
4	Cable entry	Bottom
5	Mounting	Suitable for Wall/column/structures mounting
6	Terminal Blocks	Rail mounted cage-clamp type suitable for conductor size up to 2.5 mm ²
7	Grounding	M6 earthing stud shall be used
8	Gland plate	Removable type
9	Door	Single Lockable door with gasket, able to open sideways, turnable hinge based, latch type lock without handle with common key.
10	Accessories	Tag plate, clamps, fixtures, bolts (SS), nuts (SS), Gasket (Neoprene), cable glands (SS), Lugs (Brass), Fire proof compound for sealing.

- All JB's for outdoor application shall be used with individual canopies to prevent ingress of water.
- All JB' shall have provision to add 10% additional TB's.

Document Number	Rev No.	Description	Page No.	Date of Issue

--	--------------------------

3. The marking on terminal strips shall correspond to the terminal numbering on wiring diagrams.
4. Separate Terminal blocks shall be used for Analog & Digital Signals & also for signals with different voltage levels.
5. The terminal blocks shall be arranged with at least 100 mm clearance between two sets of terminal blocks and between terminal blocks and junction box walls.
6. Separate shield bus shall be used with screw connection for terminating cable shields.
7. All spare cable entries shall be used with plugs.
8. All wires in JB shall be neatly dressed & ferruled.
9. Double deck type terminal block shall not be used.

Table 16.4
Specifications for Cable Glands

S.No.	Features	Minimum Requirements
1	Type	Double compression
2	Entry Thread	½ " NPT
3	Material	Brass
4	Finish	Cadmium Plated
5	Protection	IP-54 or better
6	Accessories	Neoprene gasket, Locknut, Reducer etc.

17. TIME SYNCHRONIZATION SYSTEM (MASTER & SLAVE CLOCK SYSTEM)*{TO BE DELETED, IF ALREADY PROCURED UNDER SG PACKAGE.}***17.1 General**

A Global Positioning Satellite (GPS) based Master Clock System shall be provided with the Plant DCS system. Necessary signal output for time synchronization from Master Clock System shall be made available to the TG control system to have common time reference.

1. The system shall be provided with a GPS based date insensitive master & slave clock system (common for the station) for time synchronization of all plant control systems & equipments.
2. The system shall be complete with receiving antennae (for receiving time from GPS), receiver and associated electronics, Redundant Master Clocks, Slave Clocks, interconnecting cables, cubicles, power supplies & any other accessories.
3. The master clock shall have adequate number of communication ports to provide independent time reference signals for the following applications.
 - All DCS system equipment including plant common systems.
 - SER systems.
 - All PLC based BOP & offsite plant control systems
 - Vibration monitoring system for Unit specific requirements and for plant utilities.
 - PADO system.
 - Computerised Maintenance Management system
 - Integrated CCTV Surveillance system
 - Management Information system
 - Station LAN Server
 - TG Integral control systems.
 - SG Integral control systems.
 - SG Flame monitoring & analysis system.
 - Any other equipment requiring time synchronising.
4. The following spare ports shall be as a minimum:
 - Spares for Hour Pulse
 - Spares for Minute Pulse
 - Spares for Second pulse
 - Spares for BCD real time output with one (1) second frequency
 - Spares for serial time code in IRIG-B format with one (10 second frequency.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[266]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- Spares for serial time code in RS 232 C with one (1) minute frequency.

17.2 Design Requirements

1. The offered master clock system shall be a fully wired panel consisting of the following minimum items & shall be located in Equipment Room in CCR :
 - GPS Antenna
 - GPS Receiver
 - Signal Processing Unit
 - Local display unit
 - Power supply
 - All required cables, mounting accessories, cabinet for the processing electronics etc.
2. The system shall be designed in a 100% redundant configuration and shall include two master clock systems.
3. The Master Clock System shall receive the synchronizing pulses from the GPS system and form a common time reference for recording of any event, logs and reports, which may take place in any portion of the network distributed throughout the Plant. Global Positioning System, to which the Master Clock gets synchronised, shall be an absolute system to provide continuously 3 dimensional position fixing, velocity measurement and Time reference generation.
4. The master Clock shall be configured as Real Time Clock with display of time in 24 hrs format & it shall drive the slave display units. It shall be ensured that loss of any slave display unit does not affect the display of any other slave unit. The character size of slave display unit shall be minimum 100 mm LEDs (4''). Since the timing synchronization of many off-site facilities is being done through station LAN, the slave clocks may be alternatively driven by respective systems / sub-systems.
5. Accuracy of the master clock system shall be as follows:
 - PPS output : +/- 500 nano second or better.
 - IRIG-B output : +/- 200 micro second of UTC or better
6. All the cables for interconnection between Master Clock and Slave Clocks & other systems shall be provided. This shall include all signal cables, (minimum Type-G cable as per specification) as well as power supply cables.

Tender Document for R&M of Unit No.[..] of [Name of the Power Plant]	[Logo of Utility]
--	-------------------

18. UNINTERRUPTED POWER SUPPLY (UPS)

{TO BE DELETED, IF ALREADY PROCURED UNDER SG PACKAGE.}

18.1 General

This specification is intended to cover the *[design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning]* of UPS system complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [..] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

18.2 Scope of Supply

Redundant, 230 VAC Uninterrupted Power Supply (UPS) System for various C&I packages including the plant control system (DCS) consisting of 2x 100% capacity static inverters, 2 x 100% capacity static switches, Manual by-pass switch, 2x 100% capacity float-cum-boost chargers, Battery with accessories, Step-down transformer, Voltage Stabilizer, 2x 100% AC Power Distribution Boards etc. shall be provided. UPS shall be provided with all interconnecting cable between UPS equipment and battery, UPS system cabinets and enclosures etc.

UPS shall be provided with all equipment and accessories required for completeness of the system including any feeder distribution as required for protecting UPS equipment and connected inputs and outputs shall be furnished in line with the specification.

18.3 Technical requirements

1. The equipment furnished under this subsection of the specification shall meet the requirements of all applicable codes and standards including ANSI, NEMA, IEEE, NEC and IS.
2. The UPS equipment and the complete system shall have Surge Withstanding Capability (SWC) to meet the requirements of ANSI C 37.90a - IEEE Standard 472-1974.
3. The UPS shall be provided to cater to all the loads for systems, equipment and instruments requiring UPS supply. Spare feeders of at least 10% of the total number of feeders shall be built in.
4. The selection and selective co ordination of all the protecting devices including fuse free circuit breakers/ fuses shall conform to the requirements of National Electric Code NEC –1984 and other applicable codes and standards. The selectivity ratios of the fuses shall be such that there is a sufficient margin between the total electric energy of the upstream fuse. The selectivity ratio shall be not be less than 2:1 in any case.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[269]	02.09.2015

5. The following general requirements shall be met for ensuring proper branch and circuit protection-
 - a) The feeder fuse ampere rating and feeder conductor ampacity must be at least 100% of the non continuous load plus 125% of the continuous load as calculated per Article 220 (220-10 G) of NEC Code- 1984. The feeder conductor must be protected by a fuse not greater than the conductor ampacity.
 - b) Each ungrounded service entrance conductor shall have a fuse in series with a rating not higher than the ampacity of the conductor.
 - c) If secondary fuses are sized not greater than 125% of transformer secondary current, individual transformer fuses are not required in the primary, provided, the primary feeder fuses are not larger than 250% of the transformer rate primary current.
6. The UPS system shall be suitable for operation at ambient conditions indicated in the specification.

18.4 Functional requirements

1. The Uninterrupted Power Supply (UPS) system of continuous duty shall supply regulated, filtered and uninterrupted 230V, 50 Hz, single-phase power, within specified tolerances. Each of the UPS loads shall receive one feeder each from the AC Distribution Board of Inverter A& B. However, each inverter shall supply only 50% loads under normal conditions.
2. Each UPS System component shall be compatible for satisfactory and well coordinated operation with other related components as well as with the input and output systems.
3. The KVA rating of the UPS shall be guaranteed at 230VAC, 50 Hz, single phase output at 50 deg C ambient temperature and load factor of 0.8 lagging. In case, the standard UPS rating are applicable at an ambient temperature lower than 50 deg C, then derating factor of at least 1.5 % / deg C shall be considered. The Bidder shall demonstrate the above stated capacity at 50 Deg C during shop testing.

18.5 Normal Operation

1. During normal operation, UPS loads shall be supplied by both 100% capacity inverters each working at 50% load. The inverters shall receive power from DC source (Charger/Battery) and their static switches shall be in the respective "Inverter" position. In this mode the two inverters shall act as hot standby for each other.
2. Necessary paralleling networks shall be included to ensure equal load sharing by both inverters. The rating of the paralleling device / circuit shall be such that it does not act as a limiting factor on the fault clearing capability of the inverters

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[270]	02.09.2015

individually and when working in parallel. Load sharing network details shall be provided to establish all functionalities including fuse clearance.

3. One inverter shall act as "Master", working on its internal oscillator and the other inverter shall follow by using the synchronising signal from master inverter for automatic control of its output frequency.

18.6 Emergency operation

In case of failure of any inverter, the static switch shall automatically transfer the UPS loads of faulty inverter (say Inverter-"A") to the healthy Inverter-"B" which shall start working at 100% capacity. Thus the feeding of UPS power is continued automatically to all loads connected to both inverters despite the failure of one inverter and the quality power supply to all UPS loads connected to both inverters shall be maintained without interruption. Isolation of faulty inverter shall be automatic and achieved in less than 4 mille seconds.

On inverter failure, the plant AC source is automatically brought in as the standby source to healthy Inverter working at 100% capacity. In this mode, the healthy Inverter shall get the synchronizing signal from the standby AC source.

Operation on internal oscillator and transfer/retransfer to standby source shall be as follows:

1. The output frequency of the healthy inverter shall be automatically synchronised with the plant stand-by AC source supplied through step down transformer and voltage stabilizer using synchronizing signal from the standby source. If the frequency of the standby source is beyond these limits, the inverter frequency control shall be automatically disconnected from stand-by synchronizing signal and the inverter shall maintain the output frequency at 50 Hz within + 0.1 percent under all conditions of load and input voltage by working on its own internal oscillators.
2. During operation on its own internal oscillator, the inverters shall continuously monitor the frequency of standby source. Upon restoration of proper frequency conditions of stand-by source, the inverter shall automatically start using stand-by source frequency as the synchronizing signal for inverter output frequency control.
3. During the operation of any inverter on its internal oscillator due to synchronizing frequency being beyond the specified limits, the transfer of static switch from "Inverter" to "Standby source" shall be inhibited.
4. While one of the inverters (healthy) is feeding 100% load and the AC source is acting as standby, and in case this inverter also fails, the 100% load shall be automatically transferred from inverter to standby AC source through static switch, provided the standby source is synchronized to the inverter (synchronous transfer). However, such transfers shall be inhibited during operation of inverter on its internal oscillator due to standby AC source frequency being beyond the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[271]	02.09.2015

synchronization limits. Asynchronous transfer of inverter loads to standby AC source with a beak, on inverter failure shall be envisaged.

5. Retransfer of loads from standby AC source to inverter shall be automatic or manual as pre selected by the operator and shall be accomplished only after synchronism of the inverter output with the standby source has been automatically accomplished.
6. The manual bypass switch shall have the provision for fully by-passing the UPS system and connecting all UPS loads to the standby AC source.

18.7 Static inverters and auxiliary equipment

The static inverters shall be solid state type employing silicon controlled rectifiers or power transistors and other solid state devices to convert direct current power to essentially sinusoidal alternating current power as per this specification. Ferro resonant type inverters shall not be acceptable. The inverter equipment shall include all necessary circuitry and devices to conform to requirements like voltage regulation, current limiting, wave shaping, transient recovery, surge suppression network, automatic synchronisation etc. as specified herein. Inverter shall be of continuous duty. Natural convection or forced cooling using redundant fans shall be used. Equipment shall be designed for operation with full load even with cooling fans failure / non-availability.

18.7.1 Inverter Capacity

Each static inverter shall have the following minimum capabilities. Continuous full load rating: meeting specification stipulations Over load capacity: 125% of full load rating for 10 minutes and 200% for 10 seconds minimum and 300% for 4ms minimum for all specified input voltages.

The inverter shall have sufficient I₂t capability to clear a slow acting HRC fuse having a continuous current rating equal to at least 20% of the continuous full load current rating of the inverter, while feeding 100% rated loads of the inverter.

Voltage regulation: $\pm 1\%$ for 0-100% load at all input voltage and all power factors.

Step load pick up: Upon transfer of full load, the inverter output voltage shall not drop below 85% of nominal voltage during the first half cycle after transfer and 90% of nominal voltage in the next half cycle. The recovery to within $\pm 1\%$ of voltage shall be in less than 50 milliseconds.

The Bidder shall indicate the maximum current rating (in Amps) of slow acting HRC fuse which can be cleared by the proposed inverters upon a branch circuit or bus fault. This shall also be accompanied by calculations and test data.

18.7.2 Input / Output Voltage

The inverters shall be fed from Battery and chargers which do not feed any other

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[272]	02.09.2015

loads. Input voltage shall be nominal DC output voltage of battery and charger of range from final voltage after discharge of battery to maximum DC bus voltage during equalize charging of battery. The inverter shall also be capable of working satisfactorily meeting all specification requirements with only the chargers connected to its input without battery in circuit. Filtering on the input of the inverters shall be furnished as required to operate with the output ripple of the chargers. Each inverter shall include equipment necessary to protect itself from damage resulting from excursions, loss or restoration of DC input voltage and synchronizing voltage. The inverter output voltage shall be 230V AC, 50 hz, single phase. Total harmonic content shall be 4% (max) and harmonic content of any single harmonic shall not exceed 3%. The inverter efficiency at 100% load and 0.8 pf shall be minimum 85% and at 50% load and 0.8 pf shall be minimum 80%.

18.7.3 Over loads, Short Circuits and Load loss

1. The inverters shall be provided with suitable fuses at the input and output which shall permit proper co-ordination with other protective devices and at the same time protect the inverter against damage due to internal faults. All necessary equipment shall be provided to protect the inverters against over loads, short circuits and 100% loss of load. The inverter shall be self protecting against damage if energized with full load connected. All the fuses used in inverter power & control circuits shall be fast acting type, operating in less than 5 ms.
2. The inverter shall be provided with current limiting circuitry which shall limit the output current to a value which will not damage the inverter or blow its fuses.
3. The inverter shall have sufficient I_{2t} capability to prevent damage to itself until short circuit conditions on the output are cleared.
4. Each inverter shall be capable of operation with non linear loads. Bidder shall furnish details of non linearity for the loads. Output waveform of the inverters) shall remain within specified limits when operating with non linear loads at 100 percent rated load.
5. The inverters shall be self protecting against all AC and DC transients, voltage surges and steady state abnormal voltages and current likely to be encountered in utility power station.

18.7.4 Automatic Synchronization

1. Inverter equipment shall include stable solid state oscillator devices designed to automatically maintain the inverter output in phase and in synchronism with the standby AC source. The frequency regulation shall be automatic within +/- 0.1% for all conditions of inputs, loads and temperature occurring simultaneously or in any combination.
2. Facility shall be provided for automatic transfer to internal oscillator operation when the standby source frequency is not within the synchronization limits.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[273]	02.09.2015

3. Provision shall be made for step less adjustment of synch disconnect frequency range from 50 Hz +/- 0.5 Hz to 50 Hz +/- 2 Hz.
4. Automatic adjustment of phase relationship between inverter output and standby AC source shall be gradual, at a controlled slew rate which shall not exceed one Hz per second.
5. The inverter shall normally work on the internal oscillator with either of the two inverters as master synchronizer and the other following it. Suitable selector facility shall be provided to select the master. When any one inverter fails the healthy inverter gets the synchronizing signal from the standby A.C. source.

The DC input current shall never exceed the full load current except for a short circuit within the inverter. This limitation applies to transient as well as steady state currents and includes inrush currents upon initial energisation of the UPS, load energisation, short circuits external to the inverter etc. For any value of the load and load power factor drawn by the equipment served, the inverter shall not impose on DC source any voltage oscillations in excess of 5 volts (RMS total, all frequencies) or any current oscillations in excess of 3 percent (RMS total, all frequencies) of the DC current at full load.

18.7.5 Static inverter auxiliary equipment

In addition to the inverter equipment specified above, auxiliary equipment shall be furnished with each static inverter as follows:

1. Output ammeter, Output voltmeter, Output KVA meter, Input voltmeter, Frequency meter, Power factor meter, Inverter ON-OFF switch, Alarm Reset Push Button etc. of one number each shall be provided on the front panel of the inverter enclosures.
2. Indicating lights shall be furnished on front of the UPS panels. For those abnormal conditions which could be of a momentary nature, the indicating lights shall remain energized and the contact remain closed until cleared by a reset push button on the panel.
3. The following indications shall be provided as a minimum i.e. DC voltage to the Inverter Low/ High, Loss of DC input to the inverter, Inverter output voltage High/ low, Inverter failure, Standby AC source failure, Inverter synchronized with standby AC source in case of failure of the other inverter, Inverter feeding 100% UPS load, Standby AC source feeding 100% UPS loads, Fan failure and temperature high etc.
4. In addition to the above indications, the Bidder shall furnish electrically independent, potential free contacts for each of the above conditions. These contacts shall be rated for 0.5 Amps, 220 Volts DC and shall be wired to the terminal blocks.

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[274]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

5. The 4-20 mA signals for Inverter A & B output voltages, output currents, output frequency etc shall be furnished.

18.8 Static Transfer Switches And Auxiliary Equipment

The static transfer switches shall be provided to perform the following functions

1. To transfer the load automatically between the Inverter to the standby inverter as described under automatic synchronization.
2. To transfer UPS load under manual control from standby AC source to inverter when placing the UPS System in service and from inverter to standby AC source when taking the UPS out of service.
3. The static transfer switches shall have two modes of operation namely automatic and manual.
4. The static transfer switches shall use silicon controlled rectifiers and other static devices required for automatic transfer of load from Inverter to Standby source and vice versa.
5. The static switches shall be provided with the requirements specified herein including the following:

- | | | |
|----|-----------------------------|---|
| a) | Capacity(continuous) | Continuous full load capacity of the inverter. |
| b) | Capacity (overload) | As per overload capacity of inverter indicated in the specification |
| c) | Capacity (Peak) | 1000% of continuous rating for 5 cycles. |
| d) | Transfer Time | 1/4 cycle maximum. (The transition shall be "make before break". Voltage failure shall be sensed at the output of static switch |
| e) | Voltage Rating (Nominal) | 230 Volts, 50 Hz, single phase. |
| f) | Transient Voltage Tolerance | 340 Volts peak above the normal line voltage. |
| g) | Ambient temperature | 50 deg C max. |
| h) | Cooling | Natural or forced circulation, using redundant fans. |

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[275]	02.09.2015

i) Duty Continuous

6. The transfer of static switch from normal "Inverter" position to "Stand-by" position shall be initiated by Inverter failure and UPS system trouble, Static switch output voltage failure, over current or manual push button operation.

The UPS bus shall be monitored by two voltage detectors. One fast acting circuit shall be used for detecting a complete and instantaneous voltage loss while the other slower acting averaging circuit with adjustable trip level shall be employed to detect voltage deviation beyond selected limits. Both voltage detector circuits shall automatically initiate operation of static transfer switch.

UPS bus current shall be continuously monitored by a current monitoring detector. This detector shall operate the static transfer switch when the load current exceeds the overload rating of any inverter. The detector shall rest when the load current falls below the rated current of the inverter resulting in retransfer of static switch with inverter position.

The static switch shall automatically transfer the load from inverter to stand-by AC source when the maximum I_{2t} capability of the inverter is reached or when the inverter output voltage drops below 90%.

Over current transfer limit shall be continuously adjustable from inverter continuous rating to inverter current limit rating.

7. Transfer Inhibit of static switch shall be under the following conditions:

Automatic or manual synchronous transfer of load from inverter to stand-by AC source or vice versa, shall be inhibited when the inverter frequency is not synchronized to the alternate source. However, asynchronous transfer facility under such condition shall be provided.

Transfer resulting from overload shall be inhibited when the standby AC source is not available. In this case the load fed by the inverter shall be automatically disconnected.

8. Static transfer switches shall be provided with necessary protective devices (circuit breakers) both in "Normal" as well as "Stand by" position.
9. The static switches shall be furnished with contacts to alarm failure of the alternate source or opening of any fuse protecting the static switches.
10. Auxiliary equipment for static transfer switch
11. Following auxiliary equipment shall be furnished with each static transfer switch a minimum:

- a) Red indicating Light to indicate switch in "Normal" position, Green indicating Light to indicate switch in "Standby" position, White indicating Light to indicate "Normal" and "Standby", power sources in synchronism, Push-button to simulate normal AC UPS power failure (sensed at static switch output) to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[276]	02.09.2015

test the satisfactory working of static switch, transfer labeled "Transfer Test", Push-button for manual retransfer of static switch to "Normal" position, Push-button for manual transfer from normal to alternate source, Light to indicate standby AC source voltage deviation high, Light to indicate voltage transfer enabled, Light to indicate voltage transfer disabled etc shall be provided on the front of the enclosure.

- b) Two (2) number each of NO contact for static switch transfer to "Standby" position and standby source voltage deviation $> \pm 2\%$ from normal shall be provided within the static transfer switch enclosure.

18.8.1 Manual by-pass switch

1. The manual by-pass switch shall be used to isolate any static switch from its load and stand-by power supply and to take the static switch out of service without power interruption to the load. In doing so, the manual by-pass switch shall connect both load buses to a single inverter. The manual bypass switch shall provide the facility for by passing the entire UPS system during the operation of the UPS in the option of the operator.
2. The manual bypass switch shall have "make before break" contacts to ensure continuous supply to UPS loads during the operation of the same.
3. The manual bypass switch shall be rated for 600 Volts, 50 Hz, single phase operation. It shall have continuous load carrying capacity equal to full load inverter current and necessary short term load carrying and interrupting capacity to meet the requirements of the UPS system.
4. Another bypass and disconnect devices shall be envisaged as required for orderly start up, shut down and maintenance of UPS system and system components.
5. The manual by-pass switch and required disconnect devices shall be furnished duly mounted and wired in enclosure.

18.8.2 Float-cum-boost chargers and auxiliary equipment

1. Two 100% capacity chargers shall be furnished for the UPS system. Each charger shall confirm to the following requirements.
2. Each charger furnished for UPS system shall be adequately rated to ensure that any one shall meet full DC load of UPS system operating at 100 % rating plus recharge the fully discharged UPS batteries.
3. The chargers shall be served from a 415 volt, 50 Hz, 3 phase system. The chargers shall maintain the output voltage within plus and minus 0.5 % from no load to full load, with an input power supply deviation in voltage level of $\pm 10\%$ and input power supply deviation in frequency of $\pm 5\%$ and with both deviations present in any combination.
4. In addition to supplying DC power for inverters, the chargers shall be designed to charge a fully discharged battery without over loading or causing over voltage or

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[277]	02.09.2015

without causing interrupting operation of AC or DC circuit breakers for the entire range of intended operating regimes. Suitable solid state electronic circuits shall be provided to ensure that the charging current is voltage regulated and current limited. After the battery is recharged the charger shall maintain the battery at full charge until the next emergency operation when the UPS battery is again required to provide DC power.

5. Float and equalizing controls shall have an adjustment range of $\pm 5\%$ continuous (without steps).
6. The chargers shall be self-regulating, solid state, silicon controlled, full-wave rectifier type designed for single and parallel operation with the battery specified. The chargers shall be designed for automatic load sharing during parallel operation.
7. The charger shall be current limited at 125% of full load to reduce output voltage for charger circuit protection and for protection of battery from overcharge. The current limit shall be continuously adjustable from 80% to 125%.
8. All necessary equipment and devices shall be provided to protect the charger from short circuits, transient voltages, surges, load and supply fluctuations including sudden loss of input or load.
9. The charger shall have a slow walk-in circuit which shall prevent application of full load DC current in less than 10 seconds after AC power is energized.
10. The minimum full load efficiency at nominal input and float output shall be 90% or better. The output regulation, ripple content and power factor shall meet the requirements of UPS system offered.

18.9 Battery Charger Auxiliary Equipment

Following auxiliary equipment shall be furnished for battery charger a minimum:

1. AC Voltmeter, DC Voltmeter, AC Ammeter, DC Ammeter, Charger On-Off push buttons, Potentiometers (one "Float Voltage Adjust" and one "Equalizing Voltage Adjust", both with manual adjustment knobs, the settings of these knobs, shall be independent of each other), Selector Switch for float charge / Equalizing charge, Charging rate setter, Selector switch and lights for ground fault detector, Indicating lights with proper actuating devices, Circuitry and legend etc shall be furnished on the front of the panel of the charger enclosure.
2. Indications such as Failure of input AC supply, Charger failure, System on battery operation, Battery equalize timer 'on', Low battery voltage, DC ground fault, Redundant fan failure and temperature high (if provided), Charger fuse failure, Low DC output voltage, High DC output voltage etc.
3. One set of independent potential free contacts rated for 0.5 amps, 220 volt DC shall be furnished for the alarms above and wired to terminal block for use of alarm annunciation system.

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[278]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

18.10 Ground Detector System

Each charger shall be furnished with a ground detector system consisting of a relay and a centre tapped resistor. The resistor shall be connected between the positive bus and the negative bus. The relay coil shall be connected to resistor and ground. The relay shall be furnished with one normally open and one normally closed contact wired to terminal blocks for connection to external circuits.

Two indicating lights and one three position spring return to centre selector switch mounted on front of charger cabinet shall be provided for each ground detector system.

18.11 UPS Battery

1. The battery shall be heavy duty Nickel-cadmium type and shall have sufficient Amp-hour capacity to supply 100% full load current of UPS for one hour. The Ni-cd battery shall conform to IS: 10918 and shall be sized according to IEEE Std. 1115.
2. The battery shall be high discharge performance type to withstand discharge/charge cycles throughout life without loss of capacity. In battery sizing calculation, Bidder shall also take into account a minimum voltage drop of 2.5 volts from battery room to the inverter input.
3. Battery sizing calculations, supporting curves/data etc. with the proposal to demonstrate that the proposed battery capacity meets the above specification shall be furnished. Various correction factors such as capacity factor, temperature derating factor (at a minimum electrolyte temperature of 4°C), design margin shall be take in to account as per data below:

Table 18.1
Battery Sizing Correction Factors

S.No.	Features	Minimum Requirements
1	Temperature derating factor (At an electrolyte temperature of 40C)	(Td)
2	Design margin	20% = 1.2
3	Capacity factor (KT) (For discharge duration of 1 hr. & end cell voltage of 1.1 volts)	AH capacity of chosen cell /(discharge current in amp for chosen cell Corresponding to 1 hour) x Float correction factor.
4	The UPS battery shall be furnished as specified herein and shall meet following requirements:

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[279]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

i)	Nominal Voltage	As per the requirement of nominal DC voltage level at the input of the inverters.
ii)	Ambient temperature	50 ° C max.
iii)	Specific gravity, full charge	1.19 ± 0.01
iv)	Voltage per cell	
	Nominal	1.2 V
	Floating	1.40 V to 1.42V
	Boost	1.53 V to 1.67V
	End cell voltage	1.1 Volts

18.12 Battery Accessories

2 nos. of Hydrometer along with syringes suitable for vent holes in different cells, Thermometers, Specific gravity correction chart, Wall mounted type holder made of teak wood for hydrometer & thermometer, Cell testing voltmeter (3-0-3V), Acid/Alkali mixing jar 2 nos. Rubber apron, Rubber gloves, Set of spanners, Goggles (industrial) Instruction Card, Variable metallic resistor & shunt, Inter cell connectors, Suitable terminal lugs for cables, Two tier teakwood battery rack, Jack for lifting the cells etc shall be provided as accessories and fittings of the Batteries and auxiliaries.

18.12.1 Step-down transformer & voltage stabilizer

One 415 Volt, 3 phase to 240 Volt, single phase transformer along with associated voltage stabilizer shall be furnished.

This transformer and stabilizer combination shall convert 415 Volt +/- 10% plant auxiliary AC supply to 230V, +/- 2% single phase standby AC Power, which shall serve as UPS system back up supply source.

The transformer and stabilizer shall be sized for 100 % UPS load and shall co-ordinate with the largest branch circuit protection device for feeder short circuit current without sacrificing voltage regulation. The voltage stabilizer shall employ silicon solid state circuitry and shall maintain a stabilized voltage for 0 -100% load with input voltage variations as indicated above.

The stabilizer shall meet the following characteristics as a minimum. Fast rate of correction - within 5 cycle; Output distortion - less than 5% under worst conditions; Efficiency shall be better than 94%; No load losses less than 5%.

18.12.2 AC Distribution Boards

Panel boards for distribution of continuous AC power to essential loads shall be dead-front type panel boards rated for 600 V, AC service. Sheet steel thickness shall be 3 mm for load bearing member and 1.6 mm for other members. The hinged panel board front shall cover the fuses and wiring gutter but not the switch

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-C	[280]	02.09.2015

Tender Document for R&M of Unit No.[.] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

handles. The hinged front and switch handles shall be covered by the enclosure-door.

Each panel board shall be constructed for 2 wire, single phase distribution with solid neutral bar. Phase and neutral bars shall be of copper. Rating of the main lugs shall be equal to the rated continuous full load current of each inverter. Type of enclosure shall be IP 42 as a minimum.

Each panel board shall have one fused disconnect switch of adequate rating for incoming feeder for AC Bus and requisite single pole, suitably rated disconnect switch branch circuit devices. Fused switches shall be equipped with arc quenchers, visible blades and quick-make quick-break operating mechanisms. The number of feeders and rating of each feeder shall be to suit the individual load requirements.

The AC distribution board and components thereof shall be from the latest proven product range of a qualified manufacturer. However, 25% spare feeders with fuses of each rating shall be provided.

18.12.3 Wiring and interconnections

All interconnections required from input to output terminals or outgoing inverter, transfer switches and distribution board equipment shall be provided within the enclosures in accordance with the manufacturer's proven practice, applicable international standards and good engineering practice. Internal wiring in factory pre-wired electronic systems cabinets may be installed according to the standard practice as to wire size, insulation and method of termination on internal equipment. Wiring for external circuits including all alarm contacts shall be brought to grouped terminal blocks located for convenient connection for external circuits entering from top or bottom.

1. CIVIL, STRUCTURAL & ARCHITECTURAL WORKS- DESIGN & EXECUTION CRITERIA

1.1 Introduction

This specification covers the design, preparation of general arrangement, construction as well as fabrication drawings, supply of all labour as well as materials and construction of all civil, structural as well as architectural work on EPC basis for Renovation and Modernisation of turbine generator (TG) and associated structures for the existing [Name of project...] Thermal Power Project. The renovated unit shall be capable of producing the output of [210/215/220/250] MW. Description of various items of work under this specification and nature of work in detail are given hereinafter. The complete work under this scope shall be as per Volume-II, Section-I, CIVIL SCOPE OF WORK.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[1]	25.09.2014

2. [BUILDINGS & STRUCTURES]

Design and construction of new buildings, structures, foundations etc. as well as repairing / retrofitting of existing buildings, structures, foundations shall take into account requirement for operation and maintenance of all equipments and its users. The buildings will have good architectural features. The surrounding areas shall be properly micro levelled and graded. The architectural design concept of buildings structure shall be evolved considering the functional, technological and other requirements for efficient operation ensuring comfortable working environment for personnel, satisfying the aesthetic requirements. Special care shall be taken to provide elegance and aesthetics, with effective use of appropriate treatment, materials fittings and finishes.

- *Due consideration shall be given for adequate natural lighting and ventilation for both plant and non-plant buildings.*
- *Retrofitting / repair works / new constructions shall not cause damage to the existing structures. The temporary supports shall not be allowed on the existing structures for any of these works unless the loads are minor and may not cause any damage to any existing structure. However in such a case Bidder shall take approval from the Owner/Consultant prior to initiating the work.*
- *Internal finishes shall be provided with latest available materials approved by Owner/Consultant with due consideration of the functional aspect of the area.*
- *External finishes shall be provided with latest materials approved by Owner/Consultant for improving the aesthetics.*
- *The orientation of the important buildings shall be in line with the existing site condition and function as such.*
- *Each building shall have its own identity. However, a total homogeneity shall be maintained in the design of all buildings.*
- *Adequate frontage shall be provided to all important buildings to create a better visual impact.*
- *All other civil and structural buildings shall be developed in conjunction with the above aspects.*

All Civil, Structural and Architectural works of the following systems shall be covered under this package.

- a) Main Power House Building*
- b) TG Deck, Columns and Foundation*
- c) Electrical Control Building*
- d) Service Building*
- e) DG Building*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[2]	25.09.2014

- f) Air Washer Building*
- g) CPU Regeneration Building*
- h) ACW Pump house*
- i) Cable & Pipe rack in Steam Turbine Generator Area*
- j) Any building inadvertently left out in the above list, however required for proper functioning of the power plant as per system requirement stipulated under Mechanical & Electrical section of this specification shall also be included.]*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[3]	25.09.2014

3. DESIGN REQUIREMENTS

3.1 Location

Geographical location of the plant site is approximately between [11°34'00" N] to [11°35'00" N], Latitude and [79°26'00" E] to [79°27'00" E], Longitude.

3.2 Ground Condition

Subsurface **condition**: The natural ground surface level approximately varies from [60 m to 74.5 m] from MSL.

[The soil profile in the plant area can be broadly classified into 3 layers namely laterite, cemented sand and cemented silt in general as per detail soil investigation report. Top soil upto a depth ranging from 0.4 m to 0.75 m is entirely non-uniform. The underlying layer is laterite whose depth varies from 4.0 m to 5.5 m followed by deep layers of cemented silt and cemented sand].

The ground water table (GWT) at finished ground level shall be considered for foundation design purposes.

The detailed soil investigation report conducted for plant shall be made available to Bidder for required replacement / refurbishment / retrofitting of Foundations, if any.

Bidder is advised to carefully study the content of detailed Soil investigation report for the existing type of foundations and design of new ones.

The type, size, depth of the foundation shall be based on the detail soil investigation **report** provided by OWNER.

3.3 Climatic Condition

a) Temperature

Maximum : [...] °C

Minimum : [...] °C

For design purpose, maximum temperature to be considered: [50.0] °C

Minimum temperature to be considered: [.....] °C

b) Rain fall

Minimum : [...] mm in May]

Maximum : [.....mm in October]

Peak hourly rain fall: [...]mm] (corresponding to 50 years return period.)

[Note: Maximum per day rainfall as per weather report has been considered conservatively as peak hourly rain fall which will be used for drainage system design etc.]

Annual average: [.....mm tomm & average mm]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[4]	25.09.2014

3.4 Seismic Zone

The site is located in [Zone II] as per IS: 1893-2002. Zone factor shall be [0.10]. Importance factor shall be considered as [1.75].

3.5 Wind Zone

The site is located in wind speed zone [... m/s] as per IS: 875 (Part 3)-1987.

3.6 Loads and Load Combinations

All new structures shall be designed and old structures requiring modification shall be checked for the most critical combinations of dead loads, imposed loads, equipment loads, wind loads, seismic loads, temperature loads, forces developed due to differential settlement and any other loading conditions which can occur during the design life of the facility.

(a) Dead Loads

Dead loads consist of the weights of the complete structure with finishes, fixtures, partitions, wall panels and all existing / modified / replaced equipments of semi-permanent nature including storage structures partitions, roofing, piping, cable trays, bus ducts etc. The content of storage structures etc. shall be measured at full capacity for this purpose.

The piping loads (for empty, operating and test conditions), cable tray loads and the contents of the storage structures shall be listed separately so that they can be excluded from dead load when dead loads are acting as stabilizing load for uplift.

The following unit weight of material shall be considered for computation of loads. Loads given in IS: 875 (part-I) shall be made use of for material not listed below.

Table 2.1
Weights of Material

Material	Unit weight (kN/m ³)
Plain cement concrete	24.0
Reinforced cement concrete	25.0
Structural steel	78.5
Brick work	19.0
Cement plaster	21.0
Floor Finish	24.0
[Coal]	12.6

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[5]	25.09.2014

(b) Superimposed Live Load (SILL)

Listed below is the minimum SILL for the areas involved. Floors and supporting members subjected to heavy equipment live loads shall be designed on the basis of the equipment loads specified by vendor or specifically defined SILL whichever is greater.

The specific minimum floor SILL is listed below:

Table 2.2
Superimposed Live Load (SILL).

S.No	Description	SILL Value
a)	Roof	
	• Flat accessible roof	1.5 kN/m ²
	• Flat accessible roof with HVAC equipments, etc.	5 kN/m ²
	• Flat inaccessible roof	0.75 kN/m ²
	• Sloped Roof	As per code IS: 875 (Part-2)
b)	Turbine building	
	• Ground Floor	
	- General Area	25 kN/m ²
	- Heavy equipment storage area	50 kN/m ²
	• Operating Floor	
	- Rotor removal area	30 kN/m ² Beams shall also be checked for ½ the rotor load at the center of the beam
	- Equipment laydown area	30 kN/m ²
	- Other areas (Corridors etc.)	15 kN/m ²
	Heater bay floor	10 kN/m ²
	Deaerator floor	10 kN/m ²
	Precast concrete covers	12 kN/m ²
	Mezzanine Floors	10 kN/m ²
	Platform around deaerator	10 kN/m ²
	Floor around feed water tank	20 kN/m ²
c)	Main control building/ Electrical building	
	• Control Room Floor	10 kN/m ²
	• MCC Room	15 kN/m ²
	• Cable vault Floor	5 kN/m ²
	• Battery Rooms	20 kN/m ²
	• AHU, AC & ventilation plant floors	10 kN/m ²

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[6]	25.09.2014

S.No	Description	SILL Value
	• Switchgear room	15 kN/m ²
	• PLCC, relay room	15 kN/m ²
d)	All other building floors & Stairs	5 kN/m ²
e)	Equipment Load	As applicable
f)	Tunnels under road, culverts & its allied structures including Concrete pipes	Class "A" / Class "70R" as per IRC standard whichever is higher / load due to bull dozers
g)	Underground basement, tunnel	Surcharge of 10 KN/m ²
h)	Vehicular traffic	Surcharge of 20 KN/m ²
i)	Covers for Channels	Surcharge of 10 KN/m ²
j)	Other areas	
	• RCC floors (Offices, laboratories, conference rooms and general floors)	5 kN/m ²
	• Balconies	5 kN/m ²
	• Chequered plate / gratings	5 kN/m ²
	• Walkways	3 kN/m ²
	• Toilets	2 kN/m ²

- In addition to LL, Hung loads for electrical, ventilation & air conditioning minimum of 0.5 kN/m² shall be considered.
- Load of 1 kN/m² shall be considered as hung load for piping unless otherwise mentioned. However, the actual loads will be as furnished by the supplier. The stringent most will be followed.
- For other areas LL shall be considered as per IS: 875 (Part-2).

(c) Seismic Load

The proposed plant is located in Seismic [Zone-I] as per IS: 1893, Seismic force on the structures will be considered accordingly.

Turbine Building shall be designed by Response spectrum method. Minimum extraction of modes shall be as per Clause 7.8.4.2 of IS- 1893 Part I, 2002.

(d) Wind Load

The proposed plant is located in Wind Speed Zone of [50 m/s] as per IS: 875 (Part 3). The wind force on the structures will be considered as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[7]	25.09.2014

Table 2.3
Wind Speeds

Description	Wind Speed
Basic Wind Speed Vb (at 10m above mean ground level)	[50 m/sec]
Risk coefficient K1 (for 100 years)	[1.07]
Category of terrain	[Category 1]
Factor K2	As per IS: 875
Topography factor K3	As per IS: 875

For the design of structures, wind force on Equipment, supported on frame including all fixtures, piping, staircase, ladder, etc, shall be considered.

Design of structures shall be checked for the condition of wind load with gust factor.

(e) Earth Pressure Loads

For earth pressure the worst condition with dry / submerged and active, passive or at rest shall be considered. The pressure coefficient shall be adopted as recommended in Soil Report or for the backfill material used.

(f) Temperature Loads

The total temperature variation shall be considered as 2/3rd of the average maximum annual variation in temperature. The average maximum annual variation in temperature for this purpose shall be taken as the average between the mean of the daily minimum ambient temperature during the coldest month of the year and mean of daily maximum ambient temperature during the hottest month of the year. The structure shall be designed to withstand stresses due to 50 % of the total considered temperature variation with temperature load applied with positive and negative sense.

For design purpose average maximum annual variation shall be taken as [+50°C] to +5°C.

Coefficient of thermal expansion of steel shall be taken as per IS: 800 where the value is given as 12x10-6/°C. Coefficient for thermal expansion for concrete shall be taken as per IS: 456.

(g) Thermal Loads (during operating condition)

When thermal loads (such as produced by temperature changes in piping, equipment and structures) results in friction between equipment and supports (exchangers) or piping and supports, the friction force will be taken as the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[8]	25.09.2014

operating load on the support multiplied by the applicable friction coefficient given below:

**Table 2.4
Thermal Loads**

Description	Value
Surfaces	Friction coefficient
Rolling supports	0.05
Steel to steel	0.30 (longitudinal) and 0.10 (lateral)
Concrete to steel	0.30

(h) Equipment Loads

Static and dynamic loads of major existing / modified / replaced equipments shall be based on the manufacturer's data of the specified equipments and shall be considered in design in addition to the live load.

Equipments to be tested for hydraulic test, tanks and piping design loading shall include hydraulic test loading. Weight of equipments, ducts, tanks, pipes, conduits, etc. supported by structure shall include maximum possible loading conditions i.e. flooded conditions and associated impacts, test loading, anchorages and constraint effects.

Air and gas duct loads shall include weight of insulation, duct attachments, dust accumulation loads, seismic, wind and other loads applicable.

(i) Cranes, Hoists, Monorail and Elevator loads

All lifting beams and monorails shall have their design loads increased for impact factor. Loads for overhead cranes, hoists, monorails and elevators shall be taken as per IS: 875.

100 % of the lifted load including elevator live load plus the cab weight shall be considered for the elevator support beam design. Pedestals in elevator pits shall be designed assuming impact factor as per IS codes.

(j) Vibration and Noise

The design shall ensure that vibrations from any moving machinery transmitted from its immediate foundations to adjacent buildings or areas of the same building shall be suppressed in accordance with the recommendations of relevant codes of practice.

(k) Other Loads

- Stresses imparted to structures due to differential settlements, variation of water table, erection and maintenance loads, creep and shrinkage shall also be considered in design of all structures.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[9]	25.09.2014

- Roof girders / trusses in the service / maintenance bay of Turbine building shall be designed for crane erection loads.
- Columns in turbine building near transformer yard shall also be designed to support tension due to strung conductors and shield wire, if the conductors are connected to the Turbine building columns.
- Dust loads

All buildings / structures shall be designed for a dust load of 1 kN/m² for flat roof and 0.5 kN/m² for sloped roof.

- Construction/ Erection/Maintenance Loads

The integrity of the structures shall be maintained without use of temporary framing struts or ties and cable bracing as far as possible. However, construction or access considerations may dictate the use of temporary structural systems. Special studies shall be made and documented to ensure the stability and integrity of the structures during any periods involving use of temporary bracing systems.

- Future Loads

Loads from future expansion shall be considered when so directed by the Owner/Consultant. Future loads may include any of the loads listed above.

- Surge Loads

Surge loads may occur in some vessels or equipment. In such cases, the magnitude and direction of the load shall be given by the equipment supplier.

(I) Basic Load Cases

Following basic loads shall be considered for analysis and design:

Dead load	:	DL
Superimposed dead load	:	SIDL
Self weight of permanent equipment	:	EL
Steam piping (Static & Dynamic) & other piping loads	:	PL
Cable loads	:	CL
Live load on floor / walkway	:	LL
Superimposed live load	:	SILL
Live load on roof	:	LLR
Seismic load	:	SL
Wind load	:	WL
Load due to soil pressure	:	SP
Load due to surcharge	:	SCL

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[10]	25.09.2014

Load due to hydrostatic pressure	: HP
Load due to temperature	: TL
Hoist, monorail loads	: MR1
Crane loads	: CRL
Special loads	: SPL

(m) Load Combinations

The individual members of the frame shall be designed for worst combination of forces such as bending moment, axial force, shear force and torsion. Permissible stresses for different load combinations shall be taken as per IS: 456, IS: 800 & IS: 875 (all parts) and other relevant IS codes.

Wind and seismic forces shall not be considered to act simultaneously.

Criticality of erection / maintenance loads shall also be checked separately in combination with other simultaneously occurring loads for possible design loading.

(n) Load Combinations for underground structures

- For the design of sub structure only liquid pressure from inside and no earth pressure and ground water Pressure and surcharge pressure from outside (applicable only to the Structures which are liable to be filled with water or any other liquid) shall be checked.
- For the design of sub structure combination of earth pressure, surcharge pressure and ground water pressure from outside and no water pressure from inside shall be applied.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[11]	25.09.2014

4. EARTHWORK AND ROCKWORK

4.1 General

This section applies to all earth and rockwork required for the replacement / refurbishment / retrofitting of existing foundations or construction of new buildings foundations (if any), any types of structure and burying service lines in the ground.

The Bidder shall satisfy himself as to the ground conditions on the site including the nature of the strata to be excavated, obstructions, possibilities of flooding and such like and shall allow for all provisions necessary to carry out the work in the most suitable manner when submitting his tender.

Generally, all buildings and structures must be founded on bearing strata which means that all excavation work for foundations shall meet the requirements of structural analysis based on the results obtained from the detailed soil investigation and of the available information and instruction given in writing by the Owner/Consultant.

Excavation shall be done to the required dimensions and shall be finished according to the specified lines and slopes, in a way acceptable to the Owner/Consultant. All necessary precautions shall be taken to cause the minimum possible alteration or disturbance to the other existing foundations, material lying under and adjacent to the excavation final lines.

4.2 Fill Materials

The fill materials used and source are to be examined and approved. Excavation materials can be used if they fulfil the requirements.

a) Select fill shall have the following properties:

Well graded (uniformity index not less than 5), non-cohesive and nearly silt free (silt content not greater than 5%; up to 10% tolerated, except below footings of structures), salt free (content less than 3%), soils free of organic matter (limit 2%). Decomposing or compressible materials shall not be used.

All materials shall be of such nature and character that it can be compacted to the specified densities in a reasonable length of time. It shall be free of highly plastic clays, of all materials subject to decay, decomposition or dissolution, and of cinders or other materials, which will corrode piping or other metal.

The intention is to use select fill below plinth, floors, roads, parking areas etc.

b) Ordinary fill shall have the following properties:

- Natural inorganic soils: salt content not greater than 5%, organic matter less than 3%. For other properties see under 'Select fill'.
- The intention is to use ordinary fill for non-built areas.

c) Special fill:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[12]	25.09.2014

- Special fill material shall be gravel or crushed rock (for other properties see under 'Select fill'). The intention is to use special fill e.g. as sub-base material for tanks.

4.3 Excavation

The works shall be excavated either by hand or by use of excavating plant and tools acceptable to the Owner/Consultant.

Last 300 mm shall be excavated by hand tools only to ensure that natural conditions of soil at foundation level should not be disturbed. In case if over excavation has been done, the depth of soil over excavated shall be filled with M10 Grade concrete and no earth filling shall be allowed to fill over excavated earth.

Also, excavation by hand may be required close to existing installations, existing foundations and/or underground services, but subject to special instruction of the Owner/Consultant.

The Bidder shall carry out all kind of earth and rockwork for the following particular works as defined hereafter (where applicable):-

- i) Clearing and grubbing
- ii) Excavation of topsoil
- iii) Open cut excavation
- iv) Backfilling
- v) Safety precaution during earthwork
- vi) Mining or underground excavation (if required)
- vii) Grading
- viii) Replacement of material
- ix) Trench excavation for service lines
- x) Embankments
- xi) Archaeological findings

4.4 Safety Precautions

The Bidder shall be responsible for all necessary safety measures.

Proper strutting, sheeting and bracing, including re-arrangement of the installations when necessary, stabilization and protection of slopes, methods of excavation to reduce risks of slides etc shall be to the Bidder's debit. The additional moving of soil resulting from such damages will not be paid for.

4.5 Over Excavation

Bidder shall ensure that no excavation work is carried out beyond the founding level of existing nearby building/equipment. Any damage to adjoining structure/ foundation shall be rectified by the Bidder without any extra cost to Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[13]	25.09.2014

4.6 Stockpiles and Disposal

Excavated material from the works selected by the Owner/Consultant for re-use shall be placed immediately in its final position, if possible, or otherwise may be stockpiled or deposited on site as directed by the Owner/Consultant.

Distance of stockpiling of excavated material from the pit edge shall be minimum 1.5 meters or half of the depth of the pit whichever is higher. The Bidder shall not have the right either to additional payment or to claim because of work involved in stockpiling materials, re-use of for carting to the waste disposal areas. Soil unfit for re-use shall be removed to sites approved by the Owner and shall not be permanently deposited elsewhere. The Bidder shall trim and form the edges of spoil to profiles and levels as directed by the Owner/Consultant.

The placing of materials within the waste disposal areas shall be made in layers not exceeding 0.50 m in thickness in order to obtain an appreciable degree of compaction by means of transportation equipment and/or if required by appropriate compaction equipment.

All traffic to or from the waste disposal areas shall run over the surface of such areas in order to achieve compaction.

4.7 Preparation of Foundation

All earth surfaces, against which concrete is to be poured, shall be clean and free of any detrimental impurities, organic matter or unsuitable material. Immediately after excavation, all such surfaces shall be moistened and treated as directed by the Owner/Consultant and then protected by means of a lean concrete layer, 7.5 cm or PCC thickness as shown in the design drawings, whichever is greater. No concrete is to be poured until formation is inspected and approved by the Owner/Consultant.

No structural concrete shall be poured against earth surface. Shuttering shall be used at sides and PCC shall be provided below foundations.

4.8 Backfilling

Foundations and structures shall be backfilled with approved material compacted in layers not exceeding 150 mm by suitable equipment upto the required designed levels. Compacting shall be carried out with special care by means of pneumatic or mechanical rollers or other compactors of a type previously approved by the Owner/Consultant.

Density requirements as per standard Proctor Test shall be in accordance with relevant parts of IS: 2720 and all tests shall be made by/on under the supervision of Owner/Consultant at Bidder's own expenses, at optimum moisture content:

- a) Backfilling of foundations and under grade slabs - 98%
- b) Under roadways and parking areas - 98%

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[14]	25.09.2014

c) Embankment

- 95%

The thickness of fill layers, number of passes and type of equipment to be used shall be proposed to the Owner/Consultant after compaction tests have been made.

Surfaces receiving fill layers shall, if smooth, be previously scarified to obtain a good key between the new fill layer and the sub-grade.

Backfilling of foundation work with approved materials shall be carried out only after foundations have been inspected by the Owner/Consultant.

4.9 Soil Replacement

The material to be used for replacement of soil shall not contain soluble or swelling components such as clays, or organic matters. Sand gravel mixtures of favourable grain size distribution shall be used in exchange. The suitability of soil for its use for filling shall be as per provisions of Indian Standards.

Prior to the commencement of work, three samples shall be taken from the anticipated borrow area and tested in respect of IS: 2720 or Proctor density, optimum moisture content, grain size distribution and content of soluble matters.

These three samples shall cover the approximate variation of materials to be expected within the borrow area.

The fill material shall be placed in horizontal layers of not more than 15 cm in compacted thickness. The fill moisture content shall be controlled and adjusted in order to achieve a maximum of compaction. Fresh water shall be used for watering of soils.

The fill material shall be compacted by vibratory roller (min. weight 20T.). However for small compaction works such as small patches etc., comparatively low weight compactors or other compaction methods may be used after taking approval from Owner / Consultant. The minimum required degree of compaction should be as defined under "Tests and Properties". One Proctor and three density tests shall be made at every fourth fill layer prior to continuation of filling work. The testing location will be indicated by the Owner/Consultant. The Bidder shall either provide all required laboratory facilities and staff to perform the tests or he shall co-operate with an experienced soil testing laboratory, subject to the approval of the Owner/Consultant.

Filling work may be continued in case all tests performed show satisfactory results.

4.10 Protection of Existing Utilities and Services

During modification/rehabilitation of existing structures or construction of new structures, the Bidder shall provide all protection for existing utilities and services as may be required by his modification and construction operations.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[15]	25.09.2014

Permanent protection of certain items shall be as included under other sections or as instructed by the Owner/Consultant.

In addition to the requirements as specified, herein the Bidder shall comply with the following requirements:

- a) Use all necessary precautionary and protective measures required to maintain existing structures, utilities, services and appurtenances that must be kept in operation. In particular, the Bidder shall take adequate measures to prevent undermining of existing structures and utilities/services presently in service.
- b) Protect existing or new utilities and services where required by the Bidder's operations and/or as directed by the Owner/Consultant. The Bidder shall be responsible for bracing and supporting existing structures, utilities and services to prevent settlement, displacement or damage.

4.11 Dust Control

The Bidder shall use all means necessary to control dust on roads, dismantling/demolition and modification areas, construction areas and borrow pits.

Surfaces shall be regularly watered to prevent dust becoming a nuisance for the public and interfering with the proper execution of the works.

4.12 Dewatering during Construction

This division applies to the methods and techniques of ground water control. Prior to the decision for the method and technique to be applied, a comprehensive knowledge of the soil and ground water conditions have to be obtained from the results of the detail soil investigation and/or information given in writing by the Owner/Consultant.

Ground water control for keeping the construction pits dry shall be included in the Bidder's scope of work.

The method and technique shall be based on the IS: 3764.

The scope of supply includes removal of all equipment, plants, pipes, machinery, etc for modification /rehabilitation of existing foundations and re-installation of all equipment, plants, pipes, machinery, etc and its removal after completion including operation & maintenance of the equipment during the construction period.

Where necessary, cofferdams, sheet piles, pump sumps, equipment and channels, troughs, inlet gutters, pipes and any other works required for the water control and discharge shall be part of the scope of supply. The dewatering system shall be designed and installed in such a way that alterations and extensions can be made at any time throughout the operating time, if necessary. Reserve units shall be kept ready for service when failure of any of the installed units occurs.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[16]	25.09.2014

The Bidder has to consider the possibility of a temporary failure of any pump, diesel engine and/or the electric power service and shall install emergency power units with sufficient capacity to feed the necessary power to the installed unit at the moment of failure. The Bidder shall submit to the Owner/Consultant, the detailed method of the envisaged pumping system for dewatering, the pump capacity and the standby reserve units. The Bidder shall adjust the system if required by the Owner/Consultant.

The Bidder must ensure that any dewatering works will not cause any interference to his own work and to those of other Bidders working elsewhere on site. Any damage occurring during the above mentioned period should then be made good by the Bidder at his own expense.

During the foundation works, the excavated areas, foundation levels, and pits are to be kept free of water down to at least [0.50] m below the foundation level.

4.13 Equipments

All equipments, instruments, machineries, tools, pipelines, etc required for execution of the water control shall be kept in good working condition throughout the operation period.

4.14 Execution

The Bidder shall keep records of all data of importance occurring during operation of the water control system. The records shall be submitted to the Owner/Consultant for information and checking every working day. For that purpose, the lowering of the water table shall be controlled by piezometers. The numbers and position of them shall be submitted to the Owner/Consultant's approval. The Bidder shall provide and maintain these piezometers at his own expenses during the dewatering works or as long as the Owner/Consultant requires it.

Pump operations shall not be stopped nor pipes, channels and equipment for dewatering and water control removed or altered in any way, except with the express permission of the Owner/Consultant. The Owner/Consultant will stipulate the time of removal. Until then, the pumps and water drainage facilities shall be kept in proper working order without extra payment being granted.

Pump sumps and channels:

Provision of pump sumps and channels of the dimensions required for each particular case shall include all necessary excavation of any kind of soil above and under water, backfill and consolidation, sheeting, bracing, stiffening, sealing, scaffolding accesses, as well as the disposal of water and all auxiliary works.

Routing of channels or pipes for discharge water shall be such as not to impede or obstruct any of the other works and/or operations.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[17]	25.09.2014

The same shall be applicable for pump sumps. Prior to the determination of any arrangement of pump sumps, the Owner/Consultant's approval shall be obtained.

Routing and location of water discharge lines shall be submitted to the relevant authorities and to the Owner/Consultant's approval.

Difficulties during dewatering:

The Bidder shall consider all difficulties and additional work due to the presence of unexpected ground water during subsequent construction work. Where it is possible to keep off or divert such water without special dewatering arrangements or where work can be carried out normally under or in water, such a method may only be applied after approval from Owner/Consultant has been obtained.

Ready for service condition:

The Bidder shall maintain ready for service and regularly clean all dewatering equipment and accessories and shall keep all access clear so that they can safely be used without risk of accident. Any recommendations made by the Owner/Consultant in this matter shall be carried out immediately.

Leakage:

Blockouts and pipe connections through structures and their closure, proper grouting of joints, etc or repairs in the event of leakage shall be the responsibility of the Bidder.

Piezometers:

The ground water lowering effect is to be checked by piezometers in unfavourable positions (e.g. in the middle of the building pit) before starting the excavation. The piezometers are to be installed at unfavourable positions or in more permeable layers (in stratified sub-soil) below the bottom of the excavation. They serve to check whether or not the water pressure (head) has been sufficiently reduced in those layers below the bottom of the excavation, which are more permeable. Security against hydrostatic uplift is to be demonstrated by calculation.

LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[18]	25.09.2014

5. REINFORCED CONCRETE STRUCTURES AND FOUNDATIONS

5.1. General

All structures, building foundations, machines / equipment foundation, water retaining structures, trenches, pits, etc. shall be checked / designed as per latest relevant IS codes in general. Construction in general shall follow provisions of IS: 456 and IS: 3370 for normal and water retaining structures respectively.

5.2. Design Methodology

a) General

All designs of RCC structures shall be carried out by limit state method as per IS: 456 unless use of working stress method is specifically mentioned. Design strength of materials and design loads shall be calculated using appropriate partial safety factors over characteristic strength and characteristic loads as per IS: 456.

IS: 11384 shall be followed for design of steel concrete composite beam.

For reinforcement detailing IS: 5525 and SP: 34 shall be followed.

The walls shall be provided with reinforcement on both faces for sections 150 mm or more, even if not required from design consideration.

b) Foundation and Underground Structures

Type of foundation system, i.e. isolated, strip, raft shall be decided based on the loading arrangement, load intensity and soil strata. Design of foundations at various levels shall be dependent upon the soil bearing capacity at that level.

Foundation system adopted shall ensure that settlement / relative settlement is as per provision of IS: 1904 and other Indian Standards. However, the settlement shall be restricted to a lower value, if necessary as per the system requirement.

All foundation including machine / equipment foundations shall be of RCC construction. All foundations shall be designed in accordance with relevant parts of the latest revisions of Indian standards IS: 2974 and IS: 456. Raft foundations shall be designed as per IS: 2950.

All foundations shall be treated as per the guidelines prescribed in IS 456: 2000 against sulphate/other aggressive chemicals if found present in soil or as per the requirements of detail Geotechnical Investigation Report.

For design of underground structures, subsoil water level shall be assumed at Finished Ground level. All underground pits, tunnels, basements, cable and pipe trenches, etc. shall be designed as leak proof RCC structure, where depth of ground water table so warrants. In case of leakage in the above structures injection grouting method shall be applied to repair the structure according to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	01	Tender Document for Selection of R&M Contractors – Turbo Generator & Auxiliaries Volume-II, Section-II, Part-D	[19]	25.09.2014

the requirement of IS: 6494. Effects of uplift and reduction in bearing capacity due to underground water table shall also be considered.

For Subsoil conditions, Average ground water table, Foundation system, Earth Pressure Coefficient, refer to detail geo-technical investigation report of the site.

The soil conditions met during the foundation works especially in the foundation level are to be checked by the Bidder's soil Engineer, recorded and compared with previous known or investigated results. If essential differences occur, which could be detrimental to the structures, the Bidder has to inform the Owner/Consultant and to propose further measures. Foundation works in such areas are to be continued only after approval of such measures by the Owner/Consultant

If there is any doubt about the soil quality or if discrepancies appear with regard to the previous decisions or investigations stated by the Owner/Consultant, then additional measures are to be taken after consulting the Owner/Consultant (e.g. additional excavation and lean concrete fill)

Allowable settlements, elastic plus consolidation, shall be limited as follows: -

- i) Total settlement : 38 mm
- ii) Differential settlement : 6 mm

Foundations for equipment shall be designed to meet the total and differential settlement established by the equipment manufacturer if they are more stringent than the allowable settlements listed above. Foundations for buildings shall be designed to meet the total and differential settlement as required for the building function if they are more stringent than the allowable settlements listed above.

c) Settlement and Expansion Joints

Joints are to be arranged in such a way that stresses and strains caused by settlements, temperature, differential settlement, etc do not adversely affect the structures. This primarily applies to differently loaded areas and structures having different foundations or foundations of different depths. The settlement joints shall run through the complete structure down to foundation level, the expansion joints however shall stop on the top level of foundations.

The joint width is to be at least 2 cm is to be planned considering all relevant factors (settlements, tilting, movements, aspects etc.).
