1	Guaranteed wear life of the part is (say=Y)	15,000 hrs	
2	Actual wear life achieved by failed part with replacement is (say Y1 & Y2)	13,000 and 11,000 hrs	Life of wear part replaced during 5 year guarantee trial period
3	Average wear life of failed wear parts is(AWL)	$= (Y1+Y2)/2$ $=12000$	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I	[135]	15.01.2016

S.No.	Description	Example	Remarks
4	Total shortfall in hours for wear part during 5 years of guarantee trial period is S	$= (Y-Y1)+(Y-Y2)$ $= 2000+4000$ $= 6000$	
5	Shortfall settlement	$= [S/AWL] \times [(20-GTP)/ (guarantee trial period)]$ $= 2.0$	If the value works out to 1.6, then in that case the same can be rounded off to the next higher whole number.

The Bidder shall provide to Owner either the wear parts of original or better quality/material number equivalent to one and a half times the quantity worked out based on the method explained in the above example so as to compensate for the shortfall in wear life for a extended plant life of [20/25] years as has been established above, or the cost of such number (i.e., one and a half time the quantity worked out as per the above example) of wear parts based on the prices agreed for mandatory spares. The final mode of compensation for such shortfall viz., by means of additional quantities of spares worked out or by cost thereof shall be as per Owner's discretion. The total cost of such replacements shall be without any limit to the maximum amount recoverable.

Average Wear Life (AWL) during guarantee trial period, to be considered for pulveriser wear part warranty shall be as arrived at from the station record for each pulveriser, and as corrected for variation in YGP index of the coal being fired during guarantee trial period. For this purpose the coal YGP shall be the average tested value during guarantee trial period. The Bidder shall collect the coal samples and get them tested for YGP index at recognised, Owner's approved test lab, periodically. (The frequency of sampling and testing shall be mutually agreed between Bidder & Owner). The YGP index testing shall be done as per the BS Standard specified. A jointly signed record shall be maintained during guarantee trial period.

c) Furnace Exit Gas Temperature (FEGT) {Applicable for PF Boilers but not for CFBC Boilers }

The Bidder shall conduct a comprehensive thermal performance test (TPT). Through such TPT the Bidder, by indirect measurement, shall demonstrate that the Furnace Exit Gas Temperature (FEGT) does not exceed the specified maximum temperature limit, with coal pulverizer combinations to Owner's choice and all other requirement in line with Specification requirements. The demonstration shall be done by backward calculations method, after having measured/tested/calculated the economizer outlet gas temperature (average), excess air (average), unit heat load (based on turbine flow and reheater flow), characteristics of coal being actually fired during testing, heat

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I	[136]	15.01.2016

absorption in different stages of heat transfer equipment (based on steam/water temperature and pressure measurements) etc. FEGT for the specified design and worst coals shall be calculated using the measured FEGT (with test coal) as above and using computer modeling technique for necessary conversion of the results to the specified design and worst coals. The FEGT demonstration using computer modeling technique shall involve following steps:

Development of a computer field model (FM) (backward) using above measured/computed field data. This will be used to calculate the surface effectiveness factor (SEF) for each of heat transfer banks including furnace water walls with test coal.

The above field model shall have to be validated by various tests (loads, coal pulverizer combination etc. with test coal) to ensure SEFs for each bank are consistent (within: 1.5%) for all tests.

Using above SEFs, for each heat transfer bank Bidder's original boiler design model will be changed.

The validity of the above model shall be checked for each test by feeding the test coal both from backward direction FM and the calibrated Unit Specific model as per step-(c) above. The model validity is established if the results for flue gas temperature profile in the boiler, zonal assumptions etc are identical in both the 'BACKWARD' and 'FORWARD DIRECTION'.

The validated Unit Specific model shall have "Fuel Switching" capability i.e. it shall be able to appropriately vary the furnace absorption with changes in the coal properties. Validation of the above fuel switching capability will also have to be established to the satisfaction of Owner.

Having established and demonstrated FUEL SWITCHING capability, the Contractual FEGT can be demonstrated by using the SITE SPECIFIC calibrated model as per step-(d) and plugging in the specified coal(s).

The detailed procedure and the correction curves for the above test shall be to Owner's approval.

The Bidder through thermal performance test (TPT) as per above shall also demonstrate that the flue gas temperature (Actual/MHVT values) at the entry and exit of various boiler heating surfaces and also the variations across the cross section perpendicular to gas flow do not exceed the values indicated in the data sheets for 100% TMCR Load.

d) Flue gas Temperature (Actual/MHVT)

The Bidder shall also demonstrate that the flue gas temperature at the entry and exit of Boiler heating surfaces and also the variations across the cross section perpendicular to gas flow do not exceed the values indicated in the Technical Specification Section-II of Volume-II at 100% TMCR load.

e) Fuel Oil Support [(Not above 30% BMCR)] {Applicable for PF Boilers but not for CFBC Boilers}

The Bidder shall demonstrate that with any combination of mills in service (to Owner's choice) the Boiler does not require any oil firing for stable and efficient Boiler operation at and above [30% BMCR load].

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I	[137]	15.01.2016

f) Steam Temperature Imbalance

The Bidder shall demonstrate that at SH and RH outlets (in case of more than one outlet) the temperature imbalance between the outlets does not [exceed 5°C] under all loads including transients.

Also Bidder to demonstrate the rated temperature at ESV & ICV of HP turbine & HP turbine respectively.

g) Rated SH/RH Imbalance

The Bidder shall demonstrate the Boiler capability to operate on continuous basis with rated SH/RH outlet steam temperature within the complete control range of the Boiler and with the whole range of specified coal(s). This demonstration test shall be conducted for at least 72 (seventy-two) hours and the metal temperature and various operating parameters of Boiler such as excess air etc shall not exceed their design/predicted values.

h) SH/RH attemperation System

The Bidder shall demonstrate that for all Boiler loads, the spray water flow for SH attemperation system does not exceed [8% of main steam flow], at superheater outlet and spray water flow for RH attemperation system does not exceed [3% of reheat flow] at reheater outlet, while firing any coal from within the range specified with HP heaters in service (to be indicated in the Bid) while maintaining the rated SH/RH steam temperatures at all loads within the control range of the Boiler up to an including BMCR.

i) Fans & Drives

- Satisfactory operation without undue noise and vibration while operating in isolation as well as parallel operation shall be demonstrated.
- Each Fan Set shall be capable of operating within the entire range i.e. from minimum flow to the design head-capacity point.

j) Air Heater Leakages

The Bidder shall demonstrate that the air heater air-in-leakage and maximum drift in air leakage do not exceed the guaranteed or specified value as per technical Specification. Above requirement needs to be combined even with recirculation of flue gas from downstream of ESP.

k) Boiler Capability with HP Heater out of service

The Bidder shall demonstrate steam generating capacity of Boiler when one and/or both or all strings of HP heaters are out of service, as offered. The metal temperature margins over the design value shall also be demonstrated for the most adverse operating conditions.

l) Integration among Boiler C&I and Turbo Generator C &I and BOP C&I

Boiler and its auxiliaries along with its control system (BOILER C&I), TG and its auxiliaries along with its control system (TG C&I) when integrated with Balance of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I	[138]	15.01.2016

Plant (BOP) C&I systems shall meet the permissible limits for important parameters, under various operating conditions specified.

m) ESP air leakage

ESP air-in leakage shall not be more than 1% of total gas flow at ESP inlet at the guarantee point condition.

n) ESP Test

Test to demonstrate for pressure drop across ESP not to exceed the applicable value.

8.4.4 Auxiliary Water System Pumps

Capacity and head and power consumption of all the pumps dedicated to Boiler & its Auxiliaries at the rated duty point (to be demonstrated and proved at shop with the respective job motors).

Vibration, noise level and parallel operation of all the pumps at the rated duty point shall be demonstrated at site.

8.4.5 Power Cycle Piping

Actual hanger readings, under cold and hot condition (at rated parameters) to match with those of design cold and hot hanger readings for MS/CRH/HRH / HP & LP by pass piping system.

8.4.6 Equipment Cooling Water System

Following parameters for ECW pumps dedicated to Boiler and its Auxiliaries:

- a) Parallel operation of pumps to be demonstrated at site
- b) Further pressure drop across the heat exchanger on the primary & secondary water circuit to be demonstrated at site.

Note: The Bidder needs to demonstrate performance parameters for the above auxiliaries, only if, any replacement / refurbishment / retrofitting are carried out by the Bidder in the respective Equipment/Systems in line with the scope of work. Nevertheless, Bidder shall demonstrate performance of Boiler & Auxiliaries closest to the predicted performance and within the safe limit of parameters.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I	[139]	15.01.2016

9 SPARE PARTS

The Bidder shall include in his scope of supply all the necessary mandatory spares, start up and commissioning spares and recommended spares and indicate these in the relevant schedules. The general requirements pertaining to the supply of these spares is given below:

9.1 Mandatory Spares

The list of mandatory spares considered essential by the Owner is enclosed in Annexure-II of this Specification. The Bidder shall indicate the prices for each and every item (except for items not applicable to the Bidders design) in the 'Schedule of mandatory spares' whether or not he considers it necessary for the Owner to have such spares. If the Bidder fails to comply with the above, the cost of such spares shall be deemed to be included in the Contract price. The Bidder shall furnish the population per unit of each item in the relevant Schedules. Whenever the quantity is mentioned in "sets" the Bidder has to give the item details and prices of each item.

Whenever the quantity is indicated as a percentage, it shall mean percentage of total population of that item in the R&M Contract unless specified otherwise, and the fraction will be rounded off to the next higher whole number. Wherever the requirement has been specified as a 'set', it will mean as applicable for one complete Unit or each type & size of the Equipment being taken up for refurbishment or replacement. Also the 'set' would include all components required to replace the item; for example, a set of bearings shall include all hardware normally required while replacing the bearings.

All mandatory spares shall be delivered at site at least two months before scheduled date of initial operation of the first unit. However, spares shall not be dispatched before dispatch of corresponding main equipment.

Wherever quantity is specified both as a percentage and a value, the Bidder has to supply the higher quantity until and unless specified otherwise. Price of mandatory spare parts will also be evaluated.

9.2 Recommended Spares

In addition to the mandatory spare parts mentioned above, the Bidder shall also provide a list of recommended spares for [five (5)] years of normal operation of the plant and indicate the list and total prices in relevant schedule. The list shall take into consideration the mandatory spares specified and should be independent of the list of the mandatory spares. The Owner reserves the right to buy any or all of the recommended spares. The recommended spares shall be delivered at project site at least two months before the scheduled date of initial operation of first unit. However, the spares shall not be dispatched before the dispatch of the main equipment.

Prices of recommended spares will not be used for evaluation of the Bids. The price of these spares will remain valid upto execution of the Contract. However,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I	[140]	28.05.2015

the Bidder shall be liable to provide necessary justification for the quoted prices for these spares as desired by the Owner.

9.3 Start-up & Commissioning Spares

Start up and commissioning spares are those spares which may be required during the start-up and commissioning of the equipment/system till the handing over of the Plant. The Bidder shall provide all such start up and commissioning spares and keep an adequate stock of the same to be brought by him to the site for the plant erection and commissioning. These must be available at site before the equipment are energized. The unused spares, if any, should be removed from there, only after handing over of the plant. All start up spares which remain unused at the time shall remain the property of the Bidder.

9.4 General Requirements

The Bidder shall indicate the service expectancy period for the spares parts (both mandatory and recommended) under normal operating conditions before replacement is necessary.

All spares supplied under this Contract shall be strictly inter-changeable with the parts for which they are intended for replacements. The spares shall be treated and packed for long storage under the climatic conditions prevailing at the site e.g. small items shall be packed in sealed transparent plastic with desiccators packs as necessary.

All the spares (both mandatory and recommended) shall be manufactured along with the main equipment components as a continuous operation as per same Specification and quality plan.

The Bidder will provide Owner with cross-sectional drawings, catalogues, assembly drawings and other relevant documents so as to enable the Owner to identify and finalize order for recommended spares.

Each spare part shall be clearly marked or labeled on the outside of the packing with its description. When more than one spare part is packed in a single case, a general description of the content shall be shown on the outside of such case and a detailed list enclosed. All cases, containers and other packages must be suitably marked and numbered for the purposes of identification.

All cases, containers or other packages are to be opened for such examination as may be considered necessary by the Owner.

The Bidder will provide the Owner with all the addresses and particulars of his sub-suppliers while placing the order on Vendors for items/ components/ equipment covered under Contract and will further ensure with his Vendors that the Owner, if so desires, will have the right to place order for spares directly on them on mutually agreed terms based on offers of such Vendors.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I	[141]	28.05.2015

The Bidder shall warrant that all spares supplied will be new and in accordance with the Contract documents and will be free from defects in design, material and workmanship.

In addition to the recommended spares listed by the Bidder, if the Owner further identifies certain particular items of spares, the Bidder shall submit the prices and delivery quotation for such spares within 30 days of receipt of such request for consideration by the Owner and placement of order for additional spares if the Owner so desires.

The Bidder shall guarantee the long term availability of spares to the Owner for the full life of the equipment covered in the Contract. The Bidder shall guarantee that before going out of production of spare parts of the equipment covered under the Contract, he shall give the Owner at least 2 years advance notice so that the latter may order his bulk requirement of spares, if he so desires. The same provision will also be applicable to Sub-Bidders. Further, in case of discontinuance of manufacture of any spares by the Bidder and/or his sub-Bidders, Bidder will provide the Owner, two years in advance, with full manufacturing drawings, material Specifications and technical information including information on alternative equipment makes required by the Owner for the purpose of manufacture/procurement of such items.

The prices of all future requirements of spares beyond [five (5)] years shall be derived from the corresponding FOB/Ex-works price at which the order for such spares have been placed by the Owner as a part of the mandatory spares or recommended spares. FOB/Ex-works order price of future spares shall be computed in accordance with the price escalation formula to be furnished by Bidder indicating base price reference variation indices for material, labour etc. Based on the formula and considering escalation indices prevailing at the time of order of spares, order price shall be worked out. The base indices will be counted from the scheduled date of successful completion of trial operation of the last plant/equipment under the project. The above option for procuring future recommended spares by the Owner shall remain valid for the period of fifteen [fifteen (15)] years from the date of successful completion of trial operation of the last plant/equipment. In case the spare parts from the same sub-Vendor are not available due to obsolescence or any other reason, the Bidder shall supply the spares for a period of [fifteen (15)] years from an alternative source.

ANNEXURES-II

Mandatory Spares

{Applicable Mandatory Spares for the equipment system to be replaced / refurbished / retrofitted under the scope of this R&M Tender shall be provided as detailed in Annexure-II. Available Mandatory spares of the existing Unit, which can be used after completion of R&M work, shall also be verified before finalization of the below mentioned Spare List. Mandatory Spares shall be defined as for each Unit. The unit, 'set', indicated in the table below will mean as applicable for one complete Unit or each type & size of the Equipment being taken up for refurbishment or replacement.}

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[2]	25.09.2014

1. MECHANICAL

1.1 [Boiler and Auxiliaries – Mechanical Spares]

1.2.1 Pressure Parts

A. Economiser

- i) Straight tube : 200m for each size, type, thickness and material
- ii) Coil end bends : 50 nos. of each size, type, radius and material.

B. Water wall

- i) Straight tube and spiral tube : 200m quantity for each thickness, size and material.
- ii) Bends for burner elevation : 20 nos. for each size, type, thickness, radius and material.
- iii) Bends for Furnace opening : 10 nos. for each size, type, thickness, radius & material.

C. Low temperature super heater (LTSH)

- i) Straight tube of 8-10 m length : 300m length for each size, thickness, and material.
- ii) Bends : 20 nos. of each size, type, thickness, radius and material.
- iii) bends/offsets for supply tubes : 20 nos. each

D. Intermediate temperature superheater (ITSH)/ Platen superheater

- i) Straight tube : 60 m length of each size, thickness, and material.
- ii) Bends : 10 nos. of each size, thickness, radius, type and material.

E. High temperature superheater/ Final superheater

- i) Straight tube : 75m length of each size, thickness, and material.
- ii) Bends : 10 nos. of each size, thickness, type, radius and material

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[3]	25.09.2014

iii) Dissimilar metal weld joint spot piece : 25 nos. of each size, radius and thickness, types & materials

F. Reheater

i) Straight tube : 100m length of each size, type and material

ii) Bends : 10 nos. of each size, thickness, type, radius and material

iii) Dissimilar metal weld joint spot piece : 25 nos. of each size, radius and thickness, types & materials

1.2.2 Headers

A. Water wall headers

i) Hand hole plate : 4 nos.

ii) Yoke plate with fasteners : 4 sets

B. Superheater headers

i) Hand hole plate assembly : 2 nos. of each type

i) Radiographic plug : 6 nos.

C. Reheater headers

i) Hand hole plate assembly : 2 nos. of each type

ii) Radiographic plug : 6 nos.

1.2.3 Superheater and Reheater Attenuation System

Desuperheater liners : 2 sets of each type

1.2.4 Steam Drum (if applicable)

i) Manhole gasket for drum : 12 nos.

ii) Local water level gauge : 1 set
glass assembly

iii) Spares for direct water : 1 set
level gauge

(such as port assembly,
glass strip lamps spring cones, gaskets etc.)

iv) Spares for remote level indicator
(such as seal ring bull deflector
plate, gasket and diaphragm) : 1 set

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[4]	25.09.2014

- v) Spare isolating valve assembly for
above gauge glass : 1 set
For separator (if applicable) spares list to be furnished by the bidder along with the bid document.

1.2.5 Boiler Water Forced Circulation Pumps

- i) Complete pump and motor
assembly : 1 no.
- ii) Motor stator winding : 1 no.
- iii) Journal bearing : 2 no
- iv) Thrust bearing : 2 no
- v) Casing wear rings : 2 no
- vi) Impeller wear rings : 3 no
- vii) Set of gaskets : 5 sets
(All gaskets including
heat exchanger)
- viii) Set of 'O' rings : 5 sets
- ix) Gland packings : 5 sets
- x) Motor heat exchanger : 1 set
- xi) Thermocouples : 1 set
- xii) Temperature switches : 1 set
- xiii) Pressure switches : 1 set
- xiv) Flow switches : 1 set

1.2.6 Fans

A. ID Fans

- i) Radial/Axial type (as applicable)
- a) Fan rotating element (complete assembly) : 1 set
- b) Impeller liners : 2 sets
- c) Casing liners : 2 set
- d) Motor bearings : 2 sets
- e) Fan bearings : 2 sets
- f) Bearing Housing : 1 No
- g) Seals, 'O' rings oil rings for
all the fan bearings : 6 sets
- h) Lube oil system

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[5]	25.09.2014

- Pump assembly : 1 no.
- Pressure regulator : 2 nos.
- Filters : 8 nos.
- Coupling between oil pump and motor : 2 nos.
- Coolers : 1 set
- i) Inlet guide vanes (IGV)if applicable : 1 set
- j) Fan blades : 1 set
- k) Spares for blade bearing assembly
 - i) Bearing : 2 sets
 - ii) 'O' rings : 2 sets
 - iii) Bushes : 2 sets
 - iv) Metallic rings : 2 sets
 - v) Intermediate piece (if applicable) : 2 sets
 - vi) Hydraulic servomotor : 2nos
 - vii) Fan Bearing Housing : 1 set
- l) ID Fan Motor complete : 1 no.

B. FD fans

- i) Fan rotor complete (including impeller and shaft) : 1 no.
- ii) Fan bearings : 1 set
- iii) Bearing Housing : 1 no
- iv) Motor bearings : 1 set
- v) Fan blades : 2 sets
- vi) Spares for blade bearing assembly
 - a) Bearings : 2 sets
 - b) 'O' rings : 2 sets
 - c) Bushes : 2 sets
 - d) Metallic rings : 2 sets
 - e) Intermediate piece : 3 sets
- vii) Lube oil system
 - a) Pump assembly : 1 no.
 - b) Pressure regulator : 3 nos.
 - c) Filters : 8 nos.
 - d) Coupling between oil pump and motor : 2 nos.
 - e) Coolers : 1 set
- viii) Couplings between fan

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[6]	25.09.2014

- and motor : 2 nos.
ix) Hydraulic servomotor : 2 nos.
x) FD fan Motor complete : 1 no.

1.2.7 Coal Pulverizers

i) Grinding elements

- Rollers/ tyres/ grinding balls : 2 sets
Bull ring segments/ bowl/ rings : 1 set

Note: One set of grinding element above is defined as under

1 set = (Grinding elements needed for complete replacement of one mill) x A

Where

A = [(8000 x N)/ GWL. Rounded off to nearest whole number]

GWL = Guaranteed wear life of grinding element as offered by Bidder

N = Number of mills installed for one Boiler unit

- ii) Gear box internals (expect bearings and seals) : 1 sets*
iii) Mill motor complete : 1no
iv) Mill motor bearing : 1 set
v) Complete gear box : 2 sets*
vi) Bearings for mills : 2 sets*
vii) Seals and rings for gear box : 2 sets*
viii) Liners with brackets & fasteners : 3 sets*
ix) Discharge valve assembly : 2 sets*
x) Multiport outlet & liners : 2 sets
xi) Mill main shaft/ yoke : 1no.
xii) Journal & Spring : 2nos.
xiii) Hydraulic loading cylinder : 3nos.
xiv) Filter cartridges : 6nos.
xv) Actuators (pneumatic/hydraulic) (complete) : 1no. of each type
xvi) Actuators (pneumatic/ hydraulic) spare kits : 1 set of each type
xvii) Mill bottom : 2nos.
xviii) Bowl hub assembly/Ring seat : 1nos.
xix) Lube oil system

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[7]	25.09.2014

- a) Pump and motor coupling : 3nos.
- b) Pump assembly : 2nos.
- c) Motor assembly : 2nos.
- d) Filters : 12 nos.
- e) Pressure regulator : 2nos.

xx) Oil cooler assembly for coal mills : 2 nos.

xxi) Bearings for gear box : 3 sets*

*One set means complete replacement of one mill

1.2.8 Feeders

- i) Belt : 6 sets*
- ii) Belt drive feeder motor : 2nos.
- iii) Belt drive reducer : 2nos.
- iv) Clean out conveyor motor : 2nos.
- v) Clean out conveyor reducer : 2nos.
- vi) Counter assembly (complete): 2nos.
- vii) Head pulley assembly (complete) : 2nos.
- viii) Weight sensing system

- a) Weighing oil : 2nos.
- b) Weighing spare roller assembly : 2nos.
- c) Drag link assembly : 2nos.

- ix) Tension roll : 2nos.
- x) Worm : 2nos.
- xi) Worm wheel : 2nos.
- xii) Feeder gate : 2nos.
- xiii) Actuator : 1no. of each type

1.2.9 Coal Burners and Coal Pipe Bends

Bidder to provide the complete list of spares as required.

1.2.10 Seal Air Fan

- i) Impeller with shaft : 1 no.
- ii) Bearings and seals : 2 sets
- iii) Motor bearings : 2 sets
- iv) Seal Air Fan Motor complete : 1 no.

* One set means complete replacement of one fan

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[8]	25.09.2014

1.2.11 Regenerative Air Preheaters (RAPH)

- i) Support bearing : 2 nos.
- ii) Guide bearing : 2 nos.
- iii) Lubricating system of support and guide bearing
 - a) Pump assembly : 1 no.
 - b) Pressure regulator : 1 no.
 - c) Filters : 6 nos.
 - d) Pump motor coupling : 3 nos.
 - e) Coolers : 1 set
- iv) Radial seals : 4sets
- v) Axial seals : 4 sets
- vi) Circumferential or bypass seals : 2 sets
- vii) Rotor post seals : 4 sets
- viii) Speed reducer
 - a) Complete speed reducer(gear box) : 1 set
 - b) Speed reducer gears, pinions and shaft : 1 set
 - c) Speed reducer bearings : 1 set
 - d) Speed reducer seals and gaskets : 2 sets
 - e) Speed reducer clutch assembly : 2 nos.
- ix) Fluid coupling 3 nos.
- x) Other couplings with inserts and fasteners : 2 nos.
- xi) Solenoid valves : 2 nos.
- xii) Spare kit for rotor stoppage alarm : 1 set
- xiii) Spare kit for fire sensing device 1 set
- xiv) Spares for cleaning device
 - a) Worm and worm wheel for gear reducer : 1 set
 - b) Coupling : 1 set
 - c) Bearing and seals for speed reducer : 1 set
 - d) Bearing for cleaning device : 2 sets

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[9]	25.09.2014

- xv) Bushings for worm gear reducer : 1 set
 - xvi) Actuators for isolation dampers : 2 no.
 - xvii) Cold, intermediate and hot end baskets : 1set for each type and size
 - xviii) RAPH motor complete : 1 no. of each type
- *One set means complete replacement for one APH*

1.2.12 Fuel Oil System

A. Heavy fuel oil system

- i) Fuel oil guns : 2nos
- ii) Oil gun nozzle (with back plate, mixing plate and cap nut) : 4 sets
- iii) Oil gun flexible hoses (including for guide pipe, air line) : 4 sets
- iv) Burner isolation valves
 - a) Isolation valves : 12 nos. or 10% whichever is higher
 - b) Gaskets for above valves : 2 sets
 - c) Gland packings for above valves : 2 sets
- v) Atomizing steam pressure reducing valve : 1 no.
- vi) Electro pneumatic quick closing valves used in oil burner area, each type size & model (complete valve with servo motors, solenoid & its limit switches for ol, air, steam : each 1 no
- vii) Oil shut off valve of each type, size & model : 1 no
- viii) Check valve of each type, size & model : 1 no
- ix) Limit switches for the displacement: device : 2 nos
- x) Steam traps : 4 nos
- xi) Heavy oil temperature control valve : 1 no.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[10]	25.09.2014

xii) Actuators of above valves : 1 no. of each type and rating

1.2.13 Light oil system

i) Light oil gun : 1 set
 ii) Oil gun nozzle (with back plate, mixing plate and cap nut) : 2 sets
 iii) Burner isolation valves
 a) Isolation valves : 4nos
 b) Gaskets for above valves : 2 sets
 c) Gland packings for above valves : 2 sets
 iv) Light oil pressure control valve : 1 no.
 v) Light oil main trip valve complete : 1 no.

1.2.14 HEA Igniters

i) HEA retractor : 2 sets
 ii) HEA spark rod : 2 sets
 iii) HEA spark tip : 2 sets
 iv) HEA exciter : 4 nos. of each type and rating
 v) Solenoid valves : 4 nos. of each type and rating
 vi) Limit switch : 4 nos. of each type and rating
 vii) Solenoid valve coil : 8 nos. of each type and rating
 viii) HEA spark gap : 8 nos.
 ix) HEA transformer : 8 nos.
 x) HEA rectifier : 8 nos.
 xi) HEA inductor : 8 nos.
 xii) Resistor : 8 nos. of each type and rating
 xiii) Capacitor : 4 nos. of each type and rating

* One set means one complete replacement of one HEA igniter

1.2.15 Soot Blowers

i) Complete assembly of water wall Deslaggers (water lances) : 2 nos.
 ii) Motor for water wall deslaggers
 a) For each drive : 3 nos.
 iii) Complete valve assembly for water wall deslaggers : 4 nos.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[11]	25.09.2014

- iv) Motor for long travel retractable soot blower(Steam soot blowers in convective pass)
 - a) For rotary motion : 2 nos.
 - b) For traverse motion : 2 nos.
- v) Complete valve assembly for long retractable soot blower : 2 nos.
- vi) motors for air preheater soot blower : 1 no. of each type
- vii) Reduction gear box and motor for air preheater soot blower oscillation : 1 no of each type
- viii) Complete valve assembly for air preheater soot blower : 1 no. of each type
- ix) Bearing and oil seals for
 - a) Long retractable soot blower : 2 sets
 - b) Water wall deslagger : 3 sets
- x) Complete steam safety valve assembly for soot blowing system : 1 no.
- xi) Steam pressure control valve assembly : 1 no.
- xii) Steam pressure control valve spares
 - a) Stem and disc assembly : 2 sets
 - b) Gaskets : 6 sets
 - c) Gland packings : 4 sets
 - d) Seat rings : 2 sets
- xiii) Long retractable soot blower assemblies complete : 1 no. of each type
- xiv) Limit switches : 2 nos. of each type and rating
- xv) Complete power pack assembly for long retractable soot blower : 2 nos. (1 no. for rotary no. for transverse)
- xvi) Spare set of rotary and transverse chain for long retractable soot blowers : 1 no. of each type and size
- xvii) Spares for rack gear assembly
 - a) Set of gears and shaft (Spur and worm) : 1 set
 - b) Rack and pinion : 1 set
- xviii) Thermocouples for temperature probes : 1 no. of each type and size

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[12]	25.09.2014

- xix) Soot blower nozzle : 10 % of populaaton
xx) Soot blower lance tube : 10 % of population

1.2.16 Valves

A. Steam drum (if applicable) safety valves

- i) Upper adjusting ring : 2 nos. of each type
ii) Lower adjusting ring : 2 nos. of each type
iii) Locking pin set : 2 nos. of each type
iv) Safety valve disc : 2 nos. of each type
v) Safety valve stem : 1 no.
vi) Valve spindle : 2 nos.
vii) Guide : 1 no.

B. SH safety valves

- i) Disc : 2 nos. of each type
ii) Upper adjusting ring : 2 nos.
iii) Lower adjusting ring : 2 nos.
iv) Valve spindle : 1 no.
v) Set of washers : 2 sets of each type
vi) Guide : 1 no. of each type
vii) Set of locking pins : 2 sets of each type

C. Hot RH safety valves

- i) Disc : 1 no. of each type
ii) Upper adjusting ring : 1 no. of each type
iii) Lower adjusting ring : 1 no. of each type
iv) Valve spindle : 1 no. of each type
v) Set of washers : 1 set of each type
vi) Set of pins : 1 no. of each type
vii) Guide : 1 no. of each type

D. Cold RH safety valves

- i) Disc : 1 no. of each type
ii) Upper adjusting ring : 1 no. of each type
iii) Lower adjusting ring : 1 no. of each type
iv) Valve spindle : 1 no. of each type
v) Locking pin set : 1 set of each type
vi) Guide : 1 set of each type
vii) Set of washers : 1 set

E. Electromatic relief valve

- i) Complete electromatic relief valve : 1 no. of each type

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[13]	25.09.2014

ii) Spares for above:

- a) Disc for main valve : 2 nos. of each type
 - b) Spring for main valve : 2 nos. of each type
 - c) Seal rings for main valve : 2 nos. of each type
 - d) Seal bushing for main valve : 2 nos. of each type
 - e) Disc and steam assembly
for pilot valve : 2 nos. of each type
 - f) Bushing for pilot valve : 2 nos. of each type
 - g) Spring for pilot valve : 2 nos. of each type
 - h) Seal ring : 2 nos. of each type -
- If air assisted safety valves are envisaged, necessary spares to be added..*

F. Superheater spray control valve

- i) Complete superheater spray control valve : 1 nos. of each size and type

ii) Spares for the above:

- a) Gland packings set : 4 sets
- b) Pressure seal gasket : 4 sets
- c) Stem : 2 nos.
- d) Plug valve : 2 nos.

G. Reheater spray control valve

- i) Complete reheater spray control valve : 1 nos. of each size and type

ii) Spares for the above:

- a) Gland packings set : 6 sets
- b) Pressure seal gasket : 6 sets
- c) Stem : 2 nos.
- d) Plug valve : 2 nos

H. Superheater Spray Block Valve

- i) Gland packing set : 2 sets of each type
- ii) Pressure seal gasket : 2 nos. of each type
- iii) Stem : 2 nos. of each type
- iv) Valve plug : 2 nos. of each type

I. Reheater Spray Block Valve

- i) Gland packing set : 2 sets of each type
- ii) Pressure seal gasket : 2 nos. of each type
- iii) Stem : 2 nos. of each type

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[14]	25.09.2014

iv) Valve plug : 2 nos. of each type

1.2.17 Boiler Main Steam Stop Valve

- i) Set of gland packings : 6 sets
- ii) Pressure seal gaskets : 8 nos.
- iii) Stem : 1 no. of each type (1 no. for main valve and 1 no. for integral bypass valve)
- iv) Disc : -do-
- v) Seat rings : -do-
- vi) Fasteners : -do-
- vii) Actuator : -do-

1.2.18 Start Up Vent Valves

- i) Stem : 1 no.
- ii) Disc : 1 no.
- iii) Body seat rings : 2 sets
- iv) Gland packings : 3 sets
- v) Pressure seal rings : 3 nos.
- vi) Fasteners : 1 set

1.2.19 Economiser Recirculation Valve

- i) Valve Stem : 1 no.
- ii) Disc : 1 no.
- iii) Body seat rings : 1 set
- iv) Gland packings : 2 sets
- v) Pressure seal rings : 2 sets.
- vi) Boiler Feed Check Valve
 - (i) Body seat rings : 2 nos.
 - (ii) Flap : 2 nos.
 - (iii) Pressure seal ring : 2 nos.
 - (iv) Gland packings : 4 sets
 - (v) Fasteners : 1 set

1.2.20 Auxiliary Steam Pressure Reducing and Desuperheating (PRDS) System

A. High capacity PRDS system (MS)

- i) Desuperheater liners : 1 set
- ii) Pressure reducing cum desuperheating valves
 - a) Stem : 1 no.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[15]	25.09.2014

- b) Disc : 1 no.
- c) Body seat rings : 2 nos. for each type, size and rating of valves
- d) Gland packings : 3 nos. for each type, size and rating of valves
- e) Pressure seal ring : 3 nos.
- f) Gasket : 3 nos.
- iii) Spray water line control valves
 - Valve trim including cage : 1 no. for each size, type and rating of valves
 - plug, stem, seat rings, guide
 - bushings, stem packing
- B. Low capacity PRDS system (CRH)
 - i) Desuperheater liners 1 set
 - ii) Pressure reducing cum desuperheating valves
 - a) Stem : 1 no.
 - b) Disc : 1 no.
 - c) Body seat rings : 2 nos. for each type, size and rating of valves
 - d) Gland packings : 3 nos. for each type, size and rating of valves
 - e) Pressure seal ring : 3 nos.
 - f) Gasket : 3 nos.
 - iii) Spray water line control valves
 - Valve trim including cage : 1 no. for each size, type and rating of valves
 - plug, stem, seat rings, guide
 - bushings, stem packing

1.2.21 Bottom ash removal system

- 1. Furnace bottom ash removal system
 - a. Wet type slag removal equipment
 - i) Round chain : 2 sets
 - ii) Nylon rings : 8 sets
 - iii) Shaft seals : 8 sets
 - iv) Round core packing : 8 sets
 - v) PIV Spare chains : 1 no.
 - vi) Roller chain between gearing

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[16]	25.09.2014

- and driving shafts* : 1 set
- vii) Bearings of various type* : 2 nos. of each type
- viii) Drive motor* : 1 no. of each type
- ix) Wear plates* : 1 set
- x) Tension pulley with bearing* : 1 no.
- xi) Deflection station* : 1 no.
- xii) Central sprocket wheel discs* : 1 no.
- xiii) Water proof bin assembly* : 8 nos.

1.2.22 Chemical dosing system(if applicable)

1. HP chemical dosing system

- i) Drive shaft cum worm* : 1 no.
- ii) Drive worm wheel* : 3 nos.
- iii) Connecting rod plate* : 1no.
- iv) Cross head* : 1no.
- v) Cross head guide bush* : 3 nos.
- vi) Plunger* : 1no.
- vii) Discharge NRV* : 1no.
- viii) Plug* : 1no.
- ix) Oil seal* : 1no.
- x) Suction NRV* : 1no.
- xi) Washer* : 2nos.
- xii) Gland nut* : 2nos.
- xiii) HP dosing pump assembly* : 1no.

1.2.23 Scanner (Cooling air fans)

- i) Filter screens for cooling air fans* : 1 no
- ii) Fan impeller* : 1 no
- iii) Motor AC* : 1 no
- iv) Seal* : 2 nos. of each type
- v) Bearings* : 1 no. of each type

1.2.24 Power Cycle Piping

- i) Spare gasket for all the gate valves of sizes 15mm NB to 500mm NB* : 5% of each type & size per unit.
- ii) Spare set of gland packings of all the gate valves for all sizes* : -do-

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[17]	25.09.2014

- iii) Spare gasket for all the globe valves for sizes 15mm NB to 500 mm NB : -do-
- iv) Spare set of gland packings of all the globe valves for all sizes : -do-
- v) Spare gaskets for NRV for all the valves : -do-
- vi) Spare set of gaskets for safety relief valves for all sizes : -do-
- vii) Complete gate valves assembly upto the size of 50NB : -do-
- viii) Complete angle valves upto the size of 50 NB : -do-
- ix) Complete globe valves upto the size of 50 NB : -do-
- x) Complete NRV's upto the size of 50 NB : -do-
- xi) Complete needle valves upto the size of 50 NB : -do-
- xii) Spring hangers : 5% of each type & stiffness of quality
- xiii) Gasket for each flanged connection on HP steam and feed line, jacking oil lines : 2 nos.
- xiv) Steam traps and Y-strainers for each size, type and rating : 10% of total population
- xv) SH spray valve (control) : 1no.
- xvi) RH spray valve (control) : 1no.
- xvii) Other valves
 - Each type, size & class 100mm below : 1no.
 - Each type, size & class 100mm above : 10% or 2nos. whichever is lesser
- xviii) Critical piping

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[18]	25.09.2014

For MS, HRH, CRH, BFD, HP-LP Bypass, Aux PRDS Systems, Spray Water and all Miscellaneous Piping including Drains (of boiler scope) as follows:

- *Pipes of dimension 100Nb and : 6 meters
above with IBR certification in
form IIIA*
- *Pipes of dimension below
100 NB with IBR certification : 6 meters
in Form III B.*
- *Gaskets for the system including
all types of metal gaskets, grafoil : 10%*

1.2.25 After Burning Grate (ABG)

ABG (1 set = requirement of one ABG)

- i) Drive shaft : 2 nos.*
- ii) Return shaft : 2 nos.*
- iii) Louvre plates : 1 set*
- iv) Side supports : 1 set*
- v) Intermediate supports : 1 sets*
- vi) Rollers : 1 set*
- vii) Lower support bar : 1 set*
- viii) PIV Gear box : 1 no*
- ix) Constant speed Gear box : 1no*
- x) Clutch assembly : 1no*
- xi) Coupling motor to PIV : 4 nos*
- xii) PIV chain assembly : 4 nos.*
- xiii) Plummer block with bearing-*
 - a) For drive shaft : 2 nos.*
 - b) For return shaft : 2 nos.*
- xiv) Drive sprocket : 1 set*
- xv) Return shaft pulley : 1 set*
- xvi) ABG Motor complete : 1 no.*

1.2.26 Electrostatic Precipitator (ESP)

- i) Support insulator : 6 nos.*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[19]	25.09.2014

- ii) Shaft insulator : 6 nos.
- iii) Bushing insulators assembly : 4 nos.
- iv) Emitting electrodes
 - a) Helical wire type : 5% of the installed quantity in one ESP
 - b) Wire pipe in rigid frame : 10% of the installed quantity in one ESP
 - c) Mast type : 2% of the installed quantity in one ESP
- v) Collecting electrode : 2% of the installed quantity in one ESP
- vi) Inner arm assembly : 20 nos. each for collecting and emitting system
- vii) Outer arm assembly : 10 nos. each for collecting and emitting system
- viii) Plain bearing : 20 nos. of each type and size
- ix) Shock bar/ anvil : 60 nos. of each type and size
- x) Rappers
 - a) For electric rappers
 - Assembled rapper/ drop rods : 20 nos. of each size and type
 - Coil assembly along with sleeve : 4 nos.
 - Casing : 4 nos.
 - Gaskets and packing : 10 nos. of each size and type
 - b) For tumbling rappers
 - Hammers : 20 nos. of each size and type
 - Bearing components : 4 nos.
 - Shafts : 4 nos.
 - Gear motors : 4 nos.
- xi) Transformer rectifier set
 - a) Complete set : 2 nos.
 - b) High voltage insulator : 4 nos.
 - c) Switches and gaskets : 1 set

(One set means one complete replacement for all the TR sets)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[20]	25.09.2014

of one ESP)

xii) Control system

- a) *Transformer-rectifier set controller: 2 nos.*
- b) *Rapper controller complete : 2 nos.*
- c) *Communication controller complete : 2 nos.*
- d) *Electronic cards*
 - *For rapper controller and ESP management system : 1 set*
 - *For transformer rectifier controller : 2 sets*
- e) *Display unit : 2 nos. of each type*
- f) *Keyboard : 2 nos. of each type*
- g) *Push buttons for:*
 - *TR set controller: 2 sets*
- h) *Indicator lamps : 1 set*
- i) *Control fuse : 1 set*
- j) *Power fuse : 1 set*
- k) *Thyristor fuse : 1 set*
- l) *Thyristor of transformer rectifier controller : 2 sets*

xiii) Rapping motor complete : 5 nos. of each type and rating]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-I, Annexure-II	[21]	25.09.2014

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

2. ELECTRICAL

S.No / Cl. No.	Item	Quantity	Remarks		
2.1 General (VENTILATION & AIR CONDITIONING) (To be repeated for each type & rating)					
2.1.1	Contactors	Min. 1 no. of each type			
2.1.2	Over load relay	2 nos. of each type			
2.1.3	Relay/ Timers	3 nos. of each type			
2.1.4	Fan motor	30 % of each rating			
2.1.5	Switch fuse unit/MCCB/ELCB	2 nos. of each rating			
2.1.6	Blower motor	30% of each rating			
VFD System (To be repeated for each type & rating)					
2.1.7	Electrical Cards				
2.1.8	Control modules	1 No of each type & rating			
2.1.9	I/o modules	2 Nos. of each type & rating			
2.1.10	Power supply modules	2 Nos. of each type & rating			
2.1.11	Thyristor gate module including gate transformer	10% of installed quantity			
2.1.12	Exciter module	1 No.			
2.1.13	Thyristor bridge leg	10%			
2.1.14	Over voltage limiter and surge suppressor network	1 set			
2.1.15	Power & Control fuse	100% of installed quantity			
2.1.16	Control transformer	1 no. of each type & rating			
2.1.17	Contractor/load break switch	1 No.			
2.1.18	CT/VT	1 No. of each type & rating

1 DESIGN AND SIZING OF BOILER & AUXILIARIES

1.1 General

[The Boilers shall be drum or once through type unit, sub - critical, either a single pass (tower type) or two pass type gas path arrangement, dry bottom, balanced draft, natural or assisted circulation semi-outdoor type, top supported, pulverized coal fired, single reheat type with all auxiliaries. The Boiler shall have the super heater and reheat outlet indicative parameters as mentioned below in the table 1.1.]

[For CFBC Boiler & Auxiliaries, refer Annexure-M1]

1.2 Codes & Standards

The design, manufacture, erection, inspection and testing and materials of the Boilers shall comply with the Indian Boiler Regulations (IBR) and any other standards that are permitted by the IBR and are acceptable to the Chief Inspector of Boilers.

The Boilers shall also comply with those specification requirements that are in addition to those specified in IBR.

International Standards other than IBR that are considered to be equivalent or superior to the IBR shall also be acceptable subject to the approval of the Chief Inspector of Boilers. However, in the event of any conflict between the requirements of the equivalent codes and standards, and the requirements of the Indian Standards/ Regulations, the latter shall govern, unless, specified otherwise in this Specification.

It shall be responsibility of the Bidder to obtain such approvals of the Inspection Authority and Chief Inspector of Boilers on behalf of the Owner, as may be required for designing, manufacturing and erecting, and testing as required by the IBR. All such documentation submitted to statutory authorities shall also be submitted to the Owner/Consultant for his review. It shall also be the responsibility of the Bidder to furnish the requisite documentation as required by the Owner for registering the boiler under IBR.

1.3 Specific Design Criteria of Boiler & Auxiliaries

**Table 1.1
Boiler Rating (Tentative Indicative Parameters)**

S.No.	Description	Unit	Rated Parameter
1	Steam flow at superheater outlet at boiler maximum continuous rating (BMCR) when firing the worst coal	%	<i>[1.02 times the steam flow at turbine VWO condition plus continuous auxiliary steam requirement of unit at TMCR condition.]</i>
2	Steam temperature a) At superheater (SH) outlet	° C	<i>[540 (Correspond to HP turbine inlet parameters of 537°C)]</i>

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[1]	15.01.2016

S.No.	Description	Unit	Rated Parameter
	b) At re-heater (RH) outlet	° C	<i>540 (Correspond to IP turbine inlet temperature of 537°C)]</i>
3	Feed water temperature at economizer inlet		<i>[247 °C]</i> The Boiler shall also be suitable for accepting feed water at lower temperature corresponding to HP heaters out of service condition without exceeding any design limits including the design metal temperature.
4	Steam pressure at superheater outlet	kg/cm ² (abs)	<i>[137 kg/cm² (a)]</i> [corresponding to turbine throttle steam pressure <i>[130 kg/cm² (a)]</i> at 100% TMCR]
5	Boiler control range		<i>[50% TMCR to 100% BMCR]</i> . However, the bidder to specify the feasible mill combinations below 60% TMCR

The above parameter shall be in line with finalized TG parameters (TG specification).

Note!

Pressure drop in reheater should not exceed *[2.5 kg/cm²]* under all operating conditions.

1.3.1 Limiting Parameters for Boiler Design

The Boiler design shall comply with the following limiting parameters with design coal firing, under stipulated air condition *[i.e. 27°C temperature and 60% relative humidity]*.

- Excess air at economiser outlet at TMCR load: *≥[20%] if (i) quoted* (ii) actual value during the PG test is higher than *[20%]* the higher value shall be taken.
- Flue gas temperature at air heater outlet at TMCR: *[135-150°C]* (minimum)

The Boiler guarantees shall however be as per the conditions stipulated in relevant section of the specification.

1.3.2 Quality Parameters of Steam

The quality parameters of steam shall be as per the requirement of the turbine manufacturer. However, the same shall not be inferior to the following under all operating conditions:

- [Silica as SiO₂ :<20ppb]*
- [Sodium + Potassium as Na + K :<10ppb]*
- [Copper as Cu :<3ppb]*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[2]	15.01.2016

d. [Iron as Fe : <20ppb]

e. [Conductivity at 25 deg C : <0.3 μ S/cm]

1.3.3 Boiler Water Quality

The quality parameters of the boiler water shall not be inferior to the following limits:

a) [Phosphate ions : 0.5 to 3 ppm]

b) [Silica_ : \leq 0.25 ppm]

c) [TDS_ : \leq 0.20 ppm]

d) [Conductivity at 25 deg C : \leq 50 μ S/cm]

e) [pH at 25 deg C : 9.2 to 9.4]

1.3.4 Minimum Load without Oil support for Flame Stabilization

The design of Boiler shall be such that it does not call for any oil support for flame stabilization [beyond 30% BMCR] load when firing any coal from the range specified, with adjacent mills in service and mill load not less than 50% of its capacity. This shall be guaranteed and demonstrated by the bidder.

1.3.5 Cyclic Load Capability and Adoptability for Sudden Load Changes/ Load Throw Off

- i) To match the desired plant operating capabilities, the Boiler shall also be designed for regular cyclic/ two shift operation. The total number of start-ups shall be as under

a Hot starts [(less than 8 hrs*)] : [4000]

b Warm starts [(between 8 and 36 hrs*)] : [1000]

c Cold starts [(greater than 36 hrs*)] : [150]

* The time specified is with respect to hours of unit shutdown.

- ii) Under the above conditions, no portion of the Boiler and the associated systems shall be stressed beyond acceptable safe stress and fatigue levels and the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[3]	15.01.2016

design of Boiler and its pressure parts shall take care of above without affecting the life of equipment and pressure parts adversely.

- iii) Boiler shall also be capable of satisfactory, stable and safe operation in case of rapid load changes in downward direction due to external disturbances or equipment malfunction. Under such conditions, the system shall stabilize itself through proven concepts and controls within the recommendation of National Fire Protection Association, USA (NFPA), and sections 85C, 8502 and 8503.
- iv) In case of sudden load throw off, in worst case from 100% TMCR, the Boiler shall be capable of automatically bringing down the steam generating capacity to match with HP-LP bypass capacity of [60% BMCR]. The bidder to indicate minimum load of Boiler to which it can be brought down under such condition, during short turbine outages or export load rejection, with a view to save fuel and reduce heat losses. The unit shall be capable of operating at house load conditions.
- v) In line with automatic run back capability of the unit load on loss of critical auxiliary equipments, the Boiler equipment and systems shall also ensure smooth and stable runback operation.

1.3.6 Operation without HP Heaters in Service

Boiler shall be designed for continuous operation with HP heaters out of operation. The Boiler heat output with HP heaters out of service shall be not less than that at 100% BMCR with all HP heaters in service. Under this condition the superheater and reheater outlet steam temperature shall be maintained at rated values within the whole control range of Boiler load. Further, during such operation the metal temperature of various pressure parts shall not exceed the limits stipulated in their design/ selection.

1.3.7 Operation with/ without Turbine HP- LP Bypass System

- i) As specified elsewhere, when unit trips under full load, HP-LP by-pass system shall come into service. This will call for boiler operation in HP-LP bypass mode, with SH flow of [60% BMCR] capacity and feed water temperature of [140°C] at economiser inlet. For such condition the economiser shall be suitably designed to take a thermal shock of sudden change of feed water temperature from the rated value to approx [140°C]. The superheater and reheater outlet steam temperatures, during such operation shall be maintained at the rated value without the metal temperature for various pressure parts exceeding the safe limits stipulated for their design/ operation.
- ii) Irrespective of the fact that HP-LP bypass system is provided for smooth start-up, fast loading and house load operation of the unit; the Boiler shall also be capable of start up without HP-LP bypass system in service, except in case of hot start-up.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[4]	15.01.2016

1.3.8 Mode of Boiler Operation and Rate of Loading

- i) In line with the plant operating capability requirements, the Boilers shall be designed for *[both constant as well as variable pressure operation]*. Thermal design of Boiler and the selection of materials shall be suitable for both the operational modes.
- ii) The Boilers shall be designed for minimum rate of loading/ unloading mentioned below from 50% to 100% (TMCR) loads without compromising on design life of pressure parts.
 - a. Step load change : Minimum $\pm 10\%$ per minute.
 - b. Ramp rate : Minimum $\pm 2\%$ per min (30% to 50% TMCR Load)

: Minimum $\pm 4\%$ per min (50% to 100% TMCR Load)

Bidder shall clearly bring out the max. rates of loading/ unloading achievable with steam generator offered and the corresponding limiting variations (+ %) of boiler parameters such as throttle pressure, oxygen in flue gas, drum level, SH steam temperature, RH steam temperature, furnace draft, etc.

1.3.9 Furnace

Furnace shall comply with following requirements at 100% BMCR with or without HP heaters out of service and with range of specified coal, under most stringent combination of operating conditions.

- i) Max heat input (NHI) per Unit plan area of furnace : $4-5 \times 10^6$ kCal/hr/m²
- ii) Max heat liberation rate : 110000 kCal/hr/m³
(Volumetric Loading)
- iii) Max burner zone heat release rate : Bidder to furnish kCal/hr/m³
- iv) Max heat input per burner : Bidder to furnish kCal/hr/m³
- v) Max furnace cooling factor : Bidder to furnish kCal/hr/m³
- vi) Max furnace exit gas temp(FEGT) : 60°C below minimum initial deformation temperature (IDT) of ash (FEGT measured at downstream of first stage Platen SH)
- vii) Minimum furnace residence time : *[1.8-2.0 seconds.(Coal specific)]*
- viii) Pressure withstanding capability : Minimum ± 660 mmwc at 67% yield strength or maximum conceivable head of fans, whichever is higher.
- ix) No. of coal burner elevation to be fed from one mill : Bidder to specify

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[5]	15.01.2016

- x) Buckstay spacing : To ensure that its natural frequency is sufficiently away from the flame pulsation frequency.
- xi) Buckstay support : Self support from furnace walls with no interconnection from the flame pulsation frequency.

1.3.10 Pressure parts

- i) The design of all pressure parts (tubes, headers, vessels etc.) shall be as per IBR or other international codes with the approval of the Owner.
- ii) Design pressure of the boiler pressure parts shall be at least 1.05 times the maximum operating pressure, or as required by IBR/ other international codes, whichever is higher. For boiler drum, the design pressure shall be higher of the value as per (i) above or lowest drum safety valve set pressure for full discharge.
- iii) The thickness of the pressure parts (steam and water tubes/ headers, pressure vessel etc.) shall be calculated using IBR formulae/factor of safety etc (or as per codes/ formulae acceptable to IBR). Such thickness as per IBR formulae shall be arrived at after allowing for tube bend thinning, where ever applicable as per IBR/international codes. Additional erosion allowance on the calculated tube thickness shall be provided at specific locations as specified in this specification.
- iv) In line with IBR, the maximum permissible temperature/ metal temperature for design of different components of the boiler shall be considered as below:

Table 1.2
Design temperature values for different components

S.No	Components	Designed values
a	Economiser tubes	Maximum working water temperature plus 11 deg C
b	Furnace and boiler tubes	Saturation temperature corresponding to maximum working pressure plus 28 deg C
c	Superheater and reheater tubes in convection path	Maximum working steam temperature plus 39 deg C
d	Superheater and reheater tubes in radiation path	Maximum working steam temperature plus 50 deg C

Material for Design Metal Temperature is given below

Design Metal Temperature	Material
Upto & including 400°C	Carbon steel to ASME SA-106 Gr. B/C or SA 209 T1 or SA 210 Gr-A1 or approved equivalent

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[6]	15.01.2016

Design Metal Temperature	Material
Upto & including 550°C	Alloy steel to ASME SA-335: P-11/P-12/P-22; ASME SA213: T-11/T-22 or approved equivalent.
Material above 550 °C & up to 600°C	Alloy steel ASME SA-335/213:P91/T-91 or approved equivalent

1.3.11 Superheaters and Reheaters

Table 1.3
Superheaters and Reheaters – Design Criteria

S.No	Components	Designed values
a	Maximum average flue gas velocity in section/ tube banks with transverse tube pitching 600 mm or less and with ≥20% excess air at economizer outlet	10 m/s (The maximum localized velocity across the cross section shall not exceed 12 m/sec)
b	Means of temperature control	
	Super heater	Spray water attemperation shall be tapped off from a suitable source upstream of HP heaters (from BFP discharge or Kicker stage outlet). The bidder can also tap off the spray water from a suitable location downstream side of HP heaters, provided bidder is having experience of such tapping, details of which shall be provided to Owner/Consultant.
	Reheater	Spray water attemperation (utilizing water tapped off from inter-stage of BFP)
	Maximum allowable spray water flow	<p><u>For Superheater:</u> 8% of TMCR flow, however the valve sizing shall be considered 12% of BMCR flow.</p> <p><u>For Reheater:</u> 3% of RH flow at TMCR (However, the control valve shall be sized for 6% of the BMCR flow.</p>

Document Number	Rev No.	Description	Page No.	Date of Issue

1.3.12 Economiser

Table 1.4
Economiser – Design Criteria

S.No	Description	Design basis
a	Type	Non steaming type, with parallel cross flow or counter cross flow arrangement
b	Feed Water Approach temperature	17 deg C (min.) at BMCR load. However, there shall be no steaming at part load and/ sliding pressure operation
c	Maximum average flue gas velocity through inter-tube space of the economizer banks (the gas velocity shall be calculated considering 17% excess air at economiser outlet)	10 m/s (maximum localized velocities shall not exceed 12m/s)

1.3.13 Air Pre Heaters

Table 1.5
Air Pre Heaters – Design Criteria

S.No.	Description	Design basis
a	Type	<i>[Regenerative type Tri-sector air pre heaters with facility of steam coil heating on secondary air side to guard against low cold end temperature.]</i> OR <i>[Tubular type air pre heaters with facility of steam coil heating to guard against low cold end temperature.]</i>
b	Design ambient air	<i>[27°C and 60% RH]</i>
c	Boiler load to be	60% BMCR with worst coal and maximum moisture <i>[with one APH in service, as applicable for Regenerative type Tri-sector air pre heaters]</i>
d	Minimum average cold- end temperature at 100% BMCR (with SCAPHs out of service)	Bidder to calculate and specify.

LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[8]	15.01.2016

S.No.	Description	Design basis
	<p>APH sizing shall also ensure following (for whole range of specified fuels)</p> <ul style="list-style-type: none"> -Minimum flue gas temperature (corrected) at APH exit at 100% TMCR load with design coal firing - Air leakage - Minimum flue gas temperature at all loads 	<p>[135-150 deg C]</p> <p>Max 10% of the TMCR flue gas weight entering air-heater <i>[as applicable for Regenerative type Tri-sector air pre heaters]</i>.</p> <p>10 deg C above acid dew point of flue gas</p>

Sizing of air-preheater(s) shall also ensure that there is no need for economiser bypass to get the desired mill outlet temperature, for the whole range of specified coal.

1.3.14 Steam Coil Air preheater (SCAPH)

SCAPH shall be designed and sized to increase the air heater inlet temperature based on following criteria

- i) Design ambient temperature : [27 deg C]
- ii) Number of SCAPHs : One (1) per *[tri-sector type]* APH
- iii) Air temperature at the inlet of each air preheater (throughout boiler control range) : To keep average cold end metal temperature minimum 10 deg C above the acid dew point for flue gases.
- iv) Design SCAPH and connected duct work suitable to handle flows corresponding to 30% BMCR loads without any undue noise/vibration.

1.3.15 Auxiliary Steam PRDS

The sizing of the auxiliary steam PRDS shall be based on the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[9]	15.01.2016

Table 1.6

Auxiliary Steam PRDS - Particulars

S.No.	Description	High capacity auxiliary PRDS	Low capacity auxiliary PRDS
1	No. of aux. PRDS unit	1	1
2	Source of steam	Main steam line	Cold reheat steam line
3	Capacity	Bidder to specify depending on requirement as per Note-1	Bidder to specify depending on requirement as per Note- 2
4	Indicative parameters of steam on downstream sides	[16 kg/cm ² (abs.) and 310 deg C]	[16 kg/cm ² (abs.) and 210 deg C]

Note-1: The high capacity PRDS shall be sized for auxiliary steam requirement of the equipment specified in the bidders scope of supply with the normal unit running at TMCR rating *[plus start-up auxiliary requirement of another unit, if any]* plus the auxiliary steam requirement of equipments in Owner's scope.

Note-2: The low capacity PRDS shall be sized for auxiliary steam requirement of the equipment specified in the bidders scope of supply with the normal unit running at TMCR rating plus the auxiliary steam requirement of equipments in Owner's scope.

1.3.16 Coal Firing System

a) Coal Mill

Type - Vertical spindle mills type *[(like pressurized type bowl mills, ball and race mills, MPS type roller mills or approved equivalent)]*

Input coal size: 20-25 mm with excursion of 50 mm up to 15%

Maximum loading of the mill with worst coal and design coal (for sizing whichever is higher) - 90% or mill loading achievable corresponding to near wear out condition of mill grinding loss whichever is less for the range of specified coals.

Expected Mill out-put: 99% thru 50 mesh (300 microns) and 70% through 200 mesh (75 microns)

No. of Mills: At 100% BMCR worst coal firing – *[N+1]*

At 100% BMCR design coal firing – *[N+2]*

At 100% TMCR worst coal firing – *[N+2]*

(Where N is no. of Working Mills)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[10]	15.01.2016

Guaranteed life of different mill components:

Seals: 20000 hours

Grinding elements (Rolls/Balls and Rings/Race): 7200 hours

Mill Discharge Valves: 15000 hours

Classifier Cone and other ceramic lined components: 25000 hours

Classifier vane: 25000 hours

b) Coal pipes

S.No	Detail	Description
1	Velocity in coal pipe	<ul style="list-style-type: none"> Minimum 15m/s Maximum 28m/s
2	Continuous operating temperature for pipe design	110 deg C (Minimum)
3	Special erosion protection (on identified areas)	Ceramic lining/wear plate liner
4	Design Pressure	3.5 kg/cm ² (minimum) as per NFPA requirement

c) Raw Coal Feeders

S.No	Detail	Description
1	Type	Gravimetric type.
2	Maximum moisture	As per specified coal
3	Feeder capacity	Minimum 20% spare capacity over maximum mill capacity
4	Environment withstand capability as per NFPA norms	a) Operating pressure of 0.14 kg/cm ² b) Explosion pressure of 3.5 kg/cm ² (minimum) c) Ambient temperature 70 deg C Other environmental conditions envisaged

d) Coal burners

S.No	Detail	Description
1	Capacity	a) To be cater to 100% BMCR load b) To ensure stable operation at BMCR with coal having lowest volatile matter without oil support.
2	Turn down ratio of each set from one mill	To be decided by bidder as per stable operation criteria detailed above subject

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[11]	15.01.2016

		to minimum of 2.5:1.
3	Special feature	a) Low NOx design. b) Total NOx emission (fuel as well as thermal NOx shall not exceed 260gms/giga joule of heat input to the boiler)
4	Control	Centralized automatic control with flame scanner and safety precautions.
5	Operation	Conforming to NFPA guidelines.

1.3.17 Fuel oil preparation and Firing System

- i) Type of fuel oil
 - Startup fuel for cold start : LDO
 - Startup fuel for normal start up, : HFO
 - low load operation, coal flame stabilization
- ii) Minimum fuel oil firing capacity
 - For LDO : [7.5% BMCR heat input capacity]
 - For HFO : [30%BMCR heat input capacity]
- iii) Oil burners
 - Type : Steam/air atomized with HEA igniters
 - Atomization medium : Air for LDO and steam for HFO
 - Capacity :
 - > To cater for [30% BMCR] heat input with HFO for load carrying and as oil support.
 - >To cater for [7.5% BMCR] heat input with LDO for startup at cold start conditions.
- iv) Turndown ratio : 4:1.
- v) Control : Centralized automatic scanner with flame scanner and safety protection.

1.3.18 Draft System

The forced draft (FD) fans and induced draft (ID) fans shall be capable of maintaining balance draft conditions in the furnace over the entire load range with any one or both FD fans and any one or both ID fans in operation while burning the specified range of fuels.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[12]	15.01.2016

Table 1.7
Draft System - Particulars

S. No.	Description	FD fans	ID fans
i)	Type of fans	Constant speed axial fans	Variable speed radial fans or constant speed axial fans with variable blade pitch control
ii)	Fan sizing criteria with all the following conditions occurring together	Each fan to be sized for 60% BMCR flow (one stream in operation) calculated taking into account following factors occurring together.	Each fan to be sized for 60% BMCR flow (one stream in operation) calculated taking into account following factors occurring together.
	a) Type of coal firing	Design/best/worst coal whichever gives maximum FD fan air requirement	Design/best/worst coal whichever gives maximum flue gas flow.
	b) Power supply frequency	47.5 Hz	47.5 Hz
	c) Excess air	≥20% over stoichiometric air requirement	≥20% over stoichiometric air requirement
	d) Fan inlet air/ flue gas temperature	[27 deg C with 60% RH]	150 deg C or actual which ever is higher, corresponding to ambient air temperature of [27 deg C with 60% RH]
	e) Air heater air-in leakage	10% or guaranteed value whichever is higher	Based on minimum 15% leakage from primary air and minimum 10% leakage from secondary air.
	f) Pressure drop through ESP	Not applicable	[25 mmwc]
	g) Air-in leakage through ESP	Not applicable	1% through ESP and 2% through duct or actual whichever is higher
	h) Pressure required at chimney inlet	Not applicable	+ 10 mmwc
	i) Air in leakage	Not applicable	+2%

LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[13]	15.01.2016

S. No.	Description	FD fans	ID fans
	through duct		
	j) Operating medium	atmospheric air	Flue gas
iii)	The fan shall also fulfil following sizing criteria in addition to that mentioned above (with both fans working):	Taking into account following conditions taken together:	Taking into account following conditions taken together:
	a) Margin over 100% BMCR flow	20%	20%
	b) Margin over 100% BMCR pressure	44%	44%
<p>(The sizing criteria specified above shall consider air heater and ducts in normally fouled up condition. The static pressure requirements only shall be considered without any credit for velocity pressure recovery.)</p> <p>Additional Points needs to be considered in design:</p> <ul style="list-style-type: none"> • Suction effect of the chimney to be neglected. • Pressure and temperature drop across ESP has to be considered. • Minimum efficiency of the ESP has to be considered. <p>Deterioration in the capacity of the fan due to wear on account of extended period of service.</p>			

1.3.19 Flue Gas Duct and Air Ducts

All necessary flue gas and air ducts shall be provided. Supply of the flue gas and air ducts shall include all access doors, inspection ports, test points and thermal insulation. The bidder shall supply all steelwork for supporting the ductwork together with all expansion joints and special supports necessary to accommodate thermal expansion. Expansion joints shall be designed so that dust or water cannot accumulate in them.

All necessary drains shall be provided to ensure complete draining of wash water. The duct design shall ensure that wash water does not accumulate on duct surfaces and cause off load corrosion. All ducts shall be designed for the most severe pressures.

- i) Maximum allowable flue gas velocity: 13 m/s (before ESP)
16 m/s (after ESP)
- ii) Maximum allowable air velocity : 16 m/s

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[14]	15.01.2016

- iii) Design Pressure : ± 660 mmwc at 67% yield strength or maximum conceivable pressure of the relevant fans, whichever is higher.
- iv) Type of damper : a) Control damper: pneumatic
b) Isolation: Electric/pneumatic, where fast closing is desirable from process point of view.
- v) Duct Plate material : a) Minimum thickness 6 mm in the flue gas ducts. However, duct plate thickness of 5 mm can be considered, provided the duct stresses remain in normal range.
b) Minimum thickness of 5 mm in the air ducts.
c) A corrosion allowance of 1.5 mm shall be considered for stress calculation for gas ducts.
d) Resistance to flow is to be kept at an economically low value.
e) Equal distribution of flow to various portions of the unit is to be ensured.
f) Dust accumulation is prevented/minimized.
g) Wind load, dead weight and weight of insulation, lagging and cladding.
h) Proper drainage of ducts.
i) Extra thickness of flue gas duct plate at the portion where flue gas changes direction.
j) Adequate provision of access by providing gas tight access doors with bolted and hinged covers and ladders / platforms staging, etc for carrying out maintenance.
k) Provision of ash/dust hopper in the flue gas ducts, as may be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[15]	15.01.2016

required, especially in vertical portions or at the place where flue gas changes direction.

l) Suitable load factors shall be applied to the design loads to care of the higher temps.

m) Vibration aspects of ducts and respective fans so that resonance does not occur under any condition.

1.4 System Description

1.4.1 Boiler

Boiler shall be designed to produce maximum continuous output power with steam parameters of [137 kg/cm² (a)] pressure and [540 deg C / 540 deg C] temperature at the SH outlet. The power plant shall be designed to operate on unit basis [having no interconnection with other units either on the boiler feed water side or main steam side. Each generator shall be connected to its own generator transformer].

Table 1.8
BOILER Parameters

S.No	Parameter	Unit	Value
1.	Main Steam Flow at BMCR	TPH	[.....]
2.	Main Steam Flow at TMCR	TPH	[.....]
3.	Main Steam pressure at SH Outlet,	kg/cm ² (a)	[137]
4.	Main Steam temperature at SH Outlet	deg C	[540]
5.	Main Steam Pressure at HP Turbine inlet	kg/cm ² (a)	[130]
6.	Main Steam Temperature at HP Turbine inlet	deg C	[537]
7.	Hot Reheat inlet Temperature at IP Turbine	deg C	[537]

The above parameters are indicative only and the bidder has to size the Boiler as per their proven standard practice for optimized and efficient [210/215/220/250] MW units.

a) Considerations for Boiler Design

The Boiler design parameters shall comply with the following limiting parameters with design coal firing. The Boiler shall be designed to operate as a base load unit. However, continuous operation under two shift and cyclic modes during certain periods of the year is also envisaged. The design should cover adequate provision for quick startup and loading of the unit to full load at a fast rate and apart from constant pressure operation would also have the facility for sliding pressure operation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[16]	15.01.2016

1. The Boiler design shall be such that the rated Reheater outlet temperature is achievable for the entire range of operation while firing the specified range of coal and under all the specified operating conditions of operation of Boiler with reduced feed water inlet temperature during the conditions of HP heaters out of operation and/or HP/LP bypass operation, at 100% TMCR load.
2. The unit and the auxiliaries shall be designed for maximum reliability and availability; operability and maintainability. The bidder shall specifically state the design features incorporated to achieve the high degree of reliability and availability.
3. The unit shall be suitably designed and provided with necessary instrumentation for rapid starting, loading and unloading without causing undue vibration, distortion, differential expansion or producing excessive thermal stresses. The design of the control system and relevant equipment shall adhere to the fail safe operation at all system conditions. The fail safe operation signifies that loss of signal/air/power supply, loss of excitation or failure of any component shall not cause hazardous conditions and at the same time prevent occurrence of false trips.
4. The work falling under the purview of Indian Boiler Regulations (IBR) shall completely meet or exceed all the requirements of the latest edition of IBR. Any other standard acceptable to IBR can also be considered, provided the requirements of that standard are equivalent or exceed IBR requirements.
5. It shall be the responsibility of the Bidder to furnish the requisite documentation as required by the Owner/consultant for ascertaining the adequacy of the design/soundness of the materials of construction /manufacturing methods adopted etc.
6. All materials used for the construction of the equipment shall be new and shall be in accordance with the requirements of this specification. Materials utilised for various components shall be those which have been established for use in such applications. It would be the responsibility of the bidder to furnish the relevant information in this regard, as required, at the time of detailed engineering.
7. All heavy parts of the plant must be provided with some convenient arrangement for aligning and for handling during erection and overhaul. Any item of plant required be stripping or lifting during period of maintenance and weighing one tonne or more shall be marked with its approximate weight. All equipment shall be designed to run satisfactorily without any undue noise and vibrations. Corresponding parts throughout shall be made to gauge and shall be interchangeable wherever possible. No welding, filling or plugging of defective parts shall be allowed without the permission in writing to the Owner.
8. The Boilers shall be supplied with all equipment and software necessary to monitor and record the fatigue and creep life usage (as appropriate) of major pressures parts which shall include but not limited to the drum, main steam and reheater outlet pipes and the superheater and reheater outlet headers.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[17]	15.01.2016

1.4.1.1 Boiler Furnace

- i. The furnace shall be designed to burn the specified fuels under all loads up to BMCR.
- ii. The furnace volume and residence time shall be sufficient to maintain efficient combustion at all loads without incurring any damage and there shall be no flame impingement on any part of the furnace walls, superheater or reheater, and no accumulation of slag or ash on the walls, tubes or hoppers that shall interfere with the continuous operation of the boiler or the easy removal of ash from the furnace hopper.
- iii. The thermal ratings of the furnace shall be selected based on previous successful operating experience with coal having similar slagging, fouling, combustion and erosion characteristics to those specified.
- iv. The design metal temperature for the boiler tubes shall not be less than the saturation temperature of the steam at the maximum allowable working pressure plus the following temperature margins:-
 - a. 39°C for tubes mainly subject to convective heat.
 - b. 50°C for tubes mainly subject to radiant heat.

Test ports shall be provided throughout the boiler for measuring temperatures, gas pressures and for gas sampling using portable instruments.

1.4.1.2 Boiler Casing

1. The furnace, superheater, reheater, convection passes and economiser shall be enclosed within a completely gas tight casing. The enclosure shall be formed using welded wall construction only. Where use of refractory is unavoidable, 4mm thick steel plate behind refractory shall be provided to form enclosure and any penetration(s) into the Boiler enclosure shall be sealed for gas tight integrity.
2. The boiler casing shall be designed and constructed to withstand the maximum internal positive or negative pressures produced by draught plant control, or explosion, and complete combustion trips. In addition, the furnace structural design pressures shall not be less severe than that required by NFPA 85.
3. Leak tests shall be carried out before commissioning the boiler and before fixing of external insulation. These tests shall prove the gas tightness of the boiler casings, associated fittings and flues. Defects shown by this test shall be made good and proved by a further test, at the bidder's expense before lagging.
4. No Dissimilar Metal Welds (DMW) between austenitic and ferritic steels, martensitic and austenitic steels, martensitic and ferritic steel shall be allowed inside the Boiler at site for the pressure parts which are exposed to hot flue gases.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[18]	15.01.2016

5. The casing/pent house and its supporting system shall be capable of taking additional loads due to accumulation of ash (300 mm thick) expected in between two overhauls of the units. This additional load is over and above the other loads considered for casing design.

1.4.1.3 Water Walls

Water/steam walls shall be of membrane wall construction and shall be made of seamless tubes.

A minimum allowance of 0.6 mm over and above the calculated thickness as per IBR shall be provided for entire water wall. An additional tube thickness of 1.0 mm over and above the tube thickness of water wall tubes calculated as per above shall be provided on all water wall tubes coming within a radius of one meter around each wall blower to guard against premature tube failure due to soot blowing steam erosion, if the soot blowing arrangement is so designed that there may be impingement of soot blowing medium on the water wall tubes.

Provide adequate nos. of furnace observation and tapping points for local instruments, gauges, switches, test pockets etc. In case water wall orifice are provided, these should be supplied with indexing holes and index pins

Important features of water walls shall be as given below:

1. Water walls made of seamless steel tubes with membrane welded construction.
2. Minimum refractory construction. Arrangement to ensure that there is no exposed refractory in the furnace except at the burner throat.
3. Water wall headers shall be sized generously and shall be located outside the gas path. These shall be provided with suitable openings with forged weld on caps for inspection and chemical cleaning. If under unavoidable circumstances it is required to locate the headers in the gas path, they shall be suitably shielded and protected from erosion due to ash impingement.
4. Water wall headers shall be completely drainable and shall be fed through down comers.
5. The water wall tubes and headers shall be provided with supports, stiffeners, etc. for carrying load, for permitting proper expansion / contraction and for protection against vibrations.

Lowest water wall header shall be at sufficient height to facilitate installation and easy access for maintenance of ash hoppers and bottom ash handling equipment. All bottom ash handling equipment shall be installed above ground level. Elevation of Furnace Bottom ring header shall be so chosen to accommodate all ash handling equipment like the Scraper Chain Conveyor and clinker grinder & bed ash transfer conveyor system equipments (by other bidder) below the header.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[19]	15.01.2016

In case of tower type design of the Boilers, necessary leak proof expansion joints shall be provided between the water walls enclosure and the flue gas duct to take care of any differential expansion.

1.4.1.4 Boiler Drum

The drum shall be provided with all necessary internals, mountings and fittings including but not limited to the following:

- i) Steam water separators
- ii) Moisture eliminators
- iii) Feed water distribution system
- iv) Chemical feed pipe
- v) Intermittent and continuous blow down pipes and vessels,
- vi) Saturated steam and water sampling probes
- vii) Nitrogen connections
- viii) Gauge Glass
- ix) Safety valves.
- x) All steam drum integral piping and associated fittings

The dissolved solids in the saturated steam shall not exceed 0.02 ppm when the total dissolved solids in the Boiler water are not greater than 15 ppm. The dryness fraction of steam leaving the drum shall not be less than 0.999

Adequate steam separators shall be provided together with a single drain collection vessel. The separators and drain collection vessel shall be of welded construction with all necessary internals, valves, mountings, fittings and accessories.

The drum dished ends shall be provided with properly sized manholes and hinged manhole covers of forged steel secured by forged steel yokes and bolts. Suitable sampling connections shall be provided to facilitate collection of representative samples of Boiler water from drum and of condensed steam from the saturated steam outlets.

The storage capacity of the drum shall be adequate so as not to cause trip out of the unit on low drum level, in case of tripping of a running boiler feed pump and cutting in of the standby pump automatically in 15 seconds. Storage capacity of drum shall also be adequate considering duration of 10 seconds to reach trip level in Boiler drum from the normal drum level at BMCR draw off condition with no inlet flow to drum.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[20]	15.01.2016

1.4.1.5 Superheater and Reheater

In the design of the superheaters and reheaters, due account shall be taken of the inaccuracies of predicting furnace exit gas temperatures to ensure that adequate surface area is provided in the superheaters and reheaters and that tube metal temperatures in excess of design are not encountered. Due account shall also be taken of the variations which shall occur in the characteristics of the specified fuels.

Measures shall be taken to prevent magnetite exfoliation of the internal surfaces of superheater and reheater tubes.

The transverse spaces between superheater and reheater elements shall be selected based on previous successful operating experience with coal having similar slagging, fouling, combustion and erosion characteristics to those specified. Bidder to ensure that the furnace exit gas temperature shall be at least 60 °C below the minimum ash deformation temperature in reducing conditions for any specified coal for all loads up to & including BMCR.

Spacing of superheater/reheater elements shall be selected with specific reference to ash quality in coal particularly in high temperature sections and accordingly the spacing shall be large. The transverse pitch of elements in heating surface meeting highest flue gas temperature region shall not be less than 800 mm and that of lowest flue gas temperature region shall not be less than 100 mm.

Design of the superheater elements shall be such that any individual tube or element can be easily repaired & replaced with or without removing it from the Boiler. Design / spacing shall also permit increase of surface area, if necessary. A minimum spacing of 1.2 m shall be provided between any two sections of super heater and reheater and between any horizontal tube banks of heat exchangers to allow personnel access for maintenance. For vertical surfaces, minimum clearance between two banks shall be 600 mm.

All the horizontal heat transfer surfaces shall be suitably supported using steam cooled tubes. The support tubes shall be designed to withstand direct radiation and shall not be subjected to distortion, erosion, corrosion and creep. The joint between the supporting tubes and the heating surfaces shall be designed so as so to permit free thermal expansion of both the supporting tubes and the heating surfaces. Necessary shielding shall be provided to prevent direct impingement of flue gases.

Necessary safety valves as per IBR shall be provided for superheater and reheater system. Test pressure gauges shall be provided on the super heater outlet pipes and the reheater inlet pipes to facilitate adjustment of the setting of safety valves.

The reheater shall be provided with isolators both at inlet and outlet to facilitate isolation of reheater during hydraulic tests. Reheater isolating devices shall be provided on cold reheat and hot reheat lines at Boiler outlet. Isolating device shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[21]	15.01.2016

consist of a robust cast steel body with carbon steel (ASTM A216 GR WCB) material for cold reheat application and alloy steel (ASTM A217 GR WC 9) for hot reheat application suitable for pressure and temperature condition to which they shall be subjected. Isolating device shall be of welded type construction and will form part of the pipe line during normal operation without any leakage. Before hydrostatic test top cover and bonnets are removed and a separate test closure assembly with sealing rings are inserted to close the flow path. Drains shall be provided on both side of the device.

For superheater and reheater tubes, erosion allowance of one (1) mm shall be provided over and above the calculated thickness as per the IBR formula. In addition to the above, +10% minimum thinning allowance on bends shall be provided. Erosion shields for the tubes shall be provided for critical zones likely to encounter erosion due to ash or due to soot blower steam. The maximum average flue gas velocity in the convection pass shall be limited to 10 m/sec, however localized velocity of flue gas shall not be allowed to exceed 12 m/sec due to installation of such shields.

The maximum skin temperature to which the tubes shall be subjected shall be 40 deg C below the oxidation limit as applicable to the material.

1.4.1.6 Arrangement of Headers

Headers shall be located outside of the gas path and shall be fully drainable. If locating the headers in the gas path is unavoidable, then such headers shall be suitably protected with erosion shields. All headers shall be seamless and shall be provided with inspection and cleaning openings. All such openings shall be readily accessible and permit the convenient internal inspection by video-scope without removal of Boiler enclosure walls or nearby headers and tubes. The topmost header shall be provided with suitable stubs for nitrogen capping. It shall be ensured that the maximum steam side header unbalance is 6%

1.4.1.7 Economiser

An inline, bare tube economizer shall be provided with vents, recirculation system, drains and sampling connections etc. The support structure and hanger designs shall be suitable for loads due to these additional surfaces. The economiser shall be of the non steaming type.

The economizer shall be so designed as to keep the feed water temp. in all sections at least 17 deg C below the saturation temperature, under all conditions of Boiler operation.

In case of tower type Boilers, economiser shall be arranged for parallel cross flow of feed water and flue gases. In case of two pass design of Boilers, it shall be arranged for counter cross flow of feed water and flue gases.

Provision for recirculation of water (economiser recirculation system) while starting shall be provided.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[22]	15.01.2016

The maximum average flue gas velocity through economiser section (with $\geq 20\%$ excess air at economizer outlet) shall not exceed 10 m/s. However; the maximum localized velocities across the cross-section shall not exceed 12m/sec. The economiser tubes shall be arranged to permit the installation of soot blowers. The design shall ensure elimination of water hammering in economiser and feed line during cold start-up. Maximum skin temperature to which the tubes shall be subjected shall not exceed the oxidation limit as applicable to the material.

The erosion shields for leading tubes of each tube bank of economiser shall be provided. In addition sturdy cassette baffles shall be provided for all front side and rear side bends of economizer banks. The tube thickness erosion allowance of 0.5 mm over and above design tube thickness considering normal erosion allowance.

If the Boiler has the flue gas down flow section with horizontal economiser tube banks, the top most row shall be shielded to reduce erosion.

1.4.1.8 Furnace Sizing

Bidder shall furnish the details of their standard design practices for sizing furnaces which shall include but not be limited to the following:

- Maximum net heat input (NHI) per unit plan area of furnace
- Maximum heat liberation Rate
- Maximum burner zone heat release rate
- Maximum heat input per burner, maximum furnace cooling factor
- Maximum furnace exit gas temperature
- Minimum furnace residence time

1.4.1.9 Steam Temperature Control

1. The Boiler design shall ensure that rated superheater and reheater outlet temperatures are achieved for the entire control ranges while firing any coal within the specified range and all the operating conditions such as the following:
 - Operation of the Boiler with HP heaters out of service
 - Turbine bypass operation
 - Mills operating with all combinations
2. During steady operation the superheater and reheater outlet steam temperatures shall be maintained constant at all loads above 65% BMCR when operating in modified sliding pressure mode and shall be within the permissible limits stated in IEC 60045-Part 1, clause 6.2(b). The superheater outlet pressure shall be within $\pm 1\%$ of the set point.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[23]	15.01.2016

3. During major load changes and during start up when the Boiler is above 60% BMCR the superheater and reheater outlet temperatures shall be within the permissible limits stated in IEC 60045-Part 1, clause 6.2(b) and the outlet pressure within $\pm 3\%$ of the set point.
4. The permissible variations in temperature and pressure shall apply when the Boiler is operated in both modified sliding pressure and constant pressure modes.
5. Superheater de-superheating shall be provided by spray type attenuators. The spray water shall be from a location on the feed system selected in after the HP Heaters' outlet accordance with the bidder's experience.
6. Each superheater and reheater spray system shall be provided with all necessary valves and fitting.

1.4.1.10 Supporting & Enclosing Structure, Galleries, Walkways, Roofing, Platforms

1. Boiler supporting structure complete with girders, beam column base plates, foundation bolts, shims etc.
Galleries, walkways, platforms, hand rails, ladders, auxiliary steel for piping supports shall include base plates, foundation bolts, nuts, washers, 'U' bolts and hangers for Drum (if applicable), superheaters, reheaters, furnace rear pass tubes (if applicable) and grating.
2. Stair cases/platforms of minimum 1000 mm width with handrails 100 cm high and 2(two) rail safety handrails of 40 mm galvanised iron (GI) pipe, on either side of Boiler from 'O' ML to the roof.
3. The interconnecting platforms between the Boiler (operating floor) and main station building at 4 elevations (excluding ground floor) at two places per Boiler.
4. Storage platforms for storing of scaffoldings, APH baskets and other maintenance item during overhaul of Boiler. Platforms for removal, handling & storage of Economiser and Reheater/Superheater sections (all horizontal heating surfaces).
The above provision shall include but shall not be limited to the following locations:
 - a) Bunker outlet gate.
 - b) All maintenance hoist levels.
 - c) All dampers and their drives.
 - d) Furnace seal trough level.
 - e) All fans and associated motors.
(Continuous platforms shall be provided around the fans and their corresponding motors).
 - f) SCAPHs
 - g) Air preheaters
 - h) All valves.
 - i) All observation ports, access manholes etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[24]	15.01.2016

- j) All soot blowers and water lancers.
 - k) All Burner levels
 - l) All Control Stations
 - m) PRDS area
5. Access platforms, staircases and walkways for sootblowers, man holes/inspection doors, dampers/damper drives, valves of critical services, ID fans, FD fans, air preheater, transmitter racks, junction boxes etc.
6. Boiler roof shall be provided with an approach ladders and all round hand railings
7. All Operating platforms and main access walkways in boiler area shall have minimum width of 1200 mm. All interconnecting platforms (with side coverings and roof) between boiler galleries and elevators landings shall also have a minimum width of 2000 mm. In case it is not possible to provide width of the platforms / walkways as mentioned above due to layout constraints, lesser widths, in exceptional cases, may be accepted subject to Owner's /Consultant's approval.
- All Maintenance access walkways in boiler area shall have a minimum width of 1000 mm. The gap between the equipment / furnace casing and walkways shall not exceed 150 mm.
- All other walkways shall have a minimum width of 800 mm.

8. Floor Grating

Floor grating for floors, platforms, stair landings, any other locations shall have minimum 5 mm thick bearing bars on 40 mm centers, 32 mm deep. Cross bars shall be spaced 100 mm on centers and electro-forged into the bearing bars to provide a non-slip surface. The gratings shall be made of steel conforming to IS: 2062 and hot dip galvanized. Galvanization shall be done as per IS: 2629 and IS: 4759. Weight of galvanization shall not be less than 610 gm/m². Grating shall also be designed for a minimum live load of 500 kg/m².

Floor grating shall be neatly cut and banded around all openings. Unless otherwise indicated, banding shall from a 100 mm high curb. Grating to head of stair runs shall have an applied chequered plate or cast iron abrasive surfaced nosing similar to that specified for stair treads.

Grating panel shall be removable type and shall have the bars of adjacent panels aligned.

Grating shall be anchored to support with bent clip fasteners secured to threaded stud field welded to supporting members. Two clips at each end of each panel and one clip (staggered) at each intermediate support shall be provided.

Penetrations through grating and floor plates that are not shop fabricated (generally opening under 500 mm in nominal size pipes and for conduits etc.) are to be cut in the field as required. Such opening shall be neatly trimmed, concentric with penetration or as required for movements. Generally 50 mm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[25]	15.01.2016

clearance shall be left over insulation and 25 mm clearance at bare metal. Openings may be ganged where accepted by the Purchaser / Consultant.

Openings less than 150 mm in maximum dimension may be squared off. Large openings shall be suitably shaped. All grating opening shall be kick plates or banded to match the shop fabricated work. All grating for a given area shall be positioned and aligned before the stud bolts are located and welded to the supporting members.

1.4.1.11 Pipe & Cable Racks

The pipe and cable rack and support structure shall be provided for the pipes / cable racks with access and adequate working platform, crossovers for erection and maintenance. Certain portions of these pipe racks shall have to accommodate Purchaser's pipes /cables also, the details of which shall be furnished to the Bidder during detailed engineering of cable racks:

All other safety requirements as per the factories act, explosives act, etc. shall be observed while developing the layout.

No cable trenches, under-ground cable vaults are acceptable in main plant as well as interplant cable routing. In case it is unavoidable, it shall be provided only with prior written approval by the Purchaser / Consultant. In that case, trenches shall be finished to surrounding floor levels/ paved area.

To the extent possible, Bidder shall route all the cablings from the Boiler house to control rooms, MCC/PMCC only at the sideways. Care shall be taken not to route / pass the same through Boiler house area.

Bidder shall ensure that in the lay out, no C&I provisions shall be installed below any of the fire hydrant provision and is suggested that routes for A.C. & ventilation ducts, piping, cables, etc. be conceptualized at initial stage to avoid or to minimize any interference during execution / actual installation.

1.4.1.12 Maintenance

The Bidder shall provide adequate handling facilities & approach as for carrying out on-line and off-line maintenance of the Boiler and its auxiliaries. In order to carry out on-line maintenance, it shall be possible to readily disassemble, repair and reassemble the equipment supplied in the shortest period. A minimum of four accesses and clean out doors in each area shall be provided to permit access to the furnace, superheater, reheater, the area between tube bank, economiser and any other area requiring maintenance.

A vertical & straight chute of minimum 500 mm dia and made from minimum 10 mm thick mild steel pipe shall be provided for Boiler, from pent house level to ground level for disposal of debris & scrap generated during erection, operation and maintenance. The chute shall be provided with branch connections with doors and suitable access to the doors at all platform levels. Garbage collection trolleys shall also be provided at the ground level.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[26]	15.01.2016

1.4.1.13 Valves

The Boiler valves shall include all necessary isolating, control, regulating, check and relief valves and/or pneumatic valves, motorized valves including main steam stop valves, vent valves, drain valves, root valves, safety valves, mountings required for the safe, efficient, and reliable operation of the Boiler. Valves and accessories shall comply with all the requirements of the applicable standards. The Boiler drain system shall include emergency drain valves and appropriate noise reducing measures on the blowdown pipes and tanks. Any other valves not mentioned specifically but needed to complete the system with drives, wherever required shall be provided

1.4.1.14 Internal Cleaning of Boiler and Associated Pipe work

1. During the construction and commissioning, the bidder shall be responsible for the internal cleaning of the Boiler.
2. On completion of erection, and after the commissioning of all the auxiliary plant associated with the Boiler, Boiler shall undergo a chemical cleaning process throughout the economiser, and the water circulating spaces. The superheaters and reheaters shall be subject to thorough water flushing or blowing out procedure. In addition, the superheaters and reheaters and steam pipes connecting the superheaters and reheaters shall be steam purged to ensure all foreign debris is removed. The procedure for steam purging, including the target plate acceptance criteria shall be reviewed by the steam turbine supplier and the Owner/consultant.
3. All the necessary temporary equipment, pipes, connections and valves, together with chemicals, inhibitors and reagents necessary for the monitoring of the effectiveness of the process shall be provided by the bidder.
4. The method adopted for the chemical cleaning process shall be to the approval of the Owner/Consultant, including the disposal of any effluent. The bidder shall be responsible for the disposal of the effluent to a suitable site.
5. The procedures for chemical cleaning and steam purging shall be in accordance with VGB-R 513, "Internal Cleaning of Water-Tube Steam Generating Plants and Associated Pipe work".
6. Bidder shall be responsible for the monitoring and supervision of all stages of the process.

1.4.1.15 Fly Ash Hopper

Bidder to furnish all necessary boiler, air heater, fly ash hoppers including ESP hoppers as required. The capacity of each hopper shall not be less than 8 hrs of storage capacity when the boiler is steaming at 100% BMCR while firing the worst coal. All hoppers shall be equipped with proper flanged pipe connection including matching counter flanges for attaching to fly ash removal system. The outlet of the fly ash hoppers shall be at a height of 3.5 meters minimum above the floor level.

1.4.1.16 Soot Blowing System & Water Lancers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[27]	15.01.2016

Bidder to supply the fully automatic sequentially controlled micro-processor based steam soot blowers for the superheaters, reheaters, economizer and airheaters complete with all pipings and accessories, including valves, controls, control panels, motor control centre complete with starter and wiring. System offered shall be for long retractable soot blowers & water lancers for the boiler furnace.

Water Lancers for furnace shall be of proven design & reliability. 2 x 100% capacity high pressure pumps and drives complete with necessary valves, instruments & piping for supplying water to the water lancers and control systems. All control & interlocks necessary for sequential operation of water lancers (for deslagging of the furnace zone) shall be incorporated by the bidder in the soot blowing control panel.

For detailed control and operation philosophy of soot blowing and water lance system refer respective instrumentation system.

1. The steam used for the blowing should be taken from the appropriate auxiliary steam header or from saturated/superheater steam header directly.
2. For air heater blowing additional provision shall be provided to tap off the steam from auxiliary steam header to clean the elements during startup when steam may not be available from the main source.
3. Adequate no of motorised drain valves shall be provided to facilitate warmup the complete piping before starting the soot blowing operation. Suitable by-pass with orifice shall also be provided. Temperature detectors with drain valves shall also be part of the complete system.
4. The retractable blowers shall be located on both sidewalls of the boiler and each shall cover little more than half the effective width of the boiler, when fully extended in order to ensure through deslagging/cleaning. Provision of retracting back the blowers during emergencies like drop in steam pressure, low steam etc, shall also be provided.
5. Platform/galleries shall be provided around all the soot blowers to facilitate access and maintenance.
6. Provision shall also be kept for additional installation of blowers/lances in the boiler. Provision shall also be kept in the control panel, if required to be installed in future.

1.4.1.17 [Boiler Startup Circulation Pumps (If applicable)]

Assisted circulation, if applicable, shall ensure adequate circulation during start-up, normal operation and sudden load changes to prevent overheating of tubes.

The design shall ensure that with the circulation pumps in operation, all duty of the boiler can be met under all operating conditions. The design should envisage adequate stand by pumps or in case assisted circulation is not envisaged, and if as per the bidder's design only one pump (1 x 100%) is envisaged during start up and low load only, the Boiler design shall ensure adequate circulation during

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[28]	15.01.2016

normal operation and sudden load changes to prevent overheating of boiler tubes.

Circulating water pump shall be hermetically sealed glandless type without requiring any external sealing arrangement. The pump and motor shall be submerged in boiler water and shall be mounted on the Boiler circulating system. The entire pump and motor shall be enclosed in the pressure tight casing, motor being protected from the high temperature fluid inside the pump casing by a suitably designed thermal throttle. The motor shall be of wet stator construction. The liquid inside the motor shall be circulated by an impeller mounted on the motor shaft in a closed cycle network and shall be cooled by indirect water/water heat exchanger. Cooling water for the heat exchanger shall be tapped off from cooling water system. The power and instrumentation leads shall be taken out of the motor through properly sealed glands with adequate provisions of differential expansion of pump body and conductor.

Pump design and installation shall be so as to ensure adequate NPSH under all operating condition of the boiler including cold start. The circulating water pumps shall be suitable for parallel operation throughout the entire operating range.

Adequately sized Journal and thrust bearings shall be provided for the common shaft of pump and motor assembly. Guide bearings shall be spherically seated journal guide bearings and thrust bearings shall be spherically seated tiling pad type double action thrust bearings. All bearings shall be lubricated by the liquid in the motor cavity. Bearing material shall preferably be Ferrobestos and leaded bronze impregnated with polytetra fluoro ethylene or FRP.

The material of construction of pumps & motors shall be suitable for continuous operation with chemically conditioned boiler quality water normally encountered in such service and shall ensure long service life. The circulation system shall be so designed that the boiler shall be capable of operating at 100% BMCR uninterruptedly when any one of the operating pumps undergoes sudden trip out.

Suitable isolating valves shall be provided in the circulating piping's so as to enable operation of Boiler with remaining pumps. Control valve shall be provided to ensure appropriate flow distribution/to prevent zonal overheating in the water walls.

Automatic cutting in feature of stand-by circulation water pump shall be provided by the bidder. Bidder shall indicate the safety protections and interlock scheme provided for the circulation water pumps.

1.4.1.18 Boiler Integral Piping

1. The integral piping shall comply with the Indian Boiler Regulations (IBR) and the requirements of the Boiler Specifications.
2. The scope shall include all necessary super heater outlet including the Main Steam Stop Valve (by-pass arrangement including valves and piping), HRH and CRH piping, HP- LP bypass system piping, complete drain collection piping from various headers and equipments, drum, safety valves, down comers, drain collection

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[29]	15.01.2016

headers, all piping downstream of and including the NRV on the feed water piping at economizer inlet. All auxiliary steam piping to SCAPH, fuel oil atomisation, mill fire fighting etc. All vent pipes and safety valves escape pipes shall be taken to a level above boiler house roof. The vents on the headers and links shall be provided with drain lines connected to a common trough and further terminated at the drain trench at the ground level.

3. All hangers and supports shall be provided with auxiliary steel structure, including columns and beams, base plates, foundation bolts, nuts and washers.
4. All the above piping systems shall be complete with valves, specialities, stubs including instrument stubs pipe reducers/expanders, matching flanges and suitable gaskets, nuts and bolts.
5. Bidder to provide tapping points with root/isolation valve for sample points for SWAS.

1.4.2

Draft Plant

Complete draft plant for the balanced draft system shall be tested in accordance with ASME PTC11.

a) Forced Draft (FD) Fans

Two FD fans (2 x 60%) of the axial, variable pitch type shall be provided with necessary ancillary equipment and VIS foundation.

Each fan shall be provided with bearing lubrication and hydraulic blade pitch control unit each consisting of 2 x 100% oil pumps, oil coolers and filters On-line bearing temperature and vibration monitoring shall be provided.

Blade material for FD fans shall be high strength aluminium alloy having minimum hardness of 75 BHN. The material of construction of fans, the blade thickness, liner thickness etc. for fans as per manufacturer's recommendation is also acceptable.

For FD fans, for limiting the noise level, silencers shall be provided at the suction of the fans to limit the noise level On-line bearing temperature and vibration monitoring shall be provided.

b) Induced Draft (ID) Fans

Two ID fans (2 x 60%) shall be provided and they shall be of the radial backward curved type with renewable liners and variable frequency drive with VIS foundation or constant speed axial type with blade pitch control with VIS foundation . The blade material of ID fan shall be minimum of 25 mm thick and provided with renewable liners of wear resistant material having a minimum thickness of 10 mm. These shall be designed to withstand high bending and axial load and a temperature upto 200°C. However, the material of construction of fans, the blade thickness, liner thickness etc. for fans as per manufacturer's recommendation is also acceptable.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[30]	15.01.2016

Each ID fan shall be provided with bearing lubrication and inlet vane control each consisting of 2 x 100% redundancy for oil pumps, oil coolers, filters. On-line bearing temperature and vibration monitoring shall be provided

1.4.3 Regenerative Air Pre-Heater (RAPH)

1. Ljungstrom regenerative type air heater with vertical axis of rotation for secondary air heating. Each boiler shall be provided with 2 x 60% regenerative air heater to reduce the diluted flue gas temperature to not less than the acid dew point when firing the specified fuels, under all boiler operating conditions. There shall be adequate margin between the sulphuric acid dew point and the temperatures of the flue gases to the electrostatic precipitators and the flue gas desulphurization equipment (if applicable) under all operating conditions. These operating conditions shall include start ups and shutdowns.
2. Each regenerative air preheater shall have 2 x 100% AC drive (1 W + 1S) and lube oil pump.
3. Each air heater shall be performance tested in accordance with ASME PTC 4.3. The air heater design and construction shall ensure that the leakage from the air space to the gas space shall not be greater than 10% of the inlet gas flow after 8760 hours of operation.
4. Air heaters shall be provided with forced lubrication system for bearing, 2 x 100% oil coolers, pressure & temperature indicators, complete piping valves, pressure switch and all the bearings shall be provided with temperature sensing elements for local as well as remote measurement.
5. The air heater shall be equipped with an approved means of internal fire detection and fire fighting water supplied from the station fire hydrant system. The equipment shall be complete with all the necessary probes, scanners and controllers etc., to operate in conjunction with the station alarm system.
6. Steam soot blowers, complete with the necessary pipe work, valves and fittings, shall be provided to enable effective on load cleaning and cleaning during the start-up period of the air heater.
7. Air heater housing shall be provided with suitable access doors for inspection, cleaning and maintenance. It shall be possible to replace the cold end elements without dismantling the RAPH. Inspection ports in the air inlet duct for rotor inspection shall be provided with glass windows and vapor proof lights. Suitable water washing arrangement shall be provided which includes necessary pumps, pipes, valves, fittings & drains. The drains shall be connected to the slag flush channel.
8. The handling arrangement for RAPH shall include hoist for
 - Basket removal operating floor to ground level (1 no common for two RAPH)
 - From Air heater top to operating floor (one number for one RAPH)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[31]	15.01.2016

1.4.4 Steam Coil Air Pre-Heaters (SCAPH)

Steam coil air preheaters shall be provided in FD fan outlets with necessary dampers, condensate collection flash tank, along with drain pipe up to flash tank and from flash tank up to condenser, auxiliary steam piping to supply heating steam to each SCAPH from the auxiliary steam system during start up along with individual temperature control valves.

SCAPH of modular construction shall be provided by the Bidder for start up, for low load operation of the boiler or at any abnormal condition when an increased air inlet temperature is considered desirable. SCAPHs shall be adequate to maintain cold end metal temperature 10 deg.C. above acid dew point throughout the load range i.e. 60%TMCR to 100% BMCR with a minimum ambient temperature specified. These shall not be used under normal operating conditions for the whole range of fuel specified.

Each SCAPH and connected air ducts to handle flows shall be designed for 30% BMCR load.

Air temperature at SCAPH outlet (with best Coal firing) shall be as below:

- At 30% BMCR - 100°C (minimum)

SCAPHs shall be provided on the outlet of each FD fan in a bypass duct with necessary shut off and control dampers so that the SCAPH can be completely isolated from the service line, whenever it is not required. Steam supply arrangement for SCAPH shall be complete with necessary valves, power operated control valves, motor operated isolating valves, steam piping, steam traps etc. Steam for SCAPH shall be taken from auxiliary steam header of the boiler. Each SCAPH shall be provided with its own drain and the drain condensate from SCAPH shall be directed to IBD tank.

1.4.5 Coal Mills

The coal Mills shall be vertical spindle type (like pressurised type bowl mills, ball and race mills, roller mills or the approved equivalent. The number of coal pulverisers to be provided shall conform to sizing /standby requirement. Each Mill shall be complete with all wear parts/ grinding elements and shall be provided with platforms around the Mill, lubrication systems (comprising of [2x100% pumps, 2x100% cooler and 2x100% filters] for each pulveriser) drive motors, auxiliary gear, instrument tapping points and any other equipment necessary for safe and efficient operation of Mill. The Mill shall also include static classifier and all the automatic auxiliary equipment necessary to make the Mill self contained. Adequate number of temperature sensors, temperature transmitters, local indicators and signaling contacts for bearings and lube oil systems shall be provided as per standard practice of Bidder. Independent purge meters, air filter cum regulator sets, local pressure indicators, instruments and sensing device for milling system including the instrument requirements shall be provided. Primary airflow measuring devices shall be provided at air inlet of each coal pulveriser.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[32]	15.01.2016

Adequate number of thermocouple type fire detection system with temperature transmitters as a composite & complete unit with all required accessories with adequate redundancy shall be provided.

Proven fire detection and fire extinguishing systems in line with the standard practice of the manufacturer shall be provided. In case of CO₂/N₂ based system, the scope of supply shall also include the required cylinder/piping and valves network etc. In case, the proposed type of mill requires inerting during start-up/ shut-down of the mill to ensure safety of operation, suitable system along with all piping, valves, instrumentation, interlock system etc. shall also be provided.

The bidder shall provide the necessary interlocking features for the coal mills for safe operation of the Boiler.

Bidder to ensure the sufficient access is provided for removal of mill components as well as from maintenance consideration. Dismantling of any duct, platforms, structural steel, coal pipes shall not be required to remove beater mill internals.

Bidder shall take care of over load imbalance in the mill and shall not be transferred to the boiler main structure.

1.4.6 Seal Air Fans

2x100% centrifugal seal air fans common for all the mills of one Boiler unit shall be provided. Seal air catered through FD Fans' discharge is also acceptable provided adequate size and capacity of FD fan /Ducts is taken care of by the bidder. The sealing system shall prevent ingress of any dust into the bearings and cold air leakage in to the Mill from atmosphere.

Following margins shall be provided for each fan over and above the calculated values under maximum duty conditions are:

Margin on flow : 25%

Margin on pressure : 30%

The above margins shall be based on an ambient temperature of 27 deg C, relative humidity of 60 % and system leakages with mill operation at maximum duty.

1.4.7 Coal Burners

- i. Number and arrangement of the coal burners shall be such that there is stable firing and efficient total combustion in the furnace while firing the specified fuel and operating with any combination of pulverisers. The basic criteria for selection of firing system shall be:
- ii. Stable flame over entire operating range of the furnace.
- iii. Complete burn out at furnace exit.
- iv. Avoiding contact between flame and furnace wall.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[33]	15.01.2016

- v. More number of burner with less heat release rate in order to ensure better turn down than few larger rates.
- vi. Selection of heat release rate for furnace & burners that will prevent inadmissible fouling in particular within the burner area.
- vii. Burner design shall be such as to minimize NO_x generation. Bidder to furnish the detail of the design to keep the NO_x level within permissible values

Pulverised coal coming out of mill goes to the vertical coal burners through pulverised piping. Each coal burner has an inclination of 10 Deg downstream. Secondary hot air is fed through proper air duct to the coal burners. Pulveriser coal velocity shall be in the range of 15-28m/sec.

The air / fuel ratio around the burner shall be optimized to ensure low emission of NO_x which shall not exceed [260] grams / gigajoule of heat input of the boiler.

1.4.8 Oil Burners

Oil Burner design basis shall be as follows:

Table 1.10

S.No	Particulars	HFO Firing System	LDO Firing System
1	Type of burner	Steam atomised (steam to tap off from the auxiliary steam header)	Air atomised(to draw from the compressed air system)
2	Burner cooling medium	Steam or air	Air
3	Burner tip material	Resistant to corrosion	Resistant to corrosion
4	Minimum life of burner tip before needed any maintenance	16000 hours	16000 hours
5	Hardness of atomizer (hardness retained even at 400°C)	Minimum vickers hardness 400	
6	Type of oil igniters	High Energy Arc Igniters	High Energy Arc Igniters
7	Oil burner turndown	4:1	4:1

1.4.9 Dampers

- Isolation dampers with electric drives on all cold air, hot air, seal air, and flue gas ducting before and after equipment.
- Electrically operated guillotine type gas tight isolators at inlet and outlet of each ID fan and electrically operated dampers at inlet and outlet of each RAPH where ever required for local/remote operation

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[34]	15.01.2016

- Regulating dampers with pneumatic drives, supporting structure for all damper drives.
- Air registers with drives at various elevations

1.4.10 ESP

- For designing ESP ash % of the coal shall be considered as [.....%] as per worst coal analysis.
- The Electrostatic Precipitators shall be of outdoor type and installed on the cold end side of regenerative air pre heaters. The flue gas shall be drawn from air pre heater outlets of the balanced draft, pulverized coal fired Boiler and guided through adequately sized duct work into the specified number of independent gas streams of the Electrostatic precipitators. Similarly, the flue gas after the Electrostatic Precipitators shall be led to the suction of the induced draft fans. The flue gas temperature may approach the economiser outlet temperature of about 300 deg C in case the regenerative air pre heaters fail to operate. The Bidder shall take these aspects into account while designing the precipitator.
- [4 Nos.]. ESPs per boiler (i.e. [four Nos. gas paths per boiler housed in four independent casings]) have been envisaged. The capacity of each ESP shall be designed for a gas flow of [30% BMCR].
- The Boilers are designed to burn HFO (Heavy furnace oil) and LDO in conjunction with pulverized coal during startup and at low loads for warm up and flame stabilization. Further, the frequency and duration for startup and low loads operation may be quite long during the first year of unit commissioning and operation after R&M. The Bidder shall take into account the entire characteristics of expected combination of fuels to be fired and shall clearly bring out in his proposal the recommendations on preventive measures or equipment to be provided by him to minimize the possibility of fires in the Electrostatic Precipitators and the features/materials provided to avoid the corrosion of ESP components/surfaces.
- The Bidder shall offer the best design to accommodate the Electrostatic precipitator and accessories within the confines of the space available. The design shall permit satisfactory duct layout before and after the ESP terminal flanges.
- ESP control room (Individual for each unit) located at grade elevation adjacent to ESP shall house the control cubicles. Man Machine Interface (MMI) to be provided to enable UCB operator to access the ESP controls for control, monitoring and data acquisition functions. The MMI may be suitably located in UCB .Necessary provision shall be provided for integration of ESP with plant DCS for effective monitoring.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[35]	15.01.2016

- vii. Bidder to furnish the ESP control room AC, ventilation system and passenger lift (if control room building is having more than 2 floors) arrangement details in the offer.
- viii. The design of the precipitators shall allow adequate space above and between the adjacent fields to carryout necessary inspection and maintenance. A permanent walkway shall be provided at each rapper level both for the discharge and collecting electrodes. Minimum 3.0m wide platforms shall be provided between the two casings of the ESP's to facilitate maintenance work. The protection for the platform and the rapping motors from exposure to rain shall also be provided.
- ix. Staircases as per the requirements shall be provided from ground to the roof of the ESPs with landings connected to all platforms. Further, the platforms between all the ESP casings shall be interconnected at least at three intermediate elevation. Stair cases and handrails shall be of 40mm GI pipes etc.
- x. A monorail system with movable trolley and an electrically operated hoist mounted on the precipitators roof shall be provided for handling and maintenance of HVRT, rapper motors, fans (if applicable) etc.
- xi. Collecting electrodes shall be designed for dimensional stability and to maintain the collection efficiency at the specified level. Minimum Specific Collection Area (sca) with one series electric field out of operation shall not be less than $[180 \text{ m}^2/\text{m}^3/\text{sec}]$ for a maximum collecting plate spacing of $[400 \text{ mm}]$ and shall not be less than $[240 \text{ m}^2/\text{m}^3/\text{sec}]$ for a maximum collecting plate spacing of $[300 \text{ mm}]$.
- xii. The plate spacing shall be either 300mm or 400 mm, and the specific collecting area and the plate spacing shall be so chosen to achieve the required dust concentration of less than $50\text{mg}/\text{Nm}^3$.
- xiii. The high tension discharge electrodes shall be of rigid frame type design, located mid-way between the collecting electrodes. The electrodes shall be self tensioned, or restrained in pipe frames. They shall be constructed from durable, corrosion and erosion resistant material, helical wires, spiral of SS material to ensure uniform current distribution. In case spiral type discharge electrodes are being offered, the material for the same shall be high tension discharge electrode of durable, corrosion and erosion resistant material like stainless steel. Vertical and horizontal members shall be rigid enough to maintain the alignment of the system without warping or distortion even at elevated temperatures. Provisions made to maintain alignment of electrodes during normal operation, including rapping and thermal transients, shall be clearly brought out in the offer. However, no anti-sway insulators shall be used at the bottom of the discharge electrodes frame to accomplish the above

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[36]	15.01.2016

- xiv. Independent rapping system shall be provided for discharge and collecting electrodes with control systems as per the requirement specified in Electrical Sub-Section (Part-B, Section-II, Volume-II). The rapping mechanism shall be of either electric impact type or tumbling hammer type. This shall be adjustable in frequency, intensity (for electric impact type only) and duration (for tumbling hammer type) to provide an efficient cleaning rate. Separate rapping equipment, shall be provided for the discharge and collecting electrodes served by one HVRT so that each mechanism can be suitably adjusted when required. It shall be so arranged that the rapping frequency can be independently set from the control room in accordance with the operating requirements. The rapping frequency range shall be adjustable in wide range from 0 to a minimum of 24 hours, and this facility shall be such that it does not require any stoppage of rapper operation. Sufficient number of rappers and rapper drives shall be provided so that minimum collection area and discharge electrode lengths are rapped at a time, which shall not be more than 4.33% of the total collection area for at least the last two fields/discharge electrode length of each field served by one HVRT. The Bidder shall provide necessary calculations in support of fulfilling the above requirements along with the offer. The rapping system shall be designed for continuous sequential rapping to prevent puffing under any conditions of precipitator operation.
- xv. All internal parts of the rapping mechanism shall be accessible for inspection and they shall be placed on wide access passages and shall be easily accessible for operational and maintenance purposes. Major part of the rapping mechanism shall be located external to the precipitator. Necessary lubrication system shall be provided for the rapping mechanism.
- xvi. The perforated plates and/or guide vanes furnished for gas distribution system shall also be provided with rapping systems.
- xvii. Dust hoppers shall be of pyramidal type, each having a storage capacity of minimum of eight (8) hours corresponding to the maximum ash collection rate of the field under which the hopper is being provided when two preceding fields are de-energized. The ash carry-over to ESP shall be taken as 90% of total ash produced while burning worst coal having maximum ash content. The hopper capacity shall be based on the inlet dust burden, gas flow rate and gas temperature indicated in ESP sizing criteria for the design point condition while firing the maximum ash coal. Storage shall be up to a level which will not reduce the overall efficiency of the precipitator due to re-entrainment. Ash storage capacity shall be at least 10% higher than the ash storage capacity theoretically required for each dust hopper. Specific weight of ash shall be assumed as 600 kg/m³ for calculating storage capacity and 1600 kg/m³ for structural design. Further for hopper strength and ESP structural calculations the level of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[37]	15.01.2016

ash in ESP shall be considered at least up to the top of hopper partition plane or the bottom of electrodes (whichever is more) plus the angle of repose from the 3rd field backward i.e. towards ESP inlet. In case a bidder desires to adopt any level higher than that calculated as above, this higher level may be adopted. Necessary calculations supporting the same shall be furnished along with the bid. The number and arrangement of dust hoppers shall be such that there is at least one dust hopper per HVRT. Further, an arrangement with one hopper being shared by more than one HVRT set is not acceptable. The hoppers for all fields shall be identical in shape and size.

- xviii. Hoppers shall be in welded steel plate construction. The lower 1.5 meters of each hopper shall be lined with 16 gauge or heavier, type 304 stainless steel. All hopper internal sloping corners shall have 100 mm radius. Hopper valley angle to the horizontal shall not be less than sixty-five (65) degrees. Hopper outlet flanges shall be terminated at 3.5 m height above the ground level to facilitate installation of fly ash removal system.
- xix. The dust hoppers shall be electrically heated up to a minimum of lower one third (1/3) of the dust hopper height but not less than 1.5 meter in height by thermostatically controlled panel type heating elements to prevent ash bridge formation. All heaters on each level shall have same wattage and be capable of maintaining internal hoppers temperature in excess of 150°C and capacity selection of these heaters shall be as per Owner approval. The heater arrangement shall be such not to produce any localized hot spot causing self burning of heaters. This temperature must be maintained even when there is no flow of flue gases through the precipitator. Maximum excursion of flue gas temperature up to 350 deg C, while the air heaters are out also shall be considered for heater mechanical design. They shall be arranged in at least three groups i.e. for the lower, middle and upper half of the heated height. The heating system shall be of low watt density, panel type to avoid hot spots and to have more uniform distribution of heat having the heating capacity not less than 10 kW per hopper, or approved equivalent and shall be complete with local junction box, indicating lamps and test lamps. The Minimum heat input shall in no case be less than 500 Watts/m² of hopper surface area. Each hopper shall be provided with separate thermostats. External surface of the hoppers shall be properly insulated.
- xx. Each hopper shall be provided with two (2) nos. of hundred (100) mm dia poke hole in mutually perpendicular directions, with threaded caps. The caps shall have flat iron bars suitable for striking with a hammer, to assist in breaking free any seized threads. The hoppers shall also be provided with suitably designed and located rapping anvils for loosening the fly ash by striking with sledgehammer.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[38]	15.01.2016

- xxi. Hopper baffles shall be designed to be capable of withstanding the unbalance of pressure created when one side of the hopper is filled with fly ash and the other side is empty. All bracing and stiffening shall be on the external side of the hoppers. Internal bracing, stiffening etc., shall not be accepted.
- xxii. Each dust hopper shall be provided with a high level, high-high level and a low level monitor operating on proven Radiofrequency measurement principle. The level monitoring system shall incorporate all the necessary accessories including three nos. level switches per hopper (one each for high, high high and other for low level), each with 2 NO + 2 NC contacts, local and remote signaling lamps and high and low level alarms. The high level ash switch shall provide contact closure and activate the alarm when the ash level reaches a level high enough to cause deterioration of ESP performance and possibility of damage to ESP structure if not corrected. After a preset time elapses with the ash under high alarm activated, the logic shall have provisions to de-energies the HVRT of the particular field of the affected ash hopper. The level control device shall be unaffected by ash build up, due to moisture or charged ash on either the hopper walls or on the probe itself. The high level switches shall be used for operation of ash evacuation systems.
- xxiii. The structural rigidity & strength of the ESP should be able to withstand the load of all hoppers fully filled with ash.
- xxiv. Each hopper shall be provided with a quick opening access door of not less than 600 mm dia, if round or not less than 450 mm x 600 mm, if rectangular. Access doors shall be hinged vertically and provided with a safety chain and grounding strap. Suitable access ladders shall be provided from the walkway beneath the hoppers to facilitate approach to the access doors.
- xxv. Thermal Insulation along with G. I. / Aluminium cladding shall be provided for ESP surfaces and hoppers having skin temperature more than 60 degree Celsius. Weather proof enclosure for insulator compartment complete with heaters, air blowers, filters, controls etc.
- xxvi. ESP shall be provided with pent house on roof top. ESP pent house shall be covered continuously with corrugated coloured metapoly sheet of min 0.6 mm thickness
- xxvii. Lower portion of each fly ash hopper shall have SS 304 liner plates. The outlet flanges shall be standard size and shall be located at a height of minimum 3.5m above the ground floor level. Suitable opening shall be provided on both sides in the lower portion of the hopper for providing fluidizing pads by others. The sizes and location of the opening shall be finalized during detailed engineering.
- xxviii. Transformer Rectifier Unit

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[39]	15.01.2016

- a) Adequate number of roof mounted transformer-rectifier (TR) sets, mounted on ESP roof top, for supplying HVDC to the ESPs shall be provided by the Bidder. Minimum one no. of TR set per stream per series electrical field shall be provided. Each leg of the TR set shall not be connected to more than one bus section. Protection against surge, excess temperature rise and under voltage, etc. shall be provided for the TR units. Ambient temperature for design of TR units shall be taken as 50°C. Transformers shall be mineral insulated oil filled type class ONAN cooling type. The transformers and its associated equipment shall conform to IS or other approved international standards (like BS / DIN/JIS etc.) Each field of each section shall be provided with one TR set.
 - b) Relays and local instruments, such as, Buchholz relay, local oil level gauge, dial type thermometer with alarm & trip contact, pressure relief valve etc. and two nos. marshalling box, one for power and other for protection & control cable entry shall be provided by the Bidder.
 - c) Clear indication for 'ON' & 'OFF' for the transformers shall be provided. Dedicated key shall be provided in each rectifier panel and corresponding transformer for maintenance purpose so that in no case running transformer can be taken for maintenance. Provision for switching off each TR set from control room shall be provided.
 - d) Silicon diode type rectifiers with proven service record and conforming to relevant IS or other approved international standards shall be provided by the Bidder. The rectifier units shall be suitably arranged to give satisfactory operation at all loads with arrangement to take any one unit off the system without affecting operation of the precipitator. Each TR set shall be placed on a metal tray to collect leakage/spillage oil. All such trays shall be connected to common drain pipe which shall be extended up to ground level with necessary valves. The TR set shall be of approved make having adequate proven experience of use and subject to approval of the Purchaser. The HV Rectifier set shall preferably be located in a separate chamber, other than the transformer tank, in order to facilitate replacement / maintenance of the diodes. However, designs having HV rectifier integral to transformer tanks are also acceptable. Over current protection shall be provided in case of failure of diodes. Each TR panel shall have a provision of interfacing with ESP control room PC for ON – OFF, data logging, alarm and display, etc. During normal operation, if power fails, the system can be restarted from PC after revival of power.
 - e) HV side of the TR set shall be provided with isolator and earthing switch that can be operated from outside the HV enclosure.
- xxix. Control Panel, auxiliary control panel, rectifier control cubicle, annunciation
- a) Control Panel

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[40]	15.01.2016

Microprocessor based semi pulse control system shall be provided. Bidder shall make a separate ESP cum VFD control building, which shall house LT transformers, Power Control Centers (PCC), MCC, auxiliary control panels and rectifier control cubicles. One no. Each unit ESP PLC shall be suitably interfaced with Plant DCS through suitable protocol located in unit control room. With this various parameters of the ESP shall be monitored and controlled from unit control room. The incomer and bus coupler status of LT main switch board, transformer troubles, indication, metering annunciation etc. of breakers, etc. shall also be monitored at DCS through hard wiring.

b) Auxiliary Control Panel

For control / regulation of operation of auxiliaries (rapping system, heating elements, etc.) auxiliary control panels for each horizontal pass of the ESP shall be provided. Each aux. control panel shall consist of necessary relays, Electronic master-controllers, timers, switches, indicating lamps etc. for the efficient operation and control of individual / group tapping mechanism and heating elements. Master controller and timer shall be designed to control the sequence and frequency of the operation of rapping mechanism of the collecting and discharge system of the different fields of the precipitators. Signal lamps shall indicate overload tripping of the rapping motors.

c) Rectifier Control Cubicle

Control cubicles for the TR unit shall incorporate protections for abnormal condition such as under-voltage protection and protection for excessive temperature rise and internal short circuit of the transformer winding. It shall also include devices like arc suppression unit. The panel shall be complete in all respects with DC and AC ammeters, voltmeters, circuit breaking devices, pulse rate controller, L.T. bus bar, control/ switches, indicators, visual and audio alarm overload and earth fault protection, current limiting relays, polarity switch (if applicable) and all necessary relays. The panel shall also provide all necessary interlocks, automatic regulator and other protective devices for safe and efficient operation of the precipitator and safety for operating personnel. DC voltage and current measurement must be directly from DC side.

d) Annunciation

Annunciation in the unit control room shall include.

- ESP rectifier faulty
- Electric supply to ESP failed
- Rapping mechanism trip
- Outlet dust emission level high
- Under voltage

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[41]	15.01.2016

The annunciations shall be suitably made available in the HMI of ESP PLC.

xxx. 415V Power cum motor control center / PCC/PMCC

- a) 415 V power control center shall have two incomers and one bus coupler (all electrically operated ACB controlled). This PCC / PMCC shall have sufficient active / spare feeders for feeding the ESP MCCs, ESP control panels, etc. ESP MCCs shall have required no. of active and spare feeders for feeding all loads of ESP. Required number of active and spare outgoing feeders for control of various ESP drives and loads (including ESP, control building lighting, air conditioning & ventilation system and hoist loads) shall be provided for each unit. Electrical panels (PCC, MCC, etc.) shall be housed in a pressure ventilated room and ESP control panels shall be housed in air conditioned room.
- b) Each ESP PMCC / PCC shall be fed from 11 KV unit switchgears located in Power House building via a pair of dry type L.T. transformers to be installed adjacent to ESP PMCC / PCC within ESP cum VFD control building. LT transformers located near the ESP switchgear shall be connected to ESP PMCC / PCC by non-segregated phase, L.T. bus duct.

xxxi. Cables and cabling

- a) All power and control cables including special cables as required for inter connection of L.T. PCC & MCC, control cubicles, auxiliary control panel, TR units, heaters and rapping mechanism motors, remote signaling devices etc. of ESP system and AC & Ventilation equipment shall also be provided by the Bidder.
- b) Supply and installation of power and control cables including termination at both ends is included in the scope. Cable trays, supporting structures, cable trestle / tunnel / trench, etc. all accessories like cable lugs, glands, clamps, etc. are also included. Cabling shall be complete with cable numbering tags, core ferrules, indicating termination and destination at both ends, cable glands, supports and accessories. Connection between the TR units and the discharge system shall be provided by bus bar in ducting by the Bidder.

xxxii. Earthing and Shielding

- a) All electrical equipment shall be properly protected and two terminals shall be provided for earthing of each equipment. Earthing of electrical equipment shall be done as detailed elsewhere. Special electronic type earthing shall be envisaged for PLC/microprocessor based control system.

xxxiii. Safety Interlocks

- a) Safety sequential interlocks with mechanical key exchange boxes shall be provided to prevent access to interior of precipitator or hoppers unless all transformer rectifier sets are de-energised and grounded. This should be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[42]	15.01.2016

achieved by key interlock between the rectifier feeder circuit breakers and the door lock of the precipitator hoppers and roof doors.

xxxiv. Power Supply

- a) 11 kV power shall be fed to ESP L.T. transformer by cables and 415V, 3 phase, 4 wire 50 Hz power from secondary of the L.T. transformer shall be received at 415 V ESP PMCC / PCC through LT bus duct. Other power supply requirement if any shall be derived from this supply by Bidder

xxxv. Routine, Acceptance and Type Tests

Routine and Acceptance Tests

All acceptance and routine tests as per the specification and relevant standards shall be carried out in the presence of the Purchaser.

Type Test

The Bidder shall submit type test certificates of similar type of the equipment for the tests indicated below.

a) TR Set

- 1). Temperature rise test at rated DC current at 1:1 charge ratio
- 2). Lightning Impulse voltage test
- 3). Jacking test on Transformer load bearing member
- 4). Measurement of harmonic current in no load current
- 5). PRD operation test
- 6). Short Circuit Test (To be conducted as described below)

This short circuit test shall be performed on TR set along with the TR panel and controller with a spark gap connected across the output. The gap is adjusted to get the spark at kVp as applicable which is the short circuit condition and the controller shall control the voltage to quench the spark.

- 7). Oil leakage test for 24 hours
- 8). Vacuum test on tank
- 9). Pressure test on tank
- 10). Induced over voltage test
- 11). Measurement of no load losses and current
- 12). Measurement of impedance voltage/ short circuit Impedance and losses
- 13). Measurement of IR

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[43]	15.01.2016

- 14). Measurement of acoustic sound level
- 15). Degree of protection test
- 16). Measurement of capacitance and tan delta

b). Insulators

- 1). Compression test on support insulator
- 2). Torsion test on shaft insulator
- 3). Lightning impulse test and one minute dry power frequency test on each type of insulators.

c). Disconnecting Switch

- 1). Lightning impulse test and one minute dry power frequency test

In case the bidder is not able to submit report of the type test(s) conducted or in the case of type test report(s) are not found to be meeting the specification requirements, the bidder shall conduct all such tests without cost implication in the presence of the Purchaser and submit the reports for approval.

However, in spite of availability of valid type test certificate following minimum tests shall have to be performed in presence of Owner / Owner's representative as per IS/IEC Standards:

- Impulse test on any one transformer of each type selected by the Owner.
- Heat run (Temperature rise) Test on any one transformer of each type selected by the Owner.

xxxvi. Model Study

- a. The Bidder shall conduct computer based model study using CFD technique to achieve optimum size and layout of the ducting, uniform flue gas distribution, maximum particulate collection, minimum draft loss, minimum dust drop out and build up and minimum re-entrainment from within the precipitator.
- b. The model study shall include the design of all connecting duct work from the air preheater gas outlets to the induced draft fans inlets, induced draft fan outlet to chimney flue inlet including the inlet duct transition piece, including all dampers, turning vanes and distribution devices. Based on the model test studies, the Bidder shall finalize the design of the duct work, guide vanes, flow splitters etc. The model study shall also include a gas distribution study for the duct system around ESP to find out the effect of isolation of one stream of the ESP.
- c. The report of CFD model study shall be furnished to the Owner. CFD model study for the ESP may not be needed in case the bidder has earlier carried out the CFD modeling for similar size and type of the ESP.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[44]	15.01.2016

The report of CFD model study earlier carried out by bidder for similar size and type of the ESP shall be furnished to the Owner.

1.4.11 Fuel Oil System

Fuel Oil System under Boiler & Auxiliaries package is envisaged from the terminal points onwards, as mentioned in Clause No. 5.1 of Section-I of Volume-II.

i. HFO Transfer System

HFO will be sent to the steam generator by means of positive displacement screw type supply pumps located in Fuel Oil Pump House. The HFO pumps shall deliver filtered heavy fuel oil in a common header kept at the correct pressure by means of a pressure control station on a recirculation line to the storage tanks; the pressure holders / accumulators if applicable, shall be installed to assure the minimum pressure required by the burners during trip of one pump and start up of the stand-by pump. Steam tracing is envisaged for all the heavy fuel oil lines to maintain required flow ability. Fuel oil burners shall be provided complete with diffusers, tips extension pipes, atomizers, burner shut off valves, flexible hoses and all other ancillaries. Oil connections to each burner from ring main shall be provided complete with fine filters as near as possible to each burner and means for determination of oil flow to each burner. Complete Piping along with auxiliary steam piping, oil drain piping, vent piping, tracing steam piping and recirculation piping shall be provided complete with all protection & instrumentation controls, suitable hangers, support, pipe trestles, etc.

ii. LDO Transfer System

LDO will be sent to the steam generator from by means of horizontal screw type LDO supply pumps complete located in Fuel Oil Pump House. A common re-circulating line with a pneumatic control valve is foreseen to re-circulate the light fuel oil to the LDO storage tanks. One pressure holder is envisaged to assure the minimum pressure required by the burners in case of trip of one pump. The light fuel oil system will have the following design features:

Relief valves will be provided on larger section of fuel oil pipes, which can be isolated. Isolation valves will be provided both on upstream and downstream sides for all in-line items like pumps, heaters, flow meters, filters, control valves etc., which are required to be taken out for maintenance. For LDO handling system, steam flushing system will be provided for cleaning during commissioning. Adequately sized pressure accumulators will be provided on fuel oil lines to individual Steam Generator for maintaining constant oil pressure. Each accumulator will be complete with a pressure gauge, stop cock and isolation valves to ensure maintainability of nitrogen pressure.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[45]	15.01.2016

iii. Pippings, Valves, Fittings, Pipe Support, etc.

The layout of oil piping, valves, flanges, steam traps, fittings and supports etc. shall be such as to facilitate maximum flexibility of interconnection of pumps, heaters, strainers. All HFO lines shall be steam traced and properly lagged. All lines carrying steam and oil shall be provided with adequate drain and vent connection. All fuel oil lines and filters shall be provided with steam flushing points at suitable locations. All steam and condensate piping handling fluid of pressure below 20kg/Sq.cm.g shall conform to the latest edition of IS: 1239 (Heavy grade) or ASTM-A-106 Gr. B or other approved equivalent standards. Oil pipelines from discharge of pressurising pump to boilers shall conform to IS: 1978 or other approved equivalent standard with latest amendments. Double isolation valves shall be provided from the discharge of the pressurizing pumps, for inline items that are to be removed for maintenance. This applies to flow meters, filters, isolation valves and the pressure maintaining valves etc. Larger lengths of piping that can be isolated shall be provided with thermal relief valves.

Between the pressure oil line and the return oil line, an interconnecting line shall be provided with automatic pressure control system to maintain the pressure of oil to the Boiler at a predetermined value. The interconnecting line shall also serve to divert the fuel oil to the return line under conditions when oil supply to the burners is to be cut off or reduced. Suitable non-return valves shall be provided on the return oil lines from the Boilers to prevent pressurized fuel oil from going back into the burners in the reverse direction when the quick acting valve closes. The fuel oil lines to individual boilers shall be provided with pressure accumulators of adequate size (if warranted by design) to maintain the oil pressure at a constant value.

All flanges shall conform to IS: 6392 or equivalent. The nominal pressure and temperature ratings of flanges shall be such as to withstand the design condition of the respective pipe/equipment to which they are attached. Matching counter flanges with nuts, bolts and gaskets shall be provided for all the system terminal points on oil, steam/condensate and air lines.

All high pressure pipe fitting shall be of butt welded construction, wherever possible and shall conform to ASTM-A-234 (carbon steel) or other approved equivalent.

All valves on oil, steam and condensate lines shall have cast steel body. Valves for oil service shall be fire safe ball valves type, easy to operate, less maintenance prone, leak proof, and self-lubricating type. The valve internals shall be chrome-steel for oil, steam / condensate lines. The drain valves shall be located at the lowest points in the system to ensure complete draining of the system.

Suitable supports / hangers shall be provided for all the piping covered under fuel oil facilities. Piping in the boiler area shall be designed with laying up on trestle supports as far as possible. The pipes crossing roads/rails shall also be trestle-supported. Dead zones in pipes shall be avoided as much as possible.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[46]	15.01.2016

The high temperature piping / heat traced piping shall be provided with expansion loops to take care of thermal expansion.

The steam traps shall be of proven design and provided with integral/separate strainers. The trap body shall be of carbon steel and the internals including strainer screen shall be of stainless steel conforming to AISI-316.

iv. **Steam Heat Tracing and Insulation**

The entire HFO pipeline shall be steam heat traced and insulated with slag wool to maintain heavy oil temperature in the system at 85 deg C \pm 5 deg C. The insulation shall be fixed with wire netting & external protection given by 22SWG thick aluminium sheets. Insulation shall be carried out as per IS: 7413.

v. **Condensate Flash Tank**

- Bidder shall provide all necessary arrangement to bring all the steam condensate drains of the fuel oil system to a common condensate flash tank.
- Condensate flash tank of adequate capacity one per boiler shall be provided in the Boiler area. The drains from these tanks shall also be led to the guard pond in effluent treatment plant

1.4.12

HP Chemical Dosing System

Phosphate Dosing System (Drum type Boiler)

High pressure chemical dosing system to be supplied shall be complete with solution preparation tanks, metering tanks, dosing pumps with motors, actuators and all accessories for pump stroke control including instrumentation, connected piping as required and all necessary relief, isolation and non-return valves, strainers and fittings, DM and condensate water supply piping as required for dosing system. The tank shall be provided as per IS:4682 and the tank shall be provided with 4.5mm thick rubber lining.

- (i). 2 x 100% capacity HP dosing pump shall be furnished for each boiler.
- (ii). Dosing pump shall be of positive displacement type, all stainless steel construction, adjustable stroke, complete with built-in recirculation type safety valve, drive motor, base plate etc. the discharge pressure of the pump shall be as per the requirement of the HP dosing system.
- (iii). On line self cleaning type filter shall be provided after the tank for removing the suspended particles.
- (iv). All piping, valves & fittings shall be as per ASTM SA 210 Gr.A1 or equivalent.

All Volatile Treatment (AVT) – For Once through Boiler

Bidder to consider an appropriate dosing system for the once through boilers as per the requirement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[47]	15.01.2016

1.4.13 Auxiliary Steam System

The auxiliary steam system (Aux. PRDS) shall include the high capacity and low capacity pressure reducing stations to meet the continuous and start-up auxiliary steam requirements of the boiler turbine units. The steam source for high capacity PRDS shall be the main steam pipes and that for the low capacity PRDS shall be the cold reheat (CRH) pipes.

A high temperature unit auxiliary steam header operating at [16 kg/cm² (a) and 310 deg C] taking steam from the above PRDS stations and also a low temperature unit auxiliary steam header operating at [16 kg/cm² (a) and 210 deg C] shall be provided.

The auxiliary steam systems of the units shall be interconnected through the station auxiliary steam headers.

Bidder shall provide auxiliary steam system for meeting internal auxiliary steam requirement for the following services:

- i) Steam coil air pre-heater
 - ii) Burner atomizing steam
 - iii) Fuel oil heaters
 - iv) Steam tracing of fuel oil system
 - v) RAPH soot blower
 - vi) Systems of TG sets & auxiliaries, vapor absorption air conditioning machine.
 - vii) Besides above, spare tapplings with isolating valves shall also be provided. System provided shall be complete with pressure reducing desuperheating stations, valves, piping, headers, spray water system, supports and necessary instrumentation and controls.
- Each Boiler shall be provided with a suitable capacity High Capacity PRDS (HCPRDS), one no. Low Capacity PRDS (LCPRDS). For the HCPRDS, steam shall be tapped off from Main Steam Line and for the LCPRDS, steam shall be tapped off from Cold Reheat Line.
 - Suitable interconnection between the headers shall be provided generally and shall be subject to approval of the Owner / consultant. All interconnections shall be through motorized isolation valves. Besides normal tapplings shown in the tender drawing. 2 nos. spare tapplings with isolation valves shall also be provided on each of the headers indicated above. All stub connections on the unit / station aux. PRDS headers shall be provided with isolation valves.
 - Isolation valves with blank flanges shall be provided on both low temperature as well as high temperature station headers for future interconnection.
 - Auxiliary steam tapping from the boiler shall be provided with a root valve and a non return valve. Main PRDS station shall be complete with pneumatic control

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[48]	15.01.2016

valve, facilities for automatic control with remote manual operation feature from fireman's panel.

- High temperature unit aux. headers shall receive steam from the above mentioned PRDS units. Low temperature unit aux. steam header shall receive steam by connecting it to high temperature header through a desuperheater. Station headers shall receive steam from respective unit auxiliary headers of both the units.
- The PRDS station shall be located at a suitable location in the boiler area. Tentative location of these low temperature header(s) & high temperature header(s) shall be in main turbine building (under the scope of TG package) *[at 32 m level in BC bay along C – row columns]*. Exact location shall be intimated to the successful Bidder after award of contract.
- The LCPRDS shall meet normal auxiliary steam requirements, whereas the HCPRDS shall meet the increased intermittent requirements of the unit and station. *[During cold start up auxiliary steam shall be supplied by the auxiliary boiler]*. Subsequently, when the MS pressure is more than 60kg/cm² and the CRH steam pressure is inadequate, the LCPRDS shall be inoperative and the auxiliary steam requirements shall be catered only by the HCPRDS. The same operation philosophy shall be adopted during hot start up also when there is adequate main steam available in the boiler and the CRH steam pressure is not adequate. Once the CRH steam pressure become adequate, LCPRDS shall become operative while the HCPRDS shall close down. Further, when the auxiliary steam requirement increases beyond the capacity of the LCPRDS, the HCPRDS shall open to meet the steam demand. However, in this case the LCPRDS shall be kept fully open and the auxiliary steam flow shall be controlled by the HCPRDS only. Thus the staggered opening of the HCPRDS shall allow parallel operation of both high and low capacity PRDS so as to meet the increased auxiliary steam demand. When the aux. Steam demand decreases within the capacity of the LCPRDS, the control shall be transferred back to the LCPRDS and the HCPRDS shall close fully. Changeover of control from HCPRDS to LCPRDS and vice versa shall be automatic with facility of manual override by the operator. Design shall ensure that changeover is bump less and smooth. Throughout the range of operation of the auxiliary PRDS, the steam flow shall be controlled either by LCPRDS or HCPRDS depending on the unit condition and steam demand. Load sharing between the two stations is not envisaged
- High Capacity PRDS shall supply steam for the following
 - i) Auxiliary steam requirement for air heater soot blowing,
 - ii) Pulveriser fire fighting etc.
 - iii) Intermittent requirements of Unit and Station
 - iv) Turbine driven Boiler Feed Pump

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[49]	15.01.2016

- v) Start up requirement of other units
- vi) As stand by to Low Capacity PRDS station
- vii) Capable of delivering at least 20 T/Hr steam to Low Temperature Auxiliary steam station header.
- The exact quantity of minimum and maximum aux. steam required under different startup and operating condition shall be furnished by the Bidder along with the sizing and arrangement of PRDS units proposed by him.
- Low Capacity PRDS shall supply steam for normal requirements of it's own unit
- Adequate capacity safety relief valves and escape pipes shall be provided at auxiliary steam headers at suitable locations as per applicable codes to protect the equipment situated downstream of the pressure reducing stations.
- If steam for the Boiler unit auxiliaries is required at pressure/temperature other than that of the auxiliary steam header, suitable arrangements shall be made by the Bidder in the design of the Boiler to meet such requirements.
- All control valves used in the system shall be pneumatically operated.
- The HCPRDS system shall comprise of steam pressure reducing cum desuperheating valve, motorized isolation valve with integral bypass valve (motorised), separate steam temperature and pressure control valves, etc. as follows:
 - i) One number angular type electro pneumatically operated combined pressure reducing cum desuperheating valve rated for full duty.
 - ii) One number motorized isolation valve with motor operated integral bypass at the up- stream of the pressure reducing and desuperheating valve.
 - iii) 2 nos. desuperheating spray water lines (one main and one 100% bypass line) each having one number pressure control valve and one no. temperature control valves (electrohydraulically / electropneumatically operated). These two lines shall be interconnected and a common line shall be led up to the combined HCPRDS.
 - iv) One number motorized isolation valve at the inlet of pressure and temperature control valves on each desuperheating spray water line.
 - v) One no. non return valve (NRV) and one number manual isolation valve at the downstream of combined HCPRDS station.
 - vi) One no. manual isolation valve on each spray water line downstream of pressure and temperature control valves. One no. NRV on common spray water line going to HCPRDS.
- The LCPRDS system shall include steam pressure control valve, motorized isolation valves, motorized bypass control valves, separate pressure and temperature control valves, etc as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[50]	15.01.2016

- i) One number electro pneumatically operated pressure reducing valve rated for full duty.
 - ii) One number of motor operated pressure reducing valve rated for full duty on the bypass line to the main pressure reducing valve.
 - iii) One number motorized isolation valve at the inlet of main pressure reducing valve.
 - iv) One number motorized isolation valve at the inlet of the motor operated pressure reducing valve on the bypass line.
 - v) One number desuperheater downstream of the pressure reducing valve.
 - vi) 2 nos. desuperheating spray water lines (one main and one 100% bypass line) each having one number pressure control valve and one no. temperature control valves (electrohydraulically / electropneumatically operated). These two lines shall be interconnected and a common line shall be led up to the desuperheater.
 - vii) One number motorized isolation valve at the inlet of pressure and temperature control valves on each desuperheating spray water line.
 - viii) One no. manual isolation valve on each spray water line down stream of pressure and temperature control valves. One no. NRV on common spray water line going to desuperheater.
 - ix) One number motorized isolation valve on the steam line, upstream of the desuperheater.
 - x) One number NRV and one number manual isolation valve on the downstream of the desuperheater.
- The control system for Auxiliary PRDS system shall be microprocessor based with facility of TFT/KBD operation as well as through the back up push button station etc.
 - For pneumatic actuation system envisaged for the control valves, positioners with complete set of feedback cams, position transmitters , smart positioners, air filter regulator sets, with inlet and outlet pressure gauges, solenoid valves, air lock(if required), limit switches and other accessories to make the system complete shall be provided.
 - All local sensors and gauges for pressure /temperature and process suitable devices as per the process requirements.
 - Complete control system inclusive of control system components, control cabinets, console inserts, transmitters, sensors, interlocks, prefabricated cables, interconnecting special cables, etc. and all required accessories shall be provided.
 - For meeting auxiliary steam requirement of the facilities falling under the battery limit of this package, entire auxiliary steam piping from the headers up to the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[51]	15.01.2016

consumer points along with all valves, supports, fittings and specialty shall be provided by the Bidder.

1.4.14 Blow Down Tanks

Blowdown vessel shall receive blow down from the drum, water walls drain header & attemperator headers. Blowdown vessel shall be designed as per IS-2825 or approved equivalents. All the inlet connection to the tanks shall be tangential and wear plate shall be provided to take of the erosion.

Two number blowdowns tanks shall be provided for each Boiler, one intermittent blow down (IBD) tank and other continuous blow down (CBD) tank. The IBD shall be sized to receive the following:

- (i). All blow down and drains from Boiler.
- (ii). Drain from water wall headers, attemperators headers and CBD tank.
- (iii). Alternate drains from main steam lines, CRH lines, HRH lines and SCAPH drains.
- (iv). Other drains from power cycle piping.

The CBD tank shall receive the continuous blow down from the Boiler drum. CBD system shall be designed for maximum blow down of 5% BMCR load. Facility for complete bypass of CBD tank shall also be provided. The flashed vapour from CBD vessel shall be led to the deaerator.

The IBD tank shall be located at ground level near Boiler and CBD tank shall be located at deaerator floor.

Tank design shall not allow discharge of any free water from vent. The steam velocity through the vent pipe shall not exceed 90 m/s. Vent pipe size shall be so selected that no pressurisation takes place in the blow down tank.

Drain valve & drain piping shall be provided with a suitable loop pipe arrangement so as to maintain a minimum water level inside the tanks. The drain shall be cooled and the cold discharge shall be connected to guard pond in the effluent treatment plant.

Blowdown tank shall include level gauges, local pneumatic level controllers, redundant level transmitters for remote level control through Boiler C&I system, control valves, safety valves, vents, drains. All other local instruments like gauge glass, level switch, high/low level alarms and pressure/temperature instrumentation shall also be provided.

1.4.17.1 Tank Constructional Features

1. Tanks shall be designed and fabricated as per requirements of IS 2825/ BS 806.
2. All drain connection to the tanks shall be tangential, and wear plates shall be provide to prevent erosion due to high pressure and high velocity drains.
3. Matching flanges shall be provided for level switches and other instruments.

LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[52]	15.01.2016

4. Drain valves and drain piping shall be provided at the bottom of the BDT. All drains from BDT shall be cooled to a temperature not exceeding 60°C.
5. Manholes on BDT shall be provided with hung on hinged type bolted doors.
6. IBD Tank drain shall be connected to guard pond provided by purchaser and the vent shall be routed to above boiler roof.

2 DESIGN AND SIZING OF POWER CYCLE PIPING

2.1 Codes & Standards

The Design, manufacture, shop testing, erection, testing and commissioning of piping and valves shall conform to the latest revisions of the following codes and Indian Standards or equivalent international codes, in addition to other standards mentioned in the tender documents subject to any modification and requirement as specified hereinafter.

IS: 778	: Gunmetal gate, globe and check valves for general purpose.
IS: 780	: Sluice valves for water purpose (50 to 300 mm).
IS: 1239	: Mild steel tubes and fittings - Part I & II, ERW pipe upto 8" diameter.
IS: 1536	: Centrifugally cast (spun) iron pipes for water, gas and sewage.
IS: 8329	: Centrifugally cast (Spun) Ductile Iron Pressure Pipe for water, gas and sewage
IS: 1537	: Vertically cast iron pressure pipe for water, gas and sewage.
IS: 1538	: Cast iron fittings for pressure pipes for water, gas and sewage.
IS: 1703	: Ball valves (horizontal) plunger type including floats for water supply purposes.
IS: 2379	: Colour for the identification of pipe line.
IS: 2685	: Code of practice for erection, installation, and maintenance of sluice valves.
IS: 2906	: Sluice valve for water works purposes (350 to 1200 mm).
IS: 3042	: Single faced sluice gates (200 to 1200 mm).
IS: 3589	: Electrically welded steel pipes for Water gas & sewage (200 to 2000 mm).
IS: 4038	: Foot valve for water works purposes.
IS: 4984	: High Density polyethylene pipes.
IS: 4985	: Unplasticised PVC Pipes.
IS: 5312	: Swing check type reflux (non-return) valve Part-I.
IS: 458	: Concrete pipes (with and without reinforcement).
IS: 3952	: Cast Iron butterfly valves for general purposes.
ASTM-A 106	: Gr.C Seamless carbon steel pipe.
ASTM 53	: Seamless carbon steel.
AWWA-C-504	: Standard for butterfly valve.
BS: 5156	: Standard for Diaphragm valve.
IS: 554	: Pipe thread for pressure tight joints.

IS : 1363	: Black hexagon bolts, nuts and lock nuts.
IS: 1364	: Precision and semi-precision hexagon bolts, screws, nuts and lock nuts.
IS: 2062	: Structural steel fusion welding quality.
IS: 4736	: Hot dip zinc coating on steel tubes.
IS: 2825	: Code of unfired pressure vessels.
IS: 2712	: Gaskets.
IS: 4192	: Part-I Rubber lining.
IS: 9523	: Specification for Ductile Iron fittings for pressure pipes for water, gas and sewage
IS: 3006	: Acid resistant SWG Pipe.
IS: 783	: Code of practice for laying RCC pipes.
IS: 3114	: Code of practice for CI Pipes.
BS: 5142	: CI globe valve.
ANSI:B 16.5	: Steel pipe flanges and flanged fittings.
ANSI:B 31.1	: Power Piping code.
ANSI B 16.34	: Valves-Flanged, threaded and welding ends
ASME Sec –VIII, Div 1	: Boiler and pressure vessels code
ASME B 16.21	: Non metallic gaskets for flange
ASME B 16.20	: Metallic gaskets for flange
ASME B 16.11	: Screwed joints
ASME B 16.25	: Welded joints
ASTM A 106, Gr. C	: Schedule 80 - Seamless carbon steel pipe
ASTM A 312 Grade TP-316	: Schedule 40s - Stainless Steel pipes
IS:4984- Class-5	: High density polyethylene pipes
IS:4985- Class-4	: PVC Pipes.
ASTM D 3517 / 4024	: GRP pipes
ASTM A 105	: Standard specification for carbon steel forgings for piping application.
ASTM A 182	: Standard specification for forged or rolled alloy and stainless steel, pipe flanges, forged fittings and valves and parts for high temperature service.

Document Number	Rev No.	Description	Page No.	Date of Issue

ASTM A 216	: Standard specification steel casting suitable for fusion welding for high temperature service.
ASTM A 217	: Standard specification for steel castings martensitic stainless and alloy for pressure containing parts suitable for high temperature service.
ASTM A 234	: Standard specification for pipe fittings of wrought carbon steel and alloy steel for moderate and high temperature service.
ASTM A 312	: Standard specification for seamless welded and heavily cold worked austenitic stainless steel pipe.
ASTM A 335	: Standard specification for seamless ferritic alloy steel pipe for high temperature service.
ASTM A 403	: Standard specification for wrought austenitic stainless steel pipe fittings.
MSS SP-58	: Pipe hangers and supports- Materials, designs and manufacture
MSS SP-69	: Pipe hangers and support – Selection and application
API-6D	: Specification for pipe line valves
API-607	: Fire test for soft seated ball valves
API-598	: Valve inspection test
API-594	: Standard for dual check valve
ASTM A-193-194	: Specification of alloy steel and stainless steel bolting material;/ nuts for high temperature services

2.2 Design Basis

1. Design, fabrication, testing & erection of Power Cycle Piping, valves & specialties for critical piping system under purview of IBR, shall satisfy IBR, and ANSI/ASME B31.1 latest code.
2. Design, fabrication, testing & erection of Power Cycle Piping, valves & specialties for non-critical piping system which are not purview of IBR, shall satisfy ANSI/ ASME B31.1 latest code.
3. Sizing, design and installation of safety valves shall conform to IBR and the non-mandatory rules for the design of safety valve installation of ANSI/ ASME B31.1.
4. Piping Flexibility analysis shall be carried-out for all piping having sizes equal to or above 50 mm NB & design temperature 100°C and more, according to ANSI/ASME B-31.1 latest & also satisfying IBR latest.
5. Design pressure and temperature shall be as per IBR. Wherever not clearly stipulated in IBR, criteria stipulated in ASME/ ANSI B31.1 for selecting design pressure & temperature shall be followed.
6. Material of construction of piping, valves & specialties shall conform to relevant ASME / ASTM / BS / IS or equivalent codes/standards. In case materials not approved by IBR are used, it is the Bidder's responsibility to obtain IBR approval, without affecting the Construction schedule.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[56]	15.01.2016

7. Type of Hangers, supports etc. shall be selected as per the following criteria:
- a) Variable spring hangers
 - (i). Where the variation in supporting effort between hot and cold condition does not exceed 20% of the higher of the operating load and cold setting load.
 - (ii). The resulting effect of load take-up/ release by a group of hangers in a span does not overstress the piping span or cause overloading at equipment terminals.
 - (iii). Thermal deflection between hot & cold conditions does not exceed 40 mm.
 - b) Constant load hangers

When thermal deflection between hot and cold conditions exceeding 40mm, these are used.
 - c) Spring hangers

These should not be loaded more than 80% of the spring travel range.
 - d) Rigid hangers & restraints

To be judiciously selected, without exceeding the stipulated limits of terminal forces & moments and stress level. Struts shall be considered where compressive load is expected.
8. Design Requirement of Hangers & Supports:-
- In order to minimize any horizontal force components of the dead weight or any binding of the pin or rocker joints used on the hangers, the hanger rods should be as long as possible. In critical piping systems, the length of the hanger assembly capable of swinging shall not be less than 20 times the maximum expected pipe movement in the horizontal plane at the hanger location. It is recommended in case of main steam piping to provide for a hanger rod length of at least 5-6 meters wherever feasible.
- Constant support type of hangers shall be adopted at all locations on critical piping excepting where the smaller of vertical movements of pipe justifies the use of variable spring hangers.
- As far as practicable, connections of hangers to supporting structure shall be achieved without welding to structural members. If welding is inevitable, adequate factor of safety shall be considered in the design and specification of the weld.
- The attachment of support brackets to brick walls shall be avoided as far as possible and where this is not possible, details of the attachment shall be furnished to the consultant for his approval. Under unavoidable circumstances, when medium or heavy brackets are bolted to walls, back plates of adequate size and thickness shall be furnished to distribute the load against the wall. Where the use of a back plate is not practical, the brackets shall, be fastened to the wall in an approved manner.
- Diameter of hanger rods for piping NB 50 mm and smaller shall not be less than 10 mm and for piping with size NB 65 mm and larger shall not be less than 13 mm.
- All components for hangers such as turn buckles, clamps, etc. shall be of forged steel.
9. Snubbers, dampers etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[57]	15.01.2016

To take seismic / dynamic loads, thrust due to safety valve discharge. Effort shall be made to limit its use by judicious placement of rigid hangers. Bottom support spring hangers are to be avoided as far as possible.

10. Design, materials, fabrication, testing and erection of hangers, supports, anchors, guides etc. shall be as per ANSI/ASME B31.1 latest code. Material of support packing used for alloy steel piping shall be same or better than the parent pipe material.
11. Hanger suspension rods, tie-rods/ struts should have proper arrangement & adequate length, so that thermal movements in direction which are free are not constrained and should not make an angle more than 4 degree with vertical due to horizontal pipe movement.
12. Pipe Thickness calculations shall be made on the basis of procedure and formula given in ANSI B31.1. Stress values of piping material for calculation shall be selected from tables given in ANSI B31.1. Thickness, thus calculated shall be checked as per the formula of IBR and the more stringent of the two shall then be selected. If it is seen that sizes arrived at for main steam and hot reheat pipes are not in the standard range of the manufacturers, ID controlled piping, shall then be selected for these piping systems.
13. Pipe sizing and piping system design shall conform to the requirements of power piping code ANSI B31.1. Statutory requirements as laid down in Indian Boiler Regulations (latest edition) shall also be taken care in pipe system designs. Pipe wall thickness as calculated by ANSI Code formula shall also be checked for IBR requirements for piping systems falling under IBR purview.
14. Inside diameters of piping shall first be calculated for the flow requirement of various systems. The velocity limits for calculating the inside diameters are listed below used to determine line size if dictated by considerations of pressure drop, NPSH, surges, water hammer, etc.
 - a) Steam
 - i) Main Steam hot and cold reheat pipes : 75 m/sec.
 - ii) Saturation steam : 40 m/sec
 - iii) Auxiliary steam : 30 m/sec.
 (Aux. steam to take care of various design flows)
 - b) Feed Water :
 - i) Suction : 2.0 m/sec.
 - ii) Discharge : 5.0m/sec.
 - c) HP bypass
 - i) Upstream : 75 m/sec.
 - ii) Downstream : 100 m/sec.
 - d) LP bypass
 - i) Upstream : 75 m/sec.
 - ii) Downstream : 100 m/sec.
 - e) Extraction steam

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[58]	15.01.2016

- i) Superheated steam : 60 m/sec.
 - ii) Saturated steam : 30 m/sec.
- f) Condensate
 - i) Discharge : 3.4 m/sec.
 - ii) Suction : 1.5 m/sec.
- g) Heater vents : 25m/sec.
- h) Heater drains : 1.5m/sec.
- 15. Other piping - As per good engineering practice.
- 16. Drains shall be provided, at all low points and vents at all high points as per actual layout regardless of whether the same have been shown in the flow diagrams or not. Pipelines shall be sloped towards the drain points. For operating temperatures of greater than 400 deg C, drip leg with drains, operated by a motor operated valve shall be provided. At all other drain locations (operating temperatures less than 400 deg C) traps shall be provided. All traps shall be provided with strainers, isolating, bypass and free blow valves. Traps shall be thermodynamic type

2.3 Piping Design

Complete design, engineering, etc. for the power cycle piping systems and other piping systems shall be the responsibility of the Bidder. Owner's/Consultant responsibility/ function in this connection shall be limited to review and approval of Bidder's design/ calculation, engineering, drawings, documents. Bidder's scope of services for complete engineering of the piping systems shall include but not be limited to the following:

1. Preparation of engineering piping diagram indicating flow schematic, flow parameter, pipe sizes, line designations and tag nos. of various components etc.
2. Design parameter selection, pipe sizing calculation, pipe schedule, valve schedule, insulation schedule, specialties schedule and hanger schedule for the systems.
3. Preparation of preliminary as well as final composite piping layout drawings of pipe size 65mm NB & above.
4. Design in detail all piping supports including restraints, guides, stops etc., after deciding the final location of hangers and supports and based on final stress analysis and hanger/ support load data.
5. Prepare separate sketches for each hanger/ support, restraint, anchor, etc. These sketches shall include the location with reference to column co-ordinates, identification number, bills of material, design loads, operating load, spring stiffness, amount of spring pre-compression etc., the method of attachment to the pipe and steel structure. Additionally the sketches shall show a key plan referenced to plant north and centre line elevation of the pipe at the point of attachment for cold and hot conditions.
6. Preparation of fabrication and erection isometric (with material take off) drawings for shop fabricated piping which are of size 65 mm NB and above.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[59]	15.01.2016

7. High pressure piping shall be manufactured from hot or cold finished, seamless steel tubes. Bosses shall be provided for the purpose of creep checking. Zero measurements shall be taken and recorded before the plant goes into service.

2.4 Stress Analysis

The Bidder shall carryout stress analysis of piping system using proven and validated software and shall submit for Owner's/Consultant approval.

- (a) Following loading conditions shall be considered for stress analysis:
- i) Internal pressure
 - ii) Thermal loads due to – (i) Piping thermal expansion and (ii) Anchor displacement due to thermal movements of piping anchors.
 - iii) Piping weight consisting of weight of piping, valves, bends, fittings, insulation etc. as well as weight of support components like clamps, shoes, suspension rods, trapeze etc. & weight of contained fluid.
 - iv) Test or cleaning fluid load
 - v) Equivalent static loads due to discharge of safety valve (SV), Electromatic relief valve (ERV), simultaneous discharge of SV & ERV where applicable.
 - vi) Dynamic load due to steam hammer (if applicable)
 - vii) Seismic loads due to
 - Equivalent static load due to seismic inertia effect and
 - Equivalent static load due to seismic anchor displacement
 - viii) Wind load where applicable
- (b) Loading combination Design load for supports, restraints, anchors & supporting structures shall be obtained by proper selection of one or combination of two or more of the loads as above based on the possibility of independent or simultaneous occurrence. Loads imposed due to hydrostatic tests shall also be taken into consideration for the design of supports.
- (c) Bidder shall clearly indicate the basis of his judicious selection or loading combination for support, restraints and anchor design. Component of thermal expansion reaction range expected to appear at cold condition, as per equation 9 & 10 of ANSI/ASME B31.1 shall be considered in loading combinations. As overload factor of 1.30 shall be considered over the computed loads except occasional loads before combining them. Bidder shall justify with reasoning in case any one of the specified loads is not considered in analysis.
- (d) Combination of Stresses the computed stress under different loading conditions shall be combined as per equation 11, 12 & 13 of ANSI/ASME B31.1 & the stress shall be within allowable limits.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[60]	15.01.2016

- (e) Allowable stress values for piping materials other than ASME/ASTM materials, values shall be derived as per the criteria defined in Appendix-P of ASME Boiler & Pressure Vessel Code, Section-VIII, and Division 1 while computing pipe wall thickness and flexibility analysis shall be conducted as per ANSI/ASME B31.1. However, higher of pipe wall thicknesses derived between IBR regulation & ANSI/ ASME B31.1 code shall be considered.
- (f) Factor to be considered in flexibility analysis.
 - i) Cyclic load operation of the Unit. Bidder shall consider value of stress range reduction factor 'f' for cyclic conditions due to temperature reversals equal to ONE.
 - ii) Stress intensification factor at all transitions, fittings & all branches as per ANSI/ASME B31.1.
 - iii) Variation in supporting effort by variable spring due to pipe movements
- (g) Piping Flexibility analysis is to be conducted as per the piping layout in case any modification of piping layout is felt essential to maintain stresses & terminal reactions within allowable ranges, same are to be carried out by the Bidder after discussion with Owner/Consultant.

The following piping systems shall be analyzed:

- i) Pipelines with a maximum operating temperature equal to or greater than 100 deg C having size 50NB or above.
- ii) A write up on the stress analysis including codes used and design conditions considered.
- iii) A copy of the computer print out for input data for the various design conditions considered for stress analysis along with the stress diagram (piping isometric marked with node points marked.)
- iv) A copy of flexibility analysis software soft copy shall also be submitted for Owner/Consultant approval.
- v) Analysis results in tabular form giving calculated and allowable reactions / forces / moments on equipment nozzles/terminals for the various design conditions considered for analysis.
- vi) Allowable and calculated code stresses at various node points in the piping for the design conditions considered based on code requirements for analysis.
- vii) Analysis results giving calculated forces and moments and movements at various hanger / support / restraint / anchor points from the static analysis corresponding to various thermal / operating conditions, sustained load case, hydro load case (other than water lines) and occasional loads, as applicable, for each piping system analyzed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[61]	15.01.2016

2.5 Statutory Approvals

- (a) It is the sole responsibility of the Bidder to identify and obtain all necessary approvals from various Government agencies / statutory authorities including IBR, CCoE, etc., as applicable for the design, manufacture and testing of pipes, valves, fittings, specialties etc.
- (b) The Bidder shall also identify and obtain all necessary approvals from the IBR authority in the state where the plant is being installed, for the erection / testing / commissioning and any other requirement as required by IBR.
- (c) It is also the responsibility of the Bidder to get approval(s) from any other statutory authority in other countries from where the supplies are made, as applicable and acceptable to IBR for the design/manufacture/testing etc. for the piping / fittings / valves / specialties etc.
- (d) In order to obtain the above approvals, all necessary documentation etc. required shall be arranged and furnished by the Bidder to the statutory authorities.

2.6 Installation

- (a) Cleaning including chemical cleaning of all systems as specified herein and installation of temporary pipe work for the same. All hot bent, forged formed, fabricated and straight pipes shall be chemically cleaned, pickled or wire brushed and purged with air blast or shot/grit blast to remove all sand and scale from the inner surface as applicable.
- (b) Making temporary closures/ stubs on piping system as required for hydrostatic testing and performing hydrostatic test on all piping. All pipes shall be hydro tested at shops for pressures as per standards and all erected piping shall be tested 1.5 times the design pressure.

The Bidder shall carryout the following cleaning after hydro test.

- i) All piping shall be mass flushed, in addition to the specific cleaning operations as described below, as required.
- ii) Main steam, cold and hot reheat piping and HP & LP bypass piping shall be steam blown.
- iii) Auxiliary steam piping and associated steam lines, heavy fuel oil/ LDO piping shall be steam blown.
- (c) Making interface piping connections at TP with equipment/piping etc. as applicable.
- (d) Apart from carrying out chemical cleaning, the work shall include neutralization disposal of water, clean up, reinstatement of the cleaned piping system, dismantling and removal all temporary piping, equipment and materials from site.
- (e) Painting of piping system shall be in accordance with the stipulations laid down elsewhere in this specification.
- (f) Weather hood for pipes crossing ceilings and walls.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[62]	15.01.2016

2.7.1 Checks after Installation

In order to ensure that all supporting elements, anchor and restraints have been installed and adjusted in accordance with design documentation, the Bidder shall inspect and log the hanger readings for the hangers associated with the power cycle piping system as follows:

- (a) After hydrostatic test with the piping in the cold position, with all travel stops removed, with the pipe completely insulated and in all respect ready for start-up.
- (b) Piping in hot position (rated parameter condition) after six (6) months of operation.
- (c) Piping in cold position during the first complete shutdown after at least six (6) months of operation.
- (d) After steam blowing, in case steam blowing is applicable for the line.
- (e) At the time of each inspection, the Bidder shall determine the necessity for revision, adjustment or replacement of pipe supporting elements, restraints and anchors. Any changes proposed shall be subject to the concurrence of the Owner/Consultant. The changes shall be incorporated by the Bidder after Owner's/Consultant concurrence.

2.7 Inspection and Testing

All shop tests as required by the applicable codes, ANSI Standards, IBR and other standards specified.

- (a) Obtaining approval from Chief Inspector of Boiler as per latest Indian Boiler Regulations (IBR) is the responsibility of the Bidder. This shall include furnishing all necessary certificates for design, manufacture and testing for pipe, valves, fittings, specialties, tanks, vessels certificate of manufacture and test for each erected entity in the relevant formats to the Chief Inspector of Boilers, obtaining his approval and furnishing the same to the Owner/Consultant.
- (b) The Bidder shall also identify and satisfy all other statutory code requirements as may be required for the piping systems covered in this specification.
- (c) Certified copies of test reports for all tests and examinations specified in the specification and for the mandatory test and analysis required by ASME/ ASTM material specification, for the materials used for piping, shall be furnished to Owner/Consultant.
- (d) Provide complete interface engineering with the suppliers of other equipment and piping with which the piping systems in the Bidder's scope are connected.
- (e) Performing all tests and implementing all quality control procedures as specified herein including provision of testing equipment, stress relieving equipment, radiography equipment and any other equipment necessary to meet the requirements of the specification.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[63]	15.01.2016

2.8 Low Pressure Piping, Valves and Fittings

This section of specification covers all low pressure piping within the battery limits handling fluids HFO, LDO, etc.

Low Pressure (LP) piping shall, basically, cover piping systems for the following services:

- i) Boiler fill system.
- ii) Fuel oil (LDO / HFO) Systems.
- iii) Chemical feed lines
- iv) Auxiliary cooling water system
- v) Drain piping system for the piping\equipment etc.
- vi) Re-circulation pipes along with valves, break-down orifices etc., wherever required.
- vii) DM, Potable and service water distribution
- viii) Compressed air piping
- ix) Laying of AC/Ventilation ducting within the battery limits.
- x) Any other piping system required to make the Low Pressure (LP) piping systems complete.

All the piping systems be designed to operate without replacement and with normal maintenance for a plant service life of [20-25] years, and shall withstand the operating parameter fluctuations and cycling which can be normally expected during this period.

2.9 Piping Materials and Sizes

All piping system shall be capable of withstanding the maximum pressure and temperature in the corresponding line. The pressure rating of individual piping system component such as valves, flanges etc shall however be not less than that specified. Nominal pipes sizes and pipe outside diameters shall generally be as per ANSI B36.10. In case of deviation Bidder shall bring it to the specific attention of Owner/Consultant for prior approval stating reasons for the deviation.

The Steel pipes (Welded type) for the services of water/clarified water/Filtered water shall conform to the following standards or codes.

- i) Pipes upto 150 NB
 - a) IS:1239 Part-I (Heavy grade-Black)
 - b) ASTM-A-53 Grade B (Welded) Sch 80 up to 2 inch nominal size(Minimum)
Sch 40 above 2 inch nominal size (Minimum).
- ii) Pipes 200 NB and above

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[64]	15.01.2016

- a) IS:3589 – Grade 410
- b) ASTM – A53 Grade B (Welded) Sch. 40 (Minimum)

2.10 Wall Thickness

The calculation of wall thickness required for pipelines subject to internal and/or external pressure shall be based on the formulae and recommendations as given in the applicable codes. Adequate allowances shall be made towards thinning due to bending, weakening at branch connections, threading, commercial tolerances on pipe wall thickness, corrosion and erosion, etc. and the same shall be subject to approval by consultant. In any case a minimum corrosion allowance of 1.0 mm shall be considered while selecting the thickness.

In case of carbon steel materials, the nominal wall thickness of pipeline shall be not less than the minimum acceptable values given below:

NB mm	15	20	25	32	40	50	65	80	100	125
(inch)	(1/2)	(3/4)	(1)	(1 1/4)	(1.5)	(2)	(2.5)	(3)	(4)	(5)
Min. thickness, mm	3.2	3.2	3.6	3.6	3.6	3.6	3.6	4.0	4.5	5.4

NB mm	150	200	250	300	350	400	450	500	600
(inch)	(6)	(8)	(10)	(12)	(14)	(16)	(18)	(20)	(24)
Min. thickness, mm	5.4	6.35	6.35	6.35	7.1	7.1	7.1	8.0	8.0

> NB 600 mm to NB 950 mm - 10.00 mm

> NB 950 mm to NB 1200 mm - 12.00 mm

2.11 Fittings

Fittings to be used with carbon steel pipes shall conform to IS: 1239 Part-II (Heavy grade) or ASTM A 234 Gr. WPB. for sizes upto 150 NB.

For sizes 200 NB & above steel fittings shall conform to ASTM A 234 Gr. WPB. However for sizes above 300 NB fabricated fittings (mitre bends etc) may be used.

Wherever regular pipe bends are employed for change of direction the same shall be to a radius of 5 times the pipe diameter. Mitre bends shall be 1.5D radius.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[65]	15.01.2016

Inside surface of all the fittings used for the rubber lined application shall be de beaded and made suitable for rubber lining.

Galvanized pipe application all the fittings shall be galvanized as per IS: 4736. Fittings to be used in other type of piping shall conform to relevant IS/BS ANSI Standards and in conformity with the parent pipe standard.

Branch connections in piping shall be made by the use of wrought or forged seamless fittings such as tees, laterals and crosses. Small stubs as may be required for instrument, drain and vent connection may be provided in the form of weld outlet fittings or forged couplings. Intersection welds are acceptable only in the event of non-availability of fittings.

2.12.1 Design and Construction

(a) Pipes, valves and Fittings

Following items shall be included for piping:

- i) Pipes, bends, elbows, tees, branches laterals, crosses, reducing unions, couplings, cap, expansion joints, flanges, blank flanges, saddles, shoes, sampling connections etc. necessary for making a reliable piping system.
- ii) Valve, gates, dampers, etc.
- iii) Strainers and filters.
- iv) Instrument tapping connection, stubs and thermo-wells, root valves.
- v) Matching flanges, pipe spools and matching pipes to connect to equipment, instruments, etc. as necessary.
- vi) Gaskets, ring joint, bracing rings, jointing material etc. as required.
- vii) Bolts, nuts, fasteners as required for interconnecting piping, valves and fitting as well as for terminal points.
- viii) Pipe supports like pedestals, Anchor blocks (for buried / over ground piping), brackets, hangers, clamps, trestles, etc.
- ix) Secondary steel for pipe supports and embedded steel. Also pipe supports and necessary embedment required to be embedded in concrete for underground/above ground pipes.
- x) Painting, anti-corrosive coatings, wrapping and coating, thermal insulation, etc. inside and outside of pipes as necessary.

(b) End connections

Unless otherwise specified, following types of end connections shall be used:

Pipes 50 NB and smaller shall have socket welded joints for chlorine line. For water, air and other services where steel pipes are used, joints of this size range shall be Socket welded/screwed/flanged type (For rubber lined pipes).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[66]	15.01.2016

All unlined steel pipes 65 NB and above (other than CI pipes and air service pipes) shall be jointed by butt welding. All rubber lined pipes shall have flanged joints.

Butt welding edge preparation shall be done as per ANSI B 16.25. The Bidder shall furnish details/specifications for all welding electrodes and welding rods including special ones, if any for approval.

Steel pipe flanges shall be generally slipped on flat face type. Weld neck flanges shall be used when flange follows immediately after a butt welding or where it is required with respect to service conditions. Slip-on type of flanges may be only up to a maximum pressure rating of ANSI 300 lbs. In case of higher pressure ratings, weld-neck type of flanges shall be employed. When weld neck or socket weld flanges are used, their bore must be made the same as that of the pipe being welded to. Socket welded or threaded flanges may be used, with the appropriate piping system for connection of pipe to the flanged equipment.

All the piping flanges and counter flanges shall conform to ANSI B 16.5 Cl. 150 (minimum). However wherever the interferences is involved with the Owner's pipe, the flange/interconnection details shall be designed to match the piping and the details of which will be intimated later.

For easy handling & removal of equipments, valves etc. and for maintenance purpose, break up flanges for 65 NB and above sizes and suitable type of compression flexible coupling for flanged joints of 50 NB and below size shall be provided. The over ground piping wherever routed inside building, shall have a clear head room of minimum 2.1 metre from operating floor/walk ways.

2.12 Piping Layout

- (a) Pipes shall be generally routed above ground but where specifically indicated/specified the pipe may be laid in trenches or buried. Buried piping shall be generally installed so that the top of pipe is 1.0 meter below the ground level unless otherwise specifically mentioned. Full length of buried piping shall be provided with 100 mm thick sand bed.
- (b) Complete supporting system for the pipe line shall be designed, fabricated and supplied by the Bidder. Inside the building, the overhead portion of the pipe line may be supported from the building structures. No support shall be taken from the brick wall. Outdoor, pipes other than buried pipes shall run on steel trestles. Crossing of the road shall be on a pipe bridge with a clear height of at least 8.0 meters (minimum) over the road surface. All the steel structure for the pipe bridge and the supporting posts/trestles along with all necessary hangers clamps, connecting steel, fixing bolts, nuts etc. shall be supplied and erected by the Bidder. All pipe rack shall be provided with 750 mm (Minimum) clear width walkways.
- (c) Hangers and supports shall be capable of carrying the sum of all concurrently acting loads. They shall be designed to provide the required supporting effects and allow pipe line movements as necessary. All guides, anchors, braces, dampener, expansion joint and structural steel to be attached to the building/structure, trenches etc. shall be provided.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[67]	15.01.2016

- (d) Mitre bends shall not be accepted for steel pipes of 250 NB and below. For sizes above 250 NB, the mitre bends shall conform to BS: 534.
- (e) For rubber lined pipe of acid service, lining should be applied in two (2) layers, giving a total thickness not less than 3 mm.
- (f) Pipe coming under purview of IBR should meet its requirements and getting the IBR approval shall be under Bidder's scope.
- (g) A commercial grade of 'E' type glass fibre should be used conforming to IS: 11320-1985 IS: 11273-1985 IS: 11551-1986 for Glass Fibre Reinforced Plastic Pipes (GRP pipe). The resin shall be either isophthalic or bisphenol. No glass fibre reinforcement shall penetrate the interior surface of pipe line. Each pipe length shall have sufficient strength to withstand class AA type vehicular loading in addition to the overburden of backfill load. The pipeline shall be designed for 2500 N/M stiffness class (min.).
- (h) Anti corrosive protection shall be provided for all buried piping including galvanised steel piping. In case of buried pipes of size 1000 mm NB and above, the Bidder shall stiffen them and/or increase the thickness of pipe adequately against ovality formation in use.
- (i) Flexibility analysis for piping systems wherever required. Whenever, straight run of the above ground yard pipes are more than 50 metres, flexibility analysis shall be conducted by the Bidder to identify the requirement of loops, type of supports etc.
- (j) The Bidder shall prepare the flow diagrams, detailed dimensional piping layout/ Isometric/ fabrication/ as built drawings of all the systems along with Cross sectional drawings, showing all supports and equipment as required.
- (k) All pipelines with size greater than NB 50 mm are considered as shop fabricated piping and detailed piping layout drawings shall be prepared for all such pipelines. The drawings shall be to scale and shall be prepared as plan & sections and shall carry the following minimum details:
 - i) Fully dimensioned layout with locating dimensions referred to plant axes and coordinates
 - ii) Details of all stub connections and other welded attachments as required for anchors, restraints, hangers supports, etc.
 - iii) Slope, drains and vents
 - iv) Edge preparation details of weld ends
 - v) Mounting and orientation of valves and specialties and maintenance space requirements
 - vi) Location and tag numbers of hangers, supports, restraints, anchors, etc.
 - vii) Location and magnitude of cold cuts, if any
 - viii) Pipe sizes, materials, design parameters, shop and field test requirements
 - ix) Insulation details

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[68]	15.01.2016

- x) Tolerances, if any
- xi) Any specific requirements on shop fabrication and/or field erection
- xii) Any other detail considered necessary by the Owner/Consultant.
- (l) Bidder shall carry-out Transient/surge analysis for long (1 kilometer or more) pipe lines, and/or large diameter (i.e. large volume) pipe lines. Bidder shall also furnish calculation to establish adequacy of size and provision of Air Release Valves in a piping system etc. These calculations are subject to Owner's/Consultant approval.
- (m) The piping shall be arranged to provide clearance for the removal of equipment requiring maintenance and for easy access to valves and other piping accessories required for operation and maintenance. Layout drawings shall indicate valve orientations and availability of access to valves and specialties. Layout of all piping shall ensure that all valves including motor operated valves are located as to be accessible conveniently for operation. Valves for operation and maintenance shall have 1.0 m clear approach space. If any of the valves are not accessible, suitable access platform shall be provided by the Bidder.
- (n) All drains & vents lies in piping system (both water and steam) with design pressure 40 KSC & above shall be provided with two valves.
- (o) The piping routing shall be such that a clear head room of not less than 2.1 m above the walkways/working areas is available.
- (p) Provision shall be made while preparing piping layout to accept control valves, flow measurement element and any other on-line specialty or equipment. Sufficient upstream and downstream lengths shall be provided for flow measuring devices, control valves, desuperheaters and other specialties as required by the respective equipment manufacturer.

2.13 Valves

- (a) All valves shall be suitable for service conditions i.e. flow, temperature and pressure under which they are required. The valves shall be of standard pressure rating as per the relevant code/ standard.
- (b) Either Butterfly type or sluice/gate valves shall be used for isolation purposes in raw water, Clarified & Filtered water application. Butterfly valves shall be of double flanged or lugged wafer type of low leakage rate conforming to AWWA-C-504 class 150 or EN-593 Class 150.
- (c) Manually operated valves shall be provided with reduction gear unit for valves of size 200 NB and above. Valve provided with motorized or pneumatic actuator shall be provided with a hand wheel for manual operation.
- (d) All the valves shall be equipped with adjustable mechanical stop-limiting devices to prevent over travel of the valve disc in the open and closed positions. The valve operators (Hand wheel or Gear reduction unit or Motor actuator etc.) shall be designed as per relevant International Standard.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[69]	15.01.2016

- (e) Ball valves or Globe Valves may also be provided for the application of Raw/ Clarified / Filtered water services for sizes 50 NB and below.
- (f) Butterfly valves or proven patented diaphragm valves shall be used for the services of demineralised water application for isolation purposes.
- (g) Sluice valve/knife edge type slide valves shall be used in the sludge and drain pipe line.
- (h) For Air services, globe valves or Ball valves may be used for sizes 50 NB and below. For sizes higher than 50 NB, either Butterfly valve or Ball valves shall be used.
- (i) Check valves for Raw / Clarified / Filtered water may be offered in Gun metal construction and with threaded ends for sizes 50 NB and below conforming to IS: 778 or Equivalent.
- (j) The safety valves / relief valves at the downstream of positive displacement type metering pumps shall be of the standard type manufactured by the pump manufacturer and the material of construction shall suit to the fluid handled.
- (k) Safety valve
 - i) Number, size, location and setting of safety valves on Superheater, reheater and drum (if applicable) shall conform to the requirement of IBR. Relieving capacity of all the safety valves on the Drum and the superheater taken together (excluding power operated impulse safety valve) shall be at least 105% of the BMCR.
 - ii) The escape pipes of safety valves shall lead to the nearest convenient point above the boiler house roof.
 - iii) Noise level during lifting of the safety valves shall not exceed 115 dBA. Silencers for the lowest set pressure safety valve on Drum, superheater and reheater separately shall be provided by the Bidder.
 - iv) Power operated impulse safety valves with isolating valves and silencer at superheater outlet shall be provided. Associated solenoid valve assembly, pressure sensing devices, controller relays, indicating lamps, impulse piping, accessories, control station, etc. shall also be provided. Relieving capacity of this valve shall be 30% of BMCR.
 - v) Power operated impulse safety valves with capacity equal to minimum 30% of reheater flow at BMCR shall also be provided at reheater outlet. This shall also be provided with all accessories as shall be provided for SH outlet impulse safety valve.
- (l) The butterfly valves for DM water application shall conform to the following requirements:
 - i) Body shall be lined (minimum 3 mm) with natural rubber, ebonite, polypropylene or PVDF.
 - ii) Disc shall be lined with PVDF, polypropylene, or natural rubber.
 - iii) Seat rings shall be of Nitrile rubber or Hypalon

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[70]	15.01.2016

- (m) Valves for Acid & Alkali Services (if applicable) shall be proven patented diaphragm type. Diaphragm shall be of reinforced teflon, EPDM/Black Butile/appd. eqv. For acid services and reinforced Neoprene/Hypalon/app eqv for alkali services.
- (n) For air application, Body material of Ball valves shall be leaded Tin Bronze (IS: 318 Gr.2) or stainless steel (AISI: 304/316). Body & Disc of Butterfly valves shall be either cast iron lined with elastomer such as PVDF or PTFE or stainless steel construction (AISI 304/316).
- (o) For the application of alum, lime, coagulant aid solution, DM water and air, the body, cover & Disc of Non return valves shall be lined with natural Rubber, PTFE or Viton.
- (p) Motor operated valves:

Motor operated valves shall be fitted with both hand and motor operating gear and where a bypass valve is provided this also shall be provided with both hand and motor operating gear and interlocked to ensure that the bypass valve is opened before the main valve. Each valve gate has reached the 'full open' or 'full closed' position (with a minimum increase in the torque). The motor shall be placed in such a position relative to the valve that there is no possibility of leakage of liquid, steam or corrosive gas from valve joints on to the motor or control equipment.

The hand operating and motor operating mechanism shall be so interlocked that the hand operating mechanism is disconnected before the motor is started. Valves shall be provided with seating control and except where specifically approved by the Owner/Consultant for small valves, a slipping clutch or other torque-limiting device shall be incorporated in the motor drive. The operation of opening or closing the valve shall be controlled by means of push buttons labeled respectively 'Open' & 'Stop'. The control shall be so arranged that the motor can be stopped with the valve in any position by means of 'stop' push button and after having been stopped can be restarted either direction by the 'open' or 'close' push buttons.

Necessary positioning indicators for valves closely connected with the operation of main units and need continuous and repeated monitoring shall be provided in plant control room/control pulpits

2.14.1 Design and Construction Features

The following design and construction features of valves shall be complied with.

All gate and globe valves shall be of rising stem, outside screw and yoke type. The design of valves shall ensure a streamlined passage and gate valves shall have low pressure drop. The seats and discs shall be easily renewable and/or shall be suitable for easy refacing and grinding. Valve discs shall be of such design as to keep the seats tight when the valve body is subjected to pressure, temperature variations and piping stresses. Gate valves shall close in both flow directions.

All globe valves shall be capable of being closed against pressure.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[71]	15.01.2016

In the case of all end-welded valves, the stub ends of the valves shall project from the valve body a sufficient amount to ensure that the welding process shall not distort the valve body and internal parts.

Valves for regulating duties shall be of the globe type with tapered plug type disc.

Hardness of seating surfaces shall be a minimum of 350 BHN and a minimum differential hardness of 50 BHN shall be provided between seats to prevent galling. This is not applicable for stellite seats.

Check valves of sizes 400 mm NB and larger shall have dash pot arrangement.

All gate and globe valves shall have back-seating arrangement to facilitate easy replacement of packing with the valve in service.

All valves shall be so designed that the hand-wheel moves in a clockwise direction to close the valve. The face of the hand-wheel shall be clearly marked with the words 'OPEN' and 'CLOSE' and an arrow to indicate the direction for opening. All hand-wheels shall be fitted with name plate. All globe valves shall be provided with position indicator.

Piston lift check valves shall have accurately guided pistons so that the pistons are cushioned in their cylinders as they move up.

All gate, globe, Y-type and angle valves intended for manual operation and falling under the following categories shall be equipped with a gear operator for ease of operation and to ensure fast and tight closure:

ANSI Pressure Rating

Valve Sizes

Class 300 and below

350 mm and larger

Class 600 and above

200 mm and larger

All gate valves falling in the following categories shall be provided with integral bypass valve. Bypass size shall conform to MSS-SP-45 as a minimum standard. The bypass valve shall be hand operated unless otherwise. Pipe for bypass shall be at least schedule 80 seamless and of a material of the same nominal chemical composition and physical properties as that used for the main line. Orientation of bypass arrangement shall be subject to the approval of Owner/Consultant.

ANSI Pressure Rating

Valve Sizes for which Bypass is required

Class 600 and over

200 mm and larger

Class 300 & 150

350 mm and larger

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[72]	15.01.2016

All gate valves of ANSI pressure rating class 150 and 300 shall have solid or flexible wedge and ANSI pressure rating class 600 and above shall have flexible or parallel slide type of wedge.

Valves with flexible wedge shall have provision for relieving the pressure in the neck of the valve when the valve is in the closed position.

All valves of ANSI pressure rating up to class 600 shall have bolted bonnet construction and class 900 and above shall have bonnet construction of the pressure seal type. Pressure seal valves shall have stainless steel inlay in the gasket area and silver-plated gaskets or other acceptable proven features.

All carbon steel valves of ANSI pressure rating up to class 150 and 300 shall have stainless steel trim (13% Cr) and ANSI pressure rating class 600 and above shall have stellited trim.

All alloy steel valves shall have stellited seats.

All valves of ANSI pressure rating up to class 900 and higher shall have yoke with anti-friction bearing arrangement.

Valves that are to be kept in full 'OPEN'/'CLOSE' position shall be provided with a non-detachable locking arrangement. The locking arrangement provided shall be subject to approval by the Owner/Consultant.

Valves operating under vacuum conditions shall have glands with water sealing. The inlet and outlet connections shall be NB 15mm. The Bidder shall indicate the maximum and minimum sealing water pressure and the required flow rate.

Motor actuators for motor operated valves shall meet requirements mentioned in the specification.

2.14 Cleaning

Prior to factory inspection, all manufacturing waste, such as metal chips and filings, welding rods and stubs, rags, debris and all other foreign matter shall be removed from the interior of each valve. All mill scale, rust, oil, grease, chalk, crayon, paint marks and other deleterious material shall be removed from the interior and exterior surfaces. At the time of shipment, valves shall be clean inside and outside.

2.15 Inspection and Tests

Inspection and tests for piping systems which are under the purview of IBR shall be tested at manufacturers work and site as per the requirement of IBR as a minimum.

Defects in excess of acceptance standards shall be removed by suitable means. If removal of surface defects does not result in reduction in wall thickness below 5% of intended thickness of metal at that location, the area shall be blended smoothly into the surrounding surface. Where defect removal results in a wall thickness less than the above resultant cavity may be repaired by welding. The procedure and operator shall be qualified as per applicable standards. Major weld repairs shall be stress relieved or heat treated in accordance with ASME Section VIII Division I-UCS 56.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[73]	15.01.2016

The required area shall be re-examined and the acceptance standards shall be as in the original examination.

Weld repairs made as a result of radiographic examination shall be radiographed after welding. Repairing a particular area more than 2 times is not permitted and the component shall be rejected. The acceptance standards for welds shall be as per ASME Boiler and Pressure Vessel Code, Section VIII, Division I, UW - 51.

Prior approval shall be obtained from the Owner/Consultant before taking up major weld repairs (major weld repair - when depth of repair exceeds 20% of thickness or 1 inch whichever is smaller). Mapping of major weld repairs is also required.

All valves shall be tested hydrostatically for strength, tightness of seats and tightness of back seating at the pressures, in accordance with MSS-SP 61, "Hydrostatic Testing of Steel Valves". Water used for hydrostatic testing of valves with stainless steel components shall not have chloride content exceeding 20 ppm. Clean potable water may be used for testing of all other valves.

All valves except check valves shall be tested for seat tightness by air at a pressure of 6 bar (g) on both sides of seat.

All check valves shall also be hydro tested at 125% of the seat hydro test pressure.

All valves shall be checked for correctness in respect of specified end details as per applicable standards.

2.16 Painting and Corrosion Protection

Two coats of primer of thickness 35 microns for each coat shall be applied to all steel and cast iron exposed surfaces as required to prevent corrosion, after release has been given for painting and before dispatch. The use of grease or oil, other than light grade mineral oil, for corrosion protection is prohibited. Bores of all valves shall be covered immediately after testing, draining and drying with suitable plastic end covers to avoid ingress of foreign materials. Also refer section-XI for painting.

2.17 Material Specification for Piping and Fittings

2.18.1 Materials for Boiler Components

The material used for Boiler components like piping, valves & fittings etc. and other components shall be equal to or better than the following unless specified otherwise:

The temperature range indicated below is design metal temperature.

- i) Up to & including 400 deg C Carbon steel to ASME SA-106Gr. B/C, SA 210 C or SA 210 Gr A1 or approved equivalent.
- ii) Up to & including 550 deg C: Alloy steel to ASME SA-335: P-11/P-12/P-22/; ASME SA213: T-11/T-22 or approved equivalent.
- iii) Up to & including 600 deg C: Alloy steel ASME SA-335/213: P 91 /T-91, or approved equivalent.

Note:

1. Testing of body, seat and back seat shall be as per ANSI B16.34
2. For water system with sizes greater than NB200 butterfly valves shall be used and shall conform to AWWA C-504.
3. Butterfly valves for main cooling water lines shall be hydraulically operated with oil pack.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[76]	15.01.2016

2.18 Gates (if applicable)

Design standard for gates shall be IS: 3042 or equivalent. The gates shall be rectangular or square sluice, rising spindle type conforming to class-1 of IS: 3042. The Material of Construction shall be as follows:

- i) Frame and Door : Cast Iron IS:210 Gr. 260
- ii) Spindles, bolts & nuts : ASTM A 182 Gr. F6A
- iii) Face & seat rings : Gun metal (as per IS: 3042).

All the parts of gates shall be applied with the coats of heavy duty bitumastic paint.

2.19 Strainers

(a) Basket Type Strainers

Basket strainers of simplex design shall have the following materials of construction for raw/clarified/filtered water application.

- i) Body : Fabricated mild steel : IS:2062 (Tested quality)
- ii) Strainers : Wire shall be stainless steel (AISI: 316 30 mesh suitably reinforced. Reinforcement material shall also be of stainless steel construction)
- iii) Drain Plug/Nuts : Gun metal

Screen (strainer) flow area shall be at least four times pipe sectional area. Flow area in any portion of Basket strainer assembly shall not be less than the pipe cross sectional area. Pressure drop in clean condition shall not be more than 1.0 MWC.

Basket Strainer shall be provided with lifting lugs and suitable mounting arrangement. Suitable Vent and drain valves shall be provided for the strainers.

For DM water service, body shall be rubber lined to minimum 4.5 mm thickness (soft rubber of shore Hardness 65 ± 5 Deg A).

(b) Y-Type Strainers

Y-Type strainer for water application shall be constructed of following materials

- i) Body : Cast Iron IS: 210 Gr. FG 260
- ii) Strainers: Wires of stainless steel AISI-316, 30 mesh suitably reinforced. Reinforcement material shall also be of stainless steel construction.
- iii) Drain Plugs: Gun metal (threaded construction)

Body of the Y-type strainers of alkali, and demineralised water shall be of Cast Iron (IS: 210, Gr.FG 260) and lined with soft or hard rubber to a thickness of 4.5 mm.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[77]	15.01.2016

For acid services, apart from the rubber lined body material, the screen material shall be Polypropylene or HDPE wire cloth of suitable mesh and thickness.

2.20 Steam Traps

- (a) The steam traps shall be inverted bucket or thermodynamic type complete with integral or separate strainers.
- (b) The internal components of traps shall be of AISI- 316 stainless steel construction. Material of construction of the body shall be selected by the Bidder based on the service conditions stipulated.
- (c) All Y-type strainers, wherever provided with steam traps or otherwise, shall have AISI-316 stainless steel screen of not more than 20 mesh size. Screen open area shall be at least three (4) times the pipe internal cross-sectional area. The strainer shall have a screwed blow-off connection with a removable plug. Material of construction of the body shall be selected by the Bidder based on the duty conditions specified.
- (d) All traps and strainers shall have socket weld ends as per ANSI B16.11 for size NB 50 mm and smaller and butt weld ends as per B 16.25 for size NB 65 mm and above.

Steam drain traps shall be provided with strainers, inlet and discharge valves and by-passes and test cocks as schematically indicated in the enclosed drawing. Materials and other details of these valves shall meet the specified requirement.

General

Note: The specification furnished above shall be considered as broad requirement. The Bidder shall consider compatible material and specification for all piping components as well as specialties for the corresponding service applications.

2.21 Instrument Connections

Unless otherwise called for by Owner, all thermo well stubs shall have an internal threading to M33 x 2.

All stubs for pressure or flow measurement for pipelines with a maximum working pressure equal to or above 42 bar(g) or with a maximum working temperature equal to or above 350 deg C shall be NPS 25 mm and double root valves shall be used.

Stubs for pressure or flow measurement on pipelines with a maximum working pressure less than 42 bar(g) and a maximum working temperature less than 350°C shall be of NPS 15 mm size and single root valves can be used.

Measurement stubs on fuel oil lines shall be of NPS 25 mm size and provided with two root valves.

2.22 Welding and Heat Treatment

All heat treatment, welding, post and pre weld temperatures shall be as per the code ASME B31.1.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[78]	15.01.2016

2.23 Painting and Corrosion Protection

All uninsulated piping systems, hangers and supports shall have two coats of red oxide Zinc Chromate primer (conforming to IS 2074) with minimum dry film thickness (DFT) of 25 microns per coat and two coats of finish paints using enamel paint to give a minimum total DFT of 100 microns (after two coats of primer and two coats of finish paint). Shades shall be as per IS 5 or as indicated by Owner. Service of the pipe/line designations shall be painted on all pipes at visible locations.

Before application of paint, Bidder shall clean the pipes of all mill scale, dirt dust, soot, grease, rust etc.

All pipe lines, piping components shall be adequately protected against corrosion during manufacture, fabrication, shipment and storage by appropriate protective paint.

2.24 Underground Protection

Where pipelines are buried, underground protection shall be provided for the piping system as indicated any one of the methods given below:

- (a) Coal tar primer, coal tar enamel, inner wrap of fiber glass, final outer wrap of enamel impregnated fiber glass. Total thickness of coating shall not be less than 4.0 mm.
- (b) With anti-corrosive tape of 4 mm thick conforming to IS-10221 and AWWA C 203-93.

Pipe surfaces shall be cleaned by shot or sand blasting before application. Slag blasting may also be considered.

Tests to be carried out after application

- (c) Bond/Adhesion test
- (d) Holiday test

2.25 Non destructive examination

- (a) Mandatory as per ASME B31.1 & Regulation 360(d) of IBR.
- (b) Special requirements
 - i) 100% UT/RT & MPI and 3% hardness testing on butt welds of P22, P12, and P11 materials.
 - ii) 100% UT/RT & MPI and 100% hardness testing on butt welds of P91, and X20 materials.
 - iii) 100% MPI on butt welds of carbon steel materials.
 - iv) 100% UT/RT for fittings of 200NB & above for X20 & P91, material.
 - v) 100% UT/RT for fittings of all other piping of size OD 508mm & above.

2.26 Hydrostatic Test Pressure

- (a) Piping system under IBR purview:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[79]	15.01.2016

- i) At Shop All piping including fabricated piping shall be hydro tested at 1.5 times the design pressure subject to regulation 374 of IBR. However, non-destructive testing in lieu of hydro test is also acceptable subject to regulation 343 (3) of IBR
- ii) After Erection all piping systems shall be hydro tested at 1.5 times the design pressure subject to regulation of 374 IBR. However, for such systems where it is practically not possible to do hydro tests, the tests as called for in ANSI B31.1& IBR in lieu of hydro test shall also be acceptable.
- (b) Non-IBR Piping Systems:-
 - i) At Shop All piping including fabricated piping shall be hydro tested at 1.5 times the design pressure.
 - ii) After Erection All piping systems shall be hydro tested at 1.5 times the design pressure subject.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[80]	15.01.2016

3 THERMAL INSULATION

3.1 Genaral

All equipment / pipes / ducts whose surface temperature is higher than 60 deg C, shall be provided thermal insulation along with aluminum cladding for personnel protection and heat conservation. The insulation material shall be chemically inert, non-combustible and shall be harmless. Outer surface of the insulation shall be covered with aluminium cladding.

3.2 Design Criteria

Thermal insulation to be provided for:

- i) Piping & equipment having rated operating temperature exceeding 60 deg C.
- ii) For insulation thickness calculation ambient temperature shall be [45 deg C] or as per ASTM C 650 or equivalent.
- iii) Wind velocity = 0.25 m/sec for outside the plant building and 0.5 m/sec for inside the plant building.
- iv) Thermal conductivity = Not less than values given in IS-8183
- v) Emissivity = 0.2

3.3 General Requirements

3.3.1 Insulation Material

- a) Material and application of insulation material, protective cladding, wire mesh etc. shall be conforming to latest edition of following Codes:
 - i) IS:8183 - Bonded mineral wool
 - ii) IS:3677 - Unbonded Rockwool/Mineral Wool
 - iii) IS:3144 - Methods of test for mineral wool thermal insulation materials
 - iv) IS: 14164 – Thermal insulation of cold services
 - v) IS:280 - Mild Steel Wire for General Engineering Purposes
 - vi) ASTM-B 209 - Standard Specification for Aluminum and Aluminum-Alloy Sheet and Plate
 - vii) IS 4412 – Copper wires for general engineering purposes
 - viii) IS 7413 – Code of practice for thermal industrial application and finishing of thermal insulating materials
 - ix) IS 9843 – Code Of Practice For Use Of Adhesives For Packaging
 - x) IS 737 – Wrought aluminium and aluminium alloy sheet and strip for general engineering purposes

Other equipment or better international codes/ standard shall also be acceptable.
- b) Insulation material for all equipments, piping, ducting, etc. shall conform to following requirements:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[81]	15.01.2016

- i) Material Lightly resin bonded mineral wool of best grade conforming to IS: 8183. (Hand made mattresses are not acceptable). Material shall be rock wool only. Slag wool or slag wool inclusion shall not be accepted. Lightly resin bonded glass wool mattress, having density 64 kg/m³ (min.), self stitched in shop can also be accepted for temperature less than 400 deg C.
- ii) Bulk density of lightly resin bonded mineral wool mattresses shall be 100 kg/m³ for use up to 400 deg C and 150 kg/m³ for use above 400 deg C.
- c) The Insulation mattress shall be rated incombustible when tested by the method prescribed in clause 15 of IS:3144 and shall meet the requirement of the Mercantile Marine department, Lloyd's Register of shipping, underwriter, fire hazards codes and other International standards.
- d) Insulation material (and protective covering) shall:
 - i) Be fresh, incombustible, rust proof, non hygroscopic,
 - ii) Be capable of withstanding continuously and without deterioration the maximum temperature to which they shall be subjected.
 - iii) Not react chemically, either to itself or with other components.
 - iv) Not sustain any fungi or vermin and must not pose health hazards.
- e) The use of insulation of finishing materials containing asbestos in any form is not permitted.
- f) Insulation mattress/section shall be supplied in thickness of 25, 40, 50 and 75 mm. Insulation of higher thickness shall be made up in multiple layers using mattress/slabs of thickness specified above. However, if the required thickness is such that by using above mattress/slabs the calculated thickness is not achieved, the mattress/slabs in increment of 5 mm shall be acceptable for outer layers. The min. thickness however, shall not be less than 25 mm and number of layers shall be minimum and innermost layer shall be thickest.

3.3.2 Sheathing Material

Sheathing material for all insulated surfaces, equipments, piping etc. confirming to ASTM B-209-1060 temper H-14 or IS: 737 Gr. 19000/H2 shall be provided as per following:

- a) For dia of insulated surfaces of 450 mm & above - 16 SWG and for flat surfaces
 - b) For dia of insulated surfaces less than 450 mm - 20 SWG
- For Boiler outer casing ribbed Aluminium - 16 SWG

3.3.3 Binding and Lacing Wires

Binding and lacing wires shall be provided in line with following:

- a) Up to 400 deg C - Galvanised Steel of 20 SWG dia.
- b) Above 400 deg C - Stainless Steel of 20 SWG dia.

3.3.4 Straps and Bands

Straps and bands shall conform to materials as under:

- a) Up to 400 deg C - Galvanised Steel

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[82]	15.01.2016

- b) Above 400 deg C - Stainless Steel
Bands shall be 20 mm wide and 0.6 mm thick
For securing Aluminium sheathing material, stainless steel or anodised aluminium bands shall be used.
Screws shall be of galvanised steel, check headed, self tapping type. Above 400 deg C temperature, screws shall be stainless steel.
Non metallic components like 3 mm thick mill board, aluminium pigment sealant, white glass cloth, insulating cement, neoprene washer shall be provided.

3.3.5 Application of Insulation

- a) All surfaces to be insulated shall be cleaned of all foreign materials such as dirt, grease, rust etc. and shall be dry before the application of insulation.
- b) Before applying the insulation the Bidder shall check that all instrument tapping, clamps, lugs and other connections on the surface to be insulated have been properly installed as per the relevant erection drawing.
- c) All flanged joints shall be insulated only after the final tightening and testing.
- d) The insulation shall be applied to all surfaces when they are at ambient temp. Ample provision shall be made for the maximum possible thermal movement and the insulation shall be applied so as to avoid breaking/telescoping due to alternate periods of expansion and contraction.
- e) All cracks voids and depressions shall be filled with finishing cement, suitable for the equipment operating temperature so as to form a smooth base for the application of cladding.
- f) All vertical pipes shall be provided with the suitable insulation supports to prevent collapsing/crushing of insulation due to its self weight. Support rings shall be provided on all vertical piping with a difference in elevation of 4 m or above, and there shall not be more than 3 m straight length between support rings.
- g) joints of insulation mattress sections of horizontal piping shall be on the bottom or at the sides of the pipe.
- h) When more than one layer of insulation mattress/section is required on piping the circumferential joints on adjacent layers shall be staggered by at least 150 mm and longitudinal joints shall be staggered by at least 50 mm.
- i) The mattress type insulation shall be formed to fit the pipe and applied with the mattress edges drawn together at the longitudinal joints and secured by lacing wire. Pipe section insulation shall be fitted on pipe using binding wires.
- j) Where insulation is applied in two or more layers each layer of mattress shall be backed with hexagonal wire mesh. For the first layer of insulation and in case of single layer insulation, hexagonal wire mesh shall be provided on both the surface of the mattress. For pipe sections, the sections shall be held in place by binding wires without any wire mesh.
- k) The ends of all wire loops shall be firmly twisted together with pliers, bent over and carefully pressed into the surface of the insulation. Any gap in the insulation shall be filled with loose mineral wool or finishing cement.
- l) Insulation mattress/section ends shall be terminated at a sufficient distance from the flanges to facilitate removal of bolts.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[83]	15.01.2016

- m) The insulation shall be held in place by fastening over with binding wire for insulation surface with diameter up to and including 550 mm and with metal bends for insulation surfaces with diameter over 550 mm. The fastening shall be done at intervals of 250 mm except where specified otherwise. The ends of the binding wires shall be hooked and embedded in the insulation. The straps shall be mechanically stretched and fastened with metallic clamping seals of the same materials as the strap.
- n) Insulation for application on bends and elbows shall be cut into mitred segments, sufficiently short to form a reasonably smooth internal surface. After the application of insulation material place, insulating cement shall be applied as required to obtain a smooth surface.
- o) Weather hoods shall be provided for insulated piping passing through floors/walls.
- p) All pipe attachments coming on horizontal pipes, inclined pipes and bends shall be insulated along with pipe such that there shall be no insulation applied to hanger rod and the component connecting hanger rod to pipe attachment. All pipe attachments exposed to weather shall be provided with weather proof covering.
- q) Upstream of all drain lines and the lines connected to steam traps, shall be insulated up to and including first isolating valve for heat conservation. Rest of such lines such as downstream of the drain valves, traps etc. and other lines such as safety valve discharges, vents, etc. shall be insulated for personnel protection.
- r) All valves fittings and specialties shall be insulated with the same type and thickness of insulation as specified for the connected piping with the special provisions and or exceptions as given below.
- s) All valves fittings and specialties shall be insulated with the same type and thickness of insulation as specified for the connected piping with the special provisions and or exceptions as given below.
- t) All valves and flanges shall be provided with removable box type of insulation covered with box fabricated from aluminium sheets of thickness same as the connected pipe cladding. Adjoining pipe insulation shall be bevelled back to permit removal bolts and nuts or bands. The portion of the valve which can not be covered by box type insulation shall be filled by loose insulating material of packing density at least equal to that of the insulating material of adjoining pipe. The insulation for valves/flanges shall be applied after the finishing has been applied over the connected piping. The cladding shall be applied in such a manner that the bonnet flange can be exposed easily without disturbing the complete insulation and cladding.
- u) Union shall not be insulated. Expansion joints, metallic or rubber, shall not be insulated unless otherwise specifically indicated.
- v) Safety valves shall be insulated.
- w) Sampling of steam, feed water lines at high temperatures shall be insulated.

3.4 Testing of Insulation

- a) All tests, as per the applicable material standards and as specified shall be carried out in accordance with the methods prescribed. Owner/Consultant shall have the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[84]	15.01.2016

right to witness any or all of the tests conducted by the Bidder at the shop or laboratory.

- b) The Bidder shall guarantee that if on actual measurement the specified maximum insulation surface temperatures are exceeded, if the Bidder shall either replace the insulation with a superior material or provide additional insulation thickness at no extra cost.

3.5 Refractories

The refractory material shall comply with relevant Indian Standards. The refractory selected shall ensure perfect sealing, and shall have good thermal cycling properties allowing quick startup/shut down of Boilers.

3.5.1 Materials

The refractory material shall

- a) Have high bulk density and minimum moisture content,
- b) Be capable of withstanding service temperature of 1700 degree Celsius.
- c) Be resistant to slagging products due to coal, and to impurities of oil like V_2O_5 , Fe_2O_3 , K_2O_2 , Na_2O etc. and to erosion due to fly ash.
- d) Be chemically inactive towards alkalis, iron, silica etc. shall pose no health hazard to working personnel, and shall not have any explosive properties.
- e) Have sufficient strength to withstand forces generated in boiler, without any rupture or damage.

3.5.2 Application

Application of refractory shall be such that:

- a) To ensure perfect sealing, easy maintenance, minimum time for application.
- b) To ensure minimum number of joints. All the joints to be filled and tightly packed with loose powder of same material.
- c) Selection of Refractory shall consider the applied stress, stress distribution and expansion allowance.
- d) Refractory shall have good thermal cycling properties to ensure quick start up and shut down of Boilers.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[85]	15.01.2016

4 QUALITY ASSURANCE

4.1 Introduction

All materials, components and equipment covered under the scope of supply shall be procured, manufactured, erected and tested at all stages as per the comprehensive Quality Assurance (QA) programme. The QA document indicating the specific inspection and testing requirements to be followed shall be subject to the approval of the Owner/Consultant. The Bidder shall submit his quality assurance programme for review by Owner/Consultant and shall generally cover the following:

- a) Organizational structure for management and implementation of the proposed quality assurance programme.
- b) Quality system manual.
- c) Documentation control system.
- d) Qualification and experience data of Bidder's key personnel.
- e) The procedure for procurement of materials, parts, components and equipment.
- f) Procedure for inspection at source, inspection of incoming raw-materials/ parts/ components & verification of materials purchased.
- g) System for shop manufacturing including process controls, fabrication and assembly controls, and procedure for product identification & traceability.
- h) System for inspection and testing during manufacture, processing, fabrication, welding, assembly and other activities.
- i) The reference documents, plant standards, acceptance norms, test and inspection procedure etc.
- j) Control of calibration and testing of measuring and testing equipments.
- k) System for quality audits, documentation to indicate conformance or nonconformance of the product to the specification and testing and inspection requirements; review and control of non- conforming items and system for corrective actions.
- l) System for indication and appraisal of inspection status.
- m) System for authorizing release of manufactured product to the Owner.
- n) System for packaging, handling, transportation, storage and delivery.
- o) System for generation and maintenance of inspection and test records.

4.2 Boiler and Auxiliaries

Testing and inspection requirements of major equipment over and above the respective codes / standards requirement are given hereunder:

4.2.1 Pressure Parts

Only those materials shall be used in the manufacture of pressure parts which can be identified against mill sheet or manufacturer test certificates. Material shall meet all the mandatory requirements (and supplementary checks, if asked

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[86]	15.01.2016

for) of specified specification, Indian Boiler Regulations (IBR), and relevant code/standard. All non destructive testing as detailed against relevant equipment shall meet the requirement of ASTM section 3 Vol. 3.03 or equivalent BIS standard.

A. Drum

- i) Each plate shall be subjected to a 100 % normal and shear ultrasonic at the mill to meet the minimum requirements of BS: 5996 grade LC3/ ASTM or equivalent standards. Elevated temperature tensile tests shall also be carried out on plate material for each heat.
- ii) After cutting to size and removal of cut outs, the plates shall be subjected to magnetic particle examination (MPE) along the edges of the plate and on areas adjacent to the cutouts.
- iii) All forged connections shall be examined by 100% ultrasonic testing (UT) before machining.
- iv) Fully machined connecting pieces of internal diameter 100mm and above, except for forgings, shall be subjected to MPE.
- v) Mechanical tests shall be carried out on specimens prepared from the production control test plates of the longitudinal welds.
- vi) Mechanical tests shall be conducted on the specimens from manhole cutouts of dished ends.
- vii) All butt welds shall be subjected to 100% radiographic test (RT) before stress relieving.
- viii) On completion of welding, the entire drum shall be subjected to stress relieving in the furnace.
- ix) All butt welds shall be subjected to 100% ultrasonic test and magnetic particle examination after stress relieving.
- x) All full penetration welds shall be subjected to ultrasonic examination after stress relief.
- xi) After stress relieving, all welds shall be examined by magnetic particle examination (MPE) methods depending on size and accessibility.
- xii) Complete drum shall be subjected to hydraulic pressure test and all compensating pads shall be pneumatically tested.

B. Headers

- i) Raw material for headers shall be subjected to UT prior to fabrication.
- ii) All butt welds shall be subjected to MPE and radiographic examination before stress relieving.
- iii) All full penetration nozzle and attachment welds shall be subjected to UT prior to stress relieving.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[87]	15.01.2016

- iv) All nozzles, branches, stubs and load bearing attachment shall be examined by MPE techniques after the toes of the weld have been ground smooth and stress relieved.
- v) Non-load bearing welds shall be examined by MPE techniques after the toes of the welds have been ground smooth and stress relieved.
- vi) Completed closed end headers shall be subjected to hydraulic pressure tests and all compensating pads shall be pneumatically tested.

C. Tubes and tube elements

- i) Raw material for tubes for water wall, superheater, reheater, economiser, riser, supply and connecting tubes including nozzle/stubs, connections for drum, headers, pipe work etc., shall be subjected to 100% UT prior to fabrication as per IBR or ASME E 213 or equivalent with the longitudinal calibration notch of depth 5% of wall thickness (0.3mm minimum and 1.5mm maximum).
- ii) All bent tubes, stubs shall be checked for ovality and thinning by ultrasonic method on first off lot and random checks on subsequent pieces.
- iii) All tubes, stubs, panels, coils shall be checked for clearance by steel ball test and for cleanliness by sponge passage.
- iv) Finished butt welds shall be subjected to RT and UT. Wherever the code/standard/process specifies random sampling, the same shall be minimum 20%. All fillet welds shall be subjected to MPE or dye penetration test (DPT).
- v) Tubes and fabricated panels, coils shall be subjected to hydraulic pressure test excluding water wall panels and loose tubes but including burner panels, reheaters, superheaters and economizers.

D. Integral piping and fittings

- i) All pipe lengths shall be subjected to 100 % ultrasonic examination as per ASME E213 or equivalent, with longitudinal calibration notch of depth 5% of wall thickness (0.3mm minimum and 1.5mm maximum) or hydraulic tests and UT or RT on longitudinal welds at the tube mill.
- ii) All mother pipes shall be subjected to 100% UT prior to fabrication as per ASME E 213 or equivalent with longitudinal calibration notch of depth 5% of wall thickness (0.3mm minimum and 1.5mm maximum).
- iii) All forged fittings shall be checked by UT and formed fittings shall be checked by MPE.
- iv) All pressure parts shall be 100 % UT tested. All welded, cast alloy steel and carbon steel fittings for use above 71 bar design conditions shall be 100 % RT tested. However, wherever the code/standard/process specifies random sampling, the same shall be minimum 20%.
- v) 10% of each lot of bent pipes shall be checked for quality and thinning by UT on first off lot and on random samples for subsequent pieces. Outer surface of bends shall be subjected to MPE or DPT.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[88]	15.01.2016

- vi) The edge preparation for shop and site welds in stainless steel and alloy steel shall be subjected to dye penetration check. Non-destructive examination of welds shall be carried out after post weld heat treatment, if any.
- vii) All butt welds shall be subjected to UT or RT and MPE. For weld on alloy steel piping, UT or RT shall be done after stress relieving. Wherever the code/ standard/ process specifies random sampling, the same shall be minimum 20 %.
- viii) All butt welds in alloy steel piping of P91, X20 and X 22 shall be checked for RT or UT and MPE after stress relieving (SR). UT shall be of digital recordable type.
- ix) All weld joints in alloy steel piping of P 91, X20 and X22 shall be checked for hardness. For preheating and post weld heat treatment (PWHT) induction heating shall be deployed. However, PWHT can be done in furnace also. 3% hardness check shall be carried out on welds of other alloy steel piping.
- x) All load-bearing attachment welds shall be subjected to MPE after stress relieving.
- xi) For HP piping, non-destructive examination of welds shall be carried out in accordance with the relevant design/manufacturing codes. However, apart from above, the following requirements shall be met. Further statutory requirement, wherever applicable shall also be complied with the following:
 - a. Temperature > 400 deg C and/ or pressure exceeding 71 bar
 - 100% RT or UT on butt welds and full penetration branch welds.
 - 100% MPE.
 - b. Temperature > 175 deg C up to 400 deg C and/or pressure exceeding 17 bar and up to 71 bar
 - 100% RT or UT on butt welds and full penetration branch welds for pipe diameter more than 100NB.
 - 10% RT or UT on butt welds and full penetration branch welds for pipe diameter up to 100NB.
 - 100% MPE.
 - c. All other pipes not covered above shall be subjected to 100% MPE or DPT in case of underground pipes and 10% MPE or DPT in case of piping above the ground. Further, 10% of butt welds of underground piping shall be subjected to RT.

E. Valves

- i) Pressure retaining parts of valves shall be subjected to NDT as per Table 4.1.
- ii) Hardened and stellited valve disc and seat shall be subjected to DPT and hardness check.
- iii) Color matching of valve disc/plug and seat shall be carried out to ensure minimum 80% contact and no through passage.
- iv) Hydraulic pressure test and seat leak test shall be carried out as per ANSI 16.34 or IBR.
- v) Air seat leak test shall be carried out as per applicable standards or codes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[89]	15.01.2016

- vi) Functional tests shall be carried out on each valve to check the following as per the approved valve data sheet
- vii) Smooth operation.
- viii) Valve travel, closing and opening time.
- ix) Current drawn by actuators.
- x) Springs for safety valves shall be tested with suitable NDT and for spring stiffness rate.
- xi) Safety relief valves shall be tested for performance.

Table 4.1

NDT requirements for pressure retaining components of valves

S.No.	Valve size NB (mm)	ANSI Class upto 300	ANSI Class above 300 upto 600	ANSI Class above 600 below 900	ANSI Class 900 and above but below 4500
1	Less than 50	Visual	Visual	Visual	MPE (for special class valves)
2	50 & above but below 100	Visual	Visual	MPE (for special class valves)	MPE and RT on 10% of valves on 100% area
3	100 & above but less than 300	Visual	MPE	MPE and RT on 10% of valves on change of section and weld ends	MPE and RT on 100% area
4	300 and above	MPE	MPE	MPE and RT on change of sections and weld ends	MPE and RT on 100% area

Note:

- a. For body and bonnet forgings, UT with MPE may be adopted in place of RT.
- b. For austenitic steel, MPE may be replaced by DPT.

F. Non pressure bearing attachments

Load bearing welds shall be subjected to UT and MPE after stress relieving. Non load bearing welds shall be subjected to MPE after stress relief. The toes of the welds adjoining the drum shall be ground smooth prior to stress relieving before carrying out this examination.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[90]	15.01.2016

G. Hydraulic test

- i) The drum and all components which are to be subjected to fluid pressure shall be tested to minimum of 150% of the design pressure. The duration of the pressure tests shall be sufficient, as approved by the Owner/Consultant, to show any leakage paths and to permit a thorough examination of the component whilst under pressure.
- ii) The temperature of the fluid used for the pressure test shall be such as to avoid any possibility of brittle fracture at a low temperature and the same shall be modified and submitted to the Owner/Consultant for approval, before commencing the test.
- iii) The fluid used shall be of a sufficient purity and where relevant, suitable inhibitors shall be used to avoid excessive corrosion and /or damage to temporary parts either during the test or prior to drying and cleaning.

H. Pneumatic test of compensating pads

All compensating pads shall be provided with two-threaded weep holes to test welds at 0.5 kg/cm² (g) with soap solution and no leakage shall be ensured.

4.2.2 Air Preheaters, Steam Coil Air Pre-Heater and Fuel Oil Heaters

A. Air Preheaters

- i) Forged shafts for air preheater like stub shaft, main rotor forging, housing hub shall be subjected to 100% UT at mill and magnetic particle examination after machining.
- ii) For non-modular design, trial assembly shall be carried out at shop prior to dispatch to site.
- iii) Critical welds of rotor post shall be subjected to radiographic examination.

B. Steam coil air pre-heater and fuel oil heaters

Hydraulic pressure test shall be carried out on the heating coils. All pipes, valves, steam traps and mountings shall be subjected to hydraulic test as called for under IBR, BS or other approved codes.

4.2.3 Soot Blowers

- i) Butt weld between nozzle and lance tube shall be subjected to 100 % radiography tests.
- ii) Soot blower shall be subjected to operational checks as below:
 - a) Smooth operation
 - b) Long tube travel, closing and opening time.
 - c) Current drawn.

4.2.4 ID and FD fans

- i) Rotor components shall be subjected to ultrasonic test at mill and magnetic particle examination/dye penetration examination after rough machining.
- ii) Butt welds in rotor components shall be subjected to 100% UT and all welds shall be subjected to MPE or DPT after stress relieving.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[91]	15.01.2016

- iii) All rotating components of fans shall be dynamically balanced to quality grade 2.5 of ISO 1940.
- iv) Test for natural frequency of all fan components, including fan blades shall be carried out for the fans.
- v) Full range performance test shall be carried out on one fan of each type and size as per BS 848, Part-1.
- vi) ID fan shall be checked for string test i.e., operational check of one fan assembly to check temperature rise, smooth operation, vibration and noise level. Dry run test shall preferably be carried out during string test.

4.2.5 Coal Mills, Pulverised Coal Piping and Burners

- i) Raw material for shaft, coupling, gears and pinions, top and bottom races and other rotating components shall be subjected to UT. MPE or DPT shall be carried out to check surface soundness.
- ii) Wear-resistant parts shall be subjected to UT or RT to check soundness after suitable heat treatment. Check for chemical composition and hardness shall be carried out. For ceramic materials check for various properties including hardness, density, wear rate and composition shall be carried out.
- iii) Butt welds in the body casing and separator of the mill shall be tested by RT and MPE. All other welds shall be tested by MPE or DPT for acceptance.
- iv) All gearboxes shall be run tested for adequate duration to check rise in oil temperature, noise level and vibration. Check for leak tightness of gear case also shall be performed.
- v) Fabricated pipe welds shall be examined by MPE.
- vi) Ceramic/basalt lined piping and bends etc. shall be checked for proper layout.
- vii) Weldments on burner components shall be checked with suitable NDT. The burner assemblies shall be tested for operation at shop.
- viii) All rotating components shall be dynamically balanced.

4.2.6 Coal Feeders

- i) Type tests including degree of protection and routine tests shall be done as per relevant Indian Standards or equivalent International Standards.
- ii) All major items like plates for casings, head pulley, tail pulley, pulley shaft and major castings shall be procured with respective material test certificates.
- iii) Explosion proof test at 50 psi as per NFPA code shall be done as type test. Leak tightness test shall be done on apron feeder casing. Endurance test for load cell shall be carried out.
- iv) Test for weighing accuracy, calibration and repeatability shall be carried out at various speeds by coal flow on one feeder.
- v) Calibration check shall be carried out on all feeder cabinet and assemblies prior to dispatch.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[92]	15.01.2016

4.2.7 Boiler structure, ducts, hoppers, dampers etc.

- i) Only those materials which have been identified against mill sheet or test certificates shall be used for construction. Structural steel and built up plate girders for main boiler shall be as per approved Indian / international standards. All plates of tension and compression flanges and connection material and plates above 40mm thickness shall be 100% ultrasonically tested.
- ii) Visual inspection of all welds shall be performed in accordance with AWS D.1.1. Also the butt and fillet welds for built up plate girders shall be inspected 100% by magnetic particle examination.
- iii) RT or UT shall be performed on all butt welds of thickness 32mm and above. For thickness below 32mm and upto 25mm, 100% MPE shall be carried out and for thickness below 25mm 10% MPE or DPT shall be performed. Edge preparations for field welding shall be examined by MPE for plate thickness 32mm and above. Field welds ends in ceiling girder shall be subjected to Ultrasonic examination for 100mm depth from the edges.
- iv) Ceiling girders, columns, ducts hoppers and tunnels shall be trial assembled and match marked prior to dispatch/erection. At least two consecutive girders along with cross member shall be assembled at a time.
- v) Drum sling rods
 - a) Sling rods forging shall be subjected to ultrasonic examination.
 - b) Welds shall be examined by UT and MPE after stress relief.
 - c) Trial fitment of the rods with the drum shell shall be carried out to ensure proper contact.
 - d) Screw thread of the rods shall be suitably protected to avoid damage during handling and transport.
- vi) Dampers
 - a) All the dampers shall be subjected to operational test/checks.
 - b) Gas tight dampers shall be subjected to shop leakage test to demonstrate the guaranteed tightness (minimum one damper of each type and size offered). In case such type test is already done, the reports of the same shall be submitted for review.
 - a) All dampers shall be checked for sealing dimensions to establish guaranteed tightness.

4.2.8 Electro- Static Precipitators (ESPs)

A. Discharge and collecting electrodes

- i) Work tests for discharge electrodes shall include the following (for the wire type electrodes):
 - a) Chemical and tensile tests.
 - b) Metallographic examination-longitudinal and transverse (250X)
 - c) Surface finish and surface purity from chloride ions.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[93]	15.01.2016

- d) Spring back and surface finish after coiling (applicable to helical discharge electrodes
- ii) Work tests for collecting electrodes and rigid discharges electrode shall include the following:
 - a) Chemical and mechanical properties.
 - b) Check for profile and straightness.
 - c) Check for surface finish and dimensional accuracy.
 - d) Cupping test for deep drawn sheets.

B. ESP structure

- i) Visual inspection of all welds shall be performed in accordance with AWS D1.1.
- ii) Also the butt and fillet welds for built up plates and columns shall be inspected by 100% MPI.
- iii) Radiographic examination shall be performed on butt welds as per AWS D1.1. 100% radiography on tension flange (bottom flange) welds and spot radiography on all joints in compression flange (top flange) of all beams and columns shall be carried out. The minimum length of welds for spot radiography and acceptance criterion shall be as per AWS D 1.1.
- iv) Edge preparation for field welding shall be examined by MPI.

ANNEXURES-E1

1.0 MOTOR

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Electric Motor complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes & Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[2]	25.09.2014

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All motors shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The motors shall be suitable for operation in a highly polluted environment.
- b. AC Motors shall be of [constant speed, squirrel cage, three/ single phase, induction type.] Motors shall be rated for [continuous duty/intermittent duty]. They shall also be suitable for long period of inactivity. They shall also be suitable for direct online starting (DOL starting).
- c. DC motors provided for emergency service shall be shunt / compound wound type. Motor shall be sized for operation with fixed resistance starter for maximum reliability.
- d. Power supply for AC motors shall be as follows:

Table: 2.0

1.	[Below 0.22 kW]	:	240V, 1 Phase, 50Hz
2.	[From 0.22 kW up to & including 160 kW]	:	415V, 3 Phase, 50Hz
3.	[Above 160 kW]	:	6.6kV, 3 Phase, 50Hz

- e. All AC motors shall be suited for the following range of frequency and voltage variations:

- i. Voltage Variation : +/-10%
- ii. Frequency Variation : 50Hz (+)3% to (-)5%
- iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency

- f. DC motors shall be rated for 220V DC supply with voltage variation of -15% to +10%.
- g. The motor characteristics shall match the requirements of the driven equipment so that adequate starting, accelerating, pull up, break down and full load torques are available for the intended service.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[3]	25.09.2014

- h. Moreover, motors shall be so designed that maximum inrush currents and locked rotor and pullout torque developed by them at extreme voltage and frequency variations do not endanger the motor and driven equipment.
- i. Motors shall be capable of developing the rated full load torque even if the supply drops to 70% of the rated voltage.
- j. For 6.6kV motors, locked rotor current not to exceed [600%] of full load current, including positive tolerance, except for BFP. For BFP the starting current shall be [450%] of FLC. For 415 V motors Locked rotor current not to exceed [600%] of full load current with IS tolerance.]
- k. For DC motors, the starters shall be provided to limit the starting current to [2] times of the full load current.
- l. Maximum continuous motor ratings shall be at least [10%] above the maximum load demand of the driven equipment under entire operating range including voltage and frequency variations.
- m. Accelerating torque at any speed with the lowest permissible starting voltage shall be at least [10%] motor full load torque. Pull out torque at rated voltage shall not be less than 205% of full load torque. It shall be 275% for crane duty motors.
- n. The motors shall be suitable for bus transfer schemes provided on the 6.6kV and 415V systems without any injurious effect on its life. If motors are connected to an automatic bus transfer system, they may be subjected to 150% of the nominal voltage during changeover of buses due to the phase difference between the incoming voltage and motor residual voltage. In such cases, motors shall be capable of restarting under full load after momentary loss of voltage.
- o. Motors shall be of [energy efficient of type Eff-2] as per IS: 12615/equivalent IEC/ International Standards.
- p. Motor shall be designed to keep torsional and rotational natural frequencies of vibration of the motor and driven equipment at least 25% above the motor operating speed range.

b)	Paint Thickness	:	[Within 100 to 150 micron.]
c)	Paint Shade	:	[RAL5012 BLUE]

1.4 Specific Requirements

1.4.1 Locked Rotor Withstand Time

- The starting time of the motor shall be at the minimum permissible voltage.
- For motors with starting time up to 20 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[6]	25.09.2014

condition at highest voltage limit shall be at least 2.5 second more than starting time.

- c) For motors with starting time more than 20 second and up to 45 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot condition at highest voltage limit shall be at least 5 second more than starting time.
- d) For motors with starting time more than 45 seconds at minimum permissible voltage during starting, the locked rotor withstand time under hot condition at highest voltage limit shall be more than starting time by at least 10% of the starting time.
- e) Speed switches mounted on the motor shaft shall be provided in cases where above requirements are not met.

1.4.2 Starting Voltage Requirement

I.	All motors (except mill motors):
a)	[85% of rated voltage for motors up to 4000 kW]
b)	[75% of voltage for motors above 4000 kW]

II.	For mill motors:
a)	[85% of rated voltage for motors above 1000 kW]
b)	[90% of rated voltage for motors below 1000 kW]

The motor shall be capable of withstanding the stresses imposed if started at 110% rated voltage.

Pump motor subject to reverse rotation shall be designed to withstand the stresses encountered when starting with non-energized shaft rotating at [125%] rated speed in reverse direction.

The motor may be subjected to sudden application of 150% rated voltage during bus transfer, due to the phase difference between the incoming voltage and motor residual voltage.

1.4.3 Winding and Insulation

a)	6.6 kV AC motors	:	Winding material shall be of copper. Insulation shall be of [Class F with winding temperature rise limited to Class B]. They shall withstand 1.2/50 microsecond switching surges of "4U + 5 KV" (U= Line voltage in KV). The coil inter-turn insulation shall be suitable for 0.3/3 micro second surge of 32 / 12 KV followed by 1 min
----	------------------	---	--

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[7]	25.09.2014

			power frequency high voltage test of appropriate voltage on inter turn insulation.
b)	415V AC & 220V DC motors	:	Winding material shall be of copper. Insulation shall be of [Class B with temperature rise limited to Class B.]
c)	Conveyor motors		Short circuit rings of conveyor motors shall be either joint less or welded type. Brazed joint is not acceptable.

1.4.4 Motor Control

a) For HV Motors

- i. Motors of rating above [160 kW] shall be suitable for 6.6 KV voltage
- ii. Frequent starting motors of rating above [160 kW] shall be suitable to be controlled by vacuum contactors

(b) For LV Motors

- i. Motors of rating less than [132 kW] shall be operated by Contactor from respective MCCs. Motors of rating up to [18.5 kW] shall be provided with MPCBs and Electronic overload relays. Motors of rating above [18.5 kW] and below [45 kW] shall be provided with MCCBs and Electronic overload relays. Motors of rating [45 kW] and above but less than [132 kW] shall be provided with MCCBs and CT operated Electronic over load relays.
- ii. Motors of rating [132 kW] and up to [160 kW] shall be suitable to be controlled by Air circuit breakers from switchgear, PMCCs and shall be provided with comprehensive numerical motor protection relays.
- iii. Only for firefighting system, motor rated [upto 200kW] shall be fed from 415V switch board.

1.4.5 Starting duty

Motors shall be suitable for [3 nos. consecutive Cold starts ups and 2 nos. consecutive Hot starts ups.] Motors shall be suitable for three equally spread starts per hour when the motor is under normal service condition.

1.4.6 Bearings

- a) Anti-friction type radial and thrust bearings (ball, roller) and sleeve bearing shall be rated for minimum standard life of 40,000 hours taking bearing and driven equipment loads (in case the drive is not having

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[8]	25.09.2014

separate thrust bearing) into account. If bearings are lubricated, loss of grease shall be scarce and it shall not creep along shaft into motor housing. Facility of removal of excess grease shall also be provided for grease lubricated bearings.

- b) Vertical shaft motors shall be provided with thrust and guide bearings. Thrust bearing of tilting pad type is preferred. However, if Anti-friction bearings can take vertical thrust, thrust & guide bearings are not required.
- c) Bearing shall be effectively sealed against dust ingress and shall be pressure grease gun lubricated. The bearing and housing shall be so designed that greasing shall be possible while the motor is running, without removal of covers.
- d) Where bearing supports are attached to the motor casing, adequate bracing shall be provided on these supports to reduce vibrations and ensure life of bearings.
- e) If the bearings are oil lubricated, a drain plug shall be provided for draining residual oil and oil level gauge shall be provided to show precisely oil level required under standstill and running conditions.
- f) Unless otherwise approved, bearing lubricating system shall be such that no external forced oil or water is necessary to maintain required oil supply to keep bearing temperature within design limits.
- g) Lubricants shall be selected for prolonged storage and normal use of motors in tropical climate and shall contain corrosion and oxidation inhibitors. Greases shall have suitable bleeding characteristics to minimize setting. The selected lubricants shall be indigenously available.
- h) Motors rated above 1000 kW shall have insulated bearings to prevent flow of shaft currents.

1.4.7 Temperature Rise

- a) For Air Cooled Motors, temperature rise of insulation should be limited to [70 °C] over ambient temperature by resistance method.
- b) For Water Cooled Motors, temperature rise of insulation should be limited to [80 °C] over inlet cooling water temperature mentioned elsewhere, by resistance method.

1.4.8 Cooling

[All motors shall be either Totally Enclosed Fan Cooled (TEFC) or Totally Enclosed Tube Ventilated (TETV) or Closed Air Circuit Air Cooled (CACA) type. However, motors rated 3000 kW or above can be Closed Air Circuit Water Cooled (CACW)]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[9]	25.09.2014

1.4.9 Enclosure

- a) All motor enclosures shall conform to the degree of protection of [IP54] for indoor and IPW-55 for outdoor installation unless otherwise specified. Motor for outdoor or semi outdoor service shall be of weather proof construction. Motors of large output rating located indoor could have screen protected drip proof (SPDP) enclosure conforming to [IP-23.]
- b) For motors located in outdoor & corrosive locations, FRP canopy shall be provided. In case steel canopy is provided, the same shall be epoxy painted to meet the surrounding atmosphere. Motors located in hazardous areas such as Hydrogen plant shall have flame proof enclosures of Group – IIB conforming to IS: 2148.
- c) For hazardous locations such as fuel oil facilities area, the enclosure of motor shall have flame proof construction conforming to IS 2148.

1.4.10 Noise Level and Vibration

Noise level shall be limited to 85 dB (A) at 1.5 meters from the motor. However the same shall be as per IS: 12065 unless otherwise specified. The peak amplitude of vibration shall be within the specified limits laid down in IS: 12075. Motors shall withstand vibrations produced by driven equipment. HV motor bearing housings shall have flats in both X and Y directions suitable for mounting 80mmX80mm vibration pads. Vibration pads with screwed holes for mounting vibration probes shall be provided at both DE and NDE.

1.4.11 Temperature Monitoring

[In HV motors, at least four numbers simplex/ two numbers duplex platinum resistance type temperature detectors shall be provided for each phase of stator winding]. Each bearing shall be provided with dial type thermometer with adjustable alarm contact and two numbers duplex Platinum resistance type temperature detector (3 wire, 100 ohm at zero °C). In case of CACA and CACW motors dial type temperature indicator shall be provided (one each for hot and cold air temperature monitoring for CACA and CACW and one each for inlet and outlet water temperature monitoring for CACW). If alarm and trip are required for cooling air temperature, temperature switch shall be provided. The contact rating shall be minimum 0.5A at 220V DC and 5A at 240V AC. Flow switches shall be provided for monitoring cooling water flow of CACW motor and oil flow of forced lubrication bearing. Low voltage motors rated 100 kW and above shall be provided with two PT100 RTDs per phase of winding.

1.4.12 Earthing

Motor body shall have two earthing points on opposite sides. Motor terminal boxes shall also have separate grounding terminals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[10]	25.09.2014

1.4.13 Termination

- a) HV motors can be offered with either Elastimold termination or dust tight phase segregated double walled (metallic as well as with insulated barrier) cable boxes. In case Elastimold terminations are offered, then protective cover and trifurcating sleeves shall also be provided. Removable gland plates of thickness 3 mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material for single core cables) shall be provided in case of cable boxes. The main cable box / terminal box shall withstand *[a fault current up to 40 kA for 0.25 seconds for HV motors and 50 kA for 0.25 seconds for LV motors]*. Separate terminal boxes shall be provided for space heaters and RTDs and NCT (if applicable).
- b) *[All terminal boxes shall be capable of being turned through 360 degrees in steps of 90 degrees unless otherwise specified.]*
- c) For HV motors the distance between gland plate and the terminal studs shall not be less than 500 mm.

1.4.14 Differential Protection

For motors rated 6.6kV, *[2000 KW & above,]* neutral current transformers of PS class shall be provided on each phase in a separate neutral terminal box for differential protection.

1.4.15 Tropical Protection

- (a) All motors shall have fungus protection involving special treatment of insulation and metal against fungus, insects and corrosion.
- (b) All fittings and hardware shall be corrosion resistant.
- (c) Space Heater
- (d) Suitable single phase space heaters operated at 240V, 50Hz, 1Phase AC supply shall be provided on motors rated for 30KW and above to maintain windings in dry condition when motor is standstill. Separate terminal box for space heaters & RTDs shall be provided.
- (e) The space heater shall be sized to maintain the motor internal temperature above dew point when the motor is in idle condition.

1.4.16 Rating Plate

Motor shall have Stainless steel nameplate(s) showing diagram of connections, all particulars as per IS: 325 / NEMA-MG-1 and following additional information:

- (a) Type of bearing and recommended lubricants along with location of insulated bearing.
- (b) Temperature rise under normal/abnormal conditions.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[11]	25.09.2014

(c) In addition to above, an arrow block shall be screwed on to the body of motor on the non-driving end to indicate normal direction of rotation of motor.

(d) Year of Manufacture

1.4.17 Drain Plug

Motor shall have drain plugs so located that they shall drain the water, resulting from the condensation or other causes from all pockets of the motor casing.

1.4.18 Dowel Pins

Motor shall be designed to permit easy access for drilling holes through motor feet or mounting flange for installation of dowel pins after assembling the motor and driven equipment.

1.4.19 Painting

The complete motor assembly including fan shall be painted with corrosion proof paints of approved class.

1.4.20 Lifting provision

Motor weighing 25 Kg or more shall be provided with eyebolt or other adequate provision of lifting.

1.4.21 Local Push Button Station (LPBS)

- a) Each motor shall be provided with push button station as per process requirement i.e. Start/Stop or Emergency Stop.
- b) The degree of protection of LPBs shall be IPW 55 for outdoor and IP 54 for indoor applications.
- c) All Push Buttons shall be push to actuate type and stop Push Button shall be lockable in off position as per the scheme requirement.
- d) The Emergency local stop push button of Stay put type shall be provided with Press to lock & turn to release keyless mechanism.
- e) All PBs shall be provided with 2 numbers NO and 2 numbers NC contacts for various interlocking purposes. One contact of stop PB shall be directly wired to switchgear module for direct tripping and another contact to control system.
- f) Terminals to be suitable for 2 cores of 2.5 Sq.mm. cable with 20% spare terminals.
- g) All LPBS shall be of Poly Carbonate /FRP / Die Cast Aluminium material.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[12]	25.09.2014

I) TestsType Test

For each type & rating of HV and LV motors of rating above [50 kW], the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last[five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The following shall constitute the type tests:

- (a) Visual and dimensional check
- (b) Winding resistance measurement
- (c) No load test
- (d) Mechanical vibration
- (e) Direction of rotation versus phase sequence
- (f) Insulation resistance measurement
- (g) High potential test
- (h) Locked rotor test
- (i) Speed/torque test
- (j) Over speed test
- (k) Temperature rise test
- (l) Determination of characteristic
- (m) Degree of protection test for the enclosure.
- (n) Noise level
- (o) Shaft current and bearing insulation test (Applicable for HV motors)

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E1	[13]	25.09.2014

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.5 Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

Dimensional General Arrangement drawing

- a) [Motor sizing calculation
- b) Foundation Plan & Loading
- c) Cable end box details
- d) Space requirement for rotor removal
- e) Thermal withstand curves hot & cold
- f) Starting and speed torque characteristics at 80% & 100% voltage
- g) Complete motor data
- h) Erection & Maintenance Manual
- i) Test reports
- j) QAP]

1.6 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

S. No.	Technical Particulars	Unit	Parameters	Remarks
1	Motor application		[As per requirement]

ANNEXURES-E2

1.0 MOTORIZED ACTUATORS

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Motor Operated Actuator complete with all accessories for efficient and trouble-free operation of valves, dampers and gates for R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes & Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS : 325	Specification for three phase induction motor.
IS : 900	Code of Practice for installation and maintenance of induction motors
IS : 996	Single phase AC motors
IS : 1271	Thermal evaluation and classification of electrical insulation.

CEA	CEA Regulations
CEA	Standard Technical Specifications For Main Plant Package
IEC: 60034-1	Rotating electrical machines.
NEMA, MG-1	Motors and Generators

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- All motor operated actuators shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%.
- Depending on the required type of services, the rating of motor operated actuators shall be selected. For isolating service, the actuator shall be [rated for three successive open-close operations of the valve/ damper or 15 minutes continuous operation whichever is higher.] Whereas for regulating service, the actuator shall be suitably [time rated for required number of duty cycle or 150 start per hour whichever is higher].
- The actuator shall be accompanied with constant speed, squirrel cage, three/ single phase, induction motor. The motor shall be designed for high

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E2	[2]	25.09.2014

torque and reversing service. They shall also be suitable for direct online starting (DOL starting).

- d. Motors of actuators shall be suited for the following range of frequency and voltage variations:

- i. Voltage Variation : +/-10%
- ii. Frequency Variation : 50Hz (+)3% to (-)5%
- iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency

- e. The motor operated actuator shall be sized for performing open / close operation at rated speed against designed differential pressure at [90%] of rated voltage. The motor shall have [10%] design margin on the shaft design power.

The actuator shall meet the following performance requirements:

- i. Open & Close the valve completely and make leak tight valve closure without jamming.
- ii. Attain full speed of operation before valve load is encountered and impart an unseating blow to start the valve in motion (hammer blow effect).
- iii. The motor reduction gearing shall be sufficient to lock the shaft when the motor gets de energized and prevent drift from torque switch spring pressure.
- iv. The entire mechanism shall withstand shock resulting from closing with improper setting of limit switches or from lodging of foreign matter under the valve seat.
- v. The actuator shall be designed for mounting in any position without any lubricant leakage or operating difficulty.

1.4 Specific Requirements

1.4.1 Construction

- a) The actuator shall essentially comprise of drive motor, limit switches, gear train, clutch, hand wheel, position indicator/ transmitter, space heater and internal wiring.
- b) The actuator enclosure shall be totally enclosed, dust tight, weather proof with [IPW 55] degree of protection.
- c) All electrical equipment, accessories and wiring shall be provided with tropical finish to prevent fungus growth.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E2	[3]	25.09.2014

- d) Gear train shall be made of metal (fiber gears are not acceptable). Self locking feature shall be provided to prevent drift under torque switch (wherever applicable) spring pressure when motor is de energized.
- e) Manual wheel shall disengage automatically during motor operation.

1.4.2 Type

- a) The actuators shall have integral starters along with overload relays with built-in single phase preventer.
- b) A 415 V, 3 phase, 3 wire, 50 Hz power supply will be provided from power plant 415 V switchgear through MCCB. Control voltage of the starter circuit shall be 110 V AC or depending on manufacturer's practice. But the same shall be derived from incoming 415 V, 3 phase, 3 wire supply.

1.4.3 Motors

- a) Type: The drive motor shall be three phase, squirrel cage induction motor suitable for direct on line starting with starting current limited to six times the rated current
- b) Enclosure: The motor shall be totally enclosed, self ventilated with [IPW 65] degree of protection.
- c) Insulation: The motor winding shall be insulated with [Class – B] insulation having temperature rise limited to [Class – B].
- d) Bearing: The motor bearing shall be [double shielded, grease lubricated and antifriction type].
- e) Earthing: At least two earthing terminals shall be provided for the motor body. Separate earthing terminal should be provided for terminal box.
- f) Protection: The following electrical protections should be provided for the motor:
 - i. Single Phasing Protection
 - ii. Overload Protection
 - iii. Overheating Protection through thermostat
 - iv. Wrong Phase Sequence Protection
- g) Limit Switches: Each actuator shall be accompanied with following switches:
 - i. Four nos. positional limit switches (2 for open & 2 for close), each adjustable at any position from fully open to fully closed positions of the valve / damper.
 - ii. Two torque limit switches, one for each direction of travel, self blocking & adjustable torque type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E2	[4]	25.09.2014

- iii. Four nos. end travel limit switches, two for each direction of travel.
 - iv. A single shaft shall actuate all contacts of limit switches at each position.
- h) Interface: Open/close command termination logic with position and torque limit switches, positioned circuit shall be suitably built in the PCB inside the actuator.
- i. For binary drive, open/close command and status thereof and disturbance monitoring signal (common contact for overload, thermostat, control supply failure, L/R selector switch at local, other protections operated) shall be provided. Interface with the control system shall be through hardwired signal only. Interposing relays provided (with coil burden 2.5 VA) in the DCS shall be energized to initiate opening and closing, by 24V DC signal from the external control system. Potential free contact provided by the IPR shall be utilized in the control circuit of the contactor of motorized actuators.
 - ii. For modulating drive, the command to actuator shall be in form of 4- 20mA signal. The necessary positioning circuit and motor protection shall be provided.
 - iii. Open/close command termination logic shall be suitably built inside actuator.
- i) Hand Wheel: Each actuator shall be provided with a hand wheel for emergency manual operation. The hand wheel shall disengage automatically when the motor is energized.
- j) Position Indicator / Transmitter: The actuator shall have
- i. One built in local position indicator for 0 – 100% travel.
 - ii. One position transmitter of modulating / inching type for remote indication suitable to stabilize 4-20mA signal and operated with [24V DC].
- k) Space Heater: Space heater of suitable rating shall be provided. The power supply shall be derived from main power supply available in the actuator.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E2	[5]	25.09.2014

- l) Wiring: All electrical devices shall be wired up to and terminated in a terminal box. The internal wiring shall be done with [2.5 sqmm] copper wires. All wiring shall be well identified at both ends with ferrules.
- m) Terminal Box:
- i. The terminal box shall be weather proof with removable front cover and cable glands suitable for cable connection. The terminals shall be suitable for connection of [2.5 sq.mm copper] conductor.
 - ii. Necessary double compression cable glands with nickel coating and tinned copper lugs for cables shall be provided.
 - iii. The terminal block shall be suitable for 650V grade power cable.
- .
- n) Rating Plate : Motor and actuator shall have Stainless steel nameplate(s) showing all particulars as per relevant IS/ IEC and following additional information:
- i. Type of bearing and recommended lubricants.
 - ii. Temperature rise under normal/abnormal conditions.
 - iii. Degree of Protection
 - iv. In addition to above, an arrow block shall be screwed on to the body of motor on the non-driving end to indicate normal direction of rotation of motor.
 - v. Year of Manufacture

1.5 Tests

The actuator and all components thereof shall be subject to routine factory tests as per relevant IS standards. In addition, if any special test is called for in equipment specification, the same shall be performed.

1.5.1 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum [7] days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc.]

1.5.2 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished with requisite no. of copies for approval of the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E2	[6]	25.09.2014

- b) The equipment shall be dispatched from works only after receipt of owner's written approval of shop test reports.

1.6 Drawings Data and Manuals

The drawings, data & manuals for the motorized actuators shall be submitted as indicated below:

1. [Actuator Data Sheet
2. General arrangement drawing
3. Internal wiring Diagram and Control Schematic.
4. Torque switch and Limit switch contacts development.
5. QAP for Test Reports
6. Manufacturer's Catalogue.
7. Instruction manuals on Installation methods.]

1.7 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

S. NO.	DESCRIPTION	UNIT	DATA
1.	Type		Integral
2.	Application		[As per project specific]
3.	Motor type		Squirrel Cage
4.	Supply voltage	V	415 V, 3 ph, 3 wire.
5.	Phase, frequency	Hz	3ph, 50 Hz
6.	Motor rated voltage	V	415V/230 V
7.	Control Voltage	V	[110 V AC]
8.	Voltage and its variation	V	± 10%
9.	Frequency and its variation	Hz	+ 3 to -5%
10.	Combined V & f variation	%	10%

TECHNICAL SPECIFICATION FOR LV TRANSFORMERS

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E3

1.0 LV TRANSFORMER (DRY TYPE/OIL TYPE)

1.1 General

This specification is intended to cover [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of LV Transformers (Dry type/Oil type) complete with all accessories for efficient and trouble free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

CODE	NAME OF STANDARD
IS:334	Dimensions for porcelain Transformer bushing
IS:335	New insulating oil for transformers and switchgears
IS:1271	Classification of insulating materials for Electrical Machinery and apparatus in relation to their stability in service.
IS 2026	Specification for power Transformer (all parts)
IS:2071	Method of high voltage testing
IS:2099	High voltage porcelain bushings
IS:2147	Degree of protection.
IS:2705	Current transformers

CODE	NAME OF STANDARD
NEMA ST 20	Dry Type Transformers for General Applications
CEA	CEA Regulations
CEA	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) The transformers shall be dry type (AN) for indoor location and shall be oil type (ONAN) for outdoor location.
- b) The oil type transformer shall be installed in hot, humid and tropical atmosphere with ambient temperature equal to 50°C. All equipment, accessories and wiring shall be provided with tropical finish to prevent fungus growth.
- c) The transformer shall be capable of continuous operation at specified rating under the following condition:
 - i) Voltage variation - $\pm 10\%$
 - ii) Frequency variation - $[+3\%, -5\%]$
 - iii) Combined voltage and frequency variation (absolute sum) - $[10\%]$
- d) The transformer shall be capable of withstanding the short circuit stresses due to a terminal fault on one winding with full voltage maintained on the other winding for minimum period of two (2) seconds.
- e) The noise level shall be limited to the value specified by NEMA Standard Publication No. TR-1-1993 when measured in accordance with conditions outlines in ANSI/IEEE C57.12.90-1999/IS13964/CBIP publication.
- f) The design shall be such as not to cause any undesirable interference with radio or communication circuits.
- g) Transformers shall accept without injurious heating, combined voltage and frequency variation which produce an over fluxing condition of 120% for one (1) minute.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[3]	25.09.2014

- h) Each transformer shall be sized based on actual load with 10% margin and considering voltage regulation factor. It shall be sized by considering 100% load connected on the bus considering other transformer outage. An appropriate load factor of 0.9 for continuous and 0.2 for intermittent shall be considered.
- i) The impedance of the transformers shall be chosen such that the fault level on the LV switchgear does not exceed 50kA including the motor contributions and also voltage dip while starting the motor does not exceed 15% at motor terminal.

1.4 Specific Requirements of Transformers

1.4.1 Enclosure (for dry type)

- a) The encapsulated cast resin transformer shall be housed in naturally ventilated floor mounted cold rolled sheet steel cubicle with louvers backed by fine brass wire mesh. The enclosure shall be of bolted type fabrication and degree of protection shall be at least IP32. The minimum sheet steel thickness shall be 2 mm.
- b) Enclosure shall be provided with lifting lugs and grounding terminals at both ends. Further the enclosure door shall have pad locking provision.
- c) The enclosure door shall be interlocked with service transformer incoming breaker such that.
 - The door can be opened only when the service transformer HV side circuit breaker is in Test/Isolated position.
 - [6.6] kV side circuit breaker can be closed only when the doors are closed.
- d) Necessary illumination with controls shall be provided in the enclosure.
- e) Thermostatically controlled space heater inside the enclosure of suitable rating shall be provided if necessary.

1.4.2 Tank (for oil type)

- a) For LV transformers, the tank shall be of conventional type.
- b) Tank shall be made from good commercial grade low carbon steel and shall be of welded construction.
- c) Tank shall be designed to permit lifting, by crane or jacks of the complete transformer assembly filled with oil. Suitable lugs and bosses shall be provided for this purpose.
- d) Tank together with radiators, coolers, conservator, bushings vessel and other fittings, shall be designed to withstand full vacuum without permanent distortion.
- e) The transformer top shall be provided with a detachable tank cover with a bolted flanged gasket joint. Lifting lugs shall be provided for removing the cover. The surface of the cover shall be suitably sloped so that it does not retain rain water.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[4]	25.09.2014

- f) The material used for gaskets shall be cork-neoprene or approved equivalent. Gasketed joints for tank and manhole covers, bushings and other bolted attachments shall be so designed that the gasket will not be exposed to the weather. Spare gaskets shall be provided for all openings as shipping gaskets will not be reused.
- g) Tank shall be provided with all necessary valves.
- h) Tank shall be provided with a pressure release device which shall operate at a pressure below the test pressure for the tank and radiators. This device shall be of sufficient size for rapid release of any pressure that may be generated in the tank and which may result in damage to the equipment. The device shall be rain proof after blowing and shall be provided with a device visible from ground to indicate operation. An equaliser pipe connecting the pressure relief device to the conservator shall be supplied. This device shall be provided for all transformers. Pressure relief device shall be equipped with remote monitoring/alarm contacts

1.4.3 Core

- a) The transformers shall be three phase core type. The core shall be built up with high grade, non-ageing, low loss, high permeability grain oriented cold rolled silicon steel laminations especially suitable for core material. Laminations shall be annealed in a non-oxidizing atmosphere to relieve stresses and restore the original magnetic properties of CRGO sheets after the cutting and punching operations.
- b) CRGO sheets shall be coated with insulation varnish. Insulation shall be able to withstand the curing temperature and shall reduce eddy current to minimum. The core shall be protected from corrosion with a rust-resistant coating.
- c) The core clamping brackets shall be designed to provide an even distribution of clamping forces to the core, yokes and legs and shall be rigidly braced to reduce sound levels and losses.

1.4.4 Winding

- a) The coils shall be manufactured from electrolytic copper conductor with sufficient number of radial supports and fully insulated for rated voltage.
- b) The insulating material shall conform to Class F. Coils shall be so insulated that impulse and power frequency voltage stresses are minimum and shall withstand even the severest of temperature fluctuations.
- c) Coil assembly shall be suitably supported between adjacent sections by insulating spacers and barriers. The windings shall be arranged to ensure a free circulation of the air and to reduce the hot spots in the winding.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[5]	25.09.2014

- d) All leads from the windings to the terminal board and bushings shall be rigidly supported to prevent injury from vibration or short circuit stresses. Guide tube shall be used where practicable.
- e) The core and coil assembly shall be securely fixed in position so that no shifting or deformation occurs during movement of transformer, under short circuit stresses, switching or other transients.
- f) All coils rated 1200V or higher shall be subjected to partial discharge tests to ensure a properly cured and void free casting.

1.4.5 Encapsulation (for dry type)

- a) HV and LV coils shall be separately cast under vacuum in fibre glass reinforced epoxy resin compound. The insulation shall be fire resistant, non-inflammable, non-hygroscopic and resistant to temperature fluctuations.
- b) The epoxy shall contain filler material providing characteristics superior to unfilled epoxy including higher temperature rating, better heat conductivity, better arc resistance and adhesion to the conductor, plus a coefficient of expansion closer to that of the conductor material. The epoxy resin shall be self extinguishing.
- c) Encapsulated winding shall be free of internal voids, surface irregularities, etc. No surface finishing of encapsulated winding shall be undertaken after the process of encapsulation.

1.4.6 Insulating Oil (for oil type)

- a) The transformer shall be filled with mineral insulating oil suitably inhibited to prevent sludging.
- b) The quality of oil to be supplied for the transformer shall conform to the parameter specified in IS: 335 with latest amendments. No inhibitors shall be used in oil. Prior to filling oil shall be tested as per IS: 335 for tan delta, specific resistivity, breakdown voltage, moisture content etc.
- c) Transformer shall be dispatched oil filled. 10% excess oil for topping up shall be supplied in non-returnable container suitable for outdoor storage.
- d) Oil preservation shall be by means of conservator tank complete with silica gel breather and oil seal.
- e) Oil preservation shall be by means of bellows/ diaphragm sealed conservator tank with silica gel breather to avoid direct connection between atmosphere and transformer oil. It shall be complete with level gauges, pipes , drain valve etc. The level gauges shall be so placed that same can be readable standing from ground.
- f) Necessary device shall be kept to provide annunciation in the event of rupturing of bellow.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[6]	25.09.2014

1.4.7 Tappings (OCTC)

- a) Off-circuit taps as specified shall be provided on the high voltage winding.
- b) The transformer shall be capable of operation at its rated KVA on any tap provided the voltage does not vary by more than $\pm 10\%$ of the rated voltage corresponding to the tap.
- c) The winding including the tapping arrangement shall be designed to maintain electromagnetic balance between HV and LV windings at all voltage ratios.
- d) A warning plate indicating that switch shall be operated only when the transformer is de-energized shall be provided.
- e) Off circuit tap changer switch where provided shall be 3 phase, hand operated, by an external handle with position markings and pad locking facility and mechanical stops to prevent over cranking beyond extreme positions.
- f) Arrangement shall be such that switch can be operated at standing height from ground level.
- g) The operating handle can be padlocked at any tap position. The design shall be such that the lock cannot be inserted unless the contacts are correctly engaged. The mechanism shall be provided with a mechanical tap position indicator with pad locking facility.

1.4.8 Fittings and Accessories:

The following fittings and accessories shall be provided :

- a) Earthing pads: Two earthing pads of copper or other non-corrodible material shall be welded at the bottom corners of the transformer tank and supplied with clamp type terminals suitable for the purchaser's earthing conductors. Suitable earthing terminals on cable boxes shall also be provided.
- b) Terminal marking and rating plates shall be as per the specified standard.
- c) In case of oil type, the conservator shall be of sufficient volume to maintain the oil seal from the minimum ambient temperature of -5°C up to an oil temperature of 100°C , with oil level varying within the minimum and maximum visible levels with necessary accessories.
- d) In case of oil filled type, Valves shall be supplied on the transformer tank and radiators.
- e) Pressure relief device: Pressure relief device shall be provided for transformers rated 2 MVA and above which shall be of sufficient size for rapid release of any pressure that may be generated within the tank and which may result in damage of the equipment
- f) Gas and Oil Actuated Relay (Magnetic Reed Type Gas & Oil Relay):

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[7]	25.09.2014

A double float type magnetic reed type gas and oil relay as per applicable standard shall be provided for all oil filled transformers. All gas evolved in the transformer shall collect in this relay. The relay shall be provided with a test cock suitable for a flexible pipe connection for checking its operation. The device shall be provided with two electrically independent ungrounded contacts, one for alarm on gas accumulation and the other for tripping on sudden rise of pressure. These contacts shall be wired up to the transformer marshalling box. The relay shall be provided with shut off valves on the conservator side as well as the tank side.

g) Temperature Indicators

i Oil temperature indicator (OTI)

All oil type transformers shall be provided with a 150 mm dial type thermometer for top oil temperature indication. The thermometer shall have adjustable, electrically independent ungrounded alarm and trip contacts, maximum reading pointer and resetting device. The contacts shall be rated minimum 0.5A making and 0.2A breaking at 220V DC.

ii Winding Temperature Indicator (WTI):

A device for measuring the hot spot temperature of the winding shall be provided. The accuracy class of winding temperature indicator shall be $\pm 20^{\circ}\text{C}$ or better.

iii Oil Level Indicator:

A magnetic type oil level indicator shall be provided to indicate oil level in the tank.

iv RTD/transducers for remote annunciation:

In addition to the above mentioned indicators, the Oil and winding temperature measurement, RTDs / transducers shall be provided for remote indication in the DCS. RTDs shall be duplex platinum type with nominal resistance of 100 ohms at zero degree centigrade.

h) Bushing Current Transformers for stand by earth fault protection shall be provided in the neutral bushing and lead shall be brought to Marshalling box.

i) Radiator (oil filled type): Tank mounted radiators banks shall have bolted flanged connections and pipe extensions to permit withdrawal of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[8]	25.09.2014

transformer tank without disturbing the radiators. Flexible joints shall be provided in the interconnecting pipes (unless otherwise approved) to facilitate erection and dismantling and reduce transfer of vibrations from tank to radiator. The interconnecting pipes shall be provided with drain plug and air release vents.

- j) Conservator (For oil filled type): The transformers rated below 7.5MVA shall be provided with conventional single compartment conservator with dry air filling the space above the oil.

1.4.9 Bushings

- a) The bushing shall conform to the requirements of IS:2099 and IS:3347.
b) All transformer bushings shall be of porcelain (for oil filled)/ epoxy (for dry type).
c) The neutral terminal of 433V winding shall be brought out on a bushing along with the 433V phase terminal to form a 4 wire system for the 433V. Neutral CTs shall be located in the lead coming out of the winding and location of these CTs shall not be inside the tank.
d) The neutral terminal of secondary shall be brought out through an outdoor. Further this neutral terminal shall be connected by a copper flat of size [50 mm x 6] mm, which shall be brought down upto 100 mm above ground. The copper flat shall be insulated and supported from the tank body.

1.4.10 Terminal arrangement

- a) Cable boxes
i. Wherever cable connections are specified, suitable cable boxes shall be provided and shall be air insulated.
ii. Cable boxes shall have drilled gland plate of adequate size to receive cables and to allow easy termination.
iii. Removable drilled gland planes shall be provided in the cable boxes.
iv. The additional supports for the cable boxes shall be galvanised iron.
v. The contractor shall provide earthing terminals on the cable box, to suit [50mmx6] mm GI flat.
b) Bus duct
i. Wherever Bus duct termination is specified a flanged throat or equivalent connection shall be provided for termination of bus duct enclosure. The winding termination shall be outdoor type bushing. The material of the bus duct termination arrangement of the transformer shall be nonmagnetic. The bus duct may be either phase-segregated or non-segregated.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[9]	25.09.2014

- ii. Tolerance permissible for the height of terminals and bus duct flange location specified for bus duct termination over ground level is $\pm 5\text{mm}$. Contractor has to ensure that radiator, conservator and explosion vent do not obstruct the path of the bus-ducts.

1.4.11 Marshalling box

- a) A sheet steel weather, vermin and dust proof marshalling box shall be furnished. The sheet steel used shall be at least 2.0 mm (CRCA) thick. The box shall be free standing floor mounted/tank mounted type and have a sloping roof. The degree of protection shall be IP-55 in accordance with IS:2147.
- b) The marshalling box shall have a glazed door of suitable size for convenience of temperature indicators reading.
- c) All incoming cables shall enter the marshalling box from the bottom.

1.4.12 Wiring

- a) All control, alarm and indication devices provided with the transformer shall be wired up to the terminal blocks.
- b) Wiring shall be done with 650V PVC wires in conduit or PVC armored cable. *[Minimum wire size shall be 1.5 sq.mm stranded copper. Not more than two wires shall be connected to a terminal. 20% spare terminals shall be provided.]*
- c) Multi-way terminal block complete with mounting channel, binding screws and washers for wire connections and marking strip for circuit identification shall be provided for terminating the panel wiring. *[Terminals shall be stud type, suitable for terminating 2 nos. 2.5 mm2 stranded copper conductor and provided with acrylic insulating cover.]*
- d) All devices and terminal blocks shall be identified by symbols corresponding to those used in applicable schematic or wiring diagram. Each wire shall be identified, at both ends, with interlocking type permanent markers bearing wire numbers as per Bidder's Wiring Diagrams. AC / DC wiring shall have separate colour-coding.
- e) Wire termination shall be made with crimping type connectors with insulating sleeves. Wires shall not be spliced between terminals.

1.4.13 Painting

- a) All steel surfaces shall be thoroughly cleaned by sand blasting and / or by chemical agents, as required to produce a smooth surface free of scales, grease and rust.
- b) The external surfaces, after cleaning, shall be given a coat of high quality red oxide or yellow chromate primer followed by filler coats.
- c) The transformer finished with two coats of epoxy based powder coated paint. The paints shall be carefully selected to withstand tropical heat,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[10]	25.09.2014

rain etc. The paint shall not scale off or crinkle or be removed by abrasion due to normal handling.

- d) Painting shade shall be subject to owner's approval.
- e) Sufficient quantity of touch-up paint shall be furnished for application at site.

1.4.14 Name Plate

Nameplates of approved design shall be furnished at each cubicle (one no. each at front as well as at backside of cubicle) and at each instruments & device mounted on or inside the cubicle. The material shall be lamicaid or approved equal, 3 mm thick with white letter on black background. Self-tapping screws shall hold the nameplate. *[Nameplate size shall be minimum 20 x 75mm for instrument/device and 40 x 150mm for panels. Caution notice on suitable metal plate shall be affixed at the back of terminal Box.]*

1.5 Tests

1.5.1 Type Tests

For each type & rating of LV Transformers, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within *[last five]* years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within *[last five]* years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The following shall constitute the type tests:

- a) Temperature rise test
- b) Dielectric test

1.5.2 Routine Tests

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

The following tests shall be performed on each transformer as a minimum:

- a) After assembly, each core shall be pressure tested for one minute at 2KV (r.m.s.) A.C. between all bolts, side plates, structural steel works and the core.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E3	[11]	25.09.2014

- b) The wiring for auxiliary power and control circuitry shall be subjected to withstand one minute power frequency test with 2.0KV (r.m.s.) to earth
- c) Measurement of winding resistance
- d) Measurement of voltage ratio and check of phase displacement
- e) Measurement of short circuit impedance and load loss
- f) Measurement of no load loss and current
- g) Dielectric routine tests
- h) Excitation loss and current measurements shall be made at 90%, 100% and 110% of the rated voltage as routine test.
- i) Partial discharge test
- j) Tan delta test

1.5.3 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

1.5.4 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings/ Data and Manuals

Drawings, data, and manuals for the transformers shall be submitted as indicated below:

- a) *[General Arrangement Drawing]*
- b) *Dimensioned general arrangement drawing showing enclosure, core coil assembly, terminal arrangement, marshalling box and various fittings.*
- c) *Transport/shipping dimensions with weights, wheel base detail etc.*
- d) *Foundation plan & loading.*
- e) *Bus duct/cable termination arrangement.*
- f) *Control schematics and wiring diagrams.*
- g) *Test reports and QAP*
- h) *Any other relevant drawing or data necessary for satisfactory installation, operation and maintenance.*
- i) *Instruction manuals on Transformer and its various fittings The manual shall clearly indicate method of installation, checkups and tests to be carried out before commissioning of the equipment.]*

ANNEXURES-E4

1.0 415V SWITCHGEAR, MCC AND DB

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of 415V Switchgear MCC and DBs, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

Codes	Name of Standard
IS : 1248	Direct acting indicating analogue electrical measuring instruments and their accessories
IS: 2551	Danger notice plates
IS :2705	Current transformers-specification
IS :3156	Voltage transformer specification
IS :3231	Specification for electrical relays for power system protection
IS: 8084	Specification for interconnection busbars for AC voltages above 1kV up to and including 36kV.
IS :8623	Specification for low-voltage switchgear and control gear assemblies
IS :8686	Specification for static protective relays
IS :10118	Code-of practice for selection installation and maintenance of switchgear and control gear
IS :12021	Specification for control transformers for switchgear and control gear for voltages not exceeding 1000 v ac
IS : 13947 (Part 1)	Specification for low-voltage switchgear and control gear
IS : 13947 (Part 2)	Specification for low-voltage switchgear and control gear –part 2: circuit breakers
IS : 13947 (Part 4)	Specification for low-voltage switchgear and control gear -part 4 : contactors and motor feeders

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[1]	25.09.2014

Codes	Name of Standard
IS : 13947 (Part 5)	Low-voltage switchgear and control gear specification Part 5 : control circuit devices and switching elements
IEC 61439	Low voltage switchgear and control gear assemblies.
CEA	CEA regulations for installation and operation of meters 2006.
CEA	Standard technical specifications for main plant package

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- All 415V Switchgear, MCC and DB shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The Switchgear shall be suitable for operation in a highly polluted environment.
- All 415V Switchgear, MCC and DB shall be suitable for following voltage & frequency variations as follows:

Voltage Variation	:	(±) 10%
Frequency Variation	:	(+) 3% to (-) 5%
Combined Variation of Voltage & Frequency	:	10% (absolute sum)
For DC system	:	-15% to +10%

- 415 V switchgear & MCCs shall be of indoor /outdoor, double front/single front [Preferably single front] and fully draw out type. ACB feeder may be of single tier/two tier configuration depending upon rating. DBs (ACDB / DCDB) shall be of single / double front [Preferably single front] and fixed type. These shall be CRCA sheet metal enclosed and assembled to form a rigid, free-standing floor mounted structure. Vertical units shall be assembled to form a continuous line up of panels. Compartmentalized multi-tier configuration shall be provided.
- All AC motor starters shall be suitable for Direct on Line (DOL) starting. Motors rated below [132]kW shall be provided with combination starters consists of MCCB/MPCB, contactors and electronic over load relay and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[2]	25.09.2014

the motor starter shall comply with Type – 2 coordination conforming to relevant code and standards. Motors rated [132] kW and above shall be breaker controlled and shall be provided with comprehensive motor protection relay. Motors rated above [160]kW shall be fed from MV Switchgear [Only for firefighting system Motor rated up to 200kW shall be fed from 415V switch board].

- e) For 415 V switchgear & MCCs Feeders rated [630A] and above shall be equipped with Air Circuit Breaker (ACB). Outgoing/Incoming feeders rating below [630] A shall be MCCBs.
- f) For DBs Incomer rated 630A and above shall be ACB. Incomer below 630A shall be MCCB. Outgoing feeder may be MCCB/MCB depending upon the bus fault level.
- g) All ACB shall be draw out type & should have Service, test and disconnected positions with positive indications for service & test positions. It shall be possible to charge the springs manually, if, required
- h) Local/remote selection shall be provided for all incoming/Outgoing ACB module. Incoming/Outgoing breaker shall be closed at service position from remote (DCS) and at test position from Local(Switchgear).
- i) Two out of three breaker logic shall be considered for switchgear/MCC. However mechanical interlock shall be considered for income of MCCB operated DBs.
- j) Also, Local/remote selection switch shall be provided for all motor modules for control from Remote(DCS). Also for breaker operated motor, breaker shall be closed in Test position from local(Switchgear).
- k) All motors shall be provided with Emergency stop push button.
- l) Control circuits shall operate at suitable voltage of 110V AC or 220V DC. Necessary control supply transformers having primary and secondary MCCB/MCB shall be provided for each MCC, 2 x 100% per section. However breaker shall operate on 220V DC. The auxiliary bus bars for control supply shall be segregated from bus bars. This control supplies shall be monitored.
- m) All the numerical relays shall have communication on two ports, local front port communication to laptop and a second port with [IEC 61850 protocol] to communicate with DCS.

1.4 Specific Requirements

1.4.1 Construction

All 415V switchgear, MCC and DBs shall have following minimum features.

- a) All 415V switchgear, MCC and DBs shall be metal enclosed, indoor, floor mounted and free standing type. The panels shall be suitable for cable entry at bottom and busduct connection at top.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[3]	25.09.2014

- b) Between 415V Switchgear and dry type transformers, non segregated phase bus duct is considered. Hence switchgear shall be suitable for this connection and necessary flange connection and co ordination with busduct manufacturer in this regards is covered in this specification.
- c) All frames and load bearing members shall be fabricated using mild steel structural sections or pressed and shaped cold rolled sheet steel of thickness not less than 2 mm.
- d) Frame shall be enclosed in cold rolled sheet steel of thickness not less than 2 mm. Doors and covers shall also be of cold rolled sheet steel of thickness not less than 1.6 mm. Removable gland plates of thickness 3mm (hot/cold rolled sheet steel) or 4 mm (non magnetic material)shall be provided for all panels. Suitable removable type lifting hooks and / or jacking pad shall be provided on each panel or shipping section for ease of lifting of switchgear. These hooks when removed shall not leave any opening in the panels
- e) Each breaker shall be housed in a separate cubicle, complete with an individual front access door. Each vertical section shall have a removable back cover.
- f) The switchgear enclosure shall confirm to the degree of protection IP-54 (for outdoor). For indoor, enclosure shall confirm to IP52, however for Busbar chamber of switchboards rated above 1600A, degree of protection shall be IP-42.
- g) Paint shade for complete panels excluding end covers shall be [RAL 9002] and [RAL 5012] for extreme end covers for all board.
- h) The switchgear assembly shall comprise a continuous, line-up of single / multi tier cubicles. The installations of circuit breakers however shall be limited to the bottom two tiers only. Working height shall be limited to [250 mm to 1800 mm] from the floor level.
- i) Metallic barriers shall be provided between vertical sections and also between adjacent modules to ensure prevention of accidental contact with live parts during routine inspection/maintenance of functional units or cable terminations of one or more functional units when working on those of adjacent units. These barriers shall have insulating inserts as necessary for taking the interconnections etc
- j) A nameplate with switchgear designation shall be fixed at the top of the central panel. A separate nameplate giving feeder details shall be provided for each compartment. A separate nameplate giving details of bus section shall also be provided for switchgears having more than one bus section.
- k) Name plate shall be provided for each equipment (lamps, push buttons, switches, relays, auxiliary contactor, etc) mounted on the switchboard. Special warning plates one each on each feeder of a shipping section shall be provided on removable covers of doors giving access to cable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[4]	25.09.2014

terminals and busbars. Name plate size shall be minimum of 20x75 mm for Instruments/devices and 40x50 mm for panels. Thickness shall be minimum 3 mm.

- l) For MCC/DB a full height vertical cable chamber with cable supports shall be provided in each section to facilitate unit wiring.
- m) 2x100%, 415V/110V AC control transformer shall be provided for control, Indication and annunciation supply for contactor operated motor feeder. All the necessary auxiliary and main contactor shall be provided suitable for this control supply.
- n) Two 220V DC feeders shall be provided for control, Indication and annunciation of breaker operated module.
- o) Compartment door shall be interlocked with main power isolating device for safety with provision for defeating it by authorized person.
- p) Supplier shall provide total 20% or minimum one (1) no. spare feeder of each type & rating with respect to total requirement of the switchgear.
- q) Motors of rating 30 kW and above shall be provided with anti-condensation heaters. Necessary provision for supply of motor space heating shall be considered in the switchgear.
- r) The incoming connection to transformer of more than 1000kVA and inter-connecting sections between switchboards shall preferably be of bus ducts.
- s) It should be possible to carryout maintenance on a feeder with adjacent feeders alive.

1.4.2

Bus and Bus taps

- a) The main buses and connections shall be of high [conductivity Aluminum / Copper] alloy sized for specified current ratings with temperature rise limited [to 40°C over ambient temperature of 50°C].
- b) Silver plating shall be done on copper bar wherever copper to copper and copper to aluminum contacts are envisaged. All connection hardware shall be non-magnetic and shall have high corrosion resistance. Adequate contact pressure shall be ensured by means of two bolts connection with plain & spring washers and locknuts. Temperature rise shall not exceed 105 degree for silver plated joints over an ambient temperature of 50 degree.
- c) Bus bars and connections shall be fully insulated for working voltage with adequate phase / ground clearances. Insulating sleeves for bus bars and shrouds for joints shall be provided.
- d) Bus insulators shall be flame-retardant, track resistant type with high creepage surface. All buses and connections shall be supported and braced to withstand the stresses due to maximum short-circuit current and also to take care of thermal expansion.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[5]	25.09.2014

- e) Bus bars shall be color coded for easy identification and so located that the sequence R-Y-B shall be from left to right, top to bottom or front to rear, when viewed from the front to switchgear assembly.
- f) Power shall be distributed to each module or compartment by a set of vertical bus bars. The vertical bus bars shall run behind the modules. Necessary tee off connectors shall be used for distributing auxiliary supply to each vertical panel. Rubber grommets shall be used for all wire entries to make the entries dust and vermin proof.
- g) The clearance between the individual bare phase power bus bars and between the phase and earth bus bars in air shall be not less than [25.4] mm.
- h) Three phase, neutral (with at least [50] % rating of main Bus bar and continuous earth bus shall be provided. Bus bar and tapping shall be provided with color coded PVC sleeves.

1.4.3

Air Circuit Breaker

- a) All Circuit Breakers for incoming feeders and Bus couplers shall be [four] poles; single throw, motor operated and air break type. Circuit breaker for outgoing feeders shall be triple pole, single throw and air break type. However for supply feeders it shall be [four] pole.
- b) Circuit Breakers shall be [draw out type] having Service, Test & Disconnected positions with positive indication for each position.
- c) Circuit breakers of identical rating shall be physically and electrically interchangeable.
- d) Bolted disconnected links shall be provided for all outgoing feeders for isolation of neutral, if necessary.
- e) For motor wound mechanism, spring charging shall take place automatically after each breaker closing operation. One open – close – open operation of the circuit breaker shall be possible after failure of power supply to the motor when the spring is charged after a closing operation.
- f) Mechanical safety interlock shall be provided to prevent the circuit breaker from being racked in or out of the service position when the breaker is closed.
- g) Automatic safety shutters shall be provided to fully cover the female primary disconnects when the breaker is withdrawn.
- h) Each breaker shall be provided with an emergency manual trip, mechanical ON-OFF indicator, an operational counter and mechanism to indicate spring charge / discharge condition.
- i) In addition to the auxiliary contacts required for normal breaker operation and indication, each breaker shall be provided with followings for interlocking purpose:-
 - i. Position / cell switch with 4 No + 4 NC contacts.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[6]	25.09.2014

- ii. Limit / auxiliary switches shall be convertible type that is facility for changing N.O. contact to N.C. and vice-versa.
- iii. Mechanical stopper to prevent accidental falling while withdrawing.
- j) Breaker cannot be racked in from 'isolated' to 'test' position with the door open together with provision for defeat of this interlocking, however, the door can be closed only when the breaker is brought back to 'isolated' position. Insertion of breaker into 'Service' position not possible if the shutters are not free.
- k) Door can be opened only when breaker is OFF and is in 'Isolated' position. Remote closing of breaker not permitted with door open.
- l) Anti pumping relay / device to ensure that there can be only one closing operation for each closing command.
- m) Suitable trolley arrangement shall be provided for breaker/starter modules. Two trolleys per switchgear room shall be provided so that top most breaker module of all types, sizes and rating can be withdrawn on trolley and lowered for maintenance purpose.
- n) Closing and tripping coil shall operate satisfactorily under the following conditions.
 - i. Closing Coil: 85% to 110% of rated voltage.
 - ii. Tripping Coil : 70% to 110% of rated voltage.

1.4.4 Contactors, MCCB and MPCB

- a) Incomers for MCCs and DBs rated below 630A shall be MCCB.
- b) Incomer and bus coupler rated below 630A shall be mechanically Interlocked.
- c) Motor starter contactors shall be of air break, electromagnetic type. Suitable for DOL starting of motor, and shall be of utilization category AC-3 for ordinary and AC-4 for reversing starters. DC contactor shall be of DC-3 utilization category.
- d) The contactors shall be three pole, air break type designed for [duty class III category A.C. –3 with non-bouncing silver / silver alloy.]
- e) Each contactor shall be provided with two (2) normally open and two (2) normally closed auxiliary contacts unless otherwise specifically stated. Rating shall be decided by the bidder.
- f) Reversing contacts shall be electrically and mechanically interlocked.
- g) Contactors with delayed dropout feature shall be provided for some essential auxiliaries. These contactors shall not dropout on power failure if the voltage is restored within 3 seconds.

1.4.5 Electronic over load relays

- a) Electronic overload relays shall conform to IEC:292-1 and shall be triple pole, ambient temperature compensated with adjustable setting, inverse time lag, built in single phase preventer and hand/auto reset type

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[7]	25.09.2014

provided as per requirement along with necessary command, feedback cable, coupling relays etc.

- b) Provided with 1 NO and 1NC contact of rating same as the auxiliary contact of the contactors.
- c) The relay shall be able to withstand prospective short circuit current without damage or injurious heating till the motor protection MCCB/MPCB clears the fault.
- d) Relays may be direct acting or CT operated, depending on current rating. CTs shall be included in the scope of supply.

1.4.6 Bus Transfer scheme:

Each switchgear of two incomer and bus coupler shall be provided with the following provisions.

- i) Dead bus closing.
- ii) Manual live change over (Momentary paralleling)
- iii) Automatic bus transfer scheme.

1.4.7 Current Transformer

- a) Current Transformers shall be cast-resin type. All secondary connections shall be brought out to terminal blocks where wye or delta connection shall be made.
- b) CTs shall have polarity makings indelibly marked on each transformer at the lead terminations and at the associated terminal block. Facility shall be provided for short circuiting and grounding the CT secondary at the terminal blocks. Secondary terminals shall be provided with protective cap.
- c) CT terminal block shall be disconnecting type and suitable for round type lugs with facility for testing and short circuiting of individual CT.
- d) All CTs shall be provided with supports independent of busbars / busbar supports. The CTs shall be located in such a way that they can be easily approached for maintenance without necessitating shutdown of adjacent feeders.
- e) CTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.8 Voltage Transformer

- a) Voltage transformers(VT) shall be cast-resin type with an accuracy class of 1.0 for metering and 3P for protection.
- b) VTs shall be of the single-phase type. VTs shall be protected on their primary side by MCCBs with interrupting ratings corresponding to breaker rating and by MCB (with auxiliary contacts) on the secondary sides.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[8]	25.09.2014

- c) VTs shall have continuous over voltage factor of 1.2 and short time over voltage factor of 1.5 for 30 seconds for effectively earthed system
- d) It shall be possible to replace VTs without having to de-energise the main busbars.
- e) VTs shall be provided with disconnected type test links in both secondary leads for carrying out current and phase angle measurement.

1.4.9 Transducer

For all the incoming and the outgoing of 415V Switchgear / MCC/ DB Feeders requiring remote metering and/or current monitoring shall be provided with multi-functional transducers. The output shall be 4-20 mA DC which shall correspond to the normal range.

1.4.10 Secondary Wiring

- a) The switchgear shall be fully wired at the factory to ensure proper functioning of control, protection and interlocking schemes.
- b) Fuse /MCB and links shall be provided to permit individual circuit isolation from bus wires without disturbing other circuits. All spare contacts of relays, switches and other devices shall be wired up to terminal blocks.
- c) Secondary wiring within the switchgear shall be carried out in a neat and systematic manner and securely held in position (either loomed or run in conduit / trunking). Wherever wiring passes through compartment, it shall be run in conduit / trunking, if metallic shall be bonded to the main earth busbar.
- d) Wiring shall be done with flexible, 1.1/0.650kV grade, PVC insulated switchboard wires with [stranded copper conductors of 2.5 mm² for CT & PT circuits and 1.5mm² for control circuit wiring.]
- e) Each wire shall be identified, at both ends, with permanent markers bearing wire numbers as per bidder's wiring diagrams. Wire terminations shall be made with crimping type connectors with insulating sleeves, wire shall not be spliced between terminals.

1.4.11 Terminal Blocks

- a) Terminal blocks shall be 660V grade box-clamp type with marking strips, similar to 10 mm² or equal. Terminals for C.T. secondary leads shall have provision for shorting.
- b) Not more than two wires shall be connected to any terminal. If more than two wires at one terminal are required, separate terminals with function wise shorting links shall be provided. [Spare terminal equal in number to 20% of active terminals shall be furnished.]
- c) Terminal blocks shall be located to allow easy access. Wiring shall be so arranged so that individual wires of an external cable can be connected to consecutive terminals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[9]	25.09.2014

1.4.12 Ground bus

- a) A ground bus, rated to carry maximum fault current, shall extend full length of the switchgear. The ground bus shall be provided with two-bolt drilling with G.I. bolts and nuts at each end to for connection to the grounding conductor / flat.
- b) Each unit shall be connected directly to the ground bus. The frame of each circuit breaker and draw out V.T. unit shall be grounded through heavy multiple contacts at all times except when the primary disconnecting devices are separated by a safe distance.
- c) C.T. & V.T. secondary neutrals shall be earthed through removable links so that earth of one circuit may be removed without disturbing others. All hinged doors shall be earthed by flexible copper bride.

1.4.13 Space Heater

- a) Each vertical section shall be provided with thermostat controlled space heater 5A, 3 pin socket plug.
- b) In addition, motor feeders rated [30 KW and above] shall be wired up for feeding the motor space heater through suitably rated breaker auxiliary NC contact and/or contactor.
- c) Cubicle heater, Motor heater, and Plug socket circuit shall have individual switch fuse units/MCB.

1.4.14 AC Distribution Boards (ACDBs)

- a) AC Distribution Boards shall have MCCB/MCB at incomer depending upon the short circuit rating. Distribution Boards may be fed from switchgear and shall have two incomers. AC distribution Boards shall be of two types - one with 415V, 4-wire, triple pole and neutral (TPN) outgoing feeders and the other with 240V, 2-wire, single pole and neutral (SPN) outgoing feeders.
- b) For small loads, MCB boards with TPN MCB as incomer and TPN/SP MCBs for outgoing may be considered. The feeder rating and quantity shall be as per requirement.
- c) Board shall be single/double front [preferably single front], metal clad, front matched, dust and vermin proof, fixed type, compartmentalized and extensible on both sides.
- d) Bus bars shall have same cross section throughout the length. Rating of the neutral bus bar shall be 50% of the main bus bar. Earth bus bar shall run in bottom chamber throughout the length of the Board.

1.4.15 DC Distribution Boards

DCDBs shall have two incomers and a bus coupler. Incomers and outgoing feeders of DCDBs shall be MCB/MCCB modules. They shall be fixed type and floor mounted. Other constructional features shall be similar to ACDB.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[10]	25.09.2014

The feeder rating and quantity shall be as per requirement.

1.4.16 Control & Indication

The circuit breaker shall be wired up for local & remote operation. Each breaker cubicle shall be equipped with following:

- a) Remote selector switch with pistol grip handle and key interlock for breakers with motor wound spring charging mechanism. In Remote position, the breaker can be operated in service position with all interlock and protections. In switchgear position, the breaker shall be operated from switchgear only in test position with only protection (no interlock).
- b) Two (2) heavy duty, oil-tight, push buttons for Trip & Close.
- c) Circuit breaker shall be indicated electrically. The following indication colour shall be used.

Breaker open - GREEN

Breaker closed - RED

Spring Charged - WHITE

Breaker Auto Trip- AMBER

- d) However, any other indication shall be provided as per owner's requirement.
- e) Lamps shall be LED type with resistance for voltage protection. Lamp and lens shall be replaceable from the front.
- f) For all MCCB feeders, trip indication lamp shall be provided on front of the compartment.
- g) For all starters, ON, OFF and trip indication lamps shall be provided on front of the compartment.

1.4.17 Relays, Protection & Metering

- a) The hardware design for protection and associated equipment shall use latest state-of-the-art technology and shall generally be integrated numerical/digital, modular in nature. Where design is based on numerical technology, adequate self testing/monitoring/diagnostic facilities shall be provided.
- b) All numerical relays, auxiliary relays and devices shall be of types, proven for the application; satisfying requirements specified elsewhere and shall be subject to Purchaser's approval. Numerical Relays shall have appropriate setting ranges, accuracy, resetting ratio, transient overreach and other characteristics to provide required sensitivity to the satisfaction of the Owner.
- c) All protective relays shall be in draw out or plug-in type / modular cases with proper testing facilities. Necessary test plugs / test handles shall be supplied loose and shall be included in supplier's scope of supply.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[11]	25.09.2014

- d) All AC operated relays shall be suitable for operation at 50 Hz. AC voltage operated relays shall be suitable for 110 Volts VT secondary and current operated relays for [1 or 5] amp CT secondary. All relays and timers shall be rated for control supply voltage as mentioned elsewhere under parameters and shall be capable of satisfactory continuous operation between 80-120% of the rated voltage. Voltage operated relays shall have adequate thermal capacity for continuous operation.
- e) Energy meters shall be provided for incomer of 415V Switchgear and MCC and shall be able to communicate with DCS. These meters shall be as per CEA regulation 2006 "Installation and operation of meters". Accuracy class shall not be less than 1.0S.
- f) Provision shall be made for easy isolation of trip circuits of each relay for the purpose of testing and maintenance.
- g) All protective relays and alarm relays shall be provided with one extra isolated pair of contacts wired to terminals exclusively for future use.
- h) The relay shall be designed to perform satisfactorily under highly noisy electrical environment. Sufficient degree of high frequency disturbance immunity and impulse voltage withstand capacity shall be built into electronic designs as stipulated in relevant standards.
- i) All protections shall be furnished complete with necessary auxiliary, supervisory, lock out relays. Suitably separate sets of single phase auxiliary C.T with multiple taps shall be provided with relay whenever required.
- j) Visual and audible alarm annunciation shall be initiated in the event of operation of protective/supervisory relay.
- k) D.C supply shall be supervised by DC supervision relays.
- l) Trip circuit shall be supervised by Trip circuit supervision.
- m) Tripping shall be done through high speed lock out relays.
- n) All meters/ instrument shall be flush mounted on front panel, at least 96mm² size with 90° linear scales and accuracy class of 2.0.
- o) Interposing relays for ON/OFF command or any other command shall be as per system requirement.
- p) For alarm and Indication at DCS end necessary contacts shall be provided at switchgear end.
- q) Metering and protection shall be as per below table

a)	Incomers	
	Protections	Metering
i	Time graded short circuit protection	Local Current (single phase) indication and remote indication through transducer.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[12]	25.09.2014

ii	Over current protection	Voltage Measurement for all three phases and remote indication through transducer.
iii	Earth fault protection	KW, Kwhr
b)	Bus coupler	
	Protections	Metering
i	Over current protection(51)	Local Current (single phase) indication.
ii	IDMT Earth fault protection(51N)	
c)	Contactor controlled motor feeders [90kW and above motor only]	
	Protections	Metering
i	Time graded short circuit protection	Local Current indication and remote indication through transducer.
ii	Over current protection	
c)	[Motor Feeders [of 132KW and above only]]	
	Protections	Metering
	Composite motor protection to cover a minimum of protections such as over current, short circuit, earth fault, locked rotor, Negative phase sequence, thermal overload etc.	Local Current indication and remote indication through transducer.
[Other feeders]		
a)	Bus PT / Line PT Modules	
	Protections	Metering
	Under voltage protection	[Voltage – phase to phase,]
	Fuse failure protection	
b)	Motor feeders (MPCB/MCCB with Contractors)	
	Protections	Metering
	Electronic Overload relay (with single phase preventor), short circuit protection (through fuse/MCCB/MPCB as specified)	
c)	Incoming feeders for ACDB/DCDB	
	Protections	Metering

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[13]	25.09.2014

	Short circuit protection (if MCCB)	[Voltage (single phase and, Phase Current (1 Phase))] Local indication only.
d)	Outgoing feeders of ACDB/DCDB	
	Protections	Metering
	Short circuit protection (through fuse/MCCB)	

1.5

Tests

I) Type Test

For each type & rating of 415V Switchgear, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the switchgear similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant /purchaser or his representative.

The minimum tests shall be conducted are as follows:

- Measurement of insulation resistance of Circuit Breaker in closed and open positions.
- Measurement of milli-volt drop across Circuit Breaker main contacts and other joints.
- Measurement of Circuit Breaker/Contactor operating time for close & open at nominal voltage and 80% of rated voltage.
- Measurement of resistance, IR value and drop-off/pick-up voltage of close and trip coils.
- Healthiness of limit switch contacts.
- Spring charging motor functional checks.
- Verification of phase sequence and checking of clearances of busbars between phase to phase and phase to earth.
- Measurement of milli-volt drop across busbar joints

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[14]	25.09.2014

- i) Torque tightness test.
- j) High voltage test on busbar.
- k) Measurement of CT/PT polarity, ratio and knee point voltage.
- l) Electrical and mechanical interlock checks.
- m) Secondary injection of all protection relays by using service settings and simulation of all protection functions.
- n) Secondary injection of all metering circuits.
- o) Functional tests to demonstrate the specified control and interlocks

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates:

Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner. The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawing & Documents

Drawings, data & manuals for the motors shall be submitted as indicated below

- a) [General Arrangement drawings and cross-section showing constructional features & cable entry with bottom view with opening.
- b) Bill of Materials.
- c) Technical Data sheet and Catalogue.
- d) Foundation drawing details with bottom view of switchgear.
- e) Descriptive write-ups and literature for the main equipment offered including relays, meters, etc.
- f) Control Schematics & Wiring diagram.
- g) Inspection and Test Plan (ITP).
- h) Suggestive list of protective relays.
- i) Transport/shipping dimensions and weights].

1.7 Ratings & Requirements

415V switchgears, MCC and DB shall comply with the particulars indicated in the following tables.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E4	[15]	25.09.2014

Table- 2.0

S. No.	DESCRIPTION	UNIT	DATA
1.0	General		
1.1	Name of Manufacturer		
1.2	Place & Country of manufacture		
1.3	Specifications and Standards		
2.0	Switchgear Details		
2.1	Rated voltage, phases & frequency		415 Volts, 3 Phase, 4 wire 50 Hz.
2.2	System neutral earthing		Solidly earthed
2.3	Voltage & frequency variation	%	+/-10%, -5%to +3% Hz.
2.4	Rated frequency	Hz	50Hz
2.4	One minute power frequency Voltage a) For power Circuits b) For Control Circuits		a) 2.5kV b) 1.5kV
2.5	Continuous current rating of busbars under site reference ambient temp.		[As per Project requirement]
2.6	Reference ambient temperature		50°C
2.7	Maximum temperature of bus bars and droppers/connectors under site conditions specified		90°C for busbars having non-silver plated joints 105°C for busbars having silver plated joints
2.8	Short circuit current withstand for busbars and droppers		
a	Short time	kA (rms)	50
b	Dynamic Rating	kA (peak)	105
2.9	Whether busbars have been insulated	Yes	Required
2.10	Type of insulation		[By Bidder]
2.11	Material of bus bar supports		[By Bidder]

TECHNICAL SPECIFICATION FOR 415V NON
SEGREGATED PHASE BUS DUCTS**

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E5

1.0 415V NON SEGREGATED PHASE BUS DUCT

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of 415V Non Segregated Phase Busduct, complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

IS 8084	Interconnecting Bus bar for AC Voltage above 1KV up to and Including 36kV
IEC 60947	Low Voltage Switchgear and Control gear
ANSI/IEEE C37.20	Metal-Clad and Station-Type Cubicle Switchgear
ANSI/IEEE C37.24	Guide for Evaluating the Effect of Solar Radiation on Outdoor Metal Enclosed Switchgear
IEC 60439	Low-voltage switchgear and control gear assemblies.
BS 159:1957	Bus bar and Bus bar connection
CEA	CEA regulations and standards

Equipment and material conforming to any other standard which ensures equal or better quality may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3 Design Criteria

- a) The 415V Non-segregated phase bus duct shall serve as an interconnection between the 415V Switchgear and 11/0.433kV LV Transformer. The Non-segregated phase bus duct shall be installed

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[1]	25.09.2014

indoor/Outdoor in a hot, humid and tropical atmosphere. All panels associated with Non-segregated phase bus duct shall be located indoors/Outdoors.

- b) Bus duct, associated equipment and wiring shall be provided with tropical finish to prevent fungus growth. All ventilation openings shall be screened and drains shall be filtered to prevent entrance of dust and insects.
- c) For continuous operation at specified ratings, temperature rise of the bus duct and auxiliary equipment shall be as specified in Clause 1.7 Rating and requirements.
- d) Bus duct and auxiliary equipment shall be capable of withstanding the mechanical forces and thermal stresses of the required short-circuit currents.
- e) The bus ducts and supporting structures shall be designed & constructed so as to withstand without damage the horizontal / vertical ground accelerations due to earthquake.
- f) The bus ducts shall be self cooled and shall not be equipped with blower or any other type of forced ventilation.
- g) The equipment rating shall be based on an ambient temperature. Same phase disposition shall be maintained throughout the run of the bus duct. Phase crossover units, if required, shall also be provided inside the Busduct itself.
- h) Bus ducts shall be suitable for continuous operation at maximum system voltage and shall be adequately sized to withstand short circuit current.

1.4 Specific Requirements

1.4.1 General

- a) 415V Non Segregated Phase Busduct is provided for connection between low voltage side of 11/0.433kV cast resin dry type /oil type transformers and associated 415V Switchgears shall be of TPN (3 phase and neutral) along with necessary bends, flexible at both transformer & switchgear ends, flanges, phase crossover chambers (if required), support structures & accessories including terminations at the equipment ends.
- b) The 415V bus duct shall be metal enclosed, non-phase segregated enclosure type, self cooled and insulated for 1.1kV voltage. The cooling medium inside the duct shall be air.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[2]	25.09.2014

- c) All parts and accessories shall have appropriate match mark and part numbers for easy identification and installation at site.
- d) The 415V non-segregated phase bus duct will be installed indoor or partially indoor & outdoor depending upon the location of equipment being interconnected in a hot, humid and tropical atmosphere. All panels associated with LV non-segregated phase bus duct will be located indoors.
- e) The continuous current rating and momentary peak withstand current rating of the Busduct between transformers & their associated switchgears shall be same as that of the associated switchgears and as indicated in the specification.
- f) All supporting steel structures shall be hot dip galvanized.
- g) The bus ducts shall be provided with space heaters to control moisture. Slicagel breather if required same shall be provided.

1.4.2 Enclosures

- a) The enclosure shall be rectangular and shall be made of [aluminium alloy/Mild steel] of grade [19000H2] as per IS-5082. The entire bus duct shall be designed with dust, weather and vermin-proof construction. The inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The bare enclosure with above painting shall be designed so as not to exceed the temperature specified in IS: 8084.
- b) *[Phases shall be enclosed in a weather-proof, dust-tight, non-magnetic metal (aluminum alloy) of 3mm for bus rating including and above 3000A whereas enclosures for normal bus current rating (<3000 A) shall be sheet steel fabricated type of 2.5mm thick].*
- c) Enclosures shall be provided with flange ends with drilled dimensions to suit the flanges at the switchgear and transformer ends.
- d) Circumferential neoprene rubber gaskets shall be provided for dust tight joints with adjacent enclosure section.
- h) The bus enclosure shall have extended bellows or equivalent means to allow for temperature changes and vibrations. Flexible joints shall be provided in enclosures at all points where the bus duct terminates at equipment to withstand vibration, expansion / contraction and at suitable intervals in any straight run of the bus duct where expansion and contraction would otherwise result in stresses in the supporting structures.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[3]	25.09.2014

- i) All outdoor bus-enclosures shall be so designed & constructed as to prevent accumulation of rain water on top sheet. Similarly all Gasketed flanged joints shall be suitably protected against direct splashing of rain water in case of outdoor runs. The connection flanges shall be sufficiently stiffened so as not to bend while tightening the bolts.
- j) Outdoor portions of the bus duct, if any, shall have continuous rain hood of non magnetic material or with suitable arrangement for rainwater prevention.
- k) Suitable inspection openings shall be provided for access to support insulators, bus joints, transformer terminals, switch gear terminals etc. All inspection openings shall have reliable sealing arrangement with neoprene gaskets.
- l) Seal-off bushings complete with wall-frame and support plates shall be provided where the bus duct penetrates the building wall. The seal is to prevent free exchange of air between indoor and outdoor portions of the bus duct.
- m) In case, the bus duct penetrates the firewall, the wall frame assembly and the seal shall be designed for the same fire rating as the firewall.
- n) Silica-gel breather shall be provided on both indoor and outdoor portions of the bus duct. Space Heaters shall be provided in the bus duct.
- o) Filtered drains for drainage of condensate shall be provided at the lowest points and at such locations where accumulation of condensate can be expected.
- p) Shipping length of the Busduct shall be not more than three (3) meters in length.
- q) Minimum Degree of protection of Busduct enclosure shall be IP-52 for indoor and IPW-55 for outdoor section of the Busduct.

1.4.3

Bus Conductor

- a) The bus conductor shall be of high conductivity, [Aluminium alloy / Aluminium].
- b) The bus conductors shall be given a coat of matt black paint to facilitate heat dissipation. However the sizing of the bus conductor shall consider the conductor as bare.
- c) The bus conductor shall be designed for bolted connections throughout the run.
- d) Flexible connection shall ensure an efficient and trouble-free connection.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[4]	25.09.2014

- e) Silver plating shall be done on copper bar wherever copper to copper and copper to aluminium contacts are envisaged. All connection hardware shall be non-magnetic and shall have high corrosion resistance.
- f) The bus conductors and their support insulators shall be designed to withstand, without damage, the forces developed while carrying the short circuit current.
- g) The bus bar shall be sleeved with FRLS heat shrinkable, colour coded PVC sleeves at intermittent points for phase identification.
- h) The material of the conductor shall be aluminium alloy of grade [63401WP] as per IS: 5082. The temperature rise of conductor shall be 40 degree over design ambient temperature of 50 degree. Also, the temperature of the bus shall not exceed 250°C while carrying the specified short circuit current for one second when a fault occurs at the operating temperature.

1.4.4 Disconnect Link

- a) Removable bolted disconnected link shall be provided in the bus for the purpose of isolation.
- b) Disconnect link shall consist of a removable section of conductor and shall be so constructed as to permit easy removal or reinsertion without alignment difficulties.
- c) The bus on both sides of the link shall be rigidly supported so that the disconnect link is equal in mechanical strength to any other section of the bus.
- d) A minimum clearance of [300 mm. (12")] shall be provided between the disconnected bus sections with the link removed.

1.4.5 Insulators

- a) The bus conductor supporting insulators shall be flame retardant, non-hygroscopic, high impact and high dielectric strength material with an anti tracking contour.
- b) Material of insulator shall be [Epoxy SMC moulded /FRP].
- c) Spacing of the bus support insulators shall be considered by giving due factor of safety to withstand the forces due to the short circuit current assigned to the bus duct.
- d) Bus support insulators shall be interchangeable, high creepage, high strength, wet process, fine glazed porcelain. Alternatively good quality cast resin insulators may be offered.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[5]	25.09.2014

- e) Insulator shall be mounted in such a way so as to permit easy removal or replacement without disassembly of the bus. The insulator mounting plate shall be designed for cantilever loading to withstand the short circuit.
- f) The conductor shall be fastened on the insulator through fixed and slip joints so as to allow conductor expansion or contraction without straining the insulator.
- g) Space heater shall be provided preferably located near to each insulator to avoid moisture condensation within bus duct.

1.4.6 Connections & Terminations

- a) All matching flanges, seal-off bushings, gaskets, fittings, hardware and supports required for termination of the Busduct at the switchgear, transformers and other equipment shall be furnished.
- b) In this connection the bidder is required to coordinate with the switchgear and auxiliary transformers manufacturer with regard to connection details, mechanical and thermal stresses.
- c) Flexible connections both for conductor and enclosure shall be furnished at all equipment termination to provide for misalignment up to 25 mm in all directions.
- d) The equipment terminal connections shall be readily accessible and shall provide sufficient air gap for safe isolation of equipment during testing.

1.4.7 Supporting Structures

- a) All supporting structures required for hanging and/or supporting the complete bus duct shall be furnished. These include all members, indoor/outdoor posts, bolts, shims, base plates, beams, hangers, brackets, bracings and hardware.
- b) All buses shall be adequately supported and braced to successfully withstand normal operation, vibration, thermal expansion, short circuit forces and all specified design loads including wind & earthquake forces.
- c) Support shall be designed to provide tolerance of ± 12 mm in the horizontal and vertical directions.
- d) All steel members shall be hot-dip galvanized after fabrication. All hardware shall be of high strength steel with weather resistant finish.
- e) The mounting arrangement of Busduct on the supporting structure shall be designed to allow movement of the Busduct during expansion and contraction.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[6]	25.09.2014

- f) All structure shall be self supporting and in no case rely for support on equipment to which the busbars are connected.

1.4.8 Ground bus

- a) The ground bus of two numbers of separately run [50x10 mm] minimum GS flat shall be provided along the run of the bus duct. All parts of the bus enclosure, supporting structures and equipment frames shall be bonded to above ground bus.
- b) Ground bus shall be finally to connected to power plant earth grid at one end.

1.4.9 Wiring

All wiring for space heaters shall be done with insulated stranded copper conductor of not less than [2.5 mm² cross-section]. Each wire shall be identified at both ends with wire designation as per bidder's wiring diagram and shall be brought out to a terminal box outside the bus duct.

Terminal blocks shall be box-clamp type minimum 10 mm² with marking strips.

At [least 20% spare terminals] shall be furnished in the terminal block.

1.4.10 Name Plate

Suitable name plate shall be furnished with each piece of equipment.

[Materials for name plate shall be plastic / lamicoid, 3 mm thick, using white letters on black background.]

1.4.11 Space Heater

Thermostatically controlled Space heaters shall be provided in the bus ducts, wherever the manufacturer considers them necessary and recommends their provision for preventing harmful moisture condensation. At least one number space heater with thermostat shall be provided at each transformer and switchgear end.

The space heaters shall be suitable for continuous operation on single phase supply, and shall be automatically controlled by thermostats. Necessary wiring up to junction boxes mounted on bus duct and from junction boxes to switchboards shall be provided.

1.4.12 Painting and Finish

- a) All surfaces to be painted including interior and enclosures and other metal parts shall be shot or sand blasted or chemically treated to remove all rust, scale, grease and other adhering foreign matters as far as

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[7]	25.09.2014

possible shall be painted with not less than two (2) coats of Acid and corrosion resistant paint

- b) Steel surfaces, exposed to weather shall be given two (2) coats of zinc chromate and two (2) coats of an 'approved' Manufacturer's paint of 'approved' colour.
- c) All metal parts not accessible for painting shall be made of corrosion resistant materials. All machine finished or bright surfaces shall be coated with a suitable rust preventive compound and wrapped or otherwise protected.
- d) Inside of the bus enclosure shall be treated with a matt paint of dark colour, preferably black to facilitate efficient heat dissipation. The shade of exterior surface finish shall be [RAL 5012].
- e) The interior surface finish shall be as per manufacturer's standard.
- f) Pretreatment consisting of degreasing, de-rusting etc. shall be done on all fabricated parts before painting or galvanizing.
- g) Paints shall be carefully selected to withstand heat and weather conditions. The paint shall not scale-off or crinkle or get removed by abrasion due to normal handling.
- h) Sufficient quantities of all paints and preservatives required for touching up at sites shall be furnished.
- i) The paint shade shall be subject to owner's approval.

1.5

Tests

l) Type Test

For each type & rating of 415V Non segregated phase bus duct, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the Busduct similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E5	[8]	25.09.2014

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works in the presence of consultant / purchaser or his representative.

Some of the specific tests required are listed below.

- a) Visual inspection and verification of dimensions
- b) Dry power frequency voltage withstand for 1-minute
- c) Milli-volt drop test & Water tightness test

1.6 Drawings and Documents

Drawings, data & manuals for the 415V Non segregated phase bus duct shall be submitted as indicated below:

- a) [Dimensional GA drawing
- b) Data sheets
- c) Typical calculation for arriving at the size of conductor and the insulator spacing.
- d) Type test report (short circuit, temperature rise test) for similar bus duct manufactured by the proposed manufacturer.
- e) Foundation layout and requirements
- f) The bidder may note that the drawings, data and manuals listed are minimum requirement only. The bidder shall ensure that all other necessary write-ups, curves and information required to fully describe the equipment offered are submitted with his bid.]

1.7 Ratings and Requirements

Major technical parameters of 415V non segregated Bus Duct are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

Table: 2.0

ASTM-D-2863	:	Test for determination of oxygen index.
CEA	:	CEA Regulations
CEA	:	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended upto date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[2]	25.09.2014

1.3 Design Criteria

- a) The cables shall be installed in hot, humid tropical atmosphere with ambient temperature of 50°C.
- b) All HV cables shall be suitable for operation under the following voltage & frequency variations:

Voltage Variation : (±) 10%

Frequency Variation : (+) 3% to (-)5%

Combined Variation of Voltage & Frequency : 10% (absolute sum)

- c) The HV power cables shall be 6600V unearthed grade, single/multi core stranded Aluminum conductor, extruded XLPE insulated with extruded PVC inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-2). These cables shall conform to IS 7098 (Part II).
- d) The continuous and short time current carrying capacity of XLPE insulated cables shall be based on maximum operating temperature of 90°C and 250°C respectively.
- e) HV power cables shall be sized taking into account the following derating factors:
 - i. Max Ambient air temperature
 - ii. Max Ambient ground temperature
 - iii. Grouping of cables/Method of laying
 - iv. Depth of laying for cable buried in ground.
 - v. Soil thermal resistivity for cable buried in ground.
- f) HV cables shall be chosen taking into account the following factors:
 - i. System Fault level.
 - ii. Maximum time for fault clearance (i.e, operating time of the backup protection relays plus the time of operation of the circuit breakers).
 - iii. Full load current of the circuit.
 - iv. Short circuit current and duration (for breaker protected cables)
 - v. Installation conditions.
 - vi. Voltage drop under normal running and starting condition
 - vii. Voltage drop at motor terminals shall be within permissible limit during starting & normal running. i.e 5% during steady state and 15% during transient or starting at motor terminal.
 - viii. The cable should withstand the maximum fault current corresponding to the particular voltage level for the minimum time before the fault is cleared.
 - ix. Consideration shall also be given to limit the cable to the nearest standard sizes instead of using too many types.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[3]	25.09.2014

1.4 Specific Requirements

1.4.1 Type of Cable

- a) HV cables shall be 6600V unearthed grade, heavy duty, stranded aluminium conductor, XLPE insulated, extruded black FRLS PVC inner sheathed, armoured and overall FRLS extruded black PVC outer sheathed (Type ST-2) cables conforming to IS: 7098 part II.

1.4.2 Conductor

The cable conductor shall be made from standard Aluminum to form compact conductor having a resistance within the limits specified.

1.4.3 Conductor Shield

The conductor having a semi-conducting screen shall ensure perfectly smooth profile and avoid stress concentration. The conductor screen shall be provided over the conductor by applying non metallic semi conducting tape or by extrusion of semi conducting tape or by extrusion of semi-conducting compound or a combination of the two. The semi conducting polymer shall be cross linked for XLPE cables.

1.4.4 Insulation

The insulation of the HV cables shall be XLPE type. It shall be designed and manufactured for the specified system voltage. The manufacturing process shall ensure that insulation shall be free from voids. The insulation shall withstand mechanical and thermal stresses under steady state and transient operating conditions. The extrusion method should give a very smooth interface between semi conducting screen and insulation. The insulation of the cables shall be of high standard quality.

1.4.5 Insulation Shield

A non magnetic semi conducting shield shall be put over the insulation to confine electrical field to the insulation. The XLPE cable insulation shield shall be strippable.

The metallic layer of the insulation shield shall be grounded at least at one location in the cable's run. In the case of single conductor cable, care should be taken with regard to ampacity when grounding at more than one point.

For all the cables having insulation shield, it shall have some form of stress relief measure at every splice at termination. This can be stress cones, moulded devices, heat shrink or cold shrink kits. All kits must be suitable for the voltage class and cable size.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[4]	25.09.2014

1.4.6 Inner Sheath

The sheath shall be suitable to withstand the site conditions and the desired temperature. It shall be of adequate thickness and applied by a continuous process to produce a sheath of consistent quality free from all defects. PVC sheath shall be extruded with FRLS properties.

1.4.7 Armour

HV cables shall be provided with galvanized steel wire/strip armouring. The hard drawn aluminium wire for armour shall be of H4 grade, as per IS-8130 (having tensile strength above 150 N/mm²). The diameter of the aluminium wire shall be as per the table for the dimensions of the galvanized steel wire armour given in the relevant standard.

1.4.8 Outer sheath

Outer sheath shall be extruded layer of FRLS PVC compound (ST-1). Sheath shall be resistant to water, Ultra Violet radiations, fungus, termites and rodent attacks. The color of the sheath shall be black.

1.4.9 Packing

[Cables shall be supplied in non-returnable drums]. Drum lengths shall be such so that cable joints are totally avoided. The drums shall be of heavy construction. *[All wooden parts shall be manufactured from seasoned wood.]* All ferrous parts used shall be treated with suitable rust preventive finish or coating to avoid rusting during transit or storage. *[Wooden cable drum shall be treated by immersing in copper-nitrate solution.]*

The ends of each cable length shall be sealed before shipment. Heat shrinkable cable cap shall be used for this purpose.

[A label shall be securely attached to each end of the reel indicating the Purchaser's order number, Owner's identification mark, length, type, voltage grade, conductor size and number of cores of the cable.] A tag containing the same information shall be attached to the leadings end of the cable inside. An arrow and necessary instructions shall be marked on the drum indicating the direction in which it should be rolled. Drum numbers are to be indicated on the cable drums. Drum length shall not be less than 500m or as per required length.

1.4.10 Identification of cores:

HV power cables shall be identified by color code.

1.4.11 Constructional Requirements

- a) Cable shall have suitable filters laid up with the conductors to provide a substantially circular cross section before the sheath is applied. Fillers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[5]	25.09.2014

shall be suitable for the operating temperature of the cable and compatible with the insulating material. All materials shall be new, unused and of finest quality.

b) Workmanship shall be neat, clean and of the highest grade.

c) Special Properties:

All the above cables shall be conforming to the relevant Indian/IEC standard in general, with the following special properties:

- i. Oxygen Index of the outer sheath shall not be less than 29, when tested as per ASTM-D-2863.
- ii. Temperature Index of the outer sheath shall not be less than 250 °C, when tested as per ASTM-D-2863.
- iii. Halogen acid contents in outer sheath shall not be more than 20%, when tested as per IEC-60754.
- iv. The maximum smoke density in percent light absorption should not exceed 60% in case of PVC compound and 20% in case of fire survival cables, when tested as per ASTM-D-2843.
- v. Swedish chimney test as per SS-4241475 class F3 and ladder test for flammability as per IEEE-383.
- vi. The cables shall be tested for resistance to Ultraviolet radiation. The retention values of tensile strength and ultimate elongation after test shall be minimum 60% of tensile strength.
- vii. Outer sheath of cable shall be subject to tests for water absorption. The methodology shall be as per IS 10810 part 33.

1.4.12 Joints and Terminations

Materials of construction for a joint/termination shall perfectly match with the dielectric chemical and physical characteristics of the associated cables. The material and design concepts shall incorporate a high degree of operating compatibility between the cable and joints. The protective outer covering (jacket) used on the joints/terminations shall have the same qualities as that of the cable outer sheath in terms of ambient/operating temperature withstand capability and resistance to hazardous environments and corrosive elements. No joints shall be allowed unless the cable drawn length is exceeded.

1.4.13 Cable Identification

Cable identification shall be provided by embossing the following on the outer sheath:

- a. [Manufacturer's name or trade mark]
- b. Voltage grade
- c. Year of manufacture
- d. Type of insulation.
- e. Type of outer sheath e.g. "FRLS" etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[6]	25.09.2014

- f. ISI marks
- g. Nominal cross sectional area of the conductor & no of cores
- h. Sequential marking
- i. Owner's identification mark]

1.4.14 Fire Proof sealing system

- i) General
 - a) Fire proof sealing system shall consist of Fire-stops/fire-seals for sealing of cable/cable tray and conduit/pipe penetrations, both horizontal and vertical, through brick or RCC walls/floors, to prevent the spread of fire from one area, which is separated from others by fire-resistant barriers.
 - b) 'Fire-breaks' provided on long runs of cable racks/trays to prevent the propagation of fire along the cable rack, within a single fire-area or fire- zone.
 - c) The FPS system shall also include all the necessary accessories and equipment required for supporting, holding in position, fixing and installation of the fire-stop/fire-break.
 - d) The FPS system shall comply in all respects with the requirements of the codes and standards listed below

IEEE-634 ASTM-E-814

ANSI-IEEE-383 IEC-331 IEC-332

ii) Fire stop/ seal

The FPS system adopted for cables or cable trays penetrating through walls and floor constitute a openings, or cables passing through embedded conduits / pipes / pipe- sleeves, fire stop / seal', which is meant to prevent spreading of fire between areas separated by fire-resistant barriers.

iii) Fire Break

The fire proofing system, other than fire-stops, adopted to retard flame propagation long runs of horizontal or vertical cable trays in the same fire zone or area, in an event of a fire, shall constitute a 'fire-break' and shall be provided by applying a suitable fire –resistance coating on cables and cable trays for the required length, with or without a fire resistant panel, at the point of the fire break to obtain the fire-rating specified.

iv) Application of fire proof sealing system

Fire stops shall be provided for cable penetration openings listed below

The passage of cables/cable trays pipe sleeves/embedded conduits through walls / floors.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[7]	25.09.2014

Vertical raceways, which carry cables between successive floors, through openings provided in the RCC floor slab, shall be sealed by fire stops at each floor level.

Cable entry through openings in floor slabs below HT/LT switchgear, MCCs, various Control and relay panels and other bottom entry panels, shall be effectively sealed by fire stop

Location of fire breaks

Firebreaks shall be provided on both cable rack and trenches at all cable tray Intersections and tee-offs.

On linear runs of cable trays between fire stops or fire breaks, fire breaks shall be provided at intervals of 15 metres on horizontal cable runs and 5 m on vertical cable runs.

Fire breaks in linear runs of cable trenches between intersections and tee-offs shall be provided at intervals of 30 metres.

Bidder shall furnish the test certificates for the fire stops and fire breaks after award of contract for Owner/Owner's Representative review. If the certificates are not satisfactory all the tests shall be conducted free of cost. The offered system i.e. fire stops and fire breaks shall be identical (or better) with the system which is successfully type tested for the specified rating i.e. the composition density of the material, thickness of coating in case of fire breaks and any other properties of the material / system offered shall be identical or better than the tested system and shall be subject to Owner / Owner's Representative.

v) Test on fire stops

The fire stops shall be subjected to the following type tests:

- a. Fire Rating Test
- b. Hose Stream Test

Type tests shall be conducted on different fire stop test specimens described above as per IEEE-634. The sizes of the fire stop test specimens shall be similar to the largest of the sizes being used in the plant.

Preconditioning of fire stop test specimens before conducting the fire rating and hose stream tests, each test specimen shall be preconditioned for thermal ageing, water immersion and vibration.

Test on Fire Stops

During the fire rating test, the transmission of heat through the cable penetration fire stop shall not raise the temperature on its unexposed surface above the self ignition temperature of the outer cable covering, the cable penetration fire stop material, or material in contact with the cable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[8]	25.09.2014

penetration fire stop, with a maximum temperature limit on the unexposed surface of 200°C.

Tests on fire breaks

Firebreaks shall undergo the following tests as per ANSI-IEEE-383:

- Ampacity test
- Flame test

1.5 Tests

1.5.1 Type Test

For each type & rating of HV cables, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The list of type tests are as follows:

- a) Tests on conductor:
 - i. Annealing test (for copper)
 - ii. Tensile test (for aluminum)
 - iii. Wrapping test (for aluminum)
 - iv. Conductor resistance test.
- b) Test for armouring wires/strips
- c) Test for thickness of insulation and sheath
- d) Physical tests for insulation and outer sheath:
 - i. Tensile strength and elongation at break
 - ii. Ageing in air oven
 - iii. Shrinkage test
 - iv. Hot deformation
 - v. Loss of mass in air oven
 - vi. Heat shock test
 - vii. Thermal Stability
- e) Insulation resistance test
- f) High voltage test (water immersion test)
- g) High voltage test at room temperature
- h) Flammability test

LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E7	[9]	25.09.2014

1.5.2 Routine Test

Cables shall be subject to acceptance and routine tests as per IS codes. Acceptance tests and FRLS test as specified earlier shall be conducted on cables and the same shall be witnessed by purchaser.

The FRLS test shall be carried out on one cable of each batch of compound used. Other acceptance tests shall be carried out on drums selected as per sampling plan as indicated in IS. Test certificates for routine acceptance and special tests shall be furnished by the Bidder for review and approval of purchaser.

1.6 Drawings, Data and Manuals

The following drawings/documents and calculation as listed below but not limited to shall be furnished along with the bid for review

- [Cable datasheets and cross sectional drawings]
- [Cable sizing calculation]
- [QAPs & Test Reports]
- [Relevant catalogues]
- [Estimated weight of cable and cable drum]

1.7 Ratings and Requirements

ANNEXURES-E8

1.0 LV CABLES

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of LV cables for power & control applications complete with all accessories for efficient and trouble-free operation for of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client]..

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified or supplemented by this specification.

Table: 1.0

IS:1554(Part I)	:	PVC insulated (heavy duty) electric cables for working voltage up to and including 1100V
IS: 2982	:	Copper conductor in insulated cables and cords.
IS: 3961	:	Recommended current ratings for cables.
IS: 3975	:	Mild steel wires, strips and tapes for armouring cables
IS: 5609	:	Specification for low frequency wirers and cables with PVC insulation and PVC sheath
IS:5831	:	PVC insulation and sheath of electric cables
IS: 6380	:	Specification of elastomeric insulation of sheath of electric cables.
IS:7098(Part I)	:	XLPE insulated PVC sheathed cables for working voltage up to 1.1kV
IS: 8130	:	Conductors for insulated electric cables and flexible cords
IEC: 60	:	High voltage test techniques

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[1]	25.09.2014

IEC: 230	:	Impulse tests on cables and their accessories
IEC: 287	:	Calculation of the continuous current rating of the cables(100% load factor).
IEC: 288	:	Nominal cross sectional area and composition of conductor of insulated cables.
IEC-331	:	Fire resisting characteristics of electric cables
IEC: 332-1	:	Test on electric cables under fire conditions.
IEEE: 383	:	Standard for type test for class IE electric cables, filled splices and connection for nuclear power generation station.
IEC: 502	:	Extruded solid dielectric insulated power cables for rated voltages from 1kV upto 30kV.
IEC: 540	:	The methods for insulations and sheath of electric cables and cords(elastomeric and thermoplastic compounds)
IEC-754-I	:	Test method for acid gas generation
NEMA-WC-5	:	Thermoplastic insulated wires and cables for transmission and distribution of electrical energy.
ASTM-D-2843	:	Standard test method for density of smoke from burning/decomposition of plastics.
ASTM-D-2863	:	Test for determination of oxygen index.
CEA	:	CEA Regulations
CEA	:	Standard Technical Specifications For Main Plant Package

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[2]	25.09.2014

The electrical installation shall meet the requirements of Indian Electricity Rules as amended upto date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) The cables shall be installed in hot, humid tropical atmosphere with ambient temperature of 50°C.
- b) All LV cables shall be suitable for operation under the following voltage & frequency variations:

Voltage Variation : (±) 10%

Frequency Variation : (+) 3% to (-)5%

Combined Variation of Voltage & Frequency : 10% (absolute sum)

- c) The LV power cables shall be 1100V grade, single/multi core stranded Aluminum conductor, extruded XLPE/PVC insulated with extruded PVC inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-1). These cables shall conform to IS 7098 (Part I) for XLPE and 1554(part 1) for PVC insulation.
- d) The control cables shall be 1100 V grade, multi core, stranded annealed high conductivity copper with extruded PVC insulated inner sheath, armoured and overall sheath with extruded Flame Retardant Low Smoke (FRLS) PVC compound (Type ST-1).
- e) The continuous and short time current carrying capacity of XLPE insulated cables shall be based on maximum operating temperature of 90°C and 250°C respectively.
- f) The continuous and short time current carrying capacity of PVC insulated cables shall be based on maximum operating temperature of 70°C and 160°C respectively.
- g) LV power cables shall be sized taking into account the following derating factors:
 - i. Max Ambient air temperature
 - ii. Max Ambient ground temperature
 - iii. Grouping of cables/Method of laying
 - iv. Depth of laying for cable buried in ground.
 - v. Soil thermal resistivity for cable buried in ground.
- h) Power cables shall be chosen taking into account the following factors:
 - i. System Fault level.
 - ii. Maximum time for fault clearance (i.e, operating time of the backup protection relays plus the time of operation of the circuit breakers).
 - iii. Full load current of the circuit.
 - iv. Short circuit current and duration (for breaker protected cables)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[3]	25.09.2014

- v. Installation conditions.
- vi. Voltage drop under normal running and starting condition
- vii. Voltage drop at motor terminals shall be within permissible limit during starting & normal running. i.e 5% during steady state and 15% during transient or starting at motor terminal.
- viii. The cable should withstand the maximum fault current corresponding to the particular voltage level for the minimum time before the fault is cleared.
- ix. Consideration shall also be given to limit the cable to the nearest standard sizes instead of using too many types.
- x. The minimum size of cables to be used shall be as follow :
 - Aluminium conductor : 6 Sq. mm.
 - Copper conductor : 2.5 Sq. mm

1.4 Specific Requirements

1.4.1 Type of Cable

- a) LV power cables shall be 1100V grade, heavy duty, stranded aluminium conductor, XLPE/ PVC insulated, extruded black FRLS PVC inner sheathed, armoured and overall FRLS extruded black PVC outer sheathed (Type ST-1) cables conforming to IS: 1554(Part 1) for PVC insulation and IS 7098(Part 1) for XLPE insulation.
- b) Control Cables shall be 1100 V grade, heavy duty with annealed high conductivity stranded copper conductor, PVC insulated, FRLS PVC inner sheathed, armoured and FRLS extruded black PVC outer sheathed (Type ST-1) cables conforming to IS : 1554.
- c) LV power cables of size above 35 sq. mm may be provided with XLPE insulation. Bidder shall clearly indicate the type of insulation provided in the technical bid.

1.4.2 Conductor

The cable conductor shall be made from standard Aluminum for LV Power cables and Copper for control cables to form compact conductor having a resistance within the limits specified. All the cables of size 25mm² and above shall have sector shaped conductors.

1.4.3 Insulation

The insulation of the LV power and control cables shall be [XLPE/PVC] type. It shall be designed and manufactured for the specified system voltage. The manufacturing process shall ensure that insulation shall be free from voids. The insulation shall withstand mechanical and thermal stresses under steady state and transient operating conditions. The extrusion method should give a very smooth interface between semi conducting screen and insulation. The insulation of the cables shall be of high standard quality.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[4]	25.09.2014

1.4.4 Inner Sheath

The sheath shall be suitable to withstand the site conditions and the desired temperature. It shall be of adequate thickness and applied by a continuous process to produce a sheath of consistent quality free from all defects. PVC sheath shall be extruded with FRLS properties.

1.4.5 Armour

LV power and control cables shall be provided with galvanized steel wire/strip armouring. The hard drawn aluminium wire for armour shall be of H4 grade, as per IS-8130 (having tensile strength above 150 N/mm²). The diameter of the aluminium wire shall be as per the table for the dimensions of the galvanized steel wire armour given in the relevant standard.

1.4.6 Outer sheath

Outer sheath shall be extruded layer of FRLS PVC compound (ST-1). Sheath shall be resistant to water, Ultra Violet radiations, fungus, termites and rodent attacks. The color of the sheath shall be black.

1.4.7 Packing

[Cables shall be supplied in non-returnable drums]. Drum lengths shall be such so that cable joints are totally avoided. The drums shall be of heavy construction. *[All wooden parts shall be manufactured from seasoned wood.]* All ferrous parts used shall be treated with suitable rust preventive finish or coating to avoid rusting during transit or storage. *[Wooden cable drum shall be treated by immersing in copper-nitrate solution.]*

The ends of each cable length shall be sealed before shipment. Heat shrinkable cable cap shall be used for this purpose.

[A label shall be securely attached to each end of the reel indicating the Purchaser's order number, Owner's identification mark, length, type, voltage grade, conductor size and number of cores of the cable.] A tag containing the same information shall be attached to the leadings end of the cable inside. An arrow and necessary instructions shall be marked on the drum indicating the direction in which it should be rolled. Drum numbers are to be indicated on the cable drums. Drum length shall not be less than the following:

- a) Power cables: 500m
- b) Control cables: 1000m

1.4.8 Identification of cores and spares:

LV power cables shall be identified by color code. However LV control cables shall be identified by the number of its cores.

[Multi-core control cables shall have 20% spare core, minimum one spare.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[5]	25.09.2014

1.4.9 Constructional Requirements

- a) Cable shall have suitable filters laid up with the conductors to provide a substantially circular cross section before the sheath is applied. Fillers shall be suitable for the operating temperature of the cable and compatible with the insulating material. All materials shall be new, unused and of finest quality.
- b) Workmanship shall be neat, clean and of the highest grade.
- c) Special Properties:
All the above cables shall be conforming to the relevant Indian/IEC standard in general, with the following special properties:
 - i. Oxygen Index of the outer sheath shall not be less than 29, when tested as per ASTM-D-2863.
 - ii. Temperature Index of the outer sheath shall not be less than 250 °C, when tested as per ASTM-D-2863.
 - iii. Halogen acid contents in outer sheath shall not be more than 20%, when tested as per IEC-60754.
 - iv. The maximum smoke density in percent light absorption should not exceed 60% in case of PVC compound and 20% in case of fire survival cables, when tested as per ASTM-D-2843.
 - v. Swedish chimney test as per SS-4241475 class F3 and ladder test for flammability as per IEEE-383.
 - vi. The cables shall be tested for resistance to Ultraviolet radiation. The retention values of tensile strength and ultimate elongation after test shall be minimum 60% of tensile strength.
 - vii. Outer sheath of cable shall be subject to tests for water absorption. The methodology shall be as per IS 10810 part 33.

1.4.10 Joints and Terminations

Materials of construction for a joint/termination shall perfectly match with the dielectric chemical and physical characteristics of the associated cables. The material and design concepts shall incorporate a high degree of operating compatibility between the cable and joints. The protective outer covering (jacket) used on the joints/terminations shall have the same qualities as that of the cable outer sheath in terms of ambient/operating temperature withstand capability and resistance to hazardous environments and corrosive elements. No joints shall be allowed unless the cable drawn length is exceeded.

1.4.11 Cable Identification

Cable identification shall be provided by embossing the following on the outer sheath:

- a. [Manufacturer's name or trade mark]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[6]	25.09.2014

- b. Voltage grade
- c. Year of manufacture
- d. Type of insulation.
- e. Type of outer sheath e.g. "FRLS" etc.
- f. ISI marks
- g. Nominal cross sectional area of the conductor & no of cores
- h. Sequential marking
- i. Owner's identification mark]

1.5 Tests

1.5.1 Type Test

For each type & rating of LV power and control cables, the Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

The list of type tests are as follows:

- a) Tests on conductor:
 - i. Annealing test (for copper)
 - ii. Tensile test (for aluminum)
 - iii. Wrapping test (for aluminum)
 - iv. Conductor resistance test.
- b) Test for armouring wires/strips
- c) Test for thickness of insulation and sheath
- d) Physical tests for insulation and outer sheath:
 - i. Tensile strength and elongation at break
 - ii. Ageing in air oven
 - iii. Shrinkage test
 - iv. Hot deformation
 - v. Loss of mass in air oven
 - vi. Heat shock test
 - vii. Thermal Stability
- e) Insulation resistance test
- f) High voltage test (water immersion test)
- g) High voltage test at room temperature
- h) Flammability test

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E8	[7]	25.09.2014

1.5.2 Routine Test

Cables shall be subject to acceptance and routine tests as per IS codes. Acceptance tests and FRLS test as specified earlier shall be conducted on cables and the same shall be witnessed by purchaser.

The FRLS test shall be carried out on one cable of each batch of compound used. Other acceptance tests shall be carried out on drums selected as per sampling plan as indicated in IS. Test certificates for routine acceptance and special tests shall be furnished by the Bidder for review and approval of purchaser.

1.6 Drawings, Data and Manuals

The following drawings/documents and calculation as listed below but not limited to shall be furnished along with the bid for review

- [Cable datasheets and cross sectional drawings]
- [Cable sizing calculation]
- [QAPs & Test Reports]
- [Relevant catalogues]
- [Estimated weight of cable and cable drum]

1.7 Ratings and Requirements

1.7.1 L.V. Power and control cables, 1100 V grade

Table: 2.0

S.No.	Technical Particulars	Unit	Parameters	Remarks
1.	System voltage		415 V	
2.	Voltage Grade		1.1 kV	
3.	Ambient Temperature		50°C	
4.	Maximum conductor temperature for continuous operation for XLPE/PVC cables		For XLPE: 90°C For PVC: 70°C	
5.	Maximum conductor temperature for		For XLPE: 250°C For PVC: 160°C

TECHNICAL SPECIFICATION FOR ILLUMINATION SYSTEM

**PREPARED BY
LAHMEYER INTERNATIONAL (INDIA) PVT. LTD.
THE CONSULTANT**

ANNEXURES-E9

1.0 ILLUMINATION SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Illumination System complete with luminaries and all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table: 1.0

Code		Name of Standard
IS 1913	:	Electrical lighting fittings- General and safety requirements
IS 2418 - Part I	:	Tubular fluorescent Lamp
IS 3480	:	Flexible steel conduits for electrical wiring
IS 3646 (Part I to III)	:	Code of Practice For Interior Illumination
IS 4012	:	Dust proof electric lighting fittings
IS4013	:	Flame proof enclosure
IS 6665	:	Code of practice for industrial lighting
IS 5077	:	Decorative light fittings
IS 9537 - Part II	:	Rigid steel conduits for electrical installations

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[1]	25.09.2014

IS 9583	:	Emergency lighting units
IS 9900	:	High pressure mercury vapor lamp
IS 9974	:	High pressure sodium vapor lamp
IS 10322	:	Luminaries for street lighting
CBIP Manual	:	Substation Equipment, Illumination and Layouts
IES (Illuminating Engineering Society of North America)	:	Application and Reference Volume
IEC 60598	:	Luminaries
CEA	:	CEA regulations and standard technical specification.

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted subject to approval of the Owner. In such case, copies of the English version of the standards adopted shall have to be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Codes of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a. All illumination systems shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The illumination systems shall be suitable for operation in a highly polluted environment.
- b. Lighting fixtures shall be suited for the following range of frequency and voltage variations:
 - i. Voltage Variation : $\pm 10\%$
 - ii. Frequency Variation : 50Hz (+)3% to (-)5%
 - iii. Combined Variation of Voltage & Frequency : 10% (absolute sum)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[2]	25.09.2014

- c. All emergency DC lighting systems shall be suited for voltage variation from -15% to + 10% of rated voltage.
- d. The design of the lighting systems shall be such that it shall ensure average lux levels specified for different areas.
- e. The illumination system shall comprise of the following:
 - i. Normal AC lighting
 - ii. Normal cum emergency lighting system
 - iii. 220V DC Emergency lighting system
 - iv. Maintenance 24V AC lighting system
 - v. Portable emergency lights with self contained battery packs.

1.4 Specific Requirements

1.4.1 Scope of work

The scope of work shall include design, preparation of Lighting design and manufacture, supply, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with Lighting system for following areas Listed below but not limited to the following:

[Note: With reference to particular package, scope of work shall be modified.]

a) TG Area:

- i) TG Platforms.
- ii) TG area Grade Levels Maintenance area.
- iii) Switchgear room and cable gallery.
- iv) All roads within battery limit.
- v) Perimeter and boundary illumination of the above premises.
- vi) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.

b) Boiler Area:

- i) Boiler Platforms
- ii) Boiler Grade Levels covering coal mill and Maintenance area.
- iii) ESP Platforms
- iv) ESP/FOPH switchgear room and cable gallery.
- v) FOPH area.
- vi) Transfer towers & Conveyor galleries.
- vii) All roads within battery limit.
- viii) Perimeter and boundary illumination of the above premises.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[3]	25.09.2014

- ix) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- c) Balance of plant Area:
 - i) Lighting system for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- d) CHP Area:
 - i) Switchgear rooms
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- e) AHP Area:
 - i) Switchgear rooms.
 - ii) All roads within battery limit.
 - iii) Perimeter and boundary illumination of the above premises.
 - iv) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard control room
 - ii) GIS building (if applicable)
 - iii) Transformer area
 - iv) All roads within battery limit.
 - v) Perimeter and boundary illumination of the above premises.
 - vi) Any other area/premises not specifically mentioned here, but which fall under the battery limit of this package is included in the scope.

1.4.2 Illumination System Description

The plant illumination system shall comprise of the following categories:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[4]	25.09.2014

a. Normal AC lighting

In this system, the lighting circuits shall be fed by the 3 phase, 4 wire normal AC supply from the normal lighting distribution boards (LDB). All the lighting fixtures connected to this system shall be available as long as the 415V station / unit auxiliary service supply is available.

b. Normal cum emergency lighting system

Certain lighting fixtures considered essential shall be connected to this system. In this system the lighting circuits shall be fed from lighting distribution board connected to 415V Normal cum Emergency Switchgear. The lighting fixtures connected to this system shall be available whenever normal supply is available in the plant and also whenever DG set supplies the power to 415V Normal emergency switchgear.

These lighting fixtures will go off for a few seconds when normal supply fails but will be automatically restored when the emergency AC bus is re-energized by automatic transfer to standby DG supply.

[20% of the total fittings shall be fed from Emergency lighting for areas such as Switchgear room and control rooms etc.]

c. Emergency 220 V D.C. Lighting

The Emergency DC Lighting System shall be located strategically in critical operating areas and at emergency exits. Emergency DC lighting shall also be provided in the Control rooms, Switchgear/ MCC rooms and other strategically important areas. These fixtures shall be fed from respective Emergency DC Lighting Panels. The Emergency DC Lighting Panels (DC ELLP) shall be fed from 220V DC Distribution Boards (DCDB).

These lights shall remain normally OFF but on failure of AC supply these lights shall be automatically ON. Tube lights with Electronic choke suitable for 230 V, AC / DC operation or other Energy Efficient Lamps may be used for DC emergency lighting.

d. Maintenance 24 V AC Lighting System

For lighting facilities comprising portable hand lamps and/or connection of portable hand tools etc., required during the routine maintenance work, 24V single phase 3 pin sockets with switches shall be provided at selected points in the areas listed below. Such sockets for routine maintenance shall be clearly identified by colour coding in order to distinguish them from the normal 240V power outlets. Necessary outlets shall be made on the inside walls of the building near equipments.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[5]	25.09.2014

- i. Boiler area: Near inspection manholes on the boiler platforms and near boiler drum at different levels on all four sides.
- ii. TG building: Near HP & LP heaters, turbine flash tank, blow down tank, near condenser water box and near bus duct termination of generator end.
- iii. ESP columns: Near inspection manholes
- iv. Near de-aerator.
- v. Cable galleries.

Any other areas considered necessary identified during detailed engineering.

e. Portable Emergency Lights

This system shall be provided by portable self-contained battery / automatic charger / inverter fed compact fluorescent lamps in isolated buildings / areas where station D.C. supply is not available. These portable emergency light units shall be switched on automatically on loss of normal AC supply. *[Battery packs for portable emergency lights shall be rated for minimum 3 hours duty and the battery shall be of Ni-Cd.]*

f. Exit lights

Emergency escape signs shall be provided at the exit doors, escape routes, intersection corridors, at different floor levels/directions, windowless rooms, toilets, firefighting equipment, lifts, control rooms, switchgear rooms and the areas considered necessary by bidder. *[9W CFL]* lamp shall be used for exit lamps.

The contractor shall design emergency exit lighting system based on plant layouts and install escape lights at suitable locations considering the various escape routes. Emergency exit lights will be fed from normal-cum-emergency lighting panel, wherever available, *[and will be with in-built battery (Ni-Cd) back up of 3 hours operation.]*

1.4.3

Illumination Calculation

- a. Standard Lumen method shall be adopted for interior and exterior lighting in order to determine the number of lighting fixtures for obtaining the desired average level of illumination.
- b. The coefficient of utilization shall be considered to take care of Lumen loss due to:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[6]	25.09.2014

- i. Effect of room dimensions.
 - ii. Absorption of light in luminaries.
 - iii. Absorption of light at various room surfaces i.e. ceiling wall etc.
 - iv. Floor cavity, ceiling cavity.
 - v. Mounting height.
- c. Moreover a maintenance factor shall also be considered to account for the fall of illumination due to aging, pollution like dust deposits etc.
- d. Voltage drop at the fixture terminals from the MLDB shall [not exceed 3%]. Circuit loading of each lighting Panel shall be done in such a way that almost balanced loading in all the phases i.e. R, Y and B is achieved. At least two sub circuits shall be used for illumination of a particular area. Sub circuit loading of each lighting panel shall be restricted to 2000 Watts.
- e. Design of lighting system shall be such that the average lux level as specified is achieved. The Bidder shall submit illumination calculation/layout for the purchaser's review.

1.4.4 Lighting Distribution System

- a. Separate lighting transformers shall be provided inside the lighting distribution boards located at required location. Lighting distribution system shall be distinct and separate from the LV main distribution. Lighting transformers shall be encapsulated cast resin dry type.
- b. AC lighting panels shall have 240V single-phase, 2 wire incomer controlled by earth leakage circuit breaker and number of single phase outgoing circuits controlled by MCBs. The lights connected to a circuit or few circuits shall be 'ON' automatically through photocell for outdoor lighting. Provision shall be made for switching 'ON' the rest of the lights. Lighting fixtures in indoor areas shall be controlled from the respective lighting panels
- c. Normal 240 V AC Lighting System
For this system, lighting points shall be supplied at 240 V AC through 415 V, 3-phase, 4-wire, 50 Hz, LDB. The supply shall be derived from 415 V, 3-phase, 4-wire, 50 Hz switchgear through delta/star lighting transformer. The secondary of lighting transformer shall be connected to respective 415 V, 3-phase, 4-wire AC lighting distribution board (LDB). The LDBs shall be provided with number of outgoing circuits controlled by double pole MCBs to feed the lighting panels distributed in and around the plant. Different circuits shall be used from different source. The whole lighting network shall be balanced as far as possible.
- d. Normal/Emergency 240V AC System
For these systems, the distribution shall be by 415V, 3-phase, 4-wire, 50 Hz supply. This supply shall be derived from 415 V, 3-phase, 4-wire, 50

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[7]	25.09.2014

Hz normal emergency switchgear for NE & lighting through delta/star lighting transformer. The secondary of lighting transformer shall be connected to respective 415 V, 3-phase, 4-wire AC lighting distribution board (LDB). The LDBs shall be provided with number of outgoing circuits controlled by double pole MCBs to feed the lighting panels distributed in and around the plant.

e. Emergency 220 V DC Lighting System

The power supply shall be obtained from the nearest 220 V DC switchboard. DC lighting panel will have one (1) incomer controlled by double pole MCB, Outgoing circuits will be controlled by DP MCB. Upon failure of the normal-cum-emergency AC supply, emergency DC lighting fixtures will be made automatically ON. The change over in the reverse direction shall also be automatic.

f. Maintenance 24V AC Lighting System

24 V AC supply for maintenance purposes (for hand lamps and/or hand operated tools) shall be supplied from 24 V AC distribution panel, which receives 240 V power supply from 415 V/240V transformer modules of N/E switchgear. 24 V AC distribution panel consists of one incomer controlled by MCB, one 240/26.5 V dry type transformer of adequate rating and number of outgoing circuits controlled by MCB.

1.4.5 Illumination levels and choice of lighting fixtures

The area-wise distribution of average illumination levels and type of luminaries shall be as indicated below:

[Note: These are indicative only. However as per specific Existing project, Bidder may refer section I of this specification for exact details of type of fixtures.]

Table 2.0

Sl. No.	Area/Structure	Average Illumination Level in Lux	Type of Fixture	Type of Luminaries
A - TURBINE GENERATOR BUILDING				
1.1	General (auxiliary equipment areas)	200	Industrial well glass fixture, dust & jet proof, die cast aluminium body, stove enamel finish, vitreous enamel reflector integral mounted control gear/industrial bulk head with integral mounted control gear.	1x70 W/ 1x150 W HPSV lamp

Sl. No.	Area/Structure	Average Illumination Level in Lux	Type of Fixture	Type of Luminaries
1.1	Control room	400	Energy Efficient 2x40W FTL industrial type of vitreous enamel finish and with Electronic choke suitable for 220V DC operation	CFL lamp
1.2	Other areas	250	Energy Efficient 2x40W FTL industrial type of vitreous enamel finish and with Electronic choke suitable for 220V DC operation	CFL lamp

1.4.6 Area wise distribution of Lighting system in plant

Area wise lighting distribution shall be as below:

Table: 3.0

Area/building	Percentage Distribution of Lighting		
	Normal	Normal & Emergency	220V DC
Turbine Generator Building (all the bays)	80%	20%	10%
Control rooms	80%	20%	10%
Boiler Area (Grade level & Platforms)	80%	20%	5%
Service building	90%	10%	5%
Various pump houses and electrical switchgear rooms such as AHP, CHP, FOPH switchgear room, etc.	90%	10%	5%
Electro static precipitator	90%	10%	5%
Switchyard and Transformer yard	80%	20%	5%

1.4.7 Lighting System Design

The lighting system design shall comply with the acceptable norms and the best engineering practices. The system design shall consider principles of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[12]	25.09.2014

lighting specified in following paragraph. The lighting layout shall be designed to provide uniform illumination with minimum glare. The layout design shall meet all the statutory requirement, local rules etc.

a. Indoor Lighting

The recommended values of illumination level for various areas in the plant are indicated in the table above. Lighting layouts shall be designed such that the ratio of minimum to average illumination shall not be less than [0.6]. Following factors shall be considered while arriving at the utilization factor to determine the number of fixtures for each area/buildings in the plant.

i. Maintenance Factor:

- Air conditioned clean interiors like office rooms, Laboratories, Auditoriums : 0.8
- Air conditioned clean interiors like office rooms, Laboratories, Auditoriums : 0.8
- Industrial areas with normal interiors such as workshops, stores : 0.7
- Industrial areas with dusty interiors : 0.6
- Industrial areas with very dusty interiors such a crusher house and junction towers : 0.5

ii. Reflection factor for wall/ceiling

- White and very light colors : 0.7
- Light colors : 0.5
- Middle tints : 0.3
- Dark colors : 0.1

iii. The working plane shall be considered at 0.85 m from the floor level.

iv. The value of the ratio of spacing (S) to mounting height (H) shall be commensurate with the type of fittings selected and uniformity of illumination. The suspension height for suspended fixtures shall not exceed 1 meter.

b. Outdoor Lighting

- i) The recommended illumination levels for outdoor areas are indicated in the above table.
- ii) Mounting height, spacing of flood lights shall be based on lamp wattage, uniformity of illumination and vertical angles. Ratio of minimum to average illumination shall not be less than 0.3 and for minimum to maximum shall not be less than 0.05.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[13]	25.09.2014

- iii) Maintenance factor shall be generally 0.6 under average conditions.
- iv) Flood lights for area lighting shall be mounted on building structures. For outdoor lighting i.e. around the power plant building and transformer yard provision to be made with 400W outdoor type lamps mounted on wall/structures.
- v) Automatic switching ON/OFF shall be shall be provided through timers/photo cells.
- vi) For road illumination inside the boundary limit lighting poles shall be provided and the distance between the poles shall not exceed 30m.
- vii) Aviation obstruction lights shall be provided on tall installations (Chimney, Cooling Towers etc) as per Airports Authority and international standards. Aviation warning lights shall be high intensity type-A flashing LED type with varying intensity for day and night.
- viii) In an area, the lighting fixtures shall be arranged in different phase / LPs such that even in case one lighting panel is faulty complete lighting is not affected. In any location the lighting shall be arranged from two phases.
- c. The circuit loading on each circuit shall be restricted to 80% of the MCB rating.
- d. The voltage drop from LDB and any fixture shall not exceed 3%.
- e. All lighting design calculations, layouts, conduit wiring diagrams, LDBs and LPs drawings and technical data sheets etc shall be furnished for Owner/ Owner's consultant's approval.

1.4.8 Lighting system equipment

- a. Lighting Distribution Boards (LDB) & Lighting Panels (LP)
 - i. The Lighting Distribution board shall be fed through 415V/433V lighting transformers with off circuit taps $\pm 5\%$ in steps of 2.5%. The lighting transformer shall be cast resin dry type , vector group of [Dy1], class F insulation with temperature rise limited to class F and shall be housed in a suitable enclosure. In general, the transformers shall conform to the specification covered under 'Service transformers. The lighting distribution boards shall consist of MCCB incomer and required number of double pole MCB controlled out going feeders to LPs. The LDB shall be designed for the required short circuit level of [20] kA. All the distribution boards shall be sheet steel clad, dust and vermin proof, cubicle type with degree of protection conforming to IP-52. Outdoor panels shall be weather proof type with IPW-55 protection. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[14]	25.09.2014

thickness of sheet steel enclosures shall be CRCA, 2 mm minimum for load bearing and 1.6 mm for other members.

- ii. Number of outgoing feeders in each LDB shall be provided as per requirement including the minimum 3 nos spare feeders for "Purchaser use". Each outgoing MCB in LDB's shall be of 15 A, but load to be limited to 2 kW or maximum 10 nos. fittings to be connected to one MCB
- iii. Individual control in office buildings shall be through single pole flush type switches/MCBs. In those areas where group controls are required, rotary switches shall be provided
- iv. External area lighting shall be fed from separate boards located at suitable places. Automatic switching ON/OFF of these circuits shall be done through timers/photo cell.
- v. In high bays, walkway shall be provided for maintaining light fittings. At other places suitable ladder / platform / approach shall be provided for maintaining / replacement of light fittings.
- vi. Each of the LDBs shall be provided with voltmeter and ammeter along with selector switches, "SUPPLY ON" indicating lamps, etc. The switch boxes, receptacle boxes etc. shall be made up of 18 SWG sheet steel.
- vii. Two ground pads with bolts and nuts shall be provided on each board for connection to 50x6/25x3 mm GS flat.

b. Lighting Fixtures and Lamps

- i) Fluorescent fixtures with electronic ballast shall be generally provided for a room height upto 5m. Type of fixture shall be industrial type with gasket, clear acrylic cover and enamelled reflector or decorative type to suit the aesthetics. For areas with false ceiling, recessed mounted decorative fixtures with mirror optic louvres shall be used. In control room / computer rooms, decorative mirror optic fluorescent light fittings with antiglare features shall be provided. The surface finish shall be smooth, unobtrusive and scratch resistant.
- ii) Reflector shall be of sheet steel or aluminium, minimum 20 SWG thick and securely fixed by fastening device of captive type.
- iii) Fixture shall be suitable for 19 mm conduit entry and 16 SWG GI earth wire connection.
- iv) Fixture shall be furnished complete with lamps and integrally mounted accessories. These shall include holders, ballast, capacitor, starter, ignitors (separate type) etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[15]	25.09.2014

- v) For corrosive areas, corrosion proof lighting fixture shall be provided. For hazardous areas, light fittings, conduits, junction boxes etc. shall have to meet the corresponding area classification requirement.
- vi) Medium bay or high bay type of lighting fixtures with HPMV/HPSV lamps shall be used depending on the mounting heights for indoor areas having room height more than 5m. Medium/ High bay fixtures shall be provided with vibration damper wherever required.
- vii) For areas like boiler and outdoor areas such as roads, street, transformer areas and open yards, weatherproof HPSV flood/ street lighting fixtures shall be used. For areas like boiler platforms, weatherproof well glass type HPSV fixtures with wire guards shall be used.
- viii) All type of fluorescent lamps including Compact Fluorescent Lamp (CFL) shall be bi-pin rotary type and either cool daylight or white.
- ix) Mercury / Sodium vapour lamp shall be colour corrected type with screwed cap.
- x) Lamps shall be suitable for use in position and capable of withstanding small vibrations.
- xi) Ballasts shall be of heavy duty, low loss and polyester-filled type with copper winding.
- xii) Ballasts for Mercury / Sodium vapour lamps shall be provided with suitable tappings to set the voltage within range specified.
- xiii) Ballasts shall be free from hum. Ballasts which produce humming sound shall be replaced, free of cost.
- xiv) In multi-lamp fixture, each lamp shall be provided with individual ballast.

c. Switches, Receptacles

- i. In the plant areas, the lighting circuits shall be controlled directly from the MCBs in the lighting panels. Wherever the lighting panel is not in the same area, separate switches shall be provided. For cabins, rooms, etc., separate switches shall be provided for each point. Similarly for entrances, building periphery lighting separate switches shall be provided
- ii. 240V, 50 Hz, 3 pin Power Receptacles (5A, 15A) shall be provided in all building/areas of the plant. Inside a building, receptacles shall be provided at interval of 30m or part thereof for hand tools, water coolers, exhaust fans etc. Inside each cabins at

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[16]	25.09.2014

least two receptacles shall be provided and the same shall be indoor/outdoor/flameproof as per the location. Minimum 2 nos of 5A and 1 no 15A receptacles shall be provided in each room. Receptacles shall be heavy duty, complete with individual plug and switch as described below:

Table: 4.0

S.No.	Type	Description
1	RA	5A, 240V, 2 Pole, 3 Pin with third pin earthed - Suitable for flush mounting in office areas and control room. The switch shall also be flush mounting piano type.
2	RB	15A, 240V, 2 Pole, 3 Pin with third pin earthed - Wall/column mounted, metal clad gasketed construction, suitable for 19 mm conduit entry, screwed metal cover tied with metal chain, weatherproof construction suitable for indoor/outdoor installation. This shall be provided at an interval of 30m, or minimum one in each room.
3	RC	63A, 415V, 3 Phase, 5 pin interlocked plug and switch with fifth pin earthed. Wall/column mounted, metal clad gasketed construction weather proof, suitable for loop in/ loop out connection of 4 Core 35 sq.mm AYWY cable. These receptacles shall be provided at an interval of 50m throughout the Plant Area.
4	RD	100A, 415V, 3 phase, 5 Pin interlocked plug and switch with fifth pin earthed Wall/column mounted metal clad gasketed construction weather proof, suitable for loop in/ loop out connection of 3.5 Core, 95 sq.mm AYWY cable.

d. Cables and Wiring

- i. Wiring from lighting DBs/panels to individual fixtures, plug points, fans, etc. shall be of single core, 2.5sq.mm, 1100 V grade PVC stranded copper conductors through surface mounted or concealed medium duty GI conduits confirming to IS 1239 with earth wire. The wires in the conduits shall not exceed 60% of the conduit area.
- ii. 1100V grade stranded copper conductor, PVC insulated, colour coded, wires laid in GI conduits shall be used for lighting in non-hazardous area. In the hazardous area, outdoor areas like transformer yard and road lighting, cabling shall be adopted. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[17]	25.09.2014

specification of cable shall conform to the details indicated in "Cabling System" section.

- iii. Minimum size of wires in case of conduit wiring shall be 2.5sq.mm copper in case of lighting and 4sq.mm copper in case of receptacle wiring
- iv. Wires of different phases shall be run in separate conduits. However, wires of same phase but having different circuit nos. can be run in same conduit. Wires of lighting and power receptacles shall be carried out in separate conduits and on separate circuits. Wires of AC and DC lighting system shall be carried out in separate conduits
- v. For outdoor lighting, the cable shall be buried at a minimum depth of 750 mm from ground level or run in cable trays. The buried cables shall have suitable bedding, protective covers and markers
- vi. Material used for saddles, clamps, JBs, etc. shall be galvanized
- vii. Office buildings, laboratory buildings shall have concealed wiring with 2.5sq.mm wires using PVC conduits. In heat zones, i.e. in the areas where ambient temperature is 600 C and above, heat resistant control cables shall be used in hot dip galvanised rigid steel surface mounted conduits

e. Fans and Regulators

- i. The fans shall have three well balanced blades, double ball bearings and shall be reasonably free from noise. Fan motor shall be totally enclosed type with copper winding and class-E insulation. Sweep shall be given as 1200 /1400 mm.
- ii. Regulators shall have minimum five steps. Electronic Regulators with smooth control shall be provided.

f. Flame-Proof Equipment

- i. The enclosure of all flameproof equipment for use in hazardous areas where gases/vapors of Group I, IIA, IIB are present, shall be of cast iron/cast aluminum, stove enamel finished. Chemical corrosion resistant epoxy finish shall be provided in corrosive areas. The construction shall comply with relevant applicable standards
- ii. If the enclosures are additionally required to be weather proof, neoprene gaskets shall be provided to make the enclosure dust and weather proof providing a degree of protection of IPW 55.
- iii. All ferrous parts, exposed to atmosphere shall be suitably plated/galvanized

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[18]	25.09.2014

- iv. All internal wiring shall be connected to terminal blocks provided in terminal enclosure on incoming side.
- v. Flameproof cable gland entries shall be provided suitable for the cable sizes. The number of required cable entries for junction/terminal boxes as required for branching, terminating of cables for lighting distribution shall be provided. All unused cable entries shall be closed by flameproof plugs.
- vi. Flameproof receptacle unit (socket with associated switch/MCB and plug) shall have interlocking feature such that plug cannot be inserted or taken out with switch/MCB in "ON" position.
- vii. Adequate mounting lugs with necessary hardware shall be provided for mounting the equipment on wall/structure.
- viii. These enclosures shall have inscription warning against opening the enclosure unless the circuit is isolated. Equipment rating and ON/OFF positions of switches/MCBs shall also be designated.
- ix. The BIDDER shall indicate that the enclosures have been tested and certified by relevant statutory authorities for use in hazardous areas.

g. Lighting poles and towers

- i. Lighting poles for street lights and flood lights shall be of swaged and welded steel, pole of height 9M/11M and shall conform to relevant standard. Poles shall be hot dip galvanized internally and externally after fabrication as per IS 2629 / IS 2633 / IS 4759 standards. The Poles shall be designed to withstand the maximum wind speed as per IS 875. The steel sheet used to manufacture steel poles shall be of minimum thickness of 3 mm and shall conform to relevant standard . Junction boxes shall be provided with weather proof flush doors and locking facility. Bidder shall design and furnish the foundation drawings for the poles to withstand basic wind speed of minimum [50]meter/sec.
- ii. The supply of poles/Towers shall be complete with base plate, foundation bolts, hot dip galvanized brackets / necessary pipe reducer for fixing the fitting and also include the necessary associated pole mounted junction boxes.
- iii. Towers for mounting flood lights shall be e of continuously tapered poly gonol cross section and shall be supplied with all acesssories. Steel structure for towers shall be made of hot dip galvanized steel. A steel ladder and platform at the top shall be provided. The length of each step of the ladder shall be at least

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[19]	25.09.2014

300 mm and spacing between two adjacent steps not more than 300 mm. The structure shall be suitable for mounting the required number of flood lights, weights of maintenance crew and specified wind pressure. The factor of safety shall be [2] for each part and section. The Contractor's structural design drawings shall be approved by the Purchaser before fabrication.

1.4.9 Name Plate

Name plates shall be furnished for identification of devices and circuits. All switches, controls and indications shall be permanently and legibly marked in English regarding the functions.

1.4.10 Painting

All surfaces shall be sand blasted, pickled and grounded as required to produce a smooth, clean surface free of scale, grease and rust.

After cleaning, the surfaces shall be given a phosphate coating followed by 2 coats of high quality primer and stoved after each coat.

The equipment shall be finished in approved color shade by owner with two coats of epoxy based powder coated paint. The coating shall be done electro statically followed by stoving.

Sufficient quantity of touch-up paint shall be furnished for application at site.

1.5 Tests

I) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant /purchaser or his representative.

Tests on Lighting Distribution Boards / Panels shall include:

a. Wiring continuity tests.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E9	[20]	25.09.2014

- b. High voltage and insulation tests.
- c. Operational tests.

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6

Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *Lighting panels & distribution boards.*
- b) *Receptacles & Junction boxes.*
- c) *Street light poles & towers.*
- d) *Lighting fixture complete with lamps and accessories.*
- e) *Non-integral/separate type control gear box for lighting fixtures, as applicable.*
- f) *Lux level calculations for each area.*
- g) *Data sheets for lighting fixture, lamps, accessories with light distribution curves, co-efficient of utilization charts etc. Type and routine test certificates of transformer and cables.*
- h) *Control schematic and wiring diagram of 415V AC/220V DC lighting panel with automatic changeover from AC to DC and vice-versa, 415V normal AC Street/area lighting panel with automatic ON/OFF feature.*
- i) *Technical leaflets and data sheet on each piece of equipment/ device such as MCB, switch, fuse, receptacle etc. Type and routine test certificates of transformer and cables.*
- j) *QAP and relevant test certificates*

Document Number	Rev No.	Description	Page No.	Date of Issue

1.0 CABLE CARRIER SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Cable Carrier system complete with all accessories for efficient and trouble free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS 800	Code of Practice for structural Steel
IS 1646	Code of Practice for Fire Safety of buildings
IS2667	Fittings for Rigid steel Conduits
IS 3419	Fittings for Rigid Non – Metallic Conduits
IS 3837	Accessories for Rigid Steel Conduits
IS 4649	Adaptors for Flexible Steel Conduits
IS 5216	Guide for Safety Procedures and Practices in electrical Work

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[1]	25.09.2014

1.3 Design Criteria

- a) Cable and cable trays shall be installed in an ambient temperature of 50 °C and relative humidity of 95%.
- b) The cable carrier system shall be designed considering the following:
 1. Facility for easy laying of cables.
 2. Access to maintenance.
 3. Neat and aesthetic appearance.
 4. Safety of equipment & personnel.
 5. Ground water seepage.
- c) Cables shall be laid in prefabricated ladder/perforated type trays and in conduits. Direct burial of cable shall be mostly avoided.
- d) Upper cable trays and all vertical cable trays shall be provided with tray covers.
- e) Cable filling in the trays or racks shall not exceed 80%. Conduits if used, the wires in the conduits shall not exceed 40% of the conduit area.
- f) Different voltage grade cables shall be laid in separate trays when trays are arranged in tiers. H.V cables shall be laid in top trays and cables of subsequent voltage grade in lower tier of trays. Instrumentation cables shall be laid at bottom most tray.
- g) At least 300mm clearance shall be provided between HV and LV cables & LV and control/Instrumentation cables.
- h) Support system for cables shall be prefabricated type.
- i) Single core cables shall be laid in trefoil touching formation. Trefoil clamp shall be provided in a staggered manner.
- j) 1100V grade power cables of [120] mm² size and above shall normally be laid in single layer in trays/on racks.
- k) 1100V grade power cables below [120] mm² may be run in double layers in case of space restrictions.
- l) Control and instrumentation cables can be laid up to a maximum of three layers in each tray/rack.

1.4 Specific Requirements

1.4.1 Scope of work:

The scope of work shall include Design, Preparation of Cable Tray, Trench/Duct bank/Conduit Layout, supply of Cable tray and its Accessories, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with the Cable Carrier System

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[2]	25.09.2014

for following package. The below list indicates area where cable carrier system to be provided but not limited to:

[Note: With reference to particular package, scope of work shall be modified.]

a) TG Area:

- i) TG Platforms.
- ii) TG area Grade Levels Maintenance area.
- iii) Preparation of Cable schedules and Inter Connection schedules/Diagram.
- iv) Laying and Termination of power & control cables for all the equipments of TG package.

b) Boiler Area:

- i) Boiler Platforms
- ii) Boiler Grade Levels covering coal mill and Maintenance area.
- iii) ESP Platforms
- iv) ESP/FOPH switchgear room.
- v) FOPH area.
- vi) Preparation of Cable schedules and Inter Connection schedules/Diagram.
- vii) Laying and Termination of power & control cables for all the equipments of Boiler package.

c) Balance of Plant Area:

- i) Cable Carrier System for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, Transformer area, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
- ii) Laying and Termination of power & control cables for all the equipments of BOP package.

d) CHP Area:

- i) CHP Switchgear room
- ii) Conveyor.
- iii) Crusher House
- iv) Stacker and Reclaimer
- v) Any other area covered in this package.
- vi) Laying and Termination of power & control cables for all the equipments of CHP package.

e) AHP Area:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[3]	25.09.2014

- i) AHP Switchgear room.
- ii) Silo Area.
- iii) Any other area covered in this package.
- iv) Laying and Termination of power & control cables for all the equipments of AHP package.
- f) Electrical Balance of Plant(Switchyard) Area:
 - i) Switchyard
 - ii) Transformer yard
 - iii) Inter plant cabling.
 - iv) Any other area covered in this package.
 - v) Laying and Termination of power & control cables for all the equipments of eBOP package.
- g) All civil and structural works necessary for successful installation and commercial operation of all electrical equipment to be erected under this specification. Supply of cement, sand, stone etc. required for the execution of the contract shall be the responsibility of the Bidder.
- h) All other ancillary works in connection with the items of work described above which are not specifically mentioned but are necessary to complete the work.
- i) For Terminal Points and Exclusions of Cable Carrier system and Specific scope of work Bidder may refer section I of this specification.

1.4.2 General Installation Requirements:

- a) Cable trays shall be fabricated from 14 gauge mild steel sheets. Cable trays shall be of hot dip galvanized Steel of ladder/perforated type, complete with all necessary coupler plates, elbows, tees, bends, reducers, stiffeners and other accessories and hardware as detailed in the relevant drawings to be submitted by Bidder. All hardware (i.e. bolts, nuts, screws, washers, etc.) shall be hot dip galvanized.
- b) Constructional details, supporting arrangement and installation details for cable trays shall be furnished by Bidder.
- c) Each 2.5 meter section of all types of cable trays and all elbows, tees, crosses, etc. shall be provided with two side coupler plates and associated bolts, nuts and washers.
- d) Cable tray covers shall be fabricated from 16 gauge MS sheets. Cable tray covers shall be hot dip galvanized and same shall be provided for all outdoor cable trays and vertical raceways/trays. Covers for vertical raceways shall be in individual, easily removable sections to facilitate cable maintenance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[4]	25.09.2014

- e) Cable Tray of Standard width of 600mm shall be followed. However, trays with 450, and 300, 150 mm width may be used in some places considering the requirement and space restrictions. For instrumentation and control purpose, some perforated type cable trays of width 150 mm may be used particularly in Boiler Platform area, and 600, 450, 300 mm perforated trays may be used depending on site requirement.
- f) Cable trays shall be ladder type with maximum rung spacing 250 mm depth 100 mm and rung width not less than 50 mm.
- g) Cable trays in areas subjected to excessive coal dust, or mechanical damage shall have hot-dip galvanized sheet metal tray cover installed on front tray in vertical run and inverted 'V' type on upper tray in horizontal run. Where covers are used on trays containing power cables, consideration should be given to ventilation requirements. Areas where corrosive chemicals are likely to be handled, cable tray and covers shall be epoxy painted.
- h) Suitable embedded steel inserts shall be provided on wall/floor/ ceiling surfaces for welding of cable tray bracket in order to make the cable tray system withstand horizontal / vertical accelerations due to seismic forces for indoor trays and also wind load for outdoor trays such as on Boiler platforms in addition to normal tray cable loadings.
- i) Cable installation work shall mean erection of cable trays/racks, supports, hangers, junction boxes, conduits, laying of cables either in ground or on trays inside trenches tunnels/overhead trays in conduits etc. dressing and clamping, jointing and termination inclusive of supply of necessary jointing/termination kits, lugs, glands, ferrules, tapes etc. and other accessories, grounding of cable armor. In case of direct laying in ground, all excavation work, necessary back-filling, supply of bricks and protective concrete slabs, removal of excess earth shall be part of the installation work.
- j) Erection of cabling work shall be executed keeping in view all necessities and requirements of fire fighting codes for Generating Stations having an adverse industrial environment.

1.4.3 Cable Routing/Laying

- a) Cables shall generally be laid on ladder type cable trays either in trenches or overhead supported from building steel/structures except in some

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[5]	25.09.2014

cases cables may have to be laid underground and for short runs in conduits for protection while crossing roads and other facilities.

- b) For interplant connections, the cables may be routed through an overhead cable bridge or cable trenches/tunnels selection being dependent on site constraints.
- c) For underground crossing of railways, roads etc. hume pipes shall be used and shall be laid at a depth of minimum 1000 mm such that cables shall not be damaged.
- d) In boiler area, trench shall be avoided as far as practicable. The cable racks shall be supported from Boiler structure in vertical configuration with suitable cover to avoid deposition of coal dust as far as practicable.
- e) Different voltage grade cables shall be laid in separate trays when trays are arranged in tiers. Power cables shall be on top trays and Control/Instrumentation cables on bottom trays, and it is recommended that trays for cables of different voltage levels be stacked in descending order with higher voltage level above.
- f) Cables for redundant equipment/system shall be run in separate trays in separate route.
- g) Cables from two different services viz. supply from station board and supply from unit board shall be fully segregated to prevent simultaneous damage due to fire in one of the services.
- h) Low level signal cables and other special Instrumentation and Control cables shall run in separate trays. In general, a minimum of 1500 mm clearance shall be maintained between these cables and noise generating equipment (large motors, generators, transformers etc.).
- i) The cable spreaders of each unit shall be compartmentalized by provision of fire proof partition wall and fire proof doors.
- j) The floor of the cable spreader rooms shall have to be made water proof so that water does not percolate to lower levels in the event of fire fighting operations. Adequate arrangement for efficient drainage of water shall be provided. The cable raceways should also be suitably planned to avoid water entry through this place.
- k) Cables shall generally be laid on cable trays either in concrete trenches or overhead supported from building steel/structures. Cables shall be run in concrete trenches in those electrical rooms at ground level, which are without any spreader room below. In mechanical equipment areas (Indoor), overhead cable trays shall generally be used.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[6]	25.09.2014

- l) For inter plant connections, the cables shall be routed through an overhead cable bridge pipe cum Cable Bridge. For isolated but long outdoor cable route with very few cables of 3/4 nos., the cables may be directly buried with prior permission from the purchaser.

1.4.4 Installation of Cables

- a) The Bidder shall install, terminate and connect up all cables and conduits with supporting arrangements as per drawings, cable schedules and interconnection chart/drawings.
- b) The HV power cables of 6.6kV shall be laid in trays or racks as follows:
- In single layer only.
 - 3 core cables to be laid in touching formation.
 - Cables in trefoil groups of the same circuit shall be laid as indicated below so as to ensure balanced current distribution:

Y Y Y Y

R B B R R B B R and so on.

- c) 1100V grade power cables shall be laid in single layer in trays depends on size of cables. Cable of up to 120 sqmm shall be laid in two layers. Beyond this size single layer will be followed.
- d) Control and Instrumentation cables can be laid up to a maximum of three layers in each tray.
- e) The trays shall be run with a vertical spacing of 300 mm for overhead cable trays as well as inside cable trenches. A minimum of 225 mm clearance shall be provided between the top of tray and beams, cold piping, 500 mm clearance for hot piping/object to facilitate installation of cables in tray.
- f) Adequate pull boxes shall be provided in conduit run to facilitate cable pulling in long runs and also to ensure that there shall not be more than 2 nos. 90 Deg. Bends between pull points.
- g) Cable tray/conduit system shall be installed to accommodate cable manufacturer's recommended maximum pulling tension, minimum bending radius and no. of bends.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[7]	25.09.2014

- h) All openings in the floor and wall for cable access shall be sealed after installation of the cable system with non-inflammable materials, as follows :
- Fire stop/Penetration seal shall be installed in the cable spreaders and cable raceways.
 - Similarly in the trenches fire stop/penetration seals shall be provided at suitable interval to avoid spread of fire.
 - For all HV, LV, Relay and Control panels, Control desk, instrumentation panels, battery charger, D.C. Dist. boards and other miscellaneous panels, fire-stops should be provided below base plate.
- i) All floor/wall openings for cable entry to the electrical equipment and accessories shall be sealed with non-inflammable materials, after completion of cable installation. Thickness of such materials shall be equal to the thickness of floor/wall unless specified otherwise.
- j) The portion of galvanized steel, which, if required, undergoes any welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.

1.4.5 Cable Termination and Joints (if applicable and not covered in cable specification)

- a) The Bidder shall supply cable termination and jointing kits in requisite quantity for HV. Power Cables, LV. Power, Control Cables, etc. along with all accessories & consumables required for making termination and joints complete . All the materials and components of the termination/joints shall be suitable and compatible with the type of cables for which the terminals/joints are intended.
- b) The straight through joints of HV. cables shall be heat shrinkable and pre moulded push on type. The end termination kits for HV. cables shall be of {Raychem/3M/Elastimold} type. Cable joint or end terminations on Electrical equipment shall be suitable for Indoor & Outdoor use, as the case may be.
- c) Glands and lugs required for termination of HV, LV. shall be supplied by the Bidder in required quantity.
- d) Cable glands shall be tinned brass gland, double compression type complete with necessary armour clamp and tapered washer etc. Cable glands shall match with the sizes of different HV/LV/Control cables.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[8]	25.09.2014

- e) Cable lugs shall be suitable for termination of different cross-sections of L.V./Control cables and shall be of following types:
 - i. Aluminium tubular terminal end for solderless crimping to aluminium conductors.
 - ii. Copper tubular terminal end for solderless crimping to copper conductors.
 - iii. Solderless crimping of terminals shall be done by using corrosion inhibiting compound. The cable lugs shall suit the type of terminals provided on the equipment. Lugs for control/instrumentation cables shall be PVC insulated/sleeved type.
 - iv. Cable lugs for control cable termination shall be insulated. These lugs shall be pin type/flat type/ring type/U type to suit the terminals provided in the panels.
 - v. The terminations shall with tinned copper only.
 - vi. For mill area, the cable shall be routed through GI pipes embedded in Ground.
 - vii. In heat zone areas as far as possible the cables shall be taken away from the area to avoid heat. If cabling in the heat zones can not be avoided, the cables shall be terminated in junction box of IP 67 protection class away from the heat zones and small length of cables may be laid from junction box to the respective equipment to facilitate easier replacement in case of fire. Bunching of cables in the heat zones and boiler areas shall be avoided and laid in separate groups.

1.4.6 Identification

- a) The complete cabling system shall be properly identified. Methods for identification of cabling system will be furnished to the Bidder and the Bidder shall strictly adhere to the said methods.
- b) Each cable and conduit run shall be tagged with numbers that appear in the cable and conduit schedule.
- c) Location of cables laid directly underground shall be clearly indicated with cable marker made of galvanized iron plate, projected above ground level.
- d) Cable tags shall be provided on all cables at each end (just before entering the equipment enclosure), on both sides of a wall or floor crossing, on each duct/conduit entry, at each bend and at every thirty (30) meters in cable tray/trench runs. Cable tags shall also be provided

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[9]	25.09.2014

inside the switchgear, MCC, control & relay panels etc. wherever required for cable identification, such as where a number of cables enter together through a gland plate.

1.5 Tests

I) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant / purchaser or his representative.

- a) Checking of continuity / phasing and IR values for all the cables before and after HV test
- b) Checking of continuity / phasing and IR values for all the cables before and after HV test.
- c) HV test and measurement of leakage current after termination of cable kits (for HT cables).
- d) Checking of earth continuity for armour.
- e) Check for mechanical protection of cables.
- f) Check for identification (tag number system) distance placement of cable marker, cable joint etc. as per the cable layout drawing.
- g) Check earthing of cable structures.
- h) Check safe head room in gallery area
- i) Check clearance from ventilation duct and light fittings for cable structures.
- j) Check proper fixing of cable structures.
- k) Check for proper drainage and removal of water (if any).

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E10	[10]	25.09.2014

obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *[General arrangement drawing Cable Tray]*
- b) *[Cable Tray Accessories like Tee, Cross, Bends, Coupler, Reducer etc]*
- c) *[Cable Tray support materials]*
- d) *[Technical Data sheets for cable carrier system].*

1.7 Rating and Requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

SL NO.	DESCRIPTION	UNIT	DATA
1.	Make/Manufacturer		[By bidder]

ANNEXURES-E11

1.0 EARTHING AND LIGHTNING PROTECTION SYSTEM

1.1 General

This specification is intended to cover the [design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning] of Earthing and Lightning Protection System complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [...] of [Name of the Power Plant] at [District], [State] for [Name of the Client].

1.2 Codes and Standards

All equipment and materials shall be designed, manufactured and tested in accordance with the latest applicable Indian Standards (IS) / IEC as given below except where modified and/or supplemented by this specification.

Table 1.0

IS:2309	Code of Practice for the protection of building and allied structures against lightning.
IS:2629	Recommended practice for hot dip galvanizing of iron & steel
IS:2633	Method for testing uniformity of coating on zinc coated articles.
IS:3043	Code of practice for Earthing
IS:9537	Conduits for electrical installation.
IEEE:80	IEEE guide for safety in AC substation grounding
IEEE:142	Grounding of Industrial & commercial power systems
CEA	CEA Regulations and standard technical specification for main plant package.

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[1]	25.09.2014

1.3 Design Criteria

- a) Earthing system design shall consist of earth grids and electrodes buried in soil in the whole plant area, embedded in concrete inside all the buildings to which all the electrical equipment, metallic structures are connected to have earth continuity for safety reasons.
- b) The main objectives of earthing system is to:
 1. Provide safety to personnel from contact of dangerous potential caused by ground fault.
 2. Ensure sufficient grounding current for effective relaying.
 3. Stabilize circuit potential with respect to ground.
- c) The earthing conductor shall be designed for fault current of [50 kA] for duration of 1 second.
- d) It is the responsibility of the Bidder to undertake the soil resistivity measurements at site and select suitable size of conductor based on the soil resistivity.
- e) Ground conductor shall be of galvanized steel for above ground and mild steel for embedded and below ground earthing.
- f) Main earth grid conductor shall be mild steel (MS) of [40] mm dia.
- g) Suitable corrosion allowance shall be considered over ground conductor size depends upon soil resistivity.
- h) The main purposes of lightning protection system are to :
 1. Provide protection to structures from lightning strokes.
 2. Provide a low resistance-conducting path to lightning discharge.
 3. Lightning protection shall be provided as per IS: 2309 for Boiler area and other tall structures within the battery limit.

1.4 Specific requirements

1.4.1 Scope of Work

The scope of work shall include Design, Preparation of Earthing and Lightning Layout, supply, unloading at site, storing, laying, fixing, jointing/termination, erection, testing and commissioning of equipment associated with the safety earthing and Lightning Protection system for following areas Listed below but not limited to the following:

[Note: With reference to particular package, scope of work shall be modified.]

- a) TG Area:
 - i) TG Platforms.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[2]	25.09.2014

- ii) TG area Grade Levels Maintenance area.
- iii) All equipments, structures etc of TG package.
- iv) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- b) Boiler Area:
 - i) Boiler Platforms
 - ii) Boiler Grade Levels covering coal mill and Maintenance area.
 - iii) ESP Platforms
 - iv) ESP/FOPH switchgear room.
 - v) FOPH area.
 - vi) All equipments, structures etc of Boiler package.
 - vii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- c) Balance of plant Area:
 - i) Earthing and lightning protection system for Mechanical BOP package like Raw water, Water pre-treatment, Fuel oil, CW / ACW System and Cooling Towers, AC and ventilation Vacuum Pump House, Silo Area, Compressor House, Guard Pond, Effluent Treatment Plant, Chimney, Fire water pump house, Cable galleries, Transformer area, all Switchgear Rooms, Control rooms, all roads within battery limit etc.
 - ii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- d) CHP Area:
 - i) Switchgear rooms
 - ii) All equipments, structures etc of Boiler package.
 - iii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- e) AHP Area:
 - i) Switchgear rooms
 - ii) All equipments, structures etc of Boiler package.
 - iii) For all above areas, above ground Earthing and Lightning protection system shall be provided.
- f) Electrical Balance of Plant (Switchyard) Area:
 - i) Switchyard, Transformer yard and BTG area are provided with earth mat of [40] mm dia MS Rod conductor buried below 600mm from ground level. Areas like AHP, CHP, Boiler and TG, and all other

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B, Annexure-E11	[3]	25.09.2014

BOP area below grounding system are covered in this eBOP package and above ground earthing for AHP, CHP, Boiler, TG and Mechanical BOP are covered in respective package itself. System Neutrals are earthed through Treated Earth Pit. All areas of power plant are interconnected to form an integrated single earthing system. Lightning system for above ground are covered in respective packages and below ground is covered in this eBOP package in same way as earthing system.

1.4.2 Earthing system

- a) Earthing system shall be designed in accordance with IS 3043 and Indian Electricity Rules and Acts.
- b) Fault current for the earthing system shall be designed for [50] KA for duration of 1 sec.
- c) All electrical equipment, non-current carrying metal parts, structures, building steel, lightning protection system, transformer neutrals shall be connected to station ground grid.
- d) Treated earth pits including riser shall be provided for transformer neutral earthing.
- e) Connection between the equipment earth lead and the grid conductor shall be welded. For rust protection, the welds shall be treated with zinc chromate primer and coated with zinc rich paint.
- f) Entire erection of grounding work shall be carried out in such a way as to be capable of withstanding the intended services of carrying full short circuit level currents to ground mat without any damage/deformation.
- g) All off site area of AHP , CHP etc shall be provide with peripheral earthing with at least two connection to main station earth grid through treated earth pit.

1.4.3 Ground Grid Conductor

- a) Ground grid conductor of mild steel rod shall be used.
- b) *[The minimum conductor section is determined on the basis of ground fault current. This section is then increased by an allowance to account for the soil corrosion loss of 0.12 mm (on diameter of conductor) per year over the design life of 40 years.]*
- c) However bidder shall consider as per CBIP norms “ Manual on Earth mat design” the corrosion allowance as below:
 - For soil resistivity greater than 100 ohm-meter: No allowance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[4]	25.09.2014

- For soil resistivity greater than 25- 100 ohm-meter: 15% allowance.
- For soil resistivity less than 25 ohm-meter: 30% allowance.

1.4.4 Underground Grid

- The ground grid mesh is designed to keep the touch and step voltages within safe limits as per recommendation of IEEE 80.
- [The ground grid conductors shall be buried in earth at a depth of 600 mm]. The length of ground conductors below earth shall be sufficient to ensure a ground resistance less than one (1) ohm.
- The ground grid conductor shall be so laid as to provide short and direct connection to building steel and major electrical equipment.
- Ground rods shall be provided at the points where system neutrals/lightning protections are connected to the ground grid.
- All ground grid conductor connections shall be welded type.
- Ground grid shall be interconnected with the ground grid of neighboring areas at least at two (2) points for further reducing the ground grid resistance.
- Suitable pigtails shall be provided and shown in the [layout drawing] for connection with ground grid of neighboring areas.
- A minimum earth coverage of [300] mm shall be provided between the ground grid conductor and the bottom of trenches, tunnels, underground pipes, foundations, railway tracks etc. The ground grid conductor shall be re-routed in case it fouls with equipment foundations.
- In some cases, it may happen that the construction work of cable trench, foundation and laying of underground pipes are being taken up after the grounding mat has been laid. It may be required to cut a portion of grounding conductor to avoid fouling with cable trench, equipment foundations, underground pipes etc. In this case, the ground conductor shall be properly rerouted and rejoined/reconnected with the main grounding mat during the construction/laying of above underground objects and good electrical continuity of grounding conductor shall be ensured.
- Grounding conductors crossing the road may have to be laid at greater depth to suit the site conditions.
- Grounding conductor around the building shall be buried in earth at a minimum distance of [1200] mm from the outer boundary of the building.
- The Bidder shall carryout the grounding of all electrical equipments and connection to main earth grid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[5]	25.09.2014

1.4.5 Ground Electrode

Ground electrodes shall be [40] mm dia. and [3] metre long M.S. rod. These are to be fabricated and driven into the ground by the side of mat conductors. All connections to the conductors shall be done by arc welding process.

1.4.6 Above Ground Connections

- Galvanized steel flats shall be used for all connections above earth.
- Inside building, ground conductors shall be run for each floor supported on building steel and/or cable trays. These ground conductors in turn shall be connected to the station ground grid through riser (at least two) coming up along building columns/cable shafts.
- Two separate and distinct ground connections shall be provided for each electrical equipment in compliance with I.E. Rules.
- All steel columns and structures shall be connected to the earth mat through earth leads.

All connections above ground shall be welded type except connection to equipment/structures which shall be bolted type.

1.4.7 Risers

Risers are required for connecting the equipment and structures with the ground mat. Risers are to be provided from underground mat to above ground levels where the ends shall be left free for connecting to the equipment. Each riser shall be 1 No. [40] mm dia. M.S. rod and shall project above grade level/concrete floor level by minimum 300 mm. They are to be clamped or supported along the outer edge of the concrete foundation. Connection to the ground mat shall be done by arc welding.

1.4.8 Equipment Ground Lead

- Equipment ground connections shall be sized to carry the ground fault current. Considerations shall also be given to mechanical ruggedness of the connections and to limit the number of sizes.
- The minimum ground conductor sizes for various equipment and structures are given in below.

Table 2.0

DESCRIPTION	SIZE	MATERIAL
a) Main Grounding Grid Conductor	[40] mm dia Rod	Mild Steel
b) Riser/Pigtail From Grounding Grid/Mat	[40] 40 mm dia Rod	- Do -

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[6]	25.09.2014

DESCRIPTION	SIZE	MATERIAL
c) Electrode	[40] mm dia, [3000] mm long Rod	- Do -
d) Conductor used for connection of various equipment/structures as listed below		
HV motors, Earthing ring, Earthing lead to earth pits etc.	[50 x 10] mm	Galvanised steel
Structures, Control Panels, Cable Trays etc.	[50 x 10] mm Flat	- Do -
415V Power Control Centres, Motor Control Centres, Distribution Boards etc.	[50 x 10] mm Flat	- Do -
Local Panels, Lighting Panels	[25 x 6] mm Flat	- Do -
Motors :		
Above 90 kW	[50 x 10] mm Flat	Galvanised steel
Above 30 kW Upto 90 kW	[25 x 6] mm Flat	- Do -
Above 5 kW Upto 30 kW	[25 x 3] mm Flat	- Do -
Upto 5 kW	[8] SWG	- Do -
Miscellaneous Items, viz. Push Button Station, Junction Boxes etc	[8] SWG	- Do -

{ The Above size of Earth flat is indicative only. Bidder shall refer Volume II Section I for size of earth flat used for existing plant or as per design. }

1.4.9

Jointing and Connection

- All ground conductor connections below ground level shall be done by electric arc welding with low hydrogen content electrode. The contact surfaces shall be thoroughly cleaned to provide good electrical continuity.
- The bending of the large diameter ground conductor where necessary shall be done by gas heating.
- The projected portion of riser/pigtail above ground shall be coated with two coats of bitumen paints (anti-corrosive paints) with a minimum thickness of 1 mm after connection.
- The connections between the riser/pigtail and earthing conductors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[7]	25.09.2014

(galvanized steel flats) and between the earthing conductors above ground level shall be made by electric arc welding.

- e) The portion of galvanized steel flats, which undergoes welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.
- f) The earthing connections to equipment grounding pads/terminals and some removable structures shall be bolted type with GI bolts and nuts. The contact surfaces shall be thoroughly cleaned (to free from scale, paint, enamel, grease, rust) before connection to ensure good electrical contact.
- g) Equipment/structures ground connections shall be coated with weather resistant paints/cold galvanizing paints after proper checking / testing.
- h) Whether specifically shown or not, all conduits, trays, cable armour and cable end box, electrical equipment such as motors, switchboards, panels, cabinets, junction boxes, lockout switches, fittings, fixtures, etc. shall be effectively grounded.

1.4.10 Earthing system installation

- a) The spacing between two electrodes shall be at least equivalent to twice the length of the electrode.
- b) Earthing conductor running exposed on column, walls, etc., shall be supported by suitable cleating, at intervals of 750 mm.
- c) The earthing conductor crossing the road / track shall be laid in hume pipe or laid at a greater depth to avoid damage.
- d) When earth conductor passes through floors, walls, etc suitable pipe sleeves shall be provided and the same shall be sealed after installation.
- e) The connection between earthing pads / terminal to the earth grid shall be made short and direct and shall be free from kinks & splices.
- f) Metallic conduits and pipes shall not be used as earth continuity conductor.
- g) Street lighting poles, flood light poles & towers, their junction boxes shall be connected to the earthing conductor to be run along with supply cable. This earth conductor shall be in turn connected to earth grid at two extreme points.
- h) The steel columns, metallic stairs, hand-rail etc. of the building where electrical equipment are located shall be connected to the nearby ground mat by earthing conductor. Electrical continuity shall be ensured by bonding the different sections of handrails and metallic stairs.
- i) Fence within the ground grid shall be bonded to the plant ground system at regular interval not exceeding ten [10] metres. Fence gate shall be separately grounded with flexible connection to permit movement.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[8]	25.09.2014

- j) [50 x 10] mm galvanized steel flats(minimum size) shall be run as main earthing conductors above ground along building columns, walls, steel structure, etc. for equipment and other structures earthing. These earthing conductors shall be interconnected between them and to the main ground grid through risers/pigtail. The connection between earthing conductor and riser shall be made above ground. Earthing conductors can be embedded in concrete floor of the building wherever necessary without having direct contact with the reinforcement rods. At the crossing of building walls, floors etc. the earthing conductor shall be passed through galvanised conduit sleeves. Both ends of the sleeve shall be sealed to prevent the passage of water through the sleeves.
- k) All indoor and outdoor electrical equipment and associated non-current carrying metal works, supporting structures, building/ boiler columns, fence, system neutrals, lightning masts/arresters shall be connected to the plant ground system.
- l) Miscellaneous devices such as junction boxes, pull boxes, pushbutton stations, lockout switches, cable end boxes, lighting fixtures, receptacles, switches etc. shall be effectively grounded whether specifically shown or not.
- m) Metallic conduits and pipes shall not be used as earth continuity conductor. These shall be grounded at both ends.
- n) A continuous [50 x 10] mm (minimum size) G.S. flat earthing conductor shall run along the cable trays and supporting structure of all cable routes. This earthing conductor shall be attached to each section of cable tray/trays through [50 x 10] mm G.S. flats. The earthing conductor shall be securely connected to the earth mat at both ends.
- o) Flexible earth conductors shall be provided at expansion joints for earthing the gates, operating handles, etc.
- p) Equipment bolted connection after being checked and tested shall be painted with anti-corrosive paint / compound.
- q) Connection between the equipment earth lead and the grid conductor shall be welded. For rust protection, the welds shall be treated with zinc chromate primer and coated with zinc rich paint.
- r) The cable sheaths, screens armour shall be earthed at both ends for multi-core cables. For single core cables the same shall be done at one end (switchgear end) only.
- s) All bimetallic connections shall be treated with suitable compound to prevent moisture ingress.
- t) Main plant earth grid and switchyard earth grid shall be interconnected each other by minimum two numbers of leads.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[9]	25.09.2014

1.4.11 Lightning Protection System Design

- a) Lightning protection design and installation work shall be provided on the basis of IS 2309 Code of Practice.
- b) Lightning protection system shall consist of vertical air termination rods, horizontal roof conductors, down conductors and pipe electrodes.
- c) The need for providing the lightning protection system shall be established by calculating risk index value for each building structure, etc., as per procedure given in IS-2309 and any building whose risk index is more than value specified in IS shall be provided with lightning protection. However, Boiler areas, station building, switchyard building shall be provided with lightning protection irrespective of the arrived risk index.
- d) Shielding angle for one vertical air termination shall be 45 degrees. For more than one rod, shielding angle between the rods shall be taken as 60 Degrees.
- e) Down conductors shall run along the outer surfaces of the building and shall have a test joint about 1500 mm above ground.
- f) A Lightning electrode shall be provided at the connection point of the down conductor with the station ground.
- g) Galvanized steel rods and flats shall be generally used for air termination and connections. All connections shall be welded type.

1.4.12 Air Terminations

- a) The vertical air terminal rods shall be installed at the roof of Turbo generator building, Boiler and chimney etc to protect these objects from lightning strokes.
- b) The projected length of the Air termination rod shall be as required to protect the object (on which the rod is fixed) from lightning stroke.
- c) The air terminal rod shall be properly fixed on the top of the building/structure to withstand very high wind pressure. In case the air terminal rod is embedded at the top of roof of building, the portion embedded inside the concrete shall not touch the reinforcement bars and shall be duly insulated from them.
- d) All the vertical air terminal rods shall be electrically connected together by means of horizontal conductors of size [50 x 6] mm galvanized steel flats.
- e) For chimney air termination, rods interconnected by circumferential conductors will be provided at the apex of flue and also upon outer shell of the chimney. The air termination system will be formed by lead coated copper conductors to prevent melting and corrosion of conductors due to flue gas.
- f) For cooling towers, air termination system will comprise of horizontal

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[10]	25.09.2014

circumferential conductors at the top

1.4.13 Down Conductors

- a) Galvanized steel down conductors of suitable size [25 x 6] shall be connected with air terminal rod/horizontal conductor at the top of roof/structure and other end connected to the nearest 40 mm dia. mild steel rod riser from ground electrode.
- b) Each down conductor shall have an independent earth termination. In no case conductors of the lightning protection system shall be connected with the conductor of grounding system above ground level.
- c) The connection between each down conductor and rod electrode (by means of 40 mm mild steel rod riser) shall be made by others. However Bringing down comer with test link at a level of 1500mm approximately from above ground level shall be boiler contractor scope of work.
- d) The down conductor shall be laid straight and sharp bends shall be avoided as far as practicable. These shall be cleared on outside of the building wall and column/structure at about 750 mm intervals unless stated otherwise in the drawing.
- e) At all supports for down conductor along the column/wall of the buildings etc. the portion embedded inside the building concrete should not touch the reinforcement bars.
- f) All exposed metallic parts of the buildings shall be bonded to the down conductors. Such parts shall include ladders, balconies, conduits etc.
- g) The down conductors shall be protected at the ground level against mechanical injury by means of non-metallic pipes, viz. PVC pipes filled with bituminous compound.

1.4.14 Switchyard Lightning protection

- a) For switchyard lightning protection shall be provided by lightning masts and/or shield wires.
- b) In case of lightning protection by shield wire, the shield wires provided shall be of GS wire strung across the pinnacles of the gantry tower structures. The size of shield wire shall be based on the lightning impulse current expected and the time duration for which it is likely to flow. Allowance shall be given in the final size to account for corrosion of the shield wire during service at rate of [0.03] mm per annum. However, minimum size of the shield wire shall not be less than [70]sq.mm. The zone of coverage for the shield wire shall be considered as 60 deg between the two shield wires and 45 deg for end shield wires. The down conductors from shield wires shall be run along the towers and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[11]	25.09.2014

connected to rod/pipe electrodes.

- c) In case of lightning protection by lightning protection masts, the down conductors from the masts/peaks/shield wires shall be run along the tower and connected to the test links mounted on the towers at 1500m from the ground level. Conductors from the test links shall be connected to the rod/pipe electrodes which in turn are connected to the main earth grid in the switchyard. Calculations for sizing and determining topography and number of lightning masts shall be furnished for approval.

1.4.15 Electrodes (for Lightning Protection)

The electrodes shall be [40 mm] diameter [3000 mm] long mild steel rod. These shall be driven into the ground.

All the electrodes shall be interconnected by means of one (1) [40 mm] dia mild steel rod which shall be laid under ground at a minimum depth of [600 mm] below finished grade level unless stated otherwise. This ground mats/electrode in turn shall be connected to main grounding grid.

1.4.16 Riser (for Lightning Protection)

All risers connected to grounding mat shall be [40 mm] mild steel rods and shall be projected 300 mm above grade level unless stated otherwise.

1.4.17 Jointing & Connection

- a) All ground conductor connections below ground level shall be done by electric arc welding with low hydrogen content electrode.
- b) The projected portion of riser above ground shall be coated with two (2) coats of bitumen paints (anti-corrosive paints) with a minimum thickness of 1 mm after connection.
- c) The joints in the lightning conductors shall be kept to a minimum and there shall be no joint in the underground portions of conductors.
- d) All the joints shall be done by arc welding process overlapping of the conductors at straight joints shall not be less than 150 mm. The contact surfaces shall be cleaned properly before jointing.
- e) The portion of galvanized steel flats, which undergoes welding at site, shall be coated with two (2) coats of cold galvanizing anti-corrosive paint after welding.
- f) The bolted joint of the test link shall be covered with thick coating of bitumen paint after successful testing.
- g) The air terminal rods and shielding mast shall be coated with weather resistant anti-corrosive paint (zinc chromate followed by two coats of aluminium paint).
- h) The steel to copper connection shall be brazed type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[12]	25.09.2014

- i) The lightning protection of inflammable liquid storage tanks wherever required, shall be provided with horizontal conductors strung between tall poles covering the entire zones or with air terminal rods mounted on top of poles/structure. These horizontal conductors/vertical air terminal rods shall be connected to rod electrodes, which in turn shall be connected to station ground mat.
- j) The sizes and materials of earthing conductors to be used in lightning protection system are listed below :
- k) Note: The above sizes are indicative only. Actual size shall be as per Bidder design or as per existing plant details as provided in Section I in case of replacement work as called for.

Table 3.0

DESCRIPTION	SIZE	MATERIAL
a) Vertical Air Termination	[20] mm dia Rod	Galvanised steel
b) Horizontal Conductor	[50 x 6] mm flat [25 x 6] mm Flat	-----do-----
c) Down Conductors	[25 x 6] mm Flat	-----do-----
d) Ground electrode / riser	[40] mm dia Rod	Mild Steel
e) Interconnection with earth mat	[40] mm dia Rod	Mild Steel

1.5

Tests

l) Type Test

The Bidder shall submit for Owner's approval the reports of all the type tests as per relevant standards and carried out within last [five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last [five] years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E11	[13]	25.09.2014

Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

II) Routine Test

All equipment shall be completely assembled, wired, adjusted and routine tested as per relevant IS / IEC Standards at manufacturer's works/site in the presence of consultant /purchaser or his representative.

The following test shall be conducted:

- a) Measurement of earth resistance for each electrode.
- b) Measurement of total earth resistance.
- c) Measurement of earth loop resistance for E/F path of biggest LV drive.
- d) Check tightness of all earth connections
- e) Check earthing of all metallic equipments, cable trays, bus bar supporting structures, building column (if steel all elect equipments, pipe lines etc. as per the drawing / specification)

III) Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

IV) Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6

Drawings, Data & Manuals

Drawings, data & manuals for the motors shall be submitted as indicated below:

- a) *[Earthing Material like conductor , flat , welding description etc]*
- b) *[Air termination rod and its accessories etc]*
- c) *[Technical Data sheets for Earthing and Lightning system].*

DIN 41488	:	Electrical engineering dimensions
-----------	---	-----------------------------------

Equipment and material conforming to any other standard, which ensures equal or better quality, may be accepted. In such case, copies of the English version of the standard adopted shall be submitted along with the bid.

The electrical installation shall meet the requirements of Indian Electricity Rules as amended up to date and relevant IS Code of Practice. In addition, other rules and regulations applicable to the work shall be followed.

1.3

Design Criteria

- a) All VFDs shall be suitable for an ambient temperature of 50 °C and relative humidity of 95%. The VFDs shall be suitable for operation in a highly polluted environment.
- b) All VFDs shall be suited for uninterrupted operation under the following variations in bus voltage and frequency:
 - i. Voltage Variation : +/-10%
 - ii. Frequency Variation : 50Hz (+)3% to (-)5%
 - iii. Combined Variation of : 10% (absolute sum)
Voltage & Frequency
- c) The VFD shall be of modern design for similar applications in power plants. The system shall be commutated inverter type with minimum [six] pulse design, [IGBT based] and PWM controlled or better control system.
- d) VFD shall consist of Input section (rectifier and filter), control section and output section (PWM module, base drive circuits).
- e) VFD shall include an input filter for limitation of the harmonic current. General requirements of VFD shall conform to IEC 61800-2 and IEEE-519.
- f) VFD shall follow EMC directives as specified in IEC-61000.
- g) VFD model shall be suitably selected based on actual cable length from VFD to motor terminals. Shielded cables suitable for VFD applications shall be provided by the bidder.
- h) For [12 pulse] VFD, required 3 winding transformer and necessary cabling shall be provided by the bidder.
- i) Bidder shall provide inverter duty motor to withstand voltage stresses produced by PWM action

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[3]	25.09.2014

1.3.1 Performance requirements:

- a) The system shall be energy efficient, designed as standard product and shall provide very high reliability, high power factor, low harmonic distortion and low vibration / wear / noise.
- b) The system shall be suitable for the load characteristics and the operational duty of the driven equipment.
- c) The drive system shall be designed to operate in one or more of the following operating modes as to suit characteristics of the driven equipment:
 - i. Variable torque changing as a function of speed i.e. speed squared.
 - ii. Constant torque over a specific speed range.
 - iii. Constant power over a specific speed range where the torque decreases when speed increases.
- d) The drive controller shall be equipped with microprocessor based digital regulator with programmable functions. The system shall be designed for linear continuous speed control from [10% to 100%] of driven equipment's rated speed and shall be of a modern proven design.
- e) The total harmonic distortion (THD) of the voltage and current at inverter output shall be as per IEC 61800-4 and it shall be considered in the design of the motor.
- f) Unless otherwise specified, the overload capacity of the controller shall be 150% of rated current of motor for one minute for constant torque applications, and 115% of rated current for one minute for variable torque applications at rated voltage. If the motor load exceeds the limit, the drive shall automatically reduce the frequency and voltage to the motor to guard against overload. If load demands exceed the current limit for more than one minute, the drive shall shut down to prevent over heating of the motor and damage to the drive.
- g) During operation, the system shall be capable of developing sufficient torque under all load conditions to respond to a 20% alteration in speed set point within a time limit up to 60 seconds.
- h) The integrator action of the speed set point alteration shall be independently adjustable for both an upward and a downward alteration. The minimum time interval between set point adjustments by the distributed control system shall be considered as 10 seconds.
- i) The drive shall trip in case the speed exceeds 105% of the maximum operational speed or reduces to 95 % of the minimum operational speed for more than 10 seconds.
- j) Maximum noise level of motor shall be measured as per relevant IS standard.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[4]	25.09.2014

- k) Variable frequency drive shall be arranged so that it can be operated in an open circuit mode, disconnected from the motor for startup adjustments and troubleshooting/ maintenance.
- l) Voltage at motor neutral shall be maintained at ground potential for the total operating condition.

The drive system shall ensure following:

- i. VFD induced torque pulsation are limited to maximum 1% (even at low speed) so there is minimal stress to the equipment
- ii. Motor is protected from dv/dt stresses.
- iii. No appreciable increase in motor audible noise.

1.3.2 Control requirement:

- a) The VFD and motor characteristics shall be suitable for load specific torque-speed characteristics.
- b) Short time voltage dips up to 20% of nominal voltage (e.g. in case of a large motor start up connected to the same bus as VFD) shall not cause the control system to stop functioning and shall not trip the drive system.
- c) The system shall also be equipped with a facility which shall restart the system in case of voltage dip over 20% or power interruptions for less than 2 seconds, with recovery of the voltage to its nominal value. The drive shall have the facility to block this feature, if required by the operator. Upon restart the converter shall be capable of synchronizing on to a rotating motor and develop full acceleration torque within 10 seconds.
- d) The power controller shall be controlled to always start the motor in the forward direction. Logic shall be provided to prevent the motor from being started in the reverse direction.
- e) The drive motor shall be speed controlled corresponding to 4-20 mA reference input signal unless otherwise specified upon complete loss of the user's speed reference signal, the drive shall automatically run at constant speed at the last speed reference available prior to the loss of signal.
- f) It shall be possible to vary the speed of the drive in either manual or auto mode. Auto/manual selection shall be from VFD panel unless otherwise specified.
 - i. With the selector switch in "manual" mode, the operator shall be able to set the speed through keypad, mounted on front of the drive panel or from speed increase/decrease push buttons from the field. Motor operated potentiometer shall be provided as a speed set point device.
 - ii. With the selector switch in "auto" mode, speed of the motor shall be controlled from a 4-20 mA signal, from owner's DCS (Process Control) system. Necessary equipment required for interfacing with DCS shall also be provided in the drive panel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[5]	25.09.2014

- g) The required provision for the interface with remote I/O (*as per requirement*) shall be through hardwired connection (with potential free contacts and transducers)
- h) Drive system shall have provision for interface with upper level automation such as electrical control system.
- i) The closed loop control feedback for the drive system having output transformer shall be tapped from the secondary side of the output transformer.
- j) Bypass Feature
 - i. Bypass breaker / contactor-HRC fuse complete with protection, annunciation and metering shall be provided.
 - ii. All Variable frequency drives (VFD) having bypass feature shall have motor protection relay along with necessary control and metering etc. Switching scheme shall be such that in case of drive mal-operation, the motor could be taken on bypass control manually, while the drive could be attended by opening its isolation devices.
 - iii. Safety interlock between inverter and bypass breaker/contactors shall be provided such that closing of healthy device is inhibited in case of external fault.

1.4 Specific Requirements

1.4.1 Constructional Requirements

- a) Panel Construction
 - i. The panel shall include suitable semi conducting power devices (Diodes / IGBT) modules with protective devices, reactors (if required), filters (if required), control circuit, control accessories, indication and annunciation etc. The construction of the panel shall provide effective protection against electromagnetic emissions and shall meet the design requirement of integrated standards.
 - ii. Upstream breaker include suitable semi conducting power devices (Diodes / IGBT) modules will be provided on the front door.
 - iii. Safety Interlock shall be provided so that power cabinet cannot be opened unless the upstream breaker is disconnected, safety-grounding switch is closed and DC link capacitor is discharged. Power source breaker can only be closed once the earthing switch is open and panel door is closed with lock defeat facility.
 - iv. The drive shall be suitably housed in sheet steel panels fabricated with 2 mm thick cold rolled sheet steel. The panel shall be suitable for indoor installation, if not otherwise specified. The panel shall be free standing with degree of enclosure protection as IP-31. The maximum and minimum operating height shall be 1800 mm and 400 mm respectively.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[6]	25.09.2014

- v. Bolted un-drilled gland plate shall be provided at bottom. Clamp type terminals shall be used for connection of all wires up to 10 mm² and terminal for higher sizes shall be bolted type suitable for cable lugs. Minimum space for power cable termination shall be 600 mm clear from bottom of the cable gland plate.
- vi. Bus bars shall be of electrolytic copper, color coded separately for AC and DC system. All the live parts shall be sleeved / shrouded to ensure complete safety to personnel intending to carry out routine inspection by opening the panel doors. All the equipment inside the panel and on the doors shall be provided with suitable nameplate.
- vii. All the switches component and accessories which are essential for normal and emergency operation shall be mounted on the door and shall be operable externally. Digital meters shall be preferred. Analogue instruments, where provided, shall be switchboard type, back connected, 72x72mm. Scale shall have red mark indicating maximum permissible operating rating.
- viii. All panels shall be of same height so as to form a uniform line-up, to give good aesthetic appearance.
- ix. All the control wiring shall be enclosed in plastic/ metal channel. Each wire shall be identified at both ends by self-sticking wire marker tapes or PVC ferrules. Power and control wiring inside the panel shall be done with PVC insulated, fire retardant, copper conductor wire. 1.5 mm² size wire shall be used for control circuits, 2.5 sq.mm for CT/PT circuits and 0.75 mm² for electronic circuits. The control fuse rating is 10 Amps or less and 2.5mm² size for control fuse rating above 16A for electrical circuits and 0.7 mm² for electronic circuits. All wires shall be ferruled and terminals shall be properly numbered. Minimum 20% spare terminals shall be provided.
- x. All electronic modules and components shall be accessible from front of panel only. Modular assemblies for both the system control electronic equipment and power electronic equipments shall be used.
- xi. All low voltage compartment and cabling shall be electrically and physically separated from the high voltage compartment.
- xii. DC link capacitor and pre charging and discharging circuit shall be preferably mounted in the rear of the panel. Suitable removable type hooks shall be provided for lifting the panel.
- xiii. Drive keypad, operator control panel required for control, monitoring and measurements shall be supplied and installed outside the panel on the front door. It shall be accessible for operation without opening the front door and shall be non-removable type.
- xiv. All equipment shall be complete with double compression glands, lugs etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[7]	25.09.2014

b) Cooling

- i. The drive panel shall be naturally cooled or water cooled type as per manufacturer's standards. However it is preferred to have natural air cooled system. If unavoidable, forced type-cooling system shall be provided. Cooling system shall include well-dimensioned panel, adequate cooling airflow path, module cooling fan and if necessary, panel cooling fan or water-cooling system shall be considered. Bidder shall ensure that the panel dimensions and flow paths have been designed for continuous running at the specified ambient without overheating. For fan cooled drives, redundant ventilating fans (N + 1) shall be provided.
- ii. Necessary starters shall be provided within the VFD panels for the ventilation fans, any other auxiliary motor etc.
- iii. The system provided shall be interfaced with drive starting and shut down such that safety interlocks such as start permit from cooling system to drive and trip signal from cooling system to drive in case of cooling system failure etc., shall be incorporated in the overall sequence logic.
- iv. MCB for motor space heater, auxiliary power supply if required for local panel, drive panel space heater etc. shall be included and mounted in easily accessible location.

1.4.2 Motor

The motor shall be designed, constructed and tested in accordance with the Specification for high Voltage Induction / Synchronous Motor, in addition to the following requirements:

- a) The motor shall be suitable for VFD control.
- b) The motor shall be suitable for the current waveforms produced by the power supply including the harmonics generated by the drive.
- c) The motor shall be designed to operate continuously at any speed in the operating range for the driven equipment (ie; ID fan / Coal feeder).
- d) The permitted voltage variation shall take into account the voltage drop across the AC drive and all other system components upstream the motor.
- e) Motors required to be transferred to DOL by-pass mode shall be rated for specified variations in system line voltage and frequency. Starting current of motor in DOL bypass mode shall be limited to value specified in motor specifications.
- f) The motor shall be constructed to withstand torque pulsations resulting from harmonics generated by the solid-state power supply.
- g) The motor insulation shall be designed to accept the applied voltage waveform, within the Vpeak and dv/dt limits as per IEC-61800-4.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[8]	25.09.2014

- h) The drive manufacturer shall be solely responsible for proper selection of the motor for the given load application and the output characteristics of the drive.

1.4.3 Static Power Converter

- a) The static power converter shall consist of a line side converter for operation as a rectifier and a load side power converter for operation as a fully controller inverter. Power converter shall be fast switching, most efficient and low loss type.
- b) The converter shall be co-ordinated with the transformers. The converter shall be able to withstand a three phase short circuit current until interrupted by normal breaker operation.
- c) Adequate short circuit and over voltage protection shall be provided for the converter and inverter system.
- d) All power converter devices shall include protective devices, snubber networks and dv/dt networks as required.
- e) The current rating of the converters semi-conductor components shall not be less than 120% of the nominal current flowing through the elements at full load of the VFD through the whole speed range. If the parallel connection of semi conductor is applied, the above current rating shall not be less than 140% of the above values.
- f) All power diodes shall be of silicon type with minimum V_{BO} rating at 2.5 times the rated operating voltage.
- g) The power converter circuit shall be designed so that motor can be powered at its full nameplate rating continuously without exceeding its rated temperature rise nor reducing its service factor due to harmonic currents generated by the inverter operation.
- h) The conversion devices and associated heat sinks shall be assembled such that individual devices can be replaced without requiring the use of any special precautions / tools.
- i) The cooling system of the electronic components, if provided, shall be monitored and necessary alarms shall be provided to prevent any consequential damage to the power control devices.

1.4.4 Converter Transformer

- a) The converter transformer, if provided, shall be copper wound dry type. Insulation class of dry type transformer shall be H with temperature rise of body limited to 75°C. Dry type transformer shall preferably be mounted inside the drive system panel. The impedances of converter input transformers with more than one secondary winding for minimum 18 pulse systems shall be selected to ensure equal load / current sharing

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[9]	25.09.2014

between the secondary windings, the converters and the motor windings under all operational conditions including starting and restarting.

- b) The transformation ratio, impedances, taps and secondary voltage shall be chosen by the drive vendor to optimize system performance.

1.4.5 DC link reactor

- a) Smoothing reactors for the DC link shall be designed to sufficiently decouple the rectifier and inverter portion of the converter and to limit fault currents in this circuit.
- b) Unless otherwise specified, the reactor shall be dry type, air cored, air-cooled or fan cooled type located within the panel.
- c) Reactor shall be suitable for withstanding earth fault continuously and for operation with the non-sinusoidal current wave shapes and DC components under all operational conditions of the system without exceeding its temperature limits.
- d) Noise level shall not exceed value specified in NEMA TR-1

1.4.6 Output filter

- a) VFD output current waveform should be inherently sinusoidal at all speeds, with harmonic limits as specified in this specification. Output filter shall be provided if required. Output filter capacitors shall be provided with discharge circuits to ensure that all residual stored charge is reduced to less than 50 V DC within 300 seconds after a loss of AC voltage. All capacitor shall be maintenance free and self-healing type.
- b) The VFD system shall inherently protect motor from high voltage dv/dt stress, independent of cable length to motor. Output filter shall be an integral part of the VFD system and included within the VFD enclosure.

1.4.7 Protection, Control, Metering, Indication and Annunciation

- a) The Bidder shall provide all the necessary system control, protection, alarm equipment and metering for the entire drive system and its auxiliary equipment.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[10]	25.09.2014

- b) Automatic sequence control shall include start-up of cooling system, auxiliary system of the motor, interlock checking, automatic start and run-up of drive, planned and emergency shutdown. The same shall be processed through microprocessor-based system.
- c) Protective Relays:
For details on protective relays used, refer to Technical Specifications on MV Switchgear
- d) Operator Control Panel
- i. Each drive shall be equipped with a front mounted operator control panel consisting of a backlit alphanumeric display and a keypad with keys for parameterization and adjusting parameter which shall not be limited to start/Stop, Local/Remote, auto/manual, Increase/Decrease, menu navigation and protection and measurement parameter selection, etc.
 - ii. All parameter names, fault messages, warnings and other information shall be displayed in complete English words or standard English abbreviations to allow the user to understand what is being displayed without the use of a manual or cross-reference table. This shall also be used for the modification of all electrical values, configuration parameters, drive menu parameters, application and activity function access, faults, local control, adjustment storage, self test and diagnostics. Keypad shall be operable with password for changing the protection setting, safety interlock etc. However the parameters such as measurements, setting, mode of drive etc. shall be allowed to be viewed without any password.
 - iii. Operator console shall have facility /port to connect external hardware such as Lap-Top etc. Console shall have facility for upload and download of all parameter settings from one drive to another identical drive for start up and operation.
 - iv. Drive system control shall also have facility to receive tripping signal from upstream breaker for tripping and also provision for closing up stream breaker after all required process parameters are achieved.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[11]	25.09.2014

- v. User-friendly software for operation and fault diagnostic shall be loaded in the drive system panel before commissioning.
 - vi. Suitable interface with DCS to be provided for control and status signals of VFD.
- e) Local Motor Control Station
- i. The local motor control station shall be installed near the motor. Components and accessories that are required in the local motor control station may be mounted on the local field mounted panel envisaged for the driven equipment.
 - ii. Meters in the local control station shall be suitable for 4-20mA transducer outputs and shall be calibrated for the actual motor current. Further, for drives with bypass facility, the meters shall be capable of reading bypass full load and starting currents, as well as the drive current.
 - iii. Requirement of controls and indications required in the Local Control Station shall be as specified in the data sheet.
- f) Protective Features:
- The system offered shall incorporate adequate protective features, properly coordinated for the drive control and for motor but not limited to the following:
- i. Incoming line surge protection
 - ii. Under / Over voltage protection
 - iii. Phase loss, phase reversal protection.
 - iv. Programmable Over current protection and under load protection.
 - v. Motor differential protection for motor rated above 1000 kW
 - vi. Inverter Fault.
 - vii. Over frequency operation.
 - viii. Ventilation loss,
 - ix. Over temperature of equipment.
 - x. Over speed of motor.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[12]	25.09.2014

- xi. Specific motor protection, including motor winding, bearing temperatures, over-current, overload, negative phase sequence, locked rotor and earth fault protections etc.
- xii. System Earth fault protection.
- xiii. Excitation system protection for synchronous motor
- xiv. Over and under frequency, rotor earth fault, field failure protection for synchronous motor
- xv. Additional protection for drive system

g) Control features

The following controls shall be provided as a part of the Operator Control Panel or through separate switches.

- i. Start/Stop
- ii. Speed control (Raise/lower)
- iii. Forward/Reverse(if Specified)
- iv. Auto/Manual /test mode
- v. Local/remote
- vi. Emergency stop
- vii. Start/stop for by pass starter (where specified)
- viii. Trip-Remote Breaker
- ix. Excitation control system for synchronous motors
- x. Sequential switching of filters

h) Metering

Digital display of the following parameters shall be as a part of the Operator Control Panel, selectable by the operator.

- i. Input AC Current
- ii. Input AC voltage
- iii. Input AC frequency
- iv. Output voltage
- v. Output current VFD / Bypass
- vi. Output frequency
- vii. Motor thermal state

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[13]	25.09.2014

- viii. Drive thermal state
- ix. Motor speed
- x. Motor energy meter
- xi. DC Link voltage
- xii. Hour Run
- xiii. Voltage and current meter for excitation system for synchronous motor.
- xiv. KVAR, power factor meter for synchronous motors
- xv. Necessary transducer shall be provided with 4-20mA output for indicating motor speed and motor current in DCS unless otherwise specified for other parameters.

i) Indications

Bidder shall provide indications as required for normal operation and for easy maintenance, which shall not be limited to the following indications both at local and at plant DCS.

- i. Motor running
- ii. Motor stopped
- iii. VFD System Fault
- iv. System ready to start
- v. AC mains ON
- vi. Motor over speed
- vii. Rectifier output 'ON'
- viii. Motor zero speed
- ix. Remote breaker trip
- x. Excitation system healthy for synchronous motors

Above indications may be provided as a part of the operator control panel, i.e., door mounted keypad or through hardwired indicating lamps/LEDS.

Potential free contacts of items i- iv shall be wired separately for remote indications in DCS.

j) Audio-visual annunciations

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[14]	25.09.2014

- i. The system shall incorporate audio-visual annunciations for protection, for various fault conditions, for the Drive motor, Supply cables, DC Reactor and the Converter, output transformer etc.
- ii. Alarms shall also be included for the failure of various auxiliaries together with identification of the failing unit, loss of cooling system, various protection devices provided for converter transformer etc.
- iii. Audio-visual window annunciations shall be provided on the front of the panel All annunciations as required for normal and satisfactorily operation of the drive system shall be included as per Bidder standards. These annunciations can be part of operator console panel or separately mounted type.
- iv. Bidder shall include audio-visual alarm as required for normal operation and maintenance of the system but not be limited to the following,
 - Rectifier fuse failure
 - Main AC failure
 - Inverter fuse failure
 - Inverter overload
 - Inverter high temperature
 - Cooling system failure
 - Motor failed to start
 - Transformer failure
 - Excitation system failure for synchronous motor
 - Battery monitoring healthiness
 - Communication and measurement system un healthy
 - Motor temperature high
 - Harmonic filters monitoring
- i. Common potential free contacts shall be provided for above annunciations and these shall be wired up to terminals of DCS I/O panels for remote alarm and monitoring.

k) Fault Diagnostic

Fault diagnostic shall be built into the system to supervise the operation and failure of the system. The information regarding failure of any of the system including shut down of the system shall be available for a period of minimum 4 days (96 hours) after a shut down even though no supply

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[15]	25.09.2014

would be available to the system. The system may be totally de-energized for maintenance or otherwise. It shall be possible to retrieve the record of events prior to tripping of the system or de-energisation. Auxiliary supply to the system components or to the electronics (firmware) for the diagnostics / display shall be taken care by the manufacturer for this purpose.

1.4.8 External Power supply for auxiliary and Control Circuit

Auxiliary power supply for devices external to VFD module, space heater supply for Motor, VFD panel space heater, auxiliary power supply for transformers, cubicle lamps (CFL) etc. shall operate on 240 volts single phase AC.

All control circuit shall operate at voltage of 110V AC or 220V DC.

Bidder shall include supply of all control transformers, protective devices, required accessories etc. and any other control supply voltage as required for the system.

1.4.9 Maintenance features

The controller design shall incorporate the following maintenance features:

- a) Modular construction
- b) All components shall be easily accessible.
- c) Standard diagnostics to aid maintenance personnel. These shall include LED or alphanumeric displays, test or measurement points.

1.4.10 Painting

- a) All metal surfaces shall be thoroughly cleaned and de-greased to remove mill scale, rust, grease and dirt. Fabricated structures shall be pickled and then rinsed to remove any trace of acid. The under-surface shall be prepared by applying a coat of phosphate paint and a coat of yellow zinc chromate primer. The under-surface shall be made free from all imperfections before undertaking the finishing coat.
- b) After preparation of the under surface, the panel shall be provided with epoxy based powder coating. The color shade of the final paint shall be as per manufacturer's standard, unless otherwise specified. Panel finish shall be free from imperfections like pinholes, orange peels, runoff paint, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[16]	25.09.2014

- c) All unpainted steel parts shall be zinc passivated, cadmium plated or suitably treated to prevent rust and corrosion. If these parts are moving elements, then these shall be greased.

Final paint shade shall be light gray and dove gray 631 and 632 as per IS-5 for indoor and outdoor equipment respectively unless otherwise specified

1.5 Tests

The Routine and Type Tests to be performed on the drive system in the presence of the purchaser of consultant shall be as follows:

1.5.1 Type Tests

For each rating and type of VFD, the Bidder shall submit for Owner's approval, the reports of all the type tests as per relevant standards and carried out within [last five] years from the date of bid opening. These reports should be for the tests conducted on the equipment similar to those proposed to be supplied under this contract and the test(s) should have been conducted at an independent laboratory.

In case the Bidder is not able to submit report of the type test(s) conducted within last five years from the date of bid opening, or in case the type test report(s) are not found to be meeting the specification requirements, the Bidder shall conduct all such tests under this contract free of cost to the Owner and submit the reports for approval.

All type tests shall be conducted as per relevant standards and test certificates of similar panels conducted within last 5 years shall be furnished.

1.5.2 Routine tests

- a) Visual Inspection
- b) It involves checking of the various equipments/components fault diagnostic unit, Wiring, Terminals, earthing ratings etc.in line with the approved drawings and visual inspection shall not be limited to the following:
- c) Insulation Test
- d) Light Load and Functional Test
- e) Load characteristics test
- f) Load duty test
- g) Checking of Auxiliary Devices
- h) Checking the properties of the control equipment

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[17]	25.09.2014

- i) Checking the Protective Devices
- j) Checking of control and functional requirements
- k) High voltage test
- l) Leakage and pressure test for cooling water system where provided
- m) Shaft current/bearing insulation
- n) Automatic restart/re-acceleration

Additional tests on switchgears and dry type transformers shall be carried out based on the requirement defined in the technical specification.

1.5.3 Test Witness

[The tests shall be carried out in presence of the Owner's representative, for which a minimum 7 days notice shall be given by the Bidder. The Bidder shall obtain the Owner's approval for the type test procedure before conducting the type test. The test procedure shall clearly specify the test set-up, instruments to be used, procedure, acceptance norms, recording of different parameters, interval of recording, precautions to be taken etc. for the type test(s) to be carried out.]

1.5.4 Test Certificates

- a) Certified copies of all tests carried out at works and at site shall be furnished in requisite no. of copies for approval of the Owner.
- b) The equipment shall be dispatched from works only after receipt of Owner's written approval of shop test reports.

1.6 Drawings, Data and Manuals

The engineering services scope and the documentation to be issued with the bid are described hereafter. The list shows the minimum requirements for the documentation, so that any additional documentation considered as necessary will be added to this.

- a) Engineering, manufacturing, delivering and test schedule
- b) Sub-Supplier lists.
- c) General arrangement drawings(plan, elevation, section view) with dimensions
- d) Foundation drawing including loading data.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-B,Annexure-E13	[18]	25.09.2014

- e) Technical Data sheets.
- f) Electrical and control wiring diagram.
- g) Terminal arrangement drawing, interconnection wiring diagram.
- h) Cross sectional drawing.
- i) Inspection and test plan.
- j) Manufacturing Quality Plan.

1.7 Ratings and requirements

Major technical parameters of motor are listed below. However, Bidder may also refer to Volume-III, technical schedule in order to submit technical data of equipment along with their technical proposal.

Table 2.0

Sl. No	Technical Parameters		
		6.6 kV	415 V
1	Manufacturer Name	[By Bidder]	[By Bidder]
2	Model No.	[By Bidder]	[By Bidder]
3	Application		
4	Quantity		
5	Enclosure Protection Rating	IP-31	IP-31

1 CONTROL & INSTRUMENTATION

1.1 General

This specification is intended to provide the technical guidelines for the fully coordinated Control & Instrumentation (C & I) system for the Steam Generators and its Auxiliaries of *[210/215/220/250]* MW, Coal fired Subcritical Thermal Power Plant. DCS & other common systems/items procured under TG package shall be deleted from SG package.

The Control and Instrumentation system for the plant shall be designed to ensure safe, efficient and reliable operation of the plant under all regimes of operation namely start up, shutdown, normal operation, part load operation and under emergency conditions resulting in cost effective power generation with optimum fuel consumption and reduced emission levels.

The technical specification shall serve as the guide specification for the proprietary controls like Boiler & its integral control, Burner Management System, Furnace Protection System including Master Fuel Trip (MFT), Safety Shutdown System, etc equipment packages, as also various stand alone system controls included as part of sub-packages, as in case of plant auxiliaries. It is not the intent or purpose of this specification to give details of every single item that might be required for completeness and/or proper integration of the overall system.

It is to be noted that where equipment or system for the Steam Generating Units are described, it shall be understood that the quantities described are per unit basis, i.e., identical sets to be furnished for each of the units. Where equipment or systems for common facilities are described, it shall be understood that the quantities described are the total quantities required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[1]	02.09.2015

2**SYSTEM DESCRIPTION**

The plant C&I system is envisaged to be configured by interfacing main plant control system for Station C&I namely Plant DCS interfaced with SG Integral control system (Separate Control system or implemented in DCS) and provided with different special plant monitoring and analysis systems to provide supervisory and reporting facilities to plant personnel and management.

The plant C&I system is envisaged to permit centralized operation and monitoring of the power plant from the central control room (CCR). The system shall consist of a functionally distributed microprocessor based system (DCS) with facility for VDU (Video Display Unit) / Keyboard & Large Video Screen based operation, control and monitoring.

SG Integral control system shall include Burner Management System (BMS) & Boiler protection system and could be an independent microprocessor based control system. BMS & Boiler Protection system shall be a fail-safe type system conforming to SIL 3 with certification from authorized agency.

SG Integral Control system (For BMS & Boiler protection system) shall be interfaced with Plant DCS through redundant bi-directional OPC link with Ethernet based TCP-I/P protocol or by only Ethernet based TCP-I/P protocol.

The plant C&I system is envisaged to be configured by interfacing main plant control system namely Plant DCS interfaced with other different plant control systems namely, TG Integral control system and other utility and auxiliary plant control systems (unit specific and plant common systems) and provided with different special plant monitoring and analysis systems to provide supervisory and reporting facilities to plant personnel and management.

The control requirements of the main power plant comprising SG with associated auxiliaries (except for SG Integral control systems) to be implemented in microprocessor based Distributed Control system.

Following PLC based systems shall be interfaced with plant DCS through redundant unidirectional OPC link with Ethernet based TCP-I/P protocol.

- ESP Control System
- Auxiliary Boiler Control System (if applicable)

CCR operation / monitoring of equipment/systems under SG Integral control systems shall be through plant DCS system OS /LCD.

A common time synchronization system is envisaged for time synchronizing of all programmable control systems like SG Integral control system, TG Integral Control System plant DCS, PLC control systems etc. for the whole station.

Operation and Monitoring of Plant Electrical 11 kV, 6.6 kV and Downstream System shall be performed through Plant DCS. Additionally, DCS shall have a redundant Software link with Substation Automation System (SAS) for monitoring of 400 KV & 220 KV switchyard systems. Switch yard system equipments shall be primarily operated from CCR (Operator stations shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[2]	02.09.2015

provided in CCR by extending the SAS bus) and control/monitored from SAS in Switchyard. For SOE inputs hardwired signals shall be connected to Plant DCS.

3 DESIGN PHILOSOPHY

This section covers the design philosophy which shall be used for all control & instrumentation system for steam generator & its auxiliaries.

1. Pressure indicators shall be used wherever indicating type Pressure transmitters are not envisaged. The applications include:
 - a) Suction and discharge lines of pumps & fans, including header section, if two or more pumps are employed for the same service.
 - b) All input and output lines of process equipments.
 - c) Inlets and outlets of heat exchangers (both the fluid media) and de-super heaters.
2. Pressure Switches shall be avoided as far as possible and in place, smart pressure transmitters with soft limit value monitoring in Plant DCS shall be used. The applications shall include the following:
 - a) On all process lines / Equipments where parameter abnormality / status including pre trips alarms to be communicated to the operator in control room.
 - b) For all permissive and protection conditions governed by safety operation of the equipments. e.g. pressure adequate, pressure very high / very low conditions.
 - c) For all interlock conditions, governing starting of standby equipment or subsequent equipments for safety operation of the system.
 - d) Inlet and outlet of filters / strainers.
3. Differential Pressure Switches (indicating type) shall be used across filters/strainers for remote monitoring.
4. Smart Pressure Transmitter shall be used for all control applications and as demand by the process. Pressure stubs with isolating valves shall be used.
5. Differential Pressure Transmitter shall be used for all the requirements of differential pressure, flow, level measurement. Pressure stubs with isolating valves shall be used.
6. Temperature indicators (Thermometers) shall be used for following applications
 - a) On all process lines where local indication is warranted by the system either for monitoring or testing.
 - b) On the inlet/outlet of equipments such as desuper-heaters, Heat Exchangers & Coolers for both the fluid media.
 - c) Differential temperature indicator shall be used across BFP suction and discharge service.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[3]	02.09.2015

7. Temperature Elements: Thermocouples / RTDs shall be used for casing metal temperature monitoring and bearing temperature monitoring of HT drives/motors.
- The elements shall be duplex type with integral thermowell (except for metal thermocouples). K Type Thermocouples shall be used for all temperature measurements wherever possible. However, for high temperature flue gas services R or S type thermocouple shall be used. For metal thermocouples suitable MS pads, clamps, flexible extension lengths etc. shall be used. Temperature elements in boiler and air ducts shall be used with protective tubes. Both the elements of duplex temperature sensors shall be brought to junction boxes.
 - Compensating cable shall be used with all thermocouples for terminating to the control system eg. Plant DCS.
 - Six nos. (2 nos. per phase) Resistance temperature detectors (RTD's) shall be used for all HT motors, for winding temperature monitoring. Each element shall be 3-wire type, duplex with thermowell assembly. RTDs shall be terminated in the external terminal box, for connection to Plant DCS system.
 - 1 no. duplex PRT-100 type RTD shall be used for each bearing of HT equipment and its driving equipment (motor).
 - All RTDs shall be PRT-100 type with each element being 3-wire type, duplex with thermowell assembly. RTDs shall be terminated in the external terminal box, for connection to Plant DCS system.
 - For process temperature up to 200 degree C, RTD shall be used. Beyond 200 °C temperature thermocouple to be used.
 - Temperature measurement shall have upscale / down scale protection features not to cause major process upset in case of sensor failure.
8. Level gauges shall be used on all tanks and the maximum length of one gauge glass shall not exceed 1 meter. The gauge glasses shall be stacked to cover the complete height of the tanks including over flow level. There shall be an overlap of minimum 100mm, when more than one level gauge is required.
9. Level switches: The instrument shall be used for the following applications:
- On all equipments (storage vessel) where parameter abnormality/status has to be communicated to the operator in the control room.
 - All permissive, interlock and protection conditions governed by the safe operation of the equipment.
 - The instrument shall be external cage type with SW connection with isolation facility for surface mounted tanks and top mounted with still pipe for all sumps. Still pipes shall be used with adequate supports.
 - Conductivity type level switches shall be used for all heaters and drain pots.
 - Radar type level switches shall be used for bulk material bunkers.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[4]	02.09.2015

10. Level Transmitters Stubs with impulse pipes, root valves for mounting Level transmitters shall be used on process equipments where continuous remote monitoring and/or control of level is envisaged. Wherever necessary standpipes or float chambers and also makeup line shall be used for filling up the constant level vessel.
- a) The instrument shall be differential pressure type for boiler drum etc.
 - b) Radar type level transmitter shall be used for fuel oil storage tanks.
 - c) Admittance or Radar type shall be for sludge and slurry applications.
11. Flow Glasses shall be used at the outlet of the pipe lines and shall be employed under the following conditions:
- a) Coolers
 - b) The instrument shall be rotary type with glass mounted for indication
 - c) Up to 6 inch on-line flow glasses shall be supplied and above 6 inch bypass type flow glasses shall be used. Sight flow and variable flow indicators shall be used for low pressure and low temperature applications.
12. Speed Measurement shall be used, where variable speed drives are controlled from remote (e.g. feeders, ID fans etc). All speed sensors shall be non-contact type. All speed transmitters shall be microprocessor based. Microprocessor based speed switches shall be used for zero speed detection, chain cut detection, locked rotor protection etc. Microprocessor based reverse rotation switch shall be used for pump protections.
13. Pneumatically Operated Control Valves shall be used for all control application. If the process demands any other control, then control valves shall be used for those applications also. Where a single control valve cannot meet the turn down ratio as dictated by the process, control valves with split range application shall be used.
- a) All bypass valves of control valves shall be motor operated valves suitable for inching operation provided with position transmitters.
 - b) All integrated bypass valves shall be motor operated. Electro-pneumatic positioners shall be used for all pneumatic control valves.
 - c) Pressure test points & drains shall be used across each control valve
14. The pneumatically operated control valves shall be used with Smart Positioners, diagnostics and HART compatibility. Control Valve diagnostics shall be transmitted through this HART Protocol to Plant DCS.
15. Solenoid Valves shall be used for all pneumatic control valves hooked up with process interlock requirements and where direct tripping is involved. All solenoid valves shall be uniformly rated for 24V DC or 220V DC. The number of ways for solenoid valve shall be used as indicated below :

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[5]	02.09.2015

- a) On line two (2) way solenoid valves shall be used, where process line of less than 2 inch with low pressure & temperature application is involved.
 - b) Three (3) way solenoid valves shall be used commonly, where the pressure is admitted or exhausted from a diaphragm valve or single acting cylinder. E.g.: Pneumatic operated spray water block valve.
 - c) Four (4) way solenoid valve shall be used for operating double acting cylinders (If applicable). E.g.: Pneumatically operated on-off type dampers.
 - d) Dual coil, latch, unlatch type Solenoid valves shall be supplied for equipment trips/critical applications.
 - e) Five port solenoid valves shall be used for pneumatic retract/insert mechanism power cylinders for Oil gun, ignition gun etc.
- 16.Position Transmitters shall be used for all motorized inching valves. Position transmitters shall be 24 V DC, 2 wire, non-contact type.
- 17.Electro-Pneumatic positioners shall be used for all pneumatically operated control valves, power cylinders etc., for converting controller output of 4-20 mA to appropriate pneumatic signal.
- 18.Air Filter Regulators along with gauges shall be used in each of the:
- a) Air supply line to valve positioners /power cylinders
 - b) Air supply line to pneumatic interlocked block valves
- 19.Interposing relay (To be mounted in Control room cabinet) for interface to the following:
- a) Solenoid valve (if output module cannot directly drive SOV) - Relays with contact rating of minimum 2 Amps.
 - b) DC Starter ((if output module cannot directly drive) - Relays with contact rating of minimum 0.2 Amps.
 - c) Hardwired signal exchange – as required.
- 20.For all HT rotating equipment bearings provision for mounting vibration probes shall be used.
- 21.Junction Boxes/Field termination cabinet: All JBs /FTCs shall be SS. Junction Boxes shall be used for:
- a) Termination of all sensors located equipment wise.
 - b) Termination of Duplex Thermocouples / RTDS
 - c) Termination of limit switch, torque switch, position transmitter and control demand, independently for each valve.
 - d) Area wise or Elevation wise bunching of cables.
- 22.Instrumentation & control cables and Prefabricated Cables with Anti-Rodent treatment shall be used to:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[6]	02.09.2015

- a) Connect field instruments to field junction boxes/Local Panels. For switches, both the SPDT contacts of switches shall be wired up to the J.B.
 - b) Connect limit switches, torque switches and position transmitters to their respective field junction boxes.
 - c) Compensating cable shall be supplied for connection between the element and the respective junction boxes / system cabinets as per guidelines.
 - d) Prefabricated cable for connecting between system cabinets, marshalling cabinet to system cabinet, system cabinet to Relay Rack, system cabinets to engineering work stations etc.
 - e) Entire I&C cable within the battery limits.
23. All field instruments including electronics located outside control room areas shall be tropicalized and shall be designed to work in site specific atmosphere/climatic conditions and enclosed in dust tight, waterproof and weatherproof enclosures. In general, transmitters and switches installed at outdoor location shall be mounted in closed type transmitter enclosure. For other areas (indoor), open type racks may be used for installation of transmitters and process switches.
24. Conventional hardwired alarm annunciation system has not been envisaged. All alarm shall be displayed in the Plant DCS HMI/LVS. However where local panels are used for local operation/monitoring, PLC/ DCS driven alarm annunciation system with LED type lamps for local panel shall be used.
25. Pressure, temperature and flow test points shall be used in line with latest performance test code requirements.
- In general, pressure and temperature test points shall be used for the following services:
- a) At the discharge of all pumps and fans
 - b) At the inlet and outlet of the heat exchangers for the fluid media involved
 - c) Adequate number at the Combustor at different zones
 - d) At the inlet and outlet of each control valve
26. The ranges of the instruments shall be selected based on the following philosophy:
- a) For pressure and draft measurements, the maximum operating pressure shall be within 70 to 80% of the maximum scale range.
 - b) For temperature measurement, the maximum operating temperature shall be within 80 to 90% of the maximum scale range.
 - c) For pressure switches and temperature switches, the set points shall fall within 40% to 70% of the scale range selected.
 - d) For level measurement, the maximum of the range shall cover the overflow point or six inches from the top of the vessel and the minimum of the range

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[7]	02.09.2015

shall be six inches above the bottom of the vessel. Also, the gauge glasses shall be stacked with overlap to cover permissive, alarm and trip levels.

- e) For flow measurement, the maximum range shall be fixed at about 10 to 15% above the maximum operating flow
 - f) For electro-chemical measurements (conductivity, pH, dissolved O₂, Silica etc.), the maximum range shall be around 10 to 15% higher than the recommended alarm settings.
 - g) For gas analyzers, the maximum range shall be around 10 to 15% higher than the recommended alarm settings.
27. Individual (one for each transmitter) purging line connected to the impulse line before the root valve with required accessories shall be used for all Air and Flue gas transmitters impulse lines.
28. Spring-loaded/ Cage clamp type terminals shall be used for termination of instrumentation cables at field JBs, FTCs and local panels.
29. Signal Exchange Between Boiler Equipments / System and Plant DCS System
- a) All the signals required for interlock / alarm / SER purpose (to be Implemented in the Plant DCS) shall be hardwired.
 - b) All binary outputs provided to local panels/sensors for connection from Plant DCS shall be potential free contacts with a rating of 0.2 amps at 220 V DC or 2 amps at 24 V DC or 5 amps at 240 V AC. All check backs to Plant DCS shall only be potential free contacts.
 - c) All analog outputs provided to local panels/sensors for connection from Plant DCS shall be isolated 4-20 mA DC.
 - d) Command outputs from Plant DCS to motorized valve actuator shall be logic level signal (24 V DC) and necessary interposing relays suitable to accept 24 V DC logic level command signal shall be used in MCC module for MOV actuator.
 - e) Push buttons station/panel for safe emergency shutdown of the plant shall be provided.
30. Flow elements for measurements of secondary airflow to the furnace & Primary air flow to Pulverizer shall be used along with 3 (three) tapping's for measurement & Control and one tapping for test purpose.
31. Airflow shall be measured by aerofoil or venturi or by any special online measurement technique with high accuracy (typically better than + /- 2%).
32. All indication lamps shall be LED type.
33. All interposing relays shall be Plug in type with screw type base & LED for status indication. Relay modules/boards etc. are not acceptable.
34. All Limit Switch shall be Non-Contact type. If there is constraints because of process conditions/space, mechanical lever actuated Limit switch may be used.

LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[8]	02.09.2015

4 DESIGN CRITERIA

This section covers the general design criteria to be adopted in designing the Control & Instrumentation system for the SG Package.

4.1 General Requirements

Ambient Conditions

Instruments, devices and equipment for location in outdoor / indoor / air-conditioned areas shall be designed to suit the environmental conditions indicated below and shall be suitable for continuous operation in the operating environment of a coal fired Power plant and also during periods of air conditioning failure without any loss of function, or departure from the specification requirements covered under this specification.

Table 4.1
Protection Class Requirement

Ambient Temperature (outside temperature)	Pressure	Relative Humidity	Atmosphere	Required Protection class of panels / cabinets / desks
Outdoor Location				
55 °C max	Atmosphere	100%Max	Air (dirty)	IP 65
4 °C min	Atmosphere	5% Min	Air (dirty)	IP 65
Indoor Location				
55 °C max	Atmosphere	95% Max	Air	IP 54
4 °C min.	Atmosphere	5% Min	Air	IP 54
Air-conditioned Area				
24 +/- 2 °C normal	Atmosphere	95% Max	Air	IP 44
50 °C Max.	Atmosphere	5 % Min	Air	IP 44
a) For Ventilated enclosures, protection class shall be IP 42. b) For hazardous areas the protection class shall be in accordance with the requirements of the relevant NEC code for the location. c) For PCs, OWS, EWS, Servers, Printers and other peripherals, maximum temperature limit shall be 35 °C, For LVS the same shall be 25 °C & for UPS the same shall be 40 °C				

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[9]	02.09.2015

4.2 Codes & Standards

All equipment, system and service covered under this specification shall comply with the requirements of the latest statutes regulations and safety codes as applicable in the locality where the equipment/systems shall be installed.

The equipment, systems and services furnished as per this specification shall conform to the latest edition of codes and standards mentioned in this section. However in the event of any conflict between the requirements of two standards or between the requirements of any standard and this specification, the more stringent requirements shall apply unless confirmed otherwise by the owner/owner's engineer in writing. The decision of the owner shall be final & binding in all such cases.

All equipments supplied under this specification shall be given tropical treatment for the climatic conditions prevailing at site as described under project data. Tropical protection shall conform to IS-3202 (Climate proofing of electrical equipments) or any other applicable international standard for protection of Electrical power equipments against climatic conditions.

Reference Codes and Standards

The design, manufacture, inspection, testing, site calibration and installation of all equipment and systems covered under this specification shall conform to the latest editions of codes and standards mentioned below and all other applicable ANSI, ASME, IEEE, NEC, NEMA, ISA, DIN, VDE and Indian Standards and their equivalents.

Temperature Measurement

- Instrument and apparatus for temperature measurement ASME PTC 19.3
- Temperature measurement - Thermocouples ANSI-MC 96.1
- Temperature measurement by electrical resistance thermometers – IS: 2806.
- Thermometer-element-platinum resistance-IS-2848 / DIN 43760/ IEC 751

Pressure Measurement

- Instrument and apparatus for pressure measurement - ASME PTC 19.2
- Bourdon tube pressure and vacuum gauges - IS 3624

Flow Measurement

- Instrument and apparatus for Flow measurement – ASME PTC 19.5 Interim supplement, Part-II
- Measurements of Fluid flow in closed conduit – BS 1042 / ISO 5167.

Electronic measuring Instruments & Control hardware

- Automatic null balancing electrical measuring instruments - ANSI C 39.4 (Rev.)
- Safety requirements for electrical and electronic measuring and controlling instrumentation - ANSI C 39.5.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[10]	02.09.2015

- Compatibility of analog signals for electronic industrial process instruments - ISA-S 50.1: ANSI MC 12.1.
- Dynamic response testing of process control instrumentation - ANSI MC 4.1: ISA-S26.
- Surge withstand capability (SWC) tests - ANSI C 37.90a IEEE Std. 472. IEC - 254.1.
- Printed circuit boards - IPC TM-650, IEC 326 C
- General requirements and tests for printed wiring boards - IS 7405 (Part-I)
- Edge socket connectors - IEC 130-11.
- Requirements and methods of testing of wire wrap terminations DIN 41611 Part-2.
- Dimensions of attachment plugs & receptacles ANSI C73.
- Direct acting Electrical Indicating Instruments: IS-1248.

Electronic Cards, Subassemblies & Components

1. Unpackaged
 - Vibration IEC 68.2.26
 - Shock IEC 68.2.27
 - Drop & Topple IEC 68.2.31
2. Packaged
 - Vibration, Drop & Static Compression – NSTA
3. Electromagnetic Compatibility
 - Electrical Fast Transient – IEC 801.4
 - Surge Withstand – IEC 255.4
 - Radiated Electromagnetic Field – IEC 801.3
 - Electrostatic Discharge – IEC 801.2
 - Electromagnetic Emissions – VDE 0871, Class B

Instrument Switches and Contacts

- Contact rating - AC services NEMA ICS Part-2 125, A600
- Contact rating - DC services NEMA ICS Part-2-125, N600.

Enclosures

- Types of enclosures - NEMA Std. ICS-6-110.15 through 110.22 (Type 4 to 13).
- Racks, panels, and associated equipment - EIA: RS-310-B (ANSI C83.9)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[11]	02.09.2015

- Protection Class for Enclosure, Cabinets, Control Panels and Desks - IS-13947, & IEC 529.

Apparatus, enclosures and installation practices in hazardous areas

- Classification of hazardous area - NFPA Art. 500, Vol.70.
- Electrical Instruments in hazardous dust locations - ISA-RP 12.11
- Intrinsically safe apparatus - NFPA Art.493 Vol.4.
- Purged and pressurized enclosure for electrical equipment in hazardous location - NFPA Art. 496.

Sampling System

- Stainless steel material of tubing and valves for sampling system - ASTM A269-82 Gr. TP316.
- Submerged helical coil heat exchangers for sample coolers ASTM D 11-92.
- Water and Steam in power cycle - ASME PTC 19.11.
- Standard methods of sampling system - ASTM D 1066-69.
- The system shall be based on established Standard & Codes of Practice, such as GDCD 234 / 164 / 163, CEGB, UK.

Annunciator

- Specifications and guides for the use of general purpose annunciator - ISA RP 19.1.
- Surge withstand capability tests - ANSI C.37.90a and IEEE std. 472

Interlocks, Protections

- Relays and relay system associated with electric power apparatus - IEEE std.3.13.
- Surges withstand capability tests - ANSI C.37.90a and IEEE Std. 472.
- General requirements & tests for switching devices for control and auxiliary circuits including contactor relays - IS-6875 (Part-I).
- Boiler safety interlocks - NFPA Section 85B, 85D, 85E, 85F, 85G.

Control Valves

- Flow Equation for Sizing Control Valves – ISA S39.2
- Control Valve Seat Leakage – ANSI / FCI 70.2
- Face to face Dimensions of Control Valves – ANSI B16.10, ISA – S75.03 & ISA – S75.16
- Steel Pipe, Flanges & Flanged Fittings – ANSI B16.34
- Control Valve Capacity Test Procedure – ISA – S75.02

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[12]	02.09.2015

- Industrial Process Control Valves - IEC 534

Process Connection and Piping

- Codes for pressure piping power piping ANSI B31.1
- Seamless carbon steel pipe ASTM A-106.
- Forged and Rolled Alloy steel pipe flanges, forged fittings, valves and parts - ASTM A-182.
- Material for socket welded fittings - ASTM A-105.
- Seamless Ferritic alloy steel pipe - ASTM A-335.
- Pipe fittings of wrought carbon steel and alloy steel - ASTM A-234.
- Composition bronze or metal castings - ASTM B-62.
- Seamless copper tube, bright annealed ASTM B-168.
- Seamless copper tube - ASTM B-75.
- Dimensions of fittings - ANSI B-16.11
- Valves flanged and butt welding ends - ANSI B16.34.
- Nomenclature for Instrument tube fittings ISA-RP-42.1.

Instrument Tubing

- Seamless carbon steel pipe - ASTM - A106.
- Material for socket welds fittings - ASTM - A105.
- Dimensions of fittings - ANSI B16.11
- Code for pressure piping, welding, hydrostatic testing - ANSI B31.1.
- Nomenclature for Instrument Tube Fittings – ISA RP 42.1
- Seamless Stainless Steel Tubes ASTM A 312 TP 304

Cables

- Thermocouple extension wires/cables - ANSI C 96.1.
- Colour coding of single or multi-pair cables - ICEA S-61- 402. (Third edition) NEMA WCS.
- Guide for design and installation of cable systems in power generating stations (insulation, jacket materials) - IEEE Std. 422.
- Requirements of vertical tray flame test - IEEE 383.
- Standard specification for tinned soft or annealed copper wire for electrical purpose - ASTM B-33 - 81.
- Oxygen index and temperature index test - ASTM D-2863.
- Smoke generation test - ASTM D-2843 and ASTM E-662.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[13]	02.09.2015

- Acid gas generation test - IEC-754-1.
- Swedish chimney test - SEN - 4241475 (F3)
- Instrumentation cables and internal wiring IS-1554 (Part-I) and IS: 5831.
- Mono-mode Fibre – ITU-T G.652 for Optical Fibre Cable
- IEEE 1138 / IEC 1089 / EIA-455 B for Optical Fibre Cable

Cable Trays, Conduits

- Guide for the design and installation of cable systems in power generating station (cable trays, support systems, conduits) - IEEE Std. 422, NFPA-70.
- Guide for the design and installation of cable systems in power generating station (Cable trays, support systems, conduits) Test Standards, NEMA VE-1.
- Galvanizing of Carbon steel cable trays - ASTM A-386-78.

4.3 Power Supply

All instruments and control devices shall be designed to operate on power supplies as follows:

1. Electric:
 - a) 230 volts AC, 50 hertz, single-phase for low torque drives with guaranteed satisfactory operation when equipment is continuously energized at any voltage from 216VAC to 264VAC.
 - b) 24V DC for PLC & DCS.
 - c) 24 VDC, 110VAC or 230 VAC for Field Instruments.
2. Pneumatic:

Clean, dry, and oil free instrument air at 4.2 to 8.6 bars gauge. All necessary pressure reducing controls, where required, shall be furnished by the equipment supplier as specified at some other place under air compressors section.

4.4 Standard Ranges of Analog Signals

The ranges of analog signals shall normally be as follows:

- a) Electric -- 4 to 20 mA DC.
- b) Pneumatic -- 0.2 to 1.0 kg/cm².

The use of any signal range other than the above shall not be acceptable.

4.5 Contact Ratings

The ratings of all instrument contacts used for alarms and interlocks shall be as follows:

Table 4.2
Contact Ratings

Voltage Rating (volts)		Continuous Rating	Switching Rating (break)	
Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[14]	02.09.2015

a)	240 AC	480 volt-amperes	1200 volt-amperes
b)	220 DC	60 watts	200 watts
c)	24 DC	12 watts	25 watts

The ratings of all microprocessor-based controller or programmable controller output contacts shall be as required by the controlled devices. Where necessary for higher current ratings or isolation, interposing relays shall be used.

4.6

Reliability and Availability

1. Each component and system shall be of established reliability. The minimum target reliability of each piece of equipment like each electronic module/card, power supply, peripheral etc. shall be established by considering its failure rate/mean time between failures (MTBF), meantime to repair (MTTR), such that the availability of the complete C&I system is assured for 99.7%.
2. Detailed reliability calculations shall be used for each system/ equipment (with the help of a schematic of various sub-system connected in series or in parallel as the case may be and MTBF & MTTR values for the various equipments). Availability calculation shall be as per IEEE Standard-P1046 or equivalent.
3. When more than one device uses the same measurement or control signal, the transmitter and other components/ module shall be fully equipped to provide all signal requirements. The system shall be arranged so that the failure of any monitoring device or control components or spurious intermediate grounding in the signal path shall not open the signal loop nor cause the loss or malfunction of signal to other devices using the same signal.
4. To ensure availability, adequate redundancy in system design shall be used at hardware, software and sensor level to satisfy the availability criteria. For the protection system, independent sensing device shall be used to ensure adequate safety of plant equipment.

4.7

Standardization & Uniformity of Hardware

To ensure smooth and optimal maintenance, easy interchange ability efficient spare parts management of various C&I instruments, ensure that all instruments/devices (Processor modules, input/output modules, power supply modules etc.) are of the same family of hardware. For example, all 4-20 mA electronic transducers, control hardware, control valves, actuators instruments/ local devices etc. being furnished shall be boiler manufacturer specific. Take special care towards selection of SG Integral Control system.

4.8

Redundancy

1. Reliability of the Control System shall be established by judicious incorporation of redundancy. In general all critical parts shall have hot standby feature to render the system immune to any single failure.
2. Measurement system (MS), Closed Loop Control System (CLCS) and Open Loop Control System (OLCS) shall all be configured with redundancy at processor modules, communication modules, data bus and power supply modules.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[15]	02.09.2015

3. Both CLCS & OLCS shall be configured with I/O channels redundancy for each sensor/signals. Where redundant sensors are provided redundant I/O channels shall be used for each sensors/signals.
4. Two out of three measurements philosophy shall be adopted for the control of all closed and critical open loop variables for reliability of operation. The control system shall select the median value for the normal control purpose.

4.9 Operability & Maintainability

1. The design of the control systems and related equipments shall adhere to the principle of 'Fail Safe' operation wherever safety of personnel / plant equipment is involved. 'Fail Safe' operation signifies that the loss of signal or failure of any component shall not cause a hazardous condition. However, it shall also be ensured that occurrence of false trips are avoided / minimized.
2. The types of failure which shall be taken into account for ensuring operability of the plant shall include but not be limited to:
 - a) Failure of sensor or transmitter,
 - b) Failure of main and/or redundant controller/other modules,
 - c) Loss of motive power to final control element,
 - d) Loss of control power.
 - e) Loss of instrument air
3. The choice of hardware shall also take into account sound maintainability principles and techniques. The same shall include but shall not be limited to the following:
 - a) Standardization of parts.
 - b) Grouping of functions.
 - c) Interchangeability.
 - d) Malfunction identification facility/self surveillance facility.
 - e) Easy modular replacement.
 - f) Fool proof design providing proper identification and other features to preclude improper mounting and installation.
 - g) Appropriate derating of electronic components and parts.

4.10 Metering Bases of Units

The following system of units shall be followed throughout the specification unless otherwise mentioned.

Table 4.3
Metering Bases of Units

S.N	Parameter	Unit
1	Pressure	Kg/sq. cm
2	Differential pressure	mm of H2O column or Kg/sq. cm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[16]	02.09.2015

S.N	Parameter	Unit
3	Draught	mm of H ₂ O column
4	Vacuum	mm of Hg
5	Temperature	Degree Celsius
6	Flow (Steam / Feedwater)	Tonnes / hr or Kg/hr
7	Flow (Air / Gas)	Tonnes / hr or N. Cu. M /hr
8	Flow (Oil)	Tonnes / hr or Kg/hr
9	Density	gm / cu.cm
10	Level	mm or M
11	Conductivity	Micro-mho/cm

4.11

Grounding System

All panels, desks, cabinets shall be used with a continuous bare copper ground bus. The ground bus shall be bolted to the panel structure on bottom on both sides. The bolts shall face inside of panels.

The system ground shall be isolated from the panel ground with suitable isolators. All internal component grounds or common shall be connected to the system ground, which shall be fabricated of copper flat (size 25 mm x 6 mm min, length as applicable).

Shield on instrumentation cables shall be grounded on panel side. When shielding termination is required in cabinets furnished under this specification, suitable terminals shall be furnished on copper flat forming system ground. System and shield ground shall be connected to earthing strip at 0.0 meter level using suitable size of cable.

4.12

Flow Element Selection

Table 4.4
Flow Element Selection

Sl. No.	Type of Flow meter	Fluid medium	Process Parameter	Pipe sizes suitable for FE	Application	Type of connection
1	Orifice Plate	Water (DM Water)	As per process requirement	For all sizes Except very large diameter pipe	DM Water Flow To CST	Flange
2	Orifice Plate	Steam	For any condition	< 3"	Soot blowing steam flow	BW
3	Flow nozzle(Al Si Type316 L)	Water	As per process requirement	For all pipe sizes except very large diameter Pipe	(i) FW Flow to boiler drum (ii) SH/RH Spray water flow	BW

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[17]	02.09.2015

4	Flow nozzle(AI SI Type316 L)	Steam	As per process requirement	For all pipe sizes except very large diameter Pipe	AUX. Steam flow	BW
5	Air foil	Air	As per process requirement	All duct sizes	(i) Primary air flow (ii)secondary air flow	BW BW
6	Any Other Services required.	Subject to Owner / Consultant's approval.				

4.13

Drive Control Philosophy

The Drive control & measurement philosophy for the project is detailed in this section.

1. Bi-directional drives (inching or open/close)
 - a) All bi-directional drives shall be operable from Remote i.e. from CCR.
 - b) Remote manual operation of all drives shall be carried out from OWS.
 - c) Remote Open/Close commands, generated in control system shall be issued to MCC module through interposing relays located in respective MCC module in the MCC room. Latching of commands shall be used in control system logic which shall be reset by Limit/Torque switch feedback. The Limit/Torque switch feedback from drive shall be directly wired to Control System.
 - d) Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
 - e) Following signal exchange shall be envisaged between Drive & Control system:
 - Open Limit Switch (Both NO & NC contacts)
 - Close Limit Switch (Both NO & NC contacts)
 - Open Torque Actuation
 - Close Torque Actuation
 - Position feedback (4-20 mA, two wire electronic type) for inching drive
 - f) Following signal exchange shall be envisaged between MCC & Control system (Remote I/O cabinet of control system located in/near MCC room):
 - Switchgear available
 - Switchgear disturbance
 - Open Command

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[18]	02.09.2015

- Close Command

2. Unidirectional LT drives

- Unidirectional LT drives shall be operable only from Remote i.e. from CCR. In addition, Local pushbutton shall be used only for emergency stopping of drive. Local start operation of the drive is not envisaged.
- Remote manual operation of all drives shall be carried out from OWS.
- Remote Start/Stop commands shall be generated in Control system & shall be issued to MCC module through interposing relays located in respective MCC modules.
- Emergency stop of the drive shall be envisaged from the local pushbutton provided near the drive. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to MCC.
- Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
- Current transducer with 4-20 mA type outputs shall be used in the MCC for monitoring the current in Control System for all Drives greater than 90 KW. Auxiliary power supply to these transducers shall be from the control supply of the respective MCC modules.
- Following signal exchange shall be envisaged between MCC & Control system (Remote I/O cabinet of control system located in MCC room):
 - Switchgear available
 - Switchgear disturbance
 - On Feedback
 - Off Feedback
 - Start Command
 - Stop Command
- All Numerical relays/Intelligent controllers for LT drives shall be interfaced to Control System through IEC 61850 protocol.

3. Solenoid Operated drives

- Solenoid operated drives shall be operable only from Remote i.e. from CCR.
- Remote manual operation of all drives shall be carried out from OWS.
- Remote Open/Close commands shall be generated in Control system & shall be issued to the Solenoid through interposing relays, located in Relay Panel.
- Necessary process interlocks shall be realized in Control system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[19]	02.09.2015

e) Following signal exchange shall be envisaged between solenoid drive & Control system:

- Open Limit Position
- Close Limit Position
- Open Command
- Close Command

4.14 HT drives

1. HT drives shall be operable only from Remote i.e. from CCR. In addition, Local pushbutton shall be used only for emergency stopping of drive. Local start operation of the drive is not envisaged.
2. Remote manual operation of all drives shall be carried out from OWS.
3. Remote Start/Stop commands shall be generated in Control system & shall be issued to MCC module through interposing relays located in respective MCC modules.
4. Emergency stop of the drive shall be envisaged from the local pushbutton provided near the drive. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to MCC.
5. Necessary Electrical protections shall be realized at MCC module whereas process interlocks & protections shall be realized in Control system.
6. Current transducer with 4-20 mA type outputs shall be used in the MCC for monitoring the current in Control System for all Drives. Auxiliary power supply to these transducers shall be from the control supply of the respective MCC modules
7. Following signal exchange shall be envisaged between MCC & Control system(Remote I/O cabinet of control system located in MCC room):
 - a) Switchgear available
 - b) Switchgear disturbance
 - c) Master Trip relay Operated
 - d) On Feedback
 - e) Off Feedback
 - f) Trip Feedback
 - g) Emergency stop feedback
 - h) Start Command
 - i) Stop Command
 - j) Current Feedback

8. All Numerical relays/Intelligent Controllers for HT drives shall be interfaced to Control System through IEC 61850 protocol.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[20]	02.09.2015

4.15 Variable Frequency Drives (VFD)

1. VFD shall be operable from Remote i.e. from CCR & from VFD Local Display unit. In addition, Local pushbutton shall be used only for emergency stopping of drive.
2. Remote manual operation of VFD shall be carried out from OWS.
3. Remote Start/Stop commands shall be generated in Control system & shall be issued to VFD Panel through interposing relays located in VFD Panel.
4. Emergency stop of the drive shall be envisaged from the local pushbutton provided in the field. The stop push button (Stay put type) shall be used with a press to lock & turn to release type keyless mechanism. Under locked position the drive operation is inhibited from remote. The local emergency stop push button shall be wired directly to VFD panel.
5. Necessary Electrical protections shall be realized at VFD module whereas process interlocks & protections shall be realized in Control system.
6. Following signal exchange shall be envisaged between VFD & Control system:
 - a) Switchgear available
 - b) Switchgear disturbance
 - c) On Feedback
 - d) Off Feedback
 - e) Trip Feedback
 - f) Emergency stop feedback
 - g) Start Command
 - h) Stop Command
 - i) Current Feedback
 - j) Speed feedback
 - k) Speed Setpoint
7. The VFD shall also be interfaced with control system via Modbus soft link.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[21]	02.09.2015

5 SG INTEGRAL CONTROL SYSTEM

The microprocessor based Control System shall be used for the safe and efficient operation of Steam Generator Protection in all regimes of operation. Implementation of all the control, monitoring, interlock and protection schemes for Steam Generator integral control system which include MFT scheme, Flame monitoring system, Burner management system, Boiler/Furnace protection, Furnace Purging etc. PLC or DCS shall be offered to implement the SG integral control system. The SG integral system shall be interfaced with Plant DCS through redundant data highway.

For all the OLCS & CLCS for SG and auxiliaries like Coordinated Master control, furnace draft control, Super heater and Re-heater steam temperature control, fuel oil flow/ fuel oil pressure control, combustion air flow control, pulveriser coal/ air temperature control, primary air pressure control, Fans start stop interlocks, SADC, Soot blower control etc. Control schemes and logics & write ups shall be provided to the Plant DCS supplier for implementation within Plant DCS system.

5.1 Control System Requirements

1. The SG Integral control system shall consists of the following System controls:
 - a) Burner Management System (BMS) including SG Protection System, Furnace Purging & Master Fuel Trip (MFT)
 - b) Coal Mill & Feeder Control Logics
 - c) Furnace flame monitoring system
 - d) Furnace Flame viewing & analysis system
 - e) Auxiliary Steam System
2. All hardware / software, whether or not specifically indicated in this specification shall fully meet operational / maintenance / safety requirement as well as statutory / international standards and proven practices.
3. The Control System shall function reliably under the environmental conditions as specified in Design Criteria/Philosophy of this specification. It shall be immune from the interference resulting from disturbance in power supply feeders, signal lines, inputs, outputs, etc. as experienced in a Power station.
4. The Control System shall have on-line simulation and testing facility. Further, it shall be possible to on-line configure and tune controllers through engineering workstation.
5. The system shall have the flexibility to easily reconfigure any controller at any time without requiring additional hardware or system wiring changes and without disabling other devices from their normal operation mode. Modifications shall not require switching off power to any part of the system.
6. Power supply to individual functional group shall be from redundant 24 V DC feeders with diode auctioneering and further sub-distribution.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[22]	02.09.2015

7. Independent and dedicated controllers (main and its 100% standby) shall be used for each of the System except for SG protection system where triple redundant controllers are to be used as per this specification. All the 100% hot / redundant backup controllers shall be identical in hardware and software implementation to their corresponding main controllers and shall be able to perform all its tasks. The backup controller shall track its corresponding main controller. There shall be an automatic and bumpless switchover from the main controller to its corresponding backup controller in case of main controller failure and vice versa without resulting in any change in control status. In case of switchover from main controller to the 100% hot backup controller, the back-up controller shall work as the main controller. Facility shall also be provided for manual switchover from main to 100% hot back-up controller and vice versa from the Engineer's Work Station.
8. The control system hardware design shall be such that it is able to withstand power line disturbances.
9. The loop / logic reaction time shall be suitable to match actual process requirements, subject to minimum requirement wherever specified.
10. The control system design shall ensure compliance of furnace safety related loop and logic in CLCS & OLCS as per NFPA requirements.

5.1.1 Burner Management System (BMS)

1. Fully proven microprocessor based system, based on hardware and software specially designed and proven for Burner Management application meeting the proven-ness criteria shall be used to achieve the Boiler protection action e.g. Master Fuel Trip (MFT), etc.
2. The BMS shall be used with automatic self-monitoring facility. All modules to be used in this system shall be of failsafe design. Any single fault either in primary sensor, I/O modules, multifunction controllers etc shall not result in loss of safety function. All faults shall be annunciated to the operator right at the time of its occurrence in the OWS.
3. Triple modular redundancy philosophy (TMR) hardware and software shall be used for safety tripping of the Boiler. The system shall be fail safe type with minimum Safety integrity Level 3 as defined in IEC 61508.
4. The MFT functions shall be implemented in a fault tolerant 2 out of 3 triple redundant configuration. Each of the three independent channels shall have its own dedicated processors, multifunction controllers, communication controllers, I/O modules, interface etc. All the primary sensors/instruments for unit / boiler protection shall be triple redundant. Signal for each trip input shall be time stamped with 1ms resolution for SOE at the input level itself, without any processing so as to enable analysis in sequence of event, the exact cause of trip.
5. The acquisition and conditioning of binary and analog protection criteria signals for MFT shall be carried out in each of the three triple redundant channels. Each channel shall compute the 2 out of 3 voting logic and issue a trip command. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[23]	02.09.2015

trip signals of the three channels shall be fed to a failsafe 2 out of 3 relay tripping unit for each drive. The protection criteria for tripping shall be executed by a program which shall be identical in each of the triple redundant channel. The check back contact signals of each relay of the 2 out of 3 relay tripping unit shall be fed back to each of the triple redundant channels and shall be continuously monitored for equivalence in each of them. In case one of the independent channels or any of the triple redundant sensors is faulty, the same shall be alarmed and the balance two channels / sensors shall be operated in 1 out of 2 mode.

6. The BMS shall be designed to :

- a) Prevent any fuel firing unless a satisfactory purge sequence has first been completed.
- b) Prevent start-up of individual fuel firing equipment unless permissive interlocks have first been satisfied.
- c) Monitor and control proper equipment sequencing during its start-up and shutdown.
- d) Provide equipment status feedback and annunciator indication to the unit operator.
- e) Provide flame monitoring when fuel-firing equipment is in service and effect a burner trip or master fuel trip upon warranted firing conditions.
- f) Continually monitor boiler conditions and actuate a master fuel trip (MFT) during adverse operating conditions which could be hazardous to equipment and personnel.
- g) Reliably operate and minimize the number of false trips.
- h) Provide a master fuel trip relay independent of processors and I/O modules to provide a completely independent trip path.
- i) Provide all logic and safety interlocks in accordance with National Fire Protection Association (NFPA).
- j) Include a first out feature in all controllers to identify the cause of any burner trip or boiler trip.
- k) Provide a complete BMS diagnostic system for the operator to immediately identify any system module failure.
- l) Allow burners and igniters to be started, stopped and tripped on a burner basis.
- m) Allow the automatic start and stop of burners based on boiler load. The sequence of which burner shall be started or stopped shall be selected by the operator from OIU/LVS.

5.1.2 Secondary Air Damper Control System (SADC)

1. SADC system shall be used to achieve the following functions

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[24]	02.09.2015

- a) Control of fuel air flow.
 - b) Control of auxiliary air flow at the oil elevations.
 - c) Control of wind box / furnace differential pressure.
 - d) Limit NO_x content in the flue gas by modulation over fire dampers, if provided
2. In case of tangentially fired boiler, SADC shall modulate fuel air dampers of each elevations based on the signal that is representative of the Coal feed rate. Further, the auxiliary air dampers at the oil elevations shall be modulated on fuel oil pressure signal whereas the auxiliary air dampers at all other elevations shall be modulated to maintain the wind box to furnace differential pressure.
 3. In order to limit the NO_x content in flue gas, SADC shall also include the control of over fire dampers (if provided). The secondary air damper controls and necessary interlocks to modulate or to open/close shall be incorporated as per the requirements of the boiler design in plant DCS.
 4. The secondary air damper control system shall also be provided even in case front or front and rear fired boiler.
 5. Individual position transmitters are to be provided for each of the secondary air dampers and the same shall be connected to Plant DCS.

5.1.3 Auxiliary Steam System

1. Auxiliary steam System shall be of integral type pressure reducing and de-superheating stations (PRDS) along with de-super heater getting spray water from Condensate Extraction Pump discharge.
2. The system shall consist of steam pressure control loop & steam temperature control loop. Auxiliary steam system shall be implemented through a set of redundant controller modules, I/O modules, redundant primary sensors etc. & suitably interface with other SG C&I controls and system shall have control provision from CCR.
3. Pressure and temperature measurements for control of Auxiliary steam system shall be in 2/3 voting circuit.
4. The system shall be provided with the pressure gauges, pressure transmitters, temperature elements and transmitters for monitoring and control purpose.

5.1.4 Binary Controls/ Open Loop Control System (OLCS) Functions

1. The OLCS shall include sequence control, interlock & protection for various plant auxiliaries/valves /dampers/drives etc. The sequence control shall provide safe and automatic start up and shut down of plant and of plant items associated with a plant group. The interlock and protection system shall ensure safe operation of plant/plant items at all times and shall automatically shut down plant/plants items when unsafe conditions arise.
2. The OLCS shall be arranged in the hierarchical control structure consisting of unit level, group level, subgroup level and drive level (as applicable).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[25]	02.09.2015

3. It shall be possible to perform automatic unit start up and shutdown by issuing minimum number of command from OWS / LVS. Thus, the unit level shall control all the Control System Blocks and issue appropriate start up and shutdown commands to various blocks of Control System.
4. The group level shall control a set of functional sub-groups of drives. Appropriate start-up and shut down commands shall be issued to the sub-group control and various check-backs shall be received from sub-groups of drives. Each sub-group shall execute the sequential start-up and shut down programs of a set of inter-related drives along with system interlocks and protections related to individual drive falling under that sub-group. The drive level shall accept commands from the sub-groups, push buttons (wherever provided) etc., and transmit them to the respective drive, after taking into account various interlocks and protections and the safety of that particular drive. For HT drive, first-up logic shall be incorporated to indicate the cause of protection / trip.
5. A sequence shall be used to move a set of groups and sub-groups from an initial steady state (for instance 'OFF') to a final steady state (for instance 'ON'). The sequence initiating command for the unit and group level shall be issued from OWS/LVS.
6. A sequence shall be made of steps. The steps shall be executed in predetermined order according to logic criteria and monitoring time consisting of the interlock & protection requirements and check back of previous step which shall act as pre-conditions before the sequence control can execute the command for that step.
7. Each step shall have a "waiting time" implying that the subsequent step would not be executed unless the specified time elapses. A monitoring time shall also be defined as the maximum time required in executing the commands of any step and the time required for appearance of check back signals. In case, this is not completed within the specified time, a message shall be displayed and programme shall not proceed further.
8. Manual intervention shall be possible at any stage of operation and the sequence control shall be able to continue at the correct point in the programme on return to automatic control. Protection commands shall have priority over manual commands, and manual commands shall prevail over auto commands.
9. Open or close priority shall be selectable for each drive.
10. The sequence start up mode shall be of the following types:
 - a) Automatic Mode
In this mode of operation, the sequence shall progress without involving any action from the operator. The sequence start / stop command shall be issued from the OWS / LVS.
 - b) Semi-Automatic Mode

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[26]	02.09.2015

In this mode of operation, once the sequence is initialized, the step progressing shall be displayed on the OWS / LVS. But the step execution command shall be prevented and shall be sent by the operator via the keyboards. It shall be possible to bypass and / or simulate one or more criteria to enable the program to proceed. This facility shall allow the program to be executed even if some criteria are not fulfilled because of defective switching devices, etc., while the plant condition is satisfactory. All the criteria bypassed shall be logged and displayed. It shall be possible to put the system on the Auto-mode after operating it on semi-automatic mode for some steps or vice-versa, without disturbance to the sequence operation.

c) Operator Guide Mode / Test Mode

It shall be possible to use the sequential control in operator guide mode / test mode i.e. the complete system runs and receives input from the plant and the individual push button stations (where provided) / keyboards but its command output is blocked. The whole programme, in this case shall run in manual mode. This mode shall allow the operator to practice manual operation using step and criteria indications. The actual protection should remain valid during this mode of operation also.

11. The sequence shall be started by putting the sequence on 'auto' and on receipt of 'start' command from the OWS / LVS or from a higher-level group / protection action as defined. The sequence shall then progress as per the defined logics. It should be possible to select alternative operation in the same sequence depending on certain process / equipment condition. Some step can be automatically bypassed also based on certain process / equipment condition. When the expected results of the sequence are reached the sequence is considered as "END". If during sequence initialization or sequence progressing or during normal running of the drive, a shutdown criterion is present, the sequence shall be stopped and the shut down sequence initiated.
12. For the drives, the command shall be used through O/P module to MCC / SWGR / Actuator as applicable and input (status, SWGR and process) shall be acquired through input modules. The drive logic shall be implemented in the redundant controller. The status for the 11 KV, 6.6 KV drives and some other important drives shall also be wired in parallel to redundant input modules so that on failure of the single input modules, the information regarding the status of the affected drive remains available in OLCS.
13. The output modules shall have the feature that ensures that in case of failure, all the outputs are driven to zero. The 24V DC command outputs to drives for ON / OPEN, OFF / CLOSE shall be separate and independent and the inverted outputs shall not be employed. For inching type of drives, position transmitter shall be used.
14. The termination for ON / OPEN, OFF / CLOSE command for the drive actuator shall be performed. However ON/OPEN feedback, OFF/CLOSE feedback, Switch gear disturbance feed back as a minimum shall be monitored in OLCS.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[27]	02.09.2015

15. The drive function i.e. basic interlocks and protection logic of the drive shall be implemented in redundant controllers. The drive function shall ensure that protection signals for the safety of the drive shall be effective under all conditions and under all modes of operation. The different commands shall be performed according to the priority of protection 'OFF', protection 'ON', manual and automatic. The standard functions like running time monitoring, status signaling, alarm / drive annunciation, etc. shall be performed in drive function. The drive function shall prevent hunting of the actuator in the presence of both open and close commands for actuators of the valves and dampers. The drive function shall be implemented in dedicated standard software functional block

5.1.5 Analog Controls/ Close Loop Control System (CLCS) Functions

1. The CLCS shall continuously act on valves, dampers or other mechanical modulating devices such as hydraulic coupling etc., which alter the plant operation conditions. The system shall be designed to give stable control action in steady state condition and for load changes in step / ramp over the load range of 60% to 100% MCR with variation or parameters within permissible.
2. The controller capability shall, as a minimum, include (i) P, PI, PD and PID control functions and their variations (ii) cascade control (iii) feed forward control (iv) state-variable based predictive control for SH/RH temperature control (v) on-off control, (vi) ratio and bias control, (vii) logical operation etc. The loop reaction time (from change of output of the sensor of the transmitter/temperature element to the corresponding control command output) shall be within 250 ms. However, for faster loops such as feed water, furnace draft, PA header pressure control loop etc. the same shall be based on actual process requirement.
3. The loop response time, for conventional I/Os, is the cumulative response time inclusive of input scan time, Controller Execution time and output card throughput time (in other words loop response is the time taken by the system to read a change in field signal at the input card terminal, process the controller task associated with the input and to make the required change in the control output at the output terminal of the output card)
4. The control system shall be bumpless transferred to manual on the conditions such as Control power supply failure, failure of redundant controllers, field input signal not available, analog input exceeding preset value, etc. as minimum conditions.
5. Any switch over from auto to manual, manual to auto and switchover from TFT operation to auto manual station operation and vice versa shall be bumpless and without resulting in any change in the plant regulations and the same shall be reported to the operator.
6. Buffered analog output (positioning signal) of 4-20mA DC shall be used from CLCS to the respective E/P converters. For electrical actuators, pulse type output (bound less control) shall be preferred. CLCS shall also provide all the necessary outputs for indicators & recorders with output loop resistance of 500 ohms for each channel of the output module.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[28]	02.09.2015

7. The system being supplied shall be such that when permissible limits are exceeded, an automatic switchover from an operation governed by maximum efficiency, to an operation governed by safety and availability is affected.
8. For safety reasons, switchover logics associated with the modulating control loops shall be performed within the closed loop control equipment.
9. Time supervision facility shall be used to monitor the final control element.
10. It shall be possible to block the controller output on a pre-programmed basis.
11. All controllers shall be freely configurable with respect to requisite control algorithms.
12. Whenever, alternate measurement is available for a control input the alternate measurement value shall be automatically substituted in the control loop in case of loss of control input. All necessary software for switching and reconfiguration shall be used. In addition, such substitution shall be balance less and bumpless and shall be reported to the operator.

5.2 General Requirements

The requirements for Control System for SG integral control are indicated on functional basis in this specification. It is not the intent or purpose of this specification to specify all individual system components.

The control and automation system and the field instruments and actuators as well as its support systems, power supplies and data networks shall be immune to the electromagnetic interference and shall conform to the internationally accepted standards.

5.2.1 System Configuration

The SG integral control system shall basically consist of:

1. Distributed Processing units (Controllers) for SG Protection & MFT, Burner management System, Mill & Coal Feeder Logics.
2. I/O modules
3. Data communication system
4. System Programming & Documentation facility (Engineering Work Station)
5. Interfacing with plant DCS
6. Integrated Annunciation functions

5.2.2 System Expandability

Modular System design shall be adopted for SG control system in order to facilitate easy system expansion. The capability and facility for expansion through the addition of controller modules, I/O cards etc. shall be provided. The system shall have the capability to add any new control loops, groups / subgroups in control system, while the existing system is fully operational. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[29]	02.09.2015

future expansion shall be expandable to allow at least 50% only by addition of extra modules without removing or modifying any existing hardware.

5.2.3 Online Maintenance

It shall be possible to remove / replace modules online (like I/O module, interface modules etc.) from its slot for maintenance purpose without switching off power supply to the corresponding rack. System design shall ensure that while doing so, undefined signalling and releases do not occur and controller operation is not affected in any way (including any control loop trip to manual, etc) except that information related to remove module is not available to controller. Further, it shall also be possible to remove / replace any of the redundant controller modules without switching off the power to the corresponding rack and this shall not result in system disturbance or loss of any controller function for the other controller. The on-line removal / insertion of controller, I/O modules etc. shall in no way jeopardize safety of plant and personnel

5.2.4 Fault Diagnostic

The control system shall include on-line self-surveillance, monitoring and diagnostic facility so that a failure / malfunction can be diagnosed automatically down to the level of individual channels of modules giving the details of the fault on the Engineers' Work Station (EWS) monitor and printers. The faults to be reported shall also include faults in main and standby power supplies, sensor fault, Controller fault, any channel fault in 2V3 channels, failure of links to other systems. These faults shall be identified by local indication on the faulty channel / module and on respective rack / cubicle. The diagnostic system shall ensure that the faults are detected before any significant change in any controller output has taken place.

5.2.5 Fault Tolerance & Controllability

1. The control system shall provide safe operation under all plant disturbances and on component failure so that under no condition the safety of plant, personnel or equipment is jeopardized. Control System shall be designed to prevent abnormal swings due to loss of control system power supply, failure of any control system component, open circuits, instrument air supply failure etc. On any of these failures the control system output shall either remain in last position before failure or shall come to fully open / close or on / off state as required for the safety of plant / personnel / equipment. System shall be designed such that there shall be no upset when Power is restored.
2. No single failure either of equipment or power source shall be capable of rendering any part / system / sub-system of control system inoperative to any degree or loss of generation.
3. The system design shall ensure that no single failure, whatsoever in any part of Control system result in loss of communication.
4. The controlled variable response rate and controllability shall be limited by the characteristics of main equipment, which is being controlled, and control system

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[30]	02.09.2015

shall not impose any limitations in the response rate or controllability. Controlled process variables shall return to normal values in a stable manner and without control loop interactions or cycling of generation when generation matches with load demand.

5.2.6 Signal Exchange

1. All the signal exchange between various functional groups of each control group shall be implemented through redundant main system bus and local system bus within a subsystem. It shall be ensured that any single failure in electronics involved for such communication e.g. communication controllers, bus interface modules, physical communication media, etc. does not result in loss of such signal exchange and there is no deterioration in specified system response and system parametric requirements. In case a controller utilizes some inputs generated / processed by any other controllers / functional group and the requirement of controller response time as specified is not met due to inadequate communication rate / procedure, then provide hardwired signal exchange for such inputs.
2. Control and Protection signal exchange between SG control system & Plant DCS, along with any other critical signal exchange shall be hardwired only. Protection signals like MFT shall necessarily be hardwired even for exchange between the same sub-systems.

5.2.7 Redundancy

The Following shall be completely redundant:

- All the parallel & serial communication buses
 - All the communication devices
 - All the Process controllers
 - All the Power Packs
 - Critical drives related I/O Modules.
1. The redundant communication buses between the process stations and the operator supervision stations shall follow different paths. The redundant processor shall be connected to the same I/O's of the processor that it is associated to and shall be able to carry out all the operations assigned to this processor. In the case of a processor failure, the redundant processor shall become operative within the cycle time, without causing any loss of data or the interruption of the process control. The switch between the processor being utilized and the reserve processor shall be bump less and shall be within 20 ms which shall not cause any interruptions or stopping of the station functions. Furthermore, this switch must also be signalled by a high priority alarm.
 2. The operator station shall be able to perform from any work station. The operator station electronic units shall be in dual configuration and independently connected to the system buses. In case of an operator stations failure, the station shall remain operative without the operator having to carry out any type

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[31]	02.09.2015

of action. Each operator electronic unit and each process station shall be powered by redundant power packs those are able to power the entire load. In case of a failure, the switch between the power packs shall not cause stops or interruption in the carrying out of the station functions. The switch between the power packs shall be signalled by a high priority alarm.

3. In order to establish a high degree of system availability, the various control systems which comprise the overall unit control system shall be configured such that no single component failure can cause a failure or mal-operation of critical automatic or manual control functions. The failure of a redundant component shall be alarmed to the operator to allow on-line removal/replacement or at the first shutdown opportunity. The system's redundancy schemes shall be designed such that the transfer from any critical element to its redundant backup shall occur without upset to normal process control or to system displays, data collection, or other normal DCS functions within 50 m sec.
4. The signal distribution from sensors which are shared due to process restrictions between control loops, logics, monitoring purposes shall be as follows:-
 - a) In the case of multiple inputs to a card, input cards used shall be restricted to a maximum of 16 inputs per card for analog input and 32 for digital inputs.
 - b) In case there is either process redundancy (Left, Right) or transmitter or switches redundancy, the inputs shall be routed through independent input cards.
 - c) No two control loops/interlock loop shall share the inputs (either binary or analog) wide input cards if process signals are independently available.
 - d) Protective inputs for two drives shall not be allotted to the same input card.
 - e) Output cards shall be independent for each control loop.
 - f) For outputs to HT and LT motors, the following shall be adopted :
 - Each HT motor and unidirectional drives shall have dedicated output cards. No other drive shall be combined with HT motor drive output card. However indication outputs can be driven from this output card for the concerned logic loop.
 - Not more than two bidirectional drives shall share one output card.
 - For unidirectional drives, not more than one drive shall be allotted to one output card.
 - g) For signal distribution or fan-out, suitable electronic cards (opto couplers) shall be used.
 - h) The processors shall contain the logic required to group individual process and system alarms into common groups as well as the annunciation sequence logic.
5. Redundant components and equipment within given systems shall be distributed among processors and I/O cards to the extent practical.
6. Critical inputs shall be supplied with redundant sensors/transmitters with each input connected to different input cards. Where redundant inputs exist, the DCS

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[32]	02.09.2015

shall be configured to automatically reject erroneous data. Where required, one-of-two, two-of-two, two-of-three, or median select schemes shall be utilized to ensure the integrity of critical inputs.

7. The use of redundant outputs driving the same final element or equipment shall generally be avoided in favour of failsafe design and redundancy of the plant equipment.
8. The operator stations shall be identical in capability and independently linked to the system. Although these stations shall be normally dedicated to a specific function, any station can replace the function of any other station at any time.
9. All power source and power conditioning equipment in the system shall be redundant.

5.2.8 System Spare Capacity

1. Following philosophy shall be followed for the spare capacity of the SG Control system:
 - a) Twenty (20) percent spare channels in each of the functional groups for each type of input/output modules fully wired up to marshalling / field termination cabinet TBs.
 - b) Ten percent (10%) installed spare I/O modules which may be capable of hot swapping.
 - c) Wired-in “usable” space for 20% modules in each of the system cabinets for mounting electronic modules shall be spared for future use. Empty slots between individual modules / group or group of modules, kept for ease in maintenance or for heat dissipation requirement as standard practice and shall not be considered as wired-in ‘usable’ space for I/O modules. Field Terminal assemblies, PCB / Connectors, corresponding to the I/O modules shall be used for above mentioned 20% blank space, distributed proportionally to main population.
 - d) Each controller shall have 40% spare functional capacity to implement additional function blocks, over and above implemented logic / loops. Further, each controller shall have spare capacity to handle minimum 40% additional inputs / outputs of each type, over and above implemented capacity. Under worst loading condition, Controller should not be loaded beyond 60%. Each of the corresponding communication controllers shall also have same spare capacity as that of controller.
 - e) The data communication system (including main system Bus and other bus system) shall have the capacity to handle the additions mentioned above.
 - f) Each Communication Network Switch shall have 20% spare ports.
 - g) Twenty (20) percent spare relays of each type and rating mounted and wired in relay cabinets. All contacts of relays shall be terminated in terminal blocks of relay cabinets. In each of the relay cabinets 20% spare terminal blocks shall be used so that additional relays can be mounted and wired.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[33]	02.09.2015

- h) For power distribution board 20% spare feeder fully wired ready for use with MCBs fuses, TBs etc. Other hardware such as signal distribution isolation, trip amplifiers etc. shall be provided with 20% spares wired ready for use.
2. Sufficient and additional software capacity shall be available in the system to take care of spares requirement as specified above to meet all functional requirements. The calculation for processor power and memory for all nodes should be furnished. Also, the dynamic processor load for all nodes either in terms of idling time or percentage load shall be available in VDU.
 3. The spare capacity as specified above shall be uniformly distributed throughout all functional groups. The system design shall ensure that above mentioned additions shall not require any additional controller / processor / peripheral drivers / cabinets in the system delivered at site. Further, these additions shall not deteriorate the system parametric requirement like response time / duty cycle etc. from those stipulated under this specification and shall meet other redundancy / functional requirement.

5.2.9 System Programming & Documentation facility

1. Programming facility (Engineering Workstation) shall be provided for Control system and system documentation.
2. The programming tools shall have in-built safety features that shall protect the system against inadvertent and unauthorized use of these tools. Necessary hard key locks and software locks, etc. shall be used for this. During on line programming, external plant / equipment should not be affected.
3. The system shall also have facility to permit the programmer to add text information at the beginning and end of each program, wherein programmer shall list out his name, time, date of change which has been made, name of the person who has authorized the change, etc.
4. Any modification done in Control System shall be suitably logged so that it can be traced to the user log-in ID and time of change
5. Structuring / configuring and tuning facilities shall be provided for structuring / modification, storing / loading, testing, tuning, monitoring, etc. of all the microprocessor based controllers of the control system. The configuration and tuning unit shall be hooked up with the system bus.
6. It shall be possible to configure the system with ease without any special knowledge of programming or high level languages. Control strategy shall be implemented using familiar and conventional automation function blocks (software implemented). Whenever any change in configuration is done, it shall be recorded and modified configurations shall be available for printing and documentation and shall be stored in non-volatile memory. The entire system configuration, tuning / fixed parameters shall be documented and printed in form of function diagrams and lists respectively.
7. On-line tuning of the control loops shall be possible without causing any disturbance in the execution of the control loops. Provision to store and retrieve

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[34]	02.09.2015

on immediate and long term basis the system configuration, data base etc. on some device such as DVD shall be included. Facility shall be used to reload / down-load the system or controller module from the already stored data, on-line.

Table 5.1

Specifications for Engineering Work Station

S.N	Features	Minimum Requirements
1	Processor	Intel i5 or better with latest generation
2	Configuration	Tower
3	Internal Clock	3.2 GHz
4	Architecture	64 Bit
5	Video Card	PCI
6	System Memory	4 GB or better
7	Hard Drive	1 TB
8	Cache	2 MB
9	CD Drive	52X DVD R/RW
10	Audio Controller	16 bit
11	Operating System	WIN NT or higher
12	Graphic Accelerator	8 MB (minimum)
13	Monitor	
a	Type	TFT Color Monitor
b	Screen Diagonal	21"
c	Display	XGA or better
d	Resolution	1280 X 1024 32 bit color support
e	Degree of Protection	IP-30
f	Power supply	230 V, 50 Hz
g	Ambient Temperature	0-50 °C
h	Humidity	95% non condensable

5.2.10

Data Communication System

1. The Data Communication System shall include a redundant System Bus for major subsystems with hot back-up. The data highway shall be high speed digital links of speed preferable 10/100 M baud. Bus protocols at control levels shall conform to OPC compliant ISO-7 layer protocol in master less, token ring or token bus (as per IEEE 802) or any standard proven and acceptable protocol in deterministic mode. Extensive error checking (CRC-16/12) or error correcting codes shall be used in these levels to improve the reliability of communication.
2. Redundant communication controllers shall be used to handle the communication between each functional group of controllers of Control System and the System Bus. The design shall be such as to minimize interruption of signals. It shall ensure that a single failure anywhere in the media shall cause no more than a single message to be disrupted and that message shall automatically be retransmitted. Any failure or physical removal of any station / module connected

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[35]	02.09.2015

to the system bus shall not result in loss of any communication function to and from any other station / module.

5.2.11 Sequence of Event Recording System

1. The DCS system shall perform the SOE functions like stamping of SOE inputs / points with 1 ms resolution. The SOE function shall be built-in function of DCS.
2. SOE shall be capable of accepting minimum 512 inputs per unit including 10% spare channels (included in total 512 inputs).
3. The system shall monitor SOE inputs with a resolution of one millisecond at all times for all inputs including spare inputs. That is, all SOE points entering status change shall be reported and time tagged within 1 (one) millisecond of their occurrence. Input card shall be equipped with digital filters with filter delay shall be such that it should meet SOE time resolution of 1 msec (identical for all points) to eliminate contact bounce such that field contact which is changing state must remain in the new state for stipulated time to be reported as one event. The start of data collection for SOE report shall be reported to OWS within 1 sec of SOE data collection initiation.
4. SOE shall be envisaged as an integral part of DCS with 1 millisecond time resolution. The SOE data base shall be an integral part of the DCS database and same shall be made available at all the OWS / EWS resident on the network. Operator can access the SOE on activation of SOE alarm page. All SOE inputs shall have real time "time-stamping" following any tripping of major equipment, or sub-system or the plant as a whole.
5. The SOE system of Plant DCS shall collect process and report SOE inputs of SG control system for a consolidated master SOE system. Necessary communication with required hardware & software at SG control system end and engineering co-ordination with Plant DCS supplier shall be done for successful implementation of a consolidated master SOE system. Consolidated master SOE system shall be used by the Plant DCS supplier.
6. The system shall have provision of rejection of chattering inputs.
7. The system shall have the facility for adding a field adjustable software delay on as per point basis.
8. The system shall also include provision for historical storage and retrieval of SOE reports for 3 months period.
9. The SOE report collection shall begin on occurrence of change of status of any SOE point and shall be printed after an operator selectable time interval of 1 to 3 min. or 100 status changes have taken place after the first event. Adequate numbers of buffers shall be provided to prevent loss of data before transferring to HSR.
10. SOE reports shall include a list of major equipment trip in chronological order and include the points that initiated SOE collection. The inputs for SOE shall include
 - a. Hardwired inputs in input cards and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[36]	02.09.2015

b. Calculated points / generated points of Control System.

- 11.All the operator initiated actions such as trip inactivation (bypass) & trip activation (inline) shall form input to SER.
- 12.All the SOE inputs shall also be available for interlock / protection functions.
- 13.SOE of other systems (SG/TG integral control systems) shall also be integrated in this system. The SOE system shall collect process & report SOE inputs of SG & TG control system for a consolidated master SOE system. Necessary communication with required hardware & software and necessary engineering co-ordination with SG & TG Supplier shall be done for successful implementation of a consolidated master SOE list.
- 14.SOE time stamping shall occur at I/O level.
- 15.Self Diagnostic Features like scanner test (a periodic test for communication between several levels), functional test by simulating abnormal Conditions shall be provided.
- 16.One (1) no dedicated SOE viewing station with SOE Log printer shall be provided.

5.2.12 Historical Storage & Retrieval System

The HSRS of Plant DCS shall collect store and process system data from SG control system for a consolidated master HSRS system. Necessary communication with required hardware & software at SG control system end and engineering co-ordination with Plant DCS supplier shall be done for successful implementation of a consolidated master HSRS system.

5.2.13 Master & Slave Clock System

A Global Positioning Satellite (GPS) based Master Clock System shall be provided by the Plant DCS supplier. Necessary signal output for time synchronization from Master Clock System shall be made available to the SG control system to have common time reference.

5.2.14 Power Supply & Grounding

1. Redundant UPS power feeder for all 230VAC equipments and/or redundant feeders for 24 V DC are required for SG control system requirements.
2. Make suitable arrangements with redundant distribution boards for each system with proper auto change over scheme to change the load from one feeder to other, in case of one feeder failure.
3. All panels, desks, cabinets shall be used with a continuous bare copper ground bus. The ground bus shall be bolted/ welded to the panel structure and shall efficiently ground the entire structure. All individual cabinet grounds shall be connected to separate earthing riser to be provided for C&I system signal grounding. The grounding requirements of various parts of the C&I system shall be properly co-ordinated with design of plant earthing system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[37]	02.09.2015

5.2.15 System Cabinets/Panels

1. All Control system modules, power supply components, other control devices (except field mounted sensors/transmitters) which are required for completeness of the system shall be housed in cabinets. All equipment and dedicated cabinets required for termination, marshalling and proper interface within the system and also with other systems shall also be provided.
2. The cabinet mounted equipments shall be fully assembled, installed in mounting racks, wired and fully tested as per specification requirements and approved drawings in the manufacturing works of a qualified manufacturer prior to shipment to the project site. It shall be ensured that the cabinets are complete and ready for installation before dispatch from manufacturing works. The installation work at project site for these cabinets should only involve connections through multi pair cables from marshalling cabinets (wherever provided) to system cabinets and inter-cabinet.
3. The Control system cabinets shall be grouped into physically separate cabinets as follows:
 - a) Control System Cabinets
 - b) Marshalling cabinets
 - c) Relay cabinets

However, in case the system design requires the termination cabinet independent from system cabinet, the marshalling cabinets can be combined with the termination cabinet. In case, the termination arrangement is part of the system cabinet, independent marshalling cabinets shall be provided.

4. A special note shall be indicated that termination of field cables directly to control system cabinets is not acceptable.
5. The Control system cabinets shall house all types of modules / hardware to achieve all functions of Control System including signal conditioning modules, controller modules, I/O modules, communication controller modules and all other requisite hardware for a complete system.

5.2.16 System Software Requirement

1. The system shall be provided with all licensed software packages with media required by the system for meeting the intent, functional/parametric requirements and performance requirements of the specification.
2. The system shall utilize a readily upgradeable, public domain software platform proven for real-time operation environment at the control and monitoring level overlaid with a relational database program. The desirable features are indicated below:
 - a) The software system shall be fully modular.
 - b) The software shall meet the following general requirements:
 - Simple, easy-to-learn editing language for editing and on-line operation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[38]	02.09.2015

- Wide range of standard and non-standard peripheral support capability by modular controllers / supervisors.
 - Effective task scheduling and support of multiple priority structure including event based interrupt etc.
 - Effective debugging.
 - Provision for on-line editing and program development without interrupting on-line functions.
 - Self-diagnostic routines.
 - Efficient memory management and effective utilization of system time.
 - Quick start-up and loading.
 - Support of multiprogramming and multi-user operation.
3. Industry standard operating system like UNIX/WINDOWS NT etc. to ensure openness and connectivity with other system in industry standard protocols (TCP / IP etc.) shall be used. The system shall have user oriented programming language & graphic user interface.
 4. All system related software including Real Time Operating System, File management software, screen editor, database management software, On line diagnostics / debug software, peripheral drivers software shall be used. Latest versions of standard PC-based software for database handling, word-processing, spread sheet, etc. and latest WINDOWS based packages etc. and any other standard language offered shall be furnished as a minimum. Systems having program development environments like EWS, Station LAN Server shall have high level programming support like Microsoft Visual Studio, Oracle, RDBMS etc.
 5. The programming language shall support Relational Data Base Management in a global and truly distributed Client-Server environment and shall have the following minimum features:
 - a) Modern high-level block structures type
 - b) Powerful, compact syntax
 - c) Logical organization that facilitates documentation, modification and maintenance of programs
 - d) Early detection of errors at compiles and run time
 - e) Fast debugging
 - f) Improved program reliability
 - g) Clearly defined data structure complemented by flexible user-declared data types
 - h) Fast execution.
 6. All application software for control system functioning like input scanning, acquisition, conditioning, processing & control along with communication among various Control System functional blocks shall be used.
 7. The system shall be provided with software locks and passwords to engineers at site for all operating & application software in order to prevent unauthorized access and only authorized engineers are able to do modifications at site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[39]	02.09.2015

8. Two sets of all final / latest software on non-rewritable/non-editable media shall be used as back-up.

9. Software License

Software license shall be used for all software in the Control System. The software licenses shall be used for the project (e.g. organization or site license) and shall not be hardware / machine-specific. That is, if any hardware / machine is upgraded or changed, the same license shall hold good and it shall not be necessary to seek a new license / renew license due to up-gradation / change of hardware / machine in control system at site. All licenses shall be valid for the continuous service life of the plant.

In case the s/w license is dependent on no. of points, then quantity to be considered is 30% above the finally implemented points.

10. Software Upgrades

The system software's installed in the plant DCS shall be periodically upgraded with the new releases, that would be taking place after the system is commissioned.

5.2.17 Measurement Functions Of Control System

All the signals coming into / going out of the Control System shall be routed through marshalling cabinets. The input / output modules employed in the Controls System shall be separated from controller hardware.

5.2.17.1 Analog Signal Conditioning & Processing

1. The conditioning and processing functions to be performed as a minimum for the analog input coming for control and information purpose are:
 - a) Galvanic isolation of input signals for which power supply source is other than the measurement system of the control system.
 - b) Transmitter power supply with per point fuse protection or current limiting and power supply monitoring.
 - c) Transducer / transmitter signal output limit check
 - d) Implementation of multiple measurement schemes
 - e) Square root extraction
 - f) Pressure and temperature compensation.
 - g) On-line ADC gain and drift monitoring and correction at periodic intervals.
 - h) Linearization of temperature signals (from thermocouples and RTD through temperature transmitters).
 - i) Reasonability checks for all analog inputs.
 - j) Monitor sensor wire break / open circuit / short circuit and take suitable actions in logic / loop. (This shall include blocking of trip signals in case of RTD failure).
 - k) Rate of rise / fall calculation

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[40]	02.09.2015

- l) LVM generation.
2. All analog signals for control purpose shall be acquired, validated, processed and their respective Controller data base updated at a maximum interval of 250 ms except for some fast-acting control loops for which the above referred time shall be as per process requirement. The validated analog inputs shall be converted into engineering units on per point basis. Analog input processing (scanning to alarm checking) shall be performed once every scan cycle.
 3. The analog 4-20 mA input cards shall have input loop resistance ≥ 250 ohm for interfacing transmitters / analyzers giving 4-20 mA DC signals along with superimposed HART interface signals. 4-20 mA DC signal shall only be used for control purpose and superimposed HART signal shall be used for configuration, maintenance, diagnostic and record keeping facility for electronic transmitters and Analyzers etc.
 4. Triple measurement scheme for analog inputs employing three independent transmitters connected to separate tapping points shall be employed for the most critical measurements. The three signals shall be auctioneered to determine the median / average value, which shall be used for control purpose. In case one transmitter fails or shows excessive deviation with respect to others, it shall be removed from computation of median / average value and the average of the other two transmitter outputs shall be used for controls. The control loop shall trip to manual when any two of the three transmitter signals fail. The outputs of the transmitters shall be continuously monitored for excessive deviation which shall be displayed, logged and alarmed.
 5. Dual measurement scheme for analog inputs employing two independent transmitters connected to separate tapping points / temperature element shall be employed for the remaining measurements used for analog control functions. The output of the redundant transmitters shall be continuously monitored for excessive deviation. In case the deviation is within limits, the mean value shall be used for the control loop. If the deviation becomes high (with both transmitters remaining healthy), the loop shall be automatically transferred to manual. However, if one transmitter fails and other transmitter remain healthy, then the output of the healthy transmitter shall be used for control. If the other transmitter also fails, loop shall trip to manual. The outputs of the transmitters shall be continuously monitored for excessive deviation which shall be displayed, logged and alarmed.
 6. Individual transmitter signal, their value and selected value for control/measurement shall be available in OWS.

5.2.17.2 Binary Signal Conditioning & Processing

1. The changeover type contacts (i.e. 'NC' + 'NO' together) shall be wired to the controller system for all the binary inputs required for control purposes, except for inputs from MCC / SWGR. The binary inputs required for information purposes only shall be wired to control system in the form of non-changeover type contacts.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[41]	02.09.2015

2. The conditioning and processing functions to be performed as a minimum for the binary inputs coming for control and information purposes are:
 - a) 24 VDC power supply for contact interrogation for all potential free contacts with per point fuse protection or suitable current limit feature / isolation through optocoupler.
 - b) Contact bounce filtering delay time of 15ms. However for SOE inputs, it shall be 4ms.
 - c) Facility for automatic pegging of the binary signal to logic one / zero or last correct value in case of failure of binary input module.
 - d) Binary signal distribution to different user shall be in such a way so as to ensures that a short / ground fault on one user is not reflected to the other user.
 - e) Implementation of multiple measurement schemes for signals for control purpose.
 - f) All binary signals shall be acquired, validated, processed, alarm checked and their data base updated within one second. In addition to this requirement, binary signals required for SOE shall have resolution of 1 millisecond.
 - g) Checking for excessive number of status changes for all binary / contact inputs and making it off-scan, if the total no. of changes exceeds a limit within pre-defined time.
 - h) The non-coincidence monitoring shall be used for binary inputs for all changeover signals.

5.2.18 Wiring Scheme for Inputs to Control System

1. Each of the triple redundant binary and analog inputs shall be wired to three separate input modules. In addition, for functions employing 2V3 controllers (e.g. BMS protection), each of the redundant binary and analog signals shall be wired to separate input modules associated with each controller. Similarly each of the dual redundant binary and analog inputs shall be wired to two separate input modules. These redundant modules shall be placed in different racks, which shall have separately fused power supply distribution. Implementation of multiple measurement schemes of these inputs shall be performed in the redundant hardware. Loss of one input module shall not affect the signal to other modules. Other channels of these modules can be used by other inputs of the same functional group.
2. No single failure in any component of the control system shall lead to unavailability of more than one of dual / triple redundant input signals to control system. Similarly, no single failure in any component of the control system shall lead to unavailability of more than one of dual / triple redundant output signal from the control system.
3. The single (i.e. non-redundant) binary and analog signal required for control purpose shall be wired as follows:
 - a) The on-off status of HT drives and Breakers with synchronization provision shall be wired to two input modules in parallel.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[42]	02.09.2015

- b) All analog and binary inputs including the limit switches of valves / dampers / MCC / SWGR, check-backs of all drives, SOE and information related signals should be wired to single input modules.
4. It is envisaged to use remote I/O modules in plant areas where it is required from location point of view. The remote I/O signals shall be connected to the respective functional groups through redundant extended I/O bus. The hardware independence of functional groups shall be applicable for remote I/O as well. The remote input / output modules shall be located in cubicles in respective areas. Remote input / output modules shall be designed in such a way to work continuously under the harsh environment expected to be encountered in these areas (high temp, dust level, humidity etc.). It shall be ensured that extending of I/O bus of functional group in field does not result in false signalling / noise pickups. Further, it shall in no way deteriorate the performance of that functional group and Control System.
 5. Power supply arrangement for these cubicles shall be similar to DCS System cabinets
 6. The measurement system of control system should be capable of acquiring data from various equipment and system in digital form through serial port, field bus/ Profibus, Ethernet connection using industry standard protocols. The control system shall include requisite modules for accepting such signals.
 7. The maximum number of inputs/outputs to be connected to each type of modules shall be as follows:

a) Analog input module	16
b) Analog output module	08
c) Binary input module	32
d) Binary output module	32
 8. The following requirements shall be met for analog/binary input / output modules as applicable:
 - a) Input filters to attenuate noise shall be used
 - b) All analog / binary inputs and outputs shall be capable of withstanding 500V DC common mode and 500V AC peak to peak between analog and digital parts. All analog outputs shall be short circuit proof.
 9. Any single sensor / transducer / transmitter failure alarm shall be used on Engineer's Station monitors for all sensors / transducers / transmitters. Similarly sensor break alarm for thermocouples etc. shall also be logged and displayed.

5.3 Redundancy in Measurements

Minimum redundancy requirement (1 out of 2 or 2 out of 3) of measurements and controls including compensation are given below. For critical Closed Loop controls 2 out of 3 sensors / transmitters shall be used including 2 out of 3 signals for compensation signals.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[43]	02.09.2015

Table 5.2
Redundancy Requirements

Parameter	Input Redundancy
Boiler Drum level	2 out of 3 (on each side of drum)
Boiler Drum pressure	2 out of 3
Feed water Flow	2 out of 3
Feed water Temperature	2 out of 3
SH Spray water flow (Left & Right)	2 out of 3
RH Spray water flow (Left & Right)	2 out of 3
Main steam Pressure	2 out of 3 (Left side)
Main steam Pressure	2 out of 3 (Right side)
Main steam Temperature	2 out of 3 (Left side)
Main steam Temperature	2 out of 3 (Right side)
BFP Suction Flow	1 out of 2
DP across feed control	2 out of 3
Secondary Air flow	1 out of 2 (Left & Right)
Coal air flow (at each elevation)	1 out of 2
Oxygen in Flue Gas	2 out of 3 (Before Economizer)
Furnace Pressure	2 out of 3
P.A. Header Pressure	2 out of 3
Mill air flow	1 out of 2
Mill outlet Temperature	1 out of 2
SH Outlet Steam temperature	2 out of 3 (Left& Right)
RH Outlet Steam Temperature	2 out of 3 (Left & Right)
Auxiliary Steam temperature	1 out of 2
Auxiliary Steam pressure	1 out of 2

1. For measurement of metal temperature of super-heater, re-heater and boiler drum, permanent / removable duplex type mineral insulated thermocouples terminated in junction boxes at boiler platforms shall be used. Super-heater tube metal thermocouples shall be used on every fourth tube connected to the intermediate super-heater outlet headers, the intermediate reheat outlet headers & the final super heater/ re- heater outlet header.
2. Bearing temperature of ID, FD, PA Fans, pulverizers and any other equipment driven by HT motors shall be used with direct mounted dial thermometers for both driven equipment and motor.
3. Duplex RTDs (PT-100) shall be used both for the driven equipment & HT motor bearing temperatures- for monitoring and interlocking in Plant DCS. In case RTD in pulverizer bearing cannot withstand vibration, suitable thermocouple like J-type thermocouple may be provided.
4. All HT motors windings shall be used with two nos. duplex RTDs (PT-100) per phase for monitoring and interlocking in Plant DCS.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[44]	02.09.2015

5. Redundant non-contact type speed sensors with transmitters shall be used with each Coal feeder and shall provide an output to the feeder speed control.
6. Monitoring and alarm provisions in the DCS shall be provided for Lube Oil Pressure and Temperature and other important parameters for subsystems of all major drives e.g. Pulverizer, ID Fans, PA and FD Fans etc.
7. A non-contact type no-Coal flow detector complete with amplifier and pick-up located at the outlet of each Coal feeder shall be used to detect no-Coal flow
8. Coal flow measurement with the help of conveyor speed and active load cells shall be used for each feeder. The Coal flow rate along with the integrator shall be made available in plant DCS.
9. Coal feeder shall be gravimetric type preferably based on variable voltage & frequency drive. The coal flow measuring system shall have the output 4-20mA DC for indication and control purposes. Weighing system of the equipment shall be based on load cell measurement and shall have the highest resolution by proper selection of load cell.
10. Measurement and totalization of oil flow shall be used with Coriolis mass flow measuring type instrument with 4-20mA DC output for Plant DCS indication and totalization. The Mass flow meter electronics shall have the facility for configuration to indicate Mass and Volumetric Flow rate.
11. In Coal Bunkers, Load Cell/Strain Gauge/Ultrasonic type level measuring system is required for displaying bunker level at the control room and generate the necessary isolated outputs for interlocking with Coal handling Plant for Coal filling operation.
12. Oxygen measurement in high temperature zones of boiler is required (in APH inlet & outlet on both side) for combustion control and performance analysis.
13. Temperature measuring devices shall be installed at different zones in the flue gas path including ID fan inlet and chimney inlet for monitoring at Plant DCS.
14. All motorized bypass valves & Bypass Dampers shall be inching type and shall be used with non-contact type position Transmitters.
15. Digital speed measurement with proximity pick-up shall be envisaged for the feeder. The control system shall be microprocessor based with the facility of on-line diagnosis of the system and integration with DCS through software link for monitoring facility of various faults and status of the feeder and feeder control system. Gravimetric feeder shall be controlled by 4-20mA DC signal and other interlocking signals from DCS. The system shall have facility for gravimetric and volumetric indications of coal flow as well as totalisation. In addition, separate instruments shall be provided for "coal flow /no coal flow" indication in DCS. Controller shall be provided with following minimum features:
16. Alphanumeric display of feed rate; material density, motor speed, total weight, automatic and manual calibration of the weighing system and adjustment of system drift, non volatile memory to store information and program data, alarm generation capability with date and time stamp, automatic transfer from gravimetric to volumetric in case of failure of load cell, status LED, keyboard for configuration. Running indication of clean out conveyor to be displayed in OWS.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[45]	02.09.2015

17. For measurement of pulverizer outlet temperature and flue gas temperature suitable abrasion resistant thermo wells shall be provided.
18. Adequate Pressure and Temperature gauges, depending upon the requirement shall be provided.
19. For all critical trip interlocks such as furnace pressure high and furnace pressure low minimum 3 numbers transmitters on each side (for deriving LVM contacts) shall be provided.
20. For lube oil protection of HT drives wherever applicable, 2 out of 3 logic shall be provided.
21. All initiating devices for starting and tripping of auxiliaries' viz. ID fan lube oil pump, FD fan lube oil pump, pulverizer lube oil pump etc. shall be provided for interlock and protection and associated annunciations.
22. Necessary pressure controller of Electromatic safety valve complete with all accessories like special cables, pressure sensing devices, solenoid valves, impulse piping etc shall be provided. A miniature electronic control station suitable for monitoring on the auxiliary control desk shall be furnished with indicating lights and switches to facilitate auto / remote / manual operation of the valve. Operation of the valve shall also be interface with DCS.
23. All local instruments related with Steam Generator and Fuel Oil System viz. pressure and temperature gauges, pressure and temperature switches shall be mounted on gauge boards located at convenient places.
24. Status of various strainers in the fuel oil line and lube oil line in the boiler area shall be monitored in DCS.
25. All pilot solenoid/solenoid operated valves, motorized valves, initiating devices and switches, sensors, transmitters, all flanges, gaskets, nuts, and bolts shall be provided.
26. All instruments for Performance Guarantee test measurements including tapping points with root valves for pressure measurement and temperature stubs with thermo wells are to be provided.
27. Local Stop push button shall be used for all HT and LT drives for emergency stopping of the drives. The contacts of the push button shall be wired directly to MCC to initiate trip & this signal shall be made available to Plant DCS/PLC for alarm annunciation/logging etc.

5.4 Other SG Related System/ Equipments

5.4.1 Steam Generator

1. For measurement of furnace draft using three pressure transmitters across the furnace, Two out of three logic shall be used.
2. Local measurement of furnace draft using minimum four numbers of draft gauges.
3. For sensing of high & low furnace draft six number of pressure switches (three on each side of furnace) shall be used and two out of three logic shall be used for tripping application.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[46]	02.09.2015

4. Flame sensing and control for each oil and gas burners with flame intensity indication in control room shall be provided along with necessary interlocks & protection against flame failure and dull flame.
5. Measurement of differential pressure between furnace and wind box shall be provided.
6. Measurement of differential pressure between furnace and scanner air pressure shall be provided along with Separate DP switch for alarm.
7. For measurement of metal temperature of primary and secondary super heater, adequate number of mineral insulated duplex type chromel-alumel thermocouples with stainless steel sheathing shall be provided. These shall be routed through suitable trays and terminated directly to temperature transmitter to be mounted in convenient and accessible location.

5.4.2 Steam Cycle

1. Measurement of steam pressure after primary super heater, de-superheater and secondary super heater, redundant pressure transmitters shall be used for the same.
2. Local measurement of steam pressure after super heater.
3. Measurement of temperature of steam after primary super heater, de-superheater and secondary super heater. Redundant temperature sensors shall be used for each application.
4. Local measurement of steam pressure at inlet to each steam coil air preheater.
5. Measurement of steam pressure at inlet to each steam coil air preheater.
6. Measurement and control of atomizing steam pressure to boiler.

5.4.3 Air System

1. Measurement of air pressure after FD fans.
2. Measurement of air pressure before and after air pre-heater.
3. Measurement of pressure of secondary air to burners.
4. Measurement of pressure of compressed air for atomization.
5. Measurement of pressure after PA fans.
6. Measurement of differential pressure across air preheater.
7. Measurement of seal air discharge pressure.
8. Sensing of low and very low air pressure after primary air fans using independent pressure switches.
9. Sensing of differential pressure between primary air heater and seal air header.
10. Local measurement of air pressure at the discharge of each FD fan. Sensing of low & very low air pressure after FD fans using independent pressure switches.
11. Local measurement of air pressure after seal air fans. Sensing of low seal air pressure at the header.
12. Local measurement of pressure at scanner air fan discharge. Sensing of low pressure at scanner

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[47]	02.09.2015

13. Local measurement of differential pressure across all air filters. Sensing of high differential pressure across all air filters using separate switches.
14. Measurement of both primary air & secondary air temperature before and after the rotary air preheater.
15. Sensing of low temperature of both primary air & secondary air after air preheater using independent switches.
16. Measurement of secondary air temperature at outlet of each steam coil air preheater.
17. Measurement of hot air temperature to each mill.
18. Measurement of flow of air after FD fans using redundant flow transmitters.
19. Measurement of flow of primary air to each mill using redundant flow transmitters.
20. Local measurement of pressure of instrument air at the header. Sensing of low pressure for the same using independent pressure switch.
21. Measurement of atomizing air pressure to boiler.
22. Measurement of temperature in air preheater for both gas side as well as air side using thermocouples connected to a scanner in the control room and also to Boiler integral control system.
23. Measurement of differential pressure between furnace and wind box.

5.4.4 Flue Gas System

1. Measurement of flue gas pressure before & after super heater.
2. Measurement of flue gas pressure after economizer.
3. Measurement of flue gas pressure after air pre heater.
4. Measurement of flue gas pressure after ESPs.
5. Measurement of flue gas differential pressure across air pre heater.
6. Measurement of flue gas pressure at the discharge of each ID fan.
7. Measurement of flue gas temperature before & after super heater.
8. Measurement of flue gas temperature after economizer.
9. Measurement of flue gas temperature after air Pre heater.
10. Measurement of flue gas temperature after ESPs.

5.4.5 Soot Blowing System

1. Soot blowing control shall be implemented in Plant DCS and operated from operator's console. Soot blowing analog and sequential control logic shall be implemented in redundant of processors of Plant DCS. However outputs to the drives of soot blowing system shall be non-redundant.
2. Soot Blower system complete with provision for individual operation of any soot blower and facility to bypass any soot blower shall be used with following:
 - a) Automatic starting of each soot blower in the system
 - b) Cancelling the selection of any soot blower in the system when not required for operation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[48]	02.09.2015

- c) Indication of the soot blower-selected to operate.
 - d) Capability to monitor all the essential parameter/status of the soot blowing system.
 - e) Capability to prevent continued soot blower operation if the system is not functioning properly.
 - f) The ability to operate two soot blowers located in opposite walls simultaneously.
 - g) Manual over-riding of the automatic operations.
 - h) To prevent automatic blowing when the parameters of soot blowing system are beyond permissible limits.
 - i) Indications of soot blower which has malfunctioned.
 - j) Control circuit for the retractable blowers shall be so designed as to prevent insertion of the blowers in to the combustion chamber unless the blowing medium is available.
 - k) Limit switches and Torque switches are to be connected to Plant DCS.
3. Soot Blower control system shall also provide controls for:
- a) Pressure control of steam.
 - b) Warm up control of the complete piping system which shall include flow control, drain temperature control etc.
 - c) Steam temperature control (if required)

5.4.6 Flame Monitoring System

1. The purpose of the system is to detect the individual burner/ type of flame and to enhance the boiler/furnace safety, to avoid spurious and unwarranted trips and to increase operational reliability, availability and efficiency of the Steam Generator such that the consumption of fuel oil shall be reduced to optimal minimum.
2. Flame monitoring system shall be microprocessor based, fail safe and easily maintainable which shall include flame detectors of proven design for the type of fuel, environmental condition and other conditions, of established reliability at all loads of the steam generator. It shall be designed to work under all adverse conditions such as wide variation in fuel/air input ratio, wide variation in fuel characteristics, variation in operating temperature, and maximum temperature under interruption of cooling air supply. The system shall conform to NFPA recommendation and location of detectors as per NEC requirements.
3. Flame detectors shall be working on the dynamic and static properties of primary combustion zone of each type of fuel and flicker frequency of flame. It shall pick up only the flame to which it is assigned and shall not respond to the adjacent and background flame or other radiations generated in the furnace. The design shall also take into account the absorption by a Coal shroud, recirculated dust or other deposition on the flame detector head & required protection of lens head against pitting. The complete system shall provide the discrimination between oil

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[49]	02.09.2015

and Coal flame. Intensity indicators for main flame shall be used along with galvanically isolated 4-20 mA DC signals and hooked to the Plant DCS.

4. The system should be easily maintainable and include automatic self test facility at regular interval.
5. A portable flame detector testing kit shall be used with built in stabilizer, capable of simulating both oil and Coal flame, and testing of flame detector head unit at field. The testing kit shall also have facility for testing all type of electronic cards as being used in the flame monitoring system.
6. In case of tangentially fired boiler, arrange flame detectors in such a manner that Coal flame detectors are available both above and below each Coal burner and separate oil flame detectors are provided for each oil burner. In case of discriminating type flame detectors capable of detecting and discriminating both oil and Coal flame, with the help of a single scanner, the same can also be utilized for monitoring both oil and Coal flame. For any other type of firing i.e. non-tangential type the flame detectors shall be used for each Coal and oil burner responding only to the flame of its associated burner.
7. In cold start up test, capability of detectors to detect oil flame under varying oil pressure shall be checked. In load test, the detector shall be able to detect when only oil is present, only Coal is present and both Coal and oil are present. It shall be ensured that the detectors are able to detect the proven flame at very low load with oil guns withdrawn. The above tests shall be performed for every Coal and oil elevation.
8. Provision of scanner air for cooling the flame detectors by 100% redundant scanner air fans shall be used. The dampers associated with scanner air fans shall be pneumatically operated with DC solenoid valves.

5.4.7 Coal Feeders Control & Instrumentation

1. A minimum of two independent speed sensors, pulser units and associated amplifiers, etc. shall be used for each of the Coal feeders. Output from the speed sensors shall be used to provide at least four numbers isolated 4-20 mA DC analog signals corresponding to Coal flow rate in tons per hour and any other signals that may be required for the control of the Coal feeder. In addition, one pulser unit shall also be used with two pulse outputs-one for use in control system and the other for remote integrator.
2. Each Coal feeder shall receive signals from Plant DCS for feeder speed control. The signal to be provided by Plant DCS shall be in the form of galvanically isolated 4-20 mA DC. All required power amplifier units/interface devices to accept this 4-20 mA signal shall be included.
3. All associated electronics like buffer amplifiers, frequency to current converters etc. shall be used for each raw Coal (RC) feeder with local and remote speed indicators and integrators. The speed sensors and pulser units shall be totally enclosed, fire, dust and weather proof, suitable for the service conditions.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[50]	02.09.2015

4. The control cabinet shall be used with reset push buttons and individual lights to signal the individual internal trip conditions.
5. Each feeder shall be used with a four position switch located at the feeder for remote off, local run (when there is no Coal on conveyor) and calibration purpose.
6. If there is any electronic modules mounted local to the feeder body then these shall be suitable for operating in a non-air-conditioned area in a suitable enclosure to combat the effect of noise, vibration, entry of dust etc.
7. All necessary paddle switches and other detectors to monitor Coal on belt, feeder discharge plugged etc. should be provided to ensure safe operation of the feeders.

5.4.8 Electromatic Safety Valve

The Electromatic Safety Valve shall be an automatic electrically actuated pressure relief valve. It shall be possible to set the value for one percent or less differential between opening and closing pressure. The Electromatic safety valve shall be used complete with all accessories like pressure measuring devices, controller units, local PB station, solenoid assembly, impulse piping etc. Provision shall also be kept to operate the Electromatic relief valves from the Plant DCS OWS and miniature PB stations on the Emergency backup panel. The operation of the valve shall be accomplished by operator command or by means of pressure sensitive element which shall precisely and automatically relieve the pressures within very close limits.

5.4.9 Furnace Temperature Probes

Two numbers of furnace temperature probes shall be provided before platen super heater and / or before Reheater regions and shall be electrically operated, fully retractable type. The furnace temperature probes shall be furnished with complete actuating mechanism and all the logics required for the actuating mechanism. The probes shall be provided with position transmitters, limits switch & indicator for remote indication. Each temperature probe shall have a duplex thermocouple suitable for the measurement range. The logics for furnace temperature probe shall be implemented in the DCS.

5.4.10 Acoustic Pyrometer {TO BE DELETED, IF NOT APPLICABLE.}

1. Acoustic pyrometers shall be provided to determine the average flue gas temperatures and complete flue gas temperature profile at furnace exit plane (for FEGT measurements), at economizer outlet & in Super heater (SH) Area. Minimum eight numbers of acoustic transceivers shall be provided for Furnace temperature measurement in SH Area.
2. For each temperature measurement plan/section, a PC based system complete with all required software, comprising of minimum eight nos. of acoustic transreceivers, signal processor, interface unit, etc. shall be provided. The system shall be suitably interfaced with DDCMIS.
3. The system shall include all software & interface hardware required for

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[51]	02.09.2015

presenting (in the HMI of DDCMIS) visual information on real time or historical gas temperatures including spatial temperature distribution profiles, individual path temperatures, temperature trends & average gas temperature within defined area.

4. The system shall be able to eliminate the varying high noise environment both in and out of an operating boiler.
5. The transit time of each of the associated transmitters/receivers shall be transmitted to the central processing unit (to be located at CER) for storage and analysis through suitable interface device. A temperature profile shall then be determined and displayed by analysing the mean temperature across every transit section using deconvolution technique. The time interval to take a complete cycle of eight transceivers should be less than one minute.
6. The measuring range should be sufficient to cover the entire regime of boiler operation and shall not be less than 1900°C. The mean temperature and profile temperature accuracy shall be $\pm 2\%$, & $\pm 4\%$ of reading respectively or better. Full colour TFT display and colour printer output shall be provided. The system shall also provide 4-20mA DC output to DDCMIS.
7. The transducers shall not be placed directly in the hot gas stream. The system shall be of proven design and it's performance must be proven using similar type of fuel. The components to be located at boiler area shall be able to withstand the stringent environmental condition expected at such locations with operating boiler.

5.4.11 Furnace & Flame Viewing System

1. The flame cameras shall be suitable for direct online continuous viewing in the central control room of the Coal and oil flame and condition of the furnace internals including slagging of the water walls and any other deterioration in the furnace condition.
2. The flame camera system shall consist of the following facilities/ components as a minimum: -
 - a) 21" High resolution color monitor.
 - b) Facility for optical zooming of lens from the monitor
 - c) Automatic Electronic shutter control mechanism
 - d) Built-in temperature sensor to measure temperature of camera tip.
 - e) Proper cooling arrangement (preferably air) and protection against
 - f) Cooling medium failure alarm.
 - g) Weatherproof local control box for mounting of electronics.
 - h) All necessary remote/ local programming tool.
 - i) All interconnecting cable and termination device.
 - j) Any other accessory to make the system completely operational.
3. The cameras and the total system shall be suitable for the furnace design, the firing arrangement, the fuel being fired considering the ash content of worst

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[52]	02.09.2015

Coal. The cameras should be expected to withstand the temperature expected in the furnace of the boiler but shall not be less than 1600 deg C.

4. The viewing angle of the camera shall be commensurate with the furnace size, the camera location and the positioning of the burners. The system shall conform to PAL and number of TV lines shall be adequate for a clear image of the furnace.
5. The flame camera system shall have a record of trouble free performance of minimum one (1) year in a Coal-fired boiler of size 210/215/220/250 MW.
6. The system shall be capable of transmitting the image to the Plant DCS system where it should be possible to display the same on the monitors of operator workstation & LVS.

5.4.12 Mill & Air heater Fire Detection System

1. Adequate number of thermocouple type fire detection system for each mill and air heater shall be used as a composite and complete unit with all required signals and accessories with adequate redundancy.
2. The controls & protection required for the mill fire detection system and air heater fire detection system shall be implemented in the Plant DCS, using rate-of-rise algorithm taking care of manufacturer's recommendation.

5.4.13 Chemical Dosing System

1. Each dosing pump shall be used with glycerin filled type pressure gauge of proper range on discharge piping with isolation valves, fittings diaphragm seal, Snubber, etc. Each solution tank shall be used with level gauge glass with graduated scale. Level switch shall be used for low-level alarm and interlock. Alarm hooter shall be used for tank level low annunciation in local panel. The chemical feed system shall be operated and adjusted from the local panel and also through the Plant DCS from CCR.
2. Minimum field instruments, transmitters', switches etc. shall be used which are to be connected to the Plant DCS for remote monitoring from CCR.
 - a) Chemical storage tank level.
 - b) Dosing Pump Discharge Pressure at downstream of NRV.
 - c) Open Close indication of all Manual Valves from the Dosing system to the CTP and DMCW system.
3. Facility shall also be provided for start stop operation of the Agitator motors and Dosing pumps from the Operator Work Station in the CCR.
4. Dosing Pumps Remote Stroke Control facility from the CCR shall be used. Necessary local controller, drive unit as required shall be used for this purpose.

5.4.14 Electronic Remote Drum Level Monitoring System

In order to measure and monitor Boiler drum level, Electronic Water level Indicator working on principle of difference in electrical conductivity between

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[53]	02.09.2015

steam and water shall be used. The monitoring system shall meet the following requirements as a minimum.

1. Each end of the drum shall have independent pressure vessels with adequate no. of electrodes covering the entire range for indication for each end of drum. Further, independent and separate pressure vessels shall also be used for each end of drum / vessels along with electrodes to provide validation for very low trip setting.
2. The sensing electrodes shall be placed in equal pitch. The maximum distance (gap) between two electrode shall be 50 mm and the electrodes shall be arranged in such a way that the last and the first electrode shall not be at any alarm or trip level. For a boiler of 210 MW and above unit, the number of electrodes shall not be less than 16 for indication and eight for validation.
3. Both indication and validation system shall be supplied with double isolation valves in water, steam, drain and vent lines with mechanical key interlock system, that is, the total number of key interlocks shall be four nos. per boiler. The provision of key interlock system shall ensure a fool proof safety feature and the details of the same shall be brought out clearly in the offer.
4. The detector unit (if not located locally), logic units, 2 x 100 % redundant power supply units / packs (to be located in control equipment room) shall be housed in separate and independent cubicle for pressure vessel on each side of the drum. The detector units, logic units etc. shall be independent for each pressure vessel.
5. Indication shall be used at field for both indication and validation system. Remote indication is to be provided for indication system at the CCR.
6. Each cubicle shall be used with 2 x 100% redundant power supply pack converters to be fed from two feeders of 24 V dc. These two power supplies shall be internally fused and failure of one power supply shall not affect the performance of the system. Self monitoring facility to detect and alarm the loss of power supply shall be used.
7. The pressure vessel shall be constructed in such a way that density level error between drum and pressure vessel shall not be more than 25 mm. All vent, drain and isolation valves shall meet 1.5 times the maximum design conditions.
8. Electrode assembly shall have blow out and leakage proof sealing arrangement. Field proven ceramic / zirconia probe insulation suitable for design pressure and temperature are to be used.
9. The system design shall be such that it shall ensure that failure of one probe circuit shall not affect another probe circuit and failure of any electrode shall not hamper the system function and operation. Further the entire system shall be of proven fail-safe design.
10. The logic shall be such that the trip and alarm relay circuits shall be independent for each for low, low-low, high and high-high levels of drum. Monitoring of set time for trip generation and provision of setting time delay shall be available in the system. Trip logic shall be independent and separate from fault finding logic.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[54]	02.09.2015

Provision shall be there to connect the alarm & trip signals to Plant DCS. Also the 4-20 mA DC output shall be available for drum level indication (both side) on Plant DCS.

11. The system shall have fault diagnostic features such as process fault, system hardware fault, probe failure, circuit board failure, shorted wire etc. Further the system shall be able to distinguish between a cable fault and an electrode fault.
12. The necessary relays and relay modules for the output contacts shall be of proven design and each contact shall be rated for 5A, 240 V AC/ 0.25 A, 220 V DC rating. All these contacts shall be SPDT type.

5.4.15 Acoustic Tube Leak Detection System

A Microprocessor based Acoustic Tube leak detection system with PC & A4 size Laser printer, working on the principle of Digital sound analysis techniques shall be provided by the bidder. This system as a minimum shall have the following features:

1. The system shall be capable of leak identification for the tube leak size of 2mm diameter.
2. A minimum of 20 sensors should be installed for tube leak detection.
3. Graphical display of audio frequency spectrum capable of displaying the size and location of detected leak.
4. Mimic display for location of the leak & Trend display to indicate the rate at which the leak is growing.
5. Alarm bar graph display (Overview of all sensor points) having different colour displays in case of Normal, Caution, Alarm, Wave guide blockage and system fault.
6. Alarm outputs which can be wired to DCS for attracting operator's attention in case of initiation of any leak.
7. User friendly MMI for selecting displays, printout in demand / time bases, alarm accept and audio selection with loud speaker.
8. History record of the previous data for trend analysis.

5.5 SG Auxiliaries

Following are indicative list of requirements for Control & Protection of SG Auxiliaries. All CLCS, measurement and Data Acquisition of SG auxiliaries instruments shall be implemented in Plant DCS.

5.5.1 ID Fans

1. Induced draught fan controls shall be implemented in DDCMIS for Induced draught control. The drive shall be compatible for 4-20 mA DC signals for regulation. The drive controls shall be blade pitch control with feedbacks to DDCMIS.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[55]	02.09.2015

2. For remote bearing temperature of fan & motor and motor winding temperatures monitoring, duplex RTD's shall be provided.
3. Vibration monitoring in X & Y directions at DE & NDE shall be provided. All vibration parameters shall be available in CCR.
4. Required Local instruments such as level, pressure, temperature gauges, Sight glass, pressure & flow switches etc. shall be provided.
5. Remote monitoring & alarm facility for the following parameters shall be provided in addition to bidder's recommended instruments:
 - a) Fan speed
 - b) Lube oil tank level
 - c) Lube oil pump discharge pressure.
 - d) DP across lube oil strainer-Alarm
 - e) Blade pitch angle (If applicable)
 - f) Fan & Motor bearing temperature
 - g) Lube oil cooler outlet temperature
 - h) Cooling water flow Low alarm

5.5.2 FD Fans

1. Inlet guide vane/blade pitch control to be operated by 4-20 mA DC signal from DDCMIS, complete with pneumatic actuator, I-to-P converter, Position transmitter etc. for control of Combustion Air Flow shall be provided
2. For remote bearing temperature of fan & motor and motor winding temperatures monitoring, duplex RTD's shall be provided.
3. Vibration monitoring in X & Y directions at DE & NDE shall be provided. All vibration parameters shall be monitored from CCR.
4. Required Local instruments such as level, pressure, temperature gauges, Sight glass, pressure & flow switches etc. shall be provided.
5. Remote monitoring & alarm facility for the following parameters shall be provided in addition to bidder's recommended instruments
 - a) Lube oil tank level
 - b) Lube oil pump discharge pressure.
 - c) DP across lube oil strainer-Alarm
 - d) Pitch control oil pressure (both control & power oil)
 - e) Fan & Motor bearing temperature

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[56]	02.09.2015

f) Lube oil cooler outlet temperature

g) Cooling water flow Low alarm

5.5.3 PA Fans

1. Inlet guide vane/blade pitch control to be operated by 4-20 mA DC signal from DDCMIS, complete with pneumatic actuator, I-to-P converter, Position transmitter etc. for control of Combustion Air Flow shall be provided
2. For remote bearing temperature of fan & motor and motor winding temperatures monitoring, duplex RTD's shall be provided.
3. Vibration monitoring in X & Y directions at DE & NDE shall be provided. All vibration parameters shall be monitored from CCR.
4. Required Local instruments such as level, pressure, temperature gauges, Sight glass, pressure & flow switches etc. shall be provided.
5. Remote monitoring & alarm facility for the following parameters shall be provided in addition to bidder's recommended instruments
 - a) Lube oil tank level
 - b) Lube oil pump discharge pressure.
 - c) DP across lube oil strainer-Alarm
 - d) Pitch control oil pressure (both control & power oil)
 - e) Fan & Motor bearing temperature
 - f) Lube oil cooler outlet temperature
 - g) Cooling water flow Low alarm.

5.5.4 Seal Air Fans

1. Pneumatic actuator shall be provided for full open/full close dampers complete with I-to-P converter, Position transmitter, Solenoid valves, AFR etc.
2. For remote bearing temperature of fan & motor and motor winding temperatures monitoring, duplex RTD's shall be provided.
3. Vibration monitoring in X & Y directions at DE & NDE shall be provided. All vibration parameters shall be monitored from CCR.
4. Required Local instruments such as level, pressure, temperature gauges, Sight glass, pressure & flow switches etc. shall be provided
5. Remote monitoring and alarm facility for the following parameters shall be provided in addition to bidder's recommended instruments:
 - a) Seal air fan discharge pressure
 - b) Motor and fan bearing temperature

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[57]	02.09.2015

5.5.5 Coal Mill

1. For remote bearing temperature & motor winding temperatures monitoring, duplex RTD's shall be provided.
2. Vibration monitoring in X & Y directions at DE & NDE shall be provided. All vibration parameters shall be monitored from CCR.
3. Temperature Elements & Gauges for lube oil & bearing temperatures, lube oil flow switch, Pressure switches for alarm/standby pump auto start, pressure gauges etc. shall be provided.
4. Remote monitoring and alarm facility for the following parameters shall be provided in addition to Bidder's recommended instruments:
 - a) DP across lube oil strainer –Alarm
 - b) Mill DP
 - c) Mill outlet temperature
 - d) Lube oil pressure
 - e) Lube oil cooler outlet temperature
 - f) Cooling water flow Low alarm

5.5.6 Coal Feeder

Remote monitoring and alarm facility for the following parameters shall be used as a minimum:

1. Coal bunker level
2. Remote operation and Open and Close indication for bunker to feeder isolating gate
3. Running indication of clean out conveyor
4. No Coal flow
5. Feeder Speed

5.5.7 Air Preheater

1. For emergency operation Air motor shall be provided. Low air pressure switch & Solenoid valve shall be provided for auto start of Air motor.
2. Support/Guide bearing oil circulation unit shall be provided with local instruments such as oil pressure switches, temperature switches, temperature elements, flow switches, local pressure & temperature gauges etc.
3. Thermocouples in Air & gas flow streams for APH fire sensing & RTD's for bearing temperature monitoring shall be provided.
4. Remote monitoring and alarm facility for the following parameters shall be provided in addition to bidder's recommended instruments:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[58]	02.09.2015

- a) O₂ measurements at each of air heater inlet and outlet in addition to the 3 nos. O₂ measurement before economiser.
- b) Differential Pressure Transmitter across air preheater.
- c) Pressure Transmitters and Temperature elements / transmitters at I/L and O/L on Flue gas path and air path.

5.5.8 SG Controls

1. CLCS controls shall be used through Plant DCS for the following control loops as minimum for which required sensors, transmitters, control valve & Valve positioner, damper etc. shall be used for controlling:

1. Combustion control
2. Furnace Draft control
3. Drum Level control
4. SH and RH steam Temperature control
5. Secondary Air Damper control
6. Soot Blower Steam Pressure control
7. Heavy Fuel Oil Pressure & Flow control
8. Light Oil Pressure & Flow control
9. Steam Coil Air-Preheater (SCAPH) Temperature control
10. SCAPH Tank Level control
11. Auxiliary Steam Header Pressure and Temperature Control
12. Mill Outlet Temperature control
13. Primary air (Mill air) header pressure control
14. Total air flow control
15. Primary air flow control
16. Atomizing steam pressure control
17. CBD Level Control
18. Air Heater average cold end temperature control
19. Oil Burner air flow control

The description of the few important closed loop control are indicated below:

a. Master Pressure Control

The function of this shall be basically to provide combustion demand signal for fuel and air flow controls, in order to maintain the steam pressure at plant header

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[59]	02.09.2015

at a constant value during load changes. The output of master pressure control shall regulate total fuel flow and total air flow and shall work in conjunction with Burner Management System.

b. Air Flow Control

The combustion set point signal derived from the master pressure control shall be compared with total fuel (coal and oil) signal and a fixed signal corresponding to minimum air flow required for furnace purge and low load operation. The maximum value selected out of above shall be the set point for the air flow control. The air flow measurement shall be corrected for temperature and trimmed for oxygen present in the flue gas. The furnace shall be designed for air LEAD circuit ensuring air-rich-furnace. The output of air flow controller shall regulate FD fan inlet dampers. Proper biasing arrangement shall be provided for FD fans for equal load sharing.

c. Furnace Draft Control

The furnace pressure shall be controlled by controlling the ID fan blade pitch/vane. Three furnace pressure transmitters shall be provided and connected to three separate tap points on the furnace. The average value of the transmitters shall be compared in the controller with the set point and output of the controller shall vary ID fan blade pitch/vane position to maintain the desired furnace pressure. Total air flow may be used as feed forward signal for furnace draft control. The fan damper interlock shall be so arranged to always provide an open flow path between FD fan inlet and ID fan discharge under all combinations of running and idle fans.

The provision for biasing shall be provided for synchronized operation of both the ID fans.

d. Super heater Steam Temperature Control

Superheated steam temperature shall be maintained by injecting feed water spray between 30% MCR and 100% MCR or may be as recommended by the bidder.

Three temperature sensors shall be provided at the outlet of final super heater for measuring steam temperature. Median value shall provide healthy signal to the controllers. The final super heater outlet temperature shall be achieved by regulating Attenuation water flow. All the required feedback signals and other necessary corrective action shall also be considered to achieve optimum temperature regulation.

e. Air Preheater Cold End Temperature Control

The function of this loop is to control cold end temperature of air heater. This shall be achieved by measuring flue gas temperature at outlet of APH by using thermocouple and throttling the steam control valve in SCAPH line.

1. Other control loops include the following as a minimum:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[60]	02.09.2015

A. Fuel oil Temperature control

The fuel oil temperature control shall maintain the temperature at outlet of fuel oil heater by regulating steam inlet valve.

B. Atomizing Steam Header Pressure Control

Fuel oil atomizing steam header pressure shall be maintained at desired value by positioning atomizing steam control valve.

C. Continuous Blow down tank Level Control

The continuous blow down tank level control shall maintain the level in the tank at the desired value by modulating a control valve in the line from continuous blow down to intermittent blow down tank.

D. Fuel Oil Header Pressure Control:

The fuel oil header pressure control shall maintain the pressure at the outlet of fuel oil heaters by recirculating (bypass) optimum quantity of fuel oil (before the heaters) back to the storage tank.

2. Typical minimum requirement of Interlock and Protection has been stated below:

a) Boiler Starting Interlock

After ID and FD fans have been started, following condition should be fulfilled for light up of boiler:

- Purging of boiler at predetermined airflow for a predetermined time
- Resetting of MFR
- Permissive of starting Igniter

b) Purging conditions

- Either or both I.D Fans running
- Either or both F.D Fans running
- MFR in tripped position
- Air registers in purge position
- Air flow between 25% to 30% MCR
- No flame condition is true
- All fuel closed
- Boiler Tripping

c) Master Fuel Trip conditions

Boiler shall trip automatically through Master Fuel Relay (MFR) if any one of the following emergencies occurs:

- Boiler Drum Level Very High: 2 out of 3
- Boiler Drum Level Very Low : 2 out of 3
- Furnace Pressure Very High : 2 out of 3

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[61]	02.09.2015

- Furnace Pressure Very Low : 2 out of 3
- Both ID Fans tripped : 2 out of 3
- Both FD Fans tripped : 2 out of 3
- Total Flame Failure : As per manufacturer's Recommendation

d) Tripping of MFR shall initiate the followings as minimum:

- Tripping of all oil burners
- Tripping of all pulverizers and Coal feeders
- Tripping of PA Fans
- HT supply to ESP
- Turbine trip

e) Followings sequence controls have been envisaged as minimum:

- Burner sequence
- Coal mills group
- ID, FD and PA fans
- Air Pre-heaters
- Coal Feeder Group
- Furnace Purging

5.5.9 SG Performance Optimization System

1. Each SG shall be used with a Combustion Control Optimization System to maximize combustion thermal efficiency and keeping the emission limit within predetermined limit during all regime of SG operation. The system shall be part of the Performance Optimization Package of Plant DCS. Functioning of the SG Combustion Optimization System shall be based on adaptive stochastic model of combustion process derived from the process inputs like flame intensity, Coal flow, air flow, Oxygen, Carbon monoxide and NOx. For this all inputs, logics, equipment design data, complete thermal design model of SG etc which shall be required for successful implementation of the Boiler Combustion Optimization System in the Plant DCS. System shall guide the operator in terms of most optimum air fuel ratio and shall also be capable to generate set point for air flow controller of combustion control system. System shall also have the capability of simultaneous firing of different grade of Coal by providing dynamic coordination of secondary air flow at different burner rows. Means shall be used to interface the signal with the combustion control system, if desired by the operator.
2. The Combustion Optimization System shall incorporate the complete thermal design model of the SG capable of both forward and backward calculation of complete SG thermal performance. The model shall be calibrated and made "Site Specific" based on series of field trials of thermal performance of the SG during startup and prior to trial operation. The input for the Combustion Optimization System shall be based on accurate and continuous on line measurement of the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[62]	02.09.2015

- a) Flue gas oxygen.
 - b) Other fluid temperature(s) entering and exiting various heat transfer banks.
 - c) Coal characteristics
3. The Combustion Optimization System shall be capable for continuous on-line calculation of the thermal performance of the SG for the operating conditions indicating performance prediction zonal absorption, metal temperature and shall have necessarily the following features:
- a) Fuel switching capability.
 - b) "WHAT IF" capability.
 - c) Selective soot blowing of furnace/super heater based on trends of zonal absorption.
 - d) Expert system diagnostics for quick identification of the 'Root Cause' of deviations from the predicted parameters.
 - e) The computer modeling and arriving at factors to make it "Site Specific".
4. Following minimum features have been envisaged for the system (the system shall be part of the PADO System of Plant DCS:
- a) Software for stochastic modeling and combustion control optimization.
 - b) Graphics for monitoring Fuel flow, Air flow, Oxygen, CO and NOx etc.
 - c) Setting of operator targets like set point for concentration limit of CO, NOx etc.
 - d) Validation of calculated variables. Provision for manual and auto bypass in case signal bad value, bad calculated variable and communication error etc.
 - e) Trend display for monitoring performance of controller. Graphic comparison of the actual model curve and curves with the reference model.
 - f) Initialization software to initialize initial characteristic curves of combustion, Input and Output configuration and communication link.
5. The System shall also include the following:-
- a) Boiler performance optimization packages including the optimized operation of soot blowing System.
 - b) Boiler stress condition analyzer.
- Interactive water and gas chemistry management system.

5.5.10 Other Auxiliary System

1. Complete and independent PLC based Control and Instrumentation system with all accessories & associated equipments and cables for the safe, efficient and reliable operation of the plant auxiliary systems such as ESP control and Auxiliary Boiler/ Auxiliary steam system etc.
2. All instruments and control equipments like primary and secondary instruments etc. which meet the requirements specified on field Instruments. In addition, all instrument devices like switches/transmitters/ controllers/ analyzers/ solenoid

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[63]	02.09.2015

valves which are located in the field/hazardous locations shall be used with explosion proof enclosure suitable for hazardous areas described in National Electric Code (USA), Article 500, Class-I, Division-I. All field wiring should be through conduits. All fittings, cable glands etc. shall be strictly as per NEC recommendation article, 500 to 503.

3. ON/OFF control, indication, annunciation of incomers and bus-coupler are also to be performed for each of the above system as applicable.
4. Take special care for selecting the PLC for all the sub-systems from same make to the extent possible.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[64]	02.09.2015

6. DISTRIBUTED CONTROL SYSTEM (DCS)*{TO BE DELETED, IF ALREADY PROCURED UNDER TG PACKAGE.}***6.1 General Requirements**

1. The requirements for Distributed Control System are indicated on functional basis in this specification. The System shall be state of the art microprocessor based & of proven design, the performance & high availability having adequately demonstrated over a substantial period of successful operation.
2. The system shall have distributed intelligence architecture and shall comprise independent multifunction processors for execution of open loop and closed loop control and data acquisition functions.
3. If DCS & other common system/items (CMMS, STMS, Station LAN, SWAS, Master Clock System etc.) have been procured under TG package, then chapter-6 for DCS, and other common system/items shall be deleted from SG package.
4. The microprocessor based Distributed Control System shall have following capabilities:
 - a) Scan, acquire, validate, time-tag, process, store, update, archive, retrieve and display all analog and digital data and parameter.
 - b) Monitor real and calculated variables for multi-level alarm conditions.
 - c) Accept and execute operator's commands and pre-programmed routines and run-times.
 - d) Perform all open and closed loop control functions.
 - e) Display plant mimics, bar-graphs, control templates, point description, trend graphs (real time & history) in interactive mode with the operator.
 - f) Prepare and print logs and reports.
 - g) Perform performance calculation based on real-time and manually entered data.
 - h) Dynamically reconfigure itself on command from engineering station.
 - i) Run its own diagnostics, watch dogs, system checks and consequent fallback routines.
 - j) All system information and diagnostic alarm like failure of I/O channel, I/O card, Multifunction controller, communication modules, node failure, CPU loading, Network loading, workstation diagnostic etc. shall be annunciated and displayed at any workstation.
 - k) Dynamic data exchange (DDE) for communication with other computers
5. When more than one device utilizes the same signal for measurement and control, signal splitting shall be performed in such a way that disconnecting, shorting or failure of one receiver device shall not cause any upset at any other consumer point or cause any change in transmitter calibration.
6. Comprehensive self-diagnostic features shall be provided to facilities easy fault location and detection of failure without individually checking each module. On-

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[65]	02.09.2015

line testing facility of control system while the unit is in operation shall be provided with suitable indication for easy identification of faulty module.

7. DCS offered shall have 'open' system architecture with open connectivity for viewing at remote locations without virus infection to control network and employing non-proprietary hardware/software. Latest hardware models & software versions shall be offered.
8. DCS shall be of distributed architecture type with VDU based operation. The entire system shall be bus organized and the plant operator shall run the plant through console consisting of LCD screens, Mouse and Keyboards. All the screens and key boards for ease of operation shall be of same design and shall enable the operator to view process data, control outputs, shut down status and to change all parameters necessary to control the plant.
9. The system software shall be governed by the operating system running in a real time mode. It shall meet all functional requirements specified in this specification as a minimum. The latest version of software at the time of SAT shall be supplied even if it is introduced after Contract finalization.
10. All the inputs shall be galvanically isolated, provided with suitable noise filter and routed through individual fuse. Isolation shall also be provided between operator console and related sub-systems connected to it. The digital outputs shall be routed through interposing relays. Each output shall be short circuit proof and protected by fuse.
11. The system shall be capable to detect open, short and earth fault conditions. The open sensor reading shall be either upscale or downscale and it shall depend on field requirement and shall be programmable from engineering station.

6.2 Design Requirements

6.2.1 System Expandability

Modular System design shall be adopted to facilitate easy system expansion. The system shall have the capability and facility for expansion through the addition of controller modules, I/O cards etc. The system shall have the capability to add any new control loops, groups / subgroups in control system, while the existing system is fully operational. The system shall be expandable to allow at least 50% future expansion only by addition of extra modules without removing or modifying any existing hardware.

6.2.2 Online Maintenance

It shall be possible to remove / replace modules online (like I/O module, interface modules etc.) from its slot for maintenance purpose without switching off power supply to the corresponding rack. System design shall ensure that while doing so, undefined signaling and releases do not occur and controller operation is not affected in any way (including any control loop trip to manual, etc) except that information related to remove module is not available to controller. Further, it shall also be possible to remove / replace any of the redundant controller

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[66]	02.09.2015

modules without switching off the power to the corresponding rack and this shall not result in system disturbance or loss of any controller function for the other controller. The on-line removal / insertion of controller, I/O modules etc. shall in no way jeopardize safety of plant and personnel.

6.2.3 Fault Diagnostic

The control system shall include on-line self-surveillance, monitoring and diagnostic facility so that a failure / malfunction can be diagnosed automatically down to the level of individual channels of modules giving the details of the fault on the Engineers Work Station (EWS) monitor and printers. The faults to be reported shall also include faults in main and standby power supplies, sensor fault, Controller fault, any channel fault in 2V3 channels, failure of links to other systems. These faults shall be identified by local indication on the faulty channel / module and on respective rack / cubicle. The diagnostic system shall ensure that the faults are detected before any significant change in any controller output has taken place.

6.2.4 Fault Tolerance & Controllability

1. The control system shall provide safe operation under all plant disturbances and on component failure so that under no condition the safety of plant, personnel or equipment is jeopardized. Control System shall be designed to prevent abnormal swings due to loss of control system power supply, failure of any control system component, open circuits, instrument air supply failure etc. On any of these failures the control system output shall either remain in last position before failure or shall come to fully open / close or on / off state as required for the safety of plant / personnel / equipment. System shall be designed such that there shall be no upset when Power is restored.
2. No single failure either of equipment or power source shall be capable of rendering any part / system / sub-system of control system inoperative to any degree or loss of generation.
3. The system design shall ensure that no single failure, whatsoever in any part of Control system result in loss of communication.
4. The controlled variable response rate and controllability shall be limited by the characteristics of main equipment, which is being controlled, and control system shall not impose any limitations in the response rate or controllability. Controlled process variables shall return to normal values in a stable manner and without control loop interactions or cycling of generation when generation matches with load demand.

6.2.5 Signal Exchange

1. All the signal exchange between various functional groups of each control group shall be implemented through redundant main system bus and local system bus within a subsystem as per standard practice. It shall be ensured that any single failure in electronics involved for such communication e.g. communication

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[67]	02.09.2015

controllers, bus interface modules, physical communication media, etc. does not result in loss of such signal exchange and there is no deterioration in specified system response and system parametric requirements. In case a controller utilizes some inputs generated / processed by any other controllers / functional group and the requirement of controller response time as specified is not met due to inadequate communication rate / procedure, then the it shall provide hardwired signal exchange for such inputs.

2. However critical signal exchanges are found required shall be hardwired. Control and Protection signal exchange between control system of SG/TG and Plant DCS shall be hardwired only. Protection signals shall necessarily be hardwired even for exchange between the same sub-systems.

6.2.6 Redundancy

The Following shall be completely redundant:

- All the parallel & serial communication buses
- All the communication devices
- All the Process controllers
- Servers (if Server based system)
- All the Power Packs
- Critical drives related I/O Modules.

1. The redundant communication buses between the process stations and the operator supervision stations shall follow different paths. The redundant processor shall be connected to the same I/O's of the processor that it is associated to and shall be able to carry out all the operations assigned to this processor. In the case of a processor failure, the redundant processor shall become operative within the cycle time, without causing any loss of data or the interruption of the process control. The switch between the processor being utilized and the reserve processor shall be bump less and shall be within 20 ms which shall not cause any interruptions or stopping of the station functions. Furthermore, this switch must also be signalled by a high priority alarm.
2. The operator station shall be able to guarantee, from any work station, the complete control of the plant. The operator station electronic units shall be in dual configuration and independently connected to the system buses. In case of an operator stations failure, the station shall remain operative without the operator having to carry out any type of action. Each operator electronic unit and each process station shall be powered by redundant power packs those are able to power the entire load. In case of a failure, the switch between the power packs shall not cause stops or interruption in the carrying out of the station functions. The switch between the power packs shall be signalled by a high priority alarm.
3. In order to establish a high degree of system availability, the various control systems which comprise the overall unit control system shall be configured such that no single component failure can cause a failure or mal-operation of critical automatic or manual control functions. The failure of a redundant component

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[68]	02.09.2015

shall be alarmed to the operator to allow on-line removal/replacement or at the first shutdown opportunity. The system's redundancy schemes shall be designed such that the transfer from any critical element to its redundant backup shall occur without upset to normal process control or to system displays, data collection, or other normal DCS functions within 50 m sec.

4. The signal distribution from sensors which are shared due to process restrictions between control loops, logics, monitoring purposes shall be as follows:-
 - a) In the case of multiple inputs to a card, input cards used shall be restricted to a maximum of 16 inputs per card for analog input and 32 for digital inputs.
 - b) In case there is either process redundancy (Left, Right) or transmitter or switches redundancy, the inputs shall be routed through independent input cards.
 - c) No two control loops/interlock loop shall share the inputs (either binary or analog) wide input cards if process signals are independently available.
 - d) Protective inputs for two drives shall not be allotted to the same input card.
 - e) Output cards shall be independent for each control loop.
 - f) For outputs to HT and LT motors, the following shall be adopted :
 - g) Each HT motor and unidirectional drives shall have dedicated output cards. No other drive shall be combined with HT motor drive output card. However indication outputs can be driven from this output card for the concerned logic loop.
 - h) Not more than two bidirectional drives shall share one output card.
 - i) For unidirectional drives, not more than one drive shall be allotted to one output card.
 - j) For signal distribution or fan-out, suitable electronic cards (opto couplers) shall be used.
 - k) The processors shall contain the logic required to group individual process and system alarms into common groups as well as the annunciation sequence logic.
5. Redundant components and equipment within given systems shall be distributed among processors and I/O cards to the extent practical.
6. Critical inputs shall be supplied with redundant sensors/transmitters with each input connected to different input cards. Where redundant inputs exist, the DCS shall be configured to automatically reject erroneous data. Where required, one-of-two, two-of-two, two-of-three, or median select schemes shall be utilized to ensure the integrity of critical inputs.
7. The use of redundant outputs driving the same final element or equipment shall generally be avoided in favour of failsafe design and redundancy of the plant equipment.
8. The operator stations shall be identical in capability and independently linked to the system. Although these stations shall be normally dedicated to a specific function, any station can replace the function of any other station at any time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[69]	02.09.2015

9. All power source and power conditioning equipment in the system shall be redundant

6.2.7 System Spare Capacity

1. Following philosophy shall be followed for the spare capacity of the Distributed Control system:
 - a) Twenty (20) percent spare channels in each of the functional groups for each type of input/output modules fully wired up to marshalling / field termination cabinet TBs.
 - b) Ten percent (10%) installed spare I/O modules which may be capable of hot swapping.
 - c) Wired-in "usable" space for 20% modules in each of the system cabinets for mounting electronic modules shall be provided for future use. Empty slots between individual modules / group or group of modules, kept for ease in maintenance or for heat dissipation requirement as per standard practice, shall not be considered as wired-in 'usable' space for I/O modules. Field Terminal assemblies, PCB / Connectors (if any in the offered system), corresponding to the I/O modules shall be provided for above mentioned 20% blank space, distributed proportionally to main population.
 - d) Each controller shall have 40% spare functional capacity to implement additional function blocks, over and above implemented logic / loops. Further, each controller shall have spare capacity to handle minimum 40% additional inputs / outputs of each type, over and above implemented capacity. Under worst loading condition, Controller should not be loaded beyond 60%. Each of the corresponding communication controllers shall also have same spare capacity as that of controller.
 - e) The data communication system (including main system Bus and other bus system) shall have the capacity to handle the additions mentioned above.
 - f) Each Communication Network Switch shall have 20% spare ports.
 - g) Twenty (20) percent spare relays of each type and rating mounted and wired in relay cabinets. All contacts of relays shall be terminated in terminal blocks of relay cabinets. In each of the relay cabinets 20% spare terminal blocks shall be provided so that additional relays can be mounted and wired.
 - h) For power distribution board 20% spare feeder fully wired ready for use with MCBs fuses, TBs etc. Other hardware such as signal distribution isolation, trip amplifiers etc. shall be provided with 20% spares wired ready for use
2. Sufficient and additional software capacity shall be available in the system to take care of spares requirement as specified above to meet all functional requirements. The calculation for processor power and memory for all nodes should be furnished. Also, the dynamic processor load for all nodes either in terms of idling time or percentage load shall be available in VDU.
3. The spare capacity as specified above shall be uniformly distributed throughout all functional groups. The system design shall ensure that above mentioned additions shall not require any additional controller / processor / peripheral drivers

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[70]	02.09.2015

/ cabinets in the system delivered at site. Further, these additions shall not deteriorate the system parametric requirement like response time / duty cycle etc. from those stipulated under this specification and shall meet other redundancy / functional requirement.

6.3 System Configuration

The Distributed Control System shall basically consist of the following:

- Control system including Auto Controls & Interlocks, Protection & Sequential control system.
- Measurement system
- Data Communication Bus system for control & communication with Process
- Man-Machine Interfacing System
- Maintenance Engineers System (Engineering Station)
- Software

The basic configuration of Distributed Control System shall be as indicated in the Drawings.

DCS system shall be independent for units yet connected at network level so that, even when system for any unit is not in service (in case of long term shutdown of a unit) or non- functional, the functioning of other unit or plant common systems shall not be disturbed.

6.3.1 Control System Requirements

The control system shall be broadly divided into SG - C&I, TG - C&I and BOP - C&I.

1. The SG- C&I part of DCS system shall perform the following function as minimum but not limited to:
 - a) Burner management system (BMS) including control & protection of coal mills, fuel oil system etc.
 - b) Analog control functions pertaining to secondary air damper control etc.
 - c) Soot blower control.
2. The TG- C&I part of DCS system shall perform the following functions:
 - a) Turbine protection system function (TPS)
 - b) Turbine governing system for main turbine
 - c) Turbine stress control system (TSCS)
 - d) Automatic turbine testing (ATT)
 - e) Automatic turbine run up system. (ATRS)
 - f) HP&LP bypass control system
 - g) Turbine generator control system
 - h) EHG, interlock & protection for turbine driven BFP
3. The BOP- C&I system shall perform the following functions:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[71]	02.09.2015

- a) Analog control functions, other than those covered in SG-C&I and TG-C&I, like co-ordinated master control, furnace draft control, SH/RH steam temperature control, FW flow control, heaters/deaerator/condenser level control, Auxiliary PRDS pressure & temperature control etc.
 - b) Binary control functions pertaining to main plant auxiliaries like FD/ID/PA fans, APH, BFP etc., Generator auxiliary systems and electrical breakers etc.
4. **Close Loop Control System (CLCS):** Modulating control functions for SG/TG/BOP system includes the CLCS SADC Control, Air/Fuel oil flow control Drum Level Control, FW Flow Control, SH/RH Temperature Control, Furnace pressure, wind box air damper, Auxiliary PRDS Coordinated Master Control, De-aerator Pressure & Level Control, HP/LP Bypass control, Hotwell Level Control, HP/LP heaters Level Control, BFP Scoop control, BFP & CEP minimum Recirculation Control & individual control and operation of modulating drives.
 5. **Open Loop Control System (OLCS):** Binary control functions pertaining to SG control system such as Sequence/ Interlock/ Protection of SG Auxiliaries includes the OLCS for FD Fan, ID Fan, APH, Soot Blowers etc. This includes controls of all HT drives, LT drives, motor operated valve, solenoid valves, Soot blower protection & auto-standby of HT & LT drives.

However the binary control functions pertaining to TG & BOP control system such as Sequence/ Interlock/ Protection of TG Auxiliaries includes the OLCS for the BFP, CEP, CW, ACW, ECW Drain & Vent Valves etc. and individual control & protection of Binary drives. This includes controls of all HT drives, LT drives, motor operated valve, solenoid valves, Electrical breaker, auto-standby of HT & LT drives.
 6. Time stamping of SOE inputs/points, Integration of BOP PLC's etc.
 7. Other Miscellaneous controls, signal processing etc.
 8. For each of the Functional Groups (FG), separate sets of controllers, I/O modules, communication controllers, power packs / modules, etc. shall be provided. Mixing of hardware of two or more FG's shall not be acceptable. However, splitting of any functional group in more than one FG's due to any limitation in system (e.g. limitation in handling number of inputs /outputs including spare capacity, limitation in implementation of number of functional blocks including, spare blocks etc.) shall be acceptable, subject to Consultant's approval. It may be noted that after splitting of the functional groups, each FG must have its own set of controllers, I/O modules, communication controllers, power packs / modules etc. It shall be ensured that failure of any set(s) of hardware of any FG does not affect other FG(s) and data communication between other FG(s) and MMI.
 9. The minimum functions to be realized in the Control System shall be as per requirements specified under subsequent clause of this specification. The system shall provided with all hardware /software, whether or not specifically indicated in this specification to fully meet operational / maintenance / safety requirement as well as statutory /international standards and proven practices.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[72]	02.09.2015

10. The Control System shall function reliably under the environmental conditions as specified in design philosophy & design criteria of this specification. It shall be immune from the interference resulting from disturbance in power supply feeders, signal lines, inputs, outputs, etc. as experienced in a power station.
11. The Control System shall have on-line simulation and testing facility. Further, it shall be possible to on-line configure and tune controllers through Engineering Station.
12. The system shall have the flexibility to easily reconfigure any controller at any time without requiring additional hardware or system wiring changes and without disabling other devices from their normal operation mode. Modifications shall not require switching off power to any part of the system.
13. Power supply to individual functional group shall be from redundant 24 V feeders with diode auctioneering and further sub-distribution.
14. The assignment of I/O channels for inputs / outputs, arrangement of modules within cabinet etc shall be identical. Further uniformity should be maintained for redundant stream of process equipment within a unit.
15. The application programs for the functional controllers shall be software based which shall be maintained even during power supply failure. The application program shall be alterable through the configuration and tuning station for all configuration and strategy changes, etc. and through the operator's console for set points / bias changes, device selection, etc. Parts replacement or parts removal shall not be required in order to accomplish changes in application programs including system tuning.
16. Independent and dedicated controllers (main and its 100% standby) shall be provided for each of the functional group (FG) of Control System. All the 100% hot / redundant backup controllers shall be identical in hardware and software implementation to their corresponding main controllers and shall be able to perform all its tasks. The backup controller shall track its corresponding main controller. There shall be an automatic and bumpless switchover from the main controller to its corresponding backup controller in case of main controller failure and vice versa without resulting in any change in control status. In case of switchover from main controller to the 100% hot backup controller, the back-up controller shall work as the main controller. Facility shall also be provided for manual switchover from main to 100% hot back-up controller and vice versa from the Engineering Work Station.
17. The loop / logic reaction time shall be suitable to match actual process requirements, subject to minimum requirement wherever specified.

6.3.1.1 Binary Controls/ Open Loop Control System (OLCS) Functions

1. These clauses are applicable for all the Binary controls of Systems for the systems of SG & TG which are to be implemented in Plant.
2. The OLCS shall include sequence control, interlock & protection for various plant auxiliaries/valves /dampers/drives etc. The sequence control shall provide safe and automatic start up and shut down of plant and of plant items associated with a plant group. The interlock and protection system shall ensure safe

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[73]	02.09.2015

operation of plant/plant items at all times and shall automatically shut down plant/plant items when unsafe conditions arise.

3. The OLCS shall be arranged in the hierarchical control structure consisting of unit level, group level, subgroup level and drive level (as applicable).
4. It shall be possible to perform automatic unit start up and shutdown by issuing minimum number of command from OWS / LCD. Thus, the unit level shall control all the Control System Blocks and issue appropriate start up and shutdown commands to various blocks of Control System.
5. The group level shall control a set of functional sub-groups of drives. Appropriate start-up and shut down commands shall be issued to the sub-group control and various check-backs shall be received from sub-groups of drives. Each sub-group shall execute the sequential start-up and shut down programs of a set of inter-related drives along with system interlocks and protections related to individual drive falling under that sub-group. The drive level shall accept commands from the sub-groups, push buttons (wherever provided) etc., and transmit them to the respective drive, after taking into account various interlocks and protections and the safety of that particular drive. For HT drive, first-up logic shall be incorporated to indicate the cause of protection / trip.
6. A sequence shall be used to move a set of groups and sub-groups from an initial steady state (for instance 'OFF') to a final steady state (for instance 'ON'). The sequence initiating command for the unit and group level shall be issued from OWS/LCD.
7. A sequence shall be made of steps. The steps shall be executed in predetermined order according to logic criteria and monitoring time consisting of the interlock & protection requirements and check back of previous step which shall act as pre-conditions before the sequence control can execute the command for that step.
8. Each step shall have a "waiting time" implying that the subsequent step would not be executed unless the specified time elapses. A monitoring time shall also be defined as the maximum time required in executing the commands of any step and the time required for appearance of check back signals. In case, this is not completed within the specified time, a message shall be displayed and programme shall not proceed further.
9. Manual intervention shall be possible at any stage of operation and the sequence control shall be able to continue at the correct point in the programme on return to automatic control. Protection commands shall have priority over manual commands, and manual commands shall prevail over auto commands.
10. Open or close priority shall be selectable for each drive.
11. The sequence start up mode shall be of the following types:

a) Automatic Mode

In this mode of operation, the sequence shall progress without involving any action from the operator. The sequence start / stop command shall be issued from the OWS / LCD.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[74]	02.09.2015

b) Semi-Automatic Mode

In this mode of operation, once the sequence is initialized, the step progressing shall be displayed on the OWS / LCD. But the step execution command shall be prevented and shall be sent by the operator via the keyboards. It shall be possible to bypass and / or simulate one or more criteria to enable the program to proceed. This facility shall allow the program to be executed even if some criteria are not fulfilled because of defective switching devices, etc., while the plant condition is satisfactory. All the criteria bypassed shall be logged and displayed. It shall be possible to put the system on the Auto-mode after operating it on semi-automatic mode for some steps or vice-versa, without disturbance to the sequence operation.

c) Operator Guide Mode / Test Mode

It shall be possible to use the sequential control in operator guide mode / test mode i.e. the complete system runs and receives input from the plant and the individual push button stations (where provided) / keyboards but its command output is blocked. The whole programme, in this case shall run in manual mode. This mode shall allow the operator to practice manual operation using step and criteria indications. The actual protection should remain valid during this mode of operation also.

12. The sequence shall be started by putting the sequence on 'auto' and on receipt of 'start' command from the OWS / LCD or from a higher-level group / protection action as defined. The sequence shall then progress as per the defined logics. It should be possible to select alternative operation in the same sequence depending on certain process / equipment condition. Some step can be automatically bypassed also based on certain process / equipment condition. When the expected results of the sequence are reached the sequence is considered as "END". If during sequence initialization or sequence progressing or during normal running of the drive, a shutdown criterion is present, the sequence shall be stopped and the shut down sequence initiated.
13. For the drives, the command shall be provided through O/P module to MCC / SWGR / Actuator as applicable and input (status, SWGR and process) shall be acquired through input modules. The drive logic shall be implemented in the redundant controller. The status for the 11 KV, 3.3 KV drives and some other important drives shall also be wired in parallel to redundant input modules so that on failure of the single input modules, the information regarding the status of the affected drive remains available in OLCS.
14. The output modules shall have the feature that ensures that in case of failure, all the outputs are driven to zero. The 24V DC command outputs to drives for ON / OPEN, OFF / CLOSE shall be separate and independent and the inverted outputs shall not be employed. For inching type of drives, position transmitter shall be provided.
15. The termination for ON / OPEN, OFF / CLOSE command for the drive actuator

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[75]	02.09.2015

shall be performed as specified in Chapter-4 Clause-4.13. However ON/OPEN feedback, OFF/CLOSE feedback, Switch gear disturbance feed back as a minimum shall be monitored in OLCS.

16. The drive function i.e. basic interlocks and protection logic of the drive shall be implemented in redundant controllers. The drive function shall ensure that protection signals for the safety of the drive shall be effective under all conditions and under all modes of operation. The different commands shall be performed according to the priority of protection 'OFF', protection 'ON', manual and automatic. The standard functions like running time monitoring, status signalling, alarm / drive annunciation, etc. shall be performed in drive function. The drive function shall prevent hunting of the actuator in the presence of both open and close commands for actuators of the valves and dampers. The drive function shall be implemented in dedicated standard software functional block

6.3.1.2 Analog Controls/ Close Loop Control System (CLCS) Functions

- These clauses are applicable for all the Analog controls of Systems included in for the systems of SG & TG which are to be implemented in Plant.
- The CLCS shall continuously act on valves, dampers or other mechanical modulating devices such as hydraulic coupling etc., which alter the plant operation conditions. The system shall be designed to give stable control action in steady state condition and for load changes in step / ramp over the load range of 60% to 100% MCR with variation or parameters within permissible limits.
- The controller capability shall, as a minimum, include (i) P, PI, PD and PID control functions and their variations (ii) cascade control (iii) feed forward control (iv) state-variable based predictive control for SH/RH temperature control (v) on-off control, (vi) ratio and bias control, (vii) logical operation etc. The loop reaction time (from change of output of the sensor of the transmitter/temperature element to the corresponding control command output) shall be within 250 ms. However, for faster loops such as feed water, furnace draft, PA header pressure control loop etc. the same shall be based on actual process requirement.
- The loop response time, for conventional I/Os, is the cumulative response time inclusive of input scan time, Controller Execution time and output card throughput time (in other words loop response is the time taken by the system to read a change in field signal at the input card terminal, process the controller task associated with the input and to make the required change in the control output at the output terminal of the output card)
- The control system shall be bumpless transferred to manual on the following conditions as a minimum. Control power supply failure, failure of redundant controllers, field input signal not available, analog input exceeding preset value, etc.
- Any switch over from auto to manual, manual to auto and vice versa shall be bumpless and without resulting in any change in the plant regulations and the same shall be reported to the operator and recorded automatically.
- Buffered analog output (positioning signal) of 4-20mA DC shall be provided from CLCS to the respective E/P converters. For electrical actuators, pulse type output

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[76]	02.09.2015

(bound less control) shall be preferred. CLCS shall also provide all the necessary outputs for indicators & recorders with output loop resistance of 500 ohms for each channel of the output module.

8. The functional requirement of the CLCS loops as well as the detailed schemes shall be subject to purchaser approval.
9. The system being supplied shall be such that when permissible limits are exceeded, an automatic switchover from an operation governed by maximum efficiency, to an operation governed by safety and availability is affected.
10. For safety reasons, switchover logics associated with the modulating control loops shall be performed within the closed loop control equipment.
11. Time supervision facility shall be provided to monitor the final control element.
12. It shall be possible to block the controller output on a pre-programmed basis.
13. All controllers shall be freely configurable with respect to requisite control algorithms.
14. Whenever, alternate measurement is available for a control input the alternate measurement value shall be automatically substituted in the control loop in case of loss of control input. All necessary software for switching and reconfiguration shall be provided. In addition, such substitution shall be balance less and bumpless and shall be reported to the operator.

Table 6.1
Specifications for Controller

S.No.	Features	Minimum Requirements
1	Type	Microprocessor based, multi loop, multi function, dual redundant configuration.
2	No. of Loops	40 (maximum/per controller)
3	Word Length	32 bits
4	Register add cycle time	1 microsecond (typical)
5	Instruction Cycle time	75 microseconds (maximum)
6	I/O address capability	256 points (minimum)
7	Memory	RAM 12 MB (minimum) with battery backup
8	Redundancy Supported	Yes
9	Fall back transparent	Yes
10	Power Supply	24V, 5V DC
11	Mounting	Sub-rack
12	Indication	Processor status & fault display
13	Diagnostic	Invalid command checking, Automatic periodic illegal address detection,

S.No.	Features	Minimum Requirements
		routine check and memory parity check, watch dog report to engineering terminal, time - out checking,

6.3.1.3 Guidelines for Functional Grouping of Plant DCS Controllers

The guidelines for functional grouping of controllers in Plant DCS shall be as described in this clause.

- Stream wise process redundancy is to be maintained in Plant DCS. That is, if there is more than one main equipment in a process block, these are to be allocated in different functional groups. For example, ID fan – A & B shall be allocated to two different functional groups, BFP- A, B & C shall be allocated to three different functional groups, etc. In the functional groups thus obtained, main equipment of similar stream shall be allocated. For example, if one functional group caters to Stream-A main equipments, all main equipments of Stream – A of the same block should be put together e.g. FD fan-A, ID fan-A should be put together. Further the auxiliaries of main equipment shall be allocated in the same functional group where corresponding main equipment is allocated e.g. Lube oil pump-A & Lube oil pump- B of FD fan –A should be allocated with FD fan-A.
- For different streams of process blocks defined below, separate sets of functional groups shall be provided. Where different streams of process blocks are not defined, separate sets functional groups shall be provided for the process blocks. The functions of two streams/process blocks should not be mixed in any case.
- The information signals of respective process areas shall be kept along with the main equipment.
- Electrical system of unit shall be a separate process block.
- The Plant DCS shall be divided into following major sub-systems:
 - BOP – SG
 - BOP – TG
 - Common System
 - Electrical system

For each of the above major sub-systems, the process blocks, along with major equipments/control loops in each block shall be as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[78]	02.09.2015

A. BOP - SG

- **Air Block:** ID Fans- A & B, FD Fans-A & B, SA Fans– A & B, Primary APH –A & B along with flue gas temperature control/fire detection, stack path, Furnace draft control, Secondary SCAPH – A & B, Air Flow Control etc.
- **Steam & Water Block:** SG vents & drains, Main Steam/RH/SH valves along with temperature control, ECW Pumps- A & B along with DP control, Chemical Dosing, Feed water valves, SG misc. Drives, Coordinated Master Control, Feed Water Control, Group Control, RH Protection, SWAS, BCWP - A, B & C, etc.
- **Mills & feeder Block:** Mills/feeder – A, B, C, D, E, F, G & H controls for outlet temperature, Primary APH – A & B along with fire detection & temperature control, Primary SCAPH – A & B, etc.

B. BOP - TG

The BOP- TG shall include the following major equipments/controls:

- BFP – A, B & C
- CEP – A, B & C along with recirculation controls
- ACWP – A, B & C
- HP Heaters valves & Level control (all HP heaters should be kept in same Functional group)
- LP Heaters valves & Level control (all LP heaters should be kept in same Functional group)
- Hotwell level control
- ECW Pumps- A & B along with DP control
- TG misc. Valves/drives controls etc.

C. Common system

The Common systems shall include the following major equipments/controls:

- Compressed Air System block
- CW pumps – A, B & C (CW pumps shall be allocated to three different functional groups)
- LDO/HFO handling system block.

D. Electrical system

All Electrical breakers, bus couplers etc. shall be covered in this sub-system.

6. The major aspects to be considered shall be as follows:

- Hardware capacity, including spare capacity.
- Software capacity, including spare capacity.
- Response time/signal acquisition time requirement of Plant DCS.
- Parametric Requirement of Plant DCS.
- Tentative Functional grouping as described in Table 6.1A.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[79]	02.09.2015

7. The exact functional grouping shall be subject to approval. The equipments, logics, controls indicated in the functional grouping are tentative & shall be dependent on the design, recommended logics & controls of the SG & TG Vendors.

Table 6.1A
Functional Grouping of Controllers

S. No.	Functional Group	Functions
1	FG-01	FD Fan – A, ID Fan –A, SA Fan –A, Stack Path A & B, etc
2	FG-02	Furnace Draft Control, RAPH-A, RAPH – A Temperature Control, SCAPH –A, RAPH –A fire detection, etc.
3	FG-03	FD Fan – B, ID Fan –B, SA Fan –B, Stack Path C & D, etc.
4	FG-04	Air flow control, Fuel Flow Control, Coal Feeder Speed Control, HFO/LDO control, RAPH-B, RAPH- B Temperature Control, SCAPH –B, RAPH –B fire detection, etc.
5	FG-05	SG misc. drives, SG Drains & Vents, SG DMCWP –A, BSCP-A, Soot Blower Control, SADC, etc.
6	FG-06	Coordinated Master Control, Group Control, RH protection, Misc. Boiler Controls, etc.
7	FG-07	RH temp. Control, SH temp. control, RH/SH spray drains & vents, Eco. I/L valves, BSCP-B, Boiler Fill Pump-A, Aux. PRDS Control, etc.
8	FG-08	FW valves, SG DMCWP-B, SG misc. drives, BSCP-C, Boiler Fill Pump-B, Dosing system drives, etc.
9	FG-09	CEP-A, CEP-A recirculation system, etc.
10	FG-10	Hotwell level control, CEP – B, CEP – B recirculation control, GSC Minimum flow, etc.
11	FG-11	ACW –A, TG ECW –A, TG ECW CLCS, LP heaters CLCS, LP Heaters (valve) Drives, etc.
12	FG-12	CEP-B, CEP-B recirculation system, HP bypass system, etc.
13	FG-13	ACW –B, TG ECW –B, HP heaters CLCS, HP Heaters Drives (valves), LP Bypass system, etc.
14	FG-14	MDBFP, Deaerator Level control, Deaerator Pressure Control, Deaerator Overflow Control, Deaerator Drives (valves), CEP-C, CEP-C recirculation system, etc.
15	FG-15	ACW –C, TG Misc. Drives, etc.
16	FG-16	IA Compressor –A , CWP- A, HFO Transfer pump – A, LDO Transfer pump –A, Service Air Compressor – A, LDO System Misc. drives, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[80]	02.09.2015

S. No.	Functional Group	Functions
17	FG-17	HFO Transfer pump -B Handling system, CWP – B, IA Compressor –B, LDO Transfer pump –B, Service Air Compressor – C, HFO Misc. drives, etc.
18	FG-18	CWP- C, HFO Transfer pump –C, IA Compressor –C, LDO Transfer pump –C, etc.
19	FG-19	Electrical systems, UPS, etc.
20	FG-20	Electrical Systems, 24 V DC system, etc.

6.3.2 Measurement System Requirements

All the signals coming into / going out of the Control System shall be routed through marshalling cabinets. The input / output modules employed in the Control System shall be separated from controller hardware.

6.3.2.1 Analog Signal Conditioning & Processing

- The conditioning and processing functions to be performed as a minimum for the analog input coming for control and information purpose are:
 - Galvanic isolation of input signals for which power supply source is other than the measurement system of the control system.
 - Transmitter power supply with per point fuse protection or current limiting and power supply monitoring.
 - Transducer / transmitter signal output limit check
 - Implementation of multiple measurement schemes
 - Square root extraction
 - Pressure and temperature compensation.
 - On-line ADC gain and drift monitoring and correction at periodic intervals.
 - Linearization of temperature signals (from thermocouples and RTD through temperature transmitters).
 - Reasonability checks for all analog inputs.
 - Monitor sensor wire break / open circuit / short circuit and take suitable actions in logic / loop. (This shall include blocking of trip signals in case of RTD failure).
 - Rate of rise / fall calculation
 - LVM generation.
- All analog signals for control purpose shall be acquired, validated, processed and their respective Controller data base updated at a maximum interval of 250 ms except for some fast-acting control loops for which the above referred time shall be as per process requirement. The validated analog inputs shall be converted into engineering units on per point basis. Analog input processing (scanning to alarm checking) shall be performed once every scan cycle.
- The analog 4-20 mA input cards shall have input loop resistance ≥ 250 ohm for interfacing transmitters / analyzers giving 4-20 mA DC signals along with

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[81]	02.09.2015

superimposed HART interface signals. 4-20 mA DC signal shall only be used for control purpose and superimposed HART signal shall be used for configuration, maintenance, diagnostic and record keeping facility for electronic transmitters and Analysers etc.

4. Triple measurement scheme for analog inputs employing three independent transmitters connected to separate tapping points shall be employed for the most critical measurements. The three signals shall be auctioneered to determine the median / average value, which shall be used for control purpose. In case one transmitter fails or shows excessive deviation with respect to others, it shall be removed from computation of median / average value and the average of the other two transmitter outputs shall be used for controls. The control loop shall trip to manual when any two of the three transmitter signals fail. The outputs of the transmitters shall be continuously monitored for excessive deviation which shall be displayed, logged and alarmed.
5. Dual measurement scheme for analog inputs employing two independent transmitters connected to separate tapping points / temperature element shall be employed for the remaining measurements used for analog control functions. The output of the redundant transmitters shall be continuously monitored for excessive deviation. In case the deviation is within limits, the mean value shall be used for the control loop. If the deviation becomes high (with both transmitters remaining healthy), the loop shall be automatically transferred to manual. However, if one transmitter fails and other transmitter remain healthy, then the output of the healthy transmitter shall be used for control. If the other transmitter also fails, loop shall trip to manual. The outputs of the transmitters shall be continuously monitored for excessive deviation which shall be displayed, logged and alarmed.
6. Individual transmitter signal, their value and selected value for control/measurement shall be available in OWS.

6.3.2.2 Binary Signal Conditioning & Processing

1. The changeover type contacts (i.e. 'NC' + 'NO' together) shall be wired to the controller system for all the binary inputs required for control purposes. The binary inputs required for information purposes only shall be wired to control system in the form of non-changeover type contacts.
2. The conditioning and processing functions to be performed as a minimum for the binary inputs coming for control and information purposes are:
 - a) 24 V DC power supply for contact interrogation for all potential free contacts with per point fuse protection or suitable current limit feature / isolation through opto-coupler.
 - b) Contact bounce filtering delay time of 15 ms. However for SOE inputs, it shall be such that it should meet SOE time resolution of 1 ms.
 - c) Facility for automatic pegging of the binary signal to logic one / zero or last correct value in case of failure of binary input module.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[82]	02.09.2015

- d) Binary signal distribution to different user shall be in such a way so as to ensures that a short / ground fault on one user is not reflected to the other user.
- e) Implementation of multiple measurement schemes for signals for control purpose.
- f) All binary signals shall be acquired, validated, processed, alarm checked and their data base updated within one second. In addition to this requirement, binary signals required for SOE shall have resolution of 1 millisecond.
- g) Checking for excessive number of status changes for all binary / contact inputs and making it off-scan, if the total no. of changes exceeds a limit within pre-defined time.
- h) The non-coincidence monitoring shall be provided for binary inputs for all changeover signals.

6.3.2.3 Wiring Scheme for Inputs to Control System

1. Each of the triple redundant binary and analog inputs shall be wired to three separate input modules. In addition, for functions employing 2V3 controllers, each of the redundant binary and analog signals shall be wired to separate input modules associated with each controller. Similarly each of the dual redundant binary and analog inputs shall be wired to two separate input modules. These redundant modules shall be placed in different racks, which shall have separately fused power supply distribution. Implementation of multiple measurement schemes of these inputs shall be performed in the redundant hardware. Loss of one input module shall not affect the signal to other modules. Other channels of these modules can be used by other inputs of the same functional group.
2. No single failure in any component of the control system shall lead to unavailability of more than one of dual / triple redundant input signals to control system. Similarly, no single failure in any component of the control system shall lead to unavailability of more than one of dual / triple redundant output signal from the control system.
3. The single (i.e. non-redundant) binary and analog signal required for control purpose shall be wired as follows:
 - a) The on-off status of HT drives and Breakers with synchronization provision shall be wired to two input modules in parallel.
 - b) All analog and binary inputs including the limit switches of valves / dampers / MCC / SWGR, check-backs of all drives, SOE and information related signals should be wired to single input modules.
4. It is envisaged to use remote I/O modules in plant areas where it is required from location point of view. The remote I/O signals shall be connected to the respective functional groups through redundant extended I/O bus. The hardware independence of functional groups shall be applicable for remote I/O as well. The remote input / output modules shall be located in cubicles in respective areas. Remote input / output modules shall be designed in such a way to work continuously under the harsh environment expected to be encountered in these

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[83]	02.09.2015

areas (high temp, dust level, humidity etc.). It shall be ensured that extending of I/O bus of functional group in field does not result in false signalling / noise pickups. Further, it shall in no way deteriorate the performance of that functional group and Control System.

5. Power supply arrangement for these cubicles shall be similar to DCS System cabinets
6. The measurement system of control system should be capable of acquiring data from various equipment and system in digital form through serial port, Field bus/ Profibus, Ethernet connection using industry standard protocols. The control system shall include requisite modules for accepting such signals.
7. The maximum number of inputs/outputs to be connected to each type of modules shall be as follows:

a) Analog input module	16
b) Analog output module	08
c) Binary input module	32
d) Binary output module	32
8. The following requirements shall be met for analog/binary input / output modules as applicable:
 - a) Input filters to attenuate noise shall be provided
 - b) All analog / binary inputs and outputs shall be capable of withstanding 500V DC common mode and 500V AC peak to peak between analog and digital parts. All analog outputs shall be short circuit proof.
9. Any single sensor / transducer / transmitter failure alarm shall be provided on Engineer's Station monitors for all sensors / transducers / transmitters. Similarly sensor break alarm for thermocouples etc. shall also be logged and displayed.

6.3.3**Data Communication Bus System Requirements**

The System offered shall be an open system and shall conform to Open Industry Standard (IEEE). A redundant 10 / 100 MBPS Ethernet based high speed switched fault tolerant Data Communication System shall be deployed that provides for multiple simultaneous bi-directional communications. Communication shall be full duplex and with TCP-IP protocol. All interfaces links of controllers, gateways, MMI stations, switches and all other communication devices on the network shall be dual so that a single point failure shall not lead to system shutdown. Network shall be capable of handshaking with any third party system following standard protocol. The primary objective shall be centralized monitoring, presentation & report of data for information and analysis of entire plant. All the functional groups shall be connected to a common high-speed data network for global distribution and peer-to-peer data communication. Any data shall be available at any point on the network as and when required. The control system shall be modular, expandable and flexible so the expansion of the system is possible by adding extra stations on the data communication bus. Comprehensive self-diagnostic features have been envisaged to facilitate easy

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[86]	02.09.2015

fault location and detection of hardware and software while the unit is in operation. It shall be able to direct intelligent routing of messages without the drawbacks of traffic jamming etc.

The Data Communication System shall include a Redundant System Bus for major subsystems with hot back-up. The data highway shall be high speed digital links of speed preferable 10/100 MBPS. Bus protocols at control levels shall conform to OPC compliant ISO-7 layer protocol in master less, token ring or token bus (as per IEEE 802) or any standard proven and acceptable protocol in deterministic mode. Extensive error checking (CRC-16/12) or error correcting codes shall be used in these levels to improve the reliability of communication.

The Data Communication System shall have following minimum features:

1. Redundant communication controllers shall be provided to handle the communication between each functional group of controllers of Control System and the System Bus. The design shall be such as to minimize interruption of signals. It shall ensure that a single failure anywhere in the media shall cause no more than a single message to be disrupted and that message shall automatically be retransmitted. Any failure or physical removal of any station / module connected to the system bus shall not result in loss of any communication function to and from any other station / module.
2. If the system bus requires a master bus controller philosophy, it shall employ redundant master bus controller with automatic switchover facility.
3. Built-in diagnostics shall be provided for easy fault detection. Communication error detection and correction facility shall be provided at all levels of communication. Failure of one bus and changeover to the standby system bus shall be automatic and completely bumpless and the same shall be suitably alarmed / logged. The above changeover shall not result in any data loss.
4. The design and installation of the system bus shall take care of the environmental conditions and hazardous area classification as applicable to similar services.
5. Data transmitting speed shall be sufficient to meet the responses of the system in terms of displays, control etc. plus 50% spare capacity shall be available for future expansion.
6. Passive coaxial cables or fibre optic cables shall be employed for System Bus. It may proposed with other type of cables as per their standard also which shall be subject to Consultant's approval. However the following buses shall be fibre-optic only.
 - a) System bus connections between Control Room & Control Equipment Room.
 - b) System bus from locally mounted control system cabinets / OWS to central location.
 - c) I/O Bus from remote I/Os to centrally located system cabinets. The redundant buses shall be physically separate and shall be routed separately.
7. If UTP / STP cables are used, then it shall routed with flexible conduit.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[87]	02.09.2015

8. In case of any distance or other limitation in the Data Communication System, then it shall be provide with special type of cables like optical fibres with repeaters as required to make the system fully operational.
9. Serial device interface module shall be capable of providing communication interface with serial devices. The Modbus interface shall support MODBUS RTU protocol and use EIA-422/485 multi loop configuration by establishing direct digital communication. The nominal capacity of a link shall not be less than 5000 digital and 200 analog inputs. The acquired & transmitted data shall integrate seamlessly with DCS database. The physical medium of communication can be twisted wire, coaxial or fibre optic cable, depending on transmission distance and surrounding electrical interference.
10. In redundant network, the communication cables of each network shall be uniquely colour coded.

6.3.3.1 DCS System Interfacing Requirements

Following Interfacing facility shall be provided for DCS System.

1. One (1) no. independent Redundant Bi-directional OPC/ Soft Link, for monitoring, operation & effective control of the system (without time delay), with Ethernet based TCP-IP protocol for SG integral Control System.
2. One (1) no. independent Redundant Bi-directional OPC/Soft Link, for monitoring, operation & effective control of the system (without time delay), with Ethernet based TCP-IP protocol for TG integral Control System.
3. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Coal Handling Plant Control System.
4. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Ash Handling Plant Control System.
5. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Water Treatment & Effluent Treatment Plant Control System.
6. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Raw Water Intake Pump house Control System.
7. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Hydrogen Generation Plant Control System.
8. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the Substation Automation System.
9. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for the ESP Control System.
10. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for Water Lance System.
11. One (1) no. independent Redundant Bi-directional OPC/Soft Link with Ethernet based TCP-IP protocol for the Emergency DG Control System.
12. One (1) no. independent Redundant Uni-directional OPC Link with Ethernet based TCP-IP protocol for Turbine Supervisory Instrumentation (TSI) System.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[88]	02.09.2015

13. One (1) no. independent Redundant Uni-directional OPC Link with Ethernet based TCP-IP protocol for Online Tube Cleaning System.
14. One (1) no. independent Redundant Uni-directional OPC Link with Ethernet based TCP-IP protocol for Turbine Lube Oil Purification System.
15. One (1) no. independent Redundant Uni-directional OPC/Soft Link with Ethernet based TCP-IP protocol for AC & Ventilation Control System.
16. One (1) no. independent Redundant Uni-directional OPC/Soft Link with Ethernet based TCP-IP protocol for Fire Detection & Protection System.
17. One (1) no. independent Redundant Uni-directional OPC Link with Ethernet based TCP-IP protocol for MIS system.
18. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for Computerized Maintenance Management System (CMMS).
19. One (1) no. independent Redundant Bi-directional OPC Link with Ethernet based TCP-IP protocol for PADO system.
20. One (1) no. independent Redundant Bi-directional Communication Link with Ethernet based TCP-IP protocol for Vibration Monitoring & Analysis System.
21. One (1) no. independent Redundant Uni-directional Communication Link with RS-485 Modbus Protocol for interfacing with SWAS.
22. One (1) no. independent Redundant Uni-directional Communication Link with RS-485 Modbus Protocol for interfacing with CEMS.
23. One (1) no. independent Redundant Uni-directional Communication Link with RS-485 Modbus Protocol for interfacing with Instrument & Service Air Compressors (NTA-1 Package).
24. Uni-directional Communication Link with IEC 61850 Protocol for interfacing with Numerical Protection relays.
25. Redundant Bi-Directional Communication Link with RS-485 Modbus Protocol for interfacing with Variable Frequency Drives.
26. Any other Communication Link as required for proper functioning of Complete System.
27. Two (2) nos. Redundant Bi-directional communication OPC Link with Ethernet based TCP-IP protocol as spare provision.
28. Two (2) nos. Redundant Uni-directional communication OPC Link with Ethernet based TCP-IP protocol as spare provision.
29. Two (2) nos. Uni-directional Communication Link with RS-485 Modbus Protocol as Spare Provision.
30. Four (4) nos. Uni-directional Communication Link with IEC 61850 Protocol as Spare Provision.

6.3.4 Man-Machine Interfacing System

1. Man-Machine interface system shall be designed and engineered for safe, efficient, reliable and convenient operation. MMI shall employ high performance, non-priority open system architecture to ensure fast access and response time

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[89]	02.09.2015

and compatibility with other system and portability of third party software. MMI System shall be used primarily for the following functions:

- a) As operator interface for control operation for the plant for accepting data from and issuing commands to control system etc.
- b) To perform plant supervisory, monitoring and information functions.
2. No single failure in MMI System shall lead to non-availability of more than one OWS or one LCD or one printer. In such an event i.e. single failure leading to non-availability of any OWS / LCD, it shall be possible to operate the entire plant in all regimes of operation including emergency conditions from each of the other available OWS / LCD.
3. The Plant data pertaining to one unit shall be available in the MMI of the respective unit. Data from common system shall be available in the MMI of units. Further, suitable displays with selection facility shall be provided for common system drives so that all common system drives can be controlled from any of the unit.

6.3.4.1 Operator Interface Requirements

1. The Operator interface of the MMI system shall consist of TFT Monitor, Mouse, Keyboards of OWS, LCD, Printers, etc. as follows:
 - a) Six (6) Nos. OWS with 21" TFT Monitors, Optical Mouse, Keyboard etc. for Unit Operation.
 - b) Two (2) Nos. OWS with 21" TFT Monitors, Optical Mouse, Keyboard etc. for Common system Operation
 - c) Two (2) Nos. OWS with 21" TFT Monitors, Optical Mouse, Keyboard etc. for Shift In Charge Engineer.
 - d) Two (2) Nos. 65" LCD with work station for display control and all other accessories, for Operation & Monitoring.
 - e) One (1) No. 65" LCD with work station for display control and all other accessories, for Operation & Monitoring of Plant Common System.
 - f) One (1) No. 65" LCD with work station for display control and all other accessories, for Operation & Monitoring of Plant Electrical System.
 - g) Two (2) Nos. Dot Matrix Printer (A3 size) for Alarm Printing.
 - h) Two (2) Nos. Dot Matrix Printer (A3 size) for Log Printing.
 - i) Two (2) Nos. Color Laser Jet Printer (A3 size) for Hard Copy Printing.
 - j) One (1) No. Color Laser Jet Printer (A4 size) for Shift In charge Station.
2. All OWS / LCD of the MMI System shall be fully interchangeable i.e. all operator functions including control, monitoring and operation of any plant area shall be possible from any of the OWS / LCD at any point of time without the necessity of any action like downloading of additional files. Each OWS / LCD shall be able to access all control information related data under all operating conditions including a single processor / computer failure in the MMI System. Further, simultaneous operation of at least two drives of control system shall be possible

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[90]	02.09.2015

from a single display without calling additional display for multiple drive operation.

3. The operator functions for each OWS / LCD shall as a minimum include control system operation (A/M selection, raise / lower, set point / bias change, on / off, open / close operation, mode / device selection, bypassing criteria, sequence auto, start / stop selection, drive auto selection, local-remote / other multi-position selection etc.), alarm acknowledge, call all kind of displays, logs, summaries, calculation results etc., printing of logs and reports, retrieval of historical data and any other functions required for smooth operation, control and management of information.
4. All frequently called important functions including major displays shall be assigned to dedicated function keys on a soft keyboard for the convenience of the operator for quick access to displays and other operator functions.
5. The display selection process shall be optimized so that the desired display can be selected with the minimum number of operations. Navigation from one display to any other should be possible efficiently through paging soft keys as well as through targets defined on the displays. There should be no limitation on number of such targets.
6. The system shall have built-in safety features that shall allow certain functions and entry fields with a function to be under password control to protect against inadvertent and unauthorised use of these functions. Assignment of allowable functions and entry field shall be on the basis of user profile. The system security shall contain various user levels with specific rights, which shall be changeable by the programmer.
7. Set points and other entries made shall be automatically checked for validity of range.
8. In addition to the OWS & LCD, minimum amount of conventional instrumentation (i.e. Push button Stations etc.) shall be provided as per standard practice for safe shut-down of the unit.

6.3.4.2 MMI System Functional Requirements

The MMI System shall be designed as an on-line system which shall process, display and store Information to provide the operator, either automatically or on demand. The Following functions shall be performed by MMI system as a minimum:

1. Plant Control Displays

Various displays on the OWS / LCD shall as a minimum include P&ID displays or mimic, bar chart displays, X-Y and X-T plot (trend) displays, operator guidance message displays, group displays, plant start-up / shut-down message displays, system status displays etc. Number of displays and the exact functionality shall be on as required basis.

Minimum contents and functionality of various types of displays shall be as under:-

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[91]	02.09.2015

a) Mimic Display

These displays shall depict the process in graphical form and shall cover all the drives operable from DCS and all process areas being monitored therein. There shall be two types of mimic display, broadly, i.e. Overview displays and sub-area / individual displays. Operation of sequences and drives shall generally be carried out through the sub-area / individual displays.

Facility of adding a user specific symbol to the standard library shall be possible. It shall be possible to go to a predefined trend display on selecting a field on any analog point on the displays.

b) Control Tile Display

In this display the drives of a loop shall be displayed with related parameters such as process value, set point, deviation for the loop along with facility for any selections (like A/M selection, valve selector etc.) and the command output, disturbance status and the position feedback signals, for each drive. It shall be possible to call this display as a Pop-up window from the controlled drives in main mimics.

c) Trend Display (X-T Plots)

These displays shall show the trend of analog points with respect to time. These displays shall be continuous curve plot and not point plots. Time spans of displays shall have operator selectable intervals of 5, 10, 15, 30, 60 minutes, 8, 24 and 72 hours. In addition, zoom in / out, stretching facilities etc. shall be provided. Sufficient buffer space shall be provided to store data for minimum 500 points at MMI system scan rate for 72 hours.

d) X-Y Plot Display

There shall be fifteen number of such X-Y plot displays each of one page, pre-programmed in the system. At any instant of time, this page shall include up to 3 independent X-Y point Plots (values of X and Y variables) of up to three equipment typically in the form of a cross 'X'. Operating curves shall be superimposed over the X-Y plot. Alphanumeric information shall be overlaid to indicate X and Y scales, point identification, current operation point value with engineering units, etc. Two or three pairs of X and Y variables having common operating curves shall be displayed on one display page only. In such cases distinct symbols shall be used to show operating point for each. The balance shall be programmable at site.

e) X-Y Plot Display using stored data

This type of display shall show the analog trend of X-axis variable with Y-axis variable with facility to select time period. Ten numbers of such displays, each of one page shall be pre-programmed in the system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[92]	02.09.2015

f) Sequence Display

Sequence chain displays for each group and sub-group shall be used to trace the sequence of a control chain as well as to facilitate the operator interventions and enable mode changes / auto selection. Sequence chain display shall present complete sequence chain, in functional blocks, steps being carried out, criteria, running time, monitoring time, waiting time, operating mode, various parameters with associated engineering units for each step and criteria. It shall be possible to display a list of missing criteria for each sequence chain on Operator's demand. The sequence chain display shall automatically move forward when the auto sequence is in operation.

g) Drive Level Display

For each drive (both binary & modulating) a drive level display shall be provided which shall indicate the value / status of drive related inputs / outputs, permissive and protection conditions, the drive level logic and other drive related information including individual drive faults and disturbance criteria. It should be possible to call these displays as pop-up displays.

h) CLCS Display

The loop schematic for each loop shall be available in a display form which shall show the individual analog and binary values (input / output and intermediate) and the loop tuning parameters also.

i) Group Display

The group display shall present point information including point ID, description, current value, range, function group, quality tag and engineering unit of a group of points. (Number of points in a page shall be minimum 20).

j) Bar Graph Display

Horizontal and vertical bar charts shall be provided for the display of related points. Number of bars in a display shall be limited only due to visibility and resolution and no restriction shall be there in the numbers otherwise.

k) Alarm/Fault Analysis Display

In order to guide the operator in case of a process fault / alarm, a fault analysis display shall be provided so that the cause of the alarm, is presented to the operator. For each alarm, various reasons for the cause of the alarm shall be displayed.

l) Alarm Querying facility

On each display, one icon shall be provided. Clicking this icon shall lead to a display indicating all the lamp boxes and list of alarms in each box along with its status. Clicking on the alarm text of a lamp box shall give detailed list along with status of the individual alarm if it is a group alarm.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[93]	02.09.2015

m) Point Detail Display

From any display, i.e. mimic alarm or any other group display, facility shall be provided to select any point for point detail display. This display shall include all the database attributes of the point. For field I/Os, the termination and interconnection details up to field sensors shall additionally be available. In the point detail display of calculated point, by simple clicking of point or through soft key it shall be possible to display the calculation used and to get further details of any other calculated points used in the calculation.

n) LCD Display

In addition, top area of the LCD (around 300mm), shall be reserved for display of soft replica of Conventional annunciation fascia (for permanent viewing i.e., not operator changeable). LCD based overview display shall be provided, which shall be overlaid across all LCD for viewing as video wall.

2. Log/ Summaries/ Reports

The system shall generate three basic types of reports / logs i.e., Event activated, Time activated and Operator demand log and summaries. The system shall have the facility for viewing of the logs / summaries on the OWS / LCD as well as for their copying in formats compatible to be used with MS-Office or similar tools.

The system shall be designed for automatic printing of all the reports / logs with a provision of inhibition of the print function for each log separately, with selectable duration and selectable page / group of each log. Manual printing of time-actuated log shall also be possible.

Automatic switching of any log function from a pre-selected primary printer to a pre-selected secondary printer (defined on a per log basis) shall be possible. However, change in the assignment of the printers shall be possible through OWS/EWS.

a) Event Activated Logs

Event activated logs shall as a minimum include alarm log, trip analysis log, start-up log, control related logs and operator action log. All operator actions, modification in database etc. shall be logged (with historical storage) along with the username responsible for that action.

The trip analysis log shall record 30-100 pre-trip and 30-100 post-trip readings, operator selectable at site for the pre-defined parameters (not less than 250 points), sub-divided in to 25 groups. The data collection rate shall be of scan rate 2 minutes (operator selectable at site).

The system shall be capable of generating and printing TG start-up logs, the functionality of which shall be similar to the trip analysis log.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[94]	02.09.2015

b) Time Activated Logs

Time activated logs shall include shift log and daily log as a minimum. Each of these shall provide hourly record of a minimum 250 points sub divided into 25 groups

c) Operator Demand Logs

Operator demand logs shall include, as a minimum, digital trend log, maintenance data log. Summary log, performance logs and some special logs.

The system shall be capable of generating and printing trend log for a minimum of 80 groups of 15 points each.

Maintenance Data Log (MDL) shall provide schedule of preventive maintenance and routine equipment inspection for 100 numbers of equipment per unit and for auxiliary plant. The data in MDL shall include current status, total running time, running time since last maintenance, running time in current financial year, loss due to downtime etc.

Performance log shall provide results of performance calculations.

d) Various Summaries

Various summaries shall include off scan summary, constants summary, point quality summary, substituted values summary, peripheral status summary, alarm annunciation group summary, etc. These summaries shall also be available process area or sub-area wise, as well as based on any other data base criterion like functional group number, cabinet number, type of signal etc.

e) Generated Reports

It shall be possible to generate certain reports in some of the PC's on the station LAN, which shall constitute partly off-line data entered there-in and on-line information collected from the system. There shall be provision of generation of minimum ten (10) such reports per PC on the LAN.

f) Log Generation Utility

The system shall have a log generation utility to generate a log / report having following facilities as a minimum:

- Define format of the log like header information, time, date etc.
- Selection of any point (scanned and calculated) from the data base and assign it to a log group.
- Selection of log data collection process initiating event, collection intervals (1, 2, 3, 5, 10, 30 & 60 minutes) for each point of a particular log group. Facility shall also be provided for selection of 100 points at a collection interval of 1, 2, 3, 5, 10 and 30 seconds.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[95]	02.09.2015

- Assignment of log printout initiation on event or time including selection of the printing interval for particular log group and time of printing. (For time initiated logs).
- Assignment of number of samples to be collected for each point.
- Select points for which minimum, maximum accumulation over a selected period, average, etc., values can be printed. Also facility shall be provided to tag the time at which the parameter passed through maximum / minimum.

It shall be possible to define 100 log groups of 15 points each. Any log group can have any point from the database. One log shall include at the maximum 10 such groups.

3. Alarm Monitoring & Reporting

- The system shall display history of alarms in chronological order on any of the OWS. The MMI system shall have the capability to store a minimum of 1000 alarms each with paging features allowing the operator to view any page. The system shall have all alarm functions and related function keys like alarm acknowledge, reset, paging, summaries etc. Other design features like set point / dead band adjustments, provision of alarm priority, manual inhibition and automatic inhibition based on predefined logic etc., shall be provided. The alarm display / report format shall be subject to approval.
- Facility of audio annunciation including voice audio shall be provided in OWS upon the occurrence of alarms irrespective of whether alarms are displayed or not. Facility to disable the audio annunciation per OWS shall be provided under the security level of Maintenance or Administrator.
- At least four levels of alarm priority shall be available which shall be displayed in different colour. It shall be possible to display and print alarms of any of the four levels only on a per OWS basis.
- Alarm boxes shall be provided in each display to alert the operator about an alarm when he is viewing some other picture. Number of alarm boxes shall be for each process area and with priority therein.
- Features viz. root cause analysis, alarm filtering, alarm cut out and display of alarms on LCD shall be provided.

4. Calculations

- All the algebraic / logical calculations related to analog points e.g. sum / difference / average / maximum / minimum / integration, selection of one analog point out of two based on status of digital point, duration for which an analog point is above / below a threshold, digital point (e.g. AND / OR / COMPARE etc.), transformations , like running average, periodic average, weighted average, hourly / daily maximum / minimum (or for a specified duration) and time of maximum / minimum, flow calculations, time projection or rate of change calculations, duration in alarm (or duration in a band), number of transgression of a point in a band etc. shall be provided. All the calculated values of the plant shall be available in the database and can be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[96]	02.09.2015

assigned to all functions just like any scanned point. It should be possible to add new algorithm for basic calculations to the standard library.

- b) Using one hour average data of process parameters, the system shall have the capability to calculate present value, expected value and deviations for parameters like plant heat rate (net and gross), boiler efficiency, major drives efficiency calculation, auxiliary power consumption. The performance calculation package shall be based on latest codes & standards as applicable like ASME, BS & HEI.
- c) Provision shall be made, including all required custom programmed software, for performing the calculations described in this clause. All calculations shall use a high level language. Calculations shall be made using floating point arithmetic. These equations shall be changeable on line at the job site.
- d) An extensive set of steam property subroutines based on the latest ASME steam tables shall be included. The calculation results shall automatically be quality coded according to the worst quality of any of the inputs to each calculation. The results of these calculations shall be available through the data base, for appropriate logs and operator displays.
- e) Calculation for monitoring the performance of the unit shall be performed. These calculations are categorized into two classes.
 - i. Class I calculations include those calculations that are made every scan cycle, generally for the purpose of detecting and alarming unit malfunctions. The following class I calculations shall be included:
 - Cold reheat steam approach to saturation temperature
 - Drum Water Saturation Temperature rate of change
 - First stage superheat outlet temperature approach to saturation temperature
 - Turbine steam metal temperature differences
 - Turbine metal temperature rates of change
 - Feed water individual heater terminal temperature difference.
 - Excess air deviation from standard.
 - Feed water leaving each heater temperatures deviation from standard
 - Turbine steam supply accounting.
 - Metal Temperature differences for SH'Y' , RH 'Y' region and any specific location.
 - ii. Class II calculations include those calculations that are made to determine the performance of individual items of equipment and the overall unit. Class II calculations shall be performed on-line using averaged data which is accumulated over a period of time. This time period shall be selectively adjustable from 10 to 30 minutes. The system shall also collect this averaged data. The operator shall be able to input coal analysis data into the computer for the class II calculations.

Class II turbine performance calculations shall comply with the recommendations of ASME Performance Test Code Report PTC 6S-

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[97]	02.09.2015

latest, Simplified procedure for Routine Performance Test of Steam Turbines. The vendor shall be responsible for altering his standard performance programme to comply with this specification and to conform to the cycle of these units.

Boiler efficiency shall be computed by the heat loss method and the input-output method. Percentage deviation between the two methods shall be calculated as recommended in the ASME Test Code PTC 4.1-latest as applicable, Steam Generating Units. If the test codes require measured data that is not actually available in the process, manually substituted values shall be used.

The following Class II calculations shall be performed.

- Unit heat rate
- Boiler Efficiency
- Operating Hours
- Air Heater Performance
- Economizer Performance
- Deaerator Performance
- HP & LP turbine enthalpy drop efficiency
- LP turbine enthalpy drop efficiency (using dry exhaust)
- Turbine heat rate
- Feed water heater performance
- Condenser performance
- Plant Load/Availability Factors
- Unit Availability Calculations
- Deviations from Expected Values for Each Calculations

5. Quality Tags

- a) The system shall identify and tag the quality of all data (scanned and calculated points) in a way that makes all users (control, calculations, logs, display, etc.) aware of its quality. Quality of data other than 'good' shall be clearly identified in all printouts and displays by appending quality character to the value / status of point. The quality tagging shall include good, bad, substitute, doubtful, missing, etc.
- b) Typically 'Good' shall designate variable that satisfies all tests for quality, 'Substitute' designating a value that has been manually substituted, 'missing' and 'bad' designating an open circuit, transducer limit violation on both upper & lower side, etc. for analog inputs & open fuses, excessive number of chattering etc for digital inputs

6. Database

- c) The database shall be organized in such a way that searching / querying & sorting of any field shall be possible. There shall be minimum 10 process areas and each database point shall have various attributes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[98]	02.09.2015

- d) Based on these attributes & its combinations, the sorting / searching of the data shall be done.
- e) The attributes shall include as a minimum single point ID, additional tag number, description, current value, quality tag, engineering unit (if applicable), alarm limits, dead band, alarm cut out point identifier, variable limit point identifier, conversion constants, electrical signal value & unit, alarm status, scan status, historical / long term storage frequency, plant area / sub area hardware details, reference of logic / loop diagram number & page etc.
- f) All the points i.e. I/O's, OLCS/CLCS, generated signals, computed signals of calculations, OPC tags, shall be identified by unique tag throughout the networked DCS system/ sub-systems including station LAN.

7. Messaging System

It shall be possible to send pre-defined messages either periodically or on occurrence of certain events in the form of

- a) Operator guidance message to OWS / LCD.
- b) E-mail messages to various clients on the station LAN.
- c) Messages to pre selected Mobile numbers

Adequate safety in the system shall be built up to avoid any unauthorized access to DCS system. All necessary Hardware & Software shall be provided to achieve the same.

6.3.4.3 MMI System Hardware Requirements

1. The MMI system shall be based on latest state of the art Workstations and Servers and technology suitable for industrial application & power plant environment.
2. The Workstation / Servers employed for HMIPIS implementation shall be based on industry standard hardware and software, which shall ensure easy connectivity with other systems and third party software.
3. Power Fail auto Restart facility with automatic time update shall be provided.
4. Necessary hardware and software for quick backup and restore shall be provided.
5. Minimum amount of conventional mosaic compatible hardware devices mounted on draw out portion of Control Desks.
6. All the peripherals shall conform to the following minimum requirement but the exact make & model shall be subject to approval.

LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[99]	02.09.2015

A) Operator Workstation**Table 6.9****Specifications for Operator Workstations**

S.No.	Features	Minimum Requirements
1	Processor	Intel i5 or better /64 bit latest generation
2	Memory	4 GB RAM expandable to 6 GB
3	Hard Disk	1 TB
4	Monitor Support	Dual
5	CD Drive	52X Read/Write
6	Power Supply	230 V 50 HZ
7	Keyboard	ASCII
8	Pointing Device	Optical Mouse
9	Monitor	Min 21" TFT Flat Monitor with resolution of 1600 x 1200 non-interlaced refresh rate min. 85 Hz

B) Servers**Table 6.10****Specifications for Servers**

S.No.	Features	Minimum Requirements
1	Processor	64 bit latest generation
2	Memory	4 GB RAM expandable to 6 GB
3	Hard Disk	3 X1 TB ultra wide SCSI/7200 RPM, Hot swappable
4	RAID	SCSI-channels, hardware RAID level 5 implemented
5	Monitor Support	Dual
6	CD Drive	52X Read/Write
7	Power Supply	Redundant Hot swappable, 230 V 50Hz 1-phase
8	Removable Bulk storage Drive	1 TB minimum
9	No. of Removable bulk storage media for above	10 nos.
10	Keyboard	ASCII
11	Pointing Device	Optical Mouse
12	Monitor	Min 21" TFT Flat Monitor with resolution of 1600 x 1200 non-interlaced refresh rate min. 85 Hz

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[100]	02.09.2015

C) LCD Screen

LCD display complete with control units & associated accessories shall be supplied as per the following specifications.

Table 6.11
Specifications for LCD

S.No.	Features	Minimum Requirements
1	Viewable Picture Area	65 inch measured diagonally
2	Resolution	1920 X 1080
3	Aspect Ratio	16:9
4	Display Colors	16.9 million colors
5	LCD Panel	Active matrix TFT LCD
6	Contrast Ratio	800:1
7	Brightness	500 cd/m2, Anti-glare
8	Viewing Angle	178° Horizontal & Vertical both
9	Computer Interface	VGA, DVI-D, HDMI,
10	Cabinet Material	ABS
11	Finish	Black
12	Mounting	Fixed Wall Mounting
13	Power supply	230 V, 50 Hz, 1-phase
14	Accessories	Universal Tilt wall mount stand, IR Remote, Power cord

Other Features of LCD

- LCD shall be designed for continuous viewing (24 hours in a day) under normal room ambient lighting without any need to darken the room. Suitable darkening of the projection screen for light absorption shall be provided for this purpose.
- The screen should be flicker free and there shall not be any screen burn-in due to display of same information for a long time.
- Auto brightness adjustment between each screen shall be provided.
- The control unit shall interface with the unit LAN. The control units shall have dual Ethernet connection with the respective Unit LANs and shall be located in the LCD panel.
- Suitable facility shall be provided to the Operator for transferring the screens, without any need of changing of hardware / wiring or software.
- Master control unit shall be capable of projecting MMI displays over a part of screen to multiple screens. Any communication of windows shall be possible. Facility for overlays shall be provided.
- The LCD Screens shall have additional features to work in association with multiple numbers of plant cameras also to be supplied under this package.

D) Printers

Table 6.12

Specifications for Dot Matrix Printer

S.No.	Features	Minimum Requirements
1	Type	Heavy duty (at least 50000 pages/month)
2	No. of Needles	24 pin
3	Printing Speed	300 characters per second/ 1000 Lines per minute
4	Character dimension	9 x 8
5	Buffer	80 KB (minimum)
6	Local Memory	RAM with battery backup
7	Communication Port	Ethernet/RS-232/parallel
8	Power supply	230 V, 50 Hz, 1-phase
9	Paper size	132 column continuous fan fold type/A4/A3
10	Paper input capacity	continuous
11	Character sets	ASCII, IBM, Italics,
12	Transfer distance	200 mtrs. Minimum
13	Print features	Graphic print, Emphasized, double width, underlined, subscript, superscript, double strike, backspace, margin etc.
14	Reliability	MTBF > 8000 hrs.
15	Noise Level	Less than 60 dBA
16	Ribbon Life	2 million characters
17	Diagnostics	Self diagnostic, LED error code display, Audio alarm – paper exhausted
18	No. of Copies	Minimum Original + 3
19	Accessories	Printer stand Table top receiving station Interface cable Paper tear box Ribbon

Table 6.13

Specifications for Laser jet Printer

S.N	Features	Minimum Requirements
1	Type	Electro-Laser photographic, Table top type
2	Printing speed	Monochrome : 24 ppm – A4 Color : 6 ppm – A4
3	Printer Memory	256 MB (minimum)
4	Resolution	1200 X 1200 DPI in color
5	No. of Color (Basic)	4 nos.
6	Duty cycle	Monochrome 75000 pages/month
7	Power supply	230 V, 50Hz, 1-phase

S.N	Features	Minimum Requirements
8	Paper size	A3/A4
9	Print media	Plain paper, Transparency, Thick stock, Glossy stock, Envelopes
10	Communication Port	Ethernet port/ Parallel port
11	Paper input capacity	500 pages
12	Others	Auto duplex function

6.3.5

Maintenance Engineer Station (Engineering Work Station)

- The system shall be provided with programming facility (Engineering Workstation) for Control system and system documentation. Three (3) Nos. of EWS shall be provided on per unit basis placed in Engineering Room. The system shall be complete with monitor, keyboard & Optical mouse.
- The system shall be also provide minimum Two (2) Nos. of Laptop computers with latest hardware configuration and loaded with suitable operating & application program as a backup portable programming and configuration station.
- Each station shall be equipped with DVD writer for archiving of the configuration.
- EWS shall have all the features of OWS and in addition shall have the following capabilities as a minimum:
 - To generate control software through logic diagrams without any programming knowledge
 - To generate graphic display and control displays, facility to change/enter all the attributes of analog and digital I/O points, calculated and Boolean variables and constants like scan rate, process range
 - To test, configure/reconfigure process interface modules/cards
 - CLCS tuning
 - To accumulate I&C faults to analyse downtimes and time to repair
 - To run offline system diagnostic programmes
 - On- line fault detection through diagnostics
 - Other maintenance Engineer's functions.
 - Online modification/addition of loops without hampering of smooth operation of plant. In case of errors in programming at engineering station, same shall be notified along with suggested corrections by the system itself, before loading.
- The programming tools shall have in-built safety features that shall protect the system against inadvertent and unauthorized use of these tools. Necessary hard key locks and software locks, etc. shall be provided for this. During on line programming, external plant / equipment should not be affected.
- The system shall also have facility to permit the programmer to add text information at the beginning and end of each program, wherein programmer shall list out his name, time, date of change which has been made, name of the person who has authorized the change, etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[103]	02.09.2015

7. Any modification done in Control System shall be suitably logged so that it can be traced to the user log-in ID and time of change. Facility for modifications shall be user friendly
8. Structuring / configuring and tuning facilities shall be provided for structuring / modification, storing / loading, testing, tuning, monitoring, etc. of all the microprocessor based controllers of the control system. The configuration and tuning unit shall be hooked up with the system bus. In case different hardware is employed for different parts of control systems and it is not possible to provide structuring/ configuration and tuning of these from the same station, then the system shall be provided with necessary number of stations for the purpose.
9. It shall be possible to configure the system with ease without any special knowledge of programming or high level languages. Control strategy shall be implemented using familiar and conventional automation function blocks (software implemented). Whenever any change in configuration is done, it shall be recorded and modified configurations shall be available for printing and documentation and shall be stored in non-volatile memory. The entire system configuration, tuning / fixed parameters shall be documented and printed in form of function diagrams and lists respectively.
10. On-line tuning of the control loops shall be possible without causing any disturbance in the execution of the control loops. Provision to store and retrieve on immediate and long term basis the system configuration, data base etc. on some device such as DVD shall be included. Facility shall be provided to reload / down-load the system or controller module from the already stored data, on-line.
11. The Engineering station shall be equipped with system/software to calculate the tuning constants i.e. P, I & D values of control loops automatically. Facility shall be provided to conduct open loop tests (i.e. controller in manual mode) and close loop tests (i.e. controller in auto mode) on control loops through GUI based user interface. It shall be possible for the user to adjust the step size of disturbance, sample time and duration of test. Facility shall be provided to choose the type of process to be tuned i.e. PI, PID etc., controller type i.e. regulating or tracking and the type of process being controlled i.e. Integrating, non-integrating etc. Further it shall also be possible to calculate the tuning constants by capturing the process changes during normal process disturbance (without conducting any test). The calculation of tuning constants shall follow internationally accepted tuning procedures.
12. Online system shall be provided for programmed development / modification to achieve various functions including development, modification and testing of software of MMI, generation and modification of graphics, logs, and HSRs functions in an interactive manner, MMI Database modification / creations, down loading the software with associated data base from the console and other features necessary for system maintenance. Also facility shall be provided to print system fault as detected by the online self-diagnostic routine.
13. The system shall have the facility to generate the associated documentation for both the Control System & MMI. The document, to be generated by the system

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[104]	02.09.2015

shall include P&ID drawings, control loop drawings, sequence drawings, signal distribution list / drawings, system interconnection drawings, cabinets general arrangement drawings, measurement list, drive schedule, alarm schedule, system hardware and functional configuration drawings for displays, logs, trends, graphics etc. The system shall also include all required software and hardware tools for creating, modifying and printing CAD drawings to achieve paperless documentation for DCS.

Table 6.14
Specifications for Engineering Workstations

S.No.	Features	Minimum Requirements
1	Processor	64 bit latest generation
2	Memory	4 GB RAM expandable to 6 GB
3	Hard Disk	1 TB
4	CD Drive	52X DVD Read/Write
5	Power Supply	230 V 50 HZ 1-phase
6	Keyboard	ASCII
7	Pointing Device	Optical Mouse
8	Monitor	Min 21" TFT Flat Monitor with resolution of 1600 x 1200 non-interlaced refresh rate min. 85 Hz

Table 6.15
Specifications for Engineering Laptop

S.No.	Features	Minimum Requirements
1	Processor	Intel i5 or better latest generation
2	Memory	4 GB DDR3 SDRAM expandable to 6 GB
3	Hard Disk	SATA2/ 1 TB/7200 RPM
4	CD Drive	52X combo CD/DVD Read/Write
5	Power Supply	230 V, 50 HZ, 1-Phase
6	Communication Ports	2 Nos. USB 1 No. Ethernet 2 Nos. Serial Port 1 Nos. Parallel port
7	Screen	15.4" TFT LCD screen
8	Battery	6-cell, LI-Ion Battery

6.3.6 Software Requirements

1. The system shall be provided with all licensed software packages with media required by the system for meeting the intent, functional / parametric requirements and performance requirements of the specification.
2. The system shall utilize a readily upgradeable, public domain software platform proven for real-time operation environment at the control and monitoring level

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[105]	02.09.2015

overlaid with a relational database program. The desirable features are indicated below:

- a) The software system shall be fully modular.
- b) The software shall meet the following general requirements:
 - Simple, easy-to-learn editing language for editing and on-line operation.
 - Wide range of standard and non-standard peripheral support capability by modular controllers / supervisors.
 - Effective task scheduling and support of multiple priority structure including event based interrupt etc.
 - Effective debugging.
 - Provision for on-line editing and program development without interrupting on-line functions.
 - Self-diagnostic routines.
 - Efficient memory management and effective utilization of system time.
 - Quick start-up and loading.
 - Support of multiprogramming and multi-user operation.
3. Industry standard operating system like UNIX/WINDOWS NT etc. to ensure openness and connectivity with other system in industry standard protocols (TCP / IP etc.) shall be provided. The system shall have user oriented programming language & graphic user interface.
4. All system related software including Real Time Operating System, File management software, screen editor, database management software, On line diagnostics / debug software, peripheral drivers software shall be provided. Latest versions of standard PC-based software for database handling, word-processing, spread sheet, Anti-virus etc. and latest WINDOWS based packages etc. and any other standard language offered shall be furnished as a minimum. Systems having program development environments like EWS, Station LAN Server shall have high level programming support like Microsoft Visual Studio, Oracle, RDBMS etc.
5. The programming language shall support Relational Data Base Management in a global and truly distributed Client-Server environment and shall have the following minimum features:
 - a) Modern high-level block structures type
 - b) Powerful, compact syntax
 - c) Logical organization that facilitates documentation, modification and maintenance of programs
 - d) Early detection of errors at compiles and run time
 - e) Fast debugging
 - f) Improved program reliability

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[106]	02.09.2015

- g) Clearly defined data structure complemented by flexible user-declared data types
 - h) Fast execution.
6. All application software for control system functioning like input scanning, acquisition, conditioning, processing & control along with communication among various Control System functional blocks shall be provided.
 7. The system shall be provided with software locks and passwords to engineers at site for all operating & application software in order to prevent unauthorized access and only authorized engineers are able to do modifications at site.
 8. Two sets of all final / latest software on non-rewritable/non-editable media shall be provided as back-up.
 9. **Software License**
 - a) The system shall be provided with software license for all software being used in the DCS system. The software licenses shall be provided for the project (e.g. organization or site license) and shall not be hardware / machine-specific. That is, if any hardware / machine is upgraded or changed, the same license shall hold good / renew license due to up-gradation / change of hardware / machine in control system at site. All licenses shall be valid for the continuous service life of the plant.
 - b) In case the s/w license is dependent on no. of points, then quantity to be considered is 30% above the finally implemented points.

10. Software Upgrades

The system software's installed in the plant DCS, shall be periodically upgrades with the new releases, that would be taking place after the system is commissioned.

6.4 DCS Sub-Systems

The DCS shall consist of the following broad sub-systems, functionally independent of each other except for mutual signal exchange.

- Sequence of Event Recording System (SOE)
- Integrated Annunciation system
- Historical storage & Retrieval system (HSRS)
- Plant Performance Analysis, Diagnostic & Optimization system (PADO)
- Management Information System (MIS)

6.4.1 Sequence Of Event Recording System

1. The DCS system shall also perform the SOE functions like stamping of SOE inputs / points with 1 ms resolution. The SOE function shall be built-in function of DCS.
2. SOE shall be capable of accepting minimum 512 inputs per unit including 10% spare channels (included in total 512 inputs).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[107]	02.09.2015

3. The system shall monitor SOE inputs with a resolution of one millisecond at all times for all inputs including spare inputs. That is, all SOE points entering status change shall be reported and time tagged within 1 (one) millisecond of their occurrence. Input card shall be equipped with digital filters with filter delay such that it should meet SOE time resolution of 1msec (identical for all points) to eliminate contact bounce such that field contact which is changing state must remain in the new state for stipulated time to be reported as one event. The start of data collection for SOE report shall be reported to OWS within 1 sec of SOE data collection initiation.
4. SER is envisaged as an integral part of DCS with 1 millisecond time resolution. The SER data base shall be an integral part of the DCS database and same shall be made available at all the OWS / EWS resident on the network. Operator can access the SER on activation of SER alarm page. All SER inputs shall have real time "time-stamping" following any tripping of major equipment, or sub-system or the plant as a whole.
5. The system shall also have provision of rejection of chattering inputs.
6. In addition to above, facility for adding a field adjustable software delay on a per point basis shall be provided.
7. The system shall also include provision for historical storage and retrieval of SOE reports for 3 months period.
8. The SOE report collection shall begin on occurrence of change of status of any SOE point and shall be printed after an operator selectable time interval of 1 to 3 min. or 100 status changes have taken place after the first event. Adequate numbers of buffers shall be provided to prevent loss of data before transferring to HSR.
9. The SOE reports shall also include a list of major equipment trip in chronological order and include the points that initiated SOE collection. The inputs for SOE shall include
 - a) Hardwired inputs in input cards and
 - b) Calculated points / generated points of Control System.
10. Further, all the operator initiated actions such as trip inactivation (bypass) & trip activation (inline) shall form input to SER.
11. All the SOE inputs shall also be available for interlock / protection functions.
12. SOE of other systems (SG/TG integral control systems) shall also be integrated in this system. The SOE system shall collect process & report SOE inputs of SG & TG control system for a consolidated master SOE system. Necessary communication with required hardware & software and necessary engineering co-ordination with SG & TG Supplier shall be done for successful implementation of a consolidated master SOE list.
13. SOE time stamping shall occur at I/O level.

14. Self Diagnostic Features like scanner test (a periodic test for communication between several levels), functional test by simulating abnormal Conditions shall be provided.
15. One (1) no dedicated SOE viewing station with SOE Log printer shall be provided for each unit.

Table 6.16
Specifications for SOE Station

S.No.	Features	Minimum Requirements
1	Processor	64 bit latest generation
2	Configuration	Tower
3	Internal Clock	3.2 GHz or better
4	Memory	4 GB RAM expandable to 6 GB
5	Hard disk	2 TB/7200 RPM
6	CD Drive	52X Combo CD/DVD read/write
7	Graphic Accelerator	16 MB
8	Communication Port	2 serial port, 1 parallel port, 4 USB port, dual 100 MBPS Ethernet port
9	Monitor support	dual
10	Keyboard	QWERTY 101 keys Keyboard
11	Pointing Device	Optical mouse
12	Monitor	Min 21" TFT Flat Monitor with resolution of 1600 x 1200 non-interlaced refresh rate min. 85 Hz.

Specifications for SOE Log Printer

S.No.	Features	Minimum Requirements
1	Type	Heavy duty Dot Matrix Printer
2	No. of Needles	24 pin
3	Printing Speed	300 characters per second/ 1000 Lines per minute
4	Character dimension	9 x 8
5	Buffer	80 KB (minimum)
6	Local Memory	RAM with battery backup
7	Communication Port	Ethernet/RS-232/parallel
8	Power supply	230 V, 50 Hz, 1-phase
9	Paper size	132 column continuous fan fold type
10	Paper input capacity	continuous
11	Character sets	ASCII, IBM, Italics,
12	Transfer distance	200 mtrs. Minimum
13	Print features	Graphic print, Emphasized, double width, underlined, subscript, superscript, double strike, backspace, margin etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[109]	02.09.2015

S.No.	Features	Minimum Requirements
14	Reliability	MTBF > 8000 hrs.
15	Noise Level	Less than 60 dBA
16	Ribbon Life	2 million characters
17	Diagnostics	Self diagnostic, LED error code display, Audio alarm – paper exhausted
18	No. of Copies	Minimum Original + 3
19	Accessories	Printer stand Table top receiving station Interface cable Paper tear box Ribbon

6.4.2 Annunciation System

- The LCD annunciation shall emulate salient features of conventional hardware annunciations while presenting more flexibility.
- The annunciation system shall be implemented as an in built function of DCS. The field contacts shall be acquired through DCS only. The annunciation points shall be presented on topmost area of LCD screens. The annunciation area shall be divided into multiple “alarm bands”. There shall be 3 nos. of alarm bands in each LCD screens.
- The annunciation functionality shall be implemented through the LCD as described below as a minimum:
 - There shall be one alarm for each alarm window. Group alarms shall be provided only for pre-defined system/field faults. The alarm text is to be displayed only when alarm is present. A top up window shall be associated with each alarm window which shall show tag no. of alarm point when cursor is brought over the alarm window.
 - Hooters/speakers (not PC Speakers) of different frequencies shall be available for reporting new alarms & resetting of alarms etc. All flashing windows shall flash together (synchronized) in any LCD screen. Suitable means shall be provided to distinguish between new alarms & return to normal message.
 - Annunciation points shall be distributed on various LCD screens based on process area.
 - No fixed space shall be fixed for any alarm band. Once a particular alarm band is full the new alarm on this band shall be reported by shifting old alarm on left side band one by one on FIFO basis. A scroll bar shall be provided to view older alarms.
 - The hooter alarms sound shall be different for different units.
 - Facility shall be provided by which the operator can view details of the alarms, acknowledge the alarm, acknowledge the hooter etc. by clicking on the pop up window options.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[110]	02.09.2015

4. The above annunciation features shall also be replicated on all OWS.

6.4.3 Historical Storage & Retrieval System(HSRS)

1. Historical storage and retrieval facility shall allow collect and store data and parameters including trends, alarms and events from DCS data base periodically and automatically to removable data storage devices once every 24 hour for long term storage and retrieval.
2. HSRS of other systems (SG integral control systems) shall also be integrated in this system. The HSR system shall collect, process & report HSR inputs of SG control system for a Consolidated master HSR system. Necessary communication with required hardware & software and necessary engineering co-ordination with SG Supplier shall be done for successful implementation of a consolidated master HSRS.
3. Provision shall be made to notify the operator when the disk is certain percentage full.
4. The data to be stored in the system shall include alarm & event list, periodic plant data, selected logs/trends/reports etc. Exact data/information to be stored and frequency of data storage & retrieval shall be as possible.
5. Historical storage should permit trending of all analog inputs with time scale selectable as 1 sec., 10 sec., 30 sec., 1 min., 5 min., 30 min., 1 hour, 8 hours & 24 hours. Vertical Range (parameter range) shall be freely programmable. It shall be possible to map real time & history trend on the same trend group display. History data shall be for minimum 30 days & after expiry shall automatically/manually transferred to the external storage device such as DVD writer or external hard disk.
6. The system shall provide user-friendly operator functions to retrieve the data from historical storage. It shall be possible to retrieve the selected data on OWS / LCD or printer in form of trend / report by specifying date, time & period through point IDs / group of points. Further, suitable index files / directories shall also be provided to facilitate the same.
7. The System shall store following data as a minimum:

a) Periodic Plant Data

- 1000 analog points with 1 sec rate
- 1000 analog points with 5 sec rate
- Balance analog points with 30 sec rate
- Binary points on status change (with suitable protection against excessive status change)

b) Logs & Reports

- All hourly, shift, daily, monthly, yearly logs
- All alarm logs
- All control related logs
- All event based logs

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[111]	02.09.2015

- Pre-Trip & Post-trip logs
- Start up logs
- SOE Reports
- Maintenance data log

Apart from this other logs comprised of computed data such as running hour logs of drives, fuel consumption log, water consumption log, Auxiliary power consumption log, metal temperature logs or calculated values like efficiency etc.

8. Dedicated Redundant workstation with dot matrix & Laser jet printer shall be provided (per unit) for historical storage & retrieval system.
9. Provision for export of data to Excel spreadsheet package shall be available.

Table 6.18**Specifications for HSRS Station**

S.No.	Features	Minimum Requirements
1	Processor	Intel i5 or better 64 bit latest generation
2	Configuration	Tower
3	Internal Clock	3.2 GHz or better
4	Memory	4 GB RAM expandable to 6 GB
5	Hard disk	2 TB/7200 RPM
6	CD Drive	52X DVD read/write
7	Graphic Accelerator	16 MB
8	Communication Port	2 serial port, 1 parallel port, 4 USB port, dual 100 MBPS Ethernet port
9	Monitor support	Dual
10	Keyboard	QWERTY 101 keys Keyboard
11	Pointing Device	Optical mouse
12	Monitor	Min 21" TFT Flat Monitor with resolution of 1600 x 1200 non-interlaced refresh rate min. 85 Hz.

LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[112]	02.09.2015

6.4.4 Plant Performance Analysis, Diagnostic & Optimization System

6.4.4.1 General

1. PADO system shall provide critical analysis of the plant performance and guidance for optimisation on continuous on-line basis. The system shall analyse dynamically the status of the process and the equipment of the power generating units and shall automatically generate the operator guidance instructions for remedial actions for maintaining the process and the system / equipment in the plant to their optimum performance.
2. PADO shall incorporate the complete thermal design model of the plant and shall use the measured data from the plant DCS acquired through a suitable interface.
3. The system to be provided shall include all necessary hardware, software, firmware and interfaces required for implementing a fully functional PADO system. PADO shall include but not limited to the details specified in subsequent paragraphs.
4. PADO system shall be independent for each unit.

6.4.4.2 Functional Requirements

PADO system shall provide following functional requirements:

- Performance analysis and monitoring of systems and components
- System and performance diagnosis
- System and performance Optimisation
- Emission analysis and monitoring
- Boiler performance optimisation
- Boiler Stress Condition Analysis
- Regenerative cycle performance Optimisation
- Interactive water and steam chemistry management system

1. Performance Analysis & Monitoring of Systems & Components

Performance analysis and monitoring of systems and components shall involve and facilitate the following:

- a) Computation of thermal performance status of the plant and efficiency of generation.
- b) Computation of all the key system performance indicators at system level such as heat rate, plant and equipment efficiency, generator output and controllable losses.
- c) Computation of all the key system performance indicators at major component. This shall include the following:
 - Assessment of boiler operation based on efficiency, excess air and cleanliness factors of super heater, re heater and economiser.
 - Turbine performance evaluation considering efficiency, enthalpies, steam flow and gland leakage flow estimation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[113]	02.09.2015

- Air Pre-heater performance involving efficiency and pressure losses.
 - Condenser performance based on heat duty and heat transfer co-efficient and cleanliness factors.
 - Performance of re-generative heaters by computing extraction flows, drain flows, terminal temperature difference and drain cooling approach.
- d) Analyse the impact of individual component performance on overall losses or gains in total unit generation along with computation and display of cost of individual loss/gain.
- e) Performing detailed analysis of each component including computation of key performance indicators such as efficiency, heat transfer co-efficient, TTD, DCA and fouling factor.
- f) Visualisation of individual component efficiencies & performances and display of the same.
- g) Visualisation of impact of incremental change of the major process parameters including but not limited to the following on boiler efficiency, turbine heat rate and unit heat rate etc. through 'What If' query facility for operator:
- Main Steam pressure
 - Super heater Spray flow
 - Re heater Spray flow
 - Economiser Inlet Temperature
 - Excess Air
 - Coal Analysis
 - Surface effective for super heater, re heater and economiser
- h) Performance computations to be carried out at specified intervals based on time averaged data during steady state operating conditions.
- i) Computations to be based on process signals, equipment status, design criteria and manual input data (where ever needed). Raw measured value for process signals shall be reconciled before usage.

2. Systems & Performance Diagnosis

- a) System and performance diagnosis shall involve detection of the abnormalities and diagnosis of system and component performance degradation up to component level to pin-pointing root cause of abnormalities existing in the process and guiding the operating personnel to attend to the same.
- b) Diagnosis function involves the following:
- Equipment health diagnosis for high/ low pressure, temperature, level & vibration etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[114]	02.09.2015

- Plant performance diagnosis for boiler, turbine, condenser, feed water and regenerative heating system
 - Identifying degradation of measuring instrument for important parameters using data validation checks.
- c) Diagnosis based on expert system in the form of “Fault Trees” / Neural and Bayesian belief networks etc. Expert systems shall draw inferences based on knowledge base, on-line measured data and computed performance indices.
- d) Diagnosis system shall be capable to provide following helps:
- Avoiding a possible trip
 - Maintaining process parameters within safe limits thereby enhancing the life of the equipment
 - Drawing the operator’s attention to the degradation of the equipment and instruments
- 3. Systems & Performance Optimization**
- System and performance optimisation involves optimisation of set points for controllable parameters by recommending to the operator the optimum set points for optimising the given process or activity at the measured operating condition using state of the art optimisation techniques.
- 4. Emission Analysis & Optimization**
- Emission analysis and monitoring functions involves the following:
- a) Monitoring, tracking and analysing plant emissions such as SO₂, NO_x, CO, CO₂ etc. in real time.
 - b) Monitor and analyse ESP & Stack conditions such as temperature, humidity, gas flow rate and opacity.
 - c) Facilitate obtaining lowest emissions by recommending optimal damper position to minimise the NO_x level measured at the stack while maintaining the CO value and unburnt carbon below desired permissible limits.
 - d) Facilitate obtaining lowest emissions while maintaining combustion efficiency.
 - e) Facilitate to set alarms to highlight conditions that violate pre-defined conditions
- 5. Boiler Performance Optimization System (BPOS)**
- BPOS shall enable operating personnel to improve boiler performance and optimise fuel consumption including optimised operation of Soot Blowing system. This system shall have following features:
- a) Incorporates the complete thermal design model of the boiler capable of both forward and backward computation of complete boiler thermal performance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[115]	02.09.2015

- b) Boiler thermal design model calibrated to made “Site- specific” based on series of field trials of thermal performance of the boiler during start up and prior to trial operation.
- c) BPOS to function continuously taking into consideration the performance of furnace, super heater, economiser, air heater and pulveriser based on the continuous on-line measurement of the including but not limited to the following parameters:
 - Flue gas temperature at ECO I/L
 - Flue gas oxygen content
 - Other fluid temperature(s) entering and exiting various heat transfer surfaces
 - Coal Characteristics
- d) BPOS shall be capable for continuous on-line calculation of the thermal performance of the boiler for the operating conditions indicating performance prediction zonal absorption, metal temperature and shall have the following features:
 - Fuel switching capability
 - “What If” query capability
 - Selective soot blowing of furnace/Super heater based on trends of zonal absorption.
- e) Expert system diagnostics for quick identification of the Root Cause of deviations from the predicted parameters.

6. Boiler Stress Condition Analysis (BSCA)

- a) BSCA monitors the thermal stresses and assess life exhaustion in thick walled components like super heater and re heater outlet headers by estimating the expended life due to low cycle fatigue and creep.
- b) BSCA shall guide the operator during start- up and shut down regarding controlling of rate of heating or cooling of metal within specified limits and also guides the margins available for the rate of steam generation (for fuel firing) during start-up.

7. Regenerative Cycle Performance Optimization System (RCPOS)

Regenerative cycle performance optimisation system shall involve the following:

- a) Analysis of deviation of performance of the turbine cycle by examining the deviation of important parameters of the turbine cycle.
- b) Analysis of actual efficiency of individual stages of turbine.
- c) Evaluation of LPH & HPH performance by comparing current values of TTD/ DCA to the reference values.
- d) Heater level evaluation

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[116]	02.09.2015

8. Interactive Steam & Water Chemistry Management System

- a) Interactive water and steam chemistry management system shall be capable of guiding the operator for appropriate chemical dosing to maintain the chemical balance, optimal blow down and carry out further investigation as advised by the system.
- b) The system shall have following features:
 - Monitoring of various steam and water parameters at certain pre-determined points in the flow cycle and warning the operator about any distinct aberration and guiding on precautionary as well as corrective actions to be taken.
 - The system shall use “Decision Trees” and “Fault Trees” or other suitable methods for each parameter to diagnose deviations in controlled parameters in order to find the root cause and advise corrective actions.
- c) The system shall provide following benefit to the user/operator:
 - Minimisation of makeup water consumption
 - Decrease in consumption of dosing chemicals
 - Prevention of carryover of impurities into the turbine
 - Decline in degradation of turbine components
 - Lessening of boiler tube scale formation

Reduction in energy consumption

6.4.4.3 Design Requirements

1. PADO system shall be based on Client- Server and expert system. The system shall operate on a commonly used hardware platform and network operating system.
2. System shall be suitable for simultaneous use by multiple users.
3. The system shall be suitable for a wide range of tagging systems and in particular KKS tagging system.
4. The system shall be password protected. It shall be possible to organise system users into groups and each group shall have a separate security profile. It shall be possible to provide additional personal security settings for individuals within a group.
5. The system shall be able to obtain requisite plant system / equipment and process data from the plant DCS. To meet the above requirement, PADO system shall be interfaced with Plant DCS through redundant bi-directional communication link.
6. The system shall have facility to store bulk data with facility for retrieval of the same. The system shall have facility to share all the data in the hard disk/back up media and provide user friendly utilities to retrieve and analyze stored data.
7. Each PADO system shall include all hardware and software as required for proper functioning of the system including:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[117]	02.09.2015

- a) One (1) No. Redundant Server (with monitor, keyboard, Mouse etc.) per unit
 - b) One (1) No. User Workstation (with monitor, keyboard, mouse, Colour Printer etc.) per unit.
 - c) PADO Software with required user License's
 - d) Bulk Data Storage & Retrieval facility
 - e) Redundant OPC communication Link with all necessary hardware & software.
8. All software licenses shall be valid for entire life of the plant. It shall be possible to upgrade the installed system with latest available version of the software model without any additional hardware/software requirements during entire life of the plant.

Table 6.21
Specifications for PADO Server

S.No.	Features	Minimum Requirements
1	Processor	Intel i5 or better /64 bit latest generation
2	Memory	4 GB RAM expandable to 6 GB
3	Hard Disk	2X1TB ultra wide SCSI/7200 RPM, Hot swappable
4	RAID	SCSI-channels, hardware RAID level 5 implemented
5	Monitor Support	Dual
6	CD Drive	52X Read/Write
7	Power Supply	Redundant Hot swappable, 230 V, 50Hz, 1-Phase
8	Removable Bulk storage Drive	1 TB minimum
9	Removable bulk storage media for above	10 nos.
10	Keyboard	ASCII
11	Pointing Device	Optical Mouse
12	Monitor	Min 21" TFT Flat Monitor with resolution of 1600 x 1200 non-interlaced refresh rate min. 85 Hz

6.4.5 Management Information System

1. An integrated Management Information System (MIS) shall be provided for the plant. System shall be able to provide information related to the following aspects to management personnel:
 - a) Plant Operation Information (Dynamic Mimics)
 - b) Plant Maintenance related Information
 - c) Environmental Information
2. MIS shall provide following plant information:
 - a) Environmental and hazard management
 - b) Equipment maintenance history
 - c) Fault cause analysis
 - d) On job information report
 - e) Plant Operation history
 - f) Plant performance details
 - g) Any other plant operation data/ details
3. MIS shall be based on client server & relational data base environment. The system shall operate on commonly used hardware platform & network operating system.
4. System shall be suitable for simultaneously used by multiple users. It should have at least 20 user licenses.
5. The system shall be password protected. It shall be possible to organize system users into groups and each group shall have a separate security profile. It shall be possible to provide additional personal security settings for individuals within a group.
6. MIS processing shall be carried out in an independent server interfaced with plant DCS, All BOP & offsite plant PLC control systems, Plant Performance Analysis, diagnostics & optimization system (PADO), Computerized Maintenance management system (CMMS) for polling of plant operational and performance data, and maintenance details. Plant environmental data shall be obtained from DCS. The MIS system server shall be connected with station LAN and all user PCs shall be connected with the station LAN.
7. The system shall have facility to store bulk data with facility for retrieval of the same. The system shall have facility to share all the data in the hard disk/back up media and provide user friendly utilities to retrieve and analyze stored data.
8. MIS shall include all hardware and software as required for proper functioning of the system including
 - a) One (1) No. Redundant Server (with monitor, keyboard, Mouse, colour printer etc.) per unit

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[119]	02.09.2015

- b) Twenty (20) Nos. (to be finalized by purchaser during detail engineering) User Workstation (with monitor, keyboard, mouse, etc.)
 - c) 42" LCD Monitor for display in different areas of plant such as Conference Room, station Entrance etc. These display boards shall include the following minimum parameters along with engineering units:
 - Unit MW
 - Unit frequency
 - Unit auxiliary power consumption
 - Station-Total MW (common)
 - Station-Total auxiliary power consumption (common).
 - d) MIS Software with minimum 50 nos. user License's
 - e) Bulk Data Storage & Retrieval facility
 - f) Redundant OPC communication Link with all necessary hardware & software.
 - g) Servers & user PC's operating licenses
9. All software licenses shall be valid for entire life of the plant. It shall be possible to upgrade the installed system with latest available version of the software model without any additional hardware/software requirements during entire life of the plant.

LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[120]	02.09.2015

Table 6.27
Specifications for MIS LCD Monitor

S.No.	Features	Minimum Requirements
1	Viewable Picture Area	42 inch measured diagonally
2	Resolution	1920 X 1080
3	Aspect Ratio	16:9
4	Display Colors	16.9 million colors
5	LCD Panel	Active matrix TFT LCD
6	Contrast Ratio	800:1
7	Brightness	500 cd/m2, Anti-glare
8	Viewing Angle	178° Horizontal & Vertical both
9	Computer Interface	VGA, DVI-D, HDMI,
10	Cabinet Material	ABS
11	Finish	Black
12	Mounting	Fixed Wall Mounting
13	Power supply	230 V, 50 Hz, 1-phase
14	Accessories	Universal Tilt wall mount stand, IR Remote, Power cord

6.5 DCS Power Supply Requirements

1. Redundant UPS power feeder shall be provided for all 230VAC equipments and/or redundant feeders for 24 V DC for DCS requirements. The necessary cabling & termination at both ends for receiving the power supply shall be furnished as per the contact requirement.
2. The DCS shall work on 24 V DC Power supply & Computers and peripherals shall work on single phase AC supply from UPS.
3. All power supply in the System cabinets shall be redundant and shall have auto change over facility or diode auctioneering. Power supply monitoring shall be provided in the DCS.
4. The power supply shall be provided with suitable arrangements with redundant distribution boards for each system with proper auto change over scheme to change the load from one feeder to other, in case of one feeder failure.
5. Redundant DC feeders (One each from DCDB) shall supply each of the connected loads. The exact rating & number of feeders of each DCDB shall be approved by the purchaser/consultant. However, 25% spare feeders (minimum 1 no.) of each rating shall be provided in each DCDB.
6. Redundant AC UPS feeders (One each from UPS ACDB) shall supply each of the connected loads. The exact rating & number of feeders of each UPS ACDB shall be subject to approval. However, 25% spare feeders (minimum 1 no.) of each rating shall be provided in each UPS ACDB.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[121]	02.09.2015

6.6 DCS System Cabinets/Panels

1. All Control system modules, power supply components, other control devices which are required for completeness of the system shall be housed in cabinets. All equipment and dedicated cabinets required for termination, marshalling and proper interface within system and also with other systems shall also be provided.
2. The cabinet mounted equipments shall be fully assembled, installed in mounting racks, wired and fully tested as per specification requirements and approved drawings in the manufacturing works of a qualified manufacturer prior to shipment to the project site. It shall be ensure that the cabinets are complete and ready for installation before dispatch from manufacturing works. The installation work at project site for these cabinets should only involve connections through multi pair cables from marshalling cabinets (wherever provided) to system cabinets and inter-cabinet.
3. The Control system cabinets shall be grouped into physically separate cabinets as follows:
 - a) Control System Cabinets
 - b) Marshalling Cabinets
 - c) Relay Cabinets

However, in case the system design requires the termination cabinet independent from system cabinet, the marshalling cabinets can be combined with the termination cabinet. In case, the termination arrangement is part of the system cabinet, independent marshalling cabinets shall be provided.

4. A special note shall be indicated that in case termination of field cables directly to control system cabinet is not acceptable.
5. The Control system cabinets shall house all types of modules / hardware to achieve all functions of Control System including signal conditioning modules, controller modules, I/O modules, communication controller modules and all other requisite hardware for a complete system.

6.7 DCS System Response Requirements

DCS System response requirement (Under worst loading conditions) shall be as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[122]	02.09.2015

Table 6.29**DCS System Response Requirements**

S.No.	Parameter/Function	Requirement
1	Scanning rate of Analog Signals	Maximum 1 sec for measurement
2	Scanning rate of digital signals	Maximum. 100 ms
3	Scanning rate of pulse signals	Maximum 100 ms
4	Loop execution time for CLCS	Maximum 250 ms (For all Loops)
5	Loop execution time for OLCS	Maximum 100 ms (For all Loops)
6	Controller output update for CLCS	Every 250 ms (For all CLCS Loops)
7	Controller output update for OLCS	Every 100 ms (For all OLCS Loops)
8	Updating rate of Analog display	Maximum 2 seconds (for measurement)
9	Updating rate of Analog display	Maximum 1 second for OLCS/CLCS
10	Updating rate of Digital value display	Maximum 4 seconds (for measurement)
11	Updating rate of Digital value display	Maximum 1 second for OLCS/CLCS
12	Time for display in CRT screen	Maximum 1-2 seconds on demand
13	Keyboard command execution time	Maximum 1 sec
14	Controller Loading	Maximum 60 %
15	Data Bus Loading	Maximum 50 %

Table 6.30**DCS System Display Response Requirements**

S.No.	Parameter/Function	Requirement
1	All control related displays	1-2 seconds
2	Point details display (single point)	1-2 seconds
3	Bar chart display (20 points, current display)	2-3 seconds
4	Plant mimic display of fair complexity with a minimum of 120 nos. of dynamic data items	2-3 seconds
5	Group review display (20 points, current values)	2-3 seconds
6	X-Y Plot display (2 X-Y Plot & single display requiring both history as well current data)	2-3 seconds
7	X-T Plot display (Trend of six analog points and a single display requiring both history as well as current data)	3-4 seconds
8	Plant summary display (e.g. bad points summary, limit check removed point summary. Assume the whole database search is required & summary display contains ten points)	3-4 seconds

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[123]	02.09.2015

6.7.1 Performance Requirement for Close Loop Control System

Table 6.31
Performance Requirement for CLCS

S.No.	Load/Rate of load change (% of MCR per min.)	Maximum Deviation of Parameters from Set Point					
		Throttle pressure deviation (Kg/cm ²)	Flue gas oxygen deviation (% O ₂)	Furnace pressure deviation (mmwcl)	S.H. steam temperature deviation (Deg.C)	R.H. steam temperature deviation (Deg.C)	*Drum Level deviation (mmwcl)
A	Steady state condition						
1	90% to 100%	± 2.0	± 0.4	± 8.0	± 5.0	± 5.0	± 15.0
2	60%	± 2.0	± 0.4	± 8.0	± 5.0	± 5.0	± 15.0
B	Ramp test (change for max. duration of five minutes)

Notes:

1. Sufficient time shall be allowed as setting period between conducting the tests. Plant operating condition, i.e. main equipment status, availability of auxiliaries, operational and equipment constraints, which can influence the test, shall also be recorded.
2. Control system shall be running in the coordinated master control (CMC) mode i.e. boiler master, fuel flow, air flow, feed water and turbine load control shall be in automatic mode. Load set point, maximum and minimum load set point, rate of raise / lower of load shall be set through the TFT, keyboard/conventional console.
3. The the control system shall be responsive and stable and shall maintain the deviation of controlled variables from set point within the limits specified so that the equipment being controlled shall operate as specified over the range required. The controls shall operate automatically, with no assistance from the operator. The controller shall successfully demonstrate the performance of

7. PROGRAMMABLE LOGIC CONTROL (PLC)**7.1 General Technical & Design Requirements**

Programmable Logic Controller (PLC) shall be microprocessor-based system. The PLC shall be versatile, expandable, user friendly and latest state of art technology. The system shall be envisaged for the purpose of sequential operation, protection and interlock, data acquisition system, alarm functions, closed loop control and data archiving for fully automatic operation. Logic controller shall be used with adequate and reliable protection safeguard for various equipments and to assist the operator for easy safe and efficient starting and stopping of various drives in the process. The system shall be designed by selecting high-grade components of proven quality and proper design of system electronics. The system shall be able to operate satisfactorily with reference to the specified environmental conditions as indicated in the specification.

1. The system shall be modular in construction and expandable in future by adding additional electronic modules, which shall be easily accessible for maintenance and repair. The modules shall preferably be Rack/Rail mounted. The types of modules shall be kept to minimum possible in order to have interchangeability and spares inventory.
2. The system shall have extensive self-diagnostic hardware and software features for easy and fast maintenance of the PLC. Safety barriers shall be used for intrinsically safe input / output circuits.
3. The PLC shall have very high noise immunity in order to ensure safe and reliable operation when subjected to electrical radio frequency interference and electromagnetic disturbances expected in a power plant.
4. The system shall be programmed as per the logic requirements required for the functioning of the systems and equipment.
5. Operation of the PLC shall be completely unaffected by a momentary power loss of the order of 20 milliseconds.
6. On-line replacement of any module shall be possible in such a way that the removal and addition of the module shall be possible without de-energizing the system or causing any interruption in the system while replacing a faulty module except for the inputs /outputs which are being handled by that module. However, in case of triple modular redundant or dual PLC configurations, there shall not be any process upset while replacement.
7. PLC shall be used with 20% hard wired installed spare I/O Channels.
8. The system shall be capable of handling the long-term storage of data for 15 days and retrieval.
9. The system shall be used with programming and diagnostic facility. Each PLC shall be used with one no. Laptop of latest configuration with programming software & communication cable.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[126]	02.09.2015

7.2 PLC System Configuration

PLC shall consist of following sub systems:

7.2.1 Input/output Sub system

1. I/O subsystem shall be suitable for accepting discrete inputs, BCD inputs and analog inputs. The I/O modules shall be mounted in the I/O racks.
2. Each I/O shall be electrically isolated from external control circuit by suitable means. The minimum isolation level between I/O and logic circuit shall be 500 V DC.
3. Each module shall have LED for each digital I/O channel to indicate the status of each input / output. Redundancy in I/O level shall be maintained as per the process requirement.
4. PLC inputs shall be used with potential free dry contacts. All the inputs shall be double ended i.e., two wires per input and not common return for all inputs. The contact interrogation voltage for input contacts shall be 24V DC minimum. Each input channel shall be protected by separate fuse.
5. Output contacts from the PLC shall be potential free dry contacts. Each output shall be short-circuit proof and protected by fuse.
6. Visual indication of fuse blown must be provided for each input and output channel.
7. There shall be at least 20% spare capacity available on input & output modules, over and above the system requirement.
8. All input/output cards shall have quick disconnect terminations allowing for card replacement without disconnection of external wiring and without switching of power supply.
9. PLC shall have the following monitoring features:
 - a) Power supply monitoring.
 - b) Contact Bounce filtering.
 - c) Optical isolation between input and output signals with the internal circuits.
 - d) In case of power supply failure or hardware fault, the critical outputs shall be automatically switched to the fail-safe mode.
 - e) Further, keying-in of individual wire connectors shall be used to ensure that only the correct card is plugged on the I/O module. It shall be possible to remove I/O module without disconnecting wiring from field inputs or outputs.

7.2.2 Processor Sub system

1. The processor sub system shall include CPU, memory, power supply, communication interface etc.
2. Dedicated PLC's shall be envisaged for each Auxiliary system. The processor shall have capability to implement all the control functions required. The processor shall have sufficient memory for storage of the program instructions as

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[127]	02.09.2015

applicable to the logic requirements. CPU shall be of 32/64 bit or upgraded version of microprocessor.

3. Memory shall be non-volatile, preferably EEPROM type. However, in case volatile memory is provided, battery backup shall be used for a minimum of three months to keep the stored program intact. A battery drain indication shall be used at least one week before the battery gets drained. Memory shall be used with adequate capacity with 40% spare capacity under worst loading condition.
4. The healthiness of processor hardware and software shall be continuously monitored by watchdog timer.
5. PLC's shall be used as a minimum with dual redundant processor subsystem including CPU, memory and power supply. Redundancy shall be used such that, in case of failure of the main processor, the standby processor shall take over automatically and vice - versa. The changeover shall be bumpless and shall not result any process or system upset.
6. In case of failure of complete processor system i.e., both processors, outputs shall take fail safe state automatically.
7. The scan time of programmable controller shall be of the order of 100 milliseconds or better. Scan time of PLC is defined as the cycle time taken by the system to read input, process input executing logic and update control output for all the logics configured within the system. Other activities like diagnostic routines, output / dump of data to peripherals, or any other activity which consume processor time shall also be accounted while computing scan time.

7.2.3 Communication Sub system

1. The communication subsystem shall provide reliable and high speed data transfer between the processor subsystem, I/O subsystem, PLC console and other devices connected to the system.
2. Redundancy in communication subsystem shall be used, such that on the failure of the active device, communication link or bus, the redundant device communication link or bus shall take-over automatically without interrupting the system operation. The communication bus shall be of coaxial / Fiber optic type.
3. Information about the failed device shall be displayed locally as well as on the PLC console. It shall be possible to manually switch-over the communication from main bus device to redundant bus device without interrupting the PLC functions.
4. The PLC shall have provisions of communication interface facility with Plant DCS system in order to make the entire system operational from CCR. Bi-directional, Redundant soft links shall be used in the PLC for the connectivity with the Plant DCS.
5. Following are also included in the system:
 - a) Cables required for interfacing with DCS.
 - b) Implementation of Tags and establishing the Link.
 - c) Any other software/hardware required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[128]	02.09.2015

7.2.4 System Power Supply

1. For PLC system, redundant 24 V DC power supply shall be used. The required power supply cable shall be used from the UPS DCDB & ACDB for SG integral control system
2. For separately mounted I/O racks, separate power supplies shall be used. Power supply module shall be of ample capacity to supply all modules. In addition 20% spare capacity for future shall be used. All the drives shall be switched ON/OFF through 24V DC coupling relays to be provided in HT/LT SWGR panels.
3. For the Operator Stations and Engineering Station the power supply shall be from the 230 VAC UPS system.

7.2.5 PLC Console

1. PLC Console or operating panel/display panel shall be used as operator Interface station for control and monitoring of the plant. This shall be done through dynamic mimic displays and control displays.
2. PLC console shall also be used for program storage, display, fault diagnostic and alarm monitoring. It shall be possible to modify, add or delete the application program on-line without affecting the outputs. It should be possible to modify or create new displays from PLC Console.
3. Isolation shall be used between programming terminal and related subsystems, if there is any possibility of high voltage from TFT being transmitted to other subsystems.
4. The PLC system shall have provision to shift the Operator Station/ Engineering Station to the CCR in future with third party interactive communication facility.

7.2.6 Displays

The system shall be capable of reading the status of equipments, acquiring the analog signals, displaying the status in the form of mimic diagram, video trend, bar graph, periodic display, alarm display, alarm overview display, logs such as hourly/shift/daily logs, alarm logs etc.

Displays include plant mimic diagrams, which shall include the complete auxiliary plant system indicating each major components of the system and the operating status of individual equipment and devices

7.2.7 Alarms

1. The system shall display history of alarms in chronological order of occurrence on the Operator Station TFT. At least three (3) levels of alarm priority shall be available which shall be displayed in different color. It should be possible to display and print alarms. System shall have all alarm related functional keys like acknowledge, reset etc. Other design features like set point / dead band adjustment, alarm priority, manual and automatic inhibition based on predefined logic etc. shall be used.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[129]	02.09.2015

2. The alarm display shall be built bottom up with the most recent alarm at the top of the list. When a point returns to normal, the associated alarm line shall change color suitably and on acknowledgement, the line shall be blanked out.
3. The alarms below the blank lines shall move upward to fill the empty lines. If the capacity of the OWS display page is exceeded, alarm history shall be stored in memory to accept the over- flow. This alarm history shall be displayed upon operator demand.
4. When a point goes into an alarm state and appears on the alarm screen, the time of alarm shall flash until acknowledged by the operator. Acknowledgement by the operator shall cause the time to stop flashing. All alarm initiations and return to normal, shall be logged on a printer.

7.2.8 System Software

1. Complete licensed software for PLC based system including the communication software system shall be supplied and implemented to meet completely the specification requirements.
2. Application software shall be built based on approved logic diagram, graphics etc and shall include controls, graphics, logs, trends, history, report generation etc.
3. The system software shall include all programs for the PLC and PLC console which are required to perform all the PLC functions including communication and self-diagnostics.
4. Diagnostic software shall have the capability to provide information about the failed module / system either in the form of a system configuration display or provide information in the form of a statement.
5. The software's shall not be machine specific. All software licenses shall be valid for the continuous service life of the plant and equipment.
6. Password security shall be used in order to ensure security level to the plant operation.

7.2.9 Peripherals

Following Peripherals shall be used for PLC:

1. VDU/ TFT shall be multi-sync, 21" color monitor with intelligent terminal and key board. TFT shall be used with graphic and mimic capabilities with minimum 64 distinct colors. The graphic resolution shall be 600x 1280 dots minimum with 0.25 mm dot pixel and refresh rate shall be 85 Hz or better
2. Suitable optical filter for minimum secondary glare shall be used.
3. One number black & white laser printer shall be used for printing A4 size paper. Printing speed shall be minimum 24 ppm. The printer shall be heavy-duty type with minimum 50,000 pages/month printing capability, 600 dpi resolution, 128 MB memory and 3000 sheet input capability.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[130]	02.09.2015

8. COMPUTERIZED MAINTENANCE MANAGEMENT SYSTEM (CMMS)*{TO BE DELETED, IF ALREADY PROCURED UNDER TG PACKAGE.}***8.1 General**

1. A completely integrated computerised maintenance management system (CMMS) with relevant data base completely populated and system customised for power plant application shall be used. The system includes all necessary hardware, software, firmware and interfaces required for implementing a fully functional CMMS system suitable for integrated maintenance management function for a modern power generation utility.
2. CMMS system shall be common for the equipment/systems for the whole plant including all the units and the plant common systems.
3. If CMMS is procured under TG Package then it shall be deleted from SG package.

8.2 Functional Requirement

CMMS shall meet following functional requirements:

8.2.1 Asset Management & Asset Register Function

1. Asset management function shall facilitate the creation of an asset register which shall hold the comprehensive details of each asset/ equipment. It shall have following features:
 - a) Building the location details and it's hierarchy
 - b) Building the equipment, it's hierarchy and specification details including drawings.
 - c) Creating hierarchies identifying operating locations as a part of multiple systems.
 - d) Defining relationship between equipment, location and system.
 - e) Building spare parts and sub-assembly catalogues of the asset/equipment.
 - f) Tracking the equipment, movements, associated costs, histories of planned and un-planned maintenance & failures.
 - g) Facility to launch condition based preventive maintenance work orders based on preset equipment- wise upper and lower limits.
 - h) Links to inventory management and purchase functions.
2. The asset management facility shall be capable of performing the following:
 - a) Control the company's list of maintainable assets through an asset register.
 - b) Control the accounting of assets, purchase price, depreciation rates etc.
 - c) Control maintenance inventory (stores management, requisition and purchasing).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[131]	02.09.2015

8.2.2 Inventory Management Function

Inventory management function shall have following features:

1. Specifying attributes and then ability to search by attribute for items, equipment and locations
2. Tracking of stocked and non-stocked items through multiple stores.
3. Tracking of items, costs and balances by bin, lot and storeroom.
4. Stock replenishment when inventory falls below minimum levels
5. Automatic reorder of items through “ lights out replenishment”
6. Tracking of items by last cost, average cost or user definable standard cost.
7. Usage of ABC analysis to assign inventory item prioritising.
8. Employing just in time methodologies to generate purchase orders.
9. Identifying out of stock items and making substitutions with alternate parts, vendor and location tracking capabilities.
10. View of work order reservations for inventory items
11. Linked up with asset register.

8.2.3 Work Order Function

Work order function shall have following features:

1. Viewing comprehensive and detailed planning information such as following:
 - a) Work Plans
 - b) Schedules (Target and scheduled date tracking)
 - c) Costs
 - d) Labour, materials, Skill set / crafts, Special tools requirement etc.
 - e) Equipment
 - f) Failure analysis
2. Recording of maintenance work and closure of work orders.
3. Scheduling of work orders based on real time criticality and logistics.
4. Sequencing of work orders for multiple equipment based on location and / or equipment.
5. Comparison of real time budgets or estimates with actual and historical data.
6. Tracking of equipment down time.
7. Tracking of equipment failure history with cause and remedy. Facility for generation of micro-level failure/ cause stratification diagram.

8.2.4 Job Planning Function

Job planning function shall have following features:

1. Tracking of costs by operation or job plan
2. Linking job plans sequentially, each with it's own parts, labour and tool estimates.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[132]	02.09.2015

3. Duplicate job plans for modification and use as templates

8.2.5 Resource Planning Function

Resource function shall allow to maintain detailed resource information to plan and analyze maintenance work related to company, service contract, tools etc.

8.2.6 Schedule Planning Function

Scheduling function shall enable to forecast future preventive maintenance dates for resource planning.

8.2.7 Preventive Maintenance Function

1. Preventive maintenance schedule shall be capable of performing the following:
 - a) Allows each asset / equipment to have a defined maintenance profile
 - b) Helps to schedule planned preventive maintenance routines
 - c) Control preventive maintenance procedures
 - d) Control the issue and documentation of planned and un-planned maintenance work.
2. Preventive maintenance function shall have following features:
 - a) Generation of preventive maintenance work-orders on demand, batched or automatically.
 - b) Generation of preventive maintenance work-orders for planned shut downs.
 - c) Sequence multiple job plans and consolidate multiple procedures on one preventive maintenance schedule.
 - d) Facilitates clustering of PM work orders for various departments / divisions to take reduced planned equipment downtime.
 - e) Capable of generating PM work orders on the basis of fixed frequency intervals or run hours.
 - f) Reservation of inventory for scheduled PM works.

8.2.8 Purchasing Function

Purchasing function shall have following features:

1. Creation of purchase requisitions or purchase orders either from scratch or from the inventory or work order modules
2. Create RFQs for multiple vendor bids
3. Automatic release of agreement Purchase orders
4. Creation of special orders for parts not stocked in inventory.
5. Elimination of costly "Maverick Buying" by establishment of approved vendors.
6. Direct issue of purchase orders and issue parts and services directly to work orders for the expense off items.
7. Analyzing of vendor performance before ordering of parts

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[133]	02.09.2015

8. Use of invoice matching
9. Defining multiple tax rates to budget for interstate and international purchasing
10. Auto re-orders PR/PO generation for the spares, when stock falls below re-order level.
11. PR to PO consolidation to group PRs by vendor into single purchase order.
12. Line item /Purchase order status generation-Initiated (Unapproved), Approved, Partial receipt, Completion of receipt, Invoice matched, Cancelled etc.

8.2.9**Personnel Function**

Personnel function shall have following features:

1. Creation of employee details including employment and personnel information tracked.
2. Assignment details like department, preferred staff and available weekly work hours tracked.
3. Craft / salary rates-employees can be expensed to work orders by an average craft rate or actual hourly rates.
4. Training / certifications of employees tracked by the system.
5. Security levels-each employee can be assigned access security levels for each of the functional areas in the system.

8.2.10**Financial Function**

Financial function shall have following features:

1. Facility for supporting double entry accounting for integration with any financial system.
2. Creation of user defined financial calendars to correlate directly with accounting periods.

8.2.11**Other Functions**

Other facilities required are as follows:

1. Interface to MS project/Primavera to permit planning of work carried out in CMMS system to MS project/Primavera for scheduling. Work progress can then be tracked in CMMS and used to update the project.
2. CAD / Image viewing capability to enable users to store, mark up and view drawings, scanned images, word documents etc.
3. Account code or project budgeting to enable users to set up periodical project budgets. The system shall then be able to track actual and committed costs against budgeted costs
4. Interfacing with existing On Line Integrated Material Management System (OLIMMS)

8.2.12**Reporting Functions**

Reporting facilities required are as follows:

1. Standard Reports-Generation of standard reports on work orders, safety plans, inventory values and other critical points about maintenance operations.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[134]	02.09.2015

2. Report types- Capabilities shall include columnar reports, forms, Bar Charts, Pie Charts, Cross tabs etc.
3. Report generation- Crystal reports.
4. Data export capability via crystal reports to Text, Excel, Word documents, E-mail, HTML & ODBC etc.

8.3 Design Requirements

1. CMMS shall be based on client server & relational data base environment. The system shall operate on commonly used hardware platform & network operating system.
2. System shall be suitable for simultaneously used by multiple users. It should have at least 20 user licenses.
3. The system shall be password protected. It shall be possible to organize system users into groups and each group shall have a separate security profile. It shall be possible to provide additional personal security settings for individuals within a group.
4. CMMS processing shall be carried out in an independent server interfaced with plant DCS, All BOP & offsite plant PLC control systems. Further CMMS system shall be interfaced with MIS system server for transmission of maintenance related details for usage with MIS. To meet the above requirements CMMS system shall be interfaced with all control systems through redundant communication links. The CMMS system server shall be connected with station LAN and all user PCs shall be connected to CMMS server through station LAN.
5. The system shall have facility to store bulk data with facility for retrieval of the same. The system shall have facility to share all the data in the hard disk/back up media and provide user friendly utilities to retrieve and analyze stored data.
6. Wherever required same user workstations shall be used for CMMS & MIS systems. Together with MIS system total 50 nos. user workstations shall be provided.
7. All software licenses shall be valid for entire life of the plant. It shall be possible to upgrade the installed system with latest available version of the software model without any additional hardware/software requirements during entire life of the plant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[135]	02.09.2015

9. SMART TRANSMITTER MAINTENANCE STATION (STMS)*{TO BE DELETED, IF ALREADY PROCURED UNDER TG PACKAGE.}***9.1 General**

A dedicated standalone PC based Smart Transmitter Maintenance Station (STMS) for each unit shall be provided for centralized configuration, maintenance, diagnostic and record keeping of all electronic smart transmitters, smart positioners & Analyzers. Transmitter signals shall be wired parallel to DCS and HART modules of STMS, which shall be connected to PC through suitable communication modules. Complete diagnostic, record keeping, calibration and configuration, event and log reports, historical data base records of all transmitters shall be possible from the STMS.

9.2 Design Requirements

1. The signals from each of the transmitter shall be wired in parallel to DCS and to HART interface modules. The DCS shall necessarily use 4-20 mA analog signals and superimposed digital signal shall be used in HART interface modules.
2. The multiplexed signal from HART interface modules shall be hooked up to a PC through associated communication modules, converters, etc. The communication module shall provide data on RS-485 link at a minimum speed of 19.2 K baud. If HART interface modules has integral communication module to provide RS-485 link, the same shall also be acceptable. In all HART interface modules, provision for connecting at least 30% extra transmitters over and above the engineered quantity shall be kept for future additions.
3. An RS-485 to RS-232 Converter shall be provided for interfacing HART data of transmitters to PC station. This converter shall also provide proper isolation to ensure data integrity.
4. Any failure / short / open-circuit and / or removal of any of the cards /devices / cables in this centralized configuration, maintenance, diagnostics and record keeping system, including failure / removal of HART interface modules, communication modules, converter, etc. shall, in no way, affect the 4-20mA analog signals being used in DCS. Further, the HART interface modules shall be organized in such way that separate cards are used for signals going to different DCS cabinets.
5. Suitable redundant & diode auctioneered 24V power supply packs / modules and redundant feeders shall be provided to feed all modules / devices. These power supply packs / modules shall be fed from redundant feeders of UPS system or from 24V DC power supply system.
6. All modules / cards / power supplies shall be mounted in cabinets to be located in Control Equipment Room. The PC station and printer shall be located in Engineering Room.

9.3 Functional Requirements

The system shall have following functionalities as a minimum:

1. Constant scanning to monitor faults or changes to instrument configuration.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[136]	02.09.2015

2. Purchaser-defined and standard calibration and configuration procedures for all transmitters.
3. Constant signal data collection facilities to maintain continuously updated records.
4. Automatic tracking of configuration changes made in the field, such as may be introduced by hand-held communicator. All configuration function associated with hand-held communicators shall be available in the system.
5. Event and log reports on screen as well as on printer.
6. Any addition / deletion of transmitter shall be reported on printer and logged in hard disk

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[137]	02.09.2015

10. STATION WIDE LOCAL AREA NETWORK*{TO BE DELETED, IF ALREADY PROCURED UNDER TG PACKAGE.}***10.1 General**

1. A plant wide Local Area Network (LAN) encompassing the different plant buildings shall be provided. The Station LAN shall interconnect the buildings together and shall facilitate the smooth transfer of Data from one building to the other.
2. A plant wide Fibre Optic high speed (100/1000 MBPS) back bone & work groups is envisaged. This network is used by different users for viewing selective plant graphics & data on real time basis, historical data & trends, MIS reports & CMMS data.
3. The MMI of unit & common system, all BOP & offsite PLC's, PADO, CMMS, MIS, CCTV etc. Shall be connected to station wide redundant Ethernet LAN. The interface with these systems shall be through OPC client-server architecture. PC stations shall also be connected to this LAN to monitor data.
4. For achieving this, the above requirement all necessary hardware & interfaces such as the Station LAN Server, LAN Switches (main & secondary) with suitable number of ports, electric / optic and optic / electric converters / trans-receivers etc., software and data communication cables shall be provided. The redundant unit LANs of the each unit shall be connected through the station LAN switch and server. It shall be ensured that failure of this network component(s) shall in no way affect individual unit operation & monitoring function in any way.
5. The Station LAN shall connect following buildings:
 - a) Station Building- Central Control Room
 - b) Service Building
 - c) Coal Handling Plant
 - d) Ash Handling Plant
 - e) ESP Control Room
 - f) CW Pump House
 - g) Water Treatment & effluent Treatment Plant
 - h) Air Compressor House
 - i) Hydrogen Generation Plant (if applicable)
 - j) Workshop
 - k) Stores
 - l) Switchyard Control Building
 - m) Any other plant area/ building where Station LAN needs to be provided for the purpose of CMMS, MIS or for Plant security/ surveillance system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[138]	02.09.2015

6. The LAN network to be provided for all user points in all the rooms in the buildings.
7. The various buildings shall be interconnected through the use of minimum 4 Core single mode fibre and shall be connected to the main switch in the CCR in a STAR topology.
8. Each building shall be provided with a 12.U high wall-mountable communications cabinet complete with glass door, 6 way power distribution unit, shelves and force ventilation. All units are to be supplied with cage nuts and bolts to house LAN switches.
9. Inter building wiring shall be a minimum of Category 5E STP cable manufactured, tested and verified to ISO11801 EIA/TIA standard. Internal building wiring shall be of the structured cabling type and shall incorporate patch panels on every floor or as required.
10. A minimum of two RJ-45 ports shall be provided for each specified location. Category 5E shuttered modules shall be used in pre-assembled faceplates to save installation time. Modules shall include a slide label system.
11. If Station Wide LAN is procured under TG package, then it shall be deleted from SG package.

10.2 Design & Functional Requirements

1. The station LAN shall be achieved through the station LAN Server and High capacity Ethernet switch (station LAN switch). The Station LAN server shall have the hardware and shall maintain a combined plant database (complete database from each unit MMI updated at 1 sec.) and data from other systems through industry standard protocols and formats, on an Open standard RDBMS package like Oracle Enterprise version or equivalent, for open access to the same from any PC station in the plant running a suitable client software. This server shall function as a database server for the Plant Wide LAN.
2. The LAN shall be of the Gigabit type (1000 MBPS) and shall utilize standard IEEE 806.3 protocols such as Ethernet.
3. The Station LAN Switch shall be a layer-III switch & shall have hot pluggable redundant power supply, Gigabit back plane (switch fabric) capability, 1000 MBPS per port minimum data speed, fibre optic and UTP cable connectivity and Gigabit ports and shall support expandability / Stackability through a dedicated high speed expansion port. It shall support minimum Four numbers virtual LANs as a minimum and shall be routable, remotely manageable and configurable. The switch shall have extensive self diagnostic and logging facilities and shall use structured cabling facilities. The Station LAN switch shall be suitably sized to provide additional ports for connecting Servers / PC-stations etc. In future and fibre optic ports for connectivity and DCS TCP/IP ports for interconnection to standard third party sub-systems.
4. Network Monitoring & Management tool shall be provided so that loading etc. on the LAN switch can be ascertained.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[139]	02.09.2015

5. The station wide LAN shall connected to IT LAN, through which the CMMS server data shall be made available to existing Online Integrated Maintenance Management System (OLIMMS). Also the PC stations for various plant personnel shall be connected to station LAN for monitoring data of all units as well as that of common systems & offsite systems. These Connections shall be through Firewall.
6. Redundant Hardware Firewalls in failover mode with intrusion prevention system (IPS) features shall be provided to ensure security of network & prevent unauthorised access.
7. Firewall shall have minimum three zones. One inside (DCS network), one outside (IT LAN/ OLIMMS network) & the De-militarized zone (DMZ). Station LAN Servers shall be placed in DMZ zone. Data required for intranet (plant PC Network) & for OLIMMS shall be made available to the redundant station LAN Servers.
8. Station LAN switch shall be provided with a network based intrusion detection system (IDS) of a make different from IPS provided with Firewall to achieve a multi layered defence mechanism against intrusion as well as to guard against possible misuse/attack from within LAN.

10.3 Security Features Requirements

1. Firewall

- a) Firewall appliance should facilitate multi-vendor, multi-application environment and should support third-party products on open alliance. It should support Active-Active configuration.
- b) The firewall should contain following features:
 - Stateful inspection of packets.
 - NAT functionality, including dynamic and static NAT translations
 - Latest version of SNMP
- c) The firewall must send log information to a separate log server via an encrypted connection. Firewall logging must not impact firewall performance.
- d) Remote network access to the firewall should only be possible through the administration interface.
- e) The firewall administration station must be capable of pushing firewall security policies and configurations to individual or multiple firewalls through a secure, encrypted connection to the firewall administration interfaces.
- f) Graphical User Interface (GUI) and a Command Line Interface (CLI) for making changes to the firewall rules set should be provided. (Access to the firewalls via the GUI or the CLI must be through a secure encrypted channel).
- g) Any changes or commands issued by an authenticated user should be logged to a database configured on any of the machines in the LAN. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[140]	02.09.2015

administration station must allow for a hierarchical architecture for rules set administration and viewing of firewall configurations Management.

h) Firewall should also meet the following requirements.

- The firewall must not support any unencrypted means of access to the firewall.
- It should Monitors ALL network traffic-traffic at Firewalls (Internet and external networks) and detects known threat through deep packet inspection.
- Detects unknown threats via anomaly scanning.
- Detect unknown threats via behaviour pattern to protect from zero day attacks.
- Keeps up-to-date on new threats and vulnerabilities.

2. Intrusion detection system (IDS) & Intrusion Protection System (IPS)

In order to inspect all inbound and outbound network activity and identify suspicious patterns that may indicate a network or system attack from someone attempting to break into or compromise a system on the Station LAN Network, the recommended IDS/IPS should contain the following features as a minimum:

- a) Able to analyze, detect and report on security related events.
- b) Able to inspect traffic and to drop malicious traffic based on the configuration of security policy.
- c) Able to inspect the content of network packets for unique Sequences/signatures.
- d) Able to detect and prevent known types of attacks such as worm or Trojan infections and hacks.
- e) Able to prevent denial of service (DOS) and Distributed Denial of Service attacks.
- f) Able to prevent abnormal behaviours by monitoring and learning normal network behaviours.
- g) Keeps up-to-date on new threats and vulnerabilities.
- h) Should provide user friendly interface to queries and reports on threats and event data so that security administrators can gain a better understanding of their ability to protect their network.
- i) Should provide detailed activity logs for auditing.
- j) Able to detect known threats via deep-packet inspection.
- k) Able to defect unknown threats via anomaly scanning.
- l) Able to detect unknown threats via behaviour pattern to protect from zero day attacks.

10.4 Network Monitoring & Management Requirements

The network monitoring & management software should contain the following features as a minimum:

1. Graphical user interface (GUI) management.
2. Automated discovery and display of Ethernet topology and devices.
3. Real-Time SNMP Support
4. Monitor traffic flow through the device
5. View a device image indicating which ports are active and which modules are installed. If a particular network device is down, it should give the tools like ping/telnet options in the same screen to further diagnose the problem.
6. Real-time activity and utilization statistics and graphical trends.
7. Facility of providing pre-defined actions like e-mail, SMS etc. upon any event generated in the network.
8. Facility of viewing logical graphs of devices like routers, web servers, according to the needs.
9. The following parameters should be monitored.
 - a) Device status
 - b) Port Status
 - c) CPU utilization
 - d) Memory Utilization
 - e) All port utilization including uplink ports.

Table - 10.1
Specifications for Station LAN Switch

S.No.	Features	Minimum Requirements
1	Type	Layer-3 Ethernet Managed type
2	Ports	24/48 RJ45 connectors for 100 Base-T/1000 Base-TX; Two (2) 10BASE-T/100BASE-TX/1000BASE-T ports; 2 mini-GBIC ports; console port; auto medium dependent interface (MDI) and MDI crossover (MDI-X); RPS port for connecting to redundant power supply unit
3	Cabling Type	Unshielded twisted pair (UTP) Category 5 or better for 10BASE-T/100BASE-TX; UTP Category 5 Ethernet or better for 1000BASE-T
4	Switching Capacity	17.6 GBPS non-blocking
5	Management interface	One 10/100/1000 Mbps RJ-45 out-of-band management port

11. STEAM & WATER ANALYSIS SYSTEM (SWAS)*{TO BE DELETED, IF ALREADY PROCURED UNDER TG PACKAGE.}***11.1 General Requirements**

1. The steam and water analysis system shall be designed to monitor the chemistry of the steam and water cycle to ensure the desired quality. The online chemical analysis for pH, Conductivity, hydrazine, sodium ion, Silica, dissolved oxygen, chloride, phosphate etc. Shall be carried out in the plant cycle at strategic points. Information from the analyser shall be used to control the high pressure and low pressure dosing system. Long term monitoring and trending of essential elements shall be carried out, to provide an indication of the general condition of the mechanical plant.
2. The sample points, their location, type of chemical analysis to be carried out for each sample, measurement ranges etc., shall be as per plant standards. The SWAS as a composite system includes sample probes, sample piping, safety valves, ball valves, relief valves, grab sample collection facility, pressure, temperature, level, flow indications, coolers, on line analysers etc. The SWAS shall include the following:
 - a) Sample conditioning panel with all accessories.
 - b) Analyzer Panel housing cells, analyzers, monitors etc.
 - c) The sample conditioning and analyser panels shall be physically separated from each other. Analyser panel shall be located in a separate air-conditioned room. Sample conditioning panel shall be walk in corridor type/open rack type. All SWAS panels shall be designed for ready access of components for easy maintenance.
 - d) PC based station for display of information & alarms to the operator, to be located in SWAS room (connected to station LAN)
3. The SWAS system should be unitised and located at the ground floor of TG building.

11.2 Design Requirements

1. Design criteria for continuous on line analytical measurements of important plant media such as water, steam shall be based on microprocessor based instruments only.
2. Separate Steam and Water Analysis System shall be furnished for continuous monitoring and control of water and steam purity in the plant cycle of each Unit and at other important points as specified in this specification.
3. The sampling system shall obtain samples from steam and water system, which shall be adequately conditioned and fed to analyzers for continuous analysis and provide parallel facility for grab sampling as specified.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[144]	02.09.2015

4. The system shall be designed in accordance with the recommendations in ASME PTC 19.11 Part II, Water and Steam in Power Cycle, ASTM standards - 31 water and ASTM D1066-69 standard method of sampling steam.
5. The equipment shall be constructed to operate accurately and safely under the operating conditions described or implied in this specification, without undue heating, vibration, wear, corrosion or other operating troubles.
6. All parts subject to high pressure or temperature or other severe duty shall be of materials suitable for the service.
7. All piping, tubing, fittings and other wetted parts in the sampling and analyzing system shall be of SS 316 or other suitable material for the service. No plastics or rubber shall be permitted except within analyzers as furnished by the manufacturer.
8. All SWAS system components and accessories shall be from the latest proven product range of qualified manufacturers.
9. To ensure operation under adverse conditions the equipments mounted outside the Sampling and Analysis Room shall be designed for outdoor conditions.
10. Sample room located instruments and electronic hardware shall be required to operate normally in an air-conditioned area.
11. However, they shall also be able to operate indefinitely with ambient room temperature between + 5°C to + 55°C and relative humidity up to 95%, during air conditioning failure.

11.3

Sample stream Requirements

SWAS shall be provided in accordance with the following guidelines:

Table 11.1

Guideline for Analytical requirements

11.4 Sample Conditioning System

- The sample conditioning system shall provide samples at 250C or a preset temperature required by the analyzer with in tolerance of +/- 1 0C, at a pressure of about 2 Kg/cm² and at a flow rate as required by individual Analyzer/stream.
- Sample conditioning system shall be designed and constructed to receive and condition all samples as required by the respective analyzers connected to the sample streams. This shall include all conditioning equipment mentioned herein and covers the following:
 - Primary Sample Cooling in the field
 - High Pressure reduction in the field
 - Two (2) nos. racks shall be provided per unit for mounting primary coolers & high pressure reducing elements in the field.
 - Sample filtering
 - Secondary sample cooling & temperature control
 - Pressure reduction & control as required
 - Flow rate control & measurement
 - Other treatment as required by individual analyzers or mentioned herein
- Sample line to analyzers shall incorporate an anti-siphon design to prevent possibility of running dry because of a broken or plugged sample line.

11.4.1 Primary Sample Cooling

- Primary cooling of all samples having temperature in excess of 45 °C shall be accomplished by passing each sample through one or more individual sample coolers of shell and tube heat exchanger type.
- The primary coolers shall use plant auxiliary cooling water.
- The overall capacity (flow rate and heat transfer capacity) for both sides of cooler/ coolers in cascade shall be adequate to cool all samples to within ± 5 °C of the cooling water inlet temperature for the combined flows of each required analyzer sample plus a manual grab sample flow rate of 500 CC/Min.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[146]	02.09.2015

4. Provision shall be kept for adjustment of the temperature of each sample line individually to an optimum value.
5. Sample coolers shall be of submerged helical coil type of shell and tube design with removable shell meeting the intent of ASTM D1192-64 (Equipment for Sampling Industrial Water and Steam). Sample tubing and coils in the coolers shall be continuous and shall extend through the cooling jacket. The sample tubing shall be of seamless type with no welded or other joints inside the cooling jacket. Unions shall be provided to facilitate removal of coils.
6. All sample tubing, fittings and other components wetted by the samples shall be constructed of SS 316.
7. Primary cooler/s shall be removable without disturbing the sample coil connections.
8. Primary cooler shall be protected on the cooling water side by relief valve on the water header. The cooling water header is provided with pressure gauge and isolating valves.
9. Provision shall be made for draining the heat exchanger shell. The drain line shall be valved and piped to waste drain header.

11.4.2 High Pressure Reducing Element

1. Pressure reduction of samples above 40 kg/cm² shall be accomplished by means of a "variable rod-in-tube capillary" or equivalent capable of discharging low flow at low pressure into a sample stream as per the requirements of all samples/analyzers under all operating conditions.
2. The device shall be designed for inlet pressure of 350 kg/cm² operating temperatures of 65 °C and flow rate of not less than 2000 milliliters per minute. The device shall be sized for maximum required sample flow rate under all operating conditions (i.e. from 25% of rated operating pressure onwards to accommodate starting conditions).

11.4.3 Sample Filtering

Sample particulate removal shall be accomplished by passing samples through cartridge type filters with 316 stainless steel body or Y-Strainer. The filter elements shall be capable of retaining particulates of 40 microns and larger. The filter elements shall be installed immediately after the sample shut off valve.

11.4.4 Temperature Switch & Solenoid Valve

Thermostat and Solenoid Valves shall be provided in the sample line downstream of sample filter and upstream of the Secondary Cooler. The thermostat shall be a bimetallic sensor to operate a micro-switch when a preset temperature is reached. This shall close the Solenoid Valve through logic, when sample temperature is above preset value (60 °C).

11.4.5 Secondary Sample Cooling

1. Secondary Cooler shall be employed to cool the sample from approximately 45 °C to 25 °C +/- 1 °C. The secondary coolers shall also be of submerged helical coil type of shell and tube design. The secondary cooler shall use chilled water at

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[147]	02.09.2015

20 OC. Chilled water for secondary cooler shall be provided by packaged refrigeration unit (chillers). Secondary cooler shall be protected by a relief valve on the cooling water jacket of each cooler in addition to a relief valve at the cooling water header. Provision shall be made for heat exchanger shell drain duly valved and piped to waste drain header.

2. Alternatively, secondary cooling may also be proposed with field proven isothermal bath.

11.4.6 Chilled Water System

1. Each chiller unit shall be designed with sufficient refrigeration capacity to ensure each sample stream temperature to 25 OC \pm 1 OC when all streams are simultaneously at maximum flow rate and maximum temperature. The chiller capacity shall have a provision of 25% spare capacity for future samples.
2. Suitable temperature monitoring and control systems shall be provided for maintaining the chilled water temperature at chiller outlet at 20 OC or at a designed preset value and within the desired band.
3. The compressor shall be readily accessible for service and shall include low noise hermetically sealed motors. Compressor assembly shall also include crank case heaters, suction and discharge valves, oil sight glasses, forced feed lubrication system and an integrated motor protection system along with the necessary instruments.
4. The condenser shall be water cooled, cleanable shell and tube with water regulating valve. The cooling water shall be supplied from closed cooling water system at a maximum temperature of 40°C and a maximum flow rate of 100 litres per minute.
5. Chiller shall be of the direct expansion type with refrigerant tubes inside a shell, completely insulated and to be constructed in accordance with the ASME code for unfired pressure vessels.
6. Refrigerant circuit shall be complete with a thermostatic expansion valve, liquid line solenoid valve, sight glasses, filter-dryer, refrigerant shut-off and charging valves.
7. The chiller water pump shall be of the centrifugal type, close coupled, bronze fitted construction, complete with motor. Pump & motor shall be designed for continuous operation.
8. Vibration dampeners shall be mounted between the packaged chiller and the channel base.
9. Cooling water and chilled water piping shall be provided with block valves.
10. The chiller system shall be provided with 100% redundant chilled water pumps with suction and discharge pressure gauges and temperature gauges; Chilled water circulation pump with 100% standby facility; Storage tank automatic water make up with manual by-pass facility, temperature indicator, level gauge and drain and overflow connection, in addition to any other instruments/equipments required for smooth, convenient operation of the system.

LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[148]	02.09.2015

11.4.7 Sample Pressure Conditioning

1. Pressure reduction of samples above 40 kg/cm² shall be accomplished by using high pressure reducing element.
2. All samples below 40 kg/cm² pressure shall be provided with back-pressure (upstream pressure) regulating valves (PCV).
3. Each sample line shall have Pressure Indicator and Temperature Indicator upstream of pressure reducer. The gauge shall be 100 mm dial with suitable stainless steel wetted parts. Casing shall be stainless steel construction.
4. Each sample line shall include a safety relief valve set at about 3 kg/cm²g, upstream of the rate set valve, having stainless steel wetted parts.

11.4.8 Flow Restricting Element

Flow Restricting Element located at grab sample line tapped from common samples to analyzers shall be provided for all samples, to maintain constant sample flow at a preset sample inlet pressure.

11.4.9 Other Requirement

The Steam and Water Analysis system shall be provided with the sample shut off valves, blow down valves, solenoid actuated valves, pressure reducing valves, safety relief valves, back pressure regulating valves, high pressure reducing valves etc. The requirements of the important valves are specified as under:

1. The sample shut off valves, blow down valves and pressure reducing valves shall have stellite spindle tip and shall be suitable for an operating pressure of 400 bars and an operating temperature of 400°C.
2. The back pressure regulating valve shall be globe type and shall be suitable for a pressure range of 0 - 50 psi. The back pressure regulating valve shall consist of a range spring and a diaphragm assembly. The back pressure of the regulating valve is adjusted to the required set point by the range spring. In case of any excess pressure the diaphragm shall be lifted to release the excess pressure to maintain back pressure equal to the set value.

11.5 Sample Pumps

1. Two (2) nos. of sample pumps for each generating unit, along with necessary pipes, valves, etc. shall be provided for condenser cooling water samples. Sampling pump motor shall be adequately rated for continuous service duty and shall meet the requirement for drive motors as per international codes and standards.
2. Pump start/stop shall be done from local. All necessary accessories including power supply, wiring and grounding for control and safe operation of the pumping system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[149]	02.09.2015

11.6 Sample Patch Board

1. A quick disconnect patch board area shall be furnished on the SWAS panel. The patch board shall allow sample to be routed to any analyzer through quick disconnect valve at patch board on the sample conditioning panel. The area shall consist of a patch board with bulk head tube fittings with double end shut-off and hose inserts. Body protector plugs shall be provided for each bulkhead tube fittings.
2. The plugs shall be of type 316 SS construction. Sufficient length of 6mm ID, 9.5mm OD tygon tubing shall be provided for complete spanning of the patch board area for interconnection of the bulkhead tube fittings. Each connection shall be provided with a Phenolic name plate engraved with a legend.

11.7 Grab Sample

Grab sample valves on the SWAS panel front shall be furnished to allow grab sample flow to be directed to either a drain header or through grab sample nozzles to the sample trough. Approximately 300 mm of flexible tubing shall be furnished for each sample to allow grab sample collection and prevent splashing. Valve body and trim shall be of SS-316.

11.8 Sample Sink

A continuous sink, located at the place of grab sample analysis, shall be provided. The sink shall be of 316 stainlesssteel, 14 gauge minimum. The sample sink shall be connected to waste drain header. Sample sink shall contain an integral stainless steel ledge to accommodate sample container. DM water connection shall be provided for cleaning of sample containers.

11.9 Analyzers

All Analyzers shall be of microprocessor-based design. The general technical specification of the analyzers is provided in this section. Each analyzer shall be indicated with the sample flow requirement and the total quantity of cooling water required for the system.

10	Cable	Up to transmitter in flexible conduit
11	Applicable Standard	IS: 6804 except as modified in this specification.
B	Transmitter	
1	Type	Microprocessor based
2	Mounting	Flush Panel
3	Protection class	As per TS requirement
4	Output	4-20mA DC (isolated)
5	Display	<ul style="list-style-type: none"> Digital Display of process variable in Engineering Unit, Temperature, Alarm Status Red / Green LED Character Height 18 mm
6	Calibration	Computer assisted 2 point calibration – within pH 0 to 14 for zero with standard buffer solutions.
7	Temp. Compensation	Manual or Automatic – selectable through keyboard
8	Diagnostic	Self diagnostic for “Calibration required”/“calibration O.K.”, electrode checking etc.
9	Alarm	Dual alarm set point, hysteresis and time delay adjustment on membrane keyboard.
10	Enclosure	Polypropylene
11	Cable Termination	Internal (cable entry through conduit)
12	Accuracy	± 0.02 pH or better
13	Repeatability	$\pm 0.1\%$ or better
14	Response Time	7 seconds for FSD or better
15	Stability	$< \pm 0.001$ pH per week
16	Power Supply	230 V AC, 50 Hz

11.10 SWAS Panels

1. The SWAS Panels shall have two sections namely sample conditioning section and analyzer section. The first section shall be the wet section of SWAS panels which shall be called as the "Sample Table". The second section shall be the dry section housing the analytical transmitters, signal conditioning devices and other requisite accessories.
2. All monitoring instruments and controls for sampling system shall be located on the front panel and shall be grouped accordingly to function in a logical and orderly fashion. There shall be a general progression of flow from top-to-bottom and left-to-right to minimize sample line length, purge times and material exposed to sample. Similarly, the conditioning components for each stream shall be grouped together wherever possible.
3. Indicating instruments such as pressure, temperature and flow shall be arranged in a vertical line directly above the grab sample valve. Sufficient clearance shall be maintained between instruments banks of adjacent sample points so that there is no confusion in reading these instruments.
4. Sample conditioning & analyzer panels shall be designed for ready access of components. Panel design shall ensure that:-
 - a) Parts subject to wear, corrosion or other deteriorations or requiring adjustments, inspection or repair are readily accessible and capable of convenient removal, when required.
 - b) Individual components or groups of components mounted on sub-panels can be removed for replacement or repair without the need of prior removal of components of other healthy streams.
 - c) Flow meters, pressure gauges and temperature indicators can be removed for repair or replacement from the front of the panel without disturbing any piping.
 - d) Filter elements and pressure reducing elements can be easily disassembled for periodic cleaning.
5. SWAS panels shall be designed based on human engineering considerations fully keeping in view the convenience of operation and maintenance personnel.
6. Each sample inlet shall be provided with bulkhead type tubing connection and an isolation valve or block valve suitable for sample operating conditions. A blow down connection and suitable blow down valve shall be furnished upstream of each isolating valve. Blow down valves shall be manifolded into a suitable blow down header. Strainers, filters, relief valves etc. shall be provided as specified and as required to properly protect the coolers, valves, analyzer elements etc.
7. All drains shall be piped into two separate drain headers. One header shall be called "Waste Drain Header" and shall receive all drains which contain substances not wanted in the plant heat cycle water. The other header shall be called "recoverable drain header" and shall receive all other drains not containing

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[161]	02.09.2015

unwanted substances. All drains shall be headered as indicated above. Vendor shall pipe the waste drain header to the building drain system.

11.11 Constructional Features

1. The SWAS panel (wet panel) shall be constructed of 3 mm thick steel plates except for the extreme top of the Sample Table and Analyzer Panel (Dry Panel) which shall be of 2 mm sheet steel. The counter top, sample sink and front section above the counter top shall be 2.5 mm type 304 or 316 stainless steel.
2. The sample table shall be of free standing, open rack whereas the Dry Panel shall be of free standing, totally enclosed construction with back doors.
3. All SWAS panels shall be furnished with 100 mm base angle for bolting to 100 mm high concrete curb.
4. Following panels are to be provided:
 - a) Sample conditioning panel : 5000 (W) x 2300 (H) x 2400 (D) mm
(Wet Panel)
 - b) Analyzer Panel : 3000 (W) x 2300 (H) x 2400 (D) mm
(Dry Panel)

The dimensions given above are tentative only.

5. Panel sections shall be reinforced to ensure true surfaces and adequate support for instruments and equipment. All equipment and piping shall be firmly anchored and supported from within the respective panel section to ensure vibration free operation.
6. Doors and equipment arrangement shall be such that all items are readily accessible for maintenance and repair. Doors shall have concealed type hinges and three point type latches to assure tight closing. Doors shall have turned back edges and additional bracing where required to assure rigidity.
7. All surfaces shall be free from waves, bellies, or other imperfections. All stainless steel surfaces shall have uniform finish. All exterior steel surfaces shall be sand blasted, ground smooth, filled, primed, sanded and finished with smooth backed enamel.

11.12 Piping, Tubing & Accessories

11.12.1 Internal Piping & Tubing

1. All internal piping, tubing and system components required for making the system complete shall be shop installed and tested as per applicable codes, prior to shipment to project site.
2. All tubing and wiring shall be located behind the face of the panel with projections allowed only for indicator faces, valve handles, manual grab sample lines etc. The physical arrangement of the tubing and wiring shall, in all cases, be so as to permit easy access for maintenance of all items of equipments.
3. All piping and tubing materials, fabrication, erection and application of piping materials shall be in accordance with the latest applicable requirements of the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[162]	02.09.2015

code for pressure piping (ANSI B 31.1,B36.19) and all other applicable regulations.

4. Unless otherwise specified, fittings used with pipe 50 mm and smaller shall be socket welding type, and fittings used with larger pipe shall be butt-welding type. All fittings shall be constructed of materials equivalent to the pipe with which they are used.
5. All piping and tubing shall be neatly installed and securely braced to ensure adequate mechanical rigidity. Routing and support of tubing shall be such that expansion and contraction of tubing or equipment mounted in the sample table do not impose any excessive stress on the tubing.
6. Special tools shall be used for all bending and forming operations. Bends in tubing shall be based on the requirement of the code for Pressure Piping (ANSI B 31.1), concerning tube thinning at the bends. Tubing shall be carefully handled to avoid flat spots, kinks and short bends. Any tubing so damaged shall not be used in this sample table.
7. All piping and tubing shall be blown with oil free compressed air after installation and before attachment to equipment at either end.
8. All piping and tubing terminal connections shall be suitably capped after completion of installation and tests to prevent entry of foreign materials during transit, storage etc.
9. All piping and tubing shall be installed so as to ensure easy accessibility for any maintenance or repair that may be required. High density tubing runs shall not interfere with accessibility to any system component and shall not impair system function.

11.12.2 Sample Piping

1. This shall include piping, fittings, valves and accessories from tapping point's up to SWAS conditioning panel located in SWAS rooms on as required basis. All sample piping shall be 3/4" NB seamless type of material ASTM A213 TP 316 H, conforming to ANSI B36.19. The schedule number shall be suitable for the particular application.
2. All fittings shall be socket welding type and of material ASTM A182 F316H conforming to ANSI B 16.11.
3. Single and multi tubes shall run with the minimum number of changes in direction. Suitable identification tags shall be provided for easy check up and for proper connections.
4. The valves to be used in sample piping shall be of globe type, forged construction and stainless steel conforming to ASTM A182. The pressure temperature ratings shall be as per ANSI B16.34. The valve design shall be such that the seats can be reconditioned and stem and disc can be replaced without removing valve body from the line

11.12.3 Material Specification for Piping

The material for piping to be furnished and installed for SWAS shall be as indicated below:-

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[163]	02.09.2015

Table 11.10
Specifications for Piping Material

S.No.	Piping System	Material Requirement
1	Piping from the sample inlet bulk-head fittings the shut-off valve for low pressure samples	Stainless Steel, ASTM A-213 Type 304 or 316, 16 BWG tubing
2	Piping from the sample inlet bulk-head fittings to the pressure reducing valves for high pressure samples and sample blow down piping	Stainless Steel, ASTM A-213 Type 304 or 316, 14 BWG tubing
3	Blow down header	Stainless Steel, ASTM A-312 Type 304 or 316, Sch. 160
4	Miscellaneous drains receiver header	Stainless Steel, ASTM A-312 Type 304 or 316, 16 BWG tubing
5	Piping from the shut-off valves for low pressure samples and from the pressure reducing valves for high pressure samples to the terminal points including branch piping	Stainless Steel, ASTM A-312 Type 304 or 316, 16 BWG tubing
6	Closed cooling water piping except grab sample	Carbon Steel, ASTM A-53 Gr. A, Sch. 40
7	Sample through drain piping and waste header piping	Carbon Steel, ASTM A-53 Gr. A, Sch. 40

11.13 Wiring

1. All control and instrumentation wiring used within the SWAS panel sections shall conform to NEC and NEMA standards. All measurement and control circuits shall be factory wired and tested by energizing at operating voltage.
2. All electric connections shall be made between devices within the SWAS panel sections and shall be made to suitable terminal blocks, if devices are to be connected to equipment outside the SWAS panel.
3. All electrical connections shall enter and leave through the top or bottom of the panels.
4. High impedance circuits shall be connected using shielded or co-axial wire suitable for the service. Terminals shall be furnished for termination of shield.
5. Wiring in the sampling section shall be routed in covered metallic trays located as distant as is practicable from sampling lines and drains with due care taken to isolate electric wiring, termination etc. from liquid areas.

11.14 Power Supply & Grounding

Power supply to all instruments and control systems shall be through UPS and separately fused, it should be possible to disconnect any instrument without interrupting power supply to any other equipment/device.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[164]	02.09.2015

11.15 Lighting & Receptacles

1. Sample table and analyzer section shall be provided with rapid start, low noise, fluorescent strip fixtures installed in a continuous row along the top of each section.
2. The panel shall have a ceiling mounted fluorescent illumination. Light switches shall be provided within the panel sections at suitable locations.
3. Three receptacles shall be provided on the front of the sample table below the work surface. These shall be equally spaced. Two more receptacles shall be provided inside the sample table and one receptacle shall be installed inside the panel.
4. Wiring for lighting and receptacles shall be run in flexible metallic conduits.

11.16 Control & Monitoring System

All alarm shall be available on the panel for the entire SWAS system, with repeat facility for each alarm in DCS, in the Control Room.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[165]	02.09.2015

12. CONTINUOUS STACK EMISSION MONITORING SYSTEM**12.1 General**

1. A fully certified Continuous Emission Monitoring System (CEMS) shall be provided at the stack to determine emissions of dust, SO_x, NO_x, CO, CO₂ etc as per state Pollution Control Board requirements.
2. A CEMS shall be provided to measure stack emissions and produce all required data logging and reporting. The analyzer system shall include microprocessor based in-situ and sampling type analyzers, a fully programmed controller, auto calibration accessories and mounting hardware for installation to provide a complete and operable system. The data logging and reporting system shall store a data for a stipulated number of years and shall be able to produce reports of required format.
3. All analysers at stack shall be located at an elevation as per state pollution control board norms and shall be accessible for maintenance.
4. CEMS shall be provided with all interconnection tubing and cabling between probe and analyser/analyser panel and cabling from analyser / analyser panel to local junction box. All the calibration gases required for one year continuous operation shall be provided. The calibration gas container material shall not contaminate the calibration gas. Auto gas calibration facility shall be provided.

12.2 Design Requirements

1. A PC based Continuous Stack Emission System shall be provided for monitoring. All output signals of all stack monitoring analysers shall be connected to plant DCS /MIS as applicable for monitoring, archiving and report generation for environmental monitoring authorities. DCS / MIS shall be equipped with necessary calculations and report generation software packages for generation of reports for submission to environmental monitoring authorities.
2. Air purge system associated with each analyser shall be adequate to keep analyser optical windows, probe elements, source elements and gas interface tubing free of particulate and other contaminants on the continuous basis.
3. A fully assembled environmentally controlled shelter shall be provided at the bottom of the chimney to house the stack gas monitoring analysers as well as all equipment required to condition the sample gas.
4. Flue gas analyzer instruments shall be provided with following common requirements:

Table 12.1**Common Requirements of Analyzers**

S.No.	Features	Minimum Requirements
1	Analog Output	4 – 20 mA DC, HART compatible
2	Binary Output	2 NO + 2 NC for alarm
3	Zero & Span Adjustment	To be provided
4	Ambient Temperature	60 Deg C
5	Local Indication	Digital

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[166]	02.09.2015

S.No.	Features	Minimum Requirements
6	Enclosure Type/ Material	Weather & Dust Proof IP67/ SS 316
7	Type of Electronics	Microprocessor Based with self diagnostic
8	Calibration	Auto & Manual
9	Error Diagnostic	To be provided
10	Digital Signal Transmission	Modbus protocol / Ethernet TCP / IP Protocol

5. Sampling type systems (if applicable) shall be provided with dual sample probes along with all required accessories such as redundant heavy duty pumps with continuous rated motors, moisture detection facility, prefabricated heated sample lines from probes to analyzer panel, solenoid valves, filters, coolers along with level switch in gas coolers for auto drain purpose & flow meter etc.

12.3

Technical Requirements of Analyzer Shelter

The Analyzer Shelter shall be a completely assembled unit suitable for installation on a concrete Pad or as a stand-alone unit. All internal piping and tubing shall terminate in bulkhead connections. Internal wiring shall terminate in external junction boxes. All equipment including tubing, conduit fittings, junction boxes, etc. shall be installed so as not to interfere with the removal of analyzers, sample handling systems and related equipment. Accessibility for maintenance shall be the prime consideration.

12.3.1

Construction Features

- The Analyzer Shelter shall consist of a self-framing exterior skin assembled on a rigid primed and painted steel superstructure. All materials used in the construction shall be non- combustible.
- Wall panels design to be completely weather resistant. The design shall allow for thermal expansion / contraction of the structure over the complete range of ambient temperatures applicable for the location without causing harmful buckling or opening of joints, etc. Materials of construction shall be 2mm thick SS sheet for external walls and 18 gauge galvanized steel for internal walls with ribbed interlocking. The ribbed interlocking shall provide a strong column for the sheets on the side valves, where the "U" profile created at the edges, when interlocked with the second sheet, increases the section modulus of ribbing.
- The wall panels of the shelter shall be insulated and designed for the given ambient conditions by glass/ rock wool of appx. 100 mm insulation thickness.
- Roof panels design and construction to be completely weather resistant. The design shall allow for thermal expansion / contraction of the structure over the complete range of ambient temperatures applicable for the location without causing harmful buckling or opening of joints, etc
- The base structure of the shelter shall be constructed using ISMC (1501125)/ISMB (100) welded properly and adequately sized to ensure structural rigidity to prevent deformation during dragging, lifting, loading and unloading of the shelter.
- The roof panels shall be provided with 80 mm thick rock wool insulation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[167]	02.09.2015

7. The analyzer house shall have two doors; one as the main entrance and the other as the emergency exit. The doors are to be mounted on special hinges to ensure gas-tight construction of the shelter. Doors shall be sturdy, double-walled, insulated with rock wool and open to the outside. Each door shall have a window with transparent toughened safety glass. The main entrance shall carry a plate indicating the Plant/Unit number and the tag- list of all the analyzers inside the shelter.
8. All tubes and cable entries to the shelter shall be through Multi-cable Transit Blocks - to ensure gas tightness of the shelter.
9. The floor is to be fabricated with anti-slip sheet and sealed continuously to ensure no loss of pressure.
10. Analyzer Shelter shall meet the standards of the Uniform Building Code with the following design loads:
 - a) Roof : 20 lb. / sq ft live load
 - b) Wind : 35 lb. / sq ft at 0-30 ft above grade elevation.
 - c) Seismic Zone : As applicable for the site

12.3.2 Painting

1. Preliminary cleaning involving removing of grease, oil, paint and dirt, which prevent pickling acid from coming in contact with the scale or mist.
2. Structural painting shall include scraping, chemical cleaning, one coat of etch primer, one coat of Epoxy Zinc Chromate Red Oxide primer and two coats of Epoxy finish Paint. The surface coating shall take sufficient care of removing all the contaminants thus ensuring against premature and complete coating failure. Precautions to be taken to avoid air bubbles and uneven coat thickness.
3. The internal walls shall be powder coated.
4. Painting for the shelter shall be completed in every respect before despatch. No painting shall be done at site except touch-up of scratches made during site erection.

12.3.3 Environmental Conditioning

Analyzer shelters shall be environmentally conditioned to keep the inside atmosphere of the shelter at a constant temperature of 24 degree \pm 3 deg. C. to obtain repeatability and reliability of the analyzers and also a comfortable working environment for workman. For this purpose either a 'Skid Mounted' type air conditioning unit or 'Split Type' air conditioner shall be provided.

12.3.4 Illumination

1. Illumination level in the shelters shall be at a minimum of 300 lux at 750mm elevation inside the shelter. Maintenance factor shall be 0.65.
2. External Dome type lighting shall be under the overhangs to provide sufficient illumination for maintenance work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[168]	02.09.2015

3. Power switches for internal and external lighting shall be provided near to the main entrance on the outside of the shelter.

12.3.5 Other Requirements

1. Fire Detection & Protection: Necessary fire detection & protection measures for the analyzer shelter shall be provided as per NFPA requirement.
2. Power distribution board for distribution of power for all individual consumers such as individual analyzers, auxiliary equipment inside and around the shelter, lighting receptacles shall be provided. Each of the main systems shall have an individual isolation circuit breaker mounted next to the individual power users
3. Telephone connection shall be provided inside the shelter.

12.4 Technical Requirements of Analyzers

Table 12.2

Specifications for carbon monoxide (CO) analyzer

S.N	Features	Minimum Requirements
1	Type of Instrument	In-Situ Type
2	Principle of Measurement	IR absorption
3	Measurement Range	0-200, 0 – 1000 ppm programmable
4	Accuracy	+/- 2% of F.S
5	Linearity	+/- 1% of F.S
6	Repeatability	< /= 0.5% of Span
7	Response Time	Less than 3 seconds to 90% of final value
8	Zero Drift	< 1% span/week
9	Span Drift	< 1% of measured value/week
10	Operating Temperature Range	0 – 300 °C
11	Purging System	Purging System to be provided with heavy duty blowers & shutter mechanism for automatic isolation of lens during purge air failure.
12	Diagnostic	<ul style="list-style-type: none"> • IR light transmittance • Intensity Indicator • Detector Level Indicator • Microprocessor Status Indicator • Calibration check

13. VIBRATION MONITORING SYSTEM**13.1 General**

1. The vibration monitoring system shall provide health of rotating machines on continuous on-line basis and shall guide the plant maintenance personnel regarding the nature of fault and the maintenance action required.
2. The system to be provided shall include all necessary hardware, software, firmware and interfaces, all special and field signal cabling required for implementing a fully functional system. System shall include but not limited to the details specified in subsequent paragraphs/Clauses.
3. Vibration monitoring system shall be independent for each unit.

13.2 Design & Functional Requirements

1. The vibration monitoring system shall provide condition monitoring the bearings of all critical machines, equipments with HT drives and their driven equipment. These shall include but not limited to the following:
 - a) ID Fans
 - b) FD Fans
 - c) PA Fans
 - d) Any other device with HT motor
2. The vibration monitoring system shall be complete with vibration sensors, Key Phasor sensors, signal conditioning cards, amplifiers, special cables, vibration monitor (if required) etc. together with all necessary equipment and accessories.
3. Vibration sensors shall be provided for measurement in both X (horizontal) and Y (vertical) axis at 90° angle to each other for each bearing.
4. For bearings of high speed machines (= / >1500 rpm) accelerometer type sensor and for low speed machines (<1500 rpm) velocity type sensor shall be provided.
5. Necessary, one or two stage integrators for obtaining vibration measurement in terms of displacement shall be provided in the system.
6. Vibration monitoring system shall provide the vibration measurement in the form of 4 - 20 mA DC signal to be directly connected by hardwired cable to plant DCS for monitoring. Limit value generation (soft) for alarm and protection applications for the auxiliaries and their drive equipment shall be carried out in DCS or applicable control system (PLC).
7. Vibration monitoring system shall be an independent microprocessor based system (PC based). The system shall be interfaced with Plant DCS system through redundant communication link in addition to hardwired signal exchange. The system shall interface with plant DCS for any process signals which may be required to perform condition monitoring functions through soft link.
8. The Vibration Monitoring system shall have Following minimum features:
 - a) Bar graph and point display indicating the set points.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[172]	02.09.2015

- b) Graphical plant and machine area representation with location of sensors and the current value.
 - c) Diagnostic of the system and sensors. Alarm to be retransmitted to DCS.
 - d) Current and history trend with resolution of 10 msec.
 - e) Spectral band and waveform plotting
 - f) Multiple trends display including process value for data correlation.
 - g) Orbit and time base plotting.
 - h) Shaft centreline plot indicating position of a machine rotor.
 - i) Bode and polar plot.
 - j) Date and Time stamped alarm list.
 - k) Log and Report generation.
 - l) Provision for beeping icon in case of appearance of alarm.
 - m) Export and import of DCS data. Both way redundant communication links with the DCS shall be provided.
 - n) Electronic documentation.
9. The system shall have facility to store bulk data for 5 years duration with facility for retrieval of the same. The system shall have facility to share all the data in the hard disk/ back up media and provide user friendly utilities to retrieve and analyze stored data.
10. Data collected in the system shall also be accessed by CMMS resident on the Station LAN for condition based maintenance.
11. The system shall be time synchronised with GPS based master clock.
12. The vibration transducers shall be installed in accordance with API-670 requirements.
13. Two nos. (One for each unit) vibration monitoring cum programming stations shall be provided in Central Control Room.

13.3 Technical Requirements

13.3.1 Vibration Sensors

1. Inductance/ piezoelectric type transducers shall be used. The sensors shall be either velocity or accelerometer type. However, the sensor type shall be selected taking into consideration equipment manufacturer's recommendation. Vibration sensors as recommended by main equipment manufacturers shall be installed both in horizontal (X) and vertical (Y) directions at each bearing housing of pump and motor. One number key-phasor (proximity type) shall also be provided for each equipment i.e. Pump/ Fan.
2. The vibration sensors shall have wide frequency response to monitor the harmonics and be housed in stainless steel enclosure conforming to protection

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[173]	02.09.2015

degree of IP-67. Sensor shall be provided with all accessories like mounting pad/cube, Low noise cables & conduits, Extension cables, Junction boxes, Prefab connectors etc.

- Vibration transducers shall be complete with all required pre-amplifier / driver/charge amplifier as necessary for proper operation of the entire vibration monitoring system.

Table 13.1
Specifications for Vibration Sensor

S.N	Features	Minimum Requirements
1	Sensitivity	4 mv/mm/sec
2	Measurement range	0 to 25.4 mm/s pk
3	Frequency Range (+/- 10%)	3 – 1000 Hz
4	Resolution	0.1 mm/s pk
5	Linearity	+/- 1%
6	Temperature Range	0 – 60 °C
7	Sensing Element	Ceramic
8	Sensing Geometry	shear
9	Housing material	SS 316
10	Sealing	Welded hermetic
11	Electrical connection type/ position	Molded Integral cable / Top
12	Excitation Voltage	12 – 30 V DC
13	Cable type/length	Polyurethane/ 10 ft.

Table 13.2
Specifications for Key Phasor Sensor

S.N	Features	Minimum Requirements
1	Type	Proximity non-contact type
2	Sensitivity	200 mv/mil
3	Measurement range	0 to 20 mil
4	Frequency Range	0 – 10 KHz
6	Linearity	+/- 1%
7	Temperature Range	0 – 60 °C
8	Probe tip material	Polyphenylene sulfide
9	Probe body material	SS 316
10	Electrical connection type/ position	Molded Integral cable 1 metre length with connector for extension / Top
11	Excitation Voltage	24 V DC from monitoring unit
12	Cable type	Polyurethane

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[174]	02.09.2015

13.3.2 Vibration Monitors/ Signal Conditioning Modules

1. The vibration monitors/ modules shall be micro-processor based with extensive self diagnostic facility. Monitoring module shall be fully software configurable.
2. One buffered 4-20 mA signal for connection to Plant DCS, and one buffered raw signal for use in vibration monitoring system shall be made available from each measuring point channel of monitor/ module. The signal shall be suitable for use as an input to DCS for analog monitoring, linear in proportion to vibration velocity as well as displacement. Monitor shall provide vibration indication calibrated in velocity units along with provisions of changing to displacement unit (field-programmable) for each measurement point in both horizontal & vertical planes.
3. Monitoring modules shall allow "hot" insertion or removal.
4. The maximum no. of channels per monitor/ module shall be four. The allocation of channels shall be such that loss of one monitor shall not affect more than one side of the bearing of one machine.
5. Sensor fault, monitor fault, power supply fault monitoring shall be provided. On sensor fault / wire break in the sensor circuit, the system shall have the feature of identifying the same through suitable means like the output being forced to a value less than 4 mA, to enable 'bad' signal detection. In case, such a feature is not available, then suitable contact shall be provided from the monitor for sensor fault/ wire break in sensor circuit.
6. Programmable high pass and low pass filtering facility shall be available to improve the frequency response.
7. All the calibration of the monitors/ modules and transducers shall be possible from the front panel.
8. All incoming and outgoing signals shall be connected through a terminal block or connection mounted at the back of the monitor.
9. In addition to the above, the monitor/ module shall contain all other required signal conditioning devices and accessories required for proper functioning.
10. Sensitivity of vibration monitoring module shall be 100 mV/mil or better
11. The Vibration monitoring system shall have an accuracy of +/- 1 % of Full Scale.
12. Input frequency shall be user programmable.

13.3.3 Power Supplies

1. System shall have provision to receive two numbers 230 V, 50 Hz feeders from purchaser UPS, further conversion and distribution shall be in done as per scope. If required, redundant external Power supply shall be provided to ensure that failure of one power supply shall not affect any monitoring function in the system. Also any power supply failure/ earth fault in any of the monitors shall be isolated without affecting other monitors/ common power supply. However, if any power supply modules internal to the monitors are envisaged, the failure of one such module should not affect more than one monitor.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[175]	02.09.2015

2. Power supply monitoring feature with suitable indication and external alarms shall be provided.

13.3.4 Cables, Conduits & Junction box

1. Each transducer shall be furnished with low noise cable in flexible conduit, as indicated earlier, in actual length as required. Conduit fittings shall be furnished or connection to vibration transducer. The other end of the flexible conduit shall be connected to a suitable junction box. The flexible conduit shall not be directly terminated to the vibration transducer to avoid any damages due to vibration. Pre-wired plug-in- type connector shall be provided for connection of the low noise cable to the vibration transducer. Terminals shall be provided for terminating the low noise cable to the junction box.
2. Provision of suitable canopy on the JB and panels installed in open area shall be provided.

Table 13.3

Specifications for Flexible Conduits

S.N	Features	Minimum Requirements
1	Type	Stainless steel flexible conduit
2	Material	AISI 304
3	Formation	Single overlapped/Square Locked
4	Minimum Bending Diameter	75 mm
5	Flexibility	Should not be permanently distorted when bent in complete turn round on a cylinder of 75 mm diameter.
6	Tensile strength	400 N or better
7	Diameter & length	As per requirement

13.3.5 Programming Functions

Suitable means shall be provided for programming the components of the system. This shall include range change, set point change, sensor fault detection/ monitoring related functions etc.

13.3.6 System Cabinet/ Monitor Racks

1. The system mounting rack shall preferably be 19" EIA rack mount for monitor based systems. The system mounting rack shall house monitor modules, indicating units, power supplies. Rack shall be fully factory wired up to rear terminal block. The Internal arrangement shall take into consideration aspects of access/ ease of maintenance etc.
2. Panel shall be provided with necessary Isolation transformers, MCBs, switch etc. Power and signal cable shall be routed in separate raceways.
3. All necessary accessory items and electrical materials shall be installed in the monitoring panels as required for completeness of the panels. These shall include but not be limited to the following:
 - a) Terminal blocks with identification tags.
 - b) Terminal lugs and wire markers at both ends of all wires.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[176]	02.09.2015

c) Panel hardware including vibration isolating devices

d) Grounding bus

4. Incoming cables from the field shall be terminated in suitable terminal blocks in logical sequence.
5. Each vibration monitor and mounting rack shall have nameplate engraved to indicate the main equipment to which the module is catering and the bearing details.
6. In case of monitor based system, the front door shall be of glass, for the portion where the monitors are mounted to enable viewing of the same.

13.3.7

Wiring

1. All instrument wiring used within the panels shall conform to NEC and NEMA standards and shall be factory installed and tested at the works.
2. Signal circuit shields shall be grounded at the system cabinet end only or as recommended by manufacturer.
3. All internal wiring (except low level instrument wiring) shall be National Electric Code Type SIS, Polymeric / Elastomeric insulated, copper stranded conductor & switchboard wire.
4. Panel wiring shall have a flame resistant insulation with adequately sized copper conductor based on current carrying capacities as set forth by the National Electric Code.

13.3.8

Terminal Blocks

1. For all inputs to the system emanating from the field or "others" systems, the system shall be furnished with screw less cage clamp type terminals suitable for core size of 0.5/1.5 square mm. stranded conductor.
2. At least 20 per cent spare unused terminals shall be provided, for circuit modifications and for termination of all conductors in a multi conductor control cable

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[177]	02.09.2015

14. FIELD INSTRUMENTS & FINAL CONTROL ELEMENTS**14.1 General Requirements**

1. All instruments shall be of proven reliability, accuracy, repeatability requiring a minimum of maintenance. They shall comply with the acceptable international standards.
2. Every panel mounted instrument requiring power supply shall be used with a pair of easily replaceable glass cartridge fuses of suitable rating. Every instrument shall be used with a grounding terminal and shall be suitably connected to the panel grounding bus.
3. All local gauges as well as transmitters, sensors, and switches for parameters like pressure, temperature, level, flow etc. as required for the safe and efficient operation and maintenance as well as for operator and management information (including all computation) of equipment shall be used.
4. The necessary root valves, impulse piping, drain cocks, gauge-zeroing cocks, valve manifolds and all the other accessories required for mounting/erection of these local instruments shall be furnished, even if not specifically asked for, on as required basis. The contacts of equipment mounted instruments, sensors, switches etc. for external connection including spare contacts shall be wired out in flexible/rigid conduits, independently to suitably located common junction boxes. The proposal shall include the necessary cables, flexible conduits, junction boxes and accessories for the above purpose. Double root valves shall be used for all pressure tapings where the pressure exceeds 40 kg/sq cm.
5. For protection purposes, transmitters can be considered in place of switches.

14.2 Pressure / Differential Pressure / Flow / Level Transmitter**Table 14.1****Specifications for Pressure / Differential Pressure / Flow / Level Transmitter**

S.N	Features	Minimum Requirements
1	Type	Microprocessor based 2 wire type, HART protocol compatible
2	Sensor Type	Capacitive/ Piezo-electric
3	Output Signal	4-20 mA signals superimposed with HART signal.
4	Signal Processing Unit	Microprocessor based
5	Overpressure	150% of max. operating pressure. For vacuum service, the element shall have under – range protection to full vacuum
6	Turn-down Ratio	10:1 for vacuum / very low pressure applications. 100:1 for other applications.
7	Stability	± 0.1% of calibrated span for six months up to 70 Kg/cm ² and ± 0.25% for range more than 70 Kg/cm ² (g).
8	Span and Zero drift	± 0.015% per deg. C at max span & 0.11% per deg. C at min. span.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[178]	02.09.2015

S.N	Features	Minimum Requirements
9	Enclosure Class	Weather proof as per IP 67 with corrosion resistance coating. For hazardous area explosion proof enclosure as described in NEC article 500
10	Zero & span adjustability	Continuous, tamper proof, remote as well as manual from instrument with zero suppression and elevation facility.
11	Local Indicator	To be provided
12	Display	Digital LCD Integral Display (minimum 5 digit) Engineering Unit
13	Process connection	½ " NPT (F)
14	Electrical Connection	½ " NPT
15	MOC of Electrical Housing	Aluminum Alloy or better
16	Ambient Temperature	65 Deg. C
17	Operating Voltage	16 – 48 Volts DC
18	Load	600 Ohms (minimum) at 24 Volts DC
19	Accuracy	± 0.075% of span or better
20	Response Time	100 millisecond or better
21	Adjustment/ calibration/ maintenance	Port/provision for Centralised PC based system maintenance.
22	Diagnostic	Self Indicating feature
23	Accessories	Diaphragm seal, pulsation damper, siphon, 3-valve or 5valve manifolds.

1. All transmitters shall be equipped with all necessary accessories like valve manifolds, mounting bracket etc. Pulsation dampeners shall be used where the process media is unstable for measurement such as at the discharge of a pump. For absolute pressure transmitter, 2 valve manifold; for gauge / vacuum pressure transmitter, 3 valve manifolds and for DP / level / flow transmitter, 5-valve manifold shall be provided. In case if it becomes necessary to use a DP transmitter for pressure measurement then a 3 valve manifold shall be used in place of 2 valve manifold.
2. Pressure transmitter shall have easily accessible span, zero and time constant adjustments. A range suppression / elevation device shall be used wherever required.
3. For pressure / differential pressure transmitter, proof pressure shall be 200% of maximum static process pressure.
4. All transmitter cases shall be dust – tight and rugged. Weather – proof and explosion – proof cases shall be used in outdoor and hazardous areas respectively. Protection clause shall be of IP 67 or better.
5. Transmitters for pressure / DP measurements of liquid and steam shall always be installed below the sampling point, preferably with the connection at the top.
6. Transmitters for pressure / DP measurements for gases and air shall always be installed above the sampling point, preferably with the connection at the bottom.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[179]	02.09.2015

7. Transmitters with diaphragm seal system shall be considered when
 - a) The process temperature is outside of the normal operating ranges of the transmitter and cannot be brought into those limits with impulse piping.
 - b) The process is corrosive and would require frequent transmitter replacement or unusual materials of construction or
 - c) The process contains suspended solids or is viscous and may plug the impulse piping or
 - d) There is a need to make density or interface measurements or
 - e) The process medium may freeze or solidify in transmitter or impulse piping.
8. Diaphragm seal shall be either capillary type or direct mounted type depending upon the application. Parts below the diaphragm shall be removable for cleaning. The entire volume above the diaphragm shall be completely filled with an inert liquid suitable for the application.
9. Differential pressure type level transmitters shall be used for range above 1219 mm, for services requiring purge or where liquid might boil in external portions.
10. Differential pressure type level transmitters for use on corrosive service shall generally be diaphragm wafer with extended filled capillary type. Flush or extended diaphragm type DP transmitter shall be considered for special application. Diaphragm material shall normally be stainless steel or any other special alloy.
11. Differential pressure type flow transmitters shall have in-built square-root extractors.

14.3 Temperature Transmitter

Table 14.2

Specifications for Temperature Transmitter

S.N	Features	Minimum Requirements
1	Type	2-Wire, Smart (HART)
2	Output Signal	4-20 mA signals superimposed with HART signal.
3	Signal Processing Unit	Microprocessor based
4	Accuracy	± 0.075 % of span or better
5	Local Indicator	To be provided
6	Display	Digital LCD Integral Display (minimum 5 digit) Engineering Unit
7	Input	Ohm input from Pt-100 RTD/ mV signal from thermocouples

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[180]	02.09.2015

S.N	Features	Minimum Requirements
8	Stability	± 0.1 % of reading or 0.1° C, whichever is greater, for 24 months for RTDs. ± 0.1 % of reading or 0.1 °C, whichever is greater, for 12 months for thermocouples
9	Output	4-20 mA DC, linear
10	Load	600 Ohms (minimum) at 24 Volts DC
11	Power Supply	24 VDC, 2- Wire Loop Power
12	MOC of Electrical Housing	Aluminum Alloy or better
13	Enclosure Class	Weather proof as per IP 67 with corrosion resistance coating. For hazardous area explosion proof enclosure as described in NEC article 500

- The temperature transmitter of following types (2-wire Loop Powered temperature transmitter) compatible with thermocouples and RTDs shall be used. Cold junction temperature compensation of the thermocouples shall be performed in the temperature transmitter itself.

Single Input DIN-rail mounted Temperature Transmitter

These shall be suitable for mounting on DIN-rails in Panels/JBs in air conditioned room. This temperature transmitter shall be the ones which are especially designed for DIN-rail mounting with IP 20 protection class. These shall have terminals for input/output provided on front side when mounted on DIN-rail. Head mounted temperature transmitter with clamps to make it suitable for DIN-rail mounting shall not be acceptable under this category.

Dual-input Temperature Transmitter with Indicator

These shall be suitable for mounting on pipes/ supports. Indicator shall be used with these transmitters. These transmitters shall have bump-less change over facility to second sensor in case first sensor fails .This changeover is to be alarmed. Protection class shall be IP67 minimum.

- Transmitters shall be used with following features:
 - Sensor drifts alarm for sensor failure prediction
 - Differential & average temperature measurement if required.
 - Automatic switch-over to back-up sensor on primary sensor failure.
 - Accepts any combination of two sensor types (RTDs, T/Cs, mV or ohms)
 - Ambient temperature compensation
 - Fault detection for electronics & sensors with fail-safe alarming.
 - Provision of built-in CJC

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[181]	02.09.2015

3. Transmitters to be used for RTD sensors shall be used with RTD EMF correction features so that it shall detect and eliminate EMF errors which are the result of small voltage produced by RTD sensing elements.
4. The product and make shall be selected so that with one make of transmitter all applications with respect to measuring range, temperature sensor (resistance thermometer / thermocouple) and connection type (2/3/4) wire connection of resistance thermometers) shall be covered.
5. Transmitters shall be capable of communication with HART (Highway Addressable Remote Transducer) communicator. HART communicator shall be used with transmitters for tuning / configuring / diagnosing / maintenance of the transmitters. It shall meet the intrinsic safety requirement if required depending upon the application.
6. All transmitters' cases shall be dust-tight and rugged. Weather-proof and explosion-proof cases shall be used in outer and hazardous areas respectively.

14.4

Thermocouple

Table 14.3
Specifications for Thermocouple

S.N	Features		Minimum Requirements
1	Wire Gauge		16 AWG (for K type) 24 AWG (for R type)
2	Protective tube		O.D. 8 mm Material SS 316 seamless Filling – Compacted Magnesium Oxide (Purity above 99.4)
3	Loading		Shall be spring loaded to ensure positive contact with the well. Prevention of rotation of the insert with respect to head and resultant twisting of leads shall be ensured.
4	Accuracy		As per ANSI MC 96.1 / IEC 751 / IS-2054 / 2055.
5	Characteristic		Linear with respect to temperature within +/- ½ per cent of top range value.
6	Reference		For temperature vs. mV characteristics, following IS shall be applicable : Type K IS – 2054 Type R IS - 2055
7	Head	Type	IP-65 universal screwed type (Explosion proof for NEC class-1, division-1 area)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[182]	02.09.2015

S.N	Features		Minimum Requirements
		Material	Die-cast aluminium or better material painted with black enamel paint.
		Terminal Block	Brass screw type / silver plated on ceramic head.
		Cable Connection	½ " NPT gland & grommet
		Cover	Screwed cover with suitable gasket & SS Chain
8	Instrument connection to Well		½ " NPT
9	Accessories	a)	Adjustable nipple-union-nipple {1/2" Sch. 80 X1/2" NPT (M)} with thermowell connection
		b)	Compression fittings/union
		c)	Flanges etc. (For flanged connection only)
		d)	SS 316 forged/barstock thermowell as per ASME PTC code. Process connection M33X2 (M) in general or 1 ½ " Flanged for Flue gas/ Furnace air etc. application

- The following types of sensors shall be used for the different temperature ranges:
 - For measurement of temperatures of up to max. 1100 °C, rapid-responded sheathed thermocouples with insulated tip, 16 AWG wire, as Chromel-Alumel (NiCr-NiAl, ISA type K) measuring element, with admissible deviation of thermo voltage of half the values stated in IS-2054, or DIN 43710.
 - For measurement of temperature between 1100°C and 1300°C, 24 AWG, Platinum Rhodium (13%) – Platinum (ISA type R) measuring elements, with admissible deviation of thermo voltage of half the values stated in IS-2055, or DIN-43710.
- All thermocouples shall be duplex type with tip grounded. Thermoelectric properties and accuracy shall be as per ANSI MC 96.1 / IS-2054 / 2055.
- The design of thermocouple assemblies shall be such that replacement on line is possible.
- Gas-tight ceramic sheaths partially reinforced with stainless steel sheath shall be used as protective tube for Pt Rh – Pt thermocouples. For other type of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[183]	02.09.2015

thermocouple stainless steel tubes shall be used as protective sheaths. For measuring temperature of high pressure process fluid, tapered protection sheath made from solid bar stock shall be used.

5. The time-constant of thermocouples shall suit the process requirement.
6. The thermocouples shall be supplied with factory tested and calibrated assemblies. The assemblies shall be complete with thermo well, sensing element, connection lead, duplex terminal block, extension nipple, compression fittings / unions / flanges etc. to meet all functional requirements. The thermocouples equipped with thermo well shall be spring loaded for positive contact with the well.
7. The duplex terminal block shall be constructed with high temperature ceramic base with brass screw type terminals.
8. Thermocouple shall be suitable for steam, water or any other liquid application. For air & flue gas service, suitable protection tubes shall be used for the thermocouples.
9. All thermocouples shall be terminated to the nearest junction boxes. The cold junction compensation shall be implemented within the measuring module level, no local/ field cold junction compensation box is allowed.

14.5

Resistance Temperature Detector (RTD)

Table 14.4

Specifications for RTD

S.No.	Features	Minimum Requirements
1	Type	3 / 4 wire , Pt-100 (100 ohm at 0 deg C) (as per DIN 43760)
2	No. of Element	Duplex
3	Housing/Head	IP-65/Diecast Aluminium. Plug in connectors are to be provided for external signal cable connection
4	Sheathing of RTD	Metal sheathed , mineral insulated, ceramic packed
5	Calibration and accuracy	As per DIN-43670 Class-A for RTD
6	Stability	Zero & span drift within 0.1% of span for a 6 month period.
7	Characteristic	Linear with respect to temp, within $\pm 1/2$ percent of top range value
8	Standard	As per DIN-43670 for RTD & ASME PTC-19.3 for Thermowell
9	Accessories	a) Adjustable Nipple-Union-Nipple with thermo well connection / plug in connectors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[184]	02.09.2015

S.No.	Features	Minimum Requirements
		b) Compression fittings / unions
		c) Flanges etc.
		d) Thermowell as per requirement

1. RTDs shall be of duplex, platinum three / four wire type with a nominal resistance of 100 ohms at 0°C and conform to DIN 43760 / BS 1904.
2. Stability of RTD over full range shall be better than 0.05 ohms and the repeatability figure shall be better than 0.02 ohms. Accuracy shall be of the order of 0.15% or better and response time shall be less than 20 seconds with thermo well.
3. The protective-sheath material shall be SS 316, seamless tubes using compacted magnesium oxide packing for insulation. The insulation resistance at 540°C shall not be less than 5 mega-ohms.

14.6

Metal Temperature Thermocouple

Table 14.5

Specifications for Metal Temperature Thermocouple

S.No.	Features	Minimum Requirements
1	Measuring medium	Metal Temperature
2	Type	K-Type
3	Wire Gauge	16 AWG
4	No. of Element	Duplex with separate hot junctions, ungrounded type
5	Sheathing/Insulation/Dia.	Metal sheathed (SS 321) , mineral insulated (Magnesium oxide), ceramic packed, 8 mm Dia.
6	Bending Radius	30 mm (minimum)
7	Cold End Sealing	SS pot seal with color coded PTFE headed sleeve insulated flexible tails. Sealing compound – Epoxy Resin
8	Standard	ANSI MC 96.01
9	Thermocouple Length	30 Mtrs. (minimum)
10	Accessories	1/2" BSP SS sliding end connector, weld pad, weld on clamps of heat resistant steel SS310.

1. For metal temperature measurement, care shall be taken for proper contact with metal surface. The thermocouples sheath for metal temperature measurement shall have to be thermally insulated to avoid radiation / conduction / convection

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[185]	02.09.2015

loss. Thermocouple assembly for metal temperature measurement shall suit the functional requirement.

2. The thermocouple shall be attached to the heater tube surface by being furnished with stainless steel welding pads or by the use of thermocouple attachment blocks. The multiple holes in these blocks shall allow for spare thermocouple element for quick replacement.
3. For boiler metal temperature measurement, the lead wires shall have to be brought into nearest Junction Boxes which are located in accessible safe zones, using suitable protection pipes.
4. For measurement of wall temperatures at boiler tubes, sheathed thermocouples, dia 3.0 mm NiCr-Ni single thermocouples shall be used. The thermocouple line shall be designed as Teflon-insulated stranded conductor, provided with glass filament insulation and stainless steel wire braiding. The thermocouple shall be welded to the compensation line outside of the boiler insulation, with the welding point spilled hermetically in a coupling element. The area of the boiler penetration shall be designed with an anti-kink spring of stainless steel and a line-fixing sleeve of stainless steel, encapsulated in synthetic resin.
5. The differential temperature "inside / centre" of the wall shall be measured by means of sheathed thermocouples NiCr-Ni, dia 3.2 mm. For this special protective sleeve shall be used. Particular emphasis shall be put on compliance with the stipulated depth of the bores in the tube wall material.
6. For detection of leakage of various drain valves, drain pipe metal temperature thermocouples and for SH, RH metal temperature thermocouples shall be used.

14.7

Cold junction Compensation (CJC) Boxes

Table 14.6A

Cold Junction Compensation (CJC) Boxes

S.No.	Medium	MOC
1	Reference Temp	60°C (+/- 1.3°C) for type K thermocouple 60°C (+/- 2°C) for type R thermocouple
2	Effect of ambient temp. variation	+/- 0.1% per 10°C
3	Material	4 mm thick fiberglass reinforced polyester with polyurethane paint and glazed finish
4	Protection class	IP 55
5	Cable entry	Bottom with gland plate suitable for cable used along with blanking facility.
6	Temp. Control	Automatic with remote temp. monitoring
7	Power supply	24VDC

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[186]	02.09.2015

14.8 Thermowell for Temperature Elements

1. The design of the thermo well shall take into consideration the temperature, pressure, medium and fluid velocity specified in the process in accordance with ASME Standard PTC 19.3.
2. Thermo wells shall, in general, be of SS 316 and shall be drilled from bar stock except for air and flue gas services. However, selection of thermo well material shall be as per following guideline.
3. Welded type thermo wells with 38 mm O.D. for welding & ½" NPT internal threads shall be used for pressure above 100 kg / sq cm or temperature above 400 deg C. Socket weld type thermo well with 34 mm O.D. for welding & ½" NPT internal thread, shall be used for pressure between 40-100 kg/cm² and temperature up to 400°C. Screwed type thermo wells with ½" NPT internal threads & M33X2 (M) outer threads shall be used for pressure below 40 kg/cm² and temperature below 400°C. For pipes having probability of prolonged vibration, seal welding may be done all around after tightening the thermo well within the base.

Table 14.6B

Thermowell MOC Selection

S.No.	Medium	MOC
1	Preheater	Black Steel, SS446
2	Steam lines	SS 316 and pipe material compatible for high temperature steam
3	Water lines	Low carbon steel/ SS316
4	Boiler Tubes	SS304 / SS309 / SS310

4. Thermo well manufacturing drawing covering material specification, dimensional details, details of special treatment, finish etc. as well as test procedure. Material certificate shall have to be furnished for each thermo well.
5. Wherever any approval is necessary from any recognized body / authority during manufacturing of high pressure wells.
6. The thermo well immersion depth (U) shall be sufficient to eliminate conduction error. A general rule which may be followed is to use an immersion length equaling a minimum of 10 times the diameter of the protective tube or well. In general, immersion length of thermo wells for different line sizes shall be as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[187]	02.09.2015

Table 14.6C
Thermowell Immersion Length

S.No.	Line Size	Immersion Length
1	From 4" to 6"	65 mm
2	From 8" & onwards	140 mm
3	Vessels	400 mm

14.9

Pressure Gauge/ Differential Pressure Gauge/Draft Gauge

Table 14.7
Specification for Pressure Gauge/ DP Gauge/ Draft Gauge

S.No.	Feature	Minimum Requirement
1	Type	Bourdon / Bellows / Diaphragm
2	Sensing Element Material	AISI 316 SS
3	Movement Material	AISI 304 SS
4	Case Material / Protection Class	SS / IP 65
5	Dial Size	150 mm For Special application like drum pressure, Main Steam pressure etc. 250 mm shall be used
6	Scale	Black lettering on white background in 270 °C arc
7	Range Selection	Normally operate at 75% of its maximum pressure range. Instruments measuring varying pressures shall operate in a band of 60% of its maximum pressure range.
8	Over range Protection	150% of maximum range by internal stop. External stop below zero.
9	Adjustment	External Micrometer screw for zero adjustment. Internal micrometer screw for range adjustment.
10	Stop at Max. Reading	Shall be used
11	Element Connection	Argon welding
12	Process Connection	½" NPT(M) bottom connection for local mounting, back connection for panel mounting
13	Accuracy	+/- 1.0 % of full scale or better
14	Operating Ambient Temperature	50 °C (Max. continuous)
15	Safety Feature	Neoprene Safety Diaphragm (Blowout disc) at the back
16	Window	Shatter-proof glass
17	Chemical Seal Unit	SS 316 Flange and Diaphragm, PTFE coated / block, Silicon Oil filling fluid
18	Accessories	Snubber for pulsating fluid applications / 3-

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[188]	02.09.2015

S.No.	Feature	Minimum Requirement
		way gauge cock / 2-valve manifold / Pigtail / Siphon for steam service / Gauge Saver, if maximum or Design Pressure is very high than the Operating Pressure / Counter Flanges / Bolts, Nuts, Gaskets / SS Tag Plate

1. Directly connected pressure measuring instruments shall be diaphragm, bourdon or bellow type elements depending upon the services conditions. In general, diaphragm elements shall be used in the range of 0 to 1000 mm water column pressure, bellow type element for ranges of 0 to 1 Kg/cm² and bourdon type element for ranges greater than 1 Kg/cm².
2. Primary element material shall be corrosion resistant to process fluid or diaphragm seals shall be used for protection.
3. For draft measurement Teflon coated beryllium copper diaphragm shall be used.
4. Snubber shall be floating pin type, externally mounted and externally adjustable. It shall be used for all pulsating services.
5. Diaphragm seals, filled type or mechanical type shall be furnished where plugging of the element may occur or where suitable material is not available in highly corrosive services. When chemical seals are required, they shall be the clean out type with flushing connection.
6. Over-range protection shall be used to at least 150 % of range. For vacuum service, the element shall have under-range protection to full vacuum
7. Ranges of the gauges shall be so selected that the gauge normally operates in the middle third of the scale and conform to IS 3624 standard dials, wherever necessary.
8. The sensing elements for all gauges shall be properly aged and factory tested to remove all residual stresses and shall be SS 316 with forged socket and tip of the same material. Elements above 70 Kg/sq. cm range shall be bored instead of drawn.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[189]	02.09.2015

14.10 Temperature Gauge

Table 14.8
Specification for Temperature Gauge

S.No.	Feature	Minimum Requirement
1	Type	Mercury filled
2	Sensing Element material	Bourdon AISI 316 SS
3	Movement Materials	AISI 304 SS
4	Case Material/Protection class	SS / IP65
5	Capillary Armouring	SS Flexible
6	Capillary	SS 316 (5 mtr. Length for Local & 15 metre for panel Mounting)
7	Bulb/Stem Diameter	12 mm
8	Dial Size	150 mm
9	Window	Shatterproof glass
10	Scale	Black lettering on white background in 270 °C arc
11	Adjustment	Micrometer screw for zero adjustment. Internal micrometer screw for range adjustment.
12	Pointer	Externally Adjustable
13	Range Selection	Normal Process Temperature – approximately two third of Temperature range.
14	Stop at Max. Reading	Shall be used
15	Over range Protection	150% of FSD
16	Instrument Connection	Bottom connection for local mounting, back connection for panel mounting.
17	Process Connection	½" NPT with Thermowell
18	Performance :-	
a	Accuracy	+/-1.0% of full scale or better
b	Repeatability	Less than 0.5% of full range
c	Response Time	30 seconds (max.) with Thermowell and 15 seconds Bare.
19	Operating Ambient Temperature	50 °C (Max. continuous)
20	Accessories	Mounting brackets, Bolts, Nuts, Gaskets / SS Tag plate, SS Thermowell etc.

- Temperature gauges shall be dial thermometers (liquid spring / steam pressure spring / metal expansion thermometer), either rigid stem or capillary tube depending upon application; if this is not possible for design reasons, industry type liquid – in – glass thermometers shall be used.
- Case shall have back or bottom connection with adjustable gland to permit adjustment of thermometer into the thermo well.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[190]	02.09.2015

3. Thermometer stem adjustable gland with union connection and bushing shall be suitable for ½ inch NPT connection.
4. Bi-metallic type dial thermometer, if used, shall be hermetically sealed, back or bottom connection type, with 150 mm dial.
5. The gauges shall be used with automatic ambient temperature compensation.
6. Scale ranges shall be selected so that normal process temperature in middle two – third of full scale range.

14.11 Level Gauge

Table 14.9
Specification for Level Gauge

S.No.	Feature	Minimum Requirement
1	Sensing Element & material	Tempered toughened Borosilicate gauge glass steel Armored reflex or transparent type
2	Body Material	Forged carbon steel / 304 SS
3	End Connection	Process connection as per ASME PTC and drain / vent 15 NB
4	Accuracy	+ 2 %
5	Scale	Linear vertical
6	Range Selection	Cover 125 % of max. of scale
7	Over Range Test	Test pressure for the assembly shall be 1.5 to the Maximum design pressure at 38 degree C
8	Housing	CS / 304 SS leak - proof
9	Identification	Engraved with service legend or or laminated phenolic Name plate
10	Packing	PTFE Teflon
11	Illumination	220 V, 50 Hz, 25 / 40 Watts either with deflector or diffuser (for transparent type level gauge) / 220V , 50 Hz, 25 /40 Watts with red and green filter for bicolor gauge
12	Accessories	Gasket for all KEL – F shield for transparent type vent and drain valves of CS / SS as per requirement
13	Others	Anti – Frost extension for low temperature service. Heating / cooling arrangement

1. Level gauges shall be steel armoured reflex or transparent or bi –colour type, top and bottom connection as per pressure vessel standard of ASME PTC code and 15 mm NB (1/2 inch NPT) Drain and Vent connection.
2. Body material and cover material shall normally be forged carbon steel, 304 stainlesssteel or other superior material.
3. Reflex type gauges shall be used for clean and colorless liquids and transparent type for other liquids. For boiler and condensate services, treated water, the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[191]	02.09.2015

transparent type with KEL – F shields shall be used to avoid their attack on the glands.

4. The gauge glass must have a rating equal to or more than the vessel design pressure and temperature.
5. The maximum length of a single gauge glass shall not exceed 1400 mm. Where large range is required, multiple gauges of preferably equal lengths shall be used with 50 mm over – lapping in visibility.
6. The visibility shall cover the operating level range and the maximum and minimum ranges expected considering start – up conditions as well as alarm and shut down points. Internal heating shall be used for viscous liquids. Integral illuminators shall be used for transparent gauges, if necessary.
7. Stand – pipes shall be used for multi – gauge glass and level controller installation and on horizontal drum or exchanger with top and bottom connections to have visibility of the complete span. The stand pipe shall not be used with block valves.
8. Primary isolation valves shall be used In addition to the gauge glass valves unless otherwise specified. When the process fluid may create lugging or leakage problem, gauge valves may be omitted. For low temperature liquid having high vapor pressure at ambient temperature, isolation and gauge valves shall not be permissible. Safety valve shall be used at the vent connection of the gauge glass where isolation is required.
9. For high pressure service such as boiler water etc., the gauge glass shall be multi – port illuminated type (Bi – colour type). Indication of water space shall be ‘green’ and indication of steam space shall be ‘red’.
10. Bi – colour level gauges shall have following features:
 - a) Temperature equalizing column expansion bend and chain patterned hand – wheel
 - b) Certification by Inspectorate of Boiler

14.12 Pressure/ Differential Pressure Switch

Table 14.10
Specification for Pressure/DP Switch

S.No.	Feature	Minimum Requirement
1	Type	Piston for high pressure application Bellow/Diaphragm for low pressure application
2	Sensing Element material	AISI 316 SS
3	Wetted Parts material	AISI 316 SS
4	Case Material	Epoxy coated Die Cast Aluminium
5	Setter Scale	Black graduation on white linear scale. Graduation 0 – 100% with red pointer for set points.
6	Over range for Pressure / Vacuum Switch	150% of maximum pressure

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[192]	02.09.2015

S.No.	Feature	Minimum Requirement
7	Set Point	Adjustable throughout switch operating range.
8	Static Pressure for Differential Pressure Switch	Maximum Line Pressure or Static Pressure on either side without permanent deformation or loss of accuracy.
9	Adjustments	Internal – set point Differential adjustable feature
10	Process Connection	½" NPT(M) bottom connected
11	Switch Configuration	2 SPDT / 1 DPDT
12	Switch Rating	230 V, 5A AC / 220 V, 0.25 A DC/24 V, 2A DC
13	Switch Type	Snap acting, shock and vibration-proof
14	Cable Connection	½ " ET conduit connections or compression gland
15	Enclosure Class	Weather proof as per IP 65 with corrosion resistance coating.
16	Accuracy	1% of span up to 3Kg/cm ² 0.5% of span for more than 3 Kg/cm ² .
17	Repeatability	0.5% of span
18	Accessories	
a)		Snubber for pulsating fluid application.
b)		Tag Number, service engraved in SS tag plate
c)		Teflon back-up sheath protection, as required.
d)		i) Remote diaphragm seal with SS 316 armored capillary for typical application. MOC of seal material shall be as per process fluid requirement. ii) Silver coated diaphragm for corrosive services like chlorinated water.
e)		Retention ring and screws for surface mounting.
f)		3-way Gauge Cock (SS 316) for PS / 5-Valve Manifold (SS 316) for DPS.
g)		Mounting bracket / Clamp for 2 " pipe, bolt & nut.

1. The pressure switches shall have sensing elements made of copper alloy or stainless steel sealed diaphragm and piston actuated for high pressure service and bellows for low pressure / vacuum service.
2. Low differential pressure switches for low static pressure ranges shall be diaphragm type with snap action switch elements.
3. Low differential pressure switches for high static pressure shall be elbows and torque tube type and snap – action switch elements and metric scale dial indicators.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[193]	02.09.2015

4. For corrosive, viscous process fluids diaphragm sealed with completely filled inert liquid shall be used. Material of diaphragm and wetted parts shall be selected considering the nature of process fluid.
5. The sensing elements shall be properly aged and factory tested to remove all residual stresses. They shall be able to withstand at least 150 % the full scale pressure without any damage or permanent deformation.
6. Actuation set point, dead band shall be internally adjustable throughout the range with tamper proof facilities.
7. Electrical connection for the switch devices shall be suitable for plug in type connection.
8. Process connection shall be ½ inch NPT. Process piping connections shall include necessary union, nut, nipple, tail pipe, isolation valve and test connection to permit servicing, testing, calibration and removal of the instrument device.
9. Instrument for steam & hot water service, shall be connected through siphon, of stainless steel or suitable material. Pulsation dampeners shall be used for all pulsating fluids.
10. Pressure switches shall be tested as per BS – 6134.

14.13 Conductivity Type Level Switch

Table 14.11
Specification for Conductivity Type Level Switch

S.No.	Feature	Minimum Requirement
1	Sensing elements	Conductivity type
2	Material	SS 316
3	Repeatability	± 0.5 % of full range or better
4	Accuracy	± 0.5 % of full scale or better
5	Working temperature	As per process requirement
6	Probe length	As per requirement

10	Rating of contacts	5A, 240 V AC / 2A, 24 V DC / 0.25 A, 220V

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[195]	02.09.2015

S.No.	Feature	Minimum Requirement
		DC
11	Enclosure	IP 65
12	Hydro Test	Chamber – 100% at 1.5 times rated pressure or as per ANSI flange rating Float – 1.1 times of operating pressure
13	Electrical Connection	Plug-in socket
14	Accessories	All mounting accessories

- Level Switch shall work on gland less magnetically coupled float or displacer operated mechanism having separate float chamber.
- Float, stem and displacer shall be 316 stainless steel.
- Level switch body, cage and process connections shall be designed to withstand the maximum pressure and temperature of the operating fluid.
- A setting adjustment on the level set point of + / - 25 mm shall be used. The adjustment shall be made externally to the switch.
- The accuracy & repeatability of the switch shall be within +/- 0.5 % of full-scale range. On – Off differential shall be adjustable.
- Process connections of the cage shall be 25 NB male plain nipples connected through socket / welded isolation valves of adequate rating.
- Level switch connections shall also include 15 NB test and drain connections to permit servicing, testing, calibration of the instrument.
- The switching elements shall be snap-acting, shock-proof and vibration-proof. All switches shall have two electrically isolated SPDT contacts with provision of external adjustment of set points and dead bands. The contact ratings shall be 5 amps at 240 V AC 50 Hz or 0.25 amps at 220 V DC.
- Switch enclosures shall be cast aluminium, weather-proof, NEMA -4X type with cable entry through compression type cable glands / ¾ "NPT conduit connections. Switches located in hazardous areas shall have dust-ignition-proof enclosure as per NEC article 500 provisions.

14.16

Ultrasonic Level Transmitter

Table 14.14
Specification for Ultrasonic Transmitter

S.No.	Feature	Minimum Requirement
1	Application	Level measurement in silos, sump water level etc.
2	Medium	Coarse, hard solid materials like ash etc. Materials may be slowly falling through the detection range.
3	Type	Non contact Microprocessor based 2 wire type, HART protocol compatible Ultrasonic Transmitter

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[196]	02.09.2015

S.No.	Feature	Minimum Requirement
4	Principle	Time of flight
4	Sensor Material	Corrosion resistant material to suit individual application requirement.
5	False signal tolerance	Transmitter shall be capable of ignoring false echoes from internal tank / sumps obstructions such as pipes, heating coils or agitator blades. Also transmitters shall have adjustable damping circuitry.
7	Range	Capable of covering the complete level span of tank/vessel taking care of blocking distance, frequency, attenuation due to surface, obstructions, vapours etc.
8	Output	4 – 20 mA DC with 600 ohms load with HART compatibility.
9	Display	minimum 4 characters display with Integral keypad, access protected by user code.
10	Diagnostics	Loss of echo alarm etc.
11	Resolution	+/- 0.1 % of range or better
12	Accuracy	+/- 2 mm or 0.2% of span
13	Repeatability	3 mm or better
14	Operating temperature	0 to 60° C
15	Power supply	24 V DC + / - 10 %
16	Mounting	Flanged connection at top of covers / side walls as per requirement.
17	Accessories	a) All weather canopies for protection from direct sunlight and direct rain.
		b) For hazardous areas, explosion proof enclosure as per NEC article 500 shall be used.
		c) All mounting hardware and accessories required for erection and commissioning. Mounting fittings material shall be SS 316.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[197]	02.09.2015

1. The power and frequency of transmission for the transmitter shall be selected to assure a sufficient signal / noise ratio.
2. The transmitter shall be designed with an electronic circuit having the features such as temperature compensation, rejection of unnecessary echoes and noises and adjusting 'zero' and 'span'. It shall consist of sensors, electronic unit and accessories.

14.17

Guided Wave Radar Type Level Transmitter

Table 14.15
Specification for Guided Wave Radar Type Transmitter

S.No.	Feature	Minimum Requirement
1	Application	Level measurement of vessel under vacuum or low pressure application
3	Type	Guided wave radar
4	Principle	TDR (Time domain reflectometry)
5	Probe Material	SS 316
6	Accuracy	5 mm or better
7	Resolution	+/- 0.1 % of range or better
8	Signal Output	4 – 20 mA DC with 600 ohms load with HART compatibility
9	Power Supply	24 V DC + / - 10 %
10	Display	Integral
11	Mounting	External cage type
12	Transmitter housing Protection Class	IP-65 with corrosion resistance coating
13	Accessories	a) All weather canopies for protection from direct sunlight and direct rain.
		b) For hazardous areas, explosion proof enclosure as per NEC article 500 shall be used.
		c) All mounting hardware and accessories required for erection and commissioning. Mounting fittings material shall be SS 316.

LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[198]	02.09.2015

14.18 Flow Switch

Table 14.16
Specification for Flow Switch

S.No.	Feature	Minimum Requirement
1	Type	Vane actuated/Differential bellow type
2	Vane/bellow Material	SS 316
3	Repeatability	± 0.5 % of full range or better
4	Accuracy	± 0.5 % of full scale or better
5	Working temperature	As per process requirement
7	Process connection	As per requirement
8	Over-range proof	150% of max. design pressure
9	No. of contact	2 NO. + 2 NC, SPDT, snap action type dry contact, shock & vibration proof
10	Rating of contacts	5A, 240 V AC / 2A, 24 V DC / 0.25 A, 220V DC
11	Enclosure	Cast Aluminium/IP 65
12	Cable connection	Compression type cable gland/ ½" NPT Conduit connection
13	Electrical Connection	Plug-in socket
14	Accessories	All mounting accessories

14.19 Rotameter

Table 14.17
Specification for Rotameter

S.No.	Feature	Minimum Requirement
1	Type	Variable area Linear scale
2	Fluid media	Water/Oil
3	Float Material	SS 316
4	Accuracy	± 2 % of full scale or better
5	Working temperature	0 to 70°C
6	Process connection	As per requirement
7	Over-range proof	150% of max. design pressure
8	Enclosure	Transparent toughened glass/IP 65
9	Accessories	Flange, orifice in case of bypass Rotameter

Rotameter shall be used for low flow & low viscosity applications of liquid.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[199]	02.09.2015

14.20 Sight Glass Indicator (Flow Glass)

Table 14.18
Specification for Flow Glass

S.No.	Feature	Minimum Requirement
1	Application	Online observation of fluid flow in Pipeline
2	Type	Double window for pressurized pipe with rotary wheel for installation in horizontal or vertical pipeline. Full view for non-pressurized pipeline.
3	Size	Double window up to 12" and 600 lbs rating. Full view up to 6" and 150 lbs rating.
3	Body Material	SS 316
4	Glass	Pyrex tempered glass
	Others	Rotor & wetted parts shall be bronze All accessories shall be SS316
5	Protection class	IP-65
6	Connection	Screwed up to 50 NB size Flanged ANSI 150 RF – above 50 NB size
7	Accessories	Name plates, mating flanges with gasket, bolts & nuts etc.

14.21 Flow Elements

a) Orifice Plate

Table 14.19
Specification for Orifice Plate

S.No.	Feature	Minimum Requirement
1	Type	Concentric as per ASME PTC – 19.5 (Part III); ISA RP – 3.2, 960; BS – 1042; ISO 5167
2	Material	SS 316
3	Thickness	3 mm for main pipe diameter up to 300 mm and 6 mm for main pipe dia above 300 mm.
3	Beta ratio	0.34 to 0.7
4	Tapping's	Flanged weld neck 3 pairs of tappings.
5	Material of Branch Pipe	Same as main pipe
6	Root Valve type	Globe
7	Root Valve material	SS 316
8	Root Valve size	1"
9	Accessories	Root valves, flanges, vent / drain hole (as required)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[200]	02.09.2015

1. Each orifice plate shall be used with a handle on which the orifice diameter, pipe diameter and pressure tap distances are stamped. This information shall be so located that it can be read without removing the orifice plate from pipe line.
2. The standard primary element shall be thin plate, square-edge concentric orifice plate mounted between a pair of weld-neck type orifice flanges with flange taps. The minimum pressure rating of flanges shall be 300 pounds ANSI. The material of the orifice plates shall be SS 316 in general. Orifice plates shall be not less than 3 mm thick for nominal pipe diameters up to and including 300 mm, and not less than 6 mm thick above 300 mm NB pipe.
3. Quadrant edge or quarter circle orifice plates shall be used for highly viscous liquids and for pipe Reynolds Number below 10,000. Conical entrance type of orifice plates shall preferably be used for very highly viscous liquids up to Reynolds Number below 250. Vent and drain holes shall be used wherever necessary.
4. Orifice diameter shall be selected, so that d/D ratio is between 0.20 to 0.70 for gas and steam and up to 0.75 for liquids.
5. Metering orifices shall not be installed in lines less than 1 ½" (40 mm) the lines shall be blown to the 1 ½ " (40 mm) size for the meter run, keeping the d/D ratio within limits.
6. Restriction orifices and integral orifice transmitters do not require upstream or downstream straight pipe runs.
7. The orifice plate shall be supplied and fitted in conformity with ISO. When the pipe diameter is larger than the value specified in ISO, the restriction ratio shall be decided by extending the specific curve externally.
8. The length of straight pipe run required for metering accuracy shall be in conformity with ISO. When it is extremely difficult to comply with the standard, a minimum straight length of 10D (D = pipe inner diameter) on the upper stream and a minimum length of 5D on the downstream shall be considered.
9. All orifice plates shall be supplied with matching flanges of material and pressure rating not less than the rating of the associated pipe system.
10. For pipeline sizes of 500 mm and less, the orifice plates shall be an integral unit comprising of carrier ring assembly, tapping arrangement on both upstream as well down stream side. For line sizes more than 500 mm, the orifice plate shall be disc type. For disc type orifice plate, suitable corner tapping arrangement on both upstream as well as downstream side shall be used. All tapping arrangements shall be complete with a piece of impulse pipe line and a shut – off valve suitable for specified line pressure.
11. For steam applications, orifice plate shall be supplied with a pair of steam condensation chambers suitable for specified line pressure.
12. Data sheets, sizing calculation, fabrication & sheets for the elements shall be submitted for approval and finalization.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[201]	02.09.2015

b) Flow Nozzle

Table 14.20
Specification for Flow Nozzle

S.No.	Feature	Minimum Requirement
1	Type	Long Radius welded type ASME PTC 19.5 (Part III) or BS – 1042
2	Material	Same as Pipe material
3	Thickness	Suitable for intended application
3	Beta ratio	Around 0.7
4	Tapping's	D and D/2 (3 nos. tappings)
5	Material of Branch Pipe	Same as main pipe
6	Root Valve type	Globe
7	Root Valve material	SS 316
8	Root Valve size	1"
9	Accessories	Root Valves, Vent & Drain Hole

- The branch pipes for holding the flow nozzle shall also be furnished along with the flow nozzle.
- Flow nozzles in high pressure pipes shall be subject to a test according to DIN 50049, 3.1C, considering the technical guideline. The test of flow nozzles shall contain:
 - Check of drawings
 - X-ray testing of the circular bead or colour soaking or ultra-sonic testing
 - Test of sizes.
- Flow nozzle shall be used with a permanent mark indicating:
 - Measuring point number
 - Direction of flow
 - Plus and minus tapping
 - Material

Moreover, the actual inside pipe diameter "D" and the diameter of the flow nozzle shall be stated on the identification plate.

- The supplier shall provide the following documents:
 - Design drawings of the flow nozzle
 - Calculation documents
 - Fabrication, assembly and installation drawings
 - Test reports.
- For measurements of steam, balancing vessels shall be used. Balancing vessels shall be used for flow measurement in steam system based on the differential

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[202]	02.09.2015

pressure method to ensure a defined water column. The balance vessels shall be arranged on the same geodetic level. If this is not possible for design reasons, the level difference shall be taken into account during calibration

c) Venturi

Table 14.21
Specification for Venturi

S.No.	Feature	Minimum Requirement
1	Design standard	BS 1042/ISO5167
2	Material	SS 316
3	Type	Fabricated Machine Cast
4	Mounting	Flanged
5	Root Valve type	Ball
6	Root Valve material	SS 316
7	Root Valve size	1/2"
8	Accessories	All required mounting accessories & piezometric ring with 4 nos. tapping's for choke removal & screwed cap/plug on the ring

14.22

Oxygen Analyzer

Table 14.22
Specification for Oxygen Analyzer

S.N	Feature	Minimum Requirement
1	Type	In-situ Heated type
2	Principle	Partial pressure using Zirconium oxide cell
3	Sensor Type	Zirconium Oxide cell
4	Measurement Range	0.01 to 10 % O ₂
5	Accuracy	+/- 0.2 % of full scale
6	Linearity	+/- 1% of full scale
7	Response time	3 seconds or less (Up to 90% of full scale)
8	Drift	+/- 0.005% per 2 Deg. Centigrade temp. change
9	Operating Temperature Range	0-1600 *C
10	Temperature compensation	Automatic
11	Sample filter	Ceramic 3.5 micron
12	Zero & Span Adjustment	Required
13	Ambient Temperature	60 *C
14	Indication	Digital
15	Enclosure Type/Material	Weather & Dust proof IP-65/ SS 316
16	Type of Electronics	Microprocessor based with self diagnostic facility
17	Calibration	Auto & manual
18	Output signals	Analog: 4-20 mA DC Binary: 2 NO + 2 NC for Alarms

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[204]	02.09.2015

14.24 Control Valves

14.24.1 Introduction

The control valves and accessories equipment furnished by the Supplier shall be designed, constructed and tested in accordance with the latest applicable requirements of code for pressure piping ANSI B 31.1, the ASME Boiler & Pressure Vessel code, Indian Boiler Regulation (IBR) & ISA or acceptable equal standards.

14.24.2 Control Valve Design & Sizing

1. The design of all valve bodies shall meet the specification requirements and shall conform to the requirements of ANSI for dimensions, material thickness and material specification for their respective pressure classes.
2. The valve sizing shall be suitable for obtaining maximum flow conditions with valve opening at approximately 80% of total valve stem travel and minimum flow conditions with valve stem travel not less than 10% of total valve travel. All the valves shall be capable of handling at least 120% of the required maximum flow. Further, the valve stem travel range from minimum flow condition to maximum flow condition shall not be less than 50% of the total valve stem travel. The sizing shall be in accordance with the latest edition of ISA Handbook on control valves. While deciding the size of valves, Supplier shall ensure that valves outlet velocity does not exceed 8 m / sec. for liquid services, 150 m/sec. for steam services and 50% of sonic velocity for flashing services. Manufacturer shall furnish the sizing calculations clearly indicating the outlet velocity achieved with the valve size selected by him as well as noise calculations.
3. Control valves for steam and water applications shall be designed to prevent cavitations, wire drawing, flashing on the downstream side of valve and downstream piping. Thus for cavitations / flashing service, only valve with anti-cavitations trim shall be used. Detailed calculations to establish whether cavitations shall occur or not for any given application shall be furnished.
4. Trim shall be multistage type having sufficient number of discrete pressure drop turns (stages) to ensure elimination of vibration, erosive – action, cavitations. Identify the number of pressure drop turns in the given equipment and shall also provide calculation demonstrating compliance to the trim exit velocity.
5. To prevent flow induced vibration and to protect the valve internals from foreign particles such as weld slag flow, direction shall be a flow to close (over the plug) configuration for liquid applications. To maximize noise attenuating benefits and to allow for constant fluid expansion, flow direction shall be under the plug for steam and gas applications.
6. Control valves for application such as SH spray control, RH spray control, Heavy oil pressuring & control system shall have permissible leakage rate as per leakage class V. All other control valves such as low and high range feed control valves etc shall have leakage rate as per leakage class IV.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[205]	02.09.2015

7. The control valve induced noise shall be limited to 85 dBA at 1 meter from the valve surface under actual operating conditions. The noise abatement shall be achieved by valve body and trim design and not by use of silencers.
8. The characteristic of the control valves shall be determined based on the application / service.
9. On supply air or electrical failure for pneumatic / electrical drive, the valve shall remain full closed, open or stay – put position as per process safety requirement.

14.24.3 Valve Construction

1. Proper selection of valve type and material of construction to meet operating requirement.
2. All valves shall be of globe body design and straightaway pattern with single or double port unless otherwise recommended by the manufacturer to be of angle body type. Rotary valve may alternatively be offered when pressure or pressure drops permit.
3. Valves with high lift cage guided plugs & quick charge trims shall be supplied.
4. Cast iron valves are not acceptable.
5. Bonnet joints for all control valves shall be of the flanged and bolted type for easy dis-assembly. Bonnet joints of internal threaded or union type shall not be acceptable.
6. Plug shall be of one – piece construction either cast, forged or machined from solid bar stock. Plug shall be screwed and pinned to valve stems or shall be integral with the valve stems.
7. All valves connected to vacuum on down stream side shall be used with packing suitable for vacuum applications (e.g. double vee type chevron packing).
8. Valve characteristic shall match with the process characteristics.
9. Extension bonnets shall be used when the maximum temperature of flowing fluid is greater than 280 degree celcius.
10. Flanged valves shall be rated at not less than ANSI pressure class of 300 lbs.
11. Teflon shall be used for valve gland packing to suit process requirement.
12. The valve body shall be marked to show direction of flow.

14.24.4 Valve Materials

1. The control valve body material shall be
 - a) Carbon steel as per ASTM – A216 GR WCB for non – corrosive, non – flashing and non – cavitations services below 275 deg c temperature like Auxiliary Steam flow to Deaerator, CRH flow to Deaerator, Condensate flow to Deaerator etc.
 - b) Alloy steel as per ASTM – A217 GR WC 9 for severe flashing / cavitations services like low load and full load feed water control, HP and LP heaters emergency drains, Deaerator overflow drain to Hotwell etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[206]	02.09.2015

- c) Alloy steel as per ASTM A – 217 GR WC 6 for low flashing / cavitations services like HP heaters & LP heaters normal drain control, drain cooler normal level control, gland steam cooler minimum flow etc.
- d) 316 SS for condensate service below 300 deg C like condensate normal and emergency make – up controls etc.

2. The control valve trim material shall be

- a) 17 – 4 PH SS for severe services listed under item D.1, 2nd point & 3rd point above
- b) 316 SS for services listed at D.1, 4th point above and
- c) 316 SS with stellite faced guide parts and bushings for remaining applications.

14.24.5 End Preparation

Valve body ends shall be either butt welded / socket welded, flanged or screwed. The welded ends wherever required shall be butt welded type as per ANSI B 16.25 for control valves of sizes 65 mm and above. For valves sizes 50 mm and below welded ends shall be socket welded as per ANSI B 16.11. Flanged ends wherever required shall be of ANSI pressure – temperature class equal to or greater than that of the control valve body.

14.24.6 Valve Actuator

1. The regulating control valves shall be furnished with pneumatic actuators. The supplier shall be responsible for proper selection and sizing of valve actuators in accordance with the pressure drop and maximum shut off pressure and leakage class requirements. The valve actuators shall be capable of operating at 60 °C continuously.
2. Valve actuators and stems shall be adequate to handle the unbalanced forces occurring under the specified flow conditions or the maximum differential pressure specified. An adequate allowance for stem force, at least 0.15 kg / cm² per linear millimeter of seating surface, shall be used in the selection of the actuator to ensure tight seating unless otherwise specified.
3. The travel time of the pneumatic actuators shall not exceed 10 seconds.
4. For quick opening / closing services (such as fuel oil shut – off valve), the actuator shall be pilot solenoid operated pneumatic drive; the rating of solenoid shall be 24 V DC.
5. Selection of actuator shall be such that it meets the requirements of thrust / torque, stroke length, angular movement, full scale travel time, repeatability & accurate positioning for successful operation of final control element.
6. All the actuators shall have also provision for manual operation during emergency / maintenance along with graduated local position indicator.

14.24.7 Control Valve Accessory Devices

All control valve accessories such as air locks, hand wheels / hand-jacks, limit switches, SMART positioners, diffusers, external volume chambers, reversible pilot for positioners, tubing and air sets, solenoid valves and junction boxes etc. shall be used as per the requirements.

Table 14.24(i)
Specification for E-to-P converter

S.N	Feature	Minimum Requirement
1	Air Supply	1.5 Kg/Sq. cm
2	Input Signal	4-20 mA DC
3	Output Signal	0.2 to 1.0 Kg/ Sq. cm
4	Linearity	0.5 % of span or better
5	Hysteresis	0.1 % of span or better
6	Ambient Temperature Effect (-20 to +60 *C)	<0.2 % of span per Degree centigrade
7	Mounting	Close to Actuator
8	Protection class	IP-65
9	Enclosure	Die cast Aluminium
10	Drift	+/- 2% of set point per hour

Table 14.24(ii)
Specification for Smart Positioners

S.No.	Feature	Minimum Requirement
1	Input	4-20 mA DC
2	Power Supply	24 V DC Loop powered
3	Type of Electronics	Microprocessor based with self diagnostic facility & digital communication by means of HART Protocol
4	Valve position sensing	Non-Contact type with 4-20 mA DC Output
5	Enclosure Type/Material	Weather & Dust proof to IP-65/ Die cast Aluminium
6	Ambient conditions	Suitable for - 30 to +80 *C temperature & 0-95% Humidity
7	Operating Range	Suitable for Full range & Split Range operation
8	Modes of operation	Suitable for Direct & reverse valve action
9	Flow characteristics	Suitable for Linear & Equal percentage Characteristics
10	Fail safe/Freeze feature	Required
11	Air Capacity	Sufficient to handle the Valves Selected/Boosters to be supplied if required.
12	Air supply pressure	To suite the Air Supply Pressure / Quality available
13	Process Connection	1/4" NPT
14	Characteristic Deviation	< =0.5% of span

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[208]	02.09.2015

S.No.	Feature	Minimum Requirement
15	Ambient Temperature effect	< = 0.01 %/Deg C or better
16	Configuration	Remote Calibration, Auto & Manual Calibration shall be possible
17	Cable Entry	½" NPT, Side or Bottom Entry to avoid water ingress
18	Accessories	a) Display with push buttons for configuration and Display on the positioner itself (Password Protected / Hardware Lock).
		b) For Supply & Output Pressure, Filter Regulator and other accessories shall be used as on required basis for making system complete
		c) Valves Mounting Assembly For Sliding Stem / Rotary / Single Acting / Double Acting on required basis

1. SMART positioner shall be a Double stage positioner. The first stage of the positioner shall be typically a flapper-nozzle that serves as a high-gain pre-amplifier. This sensitivity shall be maintained over a wide range of dynamic conditions. Second stage shall be a power amplifier that provides power to drive the actuator. Preferably this shall be a pneumatic relay. Spool Driven type SMART positioners are not preferred due to Higher Dead Band and Poor responsiveness. The SMART positioner shall have pressure sensors to measure the pneumatic outputs to the actuator.
2. The control algorithm for the positioner shall use feedback signal from the motion of the pneumatic relay beam instead of pressure feedback to minimize pneumatic related effects and for stable and smooth response of the control valve. The SMART positioner shall have user adjustable tuning sets to identify the optimum tuning for the total valve assembly. SMART Positioner with HART Communication facility shall communicate all the valve diagnostics to Plant DCS.

Table 14.24(iii)
Specification for Air Filter Regulator (AFR)

S.No.	Feature	Minimum Requirement
1	Type	Constant Bleed type
2	Inlet Pressure	10 Kg/Sq. cm (maximum)
3	Output	Adjustable from 0-2 Kg/Sq. cm or 0-7 Kg/Sq. cm (Continuous) as required
4	Filter Element	5 microns
5	Filter Element Material	Phosphor Bronze
6	Bowl Material	Metallic
7	Drain	Automatic
8	Enclosure Protection class/ Material	IP-65/ Die cast Aluminium
9	Process connection	¼ " NPT

10	Accessories	All mounting accessories. 2" dial size Pressure gauge.

Table 14.24(iv)
Specification for Position Transmitter

S.No.	Feature	Minimum Requirement
1	Power Supply	24 V DC Loop powered
2	Type	Non-Contact/ LVDT type
3	Output	4-20 mA DC/ Linear
4	Accuracy	+/- 1%
5	Enclosure Protection class/ Material	IP-65/ Die cast Aluminium
6	Cable Entry	½" NPT, Side or Bottom Entry to avoid water ingress.
7	Accessories	All mounting accessories

Table 14.24(v)
Specification for Limit Switch (Non Contact Type)

S.No.	Feature	Minimum Requirement
1	Type	Non-contact type inductive Proximity/Namur type
2	Sensing distance	10 mm minimum
3	Hysteresis	Maximum 10% of sensing distance
4	Indicator	LED indication
5	Protection class	IP 67
6	Integral Cable	1 mtr.
7	Power supply	24 V DC/ 8 V DC
8	Mounting	Flush mounting with check nut
9	Other Feature	Explosion proof enclosures shall be used wherever required by the application. Shock & Vibration proof.

14.24.8 Test & Examination

- All valves shall be tested in accordance with the quality assurance programme agreed which shall meet the requirement of IBR and other applicable codes.
- The tests shall include but not but limited to the following:
 - Non-destructive test as per ANSI B – 16.34.
 - Hydrostatic shell test in accordance with ANSI B16.34 prior to seal leakage test.
 - Valve closure test and seal leakage test in accordance with ANSI B16.34 and as per the leakage class indicated under clause no. B.6.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[210]	02.09.2015

- d) Functional test: The fully assembled valves including actuators control devices and accessories shall be functionally tested to demonstrate times from open to close position.
 - e) All control valves shall be tested with the positioners for accuracy of positioning and reproducibility over the full range of travel.
 - f) CV Test: CV test shall be carried out as type test on each size, type and design of the valves as per AISA 75.02 standard.
 - g) Magnetic particle inspection shall be performed on all machined surfaces of valves having ASA rating of 1500 lbs ASA or greater. All carbon steel valves with 1500 lbs ASA or greater shall receive 100% radio graphic examination in accordance with ASTM – E71.
3. The certificate shall be in the prescribed forms III A & III C and shall be endorsed by an Inspection Authority recognized by the Indian Boiler Regulations.

14.24.9 Pneumatic Power Cylinder

Table 14.25
Specification for Pneumatic Power Cylinder

S.No.	Feature		Minimum Requirement
1	Applicable standard		ISO 6431
2	Mounting Type		Fixed Position mounting/ Trunion mounting
3	Material	Cylinder	Seamless Steel Tube
		Piston rod	Hard Chrome Plated Steel
		Tie rod	Stainless steel
		End Cover	Cast Iron
		Sealing	Polyurathane
4	Control Signal		4-20 mA DC signal to Smart positioner with HART protocol for modulating purpose. Solenoid valve operating on pneumatic line for open & closing purpose of ON-OFF Damper.
5	Supply Air		0-7 Kg/cm ²
6	Accuracy		Better than +/- 1%
7	Repeatability		Better than 0.5 % of full travel
8	Hysteresis		Less than +/- 0.2% of full travel
9	Dead Band		+/- 0.1%
10	Selection		Based upon thrust/torque, stroke length, angular movement, full scale travel time, repeatability, space factor etc. Provision for air-to-open or air-to-close operation
11	Accessories		Air lock relay, hand wheel, AFR, Volume booster, Limit switch, Positioner, Solenoid valve, position transmitter & all required mounting accessories etc.
12	Fail safe operation		Stay put for regulating duty

14.25 Solenoid Valves

Table 14.26
Specification for Solenoid Valves

S.No.	Feature	Minimum Requirement
1	Operating Principle	Electromagnetic (noiseless), Pilot operated
2	Coil Voltage Rating	24 V DC (in general)/220 V DC/230 V AC/110 V AC as required
3	Ways	3 ways in general others as required
4	Port size	¼ " NPT all ports
5	Body	SS Bar stock/Brass
6	Trim	AISI 316 SS
7	Manual Operation	In built
8	Duty	Suitable for continuous Energisation
9	Sealing	Airtight & leak proof
10	Coil Enclosure	SS 316/Moulded type
11	Insulation class	Class H
12	Coil Casing	IP-67
13	Mounting	Suitable for mounting On pipe or in panel
14	Cable connection	½ " NPT Cable gland
15	Accessories	Mounting Bracket, nuts, bolts etc.
16	Other Features	LED Indication

14.26 Dew Point Meter

Table 14.27
Specification for Dew Point Meter

S.No.	Feature	Minimum Requirement
1	Type	Sensor- Hyper Thin Film high capacitance Al ₂ O ₃ , Transmitter- Microprocessor based 2-wire loop powered
2	Accuracy	± 5.5°F (± 3°C)
3	Repeatability	± 0.9°F (± 0.5°C)
4	Storage temperature	-40°F to + 176°F (-40°C to + 80°C)
5	Local Indication	To be provided
6	Input Resolution	0.1°C dew point
7	Power Supply	24 VDC
8	Output	4 - 20mA
9	Enclosure material	Die – cast Aluminium
10	Enclosure protection	Weatherproof IP 65
11	Electrical connections	½ " NPT
12	Process connection	As per requirement
13	Accessories	All required mounting accessories.

15. PROCESS CONNECTION PIPING

Installation and testing of all required material for completeness of impulse piping system, sample piping system and air piping system as per the requirements of this clause on as required basis for the connection of instruments and control equipment to the process and make the system complete.

Control and instrument piping & connections shall generally be designed in accordance with the following criteria and these criteria shall be closely co-ordinated with Mechanical Piping / Erector to fulfill the Mechanical Design Criteria also. This is a guideline for Piping design & selection.

1. Pressure connections and piping up to the root valves for all pressure indicators, pressure switches, pressure transmitters, etc., shall be as indicated for miscellaneous piping.
2. Temperature indicators, temperature controllers, temperature switches, temperature detectors, and test well connections shall be as follows:
 - a) Main steam -- 40 mm NPT.
 - b) Extraction steam -- 40 mm NPT.
 - c) Boiler feed water -- 32 mm NPT.
 - d) Reheat steam -- 40 mm NPT.
 - e) All others -- 19 mm NPT.
3. Draft pressure connections on steam generator walls and ducts shall be 50 mm pipe couplings.
4. Flow transmitter connections and piping up to the root valves shall be 25 mm for all piping except orifice flanges, where 15 mm piping and valves shall be used.
5. Level switch connections and piping up to root valves shall be 25mm.
6. Level controllers and level transmitters of the displacement type shall have connections and piping up to root valves of 50 mm.
7. Level controllers and level transmitters of the differential pressure type shall have connections and piping up to root valves of 25 mm.
8. Instrument columns at tanks and pressure vessels shall generally be 65 mm minimum.

15.1 Design Pressure and Temperature

Instrument primary piping design pressure and temperature shall be selected consistent with the requirements discussed in Mechanical Design Criteria of this specification, for the process pipe to which the instrument primary piping is connected. The following general criteria shall also apply:

Instrument primary piping for steam and other systems shall be designed for 1-½ times the maximum sustained process pressure and temperature (plus 20°C).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[215]	02.09.2015

15.2 Sizes of Instrument Primary Piping

Instrument primary piping shall not be smaller than the connection at the process pipe root valve and/or the following (metric sizes are nominal):-

1. 20 mm for pressure measurement piping with a design pressure equal to or less than 42.0 bar and a design temperature equal to or less than 400°C.
2. 25 mm for pressure measurement piping with a design pressure greater than 42.0 bars or a design temperature greater than 400°C.
3. Flow and level measurement by differential pressure shall also use primary piping conforming to the above requirements; however, flange tap connections may be of 13 mm size.
4. Float actuated level switch devices shall be supported on connecting piping not smaller than 25 mm.
5. Level controllers and transmitters of the displacement float type shall be supported on connecting piping not smaller than 50 mm.
6. Instrument columns for float actuated level switches and displacement float devices shall be piping of not less than 65 mm.
7. Primary piping internal diameter shall not be less than 8 mm between the process connection and instrument blow down valve.

15.3 Materials for Instrument Primary Piping

Material for instrument primary piping connecting to the root valve shall preferably be the same as that used in the process system to which it is connected. Higher strength materials may be substituted in the interest of standardization; however, welding procedures at the point of joining the instrument primary piping to the process piping must be appropriate to the combination of materials involved. Copper may be used only for compressed air services that use copper process piping.

15.4 Insulation of Instrument Primary Piping

Instrument primary piping connecting to high temperature systems, which might become hot enough to injure personnel during blow down of the instrument line, shall be insulated where such hazard exists. Insulation materials, exterior finish, and metal lagging shall conform to the standards adopted for the process piping.

All materials supplied shall be suitable for intended service, process operating conditions and type of instruments used and shall fully conform to the requirements of this specification.

15.5 Process Connection Size

Size of tapping point, stub no and size of Root valves for different type of measurements.

These shall be as follows:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[216]	02.09.2015

Table 15.1
Process Connection Stub & Root valve

S.No.	Quantity of root valves (Nos.)	Size of stub and root valves	Service condition
A. Pressure and Differential pressure measurement			
1	2	25NB	> = 62 bar or 425degree C
2	1	15NB	< 62 bar and 425 degree C
B. Level Gauge and Switch			
1	2	25 NB	> = 62 bar or 425 degree C
2	1	25NB	< 62 bar and 425 degree C
C. Level Transmitter (Displacement Type)			
1	2	40NB	> = 62 bar or 425degree C
2	1	40NB	< 62 bar and 425 degree C
D. Stand pipe for Level measuring instrument			
1	2	80 NB	> = 62 bar or 425degree C
2	1	80 NB	< 62 bar and 425 degree C
E. Flow measurement			
1	2	25NB	> = 62 bar or 425degree C
F. Level measurement			
1	1	25NB	< 62 bar and 425 degree C
G. Sampling system measurement (system and water service)			
1	2	25 NB	> = 62 bar or 425degree C
2	1	25 NB	< 62 bar and 425 degree C

15.6

Impulse Piping, Tubing, Fittings, Valves & Valve Manifolds

All impulse pipes shall be of seamless type conforming to ANSI B36.10 for schedule numbers, sizes and dimensions etc. The material of the impulse pipe shall be same as that of main process pipe. For various applications specification of impulse pipe materials and associated fittings and valves shall be as given in Table –15.2 (Process Connection Piping).

Table 15.2
Process Connection piping

S.No.	Service	Size		Impulse tube material	Impulse tube material	Impulse line fitting material	valves material
		Pipe	Tube			ANSI rating	ANSI Rating
1	Main steam/ Saturated steam	SCH.XX S 21.34m m OD	1.7 mm ODX 1.65HK	SS 316	ASTM-A- 335-Gr- P-22 (alloy steel)	ASTM-A- 182-Gr-F- 22	ASTM-A- 182-Gr-F- 22

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[218]	02.09.2015

S.No.	Service	Size		Impulse tube material	Impulse tube material	Impulse line fitting material	valves material
		Pipe	Tube			ANSI rating	ANSI Rating
		m OD	1.65mm THK		Class (Black)	3000LBS	150LBS

Notes:-

1. Impulse pipe thickness shall be selected as per ANSI B 36.10. based on the schedule indicated against each service.
2. Wherever impulse tubes are provided, all the fittings required for these shall be SS316. The following guidelines shall also be considered along with the Table 15.2 for size, material and rating for impulse line/tube fittings and accessories:

a) Impulse line / tube fittings and accessories

- Nipple shall be used for root valve size more than ½ inch and the nipple size shall be same as the root valve size. Reducer / adapter shall be used to suit instrument connection, where nipple, root valve size is more than ½ inch.
- Bulk head fitting socket welded type to be provided at instrument rack / enclosure.

b) Fittings

- All fittings except the last fitting connecting to the instrument shall be socket welded. The size of the fittings shall be same as the impulse line size.
- The fitting connecting to the instrument shall have a size and thread to suit the instrument connection.

c) Drain

Drain shall be used for all water / steam and non-inflammable / non-corrosive fluids only.

d) Drain Valve

- Two numbers of globe drain valves shall be used for process conditions of 425 degree C or 62 bar and higher.
- One number globe drain valve shall be used for process conditions of less than 425 degree C and 62 bar.
- The valve size shall be same as impulse piping / tubing size.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[219]	02.09.2015

e) Funnel with drain header

- This shall be used in the racks for blowing / draining out the process fluid in the impulse tubings.
- The size of drain header shall be 1"
- When instruments are mounted local to the tapping point and are not mounted in rack, or panel or enclosure. The drains shall be connected to the nearest floor level or plant drain.

f) Instrument Valves

- Type of the valve shall be needle valve with built in drain valve.
- Sizing of the valve shall be ½".

g) Right / left threaded fittings

- This shall be used for installation / removal of instruments without disturbing the tubing / piping.
- A suitable adapter shall be used to install the instruments on ½" right-left threaded fittings.

A ½" vent line with a ½" isolation valve shall be used in the instrument rack for air and compressible fluids or other wise if the installation call for eg., for liquid service where the transmitter is located at a higher elevation than the tapping point.

Stainless steel tube shall be used inside enclosures and racks from tee connection to valve manifold and then to instrument. For high pressure/temperature applications the material shall be ASTM A 213 TP 316H and for other applications material shall be ASTM A 213 TP 316L. The wall thickness of the tube shall be in accordance with the ANSI B31.1 standard.

All fittings shall be forged steel and shall conform to ANSI B16.11. The material of forged tube fittings for shaped application (e.g. tee, elbow etc.) shall be ASTM A182 Gr. 316 H for high pressure/ temperature applications (as defined above) and ASTM A182 Gr. 316L for other applications. The material for bar stock tube fitting (for straight application) shall be 316 SS. Metal thickness in the fittings shall be adequate to provide actual bursting strength equal to or greater than those of the impulse pipe or SS tube, with which they are to be used.

The disc and seat ring materials of carbon steel and alloy steel valves shall be ASTM A-105 and ASTM A-182, Gr. F22, hard faced with stellite (minimum hardness - 350 BHN.) The surface finish of 16 RMS or greater is required in the area of stem packing. The valve design shall be such that the seats can be re-conditioned and stem and disc may be replaced without removing the valve body from the line.

The valve manifolds shall be of 316 s Furnishing Recommended protection interlock logics stainless steel with pressure rating suitable for intended application. 2-valve manifold and 3 valve manifold shall be used for pressure

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[220]	02.09.2015

measurements using pressure transmitters/ pressure switches and differential pressure transmitters/ switches respectively. 5-valve manifold shall be used for remaining applications like DP, flow and level measurements.

For Pressure/D.P gauges in fluid application two-way globe valve on each impulse line to the instrument and in air/flue gas application two way gate valve on each impulse line to the instrument shall be used near the instrument. These shall be in addition to the three way gauge cock provided along with the pressure/D.P gauges.

15.7

Air Supply Piping

1. All pneumatic piping, fittings, valves, air filter cum regulator and other accessories required for instrument air for the various pneumatic devices/ instruments shall be used.
2. This shall include as a minimum air supply to pneumatically operated control valves, actuators, instruments, continuous and intermittent purging requirements of Local Instrument Enclosures (LIE) etc.
3. For individual supply line and control signal line to control valve, 1/4 inch size light drawn tempered copper tubing conforming to ASTM B75 shall be used. The thickness of copper tubing shall not be less than 0.065 inch and shall be PVC coated. The fittings to be used with copper tubes shall be of cast brass, screwed type.
4. All other air supply lines of 1/2 inch to 2 inch shall be of carbon steel hot dipped galvanized inside and outside as per IS-1239, heavy duty with threaded ends. The threads shall be as per ASA B.2.1. Fittings material shall be of forged carbon

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[223]	02.09.2015

steel A234 Gr. WPB galvanized inside and outside, screwed as per ASA B2.1. Dimensions of fittings shall be as per ASA B16.11 of rating 3000 lbs.

5. In the boiler area the 2 inch head shall be used up to top most elevation of boiler floor and from this 2 inch header, 1 inch sub-header shall be branched off at each floor with isolation valve. From this 1 inch sub-header, branch line of 1/2 inch, with isolation valve shall be used up to various devices. Similar air supply piping shall be done in the turbine area also. Similar system is to be followed for service air required for intermittent purging in the Local Instrument Enclosures (LIEs) etc.
6. Instrument air filter cum regulator set with mounting accessories shall be used for each pneumatic device requiring air supply. The filter regulators shall be suitable for 10 kg/ sq.cm max. inlet pressure. The filter shall be of size 5 microns and of material sintered bronze. The air set shall have 2 inch size pressure gauge and built in filter housing blow down valve. The end connection shall be as per the requirement.
7. All the isolation valves in the air supply line shall be gate valves as per ASTM B62 inside screw rising stem, screwed female ends as per ASA B2.1. Valve bonnet shall be union type & trim material shall be stainless steel, body rating 150 pounds ASA. The valve sizes shall be 1/2 inch to 2 inch.
8. Purge Air Connection for Air and Flue Gas Applications
 - a) The continuous purging with instrument air shall be done, for all air and flue gas measurements excepting instrument air and service air instruments, at the process source connection end. Necessary arrangements required for continuous purging shall be used inside all the air and flue gas local instrument enclosures.
 - b) For intermittent purging with service air, necessary arrangements inside all the air and flue gas Local Instrument enclosures/racks shall be used. The SS three way valve provided in the SS tubing shall be used for isolating the transmitter and connecting the service air quick disconnect line.
 - c) One air filter regulator, purge Rotameter and blow down device per instrument shall be used in the transmitter rack/enclosure.

16. INSTRUMENTATION CABLES & ACCESSORIES

16.1 Specifications of Instrumentation Cables

16.1.1 Common Requirements

Table 16.1

Specification of Instrumentation Cables- Common Requirement

SNo.	Property	Requirement
1	Voltage grade	1100 V (Peak Value)
2	Codes and Standard	All instrumentation cables shall comply with VDE 0815, VDE 0207, Part 4, Part 5, Part 6 , VDE 0816, VDE 0472, SEN 4241475, ANSI MC 96.1, IS-8784, IS-10810 (latest editions) and their amendments read along with this specification
3	Continuous operation suitability	At 70 deg. C for all types of cables, while 205 deg C for Type-C cables
4	Progressive automatic on-line sequential marking of length in meters.	To be provided at every one meter on outer sheath.
5	Marking to read 'FRLS'	To be provided at every 5 meters on outer sheath except for type-C cable.
6	Allowable Tolerance on overall diameter	+/- 2 mm (maximum) over the declared value in data sheet.
7	Variation in diameter	Not more than 1.0 mm throughout the length of cable.
8	Ovality at any cross-section	Not more than 1.0 mm
9	Others	a) Durable marking at intervals not exceeding 625 mm shall include manufacturer's name , insulation material, conductor's size, number of pairs, voltage rating, type of cable, year of manufacture to be provided. b) Cables shall be suitable for laying in conduits, duct, trenches, racks and underground-buried installation c) Repaired cables shall not be acceptable

16.1.2 Specific Requirements

Table 16.2

Specification of Instrumentation Cables- Specific Requirement

SNo.	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
A.	Conductors				
i.	Cross section area	0.5 Sq. mm			
ii.	Conductor material	ANSI type KX	ANSI type SX	High conductivity annealed tin coated copper	ANSI type KX
iii.	Colour code	Yellow-red	Black-Red	As per VDE-0815	Yellow-red
iv.	Conductor Grade	As per ANSI MC 96.1		Electrolytic	As per ANSI MC 96.1
v.	No. & dia. of stands	7x0.3 Sq. mm (nom)			
vi.	No. of Pairs	2, 6	2	4, 8, 12, 16, 24, 48,	2
vii.	Max. conductor resistance per Km (in ohm) at 20 deg. C	As per ANSI MC 96.1		73.4 (loop)	As per ANSI MC 96.1
viii.	Reference Standard	As per ANSI MC 96.1		VDE 0815	As per ANSI MC 96.1
B.	Insulation				
i.	Material	PVC type YI 3 with FRLS properties			Teflon (i.e. extruded FEP)
ii.	Thickness in mm (Min/Nom/Max)	0.25 / 0.3 / 0.35			0.4 / 0.50
iii.	Volume Receptivity (Min) in ohm-cm	1x10 ¹⁴ at 20 deg. C & 1x 10 ¹¹ at 70 deg.			---
iv.	Voltage rating	1100 V peak operating voltage			
v.	Reference Standard	VDE 0207 Part 4			VDE 0207 part 6 & ASTM D 2116.
vi.	Core diameter above insulation	Suitable for cage clamp connector			
C.	Pairing & Twisting				
i.	Max. lay of pairs (mm)	50			
ii.	Single layer of numbered binder tape on each pair provided	Yes			
iii.	Unit formation of four pairs with printing of	NA		Yes	NA

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[227]	02.09.2015

SNo.	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
	no. of Unit provided				
iv.	Conductor / pair identification as per VDE0815	NA		To be provided	NA
D.	Shielding				
i.	Type of shielding	Al-Mylar tape			
ii.	Individual pair shielding	No		To be provided for Type-F cable	No
iii.	Minimum thickness of individual pair shielding	No		28 micron	No
iv.	Overall cable assembly shielding	To be provided			
v.	Minimum thickness of overall cable assembly shielding	55 micron			
vi.	Shielding coverage	100% with at least 20% overlap			
vii.	Drain wire provided for individual shield	NA		Yes (for F-type) 7 -strand 20 AWG (0.51 mm ²) annealed Tin coated copper	NA
viii.	Drain wire provided for overall shield	Yes (for F-type) 7 -strand 20 AWG (0.51 mm ²) annealed Tin coated copper			
E.	Fillers				
i.	Non-hygrosopic, flame retardant	To be provided			
F.	Outer Sheath				
i.	Material	Extruded PVC compound YM1 with FRLS properties			Teflon (i.e. extruded FRP)
ii.	Minimum thickness at any point	1.8mm			0.4 mm
iii.	Nominal Thickness at any point	> 1.8mm			0.5mm
iv.	Color	Blue			
v.	Resistant to water, fungus, termite & rodent attack	Required			

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[228]	02.09.2015

SNo.	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
vi.	Oxygen index as per ASTM D-2863	Not less than 29%			NA
vii.	Temperature index as per ASTM D-2863	Not less than 250 deg. C			NA
viii.	Acid gas generation by weight as per IEC-60754-1	Maximum 20 %			NA
ix.	Smoke Density rating as per ASTM D-2843	Maximum 60% (defined as the average area under the curve when the results of smoke density test plotted on a curve indicating light absorption vs. time as ASTM D-2843)			NA
x.	Reference Standard	VDE 207 part 5			VDE 207 Part 6 & ASTM D 2116
xi.	Armour	Galvanised steel wire armoured type conforming to IS-3975			
G. Electrical Parameters					
i.	Mutual capacitance between Conductors. At 0.8KHz (Max.)	200 nF / Km		120 nF / Km for F type 1000 nF / Km for G-type	200 nF / Km
ii.	Insulation resistance (Min.)	100 M ohm / Km			
iii.	Cross talk Figure (min.) at 0.8 KHz	60 dB		60 dB	NA
iv.	Characteristics impedance (Max) At 1 KHz	NA		320 ohm for F type 340 ohm for G type	NA
v.	Attenuation Figure at 1 KHz	NA		1.2 dB / Km	NA
H. Complete Cable					
i.	Complete Cable assembly	Shall pass Swedish chimney test as per SEN-SS 4241475 class F3.			NA
ii.	Flammability	Shall pass flammability test as per IEEE-383 read in conjunction to this specification			NA
I. Accessories					
i.	Cable accessories of flame retardant quality	Yes. (Accessories such as harnessing components, markers, bedding, cable jointer, binding tape etc.)			

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[229]	02.09.2015

SNo.	Specification Requirement	Type-A	Type-B	Type- F&G	Type-C
J.	Cable Drum				
i.	Type	Non-returnable wooden drum (wooden drum to be constructed from seasoned wood free from defects with wood preservative applied to the entire drum) or steel drum.			
ii.	Outermost layer covered with waterproof paper	Yes			
iii.	Painting	Entire surface to be painted			
iv.	Length	1000m + 5% for up to & including 12 pairs 500m + 5% for above 12 pairs			

16.1.3

Type Test

Table 16.3
Type Test Requirement for Cables

S.No.	Item	Test Requirement	Standard
1	Conductor	Resistance Test Diameter test Tin coating test (drain wire)	VDE – 0815 IS – 10801 IS - 8130
2	Insulation	Loss of mass Ageing in air ovens Tensile strength & elongation test before & after ageing Heat shock Hot deformation Shrinkage Bleeding & Blooming	VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 IS – 5831
3	Inner sheath	Loss of mass Heat shock Hot deformation Shrinkage Cold bend / Cold impact test	VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 IS – 5831
4	Outer sheath	Loss of mass Ageing in air ovens Tensile strength & elongation test before & after ageing Heat shock Hot deformation Shrinkage Bleeding & Blooming Colour fastness to water Cold bend / Cold impact test Oxygen Index test Smoke Density test Acid gas generation test	VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 VDE – 0472 IS – 5831 IS – 5831 IS – 5831 ASTM D – 2863 ASTM D – 2843 IEC – 754 – I

S.No.	Item	Test Requirement	Standard
		Acid gas generation test	IEC – 754 – 1
6	AL-MYLAR Shield	Continuity test Shield thickness Overlap test	Yes Yes Yes
6	Overall cable	Flammability Noise interference Dimensional checks Cross talk Mutual capacitance HV test Drain wire continuity	IEEE 383 & IEC – 332 IEEE -TRANSACTION IS – 10810 VDE – 0472 VDE – 0472 VDE – 0815

16.1.4 Routine Test

To be carried out by supplier during various stages of manufacture.

1. Insulation & jackets: All tests as per IS – 5831 except insulation resistance, voltage & spark test shall be as per BS – 5308, Part II
2. Armor test as per IS – 3975
3. Conductor resistance
4. Cable capacitance and L/R ratio.

16.1.5 Acceptance Test

These following tests shall be carried out as acceptance test:

1. Continuity test
2. Voltage test as per BS – 5308 Part II
3. Conductor resistance and drain wire resistance
4. Cable capacitance and L/R ratio test.
5. Tests for uniformity of galvanization of armor as per IS – 2633
6. Oxygen and temperature index test as per ASTM D – 2863
7. Dimensional checks for overall diameter and under armour / over armour diameter.
8. Checking of drum length & overall length tolerances.

Immediately after completion of electrical tests, the ends of the cable shall be sealed to prevent ingress of moisture with suitable PVC / Rubber caps

16.2 Specifications of Optical Fibre Cables (OFC)

1. OFC shall be installed on cable tray, duct bank, cable trench installation as necessary. For outdoor applications the cable shall be armoured with Poly Ethylene sheathing. In all cases cable shall be routed through suitable grade HDPE permanently lubricated protection pipe as per IS-4984, IS-12235 & TEC.G/CDS-08/01 of suitable size @ 53% fill factor.
2. The optical fibre core shall be of ultrapure fused silica glass coated with UV cured acrylate suitable to withstand temperature of about 80 deg. Centigrade continuously.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[231]	02.09.2015

3. OFC shall be 4 / 8 / 12 core, galvanized corrugated steel taped armored, fully water blocked with dielectric central member for outdoor / indoor application so as to prevent any physical damage. The cable shall have multiple single-mode or multi-mode fibres on as required basis so as to avoid the usage of any repeaters. The outer sheath shall have Flame Retardant, UV resistant properties & to be identified with the manufacturer's name, year of manufacture, progressive automatic sequential on-line marking of length in meters at every meter on outer sheath.
4. The cable core shall have suitable characteristics and strengthening for prevention of damage during pulling viz. steel central member, Loose buffer tube design, 4 fibres per buffer tube (minimum), Interstices and buffer tubes duly filled with Thixotropic jelly or better material etc. The cable shall be suitable for maximum tensile force of 2000 N during installation, and once installed, a tensile 1000 N minimum. The compressive strength of cable shall be 3000N minimum & crush resistance 4000 N minimum. The operating temperature shall be -20 DegC to 70 DegC.
5. The splicing loss of any two fibres in any case shall not exceed 0.10 db/splice.
6. The total additional attenuation above the nominal attenuation due to regular splices, repair splices, connectors, temperature variation, ageing etc. shall be indicated.
7. Fibre coloring shall conform to EIA/TIA-598. The color-coding shall be permanent thus withstanding normal handling; e.g., during termination, testing, or cable relocation. Refer to EIA – 359 for color identification and coding.
8. Cables shall be designed & tested in accordance with ISO 11801, TIA-568 & ICEA 596 and Performance specifications shall be measured in accordance with the Fibre Optic test procedures(EIA/TIA -455 documents) test procedures of IEC-60793 & IEC-60794
9. The OFC shall generally conform to the following specifications

Table 16.4A
Specifications for Single Mode Optical Fibre

S.No.	Feature		Minimum Requirement
1	Maximum Uncabled Attenuation Coefficient	@1310 nm	0.4 dB/km
		@1550 nm	0.3 dB/km
2	Mode field Diameter	@1310 nm	9.2 ± 0.4 μm
		@1550 nm	10.4 ± 0.8 μm
3	Maximum Cable Cut-off Wavelength		1260 nm
4	Maximum Zero Dispersion Wavelength		1321.5 nm
5	Minimum Zero Dispersion Wavelength		1301.5 nm
6	Maximum Zero Dispersion Slope		0.092 ps/nm ² ·km
7	Maximum Polarization Mode Dispersion		0.2 ps/√km

D	Strippability	IEC 793-1-B6
E	Visual Examination	EIA/TIA-455-13 (IEC 793-1-B5)

16.3

Instrumentation Cable Interconnection & Termination Philosophy

The cable interconnection philosophy to be adopted shall be such that expensive grouping of signals by large scale use of field mounted Group Junction Boxes (JBs) at strategic locations. (Where large concentrations of signals are available, e.g. valves limit and torque switches, switchgear) is done and consequently cable with higher number of pairs are extensively used. The details of termination to be followed are mentioned in the following Table:

Table 16.5
Instrumentation Cable Interconnection & Termination Philosophy

S.No.	Application		Type of Termination		Type of Cables
	From (A)	To (B)	End A	End B	
1.	Limit, Torque switches of valves / dampers / drives (integral junction box)	Marshalling cubicle / Marshalling cum Termination Cubicle / Local group JB	Plug-in connector	Posts mount cage clamp type	G
2.	Transmitters, E/P converters, process actuated switches mounted in LIE / LIR	Integral junction box of LIE / LIR	Plug-in connector	Cage clamp (rail mount)	F, G
3.	RTD heads	Local junction Box	Plug-in connector	Cage clamp (Rail mount) type	F
4.	Thermocouples	Junction Box	Plug in connector	Cage clamp (Rail mount) type	A, B, C*
5.	Other Field Mounted Instrument	Local JB / Group JB	Plug in connector	Screwed, Cage clamp (Rail mount) type	F (For analog signals) G (For Binary Signals)
6.	Junction Box (For Thermocouples)	Marshalling Cubicle / Marshalling	Cage clamp (Rail mount)	Screwed, Cage clamp (Rail mount) type	A, C*. These signals shall

	for interlock and protection	cum Termination Cabinet	type		preferably through 6 pair cable
7.	Local junction box, Instrument Junction box of LIE / LIR / Group JB / MCC / SWGR	Group JB	Cage clamp (Rail mount) type	Cage clamp (Rail mount) type	F, G
8.	Local junction box, Instrument Junction box of LIE / LIR / Group JB / MCC / SWGR	Marshalling Cubical / Marshalling cum termination Cabinet	Cage clamp (Rail mount) type	Posts mount cage clamp type	F, G
9.	Marshalling Cubical / Termination Cabinet	Electronic system cabinet	Cage clamp post mounted type	Plug-in connector / Other System as per manufacturer's Standard	Internal Wiring

Notes:

1. Normally 10% spare cores shall be used when the numbers of pairs of cables are more than four pairs.
2. For analog signals, individual pair shielding & overall shielding & for binary signals only overall shielding of instrumentation cables shall be used.
3. * For high temperature applications only.
4. Instrument Cabling for instruments / equipment of specialized / proprietary Control System shall be as per manufacturer's standard.

16.4**Terminal Blocks**

1. All terminal blocks shall be rail mounted/post mounted, cage clamp type with high quality non-flammable insulating material of melamine suitable for working temperature of 105 deg. C. The terminal blocks in field mounted junction boxes, temperature transmitters, instrument enclosures/racks, etc. shall be suitable for cage clamp connections. The terminal blocks in Control Equipment Room logic / termination / marshalling cubicles shall be suitable for the post mounted cage clamp connection at the field input end. The terminal blocks for SG integral control system Input/ Output connections from/to SWGR/MCC, shall be used with built in test and disconnect facilities complete with plug, slide clamp, test socket etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[236]	02.09.2015

2. All the terminal blocks shall be used complete with all required accessories including assembly rail, locking pin and section, end brackets, partitions, small partitions, test plug bolts and test plug (as specified above for SWGR connections), transparent covers, support brackets, distance sleeves, warning label, marking , etc.
3. The marking on terminal strips shall correspond to the terminal numbering on wiring diagrams. At least 20% spare unused terminals shall be used everywhere including local junction boxes, instrument racks/enclosures, termination/marshalling cabinets, etc. All terminal blocks shall be numbered for identification and grouped according to the function. Engraved labels shall be used on the terminal blocks.
4. The terminal blocks shall be arranged with at least 100 mm clearance between two sets of terminal blocks and between terminal blocks and junction box walls.
5. Internal wiring in factory pre-wired electronic equipment cabinets may be installed according to the applicable standards as to wire size and method of termination or internal equipment. Terminal blocks for connection of external circuits into factory pre-wired electronic equipment cabinets shall meet all the requirements as specified above.

16.5 Internal Panels, Cabinets, System Cabinet Wiring Philosophy

1. Internal panel/cabinet wiring shall be of multi-stranded copper conductor with FRLS PVC insulation without shield and outer sheath meeting the requirements of VDE 0815.
2. Wiring to door mounted devices shall be done by 19 strand copper wire provided with adequate loop lengths of hinge wire so that multiple door opening shall not cause fatigue breaking of the conductor.
3. All internal wires shall be used with Tag identification of printed type (partex labels) at both ends. All wire directly connected to trip devices shall be distinguished by one additional red color.
4. All external connection shall be made with one wire per termination point. Wires shall not be tapped or spliced between terminal points.
5. All floor slots of desk/Panels/cabinets used for cable entrance shall be used with removable gasketed gland plates and sealing material. Split type grommets shall be used for prefabricated cables.
6. All the special tools as may be required for solder less connection.
7. Tag identification for internal wires shall be printed (partex labels)
8. Wire sizes to be utilized for internal wiring shall be as per following table.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[237]	02.09.2015

Table 16.6
Wire Size for Internal Wiring

S.No.	Application	Wire Size
1	Current (4-20mA), low voltage signals (48 V)	0.5 Sq. mm
2	Ammeter/ Voltmeter circuit, control switches etc. for electrical system.	1.5 Sq. mm
3	Power supply and internal illumination.	2.5 Sq. mm minimum (shall be as per load requirement)

16.6 Cable Installation & Routing

1. All cable assigned to a particular duct/conduit shall be grouped and pulled in simultaneously using cable grips and suitable lubricants. Cables removed from one duct/conduit shall not be reused.
2. Cables shall be segregated as per IEEE Std. 422. In vertically stacked trays, the higher voltage cable shall not be in higher position and instrumentation cable shall be in bottom tier of the tray stack. The distance between instrumentation cables and those of other system shall be as follows:
 - a) From 11KV/6.6KV/3.3KV tray system - 900 mm
 - b) From 415KV tray system - 600 mm
 - c) From control cable tray system - 300 mm
3. Cables shall terminate in the enclosures through cables glands. All cable glands shall be properly gasketed. Fire proof sealing (to prevent ingress of dust entry and propagation of fire) shall be used for all floor slots used for cable entrance. Compression cable glands (double for armored and single for other cables) shall be used.
4. All cables shall be identified by Tag. Nos. provided in approved format at both the ends as well as at an interval of 5 meters.
5. Line voltage drop due to high resistance splices, terminal contacts, insulation resistance at terminal block, very long transmission line etc. shall be reduced as far as practicable.
6. The cables emanating from redundant equipment/devices shall be routed through different paths. The above segregation of cables & wiring for redundant equipment / devices shall be in accordance with IEEE-Std-422

16.7 Cable Laying

1. Cable shall be laid strictly in line with cable schedule. In general, the cable routing from the local instrument to JB shall be such that the cable go away from the hot zone.
2. Identification tags for cables.
Indelible tags to be provided at all terminations, on both sides of wall or floor crossing, on each conduit/duct/pipe entry/exit, and every 20 m in cable trench / tray.
3. Cable tray numbering and marking.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[238]	02.09.2015

To be provided at every 10m and at each end of cables way & branch connection.

4. Joints for less than 250 Meters runs of cable shall not be permitted.

5. Buried cable protection

With concrete slabs; Route markers at every 20 meters along the route & at every bend.

6. Road Crossings

Cables to pass through buried high density PE pipes encased in PCC. At least 300 mm clearance shall be used between.

- a) HT power & LT power cables,
- b) LT power & LT control cables,
- c) LT control & instrumentation cables,

Spacing between cables of same voltage grade shall be in accordance with the derating criteria adopted for cable sizing.

7. Segregation (physical isolation to prevent fire jumping)

- a) All cable associated with the unit shall be segregated from cables of other Units.
- b) Interplant cables of station auxiliaries and unit critical drives shall be segregated in such a way that not more than half of the drives are lost in case of single incident of fire.

8. Cable clamping

All cables laid on trays shall be neatly dressed up & suitably clamped/tied to the tray. For cables in trefoil formation, trefoil clamps shall be used.

9. Optical fibre cables inside conduits shall be laid on cable trays wherever available and feasible. In areas where the same are required to be buried, the same shall be buried in separate trench approx. 1.6 meter depth, to be laid in 2" GI/rodent proof HDPE conduits covered with sand, brick and soil along the pipe line route.

10. While crossing roads- to be laid in GI/rodent proof HDPE conduits with sand filling at bottom and sand, soil filling at top with cement concrete;

While crossing canals/river- to be laid in GI/rodent proof HDPE conduits within Hume pipe.

16.8 Cable Accessories

1. Cables, which terminate in cabinets of draw out sections, shall have sufficient cable coils in the bottom of the cabinet to permit full withdrawal of draw out sections without disconnecting the cables. When prefabricated cables with factory connectors on both ends are longer than required, the excess cable shall be coiled in the bottom of one or both termination cabinets.
2. No splices shall be made in conductors for instrument and control circuits except where required at connections to devices equipped with factory installed pigtails.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[239]	02.09.2015

Such splices shall be made only in approved splicing boxes of fitting with removable cover. The splices shall be made with sufficient slack left in the wire to permit withdrawal of the splice from the splicing boxes for ease of future disconnection of the splices. All exposed conductor or connector surfaces shall be covered with a minimum of three half-lapped layers of all weather vinyl plastic electrical tape. Taping shall extend a minimum of two cable diameters over the cable jacket and a similar distance over the other insulation or connections requiring insulation.

3. Proper grounding of all equipments shall be done. Further, proper termination of cable shield shall be verified and the grounding of the same shall be coordinated so as to achieve grounding of all instrumentation cable shields at same potential. This shall be completed prior to system tests.
4. Take full care while laying/installing cables as recommended by cable manufacturers regarding pulling tensions and cable bends.

16.9

Cable Conduits

1. Conduits shall be generally used for interconnecting cables from field instruments to Local JB's. All unarmoured cables shall be installed in conduit. All rigid conduits, couplings and elbows shall be hot dipped galvanized rigid mild steel in accordance with IS: 9537 Part-I and Part-II. The conduit interior and exterior surfaces shall have continuous zinc coating with an overcoat of transparent enamel lacquer or zinc chromate. Flexible metal conduit shall be heat resistant lead coated steel, water leak, fire and rust proof. The temperature rating of flexible conduit shall be suitable for actual applications. The flexible metal conduit shall be constructed with interlocked corrosion resistant steel & manufactured in accordance with UL1 & NEC Article 348.
2. All grounding bushings within all enclosures shall be wired together and connected internally to the enclosure grounding lug or grounding bus with 8 AWG bare copper conductors. Conduit runs to individually mounted equipment shall be grounded to the cable tray grounding conductor with 12 AWG bare copper conductors.
3. All rigid conduit fittings shall conform to the requirements of IS: 2667. Galvanized steel fitting shall be used with steel conduit. All flexible conduit fittings shall be liquid tight, galvanized steel. The end fittings shall be compatible with the flexible conduit supplied.
4. All individually mounted equipment and devices shall be connected to the supply conduit, using not more than one meter of flexible conduit adjacent to the equipment or device. Flexible conduit shall be installed in all conduit runs, which are supported by both building steel and structures subject to vibration or thermal expansion. This shall include locations where conduit supported by building steel or foundation becomes supported by steam generator framing.
5. Special areas, such as Control Rooms in which external noise is to be minimized, shall have flexible conduit in conduit runs where the runs cross from the main building framing to the Control Room framing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[240]	02.09.2015

6. Conduit supports shall be furnished and installed in accordance with these specifications. Support material shall comply with the requirements.
 - a) Hanger rods shall be 12 mm diameter galvanized threaded steel rods.
 - b) Single conduit support shall be one-hole cast straps and clamp backs. Multiple conduit bank supports shall be constructed of special galvanized support channels with associated conduit clips.
7. Conduit sealing, explosion proof, dust proof and other types of special fittings shall be used as required by these specifications and shall be consistent with the area and equipment with which they are installed. Fittings installed outdoors and in damp locations shall be sealed and gasketed. Hazardous area fittings and conduits sealing shall conform to NEC requirements for the area classification.
8. Double locknuts on all conduit terminations shall be used. Water tight conduit unions and rain tight conduit hubs shall be utilized for all the application which shall be exposed to weather. Moistures pockets shall be eliminated from conduits.
9. Conduits shall be securely fastened to all boxes and cabinets.

16.10 Cable Sub Trays & Support

1. The cable sub-trays and the supporting system, to be generally used between Local/Group JB's and the main cable trays. It is the assembly of section and associated fitting forming a rigid structural system used to support the cable from the equipment or instruction enclosure up to the main cable trays (trunk route). The material of cable tray shall be GI.
2. The covers on the cable sub-trays shall be used for protection of cables in areas where damage may occur from falling objects, welding spark, corrosive environment, etc. & shall be electrically continuous and solidly grounded. The cable trays shall not have sharp edges, burrs or projections injurious to the insulation or outer sheath of the cables.
3. The supporting arrangement of cable tray system shall be able to withstand the weight of the cable and cable tray system. The supporting interval shall not be more than the recommended span for the above loading for the type of cable tray selected. The tray shall not overhang by more than one meter from the support at the dead end. As far as practicable the cable sub-tray system shall be supported from one side only, in order to facilitate installation and maintenance of cables.
4. Install the estimated quantities and size of sub trays / troughs including all required fittings and adaptors on as required basis.

Table 16.7
Specifications for Cable Tray

S.No.	Feature	Minimum Requirement
1	Material	Mild Steel as per IS-2062
2	Thickness	Not Less than 2 mm
3	Finish	Hot Dip galvanised as per IS-2629, 2633 & Zinc Coating as per IS-4579
4	Length	2.5 Mtr. +/- 10 mm

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[241]	02.09.2015

S.No.	Feature	Minimum Requirement
5	Width	W +/- 3mm
6	Inward Bend	25 mm
7	Coupler Plate	Thickness 2 mm, length 100 mm, Width 50 mm
8	Coupler plate material	MS with Hot dip galvanised
9	Nuts, Bolts, washer etc.	As required/ Hot dip galvanised
10	Cover	Dome Fixed type, Thickness 1.2 mm (Minimum)
11	Cover Material	Hot dip galvanised MS sheet

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[242]	02.09.2015

17. SYSTEM CABINETS, PANELS & JUNCTION BOX**17.1 General Requirements**

1. All control panels, system cabinets, local panels and local instrument enclosures, racks shall be furnished fully wired with necessary provision for convenience outlets, internal lighting, grounding, ventilation, space heating, anti-vibration pads and accessories as per IS:5039 as required for completeness of the system.
2. All panels & cabinets shall be free standing type and have bottom entry for cables unless otherwise specified. The bottom of panels, cabinets, enclosures shall be sealed with bottom plate, compression cable glands and fire proof sealing material to prevent ingress of dust and propagation of fire. The Cabinets shall be designed for front & back access to components, terminals and wiring.
3. The cabinets shall be used with bottom glanding plate which shall be removable from inside and shall be used with sufficient no. of knockouts. All knockouts shall be used with pluggable grommets.
4. The cabinets shall be of max. 2200mm height including base channel. The base channel shall be of 100 ISMC. All cabinets shall be of same height. Construction shall be modular.
5. System & non-system cabinets shall have "look alike" appearance.
6. All electronic system cabinets shall be designed for 50 deg C operating under maximum ambient temperature without air conditioning system in service. Further cabinets, panels shall be so designed that temperature rise due to heat load does not exceed 10 deg. C above ambient temperature under all operating conditions. Necessary louvers, fans, limited packing density, adequate spacing between instruments, devices etc. shall be used to maintain temperature rise within permissible limits.
7. Panels, cabinets enclosures wiring shall be arranged to enable the removal of modules/instruments and devices without unduly disturbing them.
8. All panels, cabinets, enclosures interiors shall be illuminated with rapid start fluorescent strip fixtures with door actuated switches. Door switch terminals shall be shrouded. All illuminated lights shall be used with isolation switch in addition to door switch for maintenance & switching off when not required. Illumination light shall be used on both front & back sides if both sides are provided with equipments/instruments/terminal blocks requiring maintenance.
9. Sufficient number of power receptacles with disconnect switches shall be installed within panels, enclosure and racks.
10. The local instrument enclosures/racks shall be used locally for mounting of electronic transmitters and switches, etc.
11. Exterior steel surface shall be sand blasted, ground smooth, filed, primed, sanded and smooth enamel painted to give a good finish subject to minimum paint thickness of 65-75 microns for sheet thickness of 3 mm and 50 microns for sheet thickness of 2mm. Minimum 2 coats of primer and two sprays of final finish colour shall be applied to all surfaces.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[243]	02.09.2015

12. The colour of the panel's interior shall be brilliant white. External colour of the panels shall be as RAL 7032 for LIE/ LIR and RAL 7035 for control room system cabinets.
13. All panels, enclosures, system cabinets, marshalling cabinets shall be used with a minimum of 20% spare terminations and system cabinets shall be used with spare space for 20% additional modules fully wired with connectors etc. in excess of the total requirement of the system design when the cabinets are delivered. The spare space capacity shall be distributed evenly throughout the cabinets.

17.2

System Cabinets

Table 17.1
Specifications for System Cabinets

S.No.	Features	Minimum Requirements
1	Application	For housing Signal conditioning cards, input/output cards, processor cards, power supply units etc.
2	Location	Indoor
3	Type	Free standing Vertical type
4	Protection class	IP-44
5	Material & Thickness	CRCA steel/ min. 2mm for panel sides & 3mm for gland plates
6	Doors	Double door with neoprene gasket, Lockable,
7	Cable entry	Bottom with fire proof compound thickness 50 mm for sealing
8	Anti vibration pad	Required, 15mm
9	Painting	Interior- Brilliant White Exterior- RAL 7035
10	Cabinet Dimension	To be decided during detail engineering
11	Grounding	M6 earthing stud shall be used
12	Ventilation	Fans & louvers with brass mesh required
13	Lighting	rapid start fluorescent strip fixtures with door actuated switches required
14	Lifting arrangement	Removable lifting eyebolts shall be used

1. Beacon Lamps shall be used in each cabinet to indicate panel having fault condition.
2. The racks in system cabinets shall have provision along with plug in sockets/back plane to house accommodate the spare slots/modules as specified elsewhere.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[244]	02.09.2015

3. The system cabinets, racks in system cabinets, slots in the racks & the terminals shall have identification numbers. A stainless steel metal tag (plate) shall be fixed to the inside of the door & the layout of the racks, slots & details of the card type/service shall be inscribed on this metal tag.
4. Each cabinet shall be used with one each 3 pin receptacles for 230 V, 1P, 50 Hz and receptacles for 24V DC.
5. One of the doors shall be used with folder to keep the relevant engineering document of the cabinet.
6. All cabinets shall have common key for locks.
7. Door shall have concealed type of hinges with 120 degree swing.
8. Door latches shall be of the three-point type to ensure tight closing.
9. Separate Power & shield earthing bus shall be used at the front & rear side of the cabinets. The earthing bus shall be isolated from panel body by suitable insulation material.

17.3

Marshalling Cabinets

Table 17.2
Specifications for Marshalling Cabinets

S.No.	Features	Minimum Requirements
1	Application	For termination of all cables originating from field.
2	Location	Indoor
3	Type	Free standing Vertical type
4	Protection class	IP-44
5	Material & Thickness	CRCA steel/ min. 2mm for panel sides & 3mm for gland plates
6	Doors	Double door with neoprene gasket, Lockable,
7	Cable entry	Bottom with fire proof compound thickness 50 mm for sealing
8	Terminal Blocks	Rail mounted cage-clamp suitable for conductor size up to 2.5 mm ² & fused type with LED indication for power supply (24 VDC, 230 V AC, 110 V AC etc.) for instruments & equipments.
9	Anti vibration pad	Required, 15mm
10	Painting	Interior- Brilliant White Exterior- RAL 7035
11	Cabinet Dimension	To be decided during detail engineering
12	Grounding	M6 earthing stud shall be used
13	Ventilation	Fans & louvers with brass mesh required

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[245]	02.09.2015

S.No.	Features	Minimum Requirements
14	Lighting	rapid start fluorescent strip fixtures with door actuated switches required
15	Lifting arrangement	Removable lifting eyebolts shall be used

1. Separate Marshalling cabinets for the system shall be supplied for terminating all cables originating from the field and for distributing the signals to different functional panels and cubicles.
2. The terminal blocks shall be cage clamp type. Fused terminal blocks hinged at one end to facilitate easy isolation shall be used wherever necessary. All cabinets shall be used with spare terminals for the spare inputs/outputs as specified elsewhere in the specification. The type of terminals for terminations from cabinets/panels shall match with the pre fabricated cables and pins supplied.
3. The terminals for field cables shall be arranged in a logical order of equipment/system wise.
4. The marshalling cabinets, the terminal blocks, the terminals and the electronic hardware if any, shall have identification numbers.
5. Each cabinet shall be used with one each 3 pin receptacles for 230 V, 1P, 50 Hz and receptacles for 24V DC.
6. One of the doors shall be used with folder to keep the relevant engineering document of the cabinet.
7. All cabinets shall have common key for locks.
8. Door shall have concealed type of hinges with 120 degree swing.
9. Door latches shall be of the three-point type to ensure tight closing.
10. Separate Power & shield earthing bus shall be used at the front & rear side of the cabinets. The earthing bus shall be isolated from panel body by suitable insulation material.

17.4 Local Instrument Enclosure & Racks

1. Transmitters and switches, devices, etc. mounted in the field shall be suitably grouped together and mounted in local instruments enclosures in case of open areas of the plant and in local instrument racks in case of covered areas. These local instrument enclosures and racks shall be furnished as per the project requirements.
2. The local instrument enclosures shall be constructed of 2 mm sheet plate and shall be of modular construction with one or more modules and two end assemblies bolted together to form an enclosure. Vibration dampeners shall be installed for supporting each enclosure. The internal layout shall be such that the impulse piping/ blow down lines are accessible from back doors of the enclosure and the transmitters etc. are accessible from front side for easy maintenance. Gaskets shall be used between all mating sections to achieve protection class of IP-65.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[246]	02.09.2015

3. The local instrument racks shall be free standing type constructed of suitable 3 mm thick channel frame of steel and shall be used with a canopy to protect the equipment mounted in racks from falling objects, water etc. The canopy shall not be less than 3 mm thick steel, and extended beyond the ends of the rack. Bulk heads, especially designed to provide isolation from process line vibration shall be used. Exact fabrication details shall be as finalized during detailed engineering stage. The junction box for racks also shall conform to IP 65 protection class.
4. Provision for continuous purging arrangement is to be made for all air and flue gas applications.
5. Each transmitter enclosure housing instruments i.e. for air and flue gas applications, requiring purge air for continuous air purging shall be used with common purge air header, air filter regulators of sufficient capacity, required pressure gauges, valves, fittings, SS tubing and individual purge meters for each purge line etc. as required.
6. The junction box of Local Instrument Enclosure & Racks shall be used with hinged type door, latch for locking & gland plates for cable entry. All terminals in junction box shall be of rail mounted cage clamp type suitable for conductor size up to 2.5 Sq. mm.

17.5

Local Junction Box

Table 17.3
Specifications for Junction Box

S.No.	Features	Minimum Requirements
1	No. of Ways	32 (2X16) with 20% spares terminals
2	Material & Thickness	3 mm thick Stainless steel
3	Protection class	IP-65 for outdoor/ IP 55 for Indoor
4	Cable entry	Bottom
5	Mounting	Suitable for Wall/column/structures mounting
6	Terminal Blocks	Rail mounted cage-clamp type suitable for conductor size up to 2.5 mm ²
7	Grounding	M6 earthing stud shall be used
8	Gland plate	Removable type
9	Door	Single Lockable door with gasket, able to open sideways, turnable hinge based, latch type lock without handle with common key.
10	Accessories	Tag plate, clamps, fixtures, bolts (SS), nuts (SS), Gasket (Neoprene), cable glands (SS), Lugs (Brass), Fire proof compound for sealing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[247]	02.09.2015

1. All JB's for outdoor application shall be used with individual canopies to prevent ingress of water.
2. All JB' shall have provision to add 10% additional TB's.
3. The marking on terminal strips shall correspond to the terminal numbering on wiring diagrams.
4. Separate Terminal blocks shall be used for Analog & Digital Signals & also for signals with different voltage levels.
5. The terminal blocks shall be arranged with at least 100 mm clearance between two sets of terminal blocks and between terminal blocks and junction box walls.
6. Separate shield bus shall be used with screw connection for terminating cable shields.
7. All spare cable entries shall be used with plugs.
8. All wires in JB shall be neatly dressed & ferruled.
9. Double deck type terminal block shall not be used.

Table 17.4
Specifications for Cable Glands

S.No.	Features	Minimum Requirements
1	Type	Double compression
2	Entry Thread	½ " NPT
3	Material	Brass
4	Finish	Cadmium Plated
5	Protection	IP-54 or better
6	Accessories	Neoprene gasket, Locknut, Reducer etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[248]	02.09.2015

18. TIME SYNCHRONIZATION SYSTEM (MASTER CLOCK SYSTEM)*{TO BE DELETED, IF ALREADY PROCURED UNDER TG PACKAGE.}***18.1 General**

A Global Positioning Satellite (GPS) based Master Clock System shall be provided with the Plant DCS system. Necessary signal output for time synchronization from Master Clock System shall be made available to the SG control system to have common time reference.

1. The system shall be provided with a GPS based date insensitive master & slave clock system (common for the station) for time synchronization of all plant control systems & equipments.
2. The system shall be complete with receiving antennae (for receiving time from GPS), receiver and associated electronics, Redundant Master Clocks, Slave Clocks, interconnecting cables, cubicles, power supplies & any other accessories.
3. The master clock shall have adequate number of communication ports to provide independent time reference signals for the following applications:
 - a) All DCS system equipment including plant common systems.
 - b) SER systems.
 - c) All PLC based BOP & offsite plant control systems
 - d) Vibration monitoring system for Unit specific requirements and for plant utilities.
 - e) PADO system.
 - f) Computerised Maintenance Management system
 - g) Management Information system
 - h) Station LAN Server
 - i) SG Integral control systems.
 - j) TG Integral control systems.
 - k) SG Flame monitoring & analysis system.
 - l) Any other equipment requiring time synchronising.
4. The following spare ports shall be as a minimum:
 - a) Spares for Hour Pulse
 - b) Spares for Minute Pulse
 - c) Spares for Second pulse
 - d) Spares for BCD real time output with one (1) second frequency
 - e) Spares for serial time code in IRIG-B format with one (10 second frequency.
 - f) Spares for serial time code in RS 232 C with one (1) minute frequency.

18.2 Design Requirements

1. The offered master clock system shall be a fully wired panel consisting of the following minimum items & shall be located in Equipment Room in CCR :

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[249]	02.09.2015

- a) GPS Antenna
 - b) GPS Receiver
 - c) Signal Processing Unit
 - d) Local display unit
 - e) Power supply
 - f) All required cables, mounting accessories, cabinet for the processing electronics etc.
2. The system shall be designed in a 100% redundant configuration and shall include two master clock systems.
 3. The Master Clock System shall receive the synchronizing pulses from the GPS system and form a common time reference for recording of any event, logs and reports, which may take place in any portion of the network distributed throughout the Plant. Global Positioning System, to which the Master Clock gets synchronised, shall be an absolute system to provide continuously 3 dimensional position fixing, velocity measurement and Time reference generation
 4. The master Clock shall be configured as Real Time Clock with display of time in 24 hrs format & it shall drive the slave display units. It shall be ensured that loss of any slave display unit does not affect the display of any other slave unit. The character size of slave display unit shall be minimum 100 mm LEDs (4''). Since the timing synchronization of many off-site facilities is being done through station LAN, the slave clocks may be alternatively driven by respective systems / sub-systems.
 5. Accuracy of the master clock system shall be as follows:
 - a) PPS output : +/- 500 nano second or better.
 - b) IRIG-B output : +/- 200 micro second of UTC or better
 6. All the cables for interconnection between Master Clock and Slave Clocks & other systems shall be provided. This shall include all signal cables, (minimum Type-G cable as per specification) as well as power supply cables.

Table 18.1
Specifications for Master clock system

S.No.	Features	Minimum Requirements
1	GPS Antenna type	Helical
2	Noise	Less than 6 dB
3	GPS Receiver	Micro processor based
4	Tracking method	Code/carrier tracking
5	Output data format	NEMA 0183 or equivalent
6	Communication speed	9600 BPS or better
7	Output rate	Every Second
8	Signal Processing unit	Micro processor based digital type
9	Reference	OCXO with stability of 1 PPM
10	Time accuracy	1 PPM

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[250]	02.09.2015

19. UNINTERRUPTED POWER SUPPLY (UPS)*{TO BE DELETED, IF ALREADY PROCURED UNDER TG PACKAGE.}***19.1 General**

This specification is intended to cover the *[design, Engineering, manufacture, assembly, testing at manufacturer's works, supply in properly packed condition for transport to site, Erection, site testing and commissioning]* of UPS system complete with all accessories for efficient and trouble-free operation of R&M of Unit No. [.] of *[Name of the Power Plant]* at *[District], [State]* for *[Name of the Client]*.

19.2 Scope of Supply

Redundant, 230 VAC Uninterrupted Power Supply (UPS) System for various C&I packages including the plant control system (DCS) consisting of 2x 100% capacity static inverters, 2 x 100% capacity static switches, Manual by-pass switch, 2x 100% capacity float-cum-boost chargers, Battery with accessories, Step-down transformer, Voltage Stabilizer, 2x 100% AC Power Distribution Boards etc. shall be provided. UPS shall be provided with all interconnecting cable between UPS equipment and battery, UPS system cabinets and enclosures etc.

UPS shall be provided with all equipment and accessories required for completeness of the system including any feeder distribution as required for protecting UPS equipment and connected inputs and outputs shall be furnished in line with the specification.

19.3 Technical requirements

1. The equipment furnished under this subsection of the specification shall meet the requirements of all applicable codes and standards including ANSI, NEMA, IEEE, NEC and IS.
2. The UPS equipment and the complete system shall have Surge Withstanding Capability (SWC) to meet the requirements of ANSI C 37.90a - IEEE Standard 472-1974.
3. The UPS shall be provided to cater to all the loads for systems, equipment and instruments requiring UPS supply. Spare feeders of at least 10% of the total number of feeders shall be built in.
4. The selection and selective co ordination of all the protecting devices including fuse free circuit breakers/ fuses shall conform to the requirements of National Electric Code NEC –1984 and other applicable codes and standards. The selectivity ratios of the fuses shall be such that there is a sufficient margin between the total electric energy of the upstream fuse. The selectivity ratio shall be not be less than 2:1 in any case.
5. The following general requirements shall be met for ensuring proper branch and circuit protection-

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[251]	02.09.2015

- a) The feeder fuse ampere rating and feeder conductor ampacity must be at least 100% of the non continuous load plus 125% of the continuous load as calculated per Article 220 (220-10 G) of NEC Code- 1984. The feeder conductor must be protected by a fuse not greater than the conductor ampacity.
 - b) Each ungrounded service entrance conductor shall have a fuse in series with a rating not higher than the ampacity of the conductor.
 - c) If secondary fuses are sized not greater than 125% of transformer secondary current, individual transformer fuses are not required in the primary, provided, the primary feeder fuses are not larger than 250% of the transformer rate primary current.
6. The UPS system shall be suitable for operation at ambient conditions indicated in the specification.

19.4 Functional requirements

1. The Uninterrupted Power Supply (UPS) system of continuous duty shall supply regulated, filtered and uninterrupted 230V, 50 Hz, single-phase power, within specified tolerances. Each of the UPS loads shall receive one feeder each from the AC Distribution Board of Inverter A& B. However, each inverter shall supply only 50% loads under normal conditions.
2. Each UPS System component shall be compatible for satisfactory and well coordinated operation with other related components as well as with the input and output systems.
3. The KVA rating of the UPS shall be guaranteed at 230VAC, 50 Hz, single phase output at 50 deg C ambient temperature and load factor of 0.8 lagging. In case, the standard UPS rating are applicable at an ambient temperature lower than 50 deg C, then derating factor of at least 1.5 % / deg C shall be considered. The Bidder shall demonstrate the above stated capacity at 50 Deg C during shop testing.

19.5 Normal Operation

1. During normal operation, UPS loads shall be supplied by both 100% capacity inverters each working at 50% load. The inverters shall receive power from DC source (Charger/Battery) and their static switches shall be in the respective "Inverter" position. In this mode the two inverters shall act as hot standby for each other.
2. Necessary paralleling networks shall be included to ensure equal load sharing by both inverters. The rating of the paralleling device / circuit shall be such that it does not act as a limiting factor on the fault clearing capability of the inverters individually and when working in parallel. Load sharing network details shall be provided to establish all functionalities including fuse clearance.
3. One inverter shall act as "Master", working on its internal oscillator and the other inverter shall follow by using the synchronising signal from master inverter for automatic control of its output frequency.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[252]	02.09.2015

19.6 Emergency operation

In case of failure of any inverter, the static switch shall automatically transfer the UPS loads of faulty inverter (say Inverter-"A") to the healthy Inverter-"B" which shall start working at 100% capacity. Thus the feeding of UPS power is continued automatically to all loads connected to both inverters despite the failure of one inverter and the quality power supply to all UPS loads connected to both inverters shall be maintained without interruption. Isolation of faulty inverter shall be automatic and achieved in less than 4 mille seconds.

On inverter failure, the plant AC source is automatically brought in as the standby source to healthy Inverter working at 100% capacity. In this mode, the healthy Inverter shall get the synchronizing signal from the standby AC source.

Operation on internal oscillator and transfer/retransfer to standby source shall be as follows:

1. The output frequency of the healthy inverter shall be automatically synchronised with the plant stand-by AC source supplied through step down transformer and voltage stabilizer using synchronizing signal from the standby source. If the frequency of the standby source is beyond these limits, the inverter frequency control shall be automatically disconnected from stand-by synchronizing signal and the inverter shall maintain the output frequency at 50 Hz within + 0.1 percent under all conditions of load and input voltage by working on its own internal oscillators.
2. During operation on its own internal oscillator, the inverters shall continuously monitor the frequency of standby source. Upon restoration of proper frequency conditions of stand-by source, the inverter shall automatically start using stand-by source frequency as the synchronizing signal for inverter output frequency control.
3. During the operation of any inverter on its internal oscillator due to synchronizing frequency being beyond the specified limits, the transfer of static switch from "Inverter" to "Standby source" shall be inhibited.
4. While one of the inverters (healthy) is feeding 100% load and the AC source is acting as standby, and in case this inverter also fails, the 100% load shall be automatically transferred from inverter to standby AC source through static switch, provided the standby source is synchronized to the inverter (synchronous transfer). However, such transfers shall be inhibited during operation of inverter on its internal oscillator due to standby AC source frequency being beyond the synchronization limits. Asynchronous transfer of inverter loads to standby AC source with a beak, on inverter failure shall be envisaged.
5. Retransfer of loads from standby AC source to inverter shall be automatic or manual as pre selected by the operator and shall be accomplished only after synchronism of the inverter output with the standby source has been automatically accomplished.
6. The manual bypass switch shall have the provision for fully by-passing the UPS system and connecting all UPS loads to the standby AC source.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[253]	02.09.2015

19.7 Static inverters and auxiliary equipment

The static inverters shall be solid state type employing silicon controlled rectifiers or power transistors and other solid state devices to convert direct current power to essentially sinusoidal alternating current power as per this specification. Ferro resonant type inverters shall not be acceptable. The inverter equipment shall include all necessary circuitry and devices to conform to requirements like voltage regulation, current limiting, wave shaping, transient recovery, surge suppression network, automatic synchronisation etc. as specified herein. Inverter shall be of continuous duty. Natural convection or forced cooling using redundant fans shall be used. Equipment shall be designed for operation with full load even with cooling fans failure / non-availability.

19.7.1 Inverter Capacity

Each static inverter shall have the following minimum capabilities. Continuous full load rating: meeting specification stipulations Over load capacity: 125% of full load rating for 10 minutes and 200% for 10 seconds minimum and 300% for 4ms minimum for all specified input voltages.

The inverter shall have sufficient I²t capability to clear a slow acting HRC fuse having a continuous current rating equal to at least 20% of the continuous full load current rating of the inverter, while feeding 100% rated loads of the inverter.

Voltage regulation: $\pm 1\%$ for 0-100% load at all input voltage and all power factors.

Step load pick up: Upon transfer of full load, the inverter output voltage shall not drop below 85% of nominal voltage during the first half cycle after transfer and 90% of nominal voltage in the next half cycle. The recovery to within $\pm 1\%$ of voltage shall be in less than 50 milliseconds.

The Bidder shall indicate the maximum current rating (in Amps) of slow acting HRC fuse which can be cleared by the proposed inverters upon a branch circuit or bus fault. This shall also be accompanied by calculations and test data.

19.7.2 Input / Output Voltage

The inverters shall be fed from Battery and chargers which do not feed any other loads. Input voltage shall be nominal DC output voltage of battery and charger of range from final voltage after discharge of battery to maximum DC bus voltage during equalize charging of battery. The inverter shall also be capable of working satisfactorily meeting all specification requirements with only the chargers connected to its input without battery in circuit. Filtering on the input of the inverters shall be furnished as required to operate with the output ripple of the chargers. Each inverter shall include equipment necessary to protect itself from damage resulting from excursions, loss or restoration of DC input voltage and synchronizing voltage. The inverter output voltage shall be 230V AC, 50 hz, single phase. Total harmonic content shall be 4% (max) and harmonic content of any single harmonic shall not exceed 3%. The inverter efficiency at 100% load

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[254]	02.09.2015

and 0.8 pf shall be minimum 85% and at 50% load and 0.8 pf shall be minimum 80%.

19.7.3 Over loads, Short Circuits and Load loss

1. The inverters shall be provided with suitable fuses at the input and output which shall permit proper co-ordination with other protective devices and at the same time protect the inverter against damage due to internal faults. All necessary equipment shall be provided to protect the inverters against over loads, short circuits and 100% loss of load. The inverter shall be self protecting against damage if energized with full load connected. All the fuses used in inverter power & control circuits shall be fast acting type, operating in less than 5 ms.
2. The inverter shall be provided with current limiting circuitry which shall limit the output current to a value which will not damage the inverter or blow its fuses.
3. The inverter shall have sufficient I_{2t} capability to prevent damage to itself until short circuit conditions on the output are cleared.
4. Each inverter shall be capable of operation with non linear loads. Bidder shall furnish details of non linearity for the loads. Output waveform of the inverters) shall remain within specified limits when operating with non linear loads at 100 percent rated load.
5. The inverters shall be self protecting against all AC and DC transients, voltage surges and steady state abnormal voltages and current likely to be encountered in utility power station.

19.7.4 Automatic Synchronization

1. Inverter equipment shall include stable solid state oscillator devices designed to automatically maintain the inverter output in phase and in synchronism with the standby AC source. The frequency regulation shall be automatic within +/- 0.1% for all conditions of inputs, loads and temperature occurring simultaneously or in any combination.
2. Facility shall be provided for automatic transfer to internal oscillator operation when the standby source frequency is not within the synchronization limits.
3. Provision shall be made for step less adjustment of synch disconnect frequency range from 50 Hz +/- 0.5 Hz to 50 Hz +/- 2 Hz.
4. Automatic adjustment of phase relationship between inverter output and standby AC source shall be gradual, at a controlled slew rate which shall not exceed one Hz per second.
5. The inverter shall normally work on the internal oscillator with either of the two inverters as master synchronizer and the other following it. Suitable selector facility shall be provided to select the master. When any one inverter fails the healthy inverter gets the synchronizing signal from the standby A.C. source.

The DC input current shall never exceed the full load current except for a short circuit within the inverter. This limitation applies to transient as well as steady state currents and includes in rush currents upon initial energisation of the UPS, load energisation, short circuits external to the inverter etc. For any value of the load and load power factor drawn by the equipment served, the inverter shall not

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[255]	02.09.2015

impose on DC source any voltage oscillations in excess of 5 volts (RMS total, all frequencies) or any current oscillations in excess of 3 percent (RMS total, all frequencies) of the DC current at full load.

19.7.5 Static inverter auxiliary equipment

In addition to the inverter equipment specified above, auxiliary equipment shall be furnished with each static inverter as follows:

1. Output ammeter, Output voltmeter, Output KVA meter, Input voltmeter, Frequency meter, Power factor meter, Inverter ON-OFF switch, Alarm Reset Push Button etc. of one number each shall be provided on the front panel of the inverter enclosures.
2. Indicating lights shall be furnished on front of the UPS panels. For those abnormal conditions which could be of a momentary nature, the indicating lights shall remain energized and the contact remain closed until cleared by a reset push button on the panel.
3. The following indications shall be provided as a minimum i.e. DC voltage to the Inverter Low/ High, Loss of DC input to the inverter, Inverter output voltage High/ low, Inverter failure, Standby AC source failure, Inverter synchronized with standby AC source in case of failure of the other inverter, Inverter feeding 100% UPS load, Standby AC source feeding 100% UPS loads, Fan failure and temperature high etc.
4. In addition to the above indications, the Bidder shall furnish electrically independent, potential free contacts for each of the above conditions. These contacts shall be rated for 0.5 Amps, 220 Volts DC and shall be wired to the terminal blocks.
5. The 4-20 mA signals for Inverter A & B output voltages, output currents, output frequency etc shall be furnished.

19.8 Static transfer switches and auxiliary equipment

The static transfer switches shall be provided to perform the following functions

1. To transfer the load automatically between the Inverter to the standby inverter as described under automatic synchronization.
2. To transfer UPS load under manual control from standby AC source to inverter when placing the UPS System in service and from inverter to standby AC source when taking the UPS out of service.
3. The static transfer switches shall have two modes of operation namely automatic and manual.
4. The static transfer switches shall use silicon controlled rectifiers and other static devices required for automatic transfer of load from Inverter to Standby source and vice versa.
5. The static switches shall be provided with the requirements specified herein including the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[256]	02.09.2015

- | | | |
|----|-----------------------------|---|
| a) | Capacity(continuous) | Continuous full load capacity of the inverter. |
| b) | Capacity (overload) | As per overload capacity of inverter indicated in the specification |
| c) | Capacity (Peak) | 1000% of continuous rating for 5 cycles. |
| d) | Transfer Time | 1/4 cycle maximum. (The transition shall be "make before break". Voltage failure shall be sensed at the output of static switch |
| e) | Voltage Rating (Nominal) | 230 Volts, 50 Hz, single phase. |
| f) | Transient Voltage Tolerance | 340 Volts peak above the normal line voltage. |
| g) | Ambient temperature | 50 deg C max. |
| h) | Cooling | Natural or forced circulation, using redundant fans. |
| i) | Duty | Continuous |

6. The transfer of static switch from normal "Inverter" position to "Stand-by" position shall be initiated by Inverter failure and UPS system trouble, Static switch output voltage failure, over current or manual push button operation.

The UPS bus shall be monitored by two voltage detectors. One fast acting circuit shall be used for detecting a complete and instantaneous voltage loss while the other slower acting averaging circuit with adjustable trip level shall be employed to detect voltage deviation beyond selected limits. Both voltage detector circuits shall automatically initiate operation of static transfer switch.

UPS bus current shall be continuously monitored by a current monitoring detector. This detector shall operate the static transfer switch when the load current exceeds the overload rating of any inverter. The detector shall rest when the load current falls below the rated current of the inverter resulting in retransfer of static switch with inverter position.

The static switch shall automatically transfer the load from inverter to stand-by AC source when the maximum I_{2t} capability of the inverter is reached or when the inverter output voltage drops below 90%.

Over current transfer limit shall be continuously adjustable from inverter continuous rating to inverter current limit rating.

7. Transfer Inhibit of static switch shall be under the following conditions:

- Automatic or manual synchronous transfer of load from inverter to stand-by AC source or vice versa, shall be inhibited when the inverter frequency is not synchronized to the alternate source. However, asynchronous transfer facility under such condition shall be provided.
- Transfer resulting from overload shall be inhibited when the standby AC source is not available. In this case the load fed by the inverter shall be automatically disconnected.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[257]	02.09.2015

8. Static transfer switches shall be provided with necessary protective devices (circuit breakers) both in "Normal" as well as "Stand by" position.
9. The static switches shall be furnished with contacts to alarm failure of the alternate source or opening of any fuse protecting the static switches.
10. Auxiliary equipment for static transfer switch
11. Following auxiliary equipment shall be furnished with each static transfer switch a minimum:
 - a) Red indicating Light to indicate switch in "Normal" position, Green indicating Light to indicate switch in "Standby" position, White indicating Light to indicate "Normal" and "Standby", power sources in synchronism, Push-button to simulate normal AC UPS power failure (sensed at static switch output) to test the satisfactory working of static switch, transfer labeled "Transfer Test", Push-button for manual retransfer of static switch to "Normal" position, Push-button for manual transfer from normal to alternate source, Light to indicate standby AC source voltage deviation high, Light to indicate voltage transfer enabled, Light to indicate voltage transfer disabled etc shall be provided on the front of the enclosure.
 - b) Two (2) number each of NO contact for static switch transfer to "Standby" position and standby source voltage deviation $> \pm 2\%$ from normal shall be provided within the static transfer switch enclosure.

19.8.1 Manual by-pass switch

1. The manual by-pass switch shall be used to isolate any static switch from its load and stand-by power supply and to take the static switch out of service without power interruption to the load. In doing so, the manual by-pass switch shall connect both load buses to a single inverter. The manual bypass switch shall provide the facility for by passing the entire UPS system during the operation of the UPS in the option of the operator.
2. The manual bypass switch shall have "make before break" contacts to ensure continuous supply to UPS loads during the operation of the same.
3. The manual bypass switch shall be rated for 600 Volts, 50 Hz, single phase operation. It shall have continuous load carrying capacity equal to full load inverter current and necessary short term load carrying and interrupting capacity to meet the requirements of the UPS system.
4. Another bypass and disconnect devices shall be envisaged as required for orderly start up, shut down and maintenance of UPS system and system components.
5. The manual by-pass switch and required disconnect devices shall be furnished duly mounted and wired in enclosure.

19.8.2 Float-cum-boost chargers and auxiliary equipment

1. Two 100% capacity chargers shall be furnished for the UPS system. Each charger shall confirm to the following requirements.
2. Each charger furnished for UPS system shall be adequately rated to ensure that any one shall meet full DC load of UPS system operating at 100 % rating plus recharge the fully discharged UPS batteries.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[258]	02.09.2015

3. The chargers shall be served from a 415 volt, 50 Hz, 3 phase system. The chargers shall maintain the output voltage within plus and minus 0.5 % from no load to full load, with an input power supply deviation in voltage level of +/- 10 % and input power supply deviation in frequency of +/- 5 % and with both deviations present in any combination.
4. In addition to supplying DC power for inverters, the chargers shall be designed to charge a fully discharged battery without over loading or causing over voltage or without causing interrupting operation of AC or DC circuit breakers for the entire range of intended operating regimes. Suitable solid state electronic circuits shall be provided to ensure that the charging current is voltage regulated and current limited. After the battery is recharged the charger shall maintain the battery at full charge until the next emergency operation when the UPS battery is again required to provide DC power.
5. Float and equalizing controls shall have an adjustment range of +/- 5% continuous (without steps).
6. The chargers shall be self-regulating, solid state, silicon controlled, full-wave rectifier type designed for single and parallel operation with the battery specified. The chargers shall be designed for automatic load sharing during parallel operation.
7. The charger shall be current limited at 125% of full load to reduce output voltage for charger circuit protection and for protection of battery from overcharge. The current limit shall be continuously adjustable from 80% to 125%.
8. All necessary equipment and devices shall be provided to protect the charger from short circuits, transient voltages, surges, load and supply fluctuations including sudden loss of input or load.
9. The charger shall have a slow walk-in circuit which shall prevent application of full load DC current in less than 10 seconds after AC power is energized.
10. The minimum full load efficiency at nominal input and float output shall be 90% or better. The output regulation, ripple content and power factor shall meet the requirements of UPS system offered.

19.9 Battery Charger Auxiliary Equipment

Following auxiliary equipment shall be furnished for battery charger a minimum:

1. AC Voltmeter, DC Voltmeter, AC Ammeter, DC Ammeter, Charger On-Off push buttons, Potentiometers (one "Float Voltage Adjust" and one "Equalizing Voltage Adjust", both with manual adjustment knobs, the settings of these knobs, shall be independent of each other), Selector Switch for float charge / Equalizing charge, Charging rate setter, Selector switch and lights for ground fault detector, Indicating lights with proper actuating devices, Circuitry and legend etc shall be furnished on the front of the panel of the charger enclosure.
2. Indications such as Failure of input AC supply, Charger failure, System on battery operation, Battery equalize timer 'on', Low battery voltage, DC ground

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[259]	02.09.2015

fault, Redundant fan failure and temperature high (if provided), Charger fuse failure, Low DC output voltage, High DC output voltage etc.

3. One set of independent potential free contacts rated for 0.5 amps, 220 volt DC shall be furnished for the alarms above and wired to terminal block for use of alarm annunciation system.

19.10 Ground Detector System

Each charger shall be furnished with a ground detector system consisting of a relay and a centre tapped resistor. The resistor shall be connected between the positive bus and the negative bus. The relay coil shall be connected to resistor and ground. The relay shall be furnished with one normally open and one normally closed contact wired to terminal blocks for connection to external circuits.

Two indicating lights and one three position spring return to centre selector switch mounted on front of charger cabinet shall be provided for each ground detector system.

19.11 UPS Battery

1. The battery shall be heavy duty Nickel-cadmium type and shall have sufficient Amp-hour capacity to supply 100% full load current of UPS for one hour. The Ni-cd battery shall conform to IS: 10918 and shall be sized according to IEEE Std. 1115.
2. The battery shall be high discharge performance type to withstand discharge/charge cycles throughout life without loss of capacity. In battery sizing calculation, Bidder shall also take into account a minimum voltage drop of 2.5 volts from battery room to the inverter input.
3. Battery sizing calculations, supporting curves/data etc. with the proposal to demonstrate that the proposed battery capacity meets the above specification shall be furnished. Various correction factors such as capacity factor, temperature derating factor (at a minimum electrolyte temperature of 4°C), design margin shall be take in to account as per data below:
 - a) Temperature derating factor (A_t : (T_d)
an electrolyte temperature of 40C)
 - b) Design margin : 20% = 1.2
 - c) Capacity factor (K_T) (For : AH capacity of chosen cell
discharge duration of 1 hr. & end : /(discharge current in amp for
cell voltage of 1.1 volts) chosen cell Corresponding to 1
hour) x Float correction factor.
 - d) The UPS battery shall be :
furnished as specified herein
and shall meet following
requirements.
 - i) Nominal Voltage : As per the requirement of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[260]	02.09.2015

- nominal DC voltage level at the input of the inverters.
- ii) Ambient temperature : 50 ° C max.
 - iii) Specific gravity, full charge : 1.19 ± 0.01
 - iv) Voltage per cell
 - Nominal : 1.2 V
 - Floating : 1.40 V to 1.42V
 - Boost : 1.53 V to 1.67V
 - End cell voltage : 1.1 Volts

19.12 Battery Accessories

2 nos. of Hydrometer along with syringes suitable for vent holes in different cells, Thermometers, Specific gravity correction chart, Wall mounted type holder made of teak wood for hydrometer & thermometer, Cell testing voltmeter (3-0-3V), Acid/Alkali mixing jar 2 nos. Rubber apron, Rubber gloves, Set of spanners, Goggles (industrial) Instruction Card, Variable metallic resistor & shunt, Inter cell connectors, Suitable terminal lugs for cables, Two tier teakwood battery rack, Jack for lifting the cells etc shall be provided as accessories and fittings of the Batteries and auxiliaries.

19.12.1 Step-down transformer & voltage stabilizer

One 415 Volt, 3 phase to 240 Volt, single phase transformer along with associated voltage stabilizer shall be furnished.

This transformer and stabilizer combination shall convert 415 Volt +/- 10% plant auxiliary AC supply to 230V, +/- 2% single phase standby AC Power, which shall serve as UPS system back up supply source.

The transformer and stabilizer shall be sized for 100 % UPS load and shall co-ordinate with the largest branch circuit protection device for feeder short circuit current without sacrificing voltage regulation. The voltage stabilizer shall employ silicon solid state circuitry and shall maintain a stabilized voltage for 0 -100% load with input voltage variations as indicated above.

The stabilizer shall meet the following characteristics as a minimum. Fast rate of correction - within 5 cycle; Output distortion - less than 5% under worst conditions; Efficiency shall be better than 94%; No load losses less than 5%.

19.12.2 AC Distribution Boards

Panel boards for distribution of continuous AC power to essential loads shall be dead-front type panel boards rated for 600 V, AC service. Sheet steel thickness shall be 3 mm for load bearing member and 1.6 mm for other members. The hinged panel board front shall cover the fuses and wiring gutter but not the switch handles. The hinged front and switch handles shall be covered by the enclosure-door.

Each panel board shall be constructed for 2 wire, single phase distribution with solid neutral bar. Phase and neutral bars shall be of copper. Rating of the main

LII-GETS12021-G-00129-001	03	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-C	[261]	02.09.2015

lugs shall be equal to the rated continuous full load current of each inverter. Type of enclosure shall be IP 42 as a minimum.

Each panel board shall have one fused disconnect switch of adequate rating for incoming feeder for AC Bus and requisite single pole, suitably rated disconnect switch branch circuit devices. Fused switches shall be equipped with arc quenchers, visible blades and quick-make quick-break operating mechanisms. The number of feeders and rating of each feeder shall be to suit the individual load requirements.

The AC distribution board and components thereof shall be from the latest proven product range of a qualified manufacture. However, 25% spare feeders with fuses of each rating shall be provided.

19.12.3 Wiring and interconnections

All interconnections required from input to output terminals or outgoing inverter, transfer switches and distribution board equipment shall be provided within the enclosures in accordance with the manufacturer's proven practice, applicable international standards and good engineering practice. Internal wiring in factory pre-wired electronic systems cabinets may be installed according to the standard practice as to wire size, insulation and method of termination on internal equipment. Wiring for external circuits including all alarm contacts shall be brought to grouped terminal blocks located for convenient connection for external circuits entering from top or bottom.

1 CIVIL, STRUCTURAL, ARCHITECTURAL WORKS-DESIGN & EXECUTION CRITERIA

1.1 Introduction

This specification covers the design, preparation of general arrangement, construction as well as fabrication drawings, supply of all labour as well as materials and construction of all civil, structural as well as architectural work on EPC basis for Boiler and associated structures for the Renovation and Modernisation of existing [Name of project...] Thermal Power Project of [210/215/220/250] MW capacity. Description of various items of work under this specification and nature of work in detail are given hereinafter. The complete work under this scope shall be as per Volume-II, Section-I, Civil Scope of Work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[1]	25.09.2014

2 BUILDINGS & STRUCTURES

Design and construction of new buildings, structures, foundations etc. as well as repairing / retrofitting of existing buildings, structures, foundations shall take into account requirement for operation and maintenance of all equipments and its users. The buildings will have good architectural features. The surrounding areas shall be properly micro levelled and graded. The architectural design concept of buildings structure shall be evolved considering the functional, technological and other requirements for efficient operation ensuring comfortable working environment for personnel, satisfying the aesthetic requirements. Special care shall be taken to provide elegance and aesthetics, with effective use of appropriate treatment, materials fittings and finishes.

- Due consideration shall be given for adequate natural lighting and ventilation for both plant and non-plant buildings.
- Retrofitting / repair works / new constructions shall not cause damage to the existing structures. The temporary supports shall not be allowed on the existing structures for any of these works unless the loads are minor and may not cause any damage to any existing structure. However in such a case Bidder shall take approval from the Owner/Consultant prior to initiating the work.
- Internal finishes shall be provided with latest available materials approved by Owner/Consultant with due consideration of the functional aspect of the area.
- External finishes shall be provided with latest materials approved by Owner/Consultant for improving the aesthetics.
- The orientation of the important buildings shall be in line with the existing site condition and function as such.
- Each building shall have its own identity. However, a total homogeneity shall be maintained in the design of all buildings.
- Adequate frontage shall be provided to all important buildings to create a better visual impact.
- All other civil and structural buildings shall be developed in conjunction with the above aspects.

2.1 Brief description of Buildings, Structures and Facilities

a) Boiler Structure and Boiler Area

[The Boiler shall be suspended from a steel structure provided by the Boiler supplier, which shall be supported on reinforced concrete foundation considering isolated /strip foundation based on soil investigation report. Criteria for designing the steel structure are described in section-2. Roof of steam generator shall be of permanently colour coated galvanised M.S

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[2]	25.09.2014

troughed metal sheet of approved profile conforming to IS 14246. Minimum base metal thickness shall be 0.8 mm. Proper drainage of the roof shall be provided by means of gutters and down take pipes. Down take pipes shall be GI pipes with threaded connections. Side cladding shall be of permanently colour coated sheet as above but minimum base metal thickness of 0.6 mm.

Provision of Air conditioned rooms for VFD panels shall also be suitably made in the steam generator area.

The reinforced concrete ground slab in the Steam Generator Areas shall include floor drainage for cleaning purpose. All the floor drains shall be connected to peripheral drains.

The RCC Transient pit for each unit (of suitable capacity as per technological requirement) for collecting & transferring the water from the Slag bath overflow water.

The RCC Underground sump with suitable compartments of adequate capacity for settling, cooling of the hot water upto the required temperature as per the system requirement along with suitable barricading system above Finished floor level.]

b) Mill and Bunker Building including Bunkers

[The framing shall be of structural steel. This shall be designed as a moment connection framing in the transverse direction and braced in the longitudinal direction. These structures primarily support coalbunkers, coal feeders and tripper arrangement to feed the coal into coalbunker.

The bunker shall be circular in plan and shall have the capacity as per the requirement stipulated elsewhere under Mechanical section. A comprehensive flow ability study shall be conducted by the CONTRACTOR for the coalbunker hopper to ensure smooth flow of coal in all seasons with different moisture contents and different percentage of fines. Geometric parameter of hopper and lining material shall be decided considering the findings of flow ability study. For the cylindrical portion of the bunker 50 mm concrete lining shall be provided using gunning technique, with nominal reinforcement unless the CONTRACTOR recommends use of other types of liners. Conical portion shall be provided with 5 mm thick liner of stainless steel of grade SS 409.

Mills are to be located on the ground floor. In addition to Mill foundations provision has to be made in the Mill bay ground floor for trenches accommodating Mill reject system conveyors.

A Mill maintenance platform shall be provided at appropriate elevation to attend to routine maintenance. This shall be a platform with chequered plate or gratings over steel framing with handrail all round. Above this floor a framing shall be provided to support under slung crane used for handling mill maintenance work. The crane runway girders shall extend to the full length of Mill bay to enable approach to the service bay also.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[3]	25.09.2014

Above this framing, feeder floor is provided. The extent of the feeder floor shall be decided by the CONTRACTOR based on his maintenance requirements. Feeder floor will be of RCC supported on structural steel framework. Handrails shall be provided on all the sides. A steel staircase shall be provided for access to feeder floor from ground floor. Access shall so be provided to feeder floor from boiler elevator.

Framework for supporting the circular bunker shall be provided above the feeder floor based on geometry of the hopper.

Bunker shall be provided with a top steel cover with slit openings for entry of coal. On sides of the bunker necessary openings shall have to be provided for bunker ventilation / dust extraction.

Tripper floor shall be immediately above the bunker. This floor shall be of RCC supported on structural steel framework.

Tripper roof shall be of RCC supported on structural steel framework. Tripper roof supports bunker ventilation / dust supporting structure. An RCC parapet or steel handrail shall be provided for the tripper roof. An access stair / ladder shall be provided from tripper floor to roof in each unit.

In addition to the above, framing arrangement for structural steel platform at various levels around the bunker shall be provided with proper access ladder, for poking, striking and attending to air cannons.

Tripper floor shall be given access through Boiler staircase / elevators.

Bunker supporting structure is normally left uncladded up to the bottom of tripper floor. For tripper floor up to 3000 mm above finished tripper floor level, brick wall shall be provided. Above this level permanent colour coated galvanised trough sheet cladding shall be provided. Fixed steel windows with 6 mm thick-wired glass shall be provided in the tripper house as per requirements for conveyor gallery.

As the roof is accessible and maintenance crew is likely to work on this floor, the entire floor shall be provided with cement / clay tiles set in CM 1:3, 25 thick and the tiles pointed with cement mixed with crude oil.

Rigid polyvinyl chloride pipes (PVC) of approved manufacturer conforming to IS: 13592 shall be provided as rainwater down comer (RWDC) pipe. These pipes shall be fixed and jointed strictly in accordance with the manufacturers' instruction. The minimum diameter of the pipe shall be 100 mm.

All structural steel work shall be given two coats of primer and minimum 2 coats of synthetic enamel paint of approved brand and shade. All exposed gratings and handrails shall be galvanised. Expansion joint shall be provided to the structure as required by IS: 800.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[4]	25.09.2014

c) Equipment Foundations (PA Fan, FD Fan, ID Fan etc.)

[All foundations shall be designed and constructed with the input data from equipment manufacturer matching with the layout and levels of the relevant structures. The foundation systems for rotating equipment will be sized and proportioned not to exceed the bearing and settlement criteria and to assure satisfactory performance of the equipment. In addition to a static analysis, a dynamic analysis will be performed to determine the fundamental frequencies of the foundation system. To preclude resonance, the fundamental frequency of the foundation will be 20 percent away from the operational frequency of the equipment. Amplitudes shall be kept within the allowable limits specified by the manufacturer or in absence of manufacturer's specified value, as specified in the IS Codes/ DIN Codes. The dynamic behaviour of the foundation will meet the requirements of IS: 2974 (Part I to IV) – Code of Practice for Design and Construction of Machine Foundations. Foundations for rotating equipments like Boiler feed pumps, ID/FD/PA fans, Coal mills, etc. shall be designed to carry loads furnished by the equipment manufacturer.

All rotating equipment will be provided with vibration isolation system mounted on foundations. The vibration isolation system supplied will be of proven make, consisting of steel helical spring units and viscous dampers (providing damping resistance in all three planes). The vibration isolation foundation system will be provided for Boiler feed pumps, ID/FD/PA fans and Coal mills. Equipment foundation will be separated from adjoining part of building and other foundations joints at floor/slab will be suitably sealed

The vibration isolation system will be capable of vibration isolation not less than 95%.

Foundations for static equipment e.g. Boiler, ESP shall be designed to carry the loads furnished by the equipment Manufacturer.

If minor equipments with dynamic load are required to be supported on building structures, floors etc. suitable vibration isolation will be provided.

The boilers shall be suspended from a steel structure provided by the boiler supplier, which shall be supported on reinforced concrete foundation resting on isolated /strip foundation. The Coal Bunkers, FD fans, PA Fans and PF Mills sited adjacent to the Boilers shall similarly be supported on reinforced concrete bases.

The foundations to the I.D Fan, units shall include reinforced concrete blocks with anti-vibration mountings.

The reinforced concrete ground slab in the Boiler Areas shall include drainage channels with water-jets for removal of boiler ash.]

d) Electro Static Precipitator

[Electrostatic Precipitator shall be supported by steel structure designed & supplied by ESP manufacturer. ESP columns shall be supported by RCC

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[5]	25.09.2014

pedestal resting on RCC strip/raft foundation based on soil investigation report. External platforms shall be provided at various levels as per operation and maintenance requirements. Access to the external platform shall be from the internal staircase. Platforms shall be provided with steel grating or chequered plate for access up to the roof of each ESP. Area below the ESP shall be paved.]

e) ESP Control Room

[This shall be two-storied RCC framed structure. The ground floor shall accommodate cable vault, toilet, and staircase. First floor shall accommodate switchgear room, control room etc. Side cladding shall be of brick wall.

Staircase area shall be protected from fire safety angle as per TAC regulations. Main door to switchgear room shall be steel sliding door having adequate area to admit switchgear. There shall be minimum two doors to the switchgear room of flush welded steel type. Control room should have one swing type aluminium glazed double panel door and one single panel door. Windows shall be steel glazed for switchgear room with wired glass. For control room if window is provided the same shall be fixed with 5.5 mm thick sheet glass. Main entrance of the building shall be provided with suitable door matching with the aesthetic and architectural features of the building. False ceiling of Aluminium type shall be provided in the Control room. Under deck insulation shall be provided above false ceiling and Air washer room.

Roof shall be given a slope of minimum 1 in 100 towards the side opposite to transformer yard. Adequate number of rainwater down take pipe shall be provided using rigid PVC pipe with a minimum dia. of 100 mm. Garland drain as well as plinth protection shall be given around the building.]

f) Cable & Pipe racks

[The cable and pipe rack shall be structural steel. All the structural steel shall be welded/ bolted. The foundations for the supports shall be of reinforced concrete. All the pipe/cable racks falling in the Steam Generator area shall be suitably connected to the pipe/cable racks of other areas as per the piping/electrical requirements.

All cable and pipe routing in and out lying area shall run over ground on structural steel pipe/cable racks at a height as per mechanical Volume II A. Where the pipes cross roads clear headroom shall be as per mechanical Volume II A. The racks can be multi tiered .Cable shall normally be laid above the pipes. Expansion provision shall be provided wherever there is a change in direction or where length of the racks exceeds 100 m. Access ladder shall be provided at suitable location. Pipe & cable racks shall be provided with walkways as per mechanical Volume II A throughout with GI gratings.]

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[6]	25.09.2014

g) Duct Supports

[Supports for ESP inlet duct between air preheater and ESP, between ESP outlet flue duct and structure of Chimney shall be of structural steel supported on RCC foundation and also columns supporting ESP.]

3 DESIGN REQUIREMENTS

3.1 Location

Geographical location of the plant site is approximately between [...] N] to [...] N], Latitude and [...] E] to [...] E], Longitude.

3.2 Ground Condition

Subsurface condition: The natural ground surface level approximately varies from [60 m to 74.5 m] from MSL.

[The soil profile in the plant area can be broadly classified into 3 layers namely laterite, cemented sand and cemented silt in general as per detail soil investigation report. Top soil upto a depth ranging from 0.4 m to 0.75 m is entirely non-uniform. The underlying layer is laterite whose depth varies from 4.0 m to 5.5 m followed by deep layers of cemented silt and cemented sand].

The ground water table (GWT) at finished ground level shall be considered for foundation design purposes.

The detailed soil investigation report conducted for plant shall be made available to Bidder for required replacement / refurbishment / retrofitting of Foundations, if any.

Bidder is advised to carefully study the content of detailed Soil investigation report for the existing type of foundations and design of new ones.

The type, size, depth of the foundation shall be based on the detail soil investigation report provided by OWNER.

3.3 Climatic Condition

a) Temperature

Maximum : [...] °C

Minimum : [...] °C

For design purpose, maximum temperature to be considered: [...] °C

minimum temperature to be considered: [...] °C

b) Rain fall

Minimum : [...] mm in May]

Maximum : [...] mm in October]

Peak hourly rain fall: [183mm] (corresponding to 50 years return period)

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[7]	25.09.2014

[Note: Maximum per day rainfall as per weather report has been considered conservatively as peak hourly rain fall which will be used for drainage system design etc.]

Annual average: [..... mm to mm & average mm]

3.4 Seismic Zone

The site is located in [Zone II] as per IS: 1893-2002. Zone factor shall be [0.10]. Importance factor shall be considered as [1.75].

3.5 Wind Zone

The site is located in wind speed zone [..... m/s] as per IS: 875 (Part 3)-1987.

3.6 Loads and Load Combinations

All new structures shall be designed and old structures requiring modification shall be checked for the most critical combinations of dead loads, imposed loads, equipment loads, wind loads, seismic loads, temperature loads, forces developed due to differential settlement and any other loading conditions which can occur during the design life of the facility.

(a) Dead Loads

Dead loads consist of the weights of the complete structure with finishes, fixtures, partitions, wall panels and all existing / modified / replaced equipments of semi-permanent nature including storage structures partitions, roofing, piping, cable trays, bus ducts etc. The content of storage structures etc. shall be measured at full capacity for this purpose.

The piping loads (for empty, operating and test conditions), cable tray loads and the contents of the storage structures shall be listed separately so that they can be excluded from dead load when dead loads are acting as stabilizing load for uplift.

The following unit weight of material shall be considered for computation of loads. Loads given in IS: 875 (part-I) shall be made use of for material not listed below.

Table 2.1
Weights of Material

Material	Unit weight (kN/m ³)
Plain cement concrete	24.0
Reinforced cement concrete	25.0
Structural steel	78.5
Brick work	19.0
Cement plaster	21.0
Floor Finish	24.0

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[8]	25.09.2014

Material	Unit weight (kN/m ³)
lignite	12.6

(b) Superimposed Live Load (SILL)

Listed below is the minimum SILL for the areas involved. Floors and supporting members subjected to heavy equipment live loads shall be designed on the basis of the equipment loads specified by vendor or specifically defined SILL whichever is greater.

The specific minimum floor SILL is listed below:

**Table 2.2
Superimposed Live Load (SILL)**

S.No	Description	SILL Value
a)	Roof	
	Flat accessible roof	1.5 kN/m ²
	Flat accessible roof with HVAC equipments, etc.	5 kN/m ²
	Flat inaccessible roof	0.75 kN/m ²
	Sloped Roof	As per code IS: 875 (Part-2)
b)	All building floors & Stairs	5 kN/m ²
c)	Walkways of Conveyor Galleries	5 kN/m ² or Concentrated Load of 3 kN at centre which ever is critical
d)	M.C.C. Floor	10 kN/m ²
e)	Equipment Load	As applicable
f)	Tunnels under road, culverts & its allied structures including Concrete pipes	Class "A" / Class "70R" as per IRC standard whichever is higher / load due to bull dozers
g)	Underground basement, tunnel	Surcharge of 10 kN/m ²
h)	Vehicular traffic	Surcharge of 20 kN/m ²
i)	Covers for Channels	Surcharge of 10 kN/m ²
j)	Other areas:	
	• RCC floors (Offices, laboratories, conference rooms and general floors)	5 kN/m ²
	• Balconies	5 kN/m ²
	• Chequered plate / gratings	5 kN/m ²
	• Walkways	3 kN/m ²
	• Toilets	2 kN/m ²

- In addition to LL, Hung loads for electrical, ventilation & air conditioning minimum of 0.5 kN/m² shall be considered.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[9]	25.09.2014

- Load of 1 kN/m² shall be considered as hung load for piping unless otherwise mentioned. However, the actual loads will be as furnished by the supplier. The stringent most will be followed.
- For other areas LL shall be considered as per IS: 875 (Part-2).

(c) Seismic Load

The proposed plant is located in Seismic [Zone-I] as per IS: 1893, Seismic force on the structures will be considered accordingly.

(d) Wind Load

The proposed plant is located in Wind Speed Zone of [50 m/s] as per IS: 875 (Part 3). The wind force on the structures will be considered as follows:

Table 2.3
Wind Speeds

Description	Wind Speed
Basic Wind Speed Vb (at 10m above mean ground level)	[50 m/sec]
Risk coefficient K1 (for 100 years)	[1.07]
Category of terrain	[Category 1]
Factor K2	As per IS: 875
Topography factor K3	As per IS: 875

For the design of structures, wind force on Equipment, supported on frame including all fixtures, piping, staircase, ladder, etc, shall be considered.

Design of structures shall be checked for the condition of wind load with gust factor.

(e) Earth Pressure Loads

For earth pressure the worst condition with dry / submerged and active, passive or at rest shall be considered. The pressure coefficient shall be adopted as recommended in Soil Report or for the backfill material used.

(f) Temperature Loads

The total temperature variation shall be considered as 2/3rd of the average maximum annual variation in temperature. The average maximum annual variation in temperature for this purpose shall be taken as the average between the mean of the daily minimum ambient temperature during the coldest month of the year and mean of daily maximum ambient temperature during the hottest month of the year. The structure shall be designed to withstand stresses due to 50 % of the total considered temperature variation with temperature load applied with positive and negative sense.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[10]	25.09.2014

For design purpose average maximum annual variation shall be taken as $[+50^{\circ}\text{C}]$ to $+5^{\circ}\text{C}$.

Coefficient of thermal expansion of steel shall be taken as per IS: 800 where the value is given as $12 \times 10^{-6}/^{\circ}\text{C}$. Coefficient for thermal expansion for concrete shall be taken as per IS: 456.

(g) Thermal Loads (during operating condition)

When thermal loads (such as produced by temperature changes in piping, equipment and structures) results in friction between equipment and supports (exchangers) or piping and supports, the friction force will be taken as the operating load on the support multiplied by the applicable friction coefficient given below:

Table 2.4
Thermal Loads

Description	Value
Surfaces	Friction coefficient
Rolling supports	0.05
Steel to steel	0.30 (longitudinal) and 0.10 (lateral)
Concrete to steel	0.30

(h) Equipment Loads

Static and dynamic loads of major existing / modified / replaced equipments shall be based on the manufacturer's data of the specified equipments and shall be considered in design in addition to the live load.

Equipments to be tested for hydraulic test, tanks and piping design loading shall include hydraulic test loading. Weight of equipments, ducts, tanks, pipes, conduits, etc. supported by structure shall include maximum possible loading conditions i.e. flooded conditions and associated impacts, test loading, anchorages and constraint effects.

Air and gas duct loads shall include weight of insulation, duct attachments, dust accumulation loads, seismic, wind and other loads applicable.

(i) Cranes, Hoists, Monorail and Elevator loads

All lifting beams and monorails shall have their design loads increased for impact factor. Loads for overhead cranes, hoists, monorails and elevators shall be taken as per IS: 875.

100 % of the lifted load including elevator live load plus the cab weight shall be considered for the elevator support beam design. Pedestals in elevator pits shall be designed assuming impact factor as per IS codes.

(j) Vibration and Noise

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[11]	25.09.2014

The design shall ensure that vibrations from any moving machinery transmitted from its immediate foundations to adjacent buildings or areas of the same building shall be suppressed in accordance with the recommendations of relevant codes of practice.

(k) Other Loads

- Stresses imparted to structures due to differential settlements, variation of water table, erection and maintenance loads, creep and shrinkage shall also be considered in design of all structures.

- Dust loads

All buildings / structures shall be designed for a dust load of 1 kN/m² for flat roof and 0.5 kN/m² for sloped roof.

- Construction/Erection/Maintenance Loads

The integrity of the structures shall be maintained without use of temporary framing struts or ties and cable bracing as far as possible. However, construction or access considerations may dictate the use of temporary structural systems. Special studies shall be made and documented to ensure the stability and integrity of the structures during any periods involving use of temporary bracing systems.

- Future Loads

Loads from future expansion shall be considered when so directed by the Owner/Consultant. Future loads may include any of the loads listed above.

- Surge Loads

Surge loads may occur in some vessels or equipment. In such cases, the magnitude and direction of the load shall be given by the equipment supplier.

(l) Basic Load Cases

Following basic loads shall be considered for analysis and design:

Dead load	: DL
Superimposed dead load	: SIDL
Self weight of permanent equipment	: EL
Steam piping (Static & Dynamic) & other piping loads	: PL
Cable loads	: CL
Live load on floor / walkway	: LL
Superimposed live load	: SILL
Live load on roof	: LLR
Seismic load	: SL

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[12]	25.09.2014

Wind load	: WL
Load due to soil pressure	: SP
Load due to surcharge	: SCL
Load due to hydrostatic pressure	: HP
Load due to temperature	: TL
Hoist, monorail loads	: MR1
Crane loads	: CRL
Special loads	: SPL

(m) Load Combinations

The individual members of the frame shall be designed for worst combination of forces such as bending moment, axial force, shear force and torsion. Permissible stresses for different load combinations shall be taken as per IS: 456, IS: 800 & IS: 875 (all parts) and other relevant IS codes.

Wind and seismic forces shall not be considered to act simultaneously.

Criticality of erection / maintenance loads shall also be checked separately in combination with other simultaneously occurring loads for possible design loading.

(n) Load Combinations for underground structures

- For the design of sub structure only liquid pressure from inside and no earth pressure and ground water Pressure and surcharge pressure from outside (applicable only to the Structures which are liable to be filled with water or any other liquid) shall be checked.
- For the design of sub structure combination of earth pressure, surcharge pressure and ground water pressure from outside and no water pressure from inside shall be applied.

(o) [Coal] Bunkers

The following densities shall be considered for design of [Coal] bunkers:

For volume calculations	: [8 kN/cum]
For structural design	: [12.6 kN/cum]

4 EARTHWORK AND ROCKWORK

4.1 General

This section applies to all earth and rockwork required for the replacement / refurbishment / retrofitting of existing foundations or construction of new

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[13]	25.09.2014

buildings foundations (if any), any types of structure and burying service lines in the ground.

The Bidder shall satisfy himself as to the ground conditions on the site including the nature of the strata to be excavated, obstructions, possibilities of flooding and such like and shall allow for all provisions necessary to carry out the work in the most suitable manner when submitting his tender.

Generally, all buildings and structures must be founded on bearing strata which means that all excavation work for foundations shall meet the requirements of structural analysis based on the results obtained from the detailed soil investigation and of the available information and instruction given in writing by the Owner/Consultant.

Excavation shall be done to the required dimensions and shall be finished according to the specified lines and slopes, in a way acceptable to the Owner/Consultant. All necessary precautions shall be taken to cause the minimum possible alteration or disturbance to the other existing foundations, material lying under and adjacent to the excavation final lines.

4.2 Fill Materials

The fill materials used and source are to be examined and approved. Excavation materials can be used if they fulfil the requirements.

a) Select fill shall have the following properties:

Well graded (uniformity index not less than 5), non-cohesive and nearly silt free (silt content not greater than 5%; up to 10% tolerated, except below footings of structures), salt free (content less than 3%), soils free of organic matter (limit 2%). Decomposing or compressible materials shall not be used.

All materials shall be of such nature and character that it can be compacted to the specified densities in a reasonable length of time. It shall be free of highly plastic clays, of all materials subject to decay, decomposition or dissolution, and of cinders or other materials, which will corrode piping or other metal.

The intention is to use select fill below plinth, floors, roads, parking areas etc.

b) Ordinary fill shall have the following properties:

- Natural inorganic soils: salt content not greater than 5%, organic matter less than 3%. For other properties see under 'Select fill'.
- The intention is to use ordinary fill for non-built areas.

c) Special fill:

- Special fill material shall be gravel or crushed rock (for other properties see under 'Select fill'). The intention is to use special fill e.g. as sub-base material for tanks.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[14]	25.09.2014

4.3 Excavation

The works shall be excavated either by hand or by use of excavating plant and tools acceptable to the Owner/Consultant.

Last 300 mm shall be excavated by hand tools only to ensure that natural conditions of soil at foundation level should not be disturbed. In case if over excavation has been done, the depth of soil over excavated shall be filled with M10 Grade concrete and no earth filling shall be allowed to fill over excavated earth.

Also excavation by hand may be required close to existing installations, existing foundations and/or underground services, but subject to special instruction of the Owner/Consultant.

The Bidder shall carry out all kind of earth and rockwork for the following particular works as defined hereafter (where applicable):-

- i) Clearing and grubbing
- ii) Excavation of topsoil
- iii) Open cut excavation
- iv) Backfilling
- v) Safety precaution during earthwork
- vi) Mining or underground excavation (if required)
- vii) Grading
- viii) Replacement of material
- ix) Trench excavation for service lines
- x) Embankments
- xi) Archaeological findings

4.4 Safety Precautions

The Bidder shall be responsible for all necessary safety measures.

Proper strutting, sheeting and bracing, including re-arrangement of the installations when necessary, stabilization and protection of slopes, methods of excavation to reduce risks of slides etc shall be to the Bidder's debit. The additional moving of soil resulting from such damages will not be paid for.

4.5 Over Excavation

Bidder shall ensure that no excavation work is carried out beyond the founding level of existing nearby building/equipment. Any damage to adjoining structure/ foundation shall be rectified by the Bidder without any extra cost to Owner.

4.6 Stockpiles and Disposal

Excavated material from the works selected by the Owner/Consultant for re-use shall be placed immediately in its final position, if possible, or otherwise may be stockpiled or deposited on site as directed by the Owner/Consultant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[15]	25.09.2014

Distance of stockpiling of excavated material from the pit edge shall be minimum 1.5 meters or half of the depth of the pit whichever is higher. The Bidder shall not have the right either to additional payment or to claim because of work involved in stockpiling materials, re-use of for carting to the waste disposal areas. Soil unfit for re-use shall be removed to sites approved by the Owner and shall not be permanently deposited elsewhere. The Bidder shall trim and form the edges of spoil to profiles and levels as directed by the Owner/Consultant.

The placing of materials within the waste disposal areas shall be made in layers not exceeding 0.50 m in thickness in order to obtain an appreciable degree of compaction by means of transportation equipment and/or if required by appropriate compaction equipment.

All traffic to or from the waste disposal areas shall run over the surface of such areas in order to achieve compaction.

4.7 Preparation of Foundation

All earth surfaces, against which concrete is to be poured, shall be clean and free of any detrimental impurities, organic matter or unsuitable material. Immediately after excavation, all such surfaces shall be moistened and treated as directed by the Owner/Consultant and then protected by means of a lean concrete layer, 7.5 cm or PCC thickness as shown in the design drawings, whichever is greater. No concrete is to be poured until formation is inspected and approved by the Owner/Consultant.

No structural concrete shall be poured against earth surface. Shuttering shall be used at sides and PCC shall be provided below foundations.

4.8 Backfilling

Foundations and structures shall be backfilled with approved material compacted in layers not exceeding 150 mm by suitable equipment upto the required designed levels. Compacting shall be carried out with special care by means of pneumatic or mechanical rollers or other compactors of a type previously approved by the Owner/Consultant.

Density requirements as per standard Proctor Test shall be in accordance with relevant parts of IS: 2720 and all tests shall be made by/on under the supervision of Owner/Consultant at Bidder's own expenses, at optimum moisture content:

- a) Backfilling of foundations and under grade slabs - 98%
- b) Under roadways and parking areas - 98%
- c) Embankment - 95%

The thickness of fill layers, number of passes and type of equipment to be used shall be proposed to the Owner/Consultant after compaction tests have been made.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[16]	25.09.2014

Surfaces receiving fill layers shall, if smooth, be previously scarified to obtain a good key between the new fill layer and the sub-grade.

Backfilling of foundation work with approved materials shall be carried out only after foundations have been inspected by the Owner/Consultant.

4.9 Soil Replacement

The material to be used for replacement of soil shall not contain soluble or swelling components such as clays, or organic matters. Sand gravel mixtures of favourable grain size distribution shall be used in exchange. The suitability of soil for its use for filling shall be as per provisions of Indian Standards.

Prior to the commencement of work, three samples shall be taken from the anticipated borrow area and tested in respect of IS: 2720 or Proctor density, optimum moisture content, grain size distribution and content of soluble matters.

These three samples shall cover the approximate variation of materials to be expected within the borrow area.

The fill material shall be placed in horizontal layers of not more than 15 cm in compacted thickness. The fill moisture content shall be controlled and adjusted in order to achieve a maximum of compaction. Fresh water shall be used for watering of soils.

The fill material shall be compacted by vibratory roller (min. weight 20T.). However for small compaction works such as small patches etc., comparatively low weight compactors or other compaction methods may be used after taking approval from Owner / Consultant. The minimum required degree of compaction should be as defined under "Tests and Properties". One Proctor and three density tests shall be made at every fourth fill layer prior to continuation of filling work. The testing location will be indicated by the Owner/Consultant. The Bidder shall either provide all required laboratory facilities and staff to perform the tests or he shall co-operate with an experienced soil testing laboratory, subject to the approval of the Owner/Consultant.

Filling work may be continued in case all tests performed show satisfactory results.

4.10 Protection of Existing Utilities and Services

During modification/rehabilitation of existing structures or construction of new structures, the Bidder shall provide all protection for existing utilities and services as may be required by his modification and construction operations. Permanent protection of certain items shall be as included under other sections or as instructed by the Owner/Consultant.

In addition to the requirements as specified, herein the Bidder shall comply with the following requirements:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[17]	25.09.2014

- a) Use all necessary precautionary and protective measures required to maintain existing structures, utilities, services and appurtenances that must be kept in operation. In particular, the Bidder shall take adequate measures to prevent undermining of existing structures and utilities/services presently in service.
- b) Protect existing or new utilities and services where required by the Bidder's operations and/or as directed by the Owner/Consultant. The Bidder shall be responsible for bracing and supporting existing structures, utilities and services to prevent settlement, displacement or damage.

4.11 Dust Control

The Bidder shall use all means necessary to control dust on roads, dismantling/demolition and modification areas, construction areas and borrow pits.

Surfaces shall be regularly watered to prevent dust becoming a nuisance for the public and interfering with the proper execution of the works.

4.12 Dewatering during Construction

This division applies to the methods and techniques of ground water control. Prior to the decision for the method and technique to be applied, a comprehensive knowledge of the soil and ground water conditions have to be obtained from the results of the detail soil investigation and/or information given in writing by the Owner/Consultant.

Ground water control for keeping the construction pits dry shall be included in the Bidder's scope of work.

The method and technique shall be based on the IS: 3764.

The scope of supply includes removal of all equipment, plants, pipes, machinery, etc for modification /rehabilitation of existing foundations and re-installation of all equipment, plants, pipes, machinery, etc and its removal after completion including operation & maintenance of the equipment during the construction period.

Where necessary, cofferdams, sheet piles, pump sumps, equipment and channels, troughs, inlet gutters, pipes and any other works required for the water control and discharge shall be part of the scope of supply. The dewatering system shall be designed and installed in such a way that alterations and extensions can be made at any time throughout the operating time, if necessary. Reserve units shall be kept ready for service when failure of any of the installed units occurs.

The Bidder has to consider the possibility of a temporary failure of any pump, diesel engine and/or the electric power service and shall install emergency power units with sufficient capacity to feed the necessary power to the installed unit at the moment of failure. The Bidder shall submit to the Owner/Consultant, the detailed method of the envisaged pumping system for dewatering, the pump

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[18]	25.09.2014

capacity and the standby reserve units. The Bidder shall adjust the system if required by the Owner/Consultant.

The Bidder must ensure that any dewatering works will not cause any interference to his own work and to those of other Bidders working elsewhere on site. Any damage occurring during the above mentioned period should then be made good by the Bidder at his own expense.

During the foundation works, the excavated areas, foundation levels, and pits are to be kept free of water down to at least *[0.50]* m below the foundation level.

4.13 Equipments

All equipments, instruments, machineries, tools, pipelines, etc required for execution of the water control shall be kept in good working condition throughout the operation period.

4.14 Execution

The Bidder shall keep records of all data of importance occurring during operation of the water control system. The records shall be submitted to the Owner/Consultant for information and checking every working day. For that purpose, the lowering of the water table shall be controlled by piezometers. The numbers and position of them shall be submitted to the Owner/Consultant's approval. The Bidder shall provide and maintain these piezometers at his own expenses during the dewatering works or as long as the Owner/Consultant requires it.

Pump operations shall not be stopped nor pipes, channels and equipment for dewatering and water control removed or altered in any way, except with the express permission of the Owner/Consultant. The Owner/Consultant will stipulate the time of removal. Until then, the pumps and water drainage facilities shall be kept in proper working order without extra payment being granted.

Pump sumps and channels:

Provision of pump sumps and channels of the dimensions required for each particular case shall include all necessary excavation of any kind of soil above and under water, backfill and consolidation, sheeting, bracing, stiffening, sealing, scaffolding accesses, as well as the disposal of water and all auxiliary works.

Routing of channels or pipes for discharge water shall be such as not to impede or obstruct any of the other works and/or operations.

The same shall be applicable for pump sumps. Prior to the determination of any arrangement of pump sumps, the Owner/Consultant's approval shall be obtained.

Routing and location of water discharge lines shall be submitted to the relevant authorities and to the Owner/Consultant's approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[19]	25.09.2014

Difficulties during dewatering:

The Bidder shall consider all difficulties and additional work due to the presence of unexpected ground water during subsequent construction work. Where it is possible to keep off or divert such water without special dewatering arrangements or where work can be carried out normally under or in water, such a method may only be applied after approval from Owner/Consultant has been obtained.

Ready for service condition:

The Bidder shall maintain ready for service and regularly clean all dewatering equipment and accessories and shall keep all access clear so that they can safely be used without risk of accident. Any recommendations made by the Owner/Consultant in this matter shall be carried out immediately.

Leakage:

Blockouts and pipe connections through structures and their closure, proper grouting of joints, etc or repairs in the event of leakage shall be the responsibility of the Bidder.

Piezometers:

The ground water lowering effect is to be checked by piezometers in unfavourable positions (e.g. in the middle of the building pit) before starting the excavation. The piezometers are to be installed at unfavourable positions or in more permeable layers (in stratified sub-soil) below the bottom of the excavation. They serve to check whether or not the water pressure (head) has been sufficiently reduced in those layers below the bottom of the excavation, which are more permeable. Security against hydrostatic uplift is to be demonstrated by calculation.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[20]	25.09.2014

5 REINFORCED CONCRETE STRUCTURES AND FOUNDATIONS

5.1 General

All structures, building foundations, machines / equipment foundation, water retaining structures, trenches, pits, etc. shall be designed as per latest relevant IS codes in general. Construction in general shall follow provisions of IS: 456 and IS: 3370 for normal and water retaining structures respectively.

5.2 Design Methodology

a) General

All designs of RCC structures shall be carried out by limit state method as per IS: 456 unless use of working stress method is specifically mentioned. Design strength of materials and design loads shall be calculated using appropriate partial safety factors over characteristic strength and characteristic loads as per IS: 456.

IS: 11384 shall be followed for design of steel concrete composite beam.

For reinforcement detailing IS: 5525 and SP: 34 shall be followed.

The walls shall be provided with reinforcement on both faces for sections 150 mm or more, even if not required from design consideration.

b) Foundation and Underground Structures

Type of foundation system, i.e. isolated, strip, raft shall be decided based on the loading arrangement, load intensity and soil strata. Design of foundations at various levels shall be dependent upon the soil bearing capacity at that level.

Foundation system adopted shall ensure that settlement / relative settlement is as per provision of IS: 1904 and other Indian Standards. However, the settlement shall be restricted to a lower value, if necessary as per the system requirement.

All foundation including machine / equipment foundations shall be of RCC construction. All foundations shall be designed in accordance with relevant parts of the latest revisions of Indian standards IS: 2974 and IS: 456. Raft foundations shall be designed as per IS: 2950.

All foundations shall be treated as per the guidelines prescribed in IS 456: 2000 against sulphate/other aggressive chemicals if found present in soil or as per the requirements of detail Geotechnical Investigation Report.

For design of underground structures, subsoil water level shall be assumed at Finished Ground level. All underground pits, tunnels, basements, cable and pipe trenches, etc. shall be designed as leak proof RCC structure, where depth of ground water table so warrants. In case of leakage in the above structures injection grouting method shall be applied to repair the structure according to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[21]	25.09.2014

the requirement of IS: 6494. Effects of uplift and reduction in bearing capacity due to underground water table shall also be considered.

For Subsoil conditions, Average ground water table, Foundation system, Earth Pressure Coefficient, refer to detail geo-technical investigation report of the site.

The soil conditions met during the foundation works especially in the foundation level are to be checked by the Bidder's soil Engineer, recorded and compared with previous known or investigated results. If essential differences occur, which could be detrimental to the structures, the Bidder has to inform the Owner/Consultant and to propose further measures. Foundation works in such areas are to be continued only after approval of such measures by the Owner/Consultant

If there is any doubt about the soil quality or if discrepancies appear with regard to the previous decisions or investigations stated by the Owner/Consultant, then additional measures are to be taken after consulting the Owner/Consultant (e.g. additional excavation and lean concrete fill)

Allowable settlements, elastic plus consolidation, shall be limited as follows: -

- i) Total settlement : 38 mm
- ii) Differential settlement : 6 mm

Foundations for equipment shall be designed to meet the total and differential settlement established by the equipment manufacturer if they are more stringent than the allowable settlements listed above. Foundations for buildings shall be designed to meet the total and differential settlement as required for the building function if they are more stringent than the allowable settlements listed above.

c) Settlement and Expansion Joints

Joints are to be arranged in such a way that stresses and strains caused by settlements, temperature, differential settlement, etc do not adversely affect the structures. This primarily applies to differently loaded areas and structures having different foundations or foundations of different depths. The settlement joints shall run through the complete structure down to foundation level, the expansion joints however shall stop on the top level of foundations.

The joint width is to be at least 2 cm is to be planned considering all relevant factors (settlements, tilting, movements, aspects etc.).

Settlements of all relevant structures shall be measured, recorded and shown in diagrams according to IS: 8009 – "Code of Practice for calculation of settlement of foundation".

d) Foundations at Different Depths

Foundations at different levels should be based beyond a load-spread angle of 30° (against the horizontal). Otherwise, the load influence (e.g. earth pressure) of the higher-level structures on the lower ones must be taken into consideration.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[22]	25.09.2014

e) Replacement

If unsuitable soils are encountered below the grade slabs or basement floor, they are to be replaced by suitable layer wise compacted material down to the good bearing soil.

Materials and compaction method as well as quality control are described in clause 'Earth and Rockworks' of this section. Selected fill is to be employed below all grade paving and basement floors.

f) [Liquid Retaining Structures]

[RCC water retaining structure like storage tanks shall be leak proof and designed as un-cracked section in accordance with IS: 3370 (Part 1 to IV) by working stress method. However the parts of such structures not coming in contact with liquid may be designed according to IS: 456.]

Water channels and substructure of pump houses shall be designed as cracked section with steel stresses as per IS: 3370 (Part 1 to IV) by working stress method and limiting crack width to 0.2 mm.

All water retaining / storage structures shall be designed assuming liquid upto the height of wall irrespective of provision of any over flow arrangement. No pressure relieving devices shall be permitted in underground structures.

In all liquid retaining structures, PVC water bar shall be provided at each construction / expansion joint. The sequence of construction shall also be specified on drawings showing construction joints.

The walls shall be designed for a surcharge load of 2000 Kg/m² or actual whichever is higher.

Liquid Retaining Structure shall be checked for two loading conditions. With water inside up to operating level and no earth fill outside or water in one compartment and no water in the other compartment (where two compartments are provided).

Base slab / raft of all liquid retaining structure shall be designed to withstand the uplift pressure.]

g) Modification of the existing foundation (as required) for the new equipment supplied

The new equipment shall be supported on an RCC deck which in turn shall be supported over steel helical springs and viscous dampers. The steel helical springs and viscous dampers shall be supported over structural steel beams which in turn shall rest over columns. The columns shall be supported over foundation. The modification of existing foundation may involve partial to full dismantling and reconstruction of new foundation as per design & constraints of space.

Precautions shall be taken not to disturb the basic building structure & other foundation and it shall be ensured that no excavation work is carried out beyond the founding level of existing nearby building/equipment. Any damage to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[23]	25.09.2014

adjoining structure/ foundation shall be rectified by the Bidder without any extra cost to Owner.

The contractor shall be responsible for maintaining all safety norms including the stability of existing structures. Any propping, shoring and under pinning required to this effect shall be put in place before the dismantling work is undertaken.

Wherever any existing concrete member is required to be partially dismantled, a coat of epoxy paint shall be applied to the exposed reinforcement and the cut surface of concrete shall be built up by providing 40 mm thick concrete with wire mesh.

h) Machine Foundations

General

Design of equipment foundation for block type machine foundation (if any) shall be done for the actual equipment loading data. The foundation arrangement shall be decided keeping in mind the existing structural arrangement and space limitation.

Block foundations resting on soil shall be designed using the elastic half space theory. The mass of the RCC block shall not be less than three times the mass of machine. Dynamic analysis shall be carried out to calculate natural frequencies in all modes including coupled modes and to calculate vibration amplitudes. Frequency and amplitude criteria as laid down by the relevant codes and/or machine manufacturer's recommendations whichever is more stringent shall be satisfied. Minimum reinforcement for all machine foundations shall be governed by 18:2974 and 18:456.

The following geotechnical data shall be worked out from the soil investigation:

Bearing capacity

Total permissible settlement

Bulk Density

Poisson's Ratio of founding strata

Shear Modulus (G) (average)

The design of machine / equipment foundation shall be as per IS: 456 and IS: 2974. The provisions of DIN 4024 shall also be followed for machine foundations. All machine / equipment foundations and structures subject to vibrations shall be suitably proportioned so that amplitude and frequency of the foundation / structures are within permissible limits.

Dynamic analysis shall be carried out to calculate natural frequencies in all modes including coupled modes and to calculate vibration amplitudes. Frequency and amplitude criteria as laid down by the relevant codes or machine manufacturers shall be satisfied. Minimum reinforcement shall be governed by IS: 2974 and IS: 456.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[24]	25.09.2014

For the foundations supporting minor equipment weighing less than one ton or if the mass of the rotating parts is less than one hundredth of the mass of the foundation, no dynamic analysis is necessary. However, if such minor equipment is to be supported on building structures, floors, etc. suitable vibration isolation shall be provided by means of springs, neoprene pads, etc. and such vibration isolation system shall be designed suitably. All such foundation shall be separated from adjoining part of building and other foundations. Joints at floor/ slab shall be suitably sealed. All appendages to such foundations shall be reinforced suitable to ensure integral action.

The frequency criteria and amplitude criteria shall be satisfied for all values of shear modulus (G) ranging from 0.5 times the average value to 1.5 times the average value.

The extent of foundation shall be based on the general arrangement of the equipment and the design requirement. However minimum width of any foundation shall not be less than one meter. Water table has to be considered at finished ground level for design of all foundations.

Suitable arrangement shall be made for prevention of transmission of vibration from the proposed foundation to the nearby structure/ foundation/ paving slab.

All design calculations and drawings shall be submitted to Owner for approval.

In case any modification to any existing nearby structural steel bracing/support system/ concrete work is required, the contractor shall check the adequacy of the design of the existing structures for the new loads. Suitable modification to the existing structure as required shall be carried out by the contractor.

Loose pockets if any found below the foundation shall be removed and filled up with PCC of grade M10.

Loads

All static and dynamic forces / loads which equipment supplier considers applicable shall be considered for analysis and design of machine foundations.

Foundation Sizing

The outline plan dimensions of foundations as given by the machine supplier will be adopted. The height of foundation will be selected after taking into consideration soil strata and operating level of the machine. The eccentricity of common CG of machine and foundation with respect to the centroid of base area should not exceed 5 % of the corresponding base dimensions of foundation. Partial contact between the foundation and soil strata shall be considered wherever applicable. The footing will be checked for minimum contact area of 80 % and maximum bearing pressure will be calculated for the actual contact area only.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[25]	25.09.2014

Analysis and Design

The minimum grade of reinforced cement concrete shall be M25, unless specified otherwise.

The analysis and design of machine foundations will be carried out to ensure the following:

- Compliance with the manufacturer's requirements and relevant standards
- No resonance phenomenon of a disturbing nature to machine operation should exist at the normal running speed
- Calculations to be performed for dynamic as well as static cases for reinforced concrete block type pedestal
- Soil bearing capacities
- Deep foundation capacities
- Lateral earth pressures
- Allowable settlements
- Structure, equipment and environmental loadings
- Equipment performance criteria
- Access and maintenance requirements
- Temporary construction loadings

The foundation will be designed for the most critical combinations of forces and moments, resulting from all possible combinations of the various loading from the equipment system. The foundation sections will be sized and reinforced adequately for bending moments and shear stresses and uplift.

The foundation shall be checked for overturning, sliding and uplift as per relevant IS Codes. The foundation will be checked for overturning with minimum and maximum vertical loads.

For analysis of machine foundation following data will be furnished by the equipment manufacturer:

- Loading diagram showing static and dynamic loads and points of application of loads
- Operating speed of machine
- Weight of rotating parts, maximum eccentricity of rotating mass from the geometric axis of rotation
- Location of C.G. of machines in all three axis
- Mass moment of inertia
- Allowable amplitude / velocity of vibration at machine bearing points
- Temperatures at various areas during operation

While designing following aspects shall also be taken care of:

- All dynamic foundations shall be isolated from building foundations. The isolation gap shall be of minimum 25 mm.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[26]	25.09.2014

- Natural frequencies of structures and components shall be away from running speed of equipment by at least 20 % generally but for important ones it shall be away by at least 30 %.
- For design of foundation of large fans etc., provision shall be kept in the foundation for addition of mass / area for retaining of the foundations if required at a later date

However following minimum factor of safety shall be followed:

- Factor of safety against overturning due to wind, seismic or other lateral loads shall be 1.5
- Factor of safety against sliding shall be 1.5
- Factor of safety against uplift due to hydrostatic forces shall be 1.2 and due to any other loads shall be 1.5. Uplift check shall be carried out during construction stage also.

For miscellaneous machines, most suitable type of foundation shall be provided. Foundation for pumps, and minor rotating equipment etc., are usually in the form of solid block foundations, resting on the ground or on a floor of the building. At such machine supports, floor may be thickened and extra reinforcement may be provided. Also the machines, which are almost vibration free, light to moderately heavy, may be supported in the above manner. Rubber or neoprene pads under some of these machines to reduce transmission of vibrations to the supporting floor will be provided if required.

All block foundations resting on soil shall be designed using the elastic half space theory. The mass of the RCC block shall not be less than three times mass of the machine. Dynamic analysis shall be carried out to calculate natural frequencies in all modes including coupled modes and to calculate vibration amplitudes. Frequency and amplitude criteria as laid down by the relevant codes or machine manufacturers shall be satisfied. Minimum reinforcement shall be governed by IS: 2974 and IS: 456. Suitable vibration isolation shall be provided by means of springs, neoprene pads, etc. and such vibration isolation system shall be designed suitably. All such foundation shall be separated from adjoining foundations.

Temperature Control of Concrete

The temperature of fresh concrete shall not exceed 25°C when placed. For maintaining the temperature of 25°C in the top decks of machine foundations, crushed ice shall be used in mixing water.

Non-Shrink Grout for Equipment Foundations

Special non-shrinking grout of approved make shall be provided in strict accordance with the manufacturer's instructions / specifications. Ready mix non-shrink grout of GP2 brand or equivalent, of approved make shall be used for base grouting of major rotating equipments.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[27]	25.09.2014

(a) Increase in Stresses

Where stresses due to wind (or seismic) and temperature are combined with those due to other loads, the allowable stresses in concrete and reinforcement steel shall be increased by 33.33% in case of working stress design.

Bearing capacity of the soil shall be allowed to be increased by 25 % under seismic/ wind load condition.

(b) Elevated Foundations

Design of all equipment foundations shall be done for the actual equipment loading data. The foundation arrangement shall be decided keeping in view the existing structural arrangement and space limitation. Adequacy of the design of the existing structures, for the new loads shall be, checked by the contractor. Suitable modification as required shall be carried out by the Contractor and complete design for the same shall be furnished to owner for approval. Where ever new columns/foundation is required the same shall be designed and constructed by the contractor as per relevant Indian Standard Code.

For the foundations of the all equipments details static and dynamic analysis shall be done. The static analysis shall include all operating condition, load cases and abnormal loads like short circuit, loss of blades & unbalance and seismic forces as per IS:1893. The dynamic analysis shall consist of free vibration analysis and forced vibration analysis. Design of RCC foundations/as well as structures, checking of design of existing structure shall be carried out by working stress method. A fatigue factor of 2.0 shall be considered for dynamic forces.

The foundation general arrangement shall be such that the spring units are placed over the structural steel beams. The isolation efficiency for steel helical springs and viscous dampers shall be at least 90%. The vibration amplitudes at the bearing locations shall not exceed the limits as per VDI 2060 or limits specified by the machine supplier whichever is more stringent. The ratio of actual spring supported weight to the nominal spring capacity shall not exceed 0.80. At least 3% to 5% of critical damping shall be provided in the form of viscous dampers.

The grade of concrete for the top deck shall be M35.

(c) Steel Helical Springs and Viscous Dampers

The supporting structural beam and columns shall be designed for the loads transferred through springs and all other loads such as piping loads, seismic loads as per IS:1893. The stiffness of the beams supporting the springs shall be at least 10 times the stiffness of the springs supported over it along both vertical and horizontal direction.

The scope of work shall be deemed to include all activities which may not have been explicitly mentioned but are reasonably implied for the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[28]	25.09.2014

successful completion of the work for which these specifications are intended.

Scope of work of the bidder shall include manufacturing, testing, supply, transport to site, pre-stressing, erection, supervision of erection, release of pre-stress, alignment, commissioning etc of Steel helical springs and viscous dampers:

- Steel helical spring units and viscous dampers along with viscous liquid including associated auxiliaries for installation of the spring units and dampers like steel shims, adhesive pads, etc.
- Frames for pre-stressing of spring elements.
- Suitable hydraulic jack system including electric pumps, high-pressure tubes etc. required for the installation, alignment etc, of the spring units. One set of extra hydraulic jacks, and hand operated pumps shall also be provided.
- Any other items which may be required for the complete installation and satisfactory commissioning of the spring system.

Supervision of complete erection and commissioning of the steel helical springs and viscous dampers including pre-stressing of elements, placing of elements in position, checking clearances on the shuttering of the RCC top deck, releasing of pre-stress in spring elements and making final adjustments and alignments after machine installation etc.

The steel helical springs and viscous dampers supplied should be of proven make. The bidder or his sub-contractor should have designed spring supported machine foundations, manufactured, supplied and installed steel helical springs and viscous dampers (conforming to DIN 2096 & DIN2089) and viscous dampers (providing damping resistance in all three planes) for not less than 2 (two) machine foundations of heavy rotating machine systems such as ID/FD/PA fans and coal mills.

The damper units or spring-cum-damper units should be of viscous type offering velocity proportional damping. The damper units should be suitable for temperatures ranging from 0 to 50°C. The damping resistance of individual damper units should be such that the designed damping can be provided using reasonable number of units.

All design calculations and drawings shall be submitted to Owner for approval.

5.3 Stability of Structures

Design shall be checked against buoyancy due to the ground water during construction and maintenance stages for structures like underground storage tanks, pits, trenches, basements, etc. Minimum factor of safety of 1.2 against buoyancy shall be ensured considering empty condition inside and ignoring the superimposed loading. For the purpose of calculating downward load due to any

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[29]	25.09.2014

overburden, only the mass located vertically above the projected area of the base slab shall be taken in to consideration.

All building sub-structures including pump houses shall be checked for sliding and overturning stability during both construction and operating conditions for various combination of loads. Factor of safety for these cases shall be taken as mentioned in IS: 456 and other latest relevant IS codes. However following minimum factor of safety shall be followed:

- Factor of safety against overturning due to wind, seismic or other lateral load shall be 1.5 minimum
- Factor of safety against sliding shall be 1.5 minimum
- Factor of safety against uplift due to hydrostatic forces shall be 1.2 and due to any other loads shall be 1.5

Stability of the structure shall also be investigated for loading conditions during construction, repair or other temporary measures. Lower factor of safety may be used for such loading conditions as per relevant IS codes.

In cases where dead load provides the restoring force, only 0.90 times characteristic dead load shall be considered. Imposed loads shall not be considered as restoring force.

5.4 Minimum Thickness of Concrete Structural Elements

The following minimum thickness shall be followed:

Table 2.5
Minimum Thickness of Concrete

S.No	Description	Thickness, mm
a)	Suspended floor / slab / walkways /canopy slabs, etc.	125
b)	Ground floor slab (non-suspended)	150
c)	Water Retaining slabs / walls	200
d)	Cable/pipe trenches/underground pits/Laundry walls and base slab	125
e)	All footings (including raft foundations)	300
f)	Parapets	125
g)	Sunshades	75 at edge
h)	Precast louvers / fins	50
i)	Precast trench cover slabs / floor slabs / louvers	75
j)	Paving	100
k)	Basement walls and base slab	200
l)	Underground tank: Below ground water table	200

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[30]	25.09.2014

S.No	Description	Thickness, mm
	Above ground water table	150

From fire resistance point of view minimum cover to reinforced concrete members shall be as per Table 16A of IS: 456.

5.5 Minimum Heights for Pedestal of Steel Columns

Pedestals to Steel Columns for building structures:

Top of RCC foundations (pedestals) shall normally be kept at a minimum [250 mm] above finished floor level (FFL) unless specified otherwise. Foundation levels for columns shall be decided to accommodate underground services, pits, trenches, etc.

Stair and ladder pedestal shall be kept [200 mm] above the finished floor level.

Pedestals to Steel Columns for Equipment structures:

- a) Equipment in open area : as required [(300 mm min)]
- b) Equipment in covered area : as required [(150 mm min)]
- c) Structures and equipment
- Supplied by vendor : as per vendor's data subject to minimum as specified above.

5.6 Minimum heights for encasement of steel columns

In case the top of pedestal is kept at a lower level so that the column base plate together with gussets and stiffeners remain below finished floor level (FFL) the column bases as well as the column sections shall be encased in concrete above FFL as per following:

- a) Open area : [300 mm] above paved level
- b) Covered area : [150 mm] above FFL

5.7 Concrete Works

i) General Description, Proportions and Mixing Mix Design

At the commencement of the contract the Bidder shall make preliminary tests to determine the proportions by weight of cement, fine aggregates, coarse aggregates and water necessary to produce required grades of concrete. The mix proportions shall be selected to ensure that workability of the fresh concrete is suitable for the conditions of handling and placing and when concrete hardens, it shall have the required strength, durability and surface finish. The Bidder shall get approval of Owner/Consultant to such proportions before he starts concreting. However, such approval shall not relieve the Bidder of his responsibility to produce concrete having compressive strengths as laid down in the foregoing Table.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[31]	25.09.2014

No departure from the approved proportions will be permitted during the works unless and until the Owner/Consultant gives written authorisation for any change in proportion. The Owner/Consultant shall have authority at any time to check whether the mixing of concrete is being carried out according to the approved proportions.

For the all major and important R.C. works and for all special works, the design of mixes shall be made by the Bidder at his own cost, for each grade of concrete as well as for various workability. The design of mixes shall be made according to I.S. 10262 or any other approved standard methods.

The concrete made by designing the mix is termed hereinafter as "Design Mix Concrete".

The cement content for various grades of concrete shall be based on design mix. However, irrespective of requirement of cement found out from design mix, cement content of concrete shall not be reduced below the quantities specified as under.

Grade of concrete	Minimum cement content per Cu.m finished concrete
M-15	290 kg
M-20	320 kg
M-25	380 kg
M-30	not less than 400 kg
M-35	not less than 400 kg

ii) Water Cement Ratio

Where a particular water cement ratio is stipulated in the design or drawing along with the characteristic grade of concrete the design of mix shall be carried out by adjusting the other variable factors to obtain the characteristic strength of concrete with stipulated water cement ratio.

In the structures where the impermeability and shrinkage of concrete have an important bearing on the durability and serviceability of the structures, such as water retaining structures, basements, underground premises, tunnels, pump houses, pre-stressed structure, thin precast members etc. the water cement ratio shall be kept low and preferably not exceeding 0.45.

The water cement ratio, as achieved in the Mix Design, or as specified in the drawings shall be adhered to strictly and shall not be varied without the permission of the Owner/Consultant.

iii) Workability

The workability of fresh concrete shall be such that the concrete is just suitable for the conditions of handling & placing so that after compaction it becomes completely consistent and homogeneously surrounds all the reinforcement and completely fills the formwork.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[32]	25.09.2014

The workability of fresh concrete at the place of batching/mixing shall be measured by compacting factor test and at the place of disposition by means of slump test. During the finalisation of Trial Mixes, the relationship between compacting factor and slump test shall be established for each grade of concrete as well as for various levels of workability. The workability tests shall be carried out in accordance with IS:1199.

Normally, in the condition of low water cement ratio as well as for medium/high workability, the workability shall be achieved by increasing the cement content, in consistent with added water.

In cases where the cement content is to be limited to reduce the heat of hydration, and the water/cement ratio is also to be kept low to reduce the permeability or due to other requirements the desired workability may be achieved with use of limited doses of plasticiser or air entraining agent. In such cases the method of mixing and dosage of the plasticiser/air entraining agent shall be according to the manufacturer's specification and with the approval of the Owner/Consultant.

The usual limits of consistency for various types of structures are given below:

iv) Limits of consistency

Degree of Workability	Slump in mm with Standard - Cone		Use for which concrete is suitable as per IS : 1199
	Minimum	Maximum	
Very low	0.0	25.0	Large mass concrete structure with heavy compaction equipment, roads and the like.
Low	25.0	50.0	Uncongested wide and shallow R.C.C structures
Medium	25.0	75.0	Deep but wide R.C.C structures with congestion of reinforcement and inserts
High	75.0	125.0	Very narrow and deep R.C.C structures with congestion due to reinforcement and Inserts

v) Durability

The durability of concrete, depending on the exposure condition, is to be taken into account while designing the mix. For given aggregates, the cement content should be sufficient to make sufficiently low water cement ratio and Appendix A of IS: 456 shall be taken as guideline for durability considerations.

Minimum fire rating of 2 hours shall be considered where fire hazard is expected and accordingly minimum cover shall be taken as per Table 16 A of

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[33]	25.09.2014

IS: 456. For structures below ground level which are exposed to sulphate attack, requirement of cement shall be as per Table 5 of IS: 456. Intermixing of different grades of concrete in the same structure shall not be allowed in a particular element.

Mix design concrete shall be used for all areas other than plain concrete work used for lean concrete, screeds and backfill.

The following minimum grades of concrete as per IS: 456 shall generally be used for the type of structures noted against each grade.

Table 2.6
Grades of Concrete

Concrete mix/Grade	Type of structure
1:5:10	Fill concrete
1:4:8	Blinding layer below foundations, trenches and underground structures, foundation below brick wall, etc. Minimum thickness of layer shall be 75 mm
M15	Plinth protection work around buildings
M25	Base plate encasement, encasement of structural steel work, all RCC paving work, ground floor slabs, cable and pipe trenches, precast concrete work etc.
M30	All RCC structures and equipment foundations, super structure, grade beams, columns, roof slabs and all underground RCC structures, cable and pipe rack foundation, pedestals, etc. water retaining structures below and above ground, boiler foundations, mill foundations, etc.

Inter mixing of different grade of concrete in the same structure shall not be allowed normally.

vi) Trial Mixes

- Before concreting commences, the Bidder shall, at his own expense, make trial mixes to determine the mix proportions required to produce the strengths specified for each class of concrete and for each degree of workability required to allow placing, transporting and compacting of the concrete with the equipment he proposes to use in any particular situation. Only materials which the Bidder intends to use for concreting (including all admixtures) shall be used in the trial mixes.
- Test cubes from trial mixes shall be made and tested in accordance with IS: 516.
- As per IS: 456 and IS: 516, three separate batches of concrete should be made, workability of each batch determined and three test cubes shall be made from each batch for each age (e.g. for 7 and 28 days) at which tests are required. The strength shall conform to target mean strength as per IS: 456 – Requirements for design mixes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[34]	25.09.2014

- The appropriate strength requirements may be considered to be satisfied if none of the strengths of the cubes is below the required characteristic strength and if the average strength of the nine cubes is not less than recommended by IS: 456 and IS: 516, trial mixes.

vii) Quality and Testing

Not more than 5% of the test results may fall below the 28 days specified strength. Making and curing of test specimens shall be in accordance with relevant IS: 456, IS: 516 and IS: 1199.

All mixes can only be placed following approval by the Owner/Consultant. The mean strength shall exceed the characteristic strength by a margin of 1.65 times the standard deviation expected from the batching plant. However, no standard deviation less than 3.5 N/mm² shall be used as a basis for designing a mix.

viii) Trial Mixes and Field Tests

Sufficient laboratory trial mixes shall be prepared to show that concrete complies fully with the specified performance criteria. The following tests are to be included:

- Air content < 1%
- Slump: Piles 170 + 25 mm, regular work 80 + 20 mm as per IS: 1199
- Fresh and hardened concrete densities
- Field trial mixes shall be carried out under full-scale site conditions as per IS: 4925 (for structural concrete only).
- Where directed by the Owner/Consultant, concrete incorporating reinforcement details shall be cored to assess stratification of mixes. Cores of 150 x 200 mm (diameter and length) shall be used.
- Each trial mix shall have 9 x (150 x 150 x 150 mm) cubes taken to measure 24 hours/7 days and 28 day compressive strengths. These trials shall be run for three consecutive days (for structural concrete only).
- At least 3 x sets of field trials shall be tested according to the provisions laid down in laboratory testing.
- The average 28 day characteristic strength for trial mixes shall be as per IS 456. Failure to comply shall result in the mix having to be re-designed.
- All test results shall have to be complied before approval can be given.

ix) Consistency of Concrete

The amount of water used in the concrete shall be adjusted as required to ensure such a consistency that it can be readily transported, placed and compacted without segregation of the materials or bleeding of free water at the surface. Addition of water to compensate for stiffening of the concrete

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[35]	25.09.2014

before placing shall not be permitted. Consistency of the concrete shall be checked by slump tests measured in accordance with IS: 1199 and shall not exceed the values given in clause 7.1 of IS: 456-2000.

x) Mixing of Concrete

- The cement and aggregate shall be thoroughly mixed in a batch-type pull mill mixer. The capacity of the mixer shall not be less than 1 (one) cubic meter and the total capacity of the batching mixing plant shall be such to accommodate the various concrete quantities to be cast in a continuous way and shall comply with the requirements of IS: 456, IS: 1791 and IS: 12119.
- The water shall not be added until all the aggregate and cement are in the drum. Mixing shall continue until the concrete is uniform in colour and for not less than 2 (two) minutes after all the materials and water are in the drum.
- Partly set or excessively wet concrete shall not be used. No concrete shall be mixed by hand.

xi) Laboratory

The Bidder shall establish and maintain a field laboratory on the site and this laboratory shall be available at all time to the owner.

The laboratory must have qualified technicians to carry out all tests and must be adequately equipped to ensure that all necessary testing work can be carried out in compliance with the standards.

5.8 Strength of Concrete

i) Testing of fresh concrete by means of test cubes

- a) All test cubes shall be made and tested for compressive strength in accordance with IS: 456, IS: 516 and IS: 1199.
- b) The minimum required strength for different classes of concrete shall be as shown in clause "General description and proportions and mixing" here above.
- c) The grade of concrete required will depend partly on the particular use and the characteristic strength needed to provide the structure with adequate ultimate strength and partly on the exposure conditions and the cover provided to any reinforcement.
- d) A minimum of four test samples (of six test cubes each) shall be taken on each concreting day (from the same mix) and for at least each 40 m³ of concrete mixed. At least one sample shall be taken for each shift.
- e) For columns, beams and cantilevers seven (7) cubes for every 15 m³ of concrete poured shall be taken. The concrete for test samples shall be taken directly from the concrete mixer and shall be handled (vibrated etc) under similar conditions to those prevailing during the construction.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[36]	25.09.2014

The moulds for the test cubes shall be made of steel. Tests shall be carried out in an approved laboratory.

- f) The strength level of each type and each strength concrete will be evaluated separately and the concrete strength will be considered satisfactory if:
- Compressive strength: The concrete shall be deemed to comply with the strength requirements when both the following conditions are met:-
 - The mean strength determined from any group of four consecutive test results complies with the appropriate limits in column 2 of table 11 of IS: 456.
 - Any individual test result complies with the appropriate limits in column 3 of table 11 of IS: 456.
 - Flexural strength: When both the following conditions are met, the concrete complies with the specified flexural strength:-
 - The mean strength determined from any group of four consecutive test results exceeds the specified characteristic strength by at least 0.3 N/mm^2 .
 - The strength determined from any test result is not less than the specified characteristic strength less 0.3 N/mm^2 .
- g) If the results are less than those specified, the Owner must suspend all concreting work and order further tests. Any concrete found not to comply with the specification shall be broken out and replaced to the satisfaction of the owner.
- h) The Bidder shall pay all costs incurred in making, curing, delivering and testing of concrete cubes.

ii) Testing of concrete in structures

- a) The types of tests described hereinafter are applicable to the finished parts of the structures. They may be used in routine inspection and for quality control.
- b) Type of tests:
- Cutting cores: The procedure used shall comply with the requirements of IS: 516 or an approved equivalent standard.
 - Gamma radiography: The testing shall be carried out in accordance with the requirement of IS: 13311, part 1 or equivalent.
 - Ultrasonic test: Such tests may be used to obtain approximate indications of the strength of the concrete in the structures (IS: 13311, part 1).
 - Electromagnetic cover measuring devices: Such tests may be used to verify the position of the reinforcement and shall be in accordance with the requirements of design (IS: 13311, part 1).

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[37]	25.09.2014

- Rebound hammer test: Such tests may be used to obtain approximate indications of the strength of the concrete (Ref. IS: 13311, part 2).
 - Load tests of structures or parts of structures: If the results of the above mentioned check tests show that the quality of the materials is inadequate or if other defects are revealed, the owner may require a loading test to be made.
- c) For the purpose of testing floors, roofs and similar structures and their supports, the test load shall be equivalent to the sum of the characteristic dead load and one-and-a quarter times (1.25 times) the characteristic imposed load for a period of 24 hours which the works or part thereof to be tested have been designed.
- d) Wherever certain procedures for testing of parts in structures are required by standards or codes of practice, these are to be followed. All tests must be conducted in the presence of the Owner/Consultant.
- e) If within 24 hours of removal of the imposed load, the structure does not recover at least 75% of the deflection under superimposed load, the test may be repeated after a lapse of 72 hours. If the recovery is less than 80%, the structure shall be deemed to be unacceptable.
- f) If the result of the test is not satisfactory, the Owner/Consultant shall instruct that the part of the works concerned be taken down or cut and reconstructed to comply with this specification. The Bidder shall at his own cost take down or cut out and reconstruct the defective work.
- g) The Owner/Consultant may require other tests to be made. Number of samples, tests and types will be as per Owner requirements.
- h) All the costs for the above mentioned tests shall be borne by the Bidder.

5.9 Materials

a. Storage of materials

All materials shall be stored and handled in a manner that will prevent contamination and/or deterioration. Storage of materials shall conform to IS-4082 "Recommendation on stacking and storage of construction materials and components at site". Deteriorated and/or contaminated material shall not be used for the concrete and shall be removed from the site at the expense of the Bidder.

b. Cement

OPC / PPC Cement of reputed make conforming to relevant codes, shall be used for all Concreting works and the certificate of manufacturer shall be furnished with each batch. Cement used shall be ordinary Portland cement

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[38]	25.09.2014

unless the chemical nature of the soil warrants special cement for structures below ground level.

Sampling and Testing of Cement

- All deliveries of cement to the concrete supplier shall be accompanied by a certified mill test report and shall include all of the physical and chemical properties as required by relevant IS: 8112 for grade 43 and IS-12330 for sulphate resistant cement.
- The manufacturer's test certificate will normally be accepted as proof of compliance with the specification, but the Owner may order further tests of a character specified in the appropriate Indian standards. The confirmatory tests are to be conducted by a recognized quality control organization. The Bidder shall bear all expenses required for the preparation, dispatch, and tests of the samples. In case the results of such tests show any sample to be inferior to specifications, the whole consignment from which the sample was taken shall not be used and shall be immediately removed from the site.

Delivery and Storage of Cement

- The following information shall be provided for all cement shipments (either whole or part) which are intended for delivery to site: date of manufacture, date of original loading, destinations en-route, date of unloading, intended date of delivery to site.
- The Bidder shall obtain and provide to the owner the manufacturer's average test certificate for each consignment of cement to the works.
- The certificates shall be provided before the consignments are required for use and shall show the chemical composition and physical properties determined in accordance with the relevant standard.
- Samples shall be taken from each consignment of cement and tested as directed by the owner in an approved independent laboratory.
- Consignments shall be used in the order in which they were delivered.
- Bagged cement shall be stored in a weatherproof building having dense impervious bituminous or concrete floors which shall be kept swept clean at all times. The storage arrangements shall be fully completed and approved by the owner before any cement is delivered to site.
- Each consignment of cement shall be separately stored for ease of access, identification, inspection and sampling. Sufficient stocks shall be maintained on site to ensure the proper progress of the works and the stock holdings shall be to the approval of the owner.
- No cement from any consignment shall be used in permanent works without the approval of the owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[39]	25.09.2014

- Cement which contains air-set or hardened lumps, re-powdered air-set material, foreign matter or which has been contaminated or is otherwise unsatisfactory in the opinion of the Owner/Consultant will be rejected and shall be removed from site without delay.
- The Bidder shall be responsible for satisfying himself that the performance characteristics of cement are not such as to necessitate excessive cement content or be likely to cause or accentuate any undesirable properties in the fresh or hardened concrete notwithstanding apparent compliance with this specification.

c. Reinforcing steel

General

Reinforcing steel used in reinforced concrete shall comply with the following standards:-

Deformed bars shall be of grade Fe500 and conform to IS: 1786.

Mild steel shall conform to IS: 432.

Mesh reinforcement shall conform to IS: 1566.

Binding wire

Binding wire for general use shall be annealed wire 16/18/20 BWG conforming to IS 280. The number of strands shall be as per IS specification.

Reinforcement supports

- Reinforcement supports shall include all spacers, chairs, ties, slab bolster, clips, chair bars, and other devices for properly assembling, placing, spacing; supporting, and fastening the reinforcement.
- Spacers shall be cast from concrete of the same quality as that in which they will be embedded.
- Concrete block spacers shall be cast in metal moulds with an approved means of separating blocks and of ensuring that the blocks are of the proper size.
- Binding wire shall be incorporated into the blocks to enable them to be securely attached to vertical or horizontal bars and the Bidder shall demonstrate both that the blocks are of the requisite strength and that the means of attachment to the reinforcement are adequate.

Certificates

Each consignment of steel reinforcement shall be accompanied by a test certificate from the manufacturer showing that the steel has been tested and analyzed and the date of such tests and analyses and that such tests

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[40]	25.09.2014

and analyses comply in all respects with the standards. The following tests shall be carried out on reinforcement:-

- Cast analysis
- Carbon equivalent value
- Tensile strength, yield stress, elongation
- Bend test
- Bond classification
- Chemical analysis

Stock of reinforcing steel

In order to ensure due progress of the works, the Bidder shall at all times maintain on the site a stock of reinforcing steel sufficient for the following month's work. No reinforcing steel shall be used upon the works until it has been accepted as satisfactory by the Owner/Consultant.

Rejection

The owner at his discretion may order random testing of the reinforcement steel and in the event of any failed test reject the entire lot notwithstanding the manufacturer's or coating applicator's certificates.

The Bidder shall remove all rejected reinforcing steel from the site without delay at his own expense.

Storage

All bars for reinforcement and steel fabric reinforcement shall be stored on the site under cover on timber or concrete supports suitably spaced and of sufficient height to keep the steel not less than 150 mm clear of the ground.

Bar-bending Schedules

The Bidder shall prepare bar bending schedules based on the detailed reinforcement drawings. These shall be presented to the Owner/Consultant for review. The Bidder is fully responsible for their completeness and correctness in every way nor shall any claim for extra cost or time be allowed on the grounds of errors or discrepancies which may arise between drawings and schedules.

d. Water

Water used for mixing and curing shall be clean and free from injurious amounts of oils, acids, alkalis, salts, sugar, organic materials or other substances that may be deleterious to concrete or steel. pH value of water shall not be less than 6.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[41]	25.09.2014

Only potable water shall be used. Tests and quality of water shall be in accordance with IS: 456 or equivalent.

e. Aggregates

General

The aggregates for concrete shall be crushed natural rock subject to Owner's approval.

The aggregate to be used in the work shall be supplied from an established pit or quarry.

The concrete supplier shall obtain from the aggregate producer, or otherwise provide current test, examination, and inspection reports performed and certified by an approved laboratory for submittal to the Owner/Consultant.

As a minimum, this information shall include the following items:-

• **Item 1**

A comprehensive description, with current photographs of the pit or quarry, including but not limited to, identification by name and location, type of deposit, age, potential reserves, primary products by size including average gradation based on previous six (6) months production and the range for each sieve size; mining methods, process equipment, quality control organization and laboratory; the primary and alternate means of product transportation; listing of primary and secondary users of the product.

• **Item 2**

Petrographic examination in accordance with IS: 2386 (Part-8) and ASTM C-295 performed by a qualified concrete aggregate petrographer. This report shall be based on material produced and examined within the previous six (6) months and must be representative of the current production.

• **Item 3**

Coarse aggregate shall be sampled from current production in accordance with IS: 2386 (Part 1 to 8). Three [20 mm, 10 mm & 5 mm] nominal maximum size (NMS) aggregates shall be sampled and tested as follows:

IS 2386(Part 1): Methods of test for aggregates for cement: Part 1
Particle size and shape (Amendments 3)

IS 2386(Part 2): Methods of test for aggregates for concrete: Part 2
Estimation of deleterious materials and organic impurities (Amendment 1)

IS 2386(Part 3): Methods of test for aggregates for concrete: Part 3
Specific gravity, density, voids, absorption and bulking

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[42]	25.09.2014

IS 2386(Part 4):	Methods of test for aggregates for concrete: Part 4 Mechanical properties (Amendments 3)
IS 2386(Part 5):	Methods of test for aggregates for concrete: Part 5 Soundness
IS 2386(Part 6):	Methods of test for aggregates for concrete: Part 6 Measuring mortar making properties of fine aggregates (Amendments 2)
IS 2386(Part 7):	Methods of test for aggregates for concrete: Part 7 Alkali aggregate reactivity
IS 2386(Part 8):	Methods of test for aggregates for concrete: Part 8 Petrographic examination
ASTM C-295	Standard guide for petrographic examination of aggregates for concrete

Aggregates when subjected to the tests defined in items above, unless otherwise approved by the Owner/Consultant shall meet the requirements of IS: 383 and IS: 456.

Testing is to be carried out at the following intervals:

Table 2.7
Grades of Concrete

Type	Coarse Agg.	Fine Agg.
Grading	Daily	Daily
Specific Gravity	7 days	7 days
Magn Sulphate soundness	30 days	-
Clay, Silt and dust content	Daily	Daily
Shape (elongation and flakiness)	3.5 days	-
Los Angeles Abrasion	Initial stage only	Initial stage only
Moisture content	2 days	Daily
Drying shrinkage	Initial only	Initial only
Organic impurities	30 days	30 days
10% fines value for concrete	7 days	-

Combined grading shall also be done on a daily basis.

Storage and handling of aggregates

- Aggregate stockpiles shall be arranged and used in a manner to avoid segregation and to prevent contamination with other materials or with other sizes of like aggregates. Aggregate delivery trucks shall be covered to prevent wind blown contamination. Aggregate stockpiles shall be located relative to prevailing winds to mitigate the accumulation of wind-borne dust.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[43]	25.09.2014

- Adequate storage shall be provided for each aggregate. The aggregate storage area shall be on concrete pavement sloped to drain excessive moisture. The aggregate storage area shall provide bulkheads to separate piles and protect against wind blown contaminants. Provision shall be made to shade and sprinkle the aggregates with potable water.
- Aggregate stockpiles shall be built in successive horizontal layers not exceeding 1 m in thickness, with each layer being completed before the next is started. No vehicles shall be allowed to operate on top of the stockpiles.
- Rescreening Coarse Aggregate: Rescreening and washing of coarse aggregates is required, if necessary, to reduce total chloride and/or sulphate contents to a level less than the maximum allowed by the specifications. If rescreening is required, the screening and washing shall be just prior to transferring aggregate to batch plant bins. Aggregates shall be dewatered over a screen to remove excess water before being stored in the batch plant bins.
- Natural or manufactured sand shall be allowed to drain until it has reached somewhat uniform moisture content before it is used.

Fine Aggregate

Fine aggregate source shall be manufactured crushed stone or river sand, excluding fines, which are by products/rejects of coarse aggregate production. The crushed stone sand shall be graded from fine to coarse with the coarse sizes predominating to give maximum density.

The amount of fine particles as ascertained by the laboratory sedimentation method shall not exceed 10% for crushed stone nor 4% for natural sand.

The amount of material passing a 75 micron sieve (IS test sieve) shall not exceed the following limits:-

Crushed Stone Sand

- i) Concrete subject to abrasion 1% by weight
- ii) All other concrete 3% by weight

There shall be no clay or fine silt present.

The amount of hollow shells like to form voids or remain partially unfilled and present in material retained on an IS 2.36 mm sieve, determined by direct visual separation, shall not exceed 3% by weight of the entire sample.

Tests are to be executed in accordance with IS: 2386. The grading of fine aggregate for concrete work shall comply with the requirements of IS: 383.

The grading of the aggregates should be such as to produce a concrete of the specified proportions, which will work readily into position without

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[44]	25.09.2014

segregation and without the use of excessive water content. The grading should be controlled throughout the work so that it conforms closely to that used for the preliminary tests.

A check on the moisture content of sand should be made at least once a day before concreting. The amount of water to be added to the concrete mix should be adjusted accordingly. Any washing, screening, classifying and other operations on the fine aggregate required to meet this specification shall be done by the Bidder. Washing is required if the content of silt adhering to the aggregate is found to be unacceptably high.

Coarse Aggregate

Coarse aggregate shall be crushed rock and shall be free from decomposed stone, clay, earth or other deleterious substances. The unit weight of the coarse aggregate shall not be less than 2.5 t/m³. Aggregate of crushed natural stone is deemed adequate if the stone reveals a crushing strength of 1000 kg/cm² when tested. Friable, flaky and laminated pieces, mica and shale shall only be present in such quantities as not to affect the strength and durability of the concrete.

The grading of coarse aggregate for concrete shall comply with the requirements of IS: 383.

Samples of aggregates shall be submitted to the Owner/Consultant, together with sieve analysis showing the proportion by weight passing sieves. When aggregates which are satisfactory to the Owner/Consultant have been selected, the Bidder shall secure his entire supply of each material from the same source so as to maintain the same quality and grading throughout the work. Should it become necessary to change the source or characteristics of the material supplied this shall only be done after additional tests.

f. Concrete additives

Use of Concrete Additives

Concrete additives approved by the Owner/Consultant shall be used to improve consistency, workability, quality and strength of the concrete.

Chemical admixtures manufacturer shall provide certified test reports from qualified independent laboratories showing actual test results indicating material that complies in all respects with the applicable specification.

Admixtures used in concrete shall conform to the appropriate specification and requirements as indicated below:-

- Air entraining admixtures shall conform to IS: 9103.
 - Water reducing and retarding admixtures shall conform to IS: 9103.
- Accelerating admixtures shall not be used.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[45]	25.09.2014

- High range water reducers shall be naphthalene-sulfonated polymer based material. No admixtures containing chlorides shall be used.
- Chemical admixture suppliers shall provide certified test reports with each shipment indicating compliance with the appropriate specification. The test reports shall include the chloride content of the admixture, specific gravity and solids content.
- Fibers: Polypropylene fibers shall be collated, fibrillated polypropylene fiber of approved manufacture.
- Admixtures used in production of concrete shall be the same as used in establishing the required concrete mix and shall be used in accordance with the manufacturer's directions.
- Liquid admixtures shall be stored in such a manner to avoid contamination, evaporation and segregation in accordance with the manufacturers' recommendations.

Accelerating and Retarding Additives

Such additives shall only be used in case of necessity and after obtaining the written approval of the Owner/Consultant.

Plasticizers and Air entraining Additives

Plasticizers and air entrainers are intended to reduce bleeding of free water at the surface. It shall only be used after the written approval of the Owner/Consultant and in accordance with the manufacturer's instructions.

5.10 Dismantling/Demolishing and Modification in PCC&RCC

- The dismantling implies, carefully taking up or down and removing without damage. This shall consist of dismantling one or more parts of a structure. This includes chipping work, cutting of reinforcement, making holes/opening etc. in concrete members, according to the required shape, size and profile at all elevations.
- The term demolition implies, taking up or down or breaking up of a structure/member, in part or full, as specified or shown in the drawings or as directed by Engineer.
- In a structural member, both dismantling and demolishing work may be involved. In such case, the portion of work treated as demolishing shall be as shown on the drawing or as directed by the Engineer.
- All material obtained from the demolition/dismantling work shall be property of the Owner, unless otherwise specified.
- All serviceable materials obtained, shall be separated out and stacked properly up to a lead of [500 meter] or shall be returned to OWNER's stores and all unserviceable materials, rubbish etc., shall be disposed off as directed by the Engineer, up to a lead of [2kms].

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[46]	25.09.2014

- The dismantling / demolishing operations shall be carried out in proper sequence so that the serviceable material can be salvaged, without being damaged during the process or work.
- Necessary propping, shoring and under pinning shall be provided for safety of adjoining work or property which is to be left intact, before dismantling/demolishing work.
- All demolition work shall be carried out in conformity with the local safety regulations, extreme caution being exercised to avoid damage to the work and the equipment, which are to be left intact. Necessary precautions shall be taken to keep the dust nuisance down. Safety requirements stipulated in IS: 4130 shall also be followed.
- As and where necessary, the dismantled/demolished materials shall be lowered to the ground and not thrown and then properly stacked as directed by the Engineer. Wherever required, temporary enclosures shall be erected to minimize the dust or moisture infiltration.
- Wherever fresh concrete is laid over old concrete, to ensure proper bond between old concrete and fresh concrete, the surface of old concrete shall be thoroughly cleared by removing all loose particles and coat of epoxy paint shall be applied.

5.11 Minimum Cover to Foundation Bolts

Minimum distance from the centre line of foundation / anchor bolt to edge of pedestal shall be the maximum of the following:

Clear distance from the edge of base plate / base frames to the outer edge of the pedestal shall be minimum 50 mm

Clear distance from the face of pocket to the outer edge of pedestal shall be 75 mm

Clear distance from the edge of sleeve or anchor plate to the edge of pedestal shall be 75 mm

5.12 Miscellaneous Requirements

Fillets at the junction of roof and vertical walls shall be provided with cast in-situ cement concrete 1:2:4 (nominal mix) followed by 12 mm thick 1:4 cement mortar.

A screed layer not less than 100 mm thick of cast in-situ concrete of nominal mix 1:3:6 shall be provided below all water retaining structures. A sliding layer of craft paper or bitumen paper shall be provided over the screed layer to destroy the bond between screed and base slab.

Plywood formwork shall be used for all water retaining / conveying structures and for all over ground concrete works. For other areas steel/ plywood formwork shall be used.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[47]	25.09.2014

Unless specified 20 mm and down graded aggregates shall be used for all structural concrete works. However 40 mm and down graded aggregates may also be used under special conditions for foundation.

Tolerance for formed and concrete dimension shall be as per IS: 456.

5.13 Major Equipment Foundation

Special requirements for concreting of major equipment foundations shall be as given below:

Coarse Aggregates

Sound and durable crushed stone aggregates shall be used. All aggregates shall be tested for alkali aggregate reaction. Materials, which contain high percentage of reactive silica, shall not be used. In exceptional cases of high percentage of reactive silica content, aggregate may be allowed where low alkali cement shall be used. Lime stone aggregate shall not generally be used for foundations, which are subjected to high temperature and repeated temperature cycles (like in the case of all machine foundations).

Temperature Control of Concrete

The temperature of fresh concrete shall not exceed 25° C when placed. For maintaining the temperature of 25° C in the top deck of machine foundations, crushed ice shall be used in mixing water.

Admixture

Plasticizer cum retarder/accelerating type admixture shall generally be added to the concrete for promoting workability in addition to retarding / accelerating setting time for mass concreting work. The Bidder shall submit the mixing proportion/report after conducting the design mix as per the relevant codes and standards. The slump of concrete shall generally be in the range given below:

Fan and Mill deck	: 100mm to 150mm
Block foundation	: 100mm to 150mm
Column	: 100mm to 150mm

Formwork

Plywood formwork shall be used for the top deck of all machine foundations. Any other type of formwork required to be used may be permitted subject to prior approval of the OWNER/CONSULTANT after submission of the required data.

Scheme for Concreting

Batching plants shall be mobilized for all RCC works. Concrete pump shall be mobilized for fans and mill foundations. Arrangements for stand-by Plant and Equipments shall also be made.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[48]	25.09.2014

Placing of Concrete

Base mat as well as top deck of machine Foundations shall be cast in a single pour. However the BIDDER shall submit method statements for various structures and shall get the prior approval from the OWNER/CONSULTANT before placing the concrete.

Ultrasonic Testing

Ultrasonic pulse velocity test shall be carried out for the top deck of all machine foundations to ascertain the homogeneity and integrity of concrete. In addition, additional cubes (at the rate of one cube per 150 cum of concrete subject to a minimum of six cubes) shall be taken to carry out Ultrasonic Pulse velocity (UPV) testing on the cubes to serve as reference UPV values. Testing shall be done as per IS: 13311 (Part-1). In case of any defects, the BIDDER shall rectify the defects suitably using cement / epoxy grout etc.

5.14 Transport of Concrete

Immediately after mixing, the concrete shall be conveyed to the place of use as rapidly as possible using methods, which will prevent the segregation, loss or contamination of materials. The concrete shall be placed and compacted within 90 minutes of the addition of water to the mix. Any concrete left unplaced after this time shall be rejected and removed from the site.

The Concrete shall be transported by transit mixers of adequate capacity. Before using concrete pumps, placer pipelines, chutes or spouts it is necessary to have the written approval of the Owner/Consultant.

The Bidder shall obtain permission well in advance of any concrete pour.

5.15 Concreting Operations

Inspection prior to Concreting

All concreting methods shall be subject to the approval of the Owner/Consultant.

Concrete placing shall not be started until the Owner/Consultant has approved all preparation of forms, reinforcement, joints and all mixing, conveying, spreading, curing, finishing and protection equipment.

Placing of Concrete

Concrete shall be placed in the forms as close as possible to its final position in a single operation to the full thickness of slabs and beams and shall be placed in horizontal layers, not exceeding 2.5 m height in a single pour in walls, columns and similar members.

The Bidder shall organize the pouring of concrete in such a manner that once concreting of a section has started the operation shall be continuous and each operation shall be completed prior to a stoppage.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[49]	25.09.2014

The temperature of concrete shall not exceed 40°C measured at discharge into the works.

The maximum allowable temperature of any point within any cast element is 60°C. The maximum allowable differential temperature between any two points in the same element is 15°C. Additional temperature control measures during construction (such as the use of insulated formwork) will be required. Bidder to prepare a process control chart and method statement verifying measures to achieve these requirements.

Temperature monitoring of concrete work is required where:

The minimum dimension of any casting is 0.8 metres or more, or otherwise instructed by the Owner/Consultant.

Where specified on the drawings, construction, expansion or contraction joints shall be provided and the concrete shall be poured continuously between two adjacent joints. No other joints than shown on the drawings shall be permitted. Stoppage (cold) joints formed between two concreting operations separated by more than 6 hours time shall be subject to the same treatment as the construction joints.

Concrete shall not be dropped into place from a height exceeding 1.5 metres. Trunking and chutes to Owner/Consultant's approval shall be used for any concrete to be deposited from a height exceeding 1.5 m.

Concrete which has partially hardened shall not be exposed to injurious vibration or shock, except for controlled re-vibration where specified. When concreting of a certain large structural element is specified strictly as to be poured continuously, then the concreting operations shall be organized for day and night working, in long shifts, as necessary.

5.16 Compaction and mechanical vibration of concrete

As concrete is being placed it shall be compacted by mechanical vibrators complying with IS: 2505, IS: 2506, IS: 2514 & IS: 4656, to obtain a dense material free from honeycombing, free from water and air holes.

The Bidder shall ensure that the vibrators are used in such a manner that the reinforcement is not displaced, the formwork not damaged and no segregation/bleeding caused, but complete compaction of the concrete is achieved.

5.17 Finish of concrete

The concrete face shall have the finishes indicated on the drawings or in the present specification. The finished surface of the concrete shall be sound, solid and free from honeycombing, protuberances, air holes or exposed aggregate. No plastering, cement wash, mortar or paint shall be applied to cover defective concrete surfaces.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[50]	25.09.2014

5.18 Construction, expansion and contraction joints

Construction joints

The number of construction joints should be kept as low as possible consistent with reasonable precautions against shrinkage. Concreting should be carried out continuously up to construction joints.

Where it is necessary to introduce construction joints, careful consideration should be given to their exact location, which should be indicated on the drawings. Alternatively, the location of joints should be subject to agreement between the Owner/Consultant and the Bidder before any work commences. Construction joints should be at right angles to the general direction of the member and should take due account of shear and other stresses.

Concrete should not be allowed to run to a featheredge and vertical joints should be formed against a stop board.

The top surface of a layer of concrete should be level and reasonably flat unless design considerations make this undesirable. Joint lines should be so arranged that they coincide with features of the finished work.

If a kicker (i.e. a starter stub) is used it should be at least 70 mm high and carefully constructed. The kicker must be incorporated with the previous concrete. Where possible, the formwork should be designed to facilitate the preparation of the joint surface, as the optimum time for treatment is usually two to four hours after placing.

The maximum horizontal length of wall to be poured in one operation in any one direction is 7.5 metres. A period of 7 days to be allowed between adjacent pours except where water stops are provided when this can be reduced with Owner/Consultant's approval. Alternatively a gap of 600 mm width shall be left between adjacent pours and filled after 7 days from the date of formation subject to Owner/Consultant's approval.

Immediately prior to recommencement of concreting on a joint, the surface of the concrete against which new concrete will be cast should be free from laitance and should be roughened to the extent that the largest aggregate is exposed but not disturbed. Care should be taken that the joint surface is clean immediately before the fresh concrete is placed against it.

Particular care should be taken in the placing of the new concrete close to the joint. This concrete should be particularly well compacted and if possible a vibrator should be used.

Where the Owner/Consultant considers that special preparation is necessary, i.e. for an in-situ structural connection, preparation should be carried out preferably when the concrete has set but not hardened, by spraying with a fine spray of water or brushing with a stiff brush, which is sufficient to remove the outer mortar skin and expose the larger aggregate. Where this treatment is

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[51]	25.09.2014

impracticable, sand blasting or a needle gun should be used to remove the surface skin and laitance. Hacking of hardened surfaces should be avoided.

A record shall be kept on site of the time and date of placing the concrete in each section of the work.

Expansion and contraction joints

The expansion joints, contraction joints and other permanent structure joints shall be provided in positions as shown in the drawings.

Joints shall be straight and vertical, except where otherwise specified, and concrete surfaces on both sides of the joint shall be flush. Where necessary, water stoppers of a type approved by the Owner/Consultant shall be embedded in the concrete. The water stopper should be made of high quality material, which must obtain its resilience through the service life of the structure for the double function of movement and sealing. The surface of water stoppers should be carefully rounded to ensure tightness of the joint even under heavy water pressure. To ensure a good tightness with or without movement of the joints the water stopper should be provided with anchor parts. The cross-section of the water stoppers should be determined in accordance with the presumed maximum water pressure and joint movements. The complete works of fixed and welded connections must be carried out strictly in accordance with the manufacturer's instructions.

All joints between structural steel and concrete parts shall be sealed by a suitable permanent flexible compound.

5.19 Concreting at night

When approval is given to carry out concreting operations (under control of the Owner/Consultant) at night or in places where daylight is excluded, the Bidder has to provide adequate lighting at all points of mixing, transportation and placing of concrete.

5.20 Protective measures for concrete

In general, the cover of rebars shall be as per IS: 456 taking into account the site conditions. However, the minimum concrete cover shall not be less than:

Concrete parts above ground (external surface)	: 40 mm
Concrete exposed to underground & groundwater	: 50 mm
Isolated footings	: 50 mm
Raft	: 75 mm
Slabs	: 25 mm
Beams	: 25 mm
Columns	: 40 mm

Immediately after the compaction of the concrete has been finished, the Bidder shall ensure adequate protection from the weather. Excessive drying can lead to crack formation as a result of plastic contraction. The concrete surface shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[52]	25.09.2014

covered with a layer of sacking, canvas, straw mats or similar absorbent material, special protection sprays kept constant moist for at least 7 days.

Curing compounds or other methods of preventing evaporation may be used if approved by the Owner/Consultant. Where formwork cannot be removed within 24 hours after placing the concrete, the formwork shall be kept shaded from the direct rays of the sun and shall be sprayed with water.

Owner/Consultant's approval to the use of a particular curing compound and to the method of application will only be given after the Bidder has completed satisfactory site trials and a sample panel has stood for at least 28 days.

Where large sections of concrete are poured, special precautions to the approval of the Owner/Consultant shall be taken to reduce and dissipate the heat generated by the setting and hardening of the concrete.

The minimum amount of reinforcement shall be present to prevent shrinking cracks.

No load of any kind, however light, shall be allowed on concrete which has not properly set and the Bidder shall prevent any load to be imposed on the concrete structures until it has been declared by the Owner/Consultant to be ready to carry loads.

5.21 Concrete with Special Properties

General requirements

The pre-condition for obtaining concrete with special properties is that it should be made with the appropriate composition, that it is placed in such a way that segregation does not occur and further that it is fully compacted and given appropriate curing.

Waterproof concrete

This concrete must meet the provisions of IS: 3370. Waterproof concrete must be sufficiently dense (impermeable).

Waterproofing and protection of underground concrete structures

Water aggressive to concrete should be kept away from the fresh concrete.

Concrete, which is exposed for a prolonged period to "very severe" chemical attack, must be protected against direct access of the aggressive substances.

The protection, which is to be laid as protection to all concrete surfaces in contact with the ground, shall consist of an approved waterproofing membrane. The membrane shall adhere to all concrete surfaces, including undersides of structures and other surfaces where concrete is cast in contact with the membrane.

Such membranes shall be PVC sheets of minimum 0.35 mm thickness with knobs of Maxlock.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[53]	25.09.2014

The waterproof membranes shall be installed in strict accordance with manufacturer's instructions.

The membranes shall extend 15 cm above ground level.

When setting forms and reinforcing steel caution shall be exercised to avoid damage to the impervious membrane. The surface of the impervious membrane extending outside the forms shall be protected during subsequent operations.

Any puncture or damaged areas shall be cleaned and patched according to manufacturer's instructions.

Concrete with high wearing resistance

Concrete which is exposed to severe mechanical action, e.g., due to intensive traffic, sliding of bulk materials, frequent impact blows or movements of heavy objects, or due to fast-flowing water carrying solids, or other causes, should possess high wearing resistance and correspond at least to grade M30.

The aggregate upto 4 mm size should consist predominantly of quartz or materials of at least equal hardness; the coarser particles should consist of stone or artificial materials possessing high abrasion resistance. In the case of particularly severe mechanical action, it will be necessary to use special hard materials. The particles of all types of aggregate should have a moderately rough surface and be of compact shape. The combined aggregate should be as coarsely graded as possible.

Furthermore, the concrete should be as stiff as possible, in order that there will be no concentration of cement slurry or water in the top layer. The concrete should be kept moist for at least 7 days after placing.

Finishing of formed surfaces

Fins and other surface projections shall be removed from all formed surfaces except exterior surfaces that shall be covered with earth backfill. Exterior surfaces that shall be exposed above grade and all interior surfaces, except those not usually exposed to view shall be cleaned and rubbed. Rubbing shall produce a smooth, uniform surface free of marks, voids, surface glaze, and discolorations.

Rubbing shall be done by hand with a carborundum stone using only the mortar produced by the rubbing action and the application of water.

Projecting ends of all form ties shall be removed. The resulting recesses shall be cleaned, wetted, and filled with patching mortar. Patches on rubbed surfaces shall match the texture of the adjacent concrete.

Finishing of unformed surfaces

No surface treatment shall be required for buried or permanently submerged concrete. As a minimum, unformed surfaces shall be finished by screeding and floating. Surfaces requiring a trowelled finish shall be finished by screeding, floating, and trowelling.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[54]	25.09.2014

Float finished and screeded surfaces shall be finished to provide a flat profile within a 6 mm deviation as measured from a 3 m straightedge. Trowel finished surfaces shall be finished to form a flat plane. The surface profile shall not deviate more than 3 mm when measured from a 3 m straightedge.

Screeding

Screeding shall provide a concrete surface conforming to the designated elevations and contours with all aggregates completely embedded in adjacent mortar. Surface irregularities in screeded surfaces shall be limited to the tolerances specified.

Floating

The surfaces shall be screeded and given an initial float finish as soon as the concrete has stiffened sufficiently to work. Coarse aggregate disturbed by the float or causing a surface irregularity shall be removed and replaced with mortar. Initial floating shall produce a surface of uniform texture and appearance.

Initial floating shall be followed by a second floating at the time of initial set. The second floating shall produce a smooth float finish of uniform texture and colour.

Floating shall be performed with hand floats or suitable mechanical compactor floats.

Trowelling

The exposed portions of the tops of equipment bases, tops of interior curbs, and the surfaces of interior slabs not receiving a separate finish shall receive a steel trowel finish. Trowelling shall be performed after the second floating when the surface has hardened sufficiently to prevent excess cement from being drawn to the surface. Trowelling shall produce a dense, smooth, uniform surface free from blemishes and trowel marks.

Surfaces to be covered with neoprene-hypalon coatings shall be lightly trowelled but not burnished.

Brooming

Brooming shall follow the float finish for exterior surfaces where a nonslip surface is required. Brooming shall be done with an acceptable steel or fiber broom not less than 450 mm wide. Brooming ridges shall be transverse to the normal traffic direction and shall be between 1.5 mm and 3 mm deep. Adjacent strokes of the broom shall overlap slightly. Broomed surfaces shall be free of porous spots, irregularities, depressions, and small pockets or rough spots.

Aggregate Exposure

Surface mortar shall be removed and the aggregate exposed from surfaces that shall be covered with mortar, concrete, or grout at a later time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[55]	25.09.2014

Edging

Unless specified otherwise, exposed edges of floated or troweled surfaces shall be edged with a tool having a 6 mm corner radius.

Finishing mortar

Finishing mortar shall be added if there is not sufficient mortar available from the concrete mix. The proportions for this finishing mortar shall be 102 kilograms of concrete sand to one sack of Portland cement, mixed with enough water for proper application. Slump for finishing mortar shall not exceed 50 mm.

Separate finishes

Certain slabs surfaces shall be finished with a separate concrete finish or floor covering.

Base slab surfaces shall be ground or filled until each surface is within the specified tolerances. Low areas shall be filled. High spots shall be ground slightly lower than required and then filled and smoothed to the proper elevation and surface.

Surfaces that receive epoxy set quarry tile and resilient tile shall be flat with a profile that shall not deviate more than 3 mm from a 3 m straightedge placed on any part of the surface. These surfaces shall be either trowel finished concrete at the elevation indicated on the drawings or a float finished surface set 3 mm low and levelled with trowel finished fill material.

Surfaces that receive a mortar set quarry tile, ceramic tile, or vitrified finish shall be given a smooth, tight, and uniform float finish with a profile tolerance of 6 mm as measured from a 3 m straightedge.

5.22 Formwork

Design and construction

For stability and type of formwork and support framing used, IS: 14687 is to be observed.

The formwork and the supporting structure are to be so dimensioned as to be able to withstand all vertical and horizontal forces safely.

Supporting structures shall be sufficiently rigid to maintain the forms in their correct position and to be true to shape and dimensions so that the final concrete is within the limits of the dimensional tolerances specified in section) "Dimensional Tolerances".

The Bidder shall submit in sufficient time in advance for the approval of the Owner/Consultant the calculations, designs and details of the methods adopted and materials proposed for the formwork.

Particular attention must be paid to the formwork supports and braces to avoid any slip when the concrete is poured.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[56]	25.09.2014

Materials for formwork

Forms shall be constructed from steel or from sound timber well seasoned and free from shakes. Plywood lining for forms shall be of timber, which is resin-bonded and water repellent.

Formwork surfaces in contact with concrete shall be free from adhering grout, projecting nails, splits or other defects.

Joints shall be sufficiently tight to prevent the leakage of cement grout. Connections shall be constructed to permit easy removal of the shuttering and shall be either nailed, screwed, bolted, or otherwise secured so as to be strong enough to retain the correct shape during consolidation of the concrete. Where a slope exceeds 1 V: 2 ½ H, formwork shall be provided for the top of the concrete faces and anchored to prevent flotation.

The details of fair-faced concrete facades have to be to the satisfaction of the Owner/Consultant. The concrete surface for facades has to be absolutely stainless and all efforts have to be taken to achieve this. All the proposed formwork shall be properly designed before its usage.

Grading of formwork and of finished concrete surfaces

Quality of formwork, materials to be used and treatments of surface are graded according to the finish of the concrete surface as given in IS: 14687.

The type and treatment of the formwork lining (plywood, metal, plastics, etc) should be appropriate to the grade of concrete finish required.

Preparation and inspection of formwork

Before concrete is placed, all formwork shall be inspected to see if it is built according to the approved plans and to see if it has been cleaned and is free from sawdust, shavings, dust, mud, earth or other contamination and properly oiled. Contact surfaces of panels shall be treated with a suitable release agent (e.g. non-staining mineral oil) where applicable. Surfaces, which are not oiled, shall be wetted thoroughly to prevent warping.

Erection and placing of formwork

All formwork shall be erected and placed in accordance with the construction drawings approved by the Owner/Consultant. Shuttering shall be true to line and braced and struttred to prevent deformation under weight and pressure of the wet concrete, live loads, wind and other forces. The deflections shall not exceed 3 mm.

The formwork for beams and slabs shall be erected so that the form on the sides of the beams and of the soffits of slabs can be removed without disturbing the beam soffit.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[57]	25.09.2014

If the formwork for columns is erected to the full height of the columns, one side shall be provided with openings for concreting in order to guarantee a proper compaction of the poured concrete.

Formwork for walls and elsewhere shall be arranged for a maximum concreting height of 2.5 m in a single pour. Wherever necessary, panel openings are to be provided in the forms for cleaning, inspection, access of vibrators, etc.

Before placing of concrete, bolts, ties and fixings shall be positioned and all devices used for forming openings, holes, pockets, chases, recesses, etc shall be fixed to the formwork carefully.

Panels shall be put together to ensure a perfect fit at the joint and fixed in both directions.

Where concrete surfaces will be exposed to view (permanently exposed surfaces) the formwork shall be such as to produce a completely true, smooth surface, free from perceptible irregularities or to show clearly the desired texture. Such formwork shall be marked on the drawings as "Fair-faced Formwork".

Where concrete surfaces are covered (non-exposed surfaces), the formwork shall be referred to and marked as "Sawn Formwork".

Internal spacers and ties, if any, shall be so arranged that after removing of the forms no holes shall extend through the concrete, in the case of watertight concrete or to be closed by plastic plugs and epoxy mortar in all other cases.

All formwork will be inspected and approved by the Owner/Consultant before concrete placing commences but this shall not relieve the Bidder of any of his responsibilities under the contract.

Striking of formwork

Formwork shall not be removed until the concrete has sufficient strength to carry its own weight plus any constructional or designed loads likely to be applied with a normal factor of safety. It shall be removed in such a manner that no shock or injury shall result to the concrete.

Before removal of the formwork, the concrete shall be examined and removal shall proceed only on the instructions and under the supervision of a competent person.

In accordance with IS: 456 clause 11.3.1, the striking period for cast in-situ concrete under certain conditions may be taken as follows: -

Table 2.8
Formwork

Type of Formwork	Minimum period before striking formwork
Vertical formwork to columns, walls, beams	16 to 24 hours
Soffit formwork to slabs (props to be refixed)	3 days

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[58]	25.09.2014

Type of Formwork	Minimum period before striking formwork
immediately after removal of formwork)	
Soffit formwork to beams (props to be refixed immediately after removal of formwork)	7 days
Props to slabs:	
1) Spanning upto 4.5 m	7 days
2) Spanning over 4.5 m	14 days
Props to beams and arches:	
1) Spanning upto 6 m	14 days
2) Spanning over 6 m	21 days

Special care is necessary in the case of components, which have to carry nearly the full-calculated load as soon as the formwork is struck.

Columns, piers and walls are to be struck before the beams and slabs supported by them. Scaffolds, formwork supports and self-supporting floor formwork are to be carefully lowered by releasing the devices.

Extreme care shall be taken to avoid chipping of corners during removal of formwork.

To keep deflections through creep and shrinkage to a small amount, auxiliary supports should be left in place or immediately repositioned after striking.

5.23 Water stoppers

Water stoppers shall be of PVC or equivalent and shall be eye-letted with a minimum 25 cm width. Type and manufacturer shall be submitted to the Owner/Consultant's approval.

All intersection pieces shall be prefabricated by the manufacturer and only welding of butt-joints in running lengths will be allowed to be carried out on the site.

The site welding of butt-joints shall be executed by using the manufacturer's purpose-made electrically heated jig and work shall be done by competent and trained personnel only. The manufacturer's instructions shall be carefully observed.

The wings of the water stoppers shall be formed with corrugations or bulbs to achieve a good bond. Moreover, the water stoppers shall conform to the following requirements:-

- The tensile strength not less than 10 N/sq.mm when tested.
- The ultimate elongation shall not be less than 22% when tested.
- The tear resistance shall not be less than 2 N/sq.mm when tested.
- The material shall not crack when tested.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[59]	25.09.2014

- Under accelerated elongation, the tensile strength shall not be less than 8 N/sq.mm and the ultimate elongation shall not be less than 200%.

The water stoppers shall be installed so that they are securely held in position during the placing of concrete, which shall be fully and properly compacted around the water stoppers to prevent voids or porous areas. Adequate clearance between the reinforcement and all the water stoppers shall be kept to permit proper compaction of concrete.

No holes or nailing shall be made through any water stopper for fixing purposes. Jointing by lapping two pieces of water stoppers shall not be permitted.

The free edges of water stoppers shall at all times be protected from direct sunlight.

5.24 Curing

Concrete shall be protected from loss of moisture for not less than 7 days after the concrete is placed and if required the concrete may be protected for few more days as per the design mix / approved methodology.

Trowelled surfaces except those that receive a separate finish or coating, shall be cured with a membrane curing compound. Float finished surfaces, except those that receive a separate finish, may be cured with either a membrane-curing compound or with water. Only water curing shall be used if the surface receives a separate finish.

Water curing

Water saturation of concrete surfaces shall begin as quickly as possible after initial set of the concrete. Water curing shall begin within 12 hours in dry weather and within 24 hours in damp weather. The rate of water application shall be regulated to provide complete surface coverage with a minimum of runoff. The application of water may be interrupted for surface rubbing. The concrete surface shall not be permitted to dry.

After the rubbing has been completed, rubbed surfaces shall be covered with burlap and kept saturated for the remainder of the curing period.

Membrane curing

Membrane curing compound shall be applied within 30 minutes after final finishing of the surface or as soon as possible after finishing without causing damage to the surface. Membrane curing compound shall be spray applied at coverage of not more than 7.4 sqm/litre. Membrane curing shall not be used on surfaces that shall be covered at a later date with mortar, concrete, damp proofing, tile, or any coating. Membrane curing shall not be used on cast-in-place concrete bases for field-erected tanks. Membrane curing will be permitted only after prior approval of the OWNER/CONSULTANT.

Floor sealer

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[60]	25.09.2014

All concrete floors shall be given two coats of clear floor sealer in addition to that applied as membrane curing compound. The first coat shall be applied at the end of the curing period before any traffic is permitted on the floor. The second coat shall be applied after the floor has been cleaned in preparation for the final inspection. Floor sealer shall be applied in strict accordance with the manufacturer's recommendations.

5.25 Waterproofing/Damp proofing

A waterproofing seal shall be provided for all below grade structures where applicable by external tanking with PVC sheets of 1.0 mm thickness with knobs for membrane type waterproofing. In addition, joints in deep underground structures shall be provided with structural waterproofing.

Damp-proof course 40 mm thick, consisting of cement concrete 1:2:4, with admixture of approved water-proofing compound shall be laid at plinth level for walls of all buildings for protection of super-structure against moisture and dampness.

5.26 Repair of damaged and defective concrete

Concrete after its final setting shall be inspected by the Owner/Consultant and any cracks, honeycomb areas, segregations, etc shall be marked. No repairs shall be carried out until directed by the Owner/Consultant.

Surface defects in formed concrete shall be repaired to the satisfaction of the Construction Manager within 24 hours. Concrete that is porous, honeycombed, or otherwise defective to a depth in excess of 25 mm shall be cut out and removed to sound concrete. Edges shall be square cut to avoid feathering. Cut surfaces shall be coated with epoxy bonding compound before the concrete is placed.

Defective concrete shall be replaced within 48 hours after the forms have been removed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[61]	25.09.2014

6 PRESSURE GROUTING

The work shall consist of drilling grout holes, exploratory holes and check holes, pressure testing, pressure washing, and injecting suspension grout under pressure, and shall include furnishing of all materials, labor, and equipment as described and specified.

6.1 Materials

a) Cement

Portland cement shall be ASTM C150 Type II or Type V, containing less than 0.6 percent alkali.

b) Aggregate

Aggregate shall be non reactive and shall be washed before use. When sources of aggregate are changed, test reports shall be provided for the material from the new source prior to commencing grout work. Fine aggregate shall be sand or crushed stone.

c) Admixtures

Admixtures shall be compatible with the grout and shall comply with the manufacturer's recommendations. Admixtures shall be added to the grout mix separately.

Water Reducing Retarder: Water reducing retarder shall comply with relevant Indian standard or as approved by Owner.

Lubricant: Lubricant additive for cement pressure grouting shall be Intrusion Prepakt Intrusion Aid, Sika Intraplast N, or as approved by Owner.

d) Water

Water for washing aggregate, for mixing and for curing shall be potable, shall not contain more than 1000 mg/l of chlorides as Cl, nor more than 1300 mg/l of sulfates as SO₄, and shall not contain impurities which may change the setting time by more than 25 percent or a reduction of more than 5 percent of the compressive strength of the grout at 14 days when compared to the results for grout made with distilled water.

e) Grout

Drypack Grout

Drypack grout shall be a mixture of approximately one part cement, 1.5 parts sand, water reducing retarder and sufficient water to make a stiff workable mix, branded Dry Pack or approved equal.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[62]	25.09.2014

Cement Grout

Cement grout shall be a mixture of one part cement, two parts sand proportioned by volume admixtures for pressure grouting and sufficient water to form a workable mix.

Nonshrink Grout:

- Non-shrink expansive flowable grout shall be used for under pinning work below base plate of columns. Non-shrink cum plasticiser admixture shall be added in the grout. For grouting of base of machine foundation high strength ready mixed non-shrink flowable grout shall be used.
- Type and grade of grouting for structural columns and equipment bases shall be as indicated. Crushing strength of the grout shall generally be one grade higher than the base concrete. Minimum grade of grout shall be M 30.
- Nominal thickness of grouting shall be at least 50 mm for building columns and pedestals of major equipment. For secondary posts, stair and ladder base, etc. grouting shall not be less than 25 mm thick.

Special grout, where specified on the drawings, shall be provided in strict accordance with the manufacturer's instructions/specifications. Pre-mixed Grout Conbextra GP-2 of 'FOSROC' make or equivalent of crushing strength 650 kg/cm² for major equipment foundations and Conbextra GP-1 or equivalent having crushing strength of 450 kg/cm² for other foundations where concrete grade M30 or higher is provided

- Forms and shims used to obtain adequate clearance shall not be removed and the anchor bolts shall not be tightened for at least three days after placing the grout. After the removal of forms and shims, area occupied by shims shall be filled and the area between the base and edge of the foundation shall be finished smooth to allow drainage away from the base. Attachment of interconnecting piping of machinery and complete load transfer of machinery shall not be done before the bolts are tightened. During this period, grouting work shall be properly cured using rags/gunny bags.

In view of extremely small proportion (about 0.01% by weight of cement) of the aluminium powder required, it is necessary to take all precautions to ensure thorough mixing. It is advisable to mix the blend of aluminium powder thoroughly with sand and cement before water is added because aluminium powder has a tendency to float on water.

- Proprietary material of approved manufacture used as an admixture to obtain non-shrinking grout shall be mixed in the proportion of 1:1:1 (1 cement: 1 admixture: 1 sand), or as per manufacturer's instructions.

Pre-mixed non-shrinking grout shall be used as per manufacturer's instructions and without any additional materials/admixtures such as cement, sand and aggregates etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[63]	25.09.2014

Epoxy Grout for Crack Repair and Dowel Anchorage

Except for applications involving pressure grouting or crack injection, epoxy shall be a high modulus, moisture insensitive, two components, 100 percent solids, thermosetting modified polyamid epoxy compound. The material shall equal which is capable of not sagging in horizontal or overhead anchoring applications.

Epoxy for applications involving pressure grouting or crack injection, shall be a high modulus, moisture insensitive, two components, injection grade, 100 percent solids blend of epoxy resin compounds. The material shall equal which is capable of achieving complete penetration of hairline and larger cracks.

Polymer Concrete for Resurfacing and Patching

Polymer concrete shall consist of a liquid binder and dry aggregate mixed together to make a flowable mortar. The liquid binder shall be a chemical and oil resistant, stress relieved, low modulus, moisture insensitive, two component epoxy resin compound. The binder material shall equal with a consistency similar to light weight oil for proper mixing with the aggregate. The aggregate shall be oven dry, kept in sealed packages until the time of mixing and be of size and consistency compatible with recommendations of the manufacturer of the liquid binder for the intended application.

Adhesive Resin for Dowel Anchorage:

Pneumatically operated caulk gun and automatically mixed at nozzle. Subject to compliance with one of the following: HIT RE500-SD Adhesive Anchoring System, Hilti, Inc. (ICC ESR-2322), HIT-HY 150 MAX-SD Adhesive Anchoring System, Hilti, Inc. (ICC ESR-3013), SET-XP Adhesive Anchoring Systems, Simpson Strong-Tie Co. (ICC ESR-2508).

6.2 Pressure Grouting Equipment

Pressure grouting equipment shall include a mixer and holdover agitator tanks designed to place grout at pressures up to 0.345N/mm² (50 psi). Gauges indicating grouting pressure shall be provided and the mixer shall be equipped with a meter capable of indicating to within 0.003 m³ the volume of grout placed.

6.3 Execution

Bonding compounds for use with grout is to be provided and installed per the manufacturer's recommendations.

a) Drypack Grout

Drypack grout is to be used for built-up surfaces, setting miscellaneous metal items and minor repairs.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[64]	25.09.2014

Surfaces required to be built-up with drypack grout are to be roughened by brushing, cleaned and coated with the bonding compound before application of grout. The grout is to be applied to the required thickness.

b) Cement Grout

Cement grout is to be used for filling nonbearing portions of equipment pads and pressure grouting.

Except for the specialized requirements for pressure grouting, grout is to be mixed and placed in the same manner as cast-in-place concrete. Grout is to be mixed for at least one minute and diluted grout is to be agitated until placed.

c) Non-shrink Grout

Nonshrink, nonmetallic aggregate grout is to be used under equipment, bearing plates and column base plates. Nonshrink, metallic aggregate grout is to be used under rotating equipment where high strength and fatigue are of concern, to grout anchor bolts and to grout reinforcing steel. Grout is to be placed and cured in accordance with the manufacturer's recommendations.

Holes required for grouting shall be blown clean with compressed air and are to be free of dust or standing water. Horizontal holes for grouting are to be drilled at a slight downward angle and with the inserted dowel or bolt bent to match.

d) Epoxy Grout

Epoxy grout shall be used for repairing cracks by pressure grouting or gravity, repairing structural concrete and may be used for setting dowels or bolts in holes. Concrete is to be primed in accordance with the grout manufacturer's recommendations.

The use of epoxy grout must comply with the following restrictions:

- Limited to areas where exposure, on an intermittent or continuous basis, to acid, chlorine gas or to machine or diesel oils, is extremely unlikely.
- Limited to applications where exposure to fire or to concrete temperatures above the product heat deflection temperature or 120 deg F (40 deg C)(whichever is less) is extremely unlikely. Overhead applications are not allowed.
- Holes for the anchors shall be drilled (not cored), shall be blown clean with compressed air and shall be free of dust or standing water.
- The anchor type, size and embedment depth shall be as shown on the drawings and the anchor must be installed in accordance with the manufacturer's recommendations.
- The anchor must not be loaded until after the full curing period has elapsed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[65]	25.09.2014

e) Pressure Grouting

Prior to grouting, cracks and holes to be grouted shall be washed clean. Washing is not required for grouting soil voids. Once started, grouting shall be continuous until completed. In case of a mechanical failure or other stoppage of the work, the grout equipment shall be washed out sufficiently to ensure that fresh only grout is pumped when the work is restarted.

After grouting is completed, the Contractor shall remove the grouting plant and all related parts, equipment, and supplies from the site, including unused materials and waste.

6.4 Field Quality Control

- The Testing Laboratory will Develop and utilize an effective method of field marking anchor and dowel test locations and results.
- Testing of grout mixes for conformance to manufacturer's specified strength: The independent testing laboratory shall take four test samples of each day's grout mix and test grout mix samples at 7 and 28 days. Test reports shall be submitted to the Owner for review.
- Test 25 % of reinforcing steel dowels installed with adhesive resin on a given day in tension using pullout procedure. Test to 80% of specified yield strength of the dowel with special inspection. Dowels specifically noted on the drawings as "No test required" do not require tension testing.
- If the failure rate of dowels exceeds 10 percent, testing will be increased to 100 percent of that day's installation of similar anchors or dowels. Testing will be reduced to 25 % of that day's installation when the failure rate is reduced to 10 percent or less. Failed dowels will be replaced at no additional cost to the Owner. The Contractor will produce daily reports of all testing activities; copies of daily reports will be submitted to the Owner in a timely manner.

6.5 Submittal

- Manufacturer's data shall be provided for bonding compounds, dry pack, non-shrink, pressure grout, retardants, epoxy grout, polymer concrete.
- Test reports, accompanied by a manufacturer's statement that previously tested material is of similar type, quality, and manufacture as that which is proposed for use on this projects, shall be submitted for Cement, Aggregates, Retardants, Bonding compounds and Epoxy resin
- The Contractor's testing laboratory shall provide evidence of correction of deficiencies noted in the inspection report before materials specified in this section are delivered to the job site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[66]	25.09.2014

7 RETROFITTING WORKS

7.1 General

- a) The Work shall, in general, conform to other works/items specified in this Specification.
 - If the specifications for any item are not available in in this Specification cited above, relevant BIS Specifications should be followed.
 - In case BIS Specifications are also not available, the decision of Engineer-in-Charge given in writing based on acceptable sound engineering practice and local usage shall be final and binding on the contractor.
- b) The work will be carried out in accordance with the architectural and structural drawings to be approved by Owner. The structural and architectural drawings shall have to be properly correlated before executing the work.
- c) For items where so desired, samples shall be prepared before starting the particular items of work for prior approval of the Owner and nothing extra shall be payable on this account.
- d) Materials brought at site of work shall not be used in the work before getting satisfactory Mandatory test results.
 - Equivalents for the various materials and the materials of approved make shall be got approved from the Owner in writing before using them on the work.
- e) The contractor shall submit the required documents regarding the genuineness of materials used such as manufacturer's certification that the firm has manufactured the supplied materials.
- f) The contractor shall get approved from the Owner the storage space for epoxy/polymer/patented/other manufacture of materials to ensure that the storage temperature is maintained between 5° C and 38° C unless recommended otherwise by the manufacturer.
- g) Contractor shall comply with manufacturer recommendations so as to comply with environmental conditions under which the repair materials may be applied.
- h) The contractor shall employ Principal Technical Representative & skilled site workers who shall have adequate qualifications and experience for the proper execution of such works and already performed works of this kind with success.
- i) Contractor shall advise all workers working with epoxies to avoid contact with eyes and skin, inhalation of vapours, and ingestion. Necessary protective and safety equipments in the form of hand gloves, welders' goggles, shall be provided by the contractor and used on site.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[67]	25.09.2014

- j) Care shall be taken to ensure that vibrations are well within acceptable limits for structural safety and users of the building.
- k) For the execution of protection and repair works, properly maintained plant and equipment permitting adequate treatment of the concrete substrate, proper execution of the work and determination of the required properties of the construction materials and construction measures must be present on the construction site.
- l) To ensure efficient and effective functioning, all plant and equipment must be checked on-site and at field material testing laboratory prior to first use and at appropriate intervals thereafter.

7.2 Chipping of Unsound/Weak Concrete Material

a) Purpose

To remove weak, loose or carbonated concrete over an area from its surface with pneumatically operated or power driven tools by chiselling, chipping etc.

b) Materials and T&P

Power or pneumatically driven chisel, chipping tools complete with accessories, hand-tools like chisels, hammer, pH indicator (0.2% phenolphthalein solution) with pH range at least up to 10.5 and clinical injection syringe.

c) Safety

Safety shall be ensured in accordance with contract conditions and specifications.

d) Procedure

Step-1: Prop and support to relieve the structural member of stress and strains.

Step-2: Scaffolding, if necessary for the exterior members, shall be done for working upon the area.

Step-3: Working Platforms for interior members, if necessary, shall be erected suitably or provided as mobile.

Step-4: Provide Protective Screen, if necessary.

Step-5: Mark off the area to be repaired using straight lines between corners. The marked area shall have 90° corners with the sides parallel or normal to the direction of the reinforcement. The marked boundaries for the repair area should be a minimum of 50 mm outside the perimeter of the spall. For a single spall, the repair area should have a minimum width of 100mm in any direction. If a number of spalls are closely located to each other, these spalls should be included in a single area marked for repair.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[68]	25.09.2014

Step-6: Cut shall be made along the marked boundary, normal-to-the surface. It should be made with a diamond cutter blade. However, when diamond cutting is not practical, the normal cut can be made with a power driven chisel. Minimum depth of cut shall be 10 mm. In situations where the diamond saw could cut into the reinforcing steel due to inadequate concrete cover, the boundary edge should be formed manually by means of chisel and impact hammers. A cover meter could be used to estimate the depth of cover.

Step-7: Chipping to remove all the unsound and weak concrete material shall be done carefully from the damaged portions of structural members by adopting mechanical or manual means up to the required depth to produce sound concrete surface to a near uniform depth for the repair area.

e) **Tolerance**

The chipping tolerances shall be ± 5 mm.

f) **Chiselling**

Hand Tools are typically applicable for concrete removal for smaller, moderate and areas of limited access. Removal should begin at the interior of the repair area and progress toward the boundaries, using suitable hammer. Power Driven Chisels/Hammers are normally applicable for chiselling smaller thicknesses up to about 50 mm. Pneumatic Hammers are normally applicable for chiselling larger thicknesses in excess of 50 mm Mechanical Milling (single drum, rotary cutter head with Tungsten-carbide bits) is applicable for large areas where the concrete cover is to be removed. Care must be taken to avoid contact with the reinforcing steel as both the reinforcement and the cutter drum could be damaged. Rounded And Feathered Edges should be hand cut to form normal-to-the-surface boundaries. All the edges and cavities shall be square shouldered.

Step-8: Test for carbonation shall be carried out at embedded or exposed reinforcement locations, by spraying phenolphthalein indicator on concrete in contact and in the immediate vicinity of reinforcement soon after its chipping. As otherwise, chipped concrete surface in contact with air is likely to get carbonated soon after its coming in contact with atmospheric carbon dioxide.

Step-9: A full-depth chiselling and removal of concrete all round reinforcement shall be carried out, in case the concrete in contact and in immediate vicinity of the reinforcement is carbonated.

Step-10: Inspection and soundness testing, after concrete removal & cleaning, for weaknesses and delamination of exposed surfaces shall be visually carried out. If required, additional removal will be done.

Step-11: Cleaning of debris and dust shall be carried out from within the chiselled/ chipped area and its disposal as per direction of the Engineer-in-Charge.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[69]	25.09.2014

7.3 Removing concrete all around reinforcement including from its behind

a) Purpose

To create an average clear air gap equal to nominal size of coarse aggregate plus 5 mm all around embedded reinforcement, in contact with carbonated concrete for rust removal & passivating its surface with fresh alkaline passivating coat and concrete/ mortar.

b) Materials and T&P

Power or pneumatically driven chiselling, abrading, chipping tools complete with accessories, hand-tools like chisels, hammer, pH indicator i.e. 0.2% solution of phenolphthalein indicator for pH range preferably up to 11.5 or at least up to 10.5, clinical injection syringe.

c) Safety

Safety shall be ensured in accordance with contract conditions and specifications.

d) Procedure

Step-1: Prop and support, if not done already, to relieve the structural member of stress and strains.

Step-2: Scaffolding & working platforms for the exterior members, if not already done and if necessary, shall be erected for working upon the area.

Step-3: Working Platforms for interior members, if not already done and if necessary, shall be erected suitably or provided as mobile.

Step-4: Provide Protective Screen, if not already done and if necessary.

Step-5: Test for carbonation shall be carried out at embedded or exposed reinforcement locations, by spraying phenolphthalein indicator on freshly chipped concrete in contact and in the immediate vicinity of reinforcement.

Step-6: A full-depth chiselling and removal of concrete all round reinforcement shall be carried out, if the concrete in contact and in immediate vicinity of the reinforcement is carbonated. The concrete around reinforcement shall be removed so as to have a near uniform air gap of about 5 mm plus the nominal size of coarse aggregate to be used in repair concrete/mortar. However, the air gap shall not be less than 15 mm in any case. Power/pneumatic driven tools/chisels shall be used for such portions of carbonated concrete around reinforcement, which could not be removed manually, to achieve a near uniform required air gap all around including behind the reinforcement. Power Driven Chisels/Hammers are normally applicable for chiselling smaller depths up to about 50 mm. Pneumatic Hammers are normally applicable for chiselling larger depth in excess of 50 mm.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[70]	25.09.2014

Step-7: Cleaning of debris and dust shall be carried out from within the chiselled /chipped area and its disposal as per direction of the Engineer-in-Charge.

7.4 Cleaning reinforcement of total rust including from behind reinforcement

a) Materials and T&P

Chiselling, abrading, chipping, hammering, wire brushes, paint brush, abrading cloth, etc hand tools complete with accessories, tested and approved chemical rust remover.

b) Safety

Safety shall be ensured in accordance with contract conditions and specifications.

c) Procedure

Step-1: Cleaning by manual method-

Remove the rust manually from all round the surface along the length of reinforcement, using hand tools like chisels, hammers, wire brushes, abrading cloth/paper, etc. This shall be continued manually along the length of the rusted reinforcement till such time that the steel surface is cleared of all rust that could be removed manually.

Step-2: Cleaning by chemicals –

Remove the Rust by using tested chemicals, if directed by Engineer-in-Charge, due to unsatisfactory results of manual rust removal. Chemical rust remover shall be brush applied over the reinforcement surface thoroughly all around the circumference and along the full length of rusted reinforcement. After 24 hours (or as prescribed by manufacturer) of its application, the surface shall be cleaned with wire brush and all loose particles removed. It shall be washed with water thoroughly and allowed to dry.

7.5 Cleaning Reinforcement and exposed concrete surface

a) Purpose

Clean the prepared concrete surface of all-loose, lightly sticking materials including the foreign materials, loose concrete, aggregates etc to provide a good bond with the applied repair material and clean the reinforcement surface of any minor rust remaining after manual and chemical cleaning to achieve shining bright metal.

b) Materials and T&P

Coarse sand conforming to Zone I or II as per IS: 383, Air compressor of a minimum 35 Kilowatt capacity, spray gun for sand, all related accessories for sand blasting, hand tools like wire brushes, chisels, etc

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[71]	25.09.2014

c) **Testing of Materials and T&P**

The sand shall be tested to conform to the specification.

The air compressor shall be tested to perform to the required standards as laid down in specifications of shotcreting.

d) **Safety**

Safety shall be ensured in accordance with contract conditions and specifications.

e) **Procedure**

Step-1: Specified tested coarse sand shall be collected at site in required quantity for sand blasting.

Step-2: Make available mechanical power driven air compressor in working condition at site with all required accessories for carrying out sand blasting as well as air blasting operations.

Step-3: Coarse sand shall be sprayed under pressure over the exposed surface so as remove all loose and foreign material and to cause an intense abrading of the reinforcement and removal of rust from entire surface of reinforcement to achieve shining bright surface. The sand blasted surface shall be subsequently cleaned with oil free air blast.

7.6 Providing drilling and inserting nipples along crack lines

a) **Purpose**

To fix injection nipples and seal the remaining portion of honey combed or cracked concrete /masonry for grout injection.

b) **Materials and T&P**

12 mm diameter approved PVC/aluminium /Galvanised Iron nipples, Chisel, hammer, power driven tool for chase cutting & drilling, hand operated blow out pump, sealing putty of polyester/epoxy/polymer modified mortar etc. and all related accessories and materials.

c) **Testing**

The sealing putty and the nipples shall be tested to conform to the manufacturers specifications. The power driven tools shall be test driven and their drill/cutting bits shall be tested for effectiveness before taking up the repair operation.

d) **Procedure**

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Personnel, Supervision, Product delivery, Storage and Handling etc.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[72]	25.09.2014

Step-2: Identify the Cracks and mark the area for injection grouting.

Step-3: Prop & support the structural member, if required, to relieve it of stress and strains.

Step-4: Open up cracked surface by making 'V' notch or groove of size 12 mm x 12mm.

Step-5: Remove plaster, if required, to identify and mark the honey combed area.

Step-6: Drill holes at least 25 mm diameter and 40mm deep along crack lines at spacing of 300 mm or thickness of the structural member, whichever is less. In honey combed area @ 9 nos per sqm. as directed by Engineer-in-Charge and up to 30 mm to 40 mm depth.

Step-7: Remove coarse debris and dust in opened up cracks and drilled holes by blowing oil free compressed air, if available with air compressor, otherwise with hand operated blow out pump. Concrete surfaces required to be grouted shall be free from all loose and unsound materials by means of mechanical abrasion using stiff wire brushes, after removing all loose areas with chisel and hammer. Area shall be made free from any deleterious materials, such as oil dust dirt etc. by means of oil free jet of compressed air. All prepared concrete surfaces shall be thoroughly inspected and got approved by the contractor.

Step-8: Insert 12mm dia specified injection nipples in holes drilled along crack lines and fix them by sealing only its sides with epoxy or polymer modified mortar.

Step-9: Seal the crack or the honey combed surface between the nipples by polymer modified mortar as may be approved by Engineer-in charge. The polymer used shall be of approved grade and applied as per specifications mentioned separately elsewhere. The polymer-modified mortar shall be moist cured for 1-3 days and allowed to gain strength before actual grouting commences.

7.7 Sealing of cracks by injection of advance grout

a) Purpose

To inject the specified grout into honeycombed or cracked concrete/masonry

b) Materials and T&P:

Cement, sand. Water and admixture for cementitious grout shall be as per clause 5 of this specification.

Polymer: It shall be as specified and shall conform to ASTM-C-1059.

Hand/power operated grouting pressure pump/gun with pressure gauge. The grouting equipment shall be capable of supplying, mixing, stirring and pumping grout to the satisfaction of the Owner. The equipment shall have

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[73]	25.09.2014

the capacity to inject grout at a pressure upto 7 kg per square centimeter measured at the grout connections. It shall be capable of mixing and pumping of cement sand grout 1:2 with water cement ratio ranging from 0.5 to 1.

Air compressor with all related accessories for carrying compressed air to the required location. Hand operated blow out pump may be allowed by Owner for small crack depths/areas.

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions), Mechanical blender for mixing, Spray equipment/brush for application of polymer modified/ bonding cement slurry

c) Execution:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured material (e.g. specified resin, hardener, polymer, cement, etc as may be required) shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the storage period shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3: If directed by Owner, collect random samples of materials for test and send to approved laboratories so as to ensure that they satisfy the physical and mechanical properties. The grout pump and the pressure gauge shall be tested before taking up the repair operation.

Step-4: Identify the Cracks and mark the area for injection grouting.

Step-5: Surface Preparation: The appropriate propping/supporting, surface preparation and crack sealing as per site requirements shall be completed, which may sequentially cover one or more of the following items of work:

- Prop & support the structural member to relieve it of stress and strains.
- Provide grouting nipples.

Step-6: Blow the compressed air followed by washing with water through nipples located at the highest level and downwards to ensure removal of even fine dust particles from the cracked surface, which could obstruct the free flow of grout material and impede its bonding with cracked surface (and drying with air blast wherever epoxy injection grout is to be used).

Step-7: Saturate the cracked surface in the vicinity of crack/honeycombed concrete/ masonry with water (but without excess water), only if the cementitious grout is to be injected. Otherwise, this step may be skipped.

Step-8: Prepare the injection grout as specified under clause 5 of this specification.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[74]	25.09.2014

Step-9: Inject the approved & specified grout into the cracks by means of suitable gun or pump at a pressure of 1- 2 kg./cm² for epoxy grout and 4-7 kg./cm² for cementitious grout. In case of vertical cracks injection shall be started at the lowest nipple and continued until the injected grout begins to flow out at the next higher nipple. Whereas in other cases of horizontal locations, the injection shall be started from one nipple and continued until the injected grout begins to flow out at the other nipple.

The first nipple shall then be closed off and injection continued at the second until the grout flows out at the third. The process shall be repeated until the whole of the crack has been sealed. As soon as the system is cured, the nipples shall be cut.

In case of Honeycombed Area, each grout hole shall be grouted individually. Grouting pressures to be used in the work will vary with the conditions encountered and different areas and the pressure used shall be between 1 to 4 kg/cm². The sequence of injection shall be as per the direction of Engineer-in-Charge.

7.8 Providing and inserting shear key bars

a) Purpose

Shear key bars are used for providing a structural connection of the applied repair material with the substrate/parent surface for transfer of forces occurring at the interface.

b) Materials and T&P:

Epoxy cartridges and specified lengths and diameter of steel reinforcement.

Standard Power driven drilling/hammering equipment, Hand operated blow out pump, brushes, epoxy dispenser, epoxy cartridge holder, disposable PVC mixing nozzle for epoxy, and any other incidental accessories and T&P items.

c) Procedure

Step 1: Mark the locations of shear keys and get the same approved for structural connection from the Owner.

Step 2: Drill holes to specified depth and diameter in concrete at marked locations for the specified dia of shear key bars.

Step 3: The drilled hole in dry state shall be cleaned with round brushes and by blowing air through a tube inserted in the hole and connected to hand operated blow out pump.

Step 4: Inject epoxy from the foil pack with the help of epoxy dispenser, epoxy cartridge holder and disposable PVC mixing nozzle inserted inside the drilled hole to fill it from bottom of the hole and upwards.

Step 5: Insert the reinforcing bar and allow the epoxy adhesive to cure.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[75]	25.09.2014

7.9 Reinforcement for RCC works etc.

a) Purpose

To provide reinforcement in repair concrete for structural purposes, controlling effects of thermal variation or holding shotcrete/gunite material in position. The reinforcement material may comprise specified grade and quality with or without zinc coating.

b) Material & T&P:

Specified reinforcing material, necessary hand or power driven tools for cutting, bending, binding, transportation, handling and placement etc. Reinforcement bars if used shall conform to I.S. 432 (Part-I) or I.S. 1786. Welded wire fabric where used shall conform to I.S. 1566.

c) Procedure

The general requirements, placing in position, measurement etc. shall be generally followed as in clause 4 of this specifications excepting those specifications provided in the following clauses.

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Testing of Material: The requisite number of test specimens of specified reinforcing material shall be collected from each batch of manufacture or supply received (whichever is less) for these to be tested for conformance to the specified requirements before use on the work.

Step-3: Execution:

The required reinforcement as per approved detailed drawings in the form of round bars or welded wire fabric in such a way so as to cause the least interference with placement of repair material.

d) Overlaps:

Lapped reinforcing bars shall not be tied together. They shall be separated by at least 50 mm wherever possible. Wire mesh shall be lapped by 1-1/2 squares in all direction. Minimum requirement of lap length of bars shall be as specified in I.S. 456.

e) Clearance around reinforcement:

Sufficient clearance shall be provided around the existing exposed and additional reinforcement to permit complete encasement with sound repair material.

f) Cover:

Minimum cover to reinforcement shall be as specified under clause 4 or as per I.S. 456. As far as possible the bars shall be arranged so as to permit shooting from opposite side.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[76]	25.09.2014

g) **Fixing:**

Reinforcement shall be fixed to existing shear key bars and depth gauges driven into the concrete with wires and secured rigidly so that the vibration resulting from the deposition of repair material shall not impair or displace them.

h) **Where Guniting /shotcrete to be done in more than one layer**

In such cases, the additional reinforcement should be so fixed that it is encased in succeeding layer. No additional reinforcement is required to be fixed in first layer of guniting.

Mesh reinforcement shall be fixed in the manner so that it is firmly held at least 12 mm away from the parent concrete surface as well as from the final finished surface. It shall be ensured that it is stiffened enough and cannot belly out during the guniting / jacketing / concrete overlays with consequent lack of cover. It shall be done by tying with parent concrete surface through shear key bars or depth gauges. GI-wire mesh fabric will add sacrificial "Zinc" coating & shall reduce corrosion process in the reinforcement. The wire mesh spacing shall be as specified in the drawings.

7.10 Alkaline Passivating bond coat over Reinforcement

a) **Purpose**

To protect steel reinforcement with a passivating alkaline layer provided all around its circumference along the length with strong adhesive to bond with applied repair concrete or mortar.

b) **Materials and T&P:**

Specified alkaline passivating & bonding materials e.g. CPCC material, epoxy, epoxy phenolic IPN-RB or specified polymer and cement, mixing water, necessary T&P for mixing and applying bond coat e.g. brush, mechanical mixer, mechanical stirrer, etc.

Epoxy Adhesives shall conform to ASTM C-882.

Polymer Latex shall conform to ASTM C-1059.

Cement shall be ordinary Portland cement conforming to IS: 269.

Patented materials e.g. CPCC or epoxy-phenolic IPN-RB as per licensee's specifications

c) **Execution:**

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured repair materials shall be received at site in factory sealed containers with labels legible and intact, if the shelf life

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[77]	25.09.2014

so permits. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3: Prepare the surface for treatment.

Step-4: Thoroughly inspect all the concrete surfaces prior to applications of passivating/ bond coat and get approved from the Engineer-in-Charge.

Step-5: Test the materials by taking random samples and testing in approved laboratories so as to check whether they satisfy the physical and mechanical properties.

Step-6: Make available at site all necessary mechanical equipment as under:

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions),

Mechanical blender for mixing

Brush for application of specified and approved passivating/bond coat.

Step-7: Material Mixing: Components of the passivating/ bond coat mix shall be weigh batched and mixed in specified proportions in a clear container free from harmful residue or foreign particles. The components shall be thoroughly blended with a mechanical mixer to a uniform and homogeneous mixture. Small batches (upto 1 litre) may however be allowed by manual mixing using spatulas, palette, knives etc.

Step-8: Material Application: The alkaline passivating & bonding material shall be applied to prepared reinforcement substrate after tying in new reinforcement wherever specified in the form of bars or welded wire fabric. It shall be applied to reinforcement surfaces by stiff nylon bristle brush. The coating material shall be worked well all round the periphery and along its exposed length using a stiff brush ensuring that no pinholes are remaining. The second coat, if required, the same shall be applied as per manufacturer's recommendation after the first coat is touch dry.

7.11 Bonding coat for hardened concrete with repair concrete/ cement mortar

a) Purpose

To provide adequately strong adhesion of parent concrete with applied repair concrete or mortar.

b) Materials and T&P

Specified bonding materials e.g. epoxy or polymer and cement, mixing water, necessary T&P for mixing and applying bond coat e.g. brush, spray gun, mixer, mechanical stirrer, etc.

Epoxy Adhesives shall conform to ASTM C-882

Polymer Latex shall conform to ASTM C-1059.

Cement shall be ordinary Portland cement conforming to IS: 269.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[78]	25.09.2014

c) Execution

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of manufactured repair materials shall be received at site in factory sealed containers with labels legible and intact, if the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer- in-Charge Full quantity shall be worked out as theoretically required for consumption in the whole work

Step-3: Prepare the surface for treatment.

Step-4: Saturate the surface with water but shall be free of excess surface water, debris and dust, where cementitious bond coat is to be applied. Otherwise, surface to remain dry and clean of debris and dust.

Step-5: Thoroughly inspect all the concrete surfaces prior to applications of adhesive and get approved from the Engineer-in-Charge.

Step-6: Test the materials by taking random samples and testing in approved laboratories so as to check whether they satisfy the physical and mechanical properties.

Step-7: Make available at site all necessary mechanical equipment as under:

Calibrated Spring Balance (for accurately weighing different components of materials in required proportions), Mechanical blender for mixing Spray equipment, brush for application of epoxy, polymer modified, bonding cement slurry.

Step-8 Bond Coat Mixing: Components of the bonding coat mix shall be weigh batched and mixed in specified proportions in a clear container free from harmful residue or foreign particles. The components shall be thoroughly blended with a mechanical mixer to a uniform and homogeneous mixture. Small batches (upto 1 litre) may however be allowed by manual mixing using spatulas, palette, knives etc.

Step-9 Bond coat application for jacket concrete/ shotcrete/ Mortar placement: The specified adhesive shall be applied to concrete surface at atmospheric temperatures below 40°C for epoxy adhesive and below 30°C for polymer modified cement or cement-sand slurry adhesive. Bonding coat shall be applied by spray equipment or stiff nylon bristle brush as approved by Engineer-in-Charge. The bonding material shall be worked well into the surface of the parent body ensuring that no pinholes are visible.

Polymer modified bonding cement slurry shall be applied to a thickness not in excess of 2 mm.

If necessary, a second coat shall be applied at right angles to the first to ensure complete coverage and absence of pin holes.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[79]	25.09.2014

All concrete surface shall be well protected beyond limits of surface receiving adhesive against spillage.

Step-10 Repair Material Application: Fresh plastic concrete/ shotcrete/ mortar shall be applied while adhesive is still tacky and well within the pot-life/ setting period. If adhesive cures to the extent of losing its tack or has set before plastic concrete/shotcrete/mortar is placed, the same shall be removed or slightly abraded and second coat of adhesive applied. Freshly placed plastic concrete shall be thoroughly consolidated to ensure full bonding of new concrete with the substrate.

d) **Bond of repair with parent concrete:**

Evaluate bonding of fresh concrete/ shotcrete/ mortar to existing concrete after the fresh material has cured for not less than 7 days by sounding and tapping fresh concrete with a blunt metal instrument to the satisfaction of Engineer-in-charge. Suspect inadequate bonding, if a hollow sound is detected in any area. In case of conflicted location contractor shall extract one core from the repaired surface area at the end of 28 days.

Conduct one core test at random for checking the bond, for every 100 square metre or part thereof. The contractor shall core each area after 28 days of application of concreting/ shotcreting/ repair mortar application for determination of bonding adequacy.

Core drilling shall be done through applied repair material and into the existing concrete. Core diameter shall be not less than three times the nominal size of the coarse aggregate used in repair material or as required by the Engineer-in-Charge. Length of cylindrical cores shall preferably be twice the core diameter or twice the thickness of applied repair material or as instructed by Engineer-in-Charge but in any case not less than the dia of the core.

Cores shall be visually inspected by Engineer-in-Charge for evidence of poor workmanship.

Cores shall be tested in tension to evaluate the quality of bond between new concrete/shotcrete/mortar and the parent concrete. If the failure is in the parent concrete the bond of new repair material shall be deemed to be satisfactory.

Failure at the bond line or in the repair material shall be concluded as lack of proper bond or inadequate strength of repair mortar

Dismantle such areas of work failed in bond or repair material and re-prepare the surface after chipping off new concrete/mortar work and abrading the epoxy/ polymer/cement slurry interface. Nothing for testing concrete for bond between old and new concrete shall be paid separately.

7.12 Curing of RCC Surfaces etc

a) **Purpose**

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[80]	25.09.2014

To ensure satisfactory hydration of cement by retaining or replenishing the mixing water lost due to natural drying and evaporation process for a specified period through exposed cementitious surfaces of the freshly placed cement mortar/ concrete.

b) General

Importance of wet curing to all items of work involving use of cement can not be over emphasised. Any surface experiencing discontinuity of dampness of surface with any patch having dried out during the specified period of curing, it shall be prominently marked with lime or other suitable prominent colour.

c) Materials and T&P:

Curing compound, brush or hand operated spraying gun and all other related accessories for application on Concrete/Plastered Surface.

d) Procedure:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of specified manufactured material shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out theoretically for consumption in the whole work.

Step-3

• **Moist Curing:**

Cover all exposed surface of concrete, when the concrete begins to harden i.e. two to three hours after compaction with moist gunny bags or any other material approved by the Owner.

Keep the exposed surfaces continuously damp after its final setting (i.e. after a maximum of 8 hours of concreting) by ponding with a sheet of water or by covering with a layer of sacks, canvass, hessian or similar water absorbent materials constantly kept wet by water sprinkling for at least 7 days, where ordinary portland cement is used and 10 days, where portland pozzolana cement is used from the date of placing of concrete. For concrete work with other types of cement, curing period shall be as per manufacturer's recommendations or as directed by the Owner.

• **Using Curing compound:**

Testing of Materials:

It must be ensured that curing compound should neither affect the strength nor the surface of concrete. It shall not leave any undesirable stains on

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[81]	25.09.2014

surface to affect the bond of plaster or other finishes to be applied later. It should be soluble in water, so that it can be removed by splashing or washing with water without scrubbing the surface.

Test for Efficacy:

The testing of curing compounds shall be done from each lot of curing compound received at site by casting two sets of 15 cm cubes with each set having 6 cubes. One set shall be moist cured by covering with damp gunny bags and subsequently by immersing under water and the other set by applying curing compound on top after 2 to 3 hours of casting and subsequently on de-moulding apply on the remaining faces all around. The cubes shall be kept in an environment similar to which the actual structure is exposed for a period of 7 days after its casting. Three concrete cubes each from both sets shall be tested after 7 days for their crushing strength as per standard test procedure. The average crushing strength of cubes cured with curing compound shall be not less than 95% of the crushing strength of cubes cured under damp or immersion curing.

Test for Staining:

The set of three sample cubes applied with curing compound, remaining after 7-day cube crushing strength test, shall be washed with water with soft brush scrubbing with nylon bristles and allowed to dry for a period of seven days in an atmosphere with relative humidity not exceeding 40% at ambient temperature. The other set of three cubes cured for seven days under damp or immersion conditions shall also be kept for another seven days under identical humidity and temperature conditions. The surface of the two sets of such cubes shall be compared by closely observing for any visible stain and texture that may detrimentally affect its bond with subsequently applied plain plaster or aesthetic appearance. Such observations shall be recorded in three categories as no effect, slight effect and moderate effect. The curing compound shall be considered as acceptable in the 'no effect' category and unacceptable in the 'moderate' category. The decision of Engineer-in-Charge, which shall be final and binding, based on the likely use of finished surface of concrete/plaster shall determine the acceptability of the 'slight effect' category.

Concrete curing compounds, after testing satisfactorily for efficacy, may be used in lieu of moist curing with the permission of the Engineer-in-Charge. Such compounds shall be applied to all exposed surfaces of the concrete by spraying or brushing within two to three hours of casting and well within an hour of removal of formwork.

7.13 Engineered Steel Tubular double Scaffolding System

Purpose

To provide a scaffolding system with adjustable working platforms on the exterior of the building for the workmen to work upon any part of the area to be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[82]	25.09.2014

accessed safely and with ease for surface preparation, application of repairs and construction activity.

Materials

The standard proprietary tubular double scaffolding system of repute with all accessories, working platforms etc.

Design

It shall be designed for all the incidental dead, live and wind loads as per IS: 875 in steel tubular sections as per general design considerations governed by IS:800. The design of the scaffolding system shall cater to the safety features for the workmen.

Fabrication and Erection

Fabrication and erection shall be done as per the design brief and installation instructions of the proprietary firm. It shall be maintained in functional condition for the work duration.

7.14 Temporary barricading using angle iron verticals and sheet panels

Purpose

To provide a barricading on ground to physically define the boundaries of the site of construction/repair activity for restricted entry of only those involved with the construction work.

Materials

Available Corrugated G.I. Sheet minimum 24 G thick; Framing structural material at least MS Angle iron of size [40x40x5mm] or equivalent.

Fabrication & Erection

Size of framing panel shall be decided depending upon site conditions and these could be approximately 2.0 metres long with height as 1.8 metre.

It shall be made up at least of two verticals, each with additional length of about 600 mm for fixing in to ground firmly and two horizontals equal to the length of panel.

It shall be made up by cutting the structural sections to size, shear punching holes in verticals and horizontals for nuts and bolts or making other suitable provision for receiving CGI sheet or other specified panelling material and connection of panel with adjoining panels.

Fabrication of frame of an individual panel shall be by welding at corners, welding MS plate at base of verticals or any other acceptable practice approved by Engineer-in-charge.

G. I sheet or other specified panelling material shall be suitably fixed. It shall preferably be done by means of nuts and bolts at its ends spaced at about 300

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[83]	25.09.2014

mm c/c transversely and at about 600 c/c longitudinally along corrugations. The corrugations of CGI sheet shall run along the shorter span of the panel.

In case of newly fabricated panels, these shall be painted with red oxide zinc chromate primer on steel work and approved primer on other material and at least one coat of paint of approved shade. In case of used panels, one coat of paint of approved shade shall be applied over the existing paint. The portion of verticals to be embedded in ground shall be suitably protected against rusting by painting it with bitumen or other suitable paint.

The fabricated panels shall be suitably fixed vertically and firmly in to the ground to the satisfaction of Engineer-in charge by maintaining a uniform height of about 1.8 metres above GL and connecting each panel with the adjoining panels with nut and bolts or other suitable means.

Suitable provision of frame/posts in the openings provided in barricading shall be made for receiving door shutter at locations as approved by Engineer-in-Charge.

7.15 Temporary protective fabric screens

Purpose

To protect passersby from falling debris and also to protect the workmen and structure being repaired against direct exposure to sun.

Materials:

For screening purpose jute cloth, woven PVC cloth, geo-textile or wire-mesh as specified and approved by Engineer-in-Charge shall be used, which shall conform to their relevant BIS Code. Screen materials shall be fixed by suitable means comprising of M.S.Flats/ J-bolts /nails/clamps, etc with washer or any other suitable means on frames of existing scaffolding etc.

Procedure

Scaffolding, if required, comprising of verticals, horizontals and diagonal bracings of steel tubes shall be fixed over ground which is payable separately.

One end of the screening material, brought to site in looms/rolls, shall be properly fixed over top horizontal member with suitable means and suspended so as to cover the required area.

The vertical fall of screen shall be suitably fixed/firmed up at intermediate levels so as to keep it in position during the work duration.

Next strip of the screening material shall be fixed with its sides stitched or suitably jointed or lapped with the previous ones as approved by Engineer-in-charge.

Spacing of frame member of scaffolding shall be so selected that the sagging of screen shall not hinder the repair process.

The contractor shall maintain the protective screens in acceptable conditions for the entire work duration as required by the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[84]	25.09.2014

8 CONCRETE RETROFITTING METHODS

In selecting the retrofitting method, the current status of the existing concrete structure as determined through inspection, the performance of the structure, the performance required of the structure after retrofitting, the conditions for retrofitting construction work, the ease of maintenance, economy and other factors shall be considered.

At the stage of selecting the retrofitting method, the current status of the existing structure and its performance shall be obtained, and the performance required for the structure after retrofitting and the conditions for retrofitting work shall be determined. Factors that should be considered in selecting the method include the effectiveness of the various retrofitting methods with respect to the required performance improvements, the viability of execution of the retrofitting work, the impact of the retrofitting work on the surrounding environment, the ease of maintenance after retrofitting, economy and other factors.

Various retrofitting methods listed below shall be used for retrofitting objective:

8.1 Retrofitting of concrete members

Continuous fiber reinforced plate bonding construction method:

Bonding continuous fiber reinforced plates to the surface of the existing structure to restore or improve load-carrying capacity

Continuous fiber reinforced plate jacketing construction method:

Jacketing with continuous fiber reinforced plates around the periphery of the existing structure to restore or improve load-carrying capacity and deformation characteristics

Prestressed concrete jacketing construction method:

Placing pre-stressing wires and pre-stressing stranded steel wires in place of lateral ties around the periphery of existing member sections and using mortar and concrete to bond them in order to reinforce the structure. To increase the restraining effect of the inner concrete, the pre-stressing steel is generally stressed during placement.

Pre-stressing introduction (internal cable) construction method:

Using internal cables for the existing concrete members to provide pre-stressing and restore or improve the load-carrying capacity of the members.

Repaving method:

Replacing some or all of the existing concrete members with new members through the use of precast members or concreting on site to restore or improve load-carrying capacity.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[85]	25.09.2014

8.2 Retrofitting as a structural body

Beam (girder) addition method:

Adding beams between the main girders of the existing reinforced concrete deck to reduce the deck span and restore or improve the load-carrying capacity of the reinforced concrete deck.

Seismic wall addition method:

Placing new reinforced concrete walls between existing reinforced concrete rigid-frame bridge piers and bonding them to form a continuous unit in order to restore or improve the load-carrying capacity as a structural body.

Support point addition method:

Supporting the intermediate sections of the beams and other existing concrete members with new members to reduce the span of the members in order to restore or improve the load-carrying capacity as a structure.

Seismic isolation method:

Using seismic isolation bearings and the like to reduce the seismic energy applied to the structure in order to improve its various performance values during an earthquake.

8.3 Foundation retrofitting

Underground wall (beam) addition method:

Connecting the foundations with cast-in-site diaphragm walls and underground connecting beams to distribute stress and ensure the stability of the entire system.

Pile/footing addition construction method:

When pile foundations are damaged or there is residual displacement, adding piles or footings to increase the load-carrying capacity of the foundation.

Foundation improvement method:

Improving the ground around the foundation with cement improvement materials to improve the ground bearing capacity and horizontal foundation resistance. Also prevents excessive pore water pressure and liquefaction.

Steel sheet-pile coffering construction method:

Placing sheet-piles around the periphery of the footings and bonding them to the footings to improve bearing capacity and horizontal resistance.

Foundation compacting method:

When insufficient foundation bearing capacity is a concern due to scouring or the like, using concrete or the like to compact the ground around the foundation in order to restore bearing capacity.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[86]	25.09.2014

8.4 Repair of cracks and missing sections

Cracks fill method:

Forcing low viscosity resin and ultra-fine cement into the cracks in existing concrete members to seal the cracks.

Fill method:

Filling cracks, rock pockets, cavities, peeling and other small-scale missing sections in existing concrete members with resin and mortar to repair sections.

Section repair method:

Removing deteriorated or damaged portions of existing concrete members and then restoring these members to their original sectional status using materials with excellent bonding to existing concrete.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[87]	25.09.2014

9 SHORING AND UNDERPINNING

9.1 Material and Equipment

- a) The contractor shall furnish all materials, tools, equipment, facilities and services as required for providing the necessary shoring and underpinning work and facilities. Jack and jacking equipment shall be more than adequate for the imposed loads and shall be provided with calibrated gauges.
- b) Shoring and bracing materials
Provide heavy timber posts, beams, planks, boards, pipe struts, pin piles, and accessories as required.
- c) Lagging and sheeting material
Provide heavy timber boards, planking or sheeting as required. Lagging board shall be secured in place by steel H-piles, with boards inserted between the H-flanges.
- d) Underpinning Pier
An excavation pit, provided generally by manual excavation, which is carried to a pre-selected bearing surface and then filled with concrete to provide supplementary foundation support for the underpinning structure.
- e) Concrete
Refer clause 4 of this specification for concrete requirements.
- f) Grout
Refer to Clause 5 of this specification for Non-Shrink Grout requirements.
- g) Structural Steel
Refer to Clause 9 of this specification for Structural steel requirements

9.2 Execution

- a) Detection of Movement
 - For each existing structure that may be affected by the work, install settlement markers on each footing, building corners, wall or surrounding improvements to be monitored. Settlement markers shall be capable of being read to an accuracy of 1.52mm.
 - Take and record readings not less than once per week during performance of the work until the permanent structures is complete to the ground level.
 - Stop work; notify the Engineer, and take immediate remedial action if movement of the existing structure occurs during performance of the work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[88]	25.09.2014

- Upon completion of the work, take weekly readings of the measurement points for a period of 4 weeks, or longer if movement persists, and report the results to the Engineer.
- The detection of movement shall be performed by a qualified licensed land surveyor or civil engineer.

9.3 Shoring and Underpinning

- Existing footings, foundations, pile caps, grade beams, retaining walls, or pavement which may be affected by excavation operations shall be shored or underpinned adequately or otherwise protected against settlement and shall be protected against lateral movement.
- Provide soldier piling, lagging and sheeting, tie-backs, slurry diaphragm wall, and cementitious grouting, as required, to hold back earth at excavations and as required to prevent cave-ins and earth sloughs.
- Footings, foundations, pile caps, grade beams, retaining walls, or pavements which have been undermined by earthwork and pile-driving operations shall be filled and supported with concrete extended to undisturbed bearing earth or bedrock.
- Concrete may be placed as a stiff mix of minimum slump (dry pack), or concrete may be pneumatically placed (shotcrete), or concrete may be placed by conventional methods with concrete formed to hold it in proper position.

9.4 Concrete Piers, Walls and Pile caps

- Install concrete underpinning piers, walls, and pile caps as indicated, with the bottom at the indicated or bearing elevation and the top approximately three inches below the structure to be underpinned. Dry pack the space within three days after concrete placement is completed.
- Where earth forms are indicated, install waterproof building paper or board between the earth and concrete to prevent water loss from the fresh concrete.
- Do not remove support of existing structure until concrete piers, walls, or pile caps have attained design strength.

9.5 Piles and Caissons

- Install pipe pile shells or drilled shafts at locations indicated, and extend from underside of existing footings to indicated elevations, plus additional penetration if required to develop the design working load of the pile or caisson.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[89]	25.09.2014

- Distribute jacking reactions over the existing structure in a manner that will not overstress or deflect the existing structure.
- Weld splices where indicated. Provide watertight welds capable of developing the full strength of the pile or caisson. Align splices to ensure the straightness of the pile from top to tip. Use outside sleeves and backup rings as necessary.
- Where the pile tip is below the ground-water table, maintain the elevation of the water inside the shell at approximately the elevation of the ground-water table during installation of the shell.
- After installation of the shell, apply the full design-working load to the empty pile shell and maintain until there is no measurable settlement over a one hour period.
- Maintain the excavation within the pile shell approximately 12 inches above the tip during driving, and dewater pile shells prior to filling with concrete in a manner which will prevent loss of earth or soil at the tip. An earth plug may be left in the pile tip or a concrete plug may be placed and cured prior to dewatering pile shells.
- After load testing to the design load, dewatering, and inspection of the shell by the Engineer, fill accepted pile shells with concrete in the presence of the Engineer. Keep an accurate record of the volume of concrete deposited in each pile. Deficiencies revealed by comparing the volume of the inside of the pile with the volume of placed concrete will be cause for rejection of the pile or correction of the deficiency.
- Securely wedge in place with steel wedges those piles that have satisfied the load-testing requirements. Weld and encase in concrete all wedges, plates, wedging struts and piles, as indicated or required.
- Following completion of load transfer of underpinned structures, fill the underpinning pits with concrete as indicated. Provide reinforcement, shear keys, dowels, and water stops as indicated or required. Place concrete to within 3 inches of the underside of the existing foundation. After three days, dry pack the space between the foundation and concrete.

9.6 Load testing of piles and acceptance criteria

- After the concrete within the pile or shaft has set for at least 24 hours, test each pile or pier by jacking to a load equal to 150 percent of the design-working load of the pile. Maintain the load until there is no measurable settlement of the pile over a one-hour period.
- Load-test piles in sequences and groupings that will minimize or eliminate eccentric loadings on the existing foundation and piles.
- Piles will be rejected and shall be retested if, in the opinion of the Engineer, there is a danger of unequal loading.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[90]	25.09.2014

- Should the existing structure fail to furnish sufficient reaction to installed underpinning piles to the test loads specified, provide additional reaction to prevent damage to, and movement of, the structure during installation of piles, and to obtain specified underpinning test loads. The additional reaction shall not detrimentally affect the structure.
- Maximum out-of-plumb tolerance for installed piles: two percent.
- Maximum offset of top of pile from the design center: 3 inches.

9.7 Fill and backfill

Provide engineered fill and backfill in accordance with Clause 3 of this specification, after acceptance of the underpinning by the Owner.

9.8 Temporary Supports

Install temporary supports where necessary to support structures to be underpinned and those that will be affected by underpinning and restoration work.

9.9 Restoration

Restore existing structures to conditions equivalent to those existing prior to the start of shoring and underpinning work, including repair of any settlement-related damage.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[91]	25.09.2014

10 STRUCTURAL STEEL WORK

Design of structural steel work shall include generally but not be limited to the steel constructions listed below:

- Steel building structure and open structures including beams, columns, bracings, supporting structures for floors, roof slabs, cladding etc.
- Hoist & monorail supporting beams etc.
- Platforms and walkways
- Ladders, staircases, handrails, etc.

10.1 Design

(a) General

Concrete floors shall be considered to provide continuous lateral support to the top (compression) flange of the support beams. However where large cut outs are to be provided in the floor slabs horizontal floor bracing shall be provided. Grating / Chequered plate floor shall neither be considered to provide lateral support to the top flange of supporting beams nor to provide a shear diaphragm. Adequate lateral support and horizontal bracing shall be provided as required in such cases.

Floors for vibrating machines of all kind together with supporting framework shall be adequately braced in both horizontal and vertical planes. Floors or structure supporting mechanical equipment shall be designed to minimize vibration, avoid resonance and maintain alignment and level.

(b) Design of structure

The Design of steel structures shall be done by Working stress or Limit state method, in accordance with the provisions of IS: 800 and other relevant IS codes as applicable to specific structures. Basic consideration for structural framing shall be stability, rigidity, building usage, ease of fabrication / erection and overall economy. Additional bracings / moment connections shall be used to assure stability of structures. Structure shall be designed such that the surfaces of all parts shall be accessible for inspection, cleaning, painting and maintenance. Most of steel superstructure shall be designed as simple space frame structures. Simple space frame design utilizes single-span beam systems, vertical diagonal bracing at main column lines and horizontal bracing at the roof and major floor levels.

Large span built-up girders shall be single web plate girders of welded construction with bearing and intermediate stiffeners. For lifting / monorails beams ISMB sections shall be preferred and the bottom flange of all beams shall be checked separately for distortion and reinforced suitably if required.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[92]	25.09.2014

Columns shall be designed to support the load combination which results in maximum interaction ratio. Exterior columns shall be designed to resist moments due to wind & seismic. Columns shall also be designed to resist moments caused by discontinuous vertical bracing or non-concentric bracing work points. Column base can be fixed or pinned. Lateral forces shall be resisted by rigid jointed moment connections in rigid frame design. For design which requires the use of the minimum column load (such as, uplift on anchor bolts, column axial tension, etc.) use 90 % of the column dead load and no live load. Uplift forces from vertical bracing and Wind uplift on the roof shall be included where applicable.

Permissible stresses for different members shall not be allowed to exceed by 33.33 % under wind and seismic conditions. However, members who shall be designed primarily to resist wind load such as bracing members, no increase in permissible stresses will be permitted. However, permissible stresses in bolts and welds shall be allowed to exceed up to 25 % only.

Base plates shall be placed on foundation pedestal with grouting. For large base plates necessary grout holes shall be provided. All anchor bolts for fastening steel columns on foundation shall be embedded in foundation during concreting itself. No anchor pockets in foundation shall be allowed. Design of base plates shall be based on design pressure on foundation which shall not exceed the following:

Pedestal in concrete grade M30 7.50 N/mm²

The total horizontal shear force at the base of column is transferred to the column pedestals through friction between the base plate and the grout. A coefficient of friction of 0.30 shall be used in conjunction with the minimum column load. If the horizontal shear force exceeds the frictional resistance force or if the column is subjected to a net uplift load, the total force shall then be transmitted through shear bars / shear keys welded to the base plate. Anchor bolts are not assumed to resist any horizontal shear force. Necessary recesses shall be kept in the foundation concrete for shear lugs.

Static analysis of overhead conveyor galleries upto a span of 24 m is allowed. However dynamic analysis shall be carried out for overhead conveyor galleries exceeding 24 m span.

For equipments, the bolt shall be either embedded or placed inside the pedestal and grouted with non-shrink grout.

The following criteria shall be followed for posting loads on the design drawings. For vertical beam reactions, the load shall be posted whenever the value exceeds the maximum allowable uniform distributed load. For axial loads in floor beams, the actual horizontal load which the beam end connection must resist shall be posted for each end of the beam. Note that this value may be different for opposite end of the same beam. For truss members, only one member force shall be noted for each member.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[93]	25.09.2014

(c) Permissible deflections

The permissible deflections of various steel members under normal loading conditions shall be as specified below. For calculation of deflections in structures and individual members dynamic effects shall not be considered, unless specified otherwise. Also, no increase in deflection limits shall be allowed when wind or seismic loads are acting concurrent with normal loading conditions.

- Vertical deflection**

a)	For beams supporting dynamic equipment	Span / 500
b)	For beams supporting floors / masonry	Span / 325
c)	For beams supporting pipes (pipe racks)	Span / 400
d)	For roofing and cladding components	Span / 250
e)	For gratings and chequered plates	Span / 200 subject to a maximum of 6 mm

For crane gantries or any member subjected to working loads, the maximum deflection under dead load and live load excluding impact shall not exceed the following values:

For manually operated cranes and monorails	: Span / 500
For electric overhead cranes	
i) Up to 50 t capacity	: Span / 750
ii) Over 50 t capacity	: Span / 1000

- Horizontal deflections**

The permissible horizontal deflections shall be as per following unless specified otherwise:

a)	Single storey building (without crane load)	Height / 325
b)	Multistoried building (without crane load)	Height / 500
c)	Pipe rack columns	Height / 200
d)	Open Structures	Height / 200
e)	Crane gantry girder due to surge	Span / 2000 limited to maximum of 15 mm
f)	Building main columns at crane rail due to action of crane surge load only	Height / 2500 limited to level maximum of 10 mm
g)	Open gantry columns at crane rail level due to action of crane surge load only	Height / 4000 limited to maximum of 10 mm

Provisions of IS: 800 and relevant latest IS Codes shall be followed for limiting deflections of structural elements not listed above.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[94]	25.09.2014

(d) Minimum thickness and size of steel elements

- Minimum Thickness**

The minimum thickness of various components of a structure and hot rolled sections shall be as follows. The minimum thickness of rolled shapes shall mean flange thickness regardless of web thickness. Structural steel members exposed to significantly corrosive environment shall be increased suitably in thickness or suitably protected otherwise as per good practice and sound engineering judgement in each instance.

Trusses, purlins, girts and bracing	6 mm
Columns and beams	8 mm
Gussets	8 mm
Stiffeners	8 mm
Base plate	10 mm
Chequered plates	6 mm o/p
Grating flats	5 mm

Minimum thickness of structural members other than gratings and chequered plate directly exposed to weather and inaccessible for painting and maintenance shall be 8 mm.

Chequered plate shall conform to IS: 3502 (latest) and minimum thickness of chequered plate for floorings, covers etc shall be 6 mm.

- Minimum Sizes**

The flange width of purlins supporting light weight concrete slab shall not be less than 65 mm and for those supporting roof sheeting and wall cladding it shall not be less than 50 mm. Width of steel rolled section connected to other member shall be at least 50 mm. The depth of beams for platform of all structures shall not be less than 125 mm.

(e) Slenderness and depth ratios

The slenderness ratio of main members in tension, compression or bending shall be in accordance with IS: 800.

The following limiting ratios of depth to span shall be considered as a general guide.

Truss	1 / 10
Rolled beams and girders for Ordinary floors and rafters	1 / 24
Supporting floor beams for vibrating Machines / equipments	1 / 15
Roof purlins and girts	1 / 45
Gable columns	1 / 30

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[95]	25.09.2014

(f) Design of Connections

Welding will be done in accordance with the recommendations of IS: 816 and IS: 9595.

Shear connections will be designed for 75 % of section strength for rolled sections and 80 % of section strength for built up section or rolled section with cover plates. Designed shear force shall be more than actual shear. Moment connections between beam and column will be designed for 100 % of moment capacity of the beam section.

All butt welds will be full penetration butt welds.

Size of fillet weld for flange to web connection for built up section will be as follows:

- i) Able to take full shear capacity or actual shear whichever is more for box section
- ii) Able to take 80 % of full shear capacity or actual shear (if indicated in drawings) or shall be 0.5 times of the web thickness whichever is more. For I-section Weld will be double fillet
- iii) All welds will be continuous. The minimum size of the fillet weld will be 6 mm as per relevant IS code

Connection of vertical bracings with connecting members will be designed for full tensile capacity of the bracings. The connection between top flange & web of built-up girder will be full penetration butt weld & for bottom flange, connection may be fillet weld.

Connection of base plate & gusset members with the columns will be done considering that total load gets transferred through weld.

Splicing

All splicing work will be full strength. Field splicing will be done with web / flange cover plates. For, exceptional cases the field splicing will be designed for 50 % of load carried by the cover plates and remaining 50 % load through full penetration butt weld. Shop splicing for all sections other than rolled will be carried out by full penetration butt welds with no cover plates. Splicing for all rolled sections will be carried out using web and flange cover plate. For design efficiency of site weld shall be considered as 80 %.

Insert plates

Insert plates shall be designed / checked for shear and bending moment. All lugs shall be checked for tension. Bond strength of concrete shall also be checked. Lugs using steel bars shall preferably be fillet welded to the plate to transfer full strength of the lug.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[96]	25.09.2014

10.2 Fabrication

(a) General

Fabrication drawings shall be prepared according to the provision of IS: 800, IS: 813, IS: 816, IS: 9595, IS: 1367 and IS: 9178.

The work to be provided by the Bidder, unless otherwise specified elsewhere in the contract, shall include, but not be limited to the following:

- i) Preparation of complete detailed fabrication drawings and erection marking drawings required for all the structures covered under the scope of the contract based on design drawings submitted by the Bidder and approved by the Owner/Consultant.
- ii) To submit revised design with calculations and detailed fabrication (drawings in case any substitution of the designed sections are to be made.
- iii) To submit design calculations for joints and connections developed by the Bidder along with detailed fabrication drawings.
- iv) Furnish all materials, labour, tools and plant and all consumables required for fabrication and supply, all necessary bolts, nuts, washers, tie rods and welding \ electrodes for field connections. The field connection materials supplied by the Bidder shall be to the extent of actual requirement plus 10 % (ten percent).
- v) Furnish shop painting of all fabricated steelwork as per requirements of this Specification.
- vi) Suitably mark, bundle and pack for transport all fabricated materials.
- vii) Prepare and furnish detailed Bill of Materials, Drawing Office Dispatch lists, Bolt List and any other list of bought out items required in connection with the fabrication and erection of the structural steelwork.

(b) Conformity with Design

Except where the standard connection details are furnished, the Bidder shall design all connections, supply and fabricate all steelwork and furnish all connection materials, Shear connectors / shear lugs on the beams in accordance with the approved drawings and / or as instructed by the Owner/Consultant Keeping in view the maximum utilization of the available sizes and sections of steel materials. The methods of painting, marking, packing and delivery of all fabricated materials shall be in accordance with the provisions of the contract and / or as approved by the Owner/Consultant. Provision of all relevant Indian Standard Specifications and Codes of Practice shall be followed unless otherwise specified in the contract.

(c) Quality control

The Bidder shall establish and maintain quality control procedures for different items of work and materials to the extent he deems necessary to ensure that all work shall be performed in accordance with this specification. In addition to the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[97]	25.09.2014

Bidder's quality control procedures, materials and workmanship at all times shall be subjected to inspection by the Owner/Consultant. As far as possible, all inspection by the Owner/Consultant shall be made at the Bidder's fabrication shop whether located at Site or elsewhere. The Bidder shall co-operate with the Owner/Consultant in permitting access for inspection to all places where work shall be done and in providing free of cost all necessary help in respect of tools and plants, instrument, labour and materials required to carry out the inspection. The inspection shall be so scheduled as to provide the minimum interruption to the work of the Bidder.

Materials or workmanship not in reasonable conformance with the provisions of this Specification may be rejected at any time during the progress of the work.

The quality control procedure shall cover but not be limited to the following items of work

- a) Steel Quality, manufacturer's test certificates, test reports of representative samples of materials from unidentified stocks if permitted to be used.
- b) Bolts, Nuts Manufacturer's certificate, dimension & Washers checks, material testing.
- c) Electrodes Manufacturer's certificate, thickness and quality of flux coating.
- d) Welders .Qualifying Tests
- e) Welding sets Performance Tests
- f) Welds Inspection, X-ray, Ultrasonic tests
- g) Paints Manufacturer's certificate, physical Inspection reports
- h) Galvanizing Tests in accordance with IS: 2633 and IS: 4759.

(d) Materials

If desired by the Owner/Consultant, Test Certificates of materials supplied by the Bidder in respect of each consignment shall be submitted in triplicate. Whenever the materials are required to be used from unidentified stocks, if permitted by the Owner/Consultant, a random sample shall be tested at an approved laboratory from each lot of 50 tonnes or less of any particular section.

Materials for main and secondary members shall be selected in line with good engineering practice and shall be arranged within any structure with due regard for maintenance of the structure and Plant and Equipment supported or sheltered by the Structure and also with regard to corrosion.

All steel materials shall be free from all imperfections, mill scales, slag intrusions, laminations, pitting, rusts, etc. that may impair their strength, durability and appearance.

All rolled steel shall conform to the requirements of the Indian Standards.

- i) Structural Steel will conform to IS: 2062 Grade-A for rolled steel members or plates up to 20 mm thickness.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[98]	25.09.2014

- ii) For plates above 20 mm thickness and welded construction, steel conforming to IS: 2062 Grade-B will be used.

(e) Workmanship

All workmanship shall be equal to the best practice in modern structural shops, and shall conform to the provisions of IS: 800 and other relevant Indian Standards or equivalent.

Straightening Material

Rolled materials before being laid off or worked, must be clean, free from sharp kinks, bends or twists and straight within the tolerances allowed as per IS:1852. If straightening is necessary, it may be done by mechanical means or by the application of a limited amount of localized heat. The temperature of heated areas, as measured by approved methods, shall not exceed 600°C.

Cutting

Cutting shall be affected by shearing, cropping or sawing. Use of a mechanically controlled gas cutting torch may be permitted for mild steel only. Gas cutting of high tensile steel may also be permitted provided special care is taken to leave sufficient metal to be removed by machining, so that all metal that has been hardened by flame is removed. Gas cutting without a mechanically controlled torch may be permitted if special care is taken and done under expert hand, subject to the approval of the Owner/Consultant.

To determine the effective size of members cut by gas, 3 mm shall be deducted from each cut edge. Gas cut edges, which will be subjected to substantial stress or which are to have weld metal deposited on them, shall be reasonably free from gouges. Occasional notches or gauges not more than 4 mm deep will be permitted. Gouges greater than 4 mm that remain from cutting shall be removed by grinding. All re-entrant corners shall be shaped notch-free to a radius of at least 12 mm. Shearing, cropping and gas cutting shall be clean, reasonably square and free from any distortion.

Planning of Edges

Planning or finishing of sheared or cropped edges of plates or shapes or of edges gas-cut with a mechanically controlled torch shall not be required, unless specifically required by design and called for on the drawings, included in a stipulation for edge preparation for welding or as may be required after the inspection of the cut surface. Surface cut with hand-flame shall generally be ground, unless specifically instructed otherwise by the Owner/Consultant.

Clearances

The erection clearance for cleated ends of members connecting steel to steel shall preferably be not greater than 2 mm at each end. The erection clearance at ends of beams without web cleats shall be not more than 3 mm at each end,

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[99]	25.09.2014

but where, for practical reasons, greater clearance is necessary, suitably designed cleatings shall be provided.

Bolted construction

All bolts and nuts shall conform to the requirements of IS: 1367.

Field connections shall preferably be bolted connections unless specified otherwise. Weld connections at site shall be avoided.

High strength friction grip bolts shall be of property class 8.8 and shall conform to IS: 3757 and shall not be less than 20 mm in diameter unless designated otherwise. High strength bolts shall be installed as bearing type joint except where loads are reversible. Bearing Type connection (H.T. bolts Grade 8.8) shall be used for all removable type connections. Bolts will be tightened to develop the required pre-tension during their installation.

All erection bolts shall be of minimum 16 mm diameter of property class 4.6 conforming to IS: 1367 unless specified otherwise.

Holes for bolts shall not be more than 1.5 mm for bolt of diameter equal or lesser than 25 mm and shall not be more than 2 mm for bolt of diameter greater than 25 mm.

Holes through more than one thickness of material for members, such as compound stanchions and girder flanges, shall be drilled after the members are assembled and tightly clamped or bolted together. Punching may be permitted before assembly, if the thickness of the material is not greater than the nominal diameter of bolt plus 3 mm subject to a maximum thickness of 16 mm provided that the holes are punched 3 mm less in diameter than the required size and reamed after assembly to the full diameter.

Holes for turned and fitted bolts shall be drilled to a diameter equal to the nominal diameter of the shank or barrel subject to a tolerance grade of H8 as specified in IS: 919. Parts to be connected shall be firmly held together by tacking welds or clamps and the holes drilled through all the thicknesses in one operation and subsequently reamed to size. Holes not drilled through all thickness in one operation shall be drilled to a smaller size and reamed out after assembly.

Holes for bolts shall not be formed by gas cutting process.

Assembly

Drifting to enlarge un-matching holes shall not generally be permitted. In case drifting is permitted to a slight extent during assembly, it shall not distort the metal or enlarge the holes. Holes that must be enlarged to admit the bolts shall be reamed. Poor matching of holes shall be cause for rejection. The component parts shall be so assembled that they are neither twisted nor damaged and shall be so prepared that the specified cambers, if any, are maintained.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[100]	25.09.2014

Bolted construction shall be permitted only in case of field connections if called for on the Drawings and is subjected to the limitation of particular connections as may be specified. In special cases, however, shop bolt connections may be allowed if directed by the Owner/Consultant.

Washers shall be tapered or otherwise suitably shaped, where necessary, to give the heads and nuts of bolts a satisfactory bearing. The threaded portion of each bolt shall project out through the nut at least one thread. In all cases the bolt shall be provided with a washer of sufficient thickness under the nut to avoid any threaded portion of the bolt being within the thickness of the parts bolted together. In addition to the normal washer, one spring washer or locknut shall be provided for each bolt for connections subjected to vibrating forces or otherwise as may be specified on the Drawings.

Welded Construction

Welding shall be in accordance with relevant Indian Standards. Welding shall be done by experienced and good welders who have been qualified by tests in accordance with IS: 817. All shop connections shall be welded type.

Preparation of Material

Surface to be welded shall be free from loose scale, slag, rust, grease, paint and any other foreign material except that mill scale which withstands vigorous wire brushing may remain. Joint surfaces shall be free from fins and tears, Preparation of edges by gas-cutting shall, wherever practicable, be done by a mechanically guided torch.

Parts to be fillet welded shall be brought in as close contact as practicable and in no event shall be separated by more than 4 mm. If the separation is 1.5 mm or greater, the size of the fillet welds shall be increased by the amount of the separation. The fit of joints at contact surfaces which are not completely sealed by welds, shall be close enough to exclude water after painting. Abutting parts to be butt-welded shall be carefully aligned. Misalignments greater than 3 mm shall be corrected and in making the correction the parts shall not be drawn into a sharper slope than 20C.

The work shall be positioned for flat welding whenever practicable.

In assembling and joining parts of a structure or of built-up members, the procedure and sequence of welding shall be such as will avoid needless distortion and minimize shrinkage stresses. Where it is impossible to avoid high residual stresses in the closing welds of a rigid assembly, such closing welds shall be made in compression elements.

In the fabrication of cover-plated beams and built-up members, all shop splices in each component part shall be made before such component part is welded to other parts of the member. Long girders or girder sections may be made by shop splicing not more than three sub-sections, each made in accordance with this paragraph.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[101]	25.09.2014

When required by the Owner/Consultant, welded assemblies shall be stress relieved by heat treating in accordance with the provisions of the relevant Indian Standard or any other Standard approved by the Owner/Consultant.

All complete penetration groove welds made by manual welding, except when produced with the aid of backing material not more than 8 mm thick with root opening not less than one-half the thickness of the thinner part joined, shall have the root of the initial layer gouged out on the back side before welding shall be started from that side, and shall be so welded as to secure sound metal and complete fusion throughout the entire cross-section. Groove welds made with the use of the backing of the same material as the base metal shall have the weld metal thoroughly fused with the backing material. Backing strips need not be removed. If required, they may be removed by gouging or gas cutting after welding is completed, provided no injury is done to the base metal and weld metal and the weld metal surface is left flush or slightly convex with full throat thickness.

Groove welds shall be terminated at the ends of a joint in a manner that will ensure their soundness. Where possible, this should be done by use of extension bars or run-off plates. Extension bars or run-off plates need not be removed upon completion of the weld unless otherwise specified elsewhere in the Contract.

To get the best and consistent quality of welding, automatic submerged arc process shall be preferred. The technique of welding employed, the appearance and quality of welds made, and the methods of correcting defective work shall all conform to the relevant Indian Standards.

No welding shall normally be done on parent material at a temperature below (-) 50C. However, if welding is to be undertaken at low temperature, adequate precautions as recommended in relevant Indian Standard shall be taken. When the parent material is less than 40 mm thick and the temperature is between (-) 50C and 00C, the surface around the joint to a distance of 100 mm or 4 times the thickness of the material, whichever is greater, shall be preheated till it is hand warm. When the parent material is more than 40 mm thick, the temperature of the area mentioned above shall be in no case be less than 200C. All requirements regarding preheating of the parent material shall be in accordance with the relevant Indian Standard.

Submerged arc welding process shall be used for welding longitudinal fillet welds (connecting flanges with web) and longitudinal / transverse butt joints for fabrication of columns, framing beams and all other built up members unless manual arc welding is specifically required. All electrodes, flux, bare wire etc will be procured from approved manufacturers. All butt welds in beams, girders & columns will be of full penetration. All butt welds will be radio-graphically or ultrasonically tested as per relevant IS codes and standard practice. The base wire electrodes for submerged arc welding will conform to IS: 7280. The combination of wire and flux will satisfy requirements of IS: 3613.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[102]	25.09.2014

Peening

Where required, intermediate layers of multiple-layer welds may be peened with light blows from a power hammer, using a round-nose tool. Peening shall be done after the weld has cooled to a temperature warm to the hand. Care shall be exercised to prevent scaling or flaking of weld and base metal from over peening.

Equipment

These shall be capable of producing proper current so that the operator may produce satisfactory welds. The welding machine shall be of a type and capacity as recommended by the manufacturers of electrodes or as may be approved by the Owner/Consultant.

Finish

Column splices and butt joints of compression members depending on contact for stress transmission shall be accurately machined and close-buttressed over the whole section with a clearance not exceeding 0.2 mm locally at any place. In column caps and bases, the ends of shafts together with the attached gussets, angles, channels etc., after welding together, should be accurately machined so that the parts connected butt over the entire surfaces of contact. Care should be taken that those connecting angles or channels are fixed with such accuracy that they are not reduced in thickness by machining by more than 2 mm.

Slab bases and caps

Bases and caps fabricated out of steel slabs, except when cut from material with true surface, shall be accurately machined over the bearing surface and shall be in effective contact with the end of the stanchion. A bearing face which is to be grouted direct to a foundation need not be machined if such face is true and parallel to the upper face.

Miscellaneous

- Lacing bars

The ends of lacing bars shall be neat and free from burrs.

- Separators

Rolled section or built-up steel separators or diaphragms shall be required for all double beams except where encased in concrete, in which case, pipe separators shall be used.

- Bearing Plates

Provision shall be made for all necessary steel bearing plates to take up reaction of beams and columns and the required stiffeners and gussets whether or not specified in Drawings.

- Architectural Clearances

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[103]	25.09.2014

Bearing plates and stiffener connections shall not be permitted to encroach on the designed architectural clearances.

- Shop Connections
 - i) All shop connections shall be welded as specified on the Drawings.
 - ii) Certain connections, specified to be shop connections, may be changed to field connections if desired by the Owner/Consultant for convenience of erection and the Bidder will have to make the desired changes at no extra cost to the Owner.
- Shop Erection

The steelwork shall be temporarily shop-erected complete or as directed by the Owner/Consultant so that accuracy of fit may be checked before despatch. The parts shall be shop-erected with a sufficient number of parallel drifts to bring and keep the parts in place. In case of parts drilled or punched using steel jigs to make all similar parts interchangeable, the steelwork shall be shop erected in such a way as will facilitate the check of interchange ability.

(f) Shop Painting

All fabricated steel material, except those galvanized or to be embedded in concrete, shall receive paint coatings as specified below. All paints shall be of approved brand and shade as per the Owner's requirement.

Steel surface, which is to paint, shall thoroughly be cleaned of all loose mill scale, rust, grease, dirt and other foreign matter by wire brush & if required by sand blasting prior to actual surface preparation. The surface shall be cleaned to grade ST-2.5 as per SIS05-5900 or as per IS: 1477 (Part -I).

All steel structures shall receive two primer coats and two finish coats of painting. After fabrication the first coat of primer shall be immediately given over the prepared steel surface. The second coat of primer shall be applied over the dried first primer coat. Two finish coats shall be applied over the primer coats before dispatch of structure at site.

Primer paint shall be red oxide zinc chromate conforming to IS: 2074. Dry film thickness of each coat shall be 50 microns. Adequate care should be taken such that the surface does not possess a slick finish to which paint may not adhere properly. Top coat shall consist of two coats of HB Synthetic enamel of approved shade and colour with glossy finish and DFT as 75 microns (total). Thus the total DFT of painting including that of primer coats shall not be less than 175 microns.

Following care shall be taken while painting:

- i) Joints to be site welded shall have no paint applied within 100 mm of welding zone. Similarly where friction grip fasteners are to be used no painting shall be provided. On completion of the joint the surfaces shall receive the paint as specified.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[104]	25.09.2014

- ii) Surfaces inaccessible after assembly shall receive two coats of primer prior to assembling.
- iii) Surfaces inaccessible after erection, including top surfaces of floor beams supporting gratings or chequered plate, shall receive one additional coat of finish paint over and above number of coats specified above before erection.
- iv) Portion of steel member embedded / to be encased in concrete shall not be painted.
- v) Areas / Surfaces subjected to chemical attacks shall be painted with acid resistant paint.
- vi) Machine finished surfaces shall be protected against corrosion by a rust inhibiting coating that can be easily removed prior to erection or which has characteristics that make removal unnecessary prior to erection.

(g) Inspection, testing and acceptance criteria

Unless specified otherwise, inspection to all work shall be made by the Owner/Consultant at the place of manufacture prior to delivery. The Owner / Consultant shall have free access at all reasonable times to those parts of the manufacturer's works which are concerned with the fabrication of the steelwork under this Contract and he shall be afforded all reasonable facilities for satisfying himself that the fabrication is being done in accordance with the provisions of this Specification. The Bidder shall provide free of charge, such labour, materials, electricity, fuel, water, stores, tools and plant, apparatus and instruments as may be required by the Owner/Consultant to carry out inspection and / or tests in accordance with the Contract.

The Bidder shall guarantee compliance with the provisions of this Specification.

The Bidder shall carry out sampling and testing in accordance with the relevant Indian Standards and as supplemented herein for the following items at his own cost, unless otherwise specified in the Contract. The Bidder shall get the specimens tested in a laboratory approved by the Owner/Consultant and submit to the Owner/Consultant the test results in triplicate within 3 (three) days after completion of the test.

Steel

All steel supplied by the Bidder shall conform to the relevant Indian Standards, except otherwise mentioned in the Contract, only tested quality steel having mill test reports shall be used. In case unidentified steel materials are permitted to be used by the Owner/Consultant, random samples of materials will be taken from each unidentified lot of 50 ton or less of any particular section for tests to conform to relevant Indian Standards. Cost of all tests shall be borne by the Bidder.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[105]	25.09.2014

All material shall be free from all imperfections like mill scales, slag intrusions, laminations, pittings, rusts etc. that may impair their strength, durability and appearance.

All raw steel plate of thickness more than 20 mm supplied by the Bidder shall be checked against lamination before procurement & prior to commencement of fabrication work in the following ways as directed by the Owner/Consultant:

- i) Ultrasonic testing along the edge of specified points of the plates shall be carried out to delete lamination in the plates, if any.
- ii) If the results of the tests in (i) are not satisfactory, the whole area of the plates shall be checked by ultrasonic testing at specified nodal points formed at equidistant grid locations. The spacing of the grids shall be determined from tests in (i) or as directed by the Owner/Consultant.

If the results of the above tests are not satisfactory, the plates shall not be taken up for fabrication work. Even after fabrication at shop, if the Owner/Consultant requires any ultrasonic testing to detect lamination of plates, the same shall be carried out by the Bidder. If the plates in the fabricated item are found to be laminated, the component will be rejected.

Welding

All electrodes shall be procured from reliable manufacturers with test certificates. The correct grade and size of electrode which has not deteriorated in storage shall be used. The inspection and testing of welding shall be performed in accordance with the provisions of the relevant Indian Standards or other equivalents. For every 50 tonnes of welded fabrication, the Owner may ask for at least one test-destructive or non-destructive including X-ray, ultrasonic test or similar, the cost of which shall be borne by the Bidder. In the event of further tests as may be desired by the Owner. The cost of such test shall be borne by the Bidder if the results are found to be unsatisfactory; and if the test shows no defect, the cost shall be borne by the Owner. In cases of the test results showing deficiency, the Owner / Consultant shall have option to reject or instruct any remedial measures to be taken free of charge to the Owner.

Bolts, nuts and washers

All bolts, nuts and washers shall be procured from reputed manufacturer approved by the Owner/Consultant and shall conform to the relevant Indian Standards. If desired by the Owner/Consultant, representative samples of these materials may have

- i) Name of the Bidder
- ii) Number and date of the Contract
- iii) Name of the office placing the contract

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[106]	25.09.2014

- iv) Nomenclature of stores
- v) A schedule of parts or pieces, giving the parts or piece number with
- vi) Tolerance

The tolerance on the dimension of the individual rolled steel components shall be as specified in IS: 1852. The tolerances on straightness, length etc. of various fabricated components (such as beams, girders, columns, etc) of the steel structures (other than steel railway and road bridges structure) subjected to dynamic loading (like wind, seismic etc.) and thin walled constructions (like box girders) shall be as specified in IS: 7215.

10.3 Erection

(a) General

The work to be provided for by the Bidder, unless otherwise specified in the Bid, shall include but not be limited to the following:

- i) The Bidder shall provide all transport equipment, lifting equipment, tools, tackle, consumables, materials, labour and supervision required for the erection of the structural steelwork.
- ii) Receiving, unloading, checking and moving to storage yard at Site including prompt attendance to all insurance matters as necessary for all fabricated steel materials arriving at Site. The Bidder shall pay all demurrage and / or wharfage charges etc. on account of default on his part.
- iii) Transportation of all fabricated structural steel materials from Site storage yard, handling, rigging, assembling, bolting, welding and satisfactory installation of all fabricated structural steel materials in proper location according to approved erection drawings and / or as directed by the Owner/Consultant. If necessary, suitable temporary approach roads to be built for transportation of fabricated steel structures.
- iv) Checking centre lines, levels of all foundation blocks including checking line, level, position and plumb of all bolts and pockets. Any defect observed in the foundation shall be brought to the notice of the Owner/Consultant. The Bidder shall fully satisfy himself regarding the correctness of the foundations before installing the fabricated steel structures on the foundation blocks.
- v) Aligning, plumbing, levelling, bolting, welding and securely fixing the fabricated steel structures in accordance with the Drawings or as directed by the Owner/Consultant.
- vi) Touch up paintings, making good any damaged shop painting and completing any unfinished portion of the shop coat shall be carried out by the Bidder free of cost to the Owner.
- vii) All minor modifications of the fabricated steel structures as directed by the Owner/Consultant including but not limited to the following:

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[107]	25.09.2014

- Removal of bends, kinks, twists etc. for parts damaged during transport and handling.
- Cutting, chipping, filling, grinding etc. if required for preparation and finishing of site connections.
- Reaming of holes for use of higher size bolt if required.
- Welding of connections in place of bolting for which holes are either not drilled at all or wrongly drilled during fabrication. Welding in place of bolting will be permitted only at the discretion of the Owner/Consultant.
- Re-fabrication of parts damaged beyond repair during transport and handling or re-fabrication of parts which are incorrectly fabricated.
- Fabrication of parts omitted during fabrication by error, or subsequently found necessary.
- Drilling of holes which are either not drilled at all or are drilled in incorrect location during fabrication.
- Carry out tests in accordance with this Specification if directed.

(b) Conformity with design

The Bidder will erect the entire fabricated steel structure, align all the members, complete all field connections and grout the foundations all as per the provisions of this specification and the design criteria detailed in the approved erection drawings and / or other stated document. All work shall conform to the provisions of the relevant Indian Standard Specifications and / or the instructions of the Owner/Consultant. The testing and acceptance of the erected structures shall be in accordance with the provisions of this Specification and / or the instructions of the Owner/Consultant.

(c) Storage of materials

All material shall be so stored as to prevent deterioration and to ensure the preservation of their quality and fitness for use in the works. Any material which has been deteriorated or damaged beyond repairs and has become unfit for use shall be removed immediately from the site.

(d) Yard

The Bidder will have to establish a suitable yard in an approved location at site for storing the fabricated steel structures and other materials which will be delivered to him by the Owner according to the Contract. The yard shall have proper facilities like, drainage, lighting, suitable access, trailers and other heavy equipments. The yard shall be fenced all round with security / arrangement and shall be of sufficiently large area to permit systematic storage of the fabricated steel structures without overcrowding and with suitable access, trailers and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[108]	25.09.2014

other equipment for use in erection work in proper sequence in accordance with the approved programme of work.

The Bidder should visit the site prior to submission of his Tender to acquaint himself with the availability of land and the development necessary by way of filling, drainage, access roads, fences, sheds etc. All of which shall be carried out by the Bidder at his own cost as directed by the Owner.

(e) Covered Store

All field connection materials, paints, etc. shall be stored on well designed racks and platforms off the ground in a properly covered store building to be built at the cost of the Bidder.

(f) Workmanship

Erection Plant and equipment

The suitability and adequacy of all erection tools and plant and equipment proposed to be used shall be efficient, dependable, in good working condition and shall have the approval of the Owner/Consultant.

Method and sequence of erection

The method and sequence of erection shall have the prior approval of the Owner/Consultant. The Erection shall arrange for most economical method and sequence available to him consistent with the Drawings and Specifications and such information as may be furnished to him prior to the execution of the Contract.

Temporary bracing

Unless adequate bracing is included as a part of the permanent framing, the erector during erection shall install, free of cost to the Owner, temporary guys and bracings where needed to secure the framing against loads such as wind or seismic forces comparable in intensity to that for which the structure has been designed, acting upon exposed framing as well as loads due to erection equipment and erection operations.

If additional temporary guys are required to resist wind or seismic forces acting upon components of the finished structure Installed by others during the course of the erection of the steel framing, arrangement for their installation by the erector shall be made free of cost to the Owner.

The responsibility of the Bidder in respect of temporary bracings and guys shall cease when the structural steel is once located plumbed levelled, aligned and grouted within the tolerances permitted under the specification and guyed and braced to the satisfaction of the Owner/Consultant.

The temporary guys, braces, false work and cribbing shall be removed immediately upon completion of the steel erection and shall return to the Owner's store in good condition if the materials are supplied by the Owner otherwise permission shall be given to Bidder to take out the materials from 'the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[109]	25.09.2014

project site. The Owner may remove and return the materials in good condition to the Bidder without any charge if they have been left in place under other agreed arrangement.

Temporary floors for buildings

It shall be the responsibility of the Bidder to provide free of cost planking and to cover such floors during the work in progress as may be required by any Act of Parliament and / or by-laws of state, Municipal or other local authorities.

Setting out

Positioning and levelling of all steelwork, plumbing of stanchions and placing of every part of the structure with accuracy shall be in accordance with the approved Drawings and to the satisfaction of the Owner/Consultant. Concrete foundations, where required, shall be made by other agencies. Anchor bolts and other anchor steel shall be embedded by other agencies. The Bidder shall check the positions and levels of the anchor bolts, etc. before concreting and get them properly secured against disturbance during pouring operations.

He shall remain responsible for correct positioning. For heavy columns, etc. the Bidder shall set proper screed bars if desired by the Owner/Consultant, to maintain proper level. No extra payment shall be made for this.

Each tier of column shall be plumbed and maintained in a true vertical position subject to the limits of tolerance allowable under this Specification.

No permanent field connections by bolting or welding shall be carried out until proper alignment and plumbing has been attained.

Field bolting

All relevant portions in respect of bolted construction of the Specification for Fabrication of Structural Steelwork applicable to the Project shall also be applicable for field bolting in addition to the following:

Bolts shall be inserted in such a way so that they may remain in position under gravity even before fixing the nut. Bolted parts shall fit solidly together when assembled and shall not be separated by gaskets or any other interposed compressible materials. When assembled, all joint surfaces, including those adjacent to the washers shall be free of scales except tight mill scales. They shall be free of dirt, loose scales, burns, and other defects that would prevent solid seating of the parts. Contact surfaces within friction-type joints shall be free of oil, paint, lacquer, or galvanizing.

Drifting

Correction of minor misfits of bolts will be considered as permissible. For this, light drifting may be used to draw holes together and drills shall be used to enlarge holes as necessary to make connections. Reaming, that weakens the member or makes it impossible to fill the holes properly or to adjust accurately after reaming shall not be allowed.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[110]	25.09.2014

11 ARCHITECTURAL WORKS

The architectural design concept of buildings shall be evolved considering the functional, technical and other requirements for efficient operation, ensuring comfortable working environment for personnel, satisfying the aesthetic requirements. Special care shall be taken to provide elegance and aesthetics, with effective use of appropriate treatment, materials, fittings and finishes. To achieve above objective Bidder shall employ a qualified architect / architectural firm to carry out all designs and hold all other architectural responsibilities for the project.

The Bidder shall obtain and be conversant with all laws, by-laws and regulations of local and Statutory Bodies as applicable to the project. The architectural concept evolved should also take care of these requirements. The Bidder shall provide the drawings and documents for such statutory approvals.

11.1 General

The architectural services shall cover finishing work of new buildings and modernised existing buildings/structures, included under the specification starting from masonry work, partition walls, cladding walls, roof protection, finishing of walls, floors and ceilings, false ceiling as required potable water system, sanitation etc.

During execution of the contract, the Bidder shall take approval from the Owner, for all building materials and finish items (e.g. floor tiles, doors, and windows, paints etc.) to be used for the contract by submitting samples and/or product literature as appropriate.

Finishing works including material used for renovation/modernisation work shall be matched with the finishing of existing structures to make similarity in architectural view of new and existing structures.

11.2 Finishes

All exposed surfaces shall be clean and smooth and members shall be sized to give a pleasing appearance. The Finishes for all Structures and Buildings shall meet the functional requirements and shall be as per the approved Finishing Schedule. However, the finishing schedule shall be pre-approved by the Owner/Consultant.

11.3 Design Requirements

(a) Architectural Concepts

- All buildings and structures shall be architecturally treated in such a way so as to be in complete harmony with the surrounding structures and environment. Local architectural characters may be judiciously imbibed. The building shall be designed initiating an architectural control common to

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[111]	25.09.2014

all buildings. The architectural control shall be clearly spelt out in terms of scale, man & form.

- Overall colour scheme of the plant and other buildings shall be designed judiciously and in a comprehensive manner taking into account the mass and void of buildings, its facade, equipments, exposed structural elements, piping, trestles, bus ducts and other service elements.
- Overall emphasis shall be on developing an eco-friendly architecture, merging with the nature with its own sustainable energy management systems.
- The scheme shall be conceptually finalized in totality including that of equipments so that the proper co-ordination with other agencies can be taken up at appropriate time.

(b) Architectural Design

- Natural light shall be used to the maximum extent. For adequate light and ventilation, National Building Code recommendation shall be followed.
- Entrance canopies, chajjas (projections, recesses) over openable windows and door openings on exterior facades shall be provided.
- All the buildings shall be architecturally designed to meet the National Building Code.
- Architectural design and detailing aspects of all the buildings shall be rendered through professional services of an Architect Statutory requirement and any clearances from local authority may be required to be met with, wherever essential. The Architect Consultant shall be of national - International repute having experience in similar kind of works. The consultant shall evolve the design philosophy and shall present it in the form of presentation drawings, prospective views, 3-D Models & detail drawings.
- A comprehensive interior design scheme shall be conceived with the intention of projecting a definite theme and aesthetic appearance to inside working environment. It shall take into account the multidisciplinary engineering activities involving plant technology and architectural & civil engineering for a smooth control hierarchy and man machine interface.

The Bidder shall develop the architectural layout of all the buildings listed in this document as per the final approved equipment disposition and other layout considerations indicated elsewhere in this specification. These drawings shall need the approval of the Owner/Consultant before construction. The Bidder shall also have to submit perspective views if so desired by the Owner/Consultant at

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[112]	25.09.2014

no expenditure to the Owner. Approval from statutory authorities, e.g. Factories Inspector, Explosives Inspector, Loss Prevention Association of India / Tariff Advisory Committee etc. shall be the responsibility of the Bidder without any obligation of the Owner.

The entire complex shall have an architectural character and style of its own and shall be visually and functionally integrated with the existing landscape. The Bidder must visit the site and have a feel of the overall environment, so that a harmonious as well as integrated architectural concept of the proposed phase of development is achieved. Special care must be taken to enhance the visual and technological quality of development by adopting updated technology, materials, finish etc.

11.4 Guideline for Architectural Works

11.4.1 Roof Insulation and Ventilation

Wherever required the roof of buildings shall be insulated with foam concrete. For ventilation requirements relevant section of the specification shall be referred.

11.4.2 Roof Waterproofing

All roofs of buildings shall be provided with 3 layers, first being elastomeric membrane water proofing treatment, secondly screed concrete shall be laid and finally the wearing course. Elastomeric membrane shall be laid as per manufacturer's specifications which shall adhere to specifications as given in IS 2645. Run off gradient shall be given a minimum of 1 in 100. Gradient shall comprise screed concrete 1:2:4 using 12.5 mm or below coarse aggregate. Over the screed concrete waterproofing treatment shall be provided as below:

A wearing course shall consist of pressed clay tiles of size 230x230x18 mm laid in water proofing compound mixed cement mortar (1:3) and sealing of joints using sealing compound.

11.4.3 Brick/stone masonry and parapet wall

All masonry works shall be designed in accordance with IS: 1597, IS: 1905, IS: 2212, IS: 4326 and other relevant IS codes as applicable. Structural design of load bearing and non-load bearing walls constructed with solid or perforated burnt clay bricks or concrete blocks shall be in accordance with criteria specified by National Building Code of India.

All walls shall be non-load bearing infill panel walls. External walls of all buildings shall be at least one brick thick. All internal walls shall be at least one brick thick except for internal partition walls for office area, canteen, change rooms, first aid rooms and toilets, which may be half brick thick.

Minimum 50 kg/sq.cm compressive strength brick shall be used for non-load bearing super structure brickwork. Cement sand mortar 1:6 for one brick thick

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[113]	25.09.2014

wall and 1:4 for half brick thick wall shall be used. For half brick walls, RCC transoms and mullions shall be provided to reinforce the wall where required.

All brickwork shall be plastered as per specification.

Even where metal cladding is specified, for initial [3 m] height from the ground level, minimum one brick thick masonry wall shall be provided.

All up stands and parapet walls on roof shall be of RCC construction, minimum height of parapet walls shall be [1050 mm] and a minimum thickness of [125 mm].

11.4.4 Cement based polymer modified mortar

a) Purpose

To carry out structural repairs to prepared patches of spalled concrete with an alkaline impervious repair material comprised of polymer admixed cement-sand mortar.

b) Materials and T&P

Polymers in emulsion or powder forms as may be specified conforming to ASTM C1059, Ordinary Portland Cement of 43 grade conforming to relevant BIS code, Sand conforming to Zone-II or Zone-III grade of IS: 383, Mixing water conforming to IS: 456-2000, mortar mixer with mechanical water dozer, spatulas, trowels, etc.

c) Procedure:

Step-1: Follow the guidelines for Safety, Quality Assurance, Environmental Protection, Product delivery, Personnel, Supervision, Storage and Handling, etc.

Step-2: Full quantity of specified polymers shall be received at site in factory sealed containers with labels legible and intact provided that the shelf life so permits. Otherwise substantial quantity as could be consumed within the shelf life shall be received as per quantity approved by Engineer-in-Charge. Full quantity shall be worked out as theoretically required for consumption in the whole work.

Step-3 Testing of Material: The requisite number of test specimens of mortar shall be cast from each batch of manufactured or supplied materials received (whichever is less). These are to be tested for conformance to the specified requirements before use on the work. Polymer modified cement mortar with cement: sand proportion by weight as (1:3) shall have the following properties

Minimum compressive strength -20N/sq.mm after 28 days at 27oC

Step-4: Identify and mark the area for Polymer modified mortar repair.

Step-5 Surface Preparation: The appropriate propping/supporting, surface preparation and crack sealing as per site requirements shall be completed, which may sequentially cover one or more of the following items of work:

Prop & support the structural member to relieve it of stress and strains.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[114]	25.09.2014

Removal of existing surface plaster/treatment shall be done.

Chipping unsound/weak concrete material shall be done.

Removing concrete all around embedded rusted reinforcement shall be done.

Removing and cleaning reinforcement of rust from its surface to give it a shining bright metal shall be done.

Sealing the cracked or honeycombed concrete with injection grouting shall be done.

Providing and inserting mild steel shear key bars shall be done with minimum 3 nos per square meter of surface area of substrate, which may also be used as depth measuring gauge.

Additional fresh reinforcement, if required, shall be tied with required overlaps or welded.

The rust, if any, persisting over the existing exposed reinforcement or the new reinforcement shall be removed mechanically or chemically.

Cleaning of lightly sticking materials and foreign matter from the exposed concrete surface and steel reinforcement by suitable means shall be done.

Step-6: Clean the dust and saturate the prepared surface of concrete and reinforcement with a clean oil free air blast and water fit for construction.

Step-7: Inspection of concrete surface prior to adhesive application shall be thoroughly inspected and got approved by the Engineer-in-Charge. Surfaces shall be ensured to be free from any deleterious materials such as oil, dust, dirt etc. using oil free air blast.

Step-8: Alignment & thickness Control- Ground wires shall be fixed at reference points to measure and control the thickness of overlay. Shear keys fixed earlier could also function as depth gauges. Adequate ground wires shall be installed to establish thickness and surface planes of the overlay build up. Ground wires shall be tight and true to line and placed in such a manner that they may be further tightened.

Step-9: Apply Passivating & bonding coat over the cleaned existing and new reinforcement.

Step-10: Apply bond coat on the cleaned concrete substrate.

Step-11: Mix and Prepare Polymer Modified Mortar to have a uniform consistency and texture by adding cement sand and polymer as weigh batched ingredients of the design mix, a specified proportion of water through water dozer.

Use of prepacked ready to use components supplied by manufacturers in containers may be allowed subject to approval of Owner. In case where prepacked ready to use materials are to be used, the contractor shall submit the manufacturer's certificate verifying conformance to material specification as

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[115]	25.09.2014

specified, manufacturer's mixing and application procedure for approval by Engineer-in-charge.

Plastering with cement based polymer modified mortar shall be done immediately after applying the bonding slurry to the prepared surfaces, preferably in coats of approximately 10mm thickness as greater thickness may lead to delamination/collapse. However, coats shall be applied in fairly rapid successions within 15 to 30 minutes. After applications of mortar the surface shall be finished using a wooden float.

Step-12: Moist cure the polymer modified mortar surface for 1-3 days followed by air curing at ambient temperature or as per manufacturer's specification, if specified otherwise. Use of flowing water or ponding of water shall not be done for curing. Steam curing shall not be permitted.

Step-13: Test the Surface of 7-day cured concrete overlay for soundness by tapping or sounding with hard blunt surface.

d) Inspection & Quality control

The mortar application work shall be continuously inspected by a qualified supervisor who shall check materials, application of mortar, curing stoppage of work during low temperatures (minimum working temperature being 8°C in most of the polymer modified mortar or as per manufacturer direction) and high winds etc. Each completed work of mortar shall be systematically sounded with a hammer to check for drummy areas after hardening.

In suspect areas or whenever directed by Engineer-in-Charge, the contractor shall drill the cores from the finished work and in to the host concrete after 28 days of mortar application. The cores shall be examined for evidence of poor workmanship by the Owner, and if he is satisfied that either the bonding work or the subsequent layer of mortar are not of the required workmanship, the contractor at the instruction of Engineer-in-Charge shall dismantle such areas of work as required by the Owner and re-do the same after re-preparing the surface by chipping off mortar work and abrading the bonding slurry interface.

11.4.5 Partition Wall

All intermediate walls shall be full brick thick wall in 1:6 cement sand mortar. Half brick thick wall in 1:4 cement: sand mortar with [2 nos. 6 mm] diameter rod in every fourth layer shall be provided. For long walls intermediate RCC pillars and RCC horizontal tie shall be provided. Full glazed partition in anodized aluminium frame shall be provided for operator's cubicles for clear view of the operating equipment and in Control room area.

11.4.6 Metal cladding

a) Permanent colour coated sandwiched insulated metal cladding system

Trough zinc-aluminium alloy coated (both sides) M.S. sheet having 0.6 mm minimum thickness (or high tensile steel sheet of 0.5 mm minimum thickness) shall be used on external face (outer face) of cladding system.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[116]	25.09.2014

Weight of coating shall not be less than 180 gm / sq.m. The outer side (exposed face) shall be permanently colour coated with Polyfluro Vinyl Coating (PVF2) of Dry Film Thickness (DFT) 20 microns (minimum) over primer. Inner side of external sheet shall be provided with suitable pre-coating of minimum 7 microns.

Galvanised M.S. sheets of minimum 0.6 mm thickness shall be used as inner liner (internal face) of cladding system. The exposed face shall be permanently colour coated with silicon modified polyester paint of DFT 20 microns (minimum) over primer. Inner face of external sheet shall be provided with suitable pre-coating of minimum 7 microns. The rate of galvanising shall not be less than 180 gm / sq. m.

The permanent colour coated sheet shall meet the general requirements of IS: 14246 and shall conform to class 3 for the durability.

Inner sheet shall fixed directly to side runners and Z spacers made of at least 2 mm thick galvanised steel sheet of grade 375 as per IS: 277. Inner sheet shall be fixed at the rate not more than 0.75 m centre to centre to hold the insulation and external sheeting.

The insulation shall be of bonded mineral wool of minimum thickness 50 mm conforming to IS: 8183, having a density of 32 kg / cu. m for glass wool & 48 kg / cu. m for rock wool.

b) Permanent colour coated (non-insulated) metal cladding system

Trough zinc-aluminium alloy coated not less than 180 gm/sq.m M.S. sheets having 0.6 mm minimum thickness (or High tensile steel sheet of 0.5 mm minimum thickness) shall be used for the cladding system. The outer side (exposed face) shall be permanently colour coated with PVF2 paint of minimum DFT 20 microns over primer and the inner side (internal face) shall be coated with same paint of minimum DFT 12 microns over primer. These shall be fixed directly to runners. The sheets shall meet the general requirement of IS: 14246 and shall conform to class 3 for the durability.

c) Flashings, Cap, Trim Closures etc.

All flashings, trim closures, caps etc. required for the metal cladding system shall be made out of plain sheets having same material and coating specification as mentioned above for the outer face of the sandwiched metal cladding.

11.4.7 Plastering

On the exterior wall & rough side of interior brick wall [18 mm] thick minimum with cement-sand mortar in two layers shall be applied. Where external finish will require rich plastering for special finish plaster shall be of 1:4/1:3.

Interior wall: [12 mm] thick with 1:4 cement-sand mortars

Ceiling: [6 mm] thick with 1:3 cement-sand mortar shall be provided to all exposed ceilings.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[117]	25.09.2014

11.4.8 Removal of plaster manually from masonry or concrete surface using chisel and hammer and disposal of debris etc

a) Purpose

For removal of all type of loose /delaminated /damaged/weak cement plaster from surface of masonry or concrete.

b) Procedure

Step-1: Safety shall be ensured in accordance with contract conditions and specifications.

Step-2: Provide double scaffolding, protective screens etc.

Step-3: Existing plaster to be identified for removal by tapping all areas and its boundary shall be marked with a colour marking (in an optimal rectangular shape), which shall be approved by Engineer-in-Charge.

Step-4: Make a cut normal to the surface all along the boundaries with power driven cutters. The depth of cut shall not exceed the thickness of plaster.

Step-5: Remove the plaster manually with the help of chisel and hammers to completely expose the parent masonry or concrete surface, so as not to have any traces of such plaster left behind.

11.4.9 False ceiling and under deck insulation

All air conditioned areas shall be provided with the suspended false ceiling system. Under deck insulation system shall be provided on the under side of the roof / floor slab of the air-conditioned areas based on the functional requirement. Aluminium false ceiling system shall comprise of [84 mm] wide [12.5 mm] deep closed type plain panels of approved colour, roll formed out of [0.5 mm] thick corrosion resistant aluminium alloy AA 5050 fixed on roll formed carriers. Additional hangers and height adjustment clips shall be provided for return air grills, supply air diffusers, light fixtures, AC ducts etc. Suitable M.S channel (minimum ISMC100) grid shall be provided above false ceiling for movement of personnel to facilitate maintenance of lighting fixtures, AC ducts etc.

Bidder shall prepare a layout of the false ceiling system incorporating light fixtures, supply air diffuser, return air grills, fire detectors, fire protection sprinklers etc. such that the ceiling looks aesthetically pleasing. Work shall commence only after the Owner approves the layout. Under deck insulation shall comprise of [50 mm] thick resin bonded mineral wool insulation mat conforming to IS:8183. This mat shall be backed with [0.05 mm] thick aluminium foil and [24 Gx25 mm] wire mesh netting. These shall be fixed to ceiling or wall as the case may be with [100x50x6 mm] slotted mild steel plate welded to M.S. plate inserts embedded at the soffit of the slab at [600 mm c/c and 14 G] steel wire drawn through slots and fixed to wire netting.

11.4.10 Doors

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[118]	25.09.2014

- Generally hollow metal (steel) flush doors with pressed steel frame shall be provided for plant and utility areas.
- Solid core factory made wooden flush doors in hard wood frame shall be used in interior office areas. Aluminium doors shall be provided in at entrances and important areas.
- Special areas like control rooms and other special area shall be provided with minimum 15 micron pre-coated Le. colour anodised aluminium glazed partitions with air lock facilities having two sets of doors.
- Fire rated doors with panic bar shall be provided in cable spreader rooms and other areas having fire hazard and also to all fire exists as per TAC requirement.
- Doors shall be provided at appropriate location to prevent dust ingress from outside.
- FRP Doors with FRP Frames shall be provided for all the toilet doors.
- Weather stripping shall be provided to all outside doors as well as air-conditioned areas and all other doors where dust-free environment is required.

11.4.11 Rolling shutters

Rolling steel shutters conforming to IS: 6248 will be used for large openings where frequent use is not envisaged. Unless noted otherwise, main entry doors of width and height to suit the requirements. Rolling shutters with area up to 8 m² shall be pull and push type hand operated, while above 8 m² shall be pull and push type with ball bearings (Electrically operated) as per IS specification.

11.4.12 Windows & Ventilators

In all buildings, full glazed windows and ventilators in minimum [15 micron] colour anodized aluminium window frame shall be provided with [4 to 6 mm] thick (depending on the size of panel) clear float glass and [6 mm] thick clear wired/laminated glass where required from safety point of view. Structural glazing may be considered as an important facade element.

The window area shall be so decided as to allow adequate natural ventilation and light.

Note: Glass thickness and member sizes of Aluminium Glazed doors and windows shall be designed by the manufacturer and to be submitted for approval by the Bidder before execution.

11.4.13 Plywood Covering Panels to Cover Windows etc. During repairs

a) Purpose

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[119]	25.09.2014

To protect the finished items against their spoiling/damage to finishes during the process of carrying out repairs in a building. The items could include finished windows, doors, glass curtain wall or other such items.

b) Materials:

Wooden Battens of size 50mm X 50mm (approximately) or as approved by Engineer-in-charge, free from warping, cracks etc. made from locally available timber.

Plywood of suitable thickness, preferably 6 mm thick, as approved by Engineer-in-Charge.

Nails, screws etc. as per requirement.

c) Fabrication:

Size of covering panels shall be more than the size of windows etc. to be shielded/ protected, enough to be fixed to the walls without damaging the windows etc.

Wooden battens shall be cut approximately to the size of panels of windows etc. to be protected. The joints of the wooden framework shall be lap joint or as approved by Engineer-in-Charge.

Where the panel size is more than 2 square metres or as specified by the Engineer-in-Charge, the stiffening shall be done with batten backing to impart stiffness enough to provide rigidity against undue deflection due to impact of falling debris, self load, etc.

Plywood shall be fixed with nails/screws over the batten frames. The spacing of nails/screws shall be about 300mm c/c or as may be required at site.

d) Fixing:

The plywood covering panel shall be suitably fixed without damaging the windows etc. being protected by such panels with nails/screws fixed in walls strong enough to resist the forces likely to be imparted during repair work. It shall be done in such a manner that it can be removed with ease without damaging the covered windows etc. after completion of repairs.

e) Removal:

After completion of work, the covering panels shall be removed carefully, so as not to cause any damage to windows etc. covered. The damages, if any, shall be made good.

11.4.14 Facilities in Buildings

Adequate toilet and drinking water facilities shall be provided for personnel working in each building. Each building shall have toilet facilities both for Gents and Ladies. Number of toilet fixtures shall be adequate for the occupancy as per National Building Code.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[120]	25.09.2014

However minimum 1 Water Closet, 1 washbasin, 1 urinal shall be provided in each toilet.

Each floor shall have drinking water facility connected through water purification system like Aquaguard or similar approved make.

11.4.15 Glazing & Glazed Partition

- Glazing in Control room between AC. and non-AC. areas shall be insulating glass consisting of [two 6 mm] thick toughened float glass sheet hermetically sealed and separated by [12 mm] gap for thermal insulation. Clear glass shall be provided where clear view is required. In other areas tinted glass may be provided.
- [4 mm] thick ground glass shall be provided for toilets.
- Glazing between two AC. areas shall be with 6 mm thick clear float glass.
- All glazing shall be in aluminium frame.
- [6mm] thick Wired / laminated glass shall be used for windows / ventilators at higher level for safety.
- [24mm] thick insulated double glazing having 6mm thick tinted heat-reflecting type float glass on outer side and 6mm thick clear float glass on inner side with [12mm] air gap & hermetically sealed shall be mounted on [15 micron] coloured anodised aluminium frame suitable for structural glazing system.

11.4.16 Sealant

Silicon sealant or polyurethane sealant shall be used in all expansion joints exposed to weather. All joints around exterior doors, windows, and expansion joints, etc. shall be sealed for proper water-lightness.

11.4.17 Damp Proof Course

[40 mm thick 1:1.5:3] concrete with waterproofing admixture. Water proofing compound shall be of Zydex, SIKA, or similar approved.

11.4.18 Plinth Protection

Minimum [1000 mm] wide and minimum [100 mm] thick M 15-grade concrete plinth protection along building periphery shall be provided with surface drain of required size and slope, to suit storm water quantity, shall be provided. The plinth protection shall be laid over prepared sub-grade and base formed with locally available broken laterite stone to thickness of [150 mm].

11.4.19 Painting

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[121]	25.09.2014

- Exterior Masonry Surface : Buildings shall be finished with [Acrylic Emulsion pain] as per IS specification with approved colour and scheme.
- Exterior Steel Work : Anti-corrosive synthetic enamel paint over [anti corrosive primer].
- All Woodwork: [Synthetic paint over a coat of primer].
- All Internal Steel Work : [Synthetic enamel over a coat of primer].
- Interior Office Spaces Rooms, All AC Areas : Acrylic emulsion paint over [2 mm] control thick plaster of paris punning.
- Balance areas: As indicated in finish schedule in this document.
- Fire Door: Post Office red shade shall be provided.

11.4.20 Flooring

Unless and otherwise specified, the nominal total thickness of floor finish shall be [50 mm] including under bed and topping. The flooring shall be laid on already matured concrete base. The under bed for floors shall consist of minimum grade of M 15 with stone chips [12.5 mm] downgraded as coarse aggregates. The under bed shall be provided appropriate slope towards catch pit for floor drainage.

- **False Flooring System**

Removable type false flooring system shall be provided wherever required (computer rooms etc.). RCC floor slab will be sunk to a depth [800 mm], which shall be height of the false floor system. The flooring shall consist of fire resistant phenol formaldehyde bonded particle board panels [600x600x35 mm] size, mounted on steel pedestals of adjustable height and supporting steel grid system to provide under floor space. [2 mm] thick flexible anti-static PVC topping on top and PVC strip edging on sides of each panel shall be provided.

- **PVC Floor Finish**

Two mm thick PVC as per IS: 3462 and laid as per IS: 5318 over concrete under bed of [48 mm] shall be provided in electronic cubicle rooms, conference room, etc. PVC tiles shall ensure anti static surface.

- **Vitrified ceramic Tiles**

Heavy duty vitrified ceramic tiles of appropriate thickness and of minimum size [600 mm x 600 mm] of approved shade & colour shall be provided for control room as per relevant code and manufacturer's specification over concrete bedding to result in an overall thickness of [50 mm].

- **IPS Flooring**

IPS (cement concrete flooring) with metallic floor hardener topping [12 mm] thick with a total thickness of [50 mm] shall be provided in maintenance and

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[122]	25.09.2014

unloading area of Mill and bunker bay, operating floor of pump house, permanent stores and other plant building areas where heavy duty flooring is required.

IPS flooring with non-metallic floor hardener shall be provided in all MCC and switchgear rooms, which are not air-conditioned.

IPS flooring shall also be provided in areas, which are not provided with any special finish. Areas which are likely to be subjected to oil spillage shall be provided with two coats of oil resistant painting over IPS floor finish. If required, Bidder has to use floor hardeners at appropriate locations.

- **Heavy Duty Ceramic Tiles**

Heavy duty vitrified ceramic tiles with suitable finish shall be used in toilets, pantry, dining hall of canteen, locker rooms etc. The tiles shall be minimum of [300 x 300 x 7 mm] of approved shade, brand and colour.

- **Acid / Alkali Resisting Tiles**

Battery rooms and other areas coming into contact with acid / alkali vapours or fumes shall be given acid / alkali resistant tiles [25 mm] thick, jointed with acid / alkali resistant cement slurry. Bedding shall comprise of potassium silicate mortar conforming to IS: 4832 (Part-I) and resin based mortar like epoxy for jointing. Total thickness of flooring shall be [50 mm].

- **Integral Floor Finish**

For cable vaults floor finish integral to the concrete base shall be provided as per IS: 2571.

11.4.21 Miscellaneous

PVC nosing shall be provided for edge protection of R.C.C. stair treads.

Angles [50x50x6 mm] (minimum) with lugs shall be provided for edge protection of cutouts / openings in floor slabs, edge of drains covering gratings, edge of R.C.C cable / pipe trenches of any other place where breakage of edges / corners is expected.

Floors of switchgear rooms shall have embedded steel channel suitable for easy movement of breaker panel.

11.4.22 Skirting/DADO

- [150 mm] skirting matching with floor finish shall be provided in all areas unless specified otherwise elsewhere.
- Toilets and locker rooms shall be provided with dado of [2100 mm] high with glazed tiles of minimum 5 mm thickness generally as per IS: 777.
- For battery room and other areas coming in contact with acid / alkali spillage / fume, dado of acid / alkali resistant tiling as per IS: 4457 shall be provided to a height of [2100 mm] set in potassium silicate mortar and joints pointed with resin bonded mortar

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[123]	25.09.2014

- Staircase wall shall be given dado of vitrified tiles of approved colour and shade to a height of [2100 mm] or as per approved drawings.

11.4.23 Roof access

All roofs shall be provided with access thorough a staircase / cage ladder. Minimum [1000 mm] wide access path shall be provided with suitable tiles to approach equipment on roof.

11.4.24 Roof Drains

(a) Roof drains design criteria

Minimum diameter of the pipe shall be [150 mm]. The roof drains shall be sized for the roof area runoff for a maximum rainfall per hour at site.

Detailed specification is mentioned elsewhere in this specification.

(b) Roof Drainage and Water Proofing

All roofs of buildings shall be provided with 3 layers, first being elastomeric membrane water proofing treatment, secondly screed concrete shall be laid and finally the wearing course. Elastomeric membrane shall be laid as per manufacturer's specifications which shall adhere to specifications as given in IS 2645. Run off gradient shall be given a minimum of 1 in 100. Gradient shall comprise screed concrete 1:2:4 using 12.5 mm or below coarse aggregate. Over the screed concrete waterproofing treatment shall be provided as below:

A wearing course shall consist of pressed clay tiles of size [230x230x18 mm] laid in water proofing compound mixed cement mortar (1:3) and sealing of joints using sealing compound.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[124]	25.09.2014

12 GENERAL REQUIREMENTS

12.1 Roof

Roof of conveyor galleries and Boiler shall be of permanently colour coated galvanised M.S troughed metal sheet of approved profile. Minimum base metal thickness shall be 0.8 mm. The rate of zinc consumption for galvanising shall be 275 gm/sq. m. The external face shall have permanent colour coating of PVF 2 paint of minimum DFT of 20 microns and inner surface shall be coated with silicon modified polyester paint with DFT of 20 microns.

12.2 Waterproofing of underground structures

All underground structures like basements, pump houses, water retaining structures etc. shall have plasticiser cum waterproofing cement additives conforming to IS: 9103. In addition, limits on permeability as given in IS: 6494 shall also be met with. The concrete surface of these structures in contact with soil shall be provided with minimum two coats of bituminous painting of grade 85/25 conforming to IS: 702 @ 1.7 kg/sq.m (minimum) for water/ damp proofing. Also provision shall be made on the inner surface of walls and base slab, so that waterproofing grouting can be injected later in case of leakage.

12.3 Anti-termite treatment/Anti-weed treatment

Pre-constructional anti termite treatment shall be given to all buildings as per IS: 6313 and other relevant Indian Standards.

Reservoirs shall be given an anti-weed treatment of approved quality and quantity as per the manufacturer's specification. Anti weed treatment shall be carried out before carrying out the lining work.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[125]	25.09.2014

13 GENERAL CIVIL WORKS AND CONSTRUCTION TOLERANCES

13.1 Basic requirements for all civil works

Design requirements

The design of all structures under this contract shall be such that differential and total settlements or other movements shall not exceed acceptable limits and full provision shall be made for all expansion and other joints. The design shall be to the approval of the Owner/Consultant.

- Structural members subjected to flexure shall be designed to have adequate stiffness to limit deflections or any deformations that affect strength or serviceability of a structure adversely. The maximum allowable deflections of structural members shall be in accordance with the relevant design standards and/or the limits prescribed by the machinery manufacturers (whichever is less).
- The superstructures and foundations subjected to vibrations (the primary source of these vibrations being the unbalanced forces generated by rotating or reciprocating equipment) shall be designed such that vibrations will be neither intolerable nor troublesome to personnel and will not cause damage to the machine or structure.
- The natural frequency of the whole of the superstructures and foundations or parts thereof and all structures adjacent thereto shall not coincide with the operating frequency of the vibrating plant.
- The differences between frequencies and the dynamic analysis of the superstructures and foundations shall be in accordance with the relevant design standard.
- The dimensions of all the buildings shall be such as to provide adequate space for the safe installation and proper operation, maintenance and repair of all plant and equipment.
- Throughout the works all floor slabs above rooms containing electrical equipment shall be watertight. No drainpipes or water pipes are permitted to pass through these rooms.
- All materials used in the works shall be of the best quality of their respective kinds as specified herein, obtained from sources and suppliers approved by the Owner/Consultant and shall comply strictly with the tests prescribed hereinafter or, where tests are not laid down in this specification, with the requirements of the latest issue of the relevant Indian, American, British, German Standards or other Standards approved by the Owner/Consultant.
- Samples of all materials proposed to be used in the works may be called for at any time by the Owner/Consultant.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[126]	25.09.2014

- The work shall be carried out by competent personnel skilled in their various trades.
- Before commencing the works, the Bidder shall ascertain the locations and nature of all existing underground services and shall take every possible precaution against any damage occurring to them or interference therewith, during the execution of the works.
- Suitable access to the roofs of the buildings by means of steel stairs shall be provided for maintenance and repair of any installation.
- All rooms with fire hazard shall be provided with suitable emergency exists.
- Proper access roads with footpaths shall be provided to bring in all the equipment and to take it out in case of maintenance. These access roads shall be suitable for the vehicles, which will be used (cars, forklifts, trucks/trailers etc) to reach up to the point of unloading of the equipment.
- Safe, convenient and straight forward accesses and means are to be provided to take equipment in and out of all rooms, at all levels using suitable stair wells and suitable electric hoists. The dimensions of rooms, stairwells, doors, etc shall be designed to suit the a.m. transport concept.
- Before starting of design works, the Bidder shall submit to the Owner/Consultant for approval the project design manual containing the design data and the detailed design criteria for all civil works. Design works shall commence only after approval of the project design manual by the Owner/Consultant.
- Before starting of design works, the Bidder shall submit to the Owner/Consultant for approval the project design manual containing the design data and the detailed design criteria for all civil works. Design works shall commence only after approval of the project design manual by the Owner/Consultant.

13.2 Basic requirements during construction

Basic Cleaning

Basic cleaning includes all floors, walls, ceilings, built-in fittings and equipment, including the furnishings. The basic cleaning operation must result in a degree of cleanness, which permits the fully equipped buildings and rooms and associated outdoor installations and secured surfaces to be taken over without complaint.

Advertising boards and stickers, temporary protective coatings and claddings, remains and splashes of paint, must be removed with water or suitable solvents. Dust and other dirt must be completely removed from all wall and floor surfaces, as well as from all furniture.

Windows and mirrors must be cleaned so that they are completely clear and without streaks.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[127]	25.09.2014

Perlator gauges, showerheads, odour traps and floor drains of the sanitary installations must be cleaned and the fittings and bright pipe work must be spotlessly polished.

Petrol and oil separators must be emptied, cleaned and refilled if necessary during basic cleaning.

Lamps, including dishes, lighting units and tubes, switches and sockets as well as bases and skirting boards, doors with frames and glazing, windows, window seats and other furniture and fittings must be included in the basic cleaning operation.

Initial Equipment

The specification is drawn up on the assumption that the scope of the initial equipment and consumption materials is to be provided complete in every respect; everything required for the use and care of the installations must be supplied, even if this is not expressly specified in the documentation.

Bidder shall ensure that during excavation ground water level shall be lowered by at least 0.50 m below the founding level adopting appropriate method of dewatering. Lean concrete below foundation shall be laid soon after excavation with minimum loss of time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-D	[128]	25.09.2014

14 STANDARDS, CODES AND REFERENCES

14.1 General

The Design of the Steel Structural Works shall be prepared and presented in accordance with IS codes. In absence of guidelines of specific items in the IS codes, International codes viz., American, BS, DIN or Australian code shall be used. All the Indian Standards referred to shall be the latest revision (including all amendments issued thereto) on the date of opening of the price bid. The Standards adopted shall be clearly stated in the calculations.

The Design shall comply with the current Local Authority Building Regulations (National Building Code) where appropriate. Subject to the agreement of the Owner, other International / Foreign National Standards, and, International / Foreign National Standard Codes of Practice, may be used.

To the extent that the Design shall include materials, methods or workmanship to be incorporated into the works, they shall be selected and incorporated into the design in accordance with the recommendations and requirements of the following (as appropriate in order of precedence but not mutually exclusive):

Statutory requirements

The Contract provisions

Bureau of Indian Standard Codes of Practice

International / Foreign National Standards

Agreement Certification for Materials

Manufacturer's recommendations for materials

Competent Trade Association recommendation

Engineering judgment

In case of any deviation / conflict between provisions of IS codes and the design criteria, the provisions that are more stringent shall be followed unless specifically directed otherwise.

Reference to only some of the codes in this document and various clauses of design criteria shall not limit or restrict the scope or applicability of other relevant codes. It shall be ensured that all other codes relevant to a specific job, in addition to those already mentioned, are followed wherever applicable.

Where British / American / DIN or other codes and standards are referred to in this document, equivalent Indian Standards may be substituted if available.

Materials supplied from India shall follow the Indian Standard Specifications.

Field and laboratory testing procedures for materials follow Indian Standard Specifications.

1

GENERAL

[The CFBC boiler shall be outdoor type, top supported with natural circulation, balanced draft , two pass circulating fluidized bed combustion using crushed limestone as the sulfur absorbent with all necessary auxiliaries, integral piping, elevator etc. The Boiler shall produce [.....] ton/hour steam to drive a steam turbine and its associated electric generator with the capacity of approximately [.....] MW Gross of each Unit. All components of the Boiler shall be designed to burn the coal with the analysis furnished. CFBC Boiler complete with all the accessories shall be covered under this section of specification.

The proposed boiler will be provided with all supporting structure, platforms, galleries and stairways for access to maintenance of each unit. All boiler platforms will be accessible by suitably located stairways. Monorails and hoists, as required, will be provided for handling of heavy pieces of equipment. The boiler design will focus on efficient & reliable operation, optimized capital & operating cost and environment protection.]

LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[1]	15.01.2016

2 SPECIFIC DESIGN CRITERIA OF BOILER & AUXILIARIES

- 2.1 Each Boiler shall be of the top supported with natural circulation, balanced draft, two pass circulating fluidized bed combustion using crushed limestone as the sulfur absorbent suitable for outdoor installation. The Boiler Maximum continuous Rating (BMCR) shall correspond to 102% of the steam flow at turbine inlet under VVO conditions plus the steam requirement for auxiliary systems of the unit. Preliminary steam turbine throttle conditions shall be [130 kg/cm² (a)], 537°C main steam and [537°C] reheat temperature respectively.
- 2.2 Boiler shall be an outdoor boiler with canopy at top. All electrical and C&I equipment shall be designed for outdoor operations. Where necessary, outdoor equipment such as pumps etc shall be protected by suitable enclosures or rain canopies to facilitate maintenance.
- 2.3 The Boiler will be operated continuously. The Boiler shall be capable of maintaining stable operation at 30% BMCR while firing worst coal without oil support. The step load change shall be minimum ±10%/min and the ramp rate shall be minimum ±2% per minute for 30-50% BMCR load and minimum ±3% per minute for 50-100% BMCR load.
- 2.4 Design life of the Boiler equipment shall be 25 years minimum. However, the unit shall also be capable of operation for two shifting cycles. The design duty for [20/25] years shall be as follows:
- Hot start : [4000]
- Warm start : [1000]
- Cold start : [150]
- 2.5 The Boiler unit shall be primarily designed for sliding pressure/ modified sliding pressure mode of operation. However flexibility to operate with constant pressure at lower loads shall also be provided.
- 2.6 Design pressure of the furnace walls shall be sufficient for the specified pressure at the superheater outlet, plus drop through superheater at the specified full load, plus not less than 6% margin. All gas side design pressures shall be in accordance with NFPA 85 or equivalent. Boiler vendor shall be responsible for determining the actual pressures based on its calculations. A furnace implosion study shall be completed to verify adequate design pressure. The minimum furnace and convection pass flue gas transient pressure shall be ±660 mmwcl at 67% of yield stress. The bidder shall consider furnace explosion vents if required.
- 2.7 The furnace shall be of the balanced draft type.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[2]	15.01.2016

2.8 In line with automatic run back capability of the unit load on loss of critical auxiliary equipments, the Boiler equipments and systems shall ensure smooth and stable runback operation.

2.9 Minimum 100% TMCR load under H.P. Heaters out Condition.

The Boiler shall be designed for continuous operation with all the High Pressure Feed Water Heaters out of service, when the feed water temperature at economiser is low. The economiser shall be suitably designed to take a thermal shock of sudden change in feed water temperature, under such conditions. The superheater and reheater temperature control system shall be designed to maintain the rated steam temperature with the HP heaters out of service from 60% to 100% TMCR.

2.10 Low Frequency Operation

The Unit shall operate the interconnected electrical net work for which the frequency may go as low as 47.5 Hz. These criteria should be considered while sizing the Boiler and its all auxiliaries.

2.11 The Boiler and auxiliaries shall perform continuously within the specified noise limit mentioned in General Technical specification.

2.12 All major auxiliaries shall be sourced from such reputed manufacturer(s) who would have supplied equipments of similar type, design for at least one (1) other power station of similar size, which are as on date of NIT, in successful commercial operation for a period of at least one year.

2.13 Limits of NOx Emission

To reduce the NOx emission from Boiler, the Bidder shall make all provisions in the Boiler design and fuel firing system.

The Bidder shall bring out the special measures incorporated in the Boiler design to keep the NOx emission within the specified limit value in the proposal.

2.14 Boiler shall be capable to undertake forced cooling under emergency.

The furnace and superheater, when cleaned by operation of soot blowers supplied with the Boiler, shall have sufficient surface to provide the BMCR Guarantee performance.

2.15 The Boiler shall be capable of 100 % BMCR load with 100% worst coal as specified.

LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[3]	15.01.2016

Tender Document for R&M of Unit No. [..] Capacity [..] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

- 2.16 The Boiler shall be capable of 100% BMCR load with worst ambient air conditions.
- 2.17 1x100% boiler fill pump shall be adequately sized to fill each boiler in not more than 2 hrs time of continuous operation, taking suction from condensate storage tank (CST). The pump shall also supply water for filling of the deaerator. *[Provision shall be kept for interconnecting the discharge of boiler fill pumps of the 2 units for flexibility and transferring condensate].*
- 2.18 The quality parameters of steam shall be as per the requirement of the turbine manufacturer. However, the same shall not be inferior to the following under all operating conditions:
- a) *[Silica as SiO₂ :<20ppb]*
 - b) *[Sodium + Potassium as Na + K :<10ppb]*
 - c) *[Copper as Cu :<3ppb]*
 - d) *[Iron as Fe :<20ppb]*
 - e) *[Conductivity at 25 deg C :<0.3 μS/cm]*
- 2.19 The quality parameters of the boiler water shall not be inferior to the following limits:
- a) *[Phosphate ions : 0.5 to 3 ppm]*
 - b) *[Silica_ : ≤ 0.25 ppm]*
 - c) *[TDS_ : ≤ 0.20 ppm]*
 - d) *[Conductivity at 25 deg C: ≤50 μS/cm]*
 - e) *[pH at 25 deg C : 9.2 to 9.4]*

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[4]	15.01.2016

3 DESIGN AND CONSTRUCTION

The Boiler shall be designed and fabricated in accordance with ASME Boiler and Pressure Vessel (B & PV) Code, Section I, or International equivalent. Piping not falling within the jurisdiction of ASME B & PV Code, Section I, shall be designed and fabricated in accordance with ANSI B31.1.

3.1 Steam Drum

The steam drum will be provided with:

- Fully welded drum with hemispherical dished ends in both sides.
- Manholes with hinged manhole doors on both sides.
- Steam drums internals comprising cyclones, scrubbers, demisters, vortex breakers etc (Demister is of SS construction).
- All nozzle connections for steam, feed water, down comers, safety valves, level gauges, mountings, CBD & IBD lines, chemical dosing lines, sampling connections etc as per approved P&IDs.
- Necessary supports like sling support/ U-rod for supporting the steam drum and disc springs (total supporting assembly).
- N₂ gas system design, N₂ nozzles and connecting piping from one point near the boiler operating floor.
- Local drum level gauges.
- Remote level gauge (Electronic drum level indicator -EDLI).
- Pressure gauges at drum floor & operating floor.
- Level transmitters and pressure transmitters.
- Temperature elements/ indicators for skin metal temperature.
- Supply of necessary piping & fittings, valves etc as per approved P&IDs.
- Supply of instruments as per approved P&IDs.
- Rust preventive painting at shop floor.
- Steam drum will be manufactured and supplied as per approved QAP.

3.2 Safety Valves & Silencers

The following safety valves and silencers shall be provided:

Steam Drum

- a) Spring loaded mechanical safety valves as per ASME requirements.
- b) Drain piping.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[5]	15.01.2016

Main Stream (FSH Outlet) Line

- a) Spring loaded mechanical safety valves (as per ASME) along with silencers and necessary piping.
- b) Drain piping
- c) EMRV (as per ASME) with hand operated isolation valves, silencers and necessary piping up to silencer.
- d) Motor operated start up vent valve (as per ASME) with manual operated isolation valve, silencer and necessary piping.

Reheater

- a) Spring loaded mechanical safety valves on inlet header (as per ASME) along with silencer and necessary piping.
- b) Spring loaded mechanical safety valves on outlet header (as per ASME) along with silencer and necessary piping.
- c) Motor operated start up vent valve on outlet header (as per ASME) with manual operated isolation valve, silencer and necessary piping.
- d) Drain piping.

3.3 Superheater and Reheater

The boiler shall be equipped with suitable superheaters and reheater of sufficient capacity and surface to superheat the steam to the required condition.

Standard and proven design shall be offered with full details for customer's review and acceptance.

3.4 Economizer

The economizer shall be of non-steaming type. The economiser shall be designed for counter flow design with the water flow upwards, through the elements and the gas flow from top to bottom. Tubes shall be arranged in parallel in-line rows. Tubes shall be welded to nipples on headers. Plain tubes or extended heating surface are acceptable, spiral fins are not acceptable. Feed stop and check valves shall be located in the feedwater piping upstream of the economizer. Double drain valves shall be provided. Economiser filling line and sampling lines shall be provided at the inlet of economiser. The sub-cooling of the economizer shall be minimum 40 deg C. The sub-cooling is defined as saturation temperature at 30% MCR load minus economizer outlet water temperature at 30% MCR load.

Maximum gas velocity through economizer section should not exceed maximum average 10 m/sec.

Boiler vendor shall furnish retractable economizer soot blowers as required to limit the buildup of fly ash between banks, tubes, and headers.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[6]	15.01.2016

Handholes shall be provided with welded covers. Where required for access and inspection, doors shall be provided with tight gasketed joints.

A pyramidal watertight hopper shall be constructed to include the entire active area of the economizer. Hopper sides shall be inclined to provide a valley angle of at least 65 degrees. Flanged connections shall be provided to connect to ash removal equipment.

The economizer shall be arranged for external water washing and an access platform shall be provided at the hopper outlet.

Space provision shall be kept for augmenting line coils/ bank in economiser sealing if required.

3.5 Furnace

The furnace may have vertical tubing configuration. Front, rear and sides of the furnace shall have fin-welded or fusion welded walls with fully welded tube walls. The roof shall be fin-welded or fusion welded where possible. Location of the wall tube field welds shall be easily accessible for testing, inspection and maintenance. The rear wall shall be accessible from the outside from the bottom elevation of the furnace to an elevation above the nose cone for operation and maintenance of soot blowers, instrumentation and other accessories. The furnace shall be designed with sufficient volume to provide complete and efficient combustion of fuel.

All furnace casing penetrations shall be gas tight.

Openings i.e. peepholes shall be provided in the furnace walls for observation of furnace conditions. There shall be an opening in each sidewall at the level of the hopper restriction.

Tubing material shall be selected for the most severe conditions imposed by operation in this application. The wall tubing material and wall thickness shall be conservatively selected to withstand all anticipated transient and steady state operating conditions expected including the erosion characteristics of the coal. However, material diagram shall also be provided from the bidder as part of the boiler specification requirement.

The tube thickness calculation shall use the maximum tube mean temperature as the design metal temperature. However, the maximum outer wall surface temperature shall be checked to make sure the selected tube thickness is adequate for the maximum outer wall surface temperature.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[7]	15.01.2016

Sleeves shall be provided in the furnace roof to permit installation of hanging scaffolds for maintenance and repair purposes. Sleeves shall extend through the penthouse roof.

The minimum distance between tubes forming the throat and discharge opening of the hopper bottom (centerline to centerline) shall be no less than 1 meter, and shall extend the full width of the furnace.

A carbon steel skirt plate of sufficient depth to accommodate furnace expansion plus 150 mm shall be securely attached to the furnace tubes and sealed to prevent air leakage. The plate shall be dimensioned in accordance with the bottom supported flooded ash hopper. The skirt plates shall be shielded from furnace radiation. The minimum height of bottom ring header shall be 10.0 meters from the ground level.

At all loads there shall be no flame impingement on any part of the furnace walls and no accumulation of slag on the walls or hoppers that will interfere with continuous satisfactory operation of the plant.

The gas velocities shall be low bearing in mind the high ash content of the fuel. The gas passages shall be designed to ensure a smooth flow without any abrupt change in direction. Erosion problems in tubes shall be taken care of by providing least nos. of baffles, screens etc. The erosion allowances considered in tube design shall be clearly indicated. Allowance of 1.0 mm to furnace tube thickness and 0.5 mm allowance to FSH and final RH tube thickness shall be considered.

The gas temperature at furnace exit shall be minimum 60 Deg.C less than ash initial deformation temperature so as to minimize possible surface fouling consistent with the requirements of superheat temperature.

Furnace shall be designed in such a way that it will provide sufficient tolerance against Departure from Nucleate Boiling (DNB) for all furnace upset conditions while operating in subcritical regime.

Provision shall be made for installation of additional soot blowers in the furnace after the unit is commissioned, if the operational requirements warrant the same.

Furnace/evaporator/waterwalls shall comply requirements at 100% BMCR and HP Heaters out conditions for the range of specified coals, under most stringent combination of conditions.

3.6 Combustion Chamber

A balanced draft, water-cooled combustor, of fusion welded membrane wall type construction complete with water wall tubes and headers and drains etc shall be provided to make it gas and pressure tight envelope.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[8]	15.01.2016

This shall be as per bidder's standard practice but the details will be furnished along with the offer for customers review and acceptance.

3.7 Hot Plate Cyclone

The entire cyclone and loop seal assembly shall be designed as top supported to expand downwards with the furnace and the back pass. The tube metal temperatures in both furnace and cyclone / loop seal assembly would be same to avoid any differential thermal expansion between the components.

This shall be as per bidders' standard practice but the details shall be furnished along with the offer for customers review and acceptance.

3.8 Fuel Feeding System

The fuel feeding system shall consist of fuel (coal/Lignite) bunkers, outlet gate valves, coal feeders, outlet chutes etc. The system shall be provided with the necessary arrangements to continue feeding within design range of fuel size and within design range of moisture content.

Crushed fuel (coal / Lignite) matching the design size requirement will be supplied by the owner through the belt conveyors and trippers (covered in a separate package) to the steel bunkers included in the scope of this package. The storage capacity of the bunkers shall be designed for 14 hrs capacity corresponding to worst fuel quality. The bunker supporting structures shall be designed considering the optimum bulk density of the worst fuel. The conical hopper portions of the bunker shall be lined with stainless steel including an optimum height from the bottom. The bunker valley angle shall be maintained not to exceed 65 degrees and the bottom openings shall be liberally sized to ensure a smooth flow of fuel from the bunkers by preventing any hang up or plugging.

Fuel feeders of drag chain type shall be provided to receive fuel from each bunker. The fuel feeders shall be provided with variable frequency drives (VFDs) so that fuel feed rate can be controlled by varying the speed of the feeders. The feeders shall be designed in such a way that even when one feeder goes out of operation, the full steam capacity of the boiler can be met with the required fuel feeding through other feeders. The fuel feeders shall be designed to deliver the maximum specified output when the boiler is in operation either with the design fuel or the worst fuel.

The fuel feeders shall be entirely enclosed with casing. The complete feeder shall be kept at a slightly positive pressure with the provision of seal air connection to prevent any back flow of fuel and air from the high pressure furnace bottom. The

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[9]	15.01.2016

outlet of the feeders shall be fitted with an air bustle to supply the necessary assistance air to augment smooth fuel feeding apart from the gravity fed provision.

Inclined coal chutes of stainless steel shall be provided at the outlet of the air bustle of each feeder. The inclination of the chutes shall be selected to ensure smooth flow of fuel at all operating conditions.

3.9 Limestone (Sorbent) Feeding System

Limestone feeding system shall be provided to reduce SOx emissions. The capacity of the system shall be designed on the basis of sulfur content in the fuel. The system shall consist of limestone milling plant, limestone powder handling system for conveying the pulverized limestone pneumatically up to limestone storage bunkers in the boiler area and limestone injection system from the storage bunkers up to the furnace inlet. Airlock feeders of gravimetric type shall be provided for injecting the limestone powder from the storage bunkers to the furnace inlet.

3.10 Loop Seal

A loop seal consisting of a bubbling fluidized bed shall be provided between the cyclone separator and the furnace. The loop seal shall be complete with distribution grid, air nozzles, fuel injection arrangement, sorbent injection arrangement and dedicated air blowers with accessories shall be provided. The pressure in the Loop seal shall be higher than the furnace pressure so as to prevent combustion gases to back flow into the cyclone. The details of loop seal shall be furnished along with the offer for customers review and acceptance.

3.11 External Fluidized Bed Heat Exchanger (EFBHE)

EFBHE consisting of a bubbling fluidized bed complete with distribution grid, air nozzles, heat exchanger tube bundles and dedicated air blowers with accessories shall be provided as per the bidder's standard practice. The details of EFBHE shall be furnished along with the offer for customers review and acceptance.

3.12 Bottom Ash Removal System

Bottom ash removal system shall be designed to remove bed ash by continuous overflow to maintain bed height and also by intermittent flow from the bottom through ash drains to remove oversize particles, maintain bed pressure drop, avoid accumulation and consequent de-fluidization. The system shall be designed as the bidder's standard practice. The details of Bottom ash removal

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[10]	15.01.2016

system shall be furnished along with the offer for customers review and acceptance.

3.13 Bottom Ash Cooling System

Bottom ash cooling system shall be provided to cool the bottom ash to 120 to 150 deg C before entering the bottom ash conveying system. For this purpose, suitable ash coolers either of air cooled or water cooled type shall be provided as the bidder's standard practice. The details of Bottom ash cooling system shall be furnished along with the offer for customers review and acceptance.

3.14 Enclosures

The Boiler shall be constructed to form an air and gas tight chamber from air inlet to flue gas outlet for preventing leakage.

Adequate number of access and observation openings/doors shall be provided at various levels and positions in the furnace, superheaters, reheater and other enclosed parts. Doors shall be hinged and air tight and shall meet all safety requirements by law or special regulations.

Access shall be adequate for taking power operated maintenance cradle within the furnace, either in assembled or dismantled condition. Adequate openings on roof and fixing arrangements as required shall also be provided.

Enclosure shall include a fin-welded or fusion-welded wall or a welded steel plate casing fastened directly to furnace tubes, necessary insulation and an outer lagging or ribbed type clad aluminum alloy 3004 with stucco embossed finish, not less than 1 millimeter (0.040 inch).

Furnace and rear pass enclosure walls shall be suitable for water washing.

Hinged access doors, arranged to permit convenient and safe access for maintenance, shall be provided at floor and platform levels. Access and observation doors shall be also provided to permit access to all compartments and the easy removal of slag accumulation. Access doors shall be not less than 400 millimeters (16 inch) in diameter. All doors shall be provided with seals.

3.15 Air Heaters

Tubular type air heaters shall be provided for heating the primary air and secondary air and shall be designed for 60% BMCR condition.

Gas velocity through air heater should not exceed 10 m/sec.

Access doors shall be air and gas tight when closed and be of adequate size for inspection, cleaning and replacement of parts.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[11]	15.01.2016

Isolating gates/ dampers (flap type with sealing efficiency > 99.5%) shall be provided for both APH at inlet & outlet of the APH and carrying out maintenance.

The Steam Coil Air Preheater (SCAPH) shall be adequate to maintain cold end mean metal temperature 10 deg.C above acid dew point. SCAPH shall be complete with necessary valves, remote operated control valve, motor operated isolating valve, steam piping, steam traps etc.

Suitable water wash hopper(s) shall be furnished with flanged connection(s). Hoppers shall be water tight for water washing. The air heaters shall be arranged for external water washing. An access platform shall be provided at each hopper outlet flange.

A complete air heater soot blowing system shall be provided with each air heater.

The Steam Coil Air Preheater (SCAPH) shall be adequate to maintain cold end mean metal temperature 10 deg.C above acid dew point. SCAPH shall be complete with necessary valves, remote operated control valve, motor operated isolating valve, steam piping, steam traps etc.

Bidder may propose alternate arrangement for the SCAPH for the back end corrosion protection (viz hot air recirculation or gas bypass etc). However, for such alternative bidder shall clearly explain their proposed arrangement in the bid document for Owner's review.

Design of air and gas ducts to and from the air heater shall be of suitable design for even distribution of gas and air across the air heater at all loads. Design of air heater shall permit off-load water washing with suitable hoppers.

3.16 Air and Flue Gas System

The air and flue gas system shall be designed to meet the requirements of 100% SG MCR conditions and with the fuels specified.

The air and flue gas system shall consist of 2x 60% capacity centrifugal backward curved fans of each type, tubular air preheater (APH), Air heater bypass system, cold air, hot air, and flue gas ducting, dampers and expansion joints etc.

The air and flue gas system for each of the Boiler unit shall be balanced draft system and shall consist of 2 x 60% capacity PA fans, 2 x 60% capacity SA Fans, 2 x 60% capacity centrifugal type ID fans with variable speed hydraulic coupling, 1 x 100% tubular air preheater shall be provided for preheating the

- (a)Primary Air and
- (b)Secondary Air

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[12]	15.01.2016

High pressure blowers (2 x100 % capacity) shall be provided for supplying the fluidizing air for the ash coolers and ash classifier [if applicable] with 100 % isolation and handling arrangement for individual streams with associated cold air, hot air and flue gas ducting and dampers to handle the Boiler requirements.

All the dampers and shafts shall be bearing supported.

The sizing criteria for the fans shall be as follows:

Sl no	Particulars	Primary fan	air Secondary air (SA) Fan	Seal blowers for sealing air requirement	Wall for fluidising air Blower for ash coolers	ID Fan
a.	No of fans per unit	2 x 60 %	2 x 60 %	2 x 100 %	2 x 100 %	2 x 60 %
b.	Test block margins					
i)	Flow, Mass Rate	+ 20 %	+ 20 %	+ 20 %	+ 20 %	+ 20 %
ii)	Variable pressure *	+ 30 %	+ 30 %	+ 30 %	+ 20 %	+30 %
iii)	Temperature , OC	+ 5	+ 5	+14	Max Ambient	+15
c.	Maximum rotating speed, rpm	< 1500	<1500	<1500	<3000	<750
d)	Type of motor	Induction	Induction	Induction	Induction	Induction

*Variable pressure is defined as pressure loss associated with ducts, dampers and valves.

Fans shall be sized to provide adequate air flow for the range of fuels specified at BMCR load. Owner reserves the right to review all fan and blower calculations, including supporting calculations.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[13]	15.01.2016

The rotor shall be overspeed tested to at least 10% above the maximum operating speed and shall be dynamically balanced. The fan shaft is to be supported in bearings on either side independent of the casings. Overhung impellers will not be acceptable.

All fans shall be designed for under frequency operation up to 47.5 Hz without any reduction in its performance. The first critical speed of the rotor shall be well above the operating speeds (by at least 15%).

Forced oil lubrication system (if offered) for the fans and motors shall consist of 2 x 100% oil pumps each with motor, 2 x 100% oil coolers and filters; one (1) oil tank associated valves, piping, one number nitrogen filled pressure vessel etc.

The flow induced pulsation should be avoided by suitable design of fan and connecting duct work.

Suitable design of shaft sealing shall be provided to prevent ingress of atmospheric air.

Each bearing pedestal of all the fans and blowers shall be provided with vibration sensors to facilitate on line monitoring from the control room.

Each bearing housing of all the fans and blowers shall be provided with adequate number of duplex RTD's and temperature indicators for remote and local monitoring.

Each bearing is to be provided with oil level indicator and a screwed drain plug. Adequate sealing arrangement shall be provided at each end of the bearing housing to prevent leakage of lubricating oil.

Silencer shall be provided at the inlet of fans sucking atmospheric air with weather hood and inlet screen. The suction shall be taken at least 10m above the ground. The silencer shall be adequately designed with GI sheets of 2 mm thickness.

Each bearing shall be provided with an oil bath to prevent bearing damage in case of complete loss of plant auxiliary power when the fans must coast down without power.

An adequate number of interconnecting, isolating and control dampers with drives shall be provided on all cold air, hot air, seal air and flue gas ducting before and after equipment on these systems to permit proper operations. The control dampers shall be pneumatically operated and isolation dampers shall be electrically operated along with manual operation provision.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[14]	15.01.2016

The gas and air ducts shall be designed for wind loads as loads as specified for the steam generating unit proper and their own weight including fly ash load which may get deposited at the duct bottom, insulation and lining. The top of the ducts shall be crowned to ensure proper drainage. The bottom portion of the flue gas duct between air heater outlet and ESP inlet shall have wall thickness of minimum 10mm to counter erosion. However the thickness of the other three sides of this duct shall be of minimum 6 mm thick.

The duct work shall be free to expand, but it shall be rigid against wind and seismic disturbances. Adequate provision shall be made for all expected expansion or contraction. Metallic expansion joints shall be used in air and flue gas systems. MEJ shall be provided with internal sleeve to protect against ash, bed material etc. If Non metallic Expansion joints are used, same shall be with bolster arrangement.

All gas and air ducts shall be designed to ensure uniform distribution of gas and air flow to the various portions of the unit. These ducts shall consist of turning vanes / baffle plates, stiffening devices, metallic expansion joints, interior bracings, access doors and brackets, support structures and hangers as necessary. Compensator protection plates shall be provided in all the metallic expansion joints.

The maximum air and flue gas velocity to be considered for sizing of duct system considering 25 % excess air requirement shall be as follows:

- a) Maximum air velocity : 13 meter /sec for cold air
: 20 meter /sec for hot air
- b) Maximum flue gas velocity : 12 meter /sec for ducting up to ESP inlet
: 16 meter /sec for ducting from ESP outlet to chimney inlet

Access Doors shall be provided in all air and flue gas ducts particularly near all dampers for maintenance purposes. Each ID fan shall be provided with an access door before discharge damper.

Aerofoils shall be provided in the air ducts for the measurement of air flow of PA & SA fans at individual limbs and total air flow after air pre-heaters.

Individual continuous purging shall be provided for all Air and Flue gas transmitters. The tap points for these services shall be "Y" shaped.

The purging line shall be connected near the root valve only and not at the Transmitter end.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[15]	15.01.2016

Locking devices shall be provided to dampers to permit locking in both open and shut positions. All damper bearing shafts shall be bearing supported.

Electrical operated guillotine type isolation dampers along with drives shall be provided at locations required for carrying out internal repairs and maintenance of the equipments /fans when the Boiler is on load. The inlet dampers for ID fans shall be located in horizontal duct of main inlet duct to avoid fly ash build up when in closed position. All other regulation dampers shall be pneumatically operated and isolation dampers shall be motor operated. As a minimum guillotine type isolation dampers shall be provided before and after each ID fan.

The flue gas duct layout shall be designed considering the following aspects:

- The change of direction of flue gas duct shall be gradual to avoid ash collection at the bottom of the duct and also to prevent erosion by local concentration of fly ash.
- The number of direction changes of the flue gas duct shall be minimal to minimise the ash collection points. Adequate number of baffles to be provided at all direction changing locations.
- However, the air preheater, economiser and duct hoppers shall have provision for removal of fly ash during maintenance period when the steam generation is out of operation. To facilitate such fly ash removal, a 100% gas tight isolation gate near the hopper bottom shall be provided. The hopper bottom shall be blanked with a blind chute suitable for unloading fly ash from all the above mentioned hoppers.

All the fans and blowers shall be provided with electrically operated hoists both on fan and motor side. The primary air discharge ducts of left and right shall be interconnected with isolation dampers. The similar interconnection shall be carried out in secondary air system.

3.17

Soot Blowing System

A complete set of automatic, programmable, selective sequential-type electric motor operated and driven soot blowing equipment shall be furnished for the furnace walls, superheater, reheater, economizer and air heaters. The soot blowing system shall include all necessary blowers, electric drive motors, DCS based sequence control, all piping including drain system piping (to grade floor level), valves, safety valves, switches, hoses, electrical accessories, relays, support frames and hangers complete including all components for operation. Soot blowers shall be provided with a means of locally de-energizing both power and control circuitry for maintenance.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[16]	15.01.2016

The soot blower elements shall be as automatic sequentially operated. Adequate wall blowers have been considered for dislodging of the ash on coils and tubes.

Necessary valves for PRDS station have been considered for steam soot blowing system. LT Switchgear, control panel, complete power, control & inst. Cable of soot blower system.

The soot blower piping includes the following

- a) Supply piping through pressure reducing station.
- b) Drain piping
- c) Vent piping
- d) The complete soot blower piping shall have warm up and automatic draining features.
- e) All necessary valves, relief valves and mountings and fittings have been considered.

Electrically operated long retractable/ rotary soot blowers complete with PRV and other accessories & fittings should be supplied as per design requirement.

Sequential operation of the soot blowers will be realized in soot blower PLC panel.

3.18 Boiler Coal feeding system

The coal burning system shall be designed to meet the requirement of Boiler at 100% SG MCR condition.

To transport the solid fuel (coal) from the bunker outlets to the boiler, the system shall be complete with isolation valves /gates, chutes, feeders, with all supports / hangers, instrumentation etc for a complete system.

3.19 Blow Down System

Systems indicated below shall be as per Bidder's standard practice but details of which shall be furnished along with the offer for customer's review and acceptance.

Other specific requirements are indicated below. These are, however, minimum required.

A Blow down Tanks

One (1) no. continuous & One (1) intermittent blow down tanks (as applicable) including level gauges, redundant level transmitters for remote level control through SG C&I system, control valves, safety valves with silencer, vents, drains.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[17]	15.01.2016

All other local instruments like gauge glass, level switch, high/low level alarms and pressure/temperature instrumentation shall also be provided.

B Valves

All necessary isolating, control, regulating, check and relief valves and/or pneumatic valves, motorized valves including main steam stop valves, vent valves, drain valves, root valves, safety valves with silencer, mountings etc., as required for the boiler integral piping system. All Pneumatic operated valves shall be complete with actuator assemblies and accessories like limit switch assemblies, position transmitters, air locks etc. Integral bypass valves with actuators and accessories, for all high pressure isolating valves as specified. Any valve/mounting not specifically indicated but required for safe/efficient/reliable operation of the boiler shall be included.

The valves and accessories shall comply with the following requirements and shall include:

- a) Drain, vent, air release, instrument root drains and sampling lines shall be provided with two valves in series. However, single isolating valve shall be provided in case pressure is less than 40 Kg/ sq cm (a).
- b) Main stream stop valves with motor drives along with motorized bypass valves and piping.
- c) One non-return valve and a motor operated isolating valve with integral bypass valve on feed line(s) at inlet and as close as possible to the economizer.
- d) Steam drum safety valves with silencer and drain pans.
- e) Superheater and reheater safety valves with silencer and the drain pans for these.
- f) Electromatic relief valves, on SH outlet and RH outlet and the drain pans for these. Each of these electromatic relief valves at SH/RH outlet(s) shall be composite unit including solenoid valve assembly, pressure sensing device, impulse piping, accessories etc. The control of ERV shall be performed in DDCMIS with CRT/KBD operation. A motorised remote operated isolation valve shall be provided on upstream side of each relief valve.
- g) Start-up drain and vent isolating valves with motor drives.
- h) All start-up vents, lowest set pressure spring loaded safety valve and electromatic safety valves at superheater outlet, lowest set pressure spring loaded safety valves on steam drum and reheater outlet and impulse safety valve on reheater outlet shall be provided with separate

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[18]	15.01.2016

and independent silencers for each. The silencers shall meet specified noise levels and the safety/ relief valve floats.

- i) All instrument tapping points with root valves. Two root valves in series shall be provided for lines above 40 kg/cm² (a) pressure.
- j) Isolating and drain valves for each of gauge glasses.
- k) Necessary drain system including low noise drain valve to ensure draining of the Boilers in one hour without any assistance.
- l) A non return valve and isolation valve on boiler fill line.
- m) Any other valves not mentioned specifically but needed to complete the system with drives, wherever required.
- n) The start-up, load maneuvering and shut down of Boiler is proposed from the unit control room. The Contractor shall provide all required valves with their actuators and remote operation facilities to achieve this.
- o) Emergency drum drain valves, two (2) in series with motor drives.
- p) Power operated, regulating type valve on continuous blow down line with motorized isolation valve on either side.
- q) An identical bypass arrangement to the valves on continuous blow down line, as indicated above, shall also be provided.
- r) All other operational requirements specified elsewhere shall also be complied with. The Bidder shall provide all required valves with specified type of actuator to meet such operational requirements.

3.20 Chemical Dosing System & SWAS

- a) Skid mounted HP dosing system comprising of mixing cum storage tank (MSRL/ SS304) with motorized agitator and variable stroke, positive displacement type pumps. The plunger of the pump will be of SS304.
- b) Associated piping from pump outlet to steam drum inlet, valves, mountings, fittings, safety valves within system as per approved P&IDs.
- c) Base frame, foundation bolts & nuts, coupling set, safeguard, mating flanges etc.
- d) Necessary supports & supporting structure.
- e) Complete SWAS system.

3.21 Pressure parts design criteria

The design of all pressure parts (tubes, headers, vessels etc.) shall be as per ASME or other international codes with the approval of the purchasers. It is however, the responsibility of the Contractor to get various calculations and other

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[19]	15.01.2016

technical documentations approved by the statutory authorities in the State and country of location of the plant.

Design pressure of the boiler pressure parts shall be atleast 1.05 times the maximum operating pressure, or as required by ASME/ other international codes, whichever is higher.

For boiler drum, the design pressure shall be higher of the value as per above or highest set safety valve pressure for full discharge.

The thickness of the pressure parts (steam and water tubes/ headers, pressure vessels etc.) shall be calculated using ASME formulae/factor of safety etc. Additional erosion allowance on the calculated tube thickness shall be provided at specified locations as specified by the purchasers in these specifications.

3.22 Pressure part materials

Materials used for boiler tubing, headers, piping, vessels and other pressure parts shall comply with maximum permissible temperature limits for various materials as specified below:

- a) Up to and including 400 deg C : Carbon steel to ASTM 106 Gr C. or SA 210C or approved equivalent
- b) Above 400 deg C but below 550 deg C : Alloy steel to ASTM A335, P-11/T-11, 22/T22, P91/T91 or approved equivalent.
- c) For SH/RH outlet leg (High temperature zone) : T-91/P-91
- d) Above 550 deg C : P-91/T-91* Austenitic Steel Grade to owner's approval.

*Note: P91/ T91 material could be used only up to 590 deg C.

Water walls shall be of membrane type and water wall tubes shall be of seamless design.

3.23 Thermal Insulation

The furnace, fans, air heaters, flues, ducts, hoppers, and piping, shall be thermally insulated so that the outside surface temperature will not exceed 60 deg C. In areas where surface temperature exceeds 60 deg C, personnel protection shall be provided within 1 meters (3 feet) of platforms, walkways and general access areas, and up to 2meters (7 feet) from grade or

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-II, Section-II, Part-A	[20]	15.01.2016

platforms/walkways, or where personnel may inadvertently make contact with those surfaces.

Thermal insulation on flues, ducts, and the wind box shall be mineral fiber block or mineral fiber blanket type insulation complete with outer lagging. Lagging of the ribbed type clad aluminum alloy 3004 with stucco embossed finish, not less than 1 millimeter (0.040 inch) thick shall be provided. All surfaces shall be self-draining.

Thermal insulation on the furnace casing shall be non-corrosive, non-asbestos material, readily removable and designed to prevent hot spots due to passage of hot gasses past butted joints. Insulation shall be thoroughly dried prior to installation of the casing.

Thermal insulation on pipe and equipment shall be calcium silicate or mineral fiber block type insulation complete with aluminum outer lagging. Aluminum lagging shall be of alloy 3003 or 3005, with a minimum thickness of 0.5 millimeters (0.016 inch) and fastened with stainless steel bands. Multi-layer insulation shall be applied where the inner surface of the insulation is 316°C (600°F) and above. The maximum thickness of the insulation per layer shall not exceed 75 millimeters (3 inches).

Procedure qualification and welder performance qualification shall be in accordance with either ASME B&PV Code, Section IX or ANSI B31.1 as applicable.

3.24 Welding and Repair welding

Post-weld Heat Treatment (PWHT) along with careful attention to welding procedures is required for welded joints to ensure minimal stress and optimum ductility. Boiler design shall maximize shop-welding and minimize field connections to reduce field heat treatment as much as possible. In the weldment of dissimilar alloys, material selection must be based on consideration of PWHT temperature. All boiler field welds will be on similar tubes. All welds between transition stub tubes and austenitic stainless steel tubes should be shop-welded.

All boiler field welds shall be on similar tubes. Welds between transition stub tubes and austenitic stainless steel tubes shall be shop-welded.

All pressure parts welding and repair welding, including non-destructive examinations, shall comply with ASME B&PV Code, Section I and ANSI B 31.1, as applicable or Equivalent International Standards.

Procedure qualification and welder performance qualification shall be in accordance with ASME B&PV Code, Section IX or ANSI B31.1 as applicable.

3.25 Start Up Light Diesel Oil System

LDO system shall comprise of pressurizing pump sets of adequate capacity to meet startup requirement of Boiler, filters, strainers, burners, control valves, control and instrumentation etc with equipment redundancy and flexibility of operation, complete piping, valves, and fittings commencing from pump suction inlet from tanks right up to the burners in combustor, and re-circulating system, high energy arc igniters, scanners, and scanner cooling air system.

The startup firing system shall not require adjustment to increase capacity. The burners shall be furnished complete with all piping, manual valves, strainers, instruments, pressure regulators, solenoid valves, safety valves, and all necessary equipment and controls in accordance with NFPA 85C as applicable. Flexible stainless steel hoses to connect the burners to the LDO piping shall be provided. The system shall provide stability to solid fuel firing system. The contractor shall supply all piping and hangers for piping between each burner valve rack and the main shutoff rack.

S.No	Detail	Description
	d. Details of Pressure vessels	
	e. Details of Safety valves	
	f. Items, a,b,c shall also include tube sizes, materials, quantities and spacing	
22.2.6	Recommended mode of erection, erection sequence and other relevant particulars in respect of installation of	
	a. Structural steel	
	b. Pressure parts	
	c. Rotating and static equipment	
	d. Ducting	
	e. Steam drum	
	f. Others, as applicable	
22.2.7	Detailed recommended procedures for welding and erection	
22.2.8	Complete Fuel firing equipment description	
22.2.9	Complete description and functional writeup of the Burner Management system / FSSS including Pulveriser automation and combustion air control and general arrangement and cutout details of console inserts with bill of materials.	
22.2.10	General Arrangement and writeup on Rotary Air heaters giving details of lubrication system and instrumentation	
22.2.11	Soot blowing system description complete with Control system write-up, console Mimic diagram ,logic panel general arrangement and cut out drawings	
22.2.12	Write-up on general description of Flue ducts and dampers	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-III, Part-A	[82]	15.01.2016

S.No	Detail	Description
22.2.13	Recommended Functional block diagrams with write-ups for each Control loop required for safe and efficient Steam Generator operation	
22.2.14	A complete list of local instruments, sensing devices and control equipment covered in the proposal with type, make, accuracy, range, connection sizes, contact details, dial size etc. in the Bidder's scope.	
22.2.15	Write-up on interlocks and protection other than BMS/FSSS with logic diagrams	
22.2.16	Startup and shut down procedures	
22.2.17	Startup diagrams showing the following plotted vs. time from ignition of first ignitor to BMCR	
	a. Ignitor fuel input	
	b. Main fuel input	
	c. Drum pressure	
	d. Feed water flow	
	e. Steam flow through Super-heater	
	f. Primary Superheater outlet temperature	
	g. Superheater attemperator spray water flow	
	h. Final Superheater outlet temperature	
	i. Steam flow through Reheater	
	j. Reheater outlet temperature	
	k. If burner tilt offered	
22.2.18	Limiting conditions if any for Quick starting and loading	
	a) Write up on the boiler variable and constant pressure operations	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-III, Part-A	[83]	15.01.2016

S.No	Detail	Description
	b) Detailed write-up with supporting technical literature on the method proposed to limit NOx emission	
	c) Complete list of mill wear parts with materials and anticipated life of each part	
	d) For ESP	
	i) Schedule of power consumption for all gas streams connected to one boiler	
	ii) List of annunciations giving suggested set values of parameters	
	iii) Write up on ESP internals	
	iv) Description of T/R sets	
	v) Write up on interlocks and protections	
	vi) Detailed hopper sizing calculations	
	vii) Write up on rapping mechanism	
	e) Write up on control philosophy of F.O.system along with a list of annunciation	
	f) Write up on tracing	
	g) Write up on control philosophy of compressed air system	
	h) Write up on control philosophy of auxiliary boiler	
22.2.19	a. Schedule of valves with full particulars of valves with actuators (for powered valves) such as type, make motor rating, pneumatic consumption, limit & torque switch details, time for full opening/closing etc.	
	b. Schedule of control valves giving type and make of valves and actuators, size body & trim material etc. stroking time and full technical particulars of valves and their actuators and associated	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-III, Part-A	[84]	15.01.2016

S.No	Detail	Description
	accessories	
	c. Schedule of Dampers and vanes with full particulars of dampers and their actuators (for powered dampers) such as type of Damper & actuator, make, torque rating, stroke and stroking time, electrical rating/pneumatic consumption, limit and torque switch, position transmitter details etc. including details of associated accessories.	
22.2.20	List of insert panels, control cabinets and local control panels included in the proposal with GA drawings, mounting and cutout details	
22.2.21	List of flow elements covered in the proposal with full particulars such as design details, data sheets, make and dimensions	
22.2.22	List of Field mounted junction boxes included in the proposal	
22.2.23	List & details of Instruments and Control items mounted on control panels, including details like type, make, cutout and dimensional drawings etc.	
22.2.24	Instrument and control equipment to be made available for Light up & Steam blowing	
22.2.25	List of Measuring signals to be fed to DAS	
22.2.26	List of Annunciations giving suggested set values of parameters	
22.2.27	Boiler GA drawings for making instrument tapping points	
22.2.28	Particulars of prefabricated & other special cables included in the steam generator scope	
22.2.29	Electromatic impulse safety valve functional write-up, type, make & cut out details of the remote control station	
22.2.30	Boiler tube metal thermocouples	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-III, Part-A	[85]	15.01.2016

S.No	Detail	Description
	details, number, type, make etc.	
23.0	DRAWINGS AND EQUIPMENT LOADING DATA	
23.1	<u>Steam Generator</u>	
	a. Plan of Steam Generator and its auxiliaries at ground floor level; at lowest burner level; drum level; and at an intermediate level (preferably at the long retractable soot blower level), indicating the galleries, platforms and stairways.	
	b. Front elevation; side elevation and cross section of the Steam Generating unit showing location of headers and drums, manholes etc.	
	c. Layout of Steam Generator structural steel columns upto Stack. These shall indicate the size of members and main dimensions, with design loadings and all lifting facilities for purposes of maintenance	
	d. Layout of interconnecting platforms	
	e. Preliminary layout of air and gas ducts showing damper location, manholes, expansion joints, supports etc.	
	f. Drawing for fully gas tight dampers clearly indicating how sealing is effected and the gas tightness efficiency (on flow)	
	g. General arrangement drawings of the pulverised Coal preparation and firing equipment including locations of various dampers	
	h. Schematic drawings of the fuel/oil preparation and firing equipment	
	i. General arrangement drawings showing arrangement of FD, ID fans, air heaters, Coal pulverisers, ducting	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-III, Part-A	[86]	15.01.2016

S.No	Detail	Description
	arrangement between the Boiler and the Electrostatic Precipitator inlet cone and Precipitator outlet cone to stack with dimensions and weight	
	j. Schematic diagram indicating terminal points and Instrumentation and Controls included in Bidder's scope and suggested for following circuits clearly indicating pipe duct size (OD's and ID's) operating parameters; maximum fluid velocities; insulation thickness; and material specifications of MS, CRH, HRH, Steam Generator feed and fuel oil piping, type of actuators	
	i) Steam flow	
	ii) Feed water flow	
	iii) Blow down	
	iv) Vents and drains	
	v) Air, fuel and flue gas	
	vi) Pulveriser system	
	vii) HFO/ & LDO system in the boiler area and burner system.	
	viii) HFO heating and HFO/ & LDO pressurising system	
	ix) lubrication systems of fans/ fan motors and any other equipment	
	x) Rotary air heaters	
	xi) Soot blower piping arrangement	
	xii) Auxiliary steam system	
	xiii) Cooling water	
	xiv) Service Air	
	xv) Instrument air	
	k. Drawings of Drum with preliminary dimensions and indicating stubs, locations and details for local and remote	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-III, Part-A	[87]	15.01.2016

S.No	Detail	Description
	instruments and controls.	
	l. Scheme drawing of Chemical Dosing	
	m. Necessary erection drawings for all equipment, piping, systems, sub systems etc.	
23.2	Boiler Duct Supporting Columns	
	a. Location plan Details of location and arrangement scheme of columns, embedments and fixing details, sizes of pedestals, levels, blockouts and anchor bolts and channels indicating scope of supply by equipment supplier.	
	b. Loading on foundations Axial load, bending moments and shear forces transmitted to foundations	
	c. Complete bracing arrangement for Boiler supporting structure and combinations of (+ve) and (-ve) forces for the seismic or wind (whichever is governing).	
23.3	*Foundation and loading details of ID, & FD Fans and their drives Including Lube Oil system	
	a. Location plan, dimensions and levels of foundation, pedestal, giving details of blockouts, inserts & embedments etc.	
	b. Fixing details of motor & fan	
	c. Details of fan giving weight of fan, weight of rotating parts, GD2 max. unbalanced force, speed of fan etc.	
	d. Complete loading data at various points of fan foundation	
	e. Loading details of the Motors giving total weight of motor; weight of stator ; weight of rotor; GD2 of rotating parts; short circuit Torque; motor speed and its rating etc.	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	04	Tender Document for Selection of R&M Contractors – Boiler & Auxiliaries Volume-III, Part-A	[88]	15.01.2016

S.No	Detail	Description
23.4	*Foundation and Loading Details of Pulveriser including lube oil system	
	a. Location plan dimensions and levels of foundation pedestal giving details of blockouts, inserts & embedments etc.	
	b. Fixing details of Pulveriser & motor	
	c. Details of Pulveriser giving total weight and its speed	
	d. Details of Pulveriser motor giving total weight of motor, weight of stator, weight of rotor, GD2, short circuit torque, speed and rating.	
	e. Pulveriser handling arrangement drawings	
	f. Details and loading of monorail in Pulveriser bay, if any	
	g. Loading, level & arrangement details for Pulveriser maintenance platform.	
23.5	<u>Coal Feeder</u>	
	Location, size, loading (static+dynamic) and fixing arrangement with floor and floor cutouts.	
23.6	<u>Fuel Piping</u>	
	Layout and location of supports, loading at support points.	
23.7	<u>Miscellaneous</u>	
	a). Arrangement of interconnecting platforms between Steam Generator with Power house and Mill bunker indicating location in plan, levels, loads transmitted from these platforms to Power house structure in the vertical & horizontal direction due to dead load & seismic effects	

Document Number	Rev No.	Description	Page No.	Date of Issue

Technical Specification For R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

SL. NO.	DESCRIPTION	UNIT	DATA
	Starting current as % of full load current		
19.	Torque at full load in Kgm.		
a)	Break away torque in % of full load torque		
b)	Pull up torque in % of full load torque		
c)	Pull out torque in % of full load torque		
20.	Starting time in sec.		
a)	Without mechanism coupled		
b)	Mechanism coupled through hydraulic coupling when it may be presumed that load is transferred to motor shaft only after attaining almost full speed.		
	i. with rated voltage		
	ii. with 80% of rated voltage		
	iii. with 110% of rated voltage		
21.	Starting time in sec. With mechanism coupled through flexible coupling		
a)	with rated voltage		
b)	with 80% of rated voltage		
c)	with 110% of rated voltage		
22.	Safe stall time (hot motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
23.	Safe stall time (Cold motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
24.	Limiting motor temperature to determine safe stall time		
25.	Permissible maximum accelerating time (hot motor)		
	i. At rated voltage		
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
26.	Permissible maximum accelerating time (cold motor)		
	i. At rated voltage

---	-------------------

SL. NO.	DESCRIPTION	UNIT	DATA
	ii. At 80% of rated voltage		
	iii. At 110% of rated voltage		
27.	Class of Insulation And Material		
28.	Whether insulation is suitable for 415 V, 6.6kV system		
29.	Temperature rise under normal conditions over 50°C ambient temperature		
30.	By resistance method --- °C over cooling water temp. for CACW motors.		
31.	Degree centigrade over cooling air temp. for CACA motor.		
32.	By Thermometer method ---- Degree centigrade over cooling water temp. for CACW motor.		
33.	Degree centigrade over cooling air temp. for CACA motor.		
34.	Method of starting :		
35.	Permissible starting duty cycles :		
36.	Stator thermal time constant :		
37.	Method of cooling (If applicable)		
	Details of water cooling system		
a)	No. of cooler		
b)	Water requirement per cooler		
c)	Losses removed by cooler		
d)	Max. permissible temperature of cooling water at inlet		
e)	Max. permissible temperature of cooling water at outlet		
f)	Maximum permissible pressure at water outlet		
g)	Water pressure drop through the cooler		
h)	Temp. of cold air coming out & entering the machine For permissible cooling water temperature of [31°C]		
i)	Temp. rise of air passing through machine at full load.		
j)	Air pressure drop through The cooler		
k)	Temp. rise of water through cooler		
l)	Protection against leakage of water :		
m)	Arrangement to ensure the water flow		
38.	Bearings		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	TECHNICAL DATASHEET FOR R&M WORKS OF BOILER & AUXILIARIES VOLUME-III, PART-B	[3]	25.09.2014

SL. NO.	DESCRIPTION	UNIT	DATA
a)	Number :		
b)	Type :		
c)	Lubrication system :		
d)	Quantity of lubricant reqd. For both the bearings. Life in hours at rated speed :		
e)	Recommended lubricant :		
f)	Bearing end play :		
g)	Inlet oil pressure :		
h)	Temp. rise of oil :		
i)	Max. permissible temp. of bearing :		
j)	Max. Permissible temp. of Oil		
k)	Permissible running time without forced oil at full load & full speed :		
39.	Whether bearings are provided with 4 wire, platinum RTD having 100-ohm resistance at 0°C for remote temp. Indication.		
a)	Whether bearings are provided with local temperature indicator having two adjustable contacts rated for 5A at 240V AC or 0.5A at 220V DC. : Yes/No		
b)	If forced lube oil system provided : Yes / No		
c)	Qty of lubricant required for initial filling.		
d)	Recommended period after which lubricant should be replaced		
e)	Bearing cooling water requirement		
f)	Max. Permissible bearing cooling water inlet temp. (permissible)		
g)	Max. Permissible bearing cooling water outlet temp.		
h)	Terminal designation corresponds to direction of rotation (Facing driving end).		
i)	Terminal boxes with accessories separate terminal boxes provided.		
40.	Winding temp. detectors		
41.	Bearing temp. detectors		
42.	Moisture detectors		
43.	Neutral terminals		
44.	Main terminal box details

Technical Specification For R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

SL. NO.	DESCRIPTION	UNIT	DATA
	ii. Tropicalised (Yes/No) :		
	iii. Temp. rise over specified ambient of 50 °C. :		
	iv. Method of temp. measurement :		
b)	Degree of protection of terminal box for :		
	i. Main terminal box :		
	ii. Space heaters (AUX. TB) :		
c)	For main terminal box :		
	i. No. and type of cable gland :		
	ii. Recommended cable size (Armature/field) :		
d)	Fault level (KA, sec) :		
e)	Bearings :		
	i. Type (at DE/NDE):		
	ii. Make :		
	iii. Recommended lubricant :		
	iv. Life :		
f)	Weight of motor (Kg.) :		
g)	Field current at rated speed (A)		
h)	Field resistance (Ohm) at rated speed at 30 °C		
i)	Field trimmer rating (Ohm) for getting basic speed at 30 °C.		
j)	Resistance (Ohm) between terminals at 30°C.		
	i. Armature :		
	ii. Series winding :		
	iii. Inter pole winding :		
	iv. Shunt winding resistance:		
k)	1 st and 2 nd critical speed :		
l)	Overload that can be carried by motor without changing overall performance and period for which it is applicable		
m)	Grounding device :		
n)	Space heater :		
	i. No. & location :		
	ii. Volt & KW rating :		
4.	RESISTORS		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	TECHNICAL DATASHEET FOR R&M WORKS OF BOILER & AUXILIARIES VOLUME-III, PART-B	[8]	25.09.2014

Technical Specification For R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

SL. NO.	DESCRIPTION	UNIT	DATA
a)	Starting (external) resistance :		
	i. Type of resistor :		
	ii. Ohmic, current & power rating of resistor elements		
	iii. Max. permissible temp. of resistor elements :		
	iv. Connection diag. Of resistor elements		
	v. No. of startup stages/steps :		
	vi. Resistance values of stages :		
	-at 30 deg. C (Ohm) :		
	-at running condition (Ohm) :		
	vii. Expected temp of resistor at running condition		
	viii. Expected temp of box at running condition		
	ix. Mounting/stacking of resistor elements and G.A. of resistor box		
b)	Schematic connection diag. Of motor with starting resistor and field trimmer resistor.		
5.	CHARACTERISTIC CURVES		
a)	Starting current/times :		
b)	Thermal withstand curve for hot and cold condition		
c)	Torque/speed		
d)	Load/Efficiency		
e)	Speed/Time		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	TECHNICAL DATASHEET FOR R&M WORKS OF BOILER & AUXILIARIES VOLUME-III, PART-B	[9]	25.09.2014

Technical Specification For R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]

4 LT PCC/MCC/DISTRIBUTION BOARD

S. No.	DESCRIPTION	UNIT	DATA
1.0	General		
1.1	Name of Manufacturer		
1.2	Place & Country of manufacture		
1.3	Specifications and Standards		
2.0	Switchgear Details		
2.1	Rated voltage, phases & frequency		
2.2	System neutral earthing		
2.3	Voltage & frequency variation	%	
2.4	Rated frequency	Hz	
2.4	One minute power frequency Voltage a) For power Circuits b) For Control Circuits		
2.5	Continuous current rating of busbars under site reference ambient temp.		
2.6	Reference ambient temperature		
2.7	Maximum temperature of bus bars and droppers/connectors under site conditions specified		
2.8	Short circuit current withstand for busbars and droppers		
a	Short time	kA (rms)	
b	Dynamic Rating	kA (peak)	
2.9	Whether busbars have been insulated	Yes	
2.10	Type of insulation		
2.11	Material of bus bar supports		
2.12	Switchgear designation		
2.13	Bus bar material	Cu/Al	
2.14	Fully draw out (FD)/ Fixed (F)		
2.15	Entry –Top (T)/Bottom (B)		
2.16	Degree of protection		
2.17	Colour finish shade	Interior exterior	

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	TECHNICAL DATASHEET FOR R&M WORKS OF BOILER & AUXILIARIES VOLUME-III, PART-B	[14]	25.09.2014

Technical Specification For R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
---	-------------------

S. No.	DESCRIPTION	UNIT	DATA
2.18	Earthing bus	Material	
2.19	Minimum clearances in air of live parts	mm	
3.0	Starters		
3.1	Type	DOL Rev / Star-Delta	
3.2	Contactor rated duty		
3.3	Single phasing preventer required.	Yes / no	
3.4	Thermal overload relay reset	Manual / Auto	
4.0	Circuit breakers		
4.1	Maker's name		
4.2	Voltage, frequency & no.of phases , poles		
4.3	Rated operating duty		
4.4	Circuit breakers type		
4.5	Short circuit withstand current for 1 sec. Duration	kA	
4.6	Rated making current	kAp	
4.7	Rated current at site reference ambient temp	A °C	
4.8	Type of operating mechanism		
4.9	Minimum no. of auxiliary Contacts for purchaser's use		
4.10	Control voltage		
a	For Spring charging motor	V AC/DC	
b	For closing/tripping	V AC/DC	
4.11	Limits of voltage for satisfactory operation of the following devices as a % of normal voltage		
a	Operating mechanism	%	
b	Closing at normal voltage	%	
c	Trip coil	%	
4.12	Power required for closing at normal voltage	W	
4.13	Power required for tripping at normal voltage	W	
4.14	Spring charging motor details:

5 415V NON SEGREGATED PHASE BUS DUCT

S. No.	DESCRIPTION	UNIT	DATA
1.	Make/ Name of Manufacturer		
2.	Type of Busduct	Segregated /non segregated	
3.	Type of cooling	Natural/Forced	
4.	Reference Standard		
5.	Rated Voltage	V	
6.	No of phase and Frequency	Hz	
7.	Insulation level a) Min Power frequency Voltage b) Impulse withstand voltage	kVrms kVp	
8.	Rated Continuous current	Amp	
9.	Short time withstand capability a) Symmetrical for 1 sec b) Momentary	kA kAp	
10.	Maximum temperature rise over 50 degree design ambient temperature a) Bus bar b) Enclosure	Degree	
11.	Degree of protection of enclosure		
12.	Bus bar a) Material & Grade b) Conductivity c) Size		
13.	Enclosure a) Material & Grade b) Thickness c) Ph- ph spacing d) Over all dimension		
14.	Dc resistance in micro ohm/metre/phase a) At 20 degree b) At 85 degree

6 HV CABLES

S. No.	DESCRIPTION	UNIT	DATA
1.1.	Name of Manufacturer		
1.2	Place & Country of manufacture		
1.3	Specifications and Standards		
1.4	Design ambient temperature	°C	
1.5	System Particulars (Fill separate columns for the following particulars for each type and size of cables)		
1.6	ISI registration and validity date		
1.7	Cable type		
1.8	Whether cable shall carry ISI mark		
1.9	Voltage grade		
1.10	No. of cores and size	in sq.mm	
1.11	Suitable for earthed/unearthed system		
1.12	Permissible voltage and frequency variation for satisfactory operation		
a	Voltage		
b	Frequency		
c	Voltage and Frequency combined Continuous current carrying capacity		
1.13	For standard conditions as per IS		
a	In air	A	
b	In ground	A	
c	In duct	A	
d	In trench	A	
1.14	For site conditions :		
a)	In air	A	
b)	In ground	A	
c)	In duct	A	
d)	In trench	A	
1.15	De-rating factors for various conditions of laying are not worse than the ones specified in applicable IS Yes/No		
1.16	Conductor		
a)	Material reference standard for conductor

S. No.	DESCRIPTION	UNIT	DATA
1.2.	Name of Manufacturer		
1.2	Place & Country of manufacture		
1.3	Specifications and Standards		
1.4	Design ambient temperature	°C	
1.5	System Particulars (Fill separate columns for the following particulars for each type and size of cables)		
1.6	ISI registration and validity date		
1.7	Cable type		
1.8	Whether cable shall carry ISI mark		
1.9	Voltage grade		
1.10	No. of cores and size	in sq.mm	
1.11	Suitable for earthed/unearthed system		
1.12	Permissible voltage and frequency variation for satisfactory operation		
a	Voltage		
b	Frequency		
c	Voltage and Frequency combined Continuous current carrying capacity		
1.13	For standard conditions as per IS		
a	In air	A	
b	In ground	A	
c	In duct	A	
d	In trench	A	
1.14	For site conditions :		
e)	In air	A	
f)	In ground	A	
g)	In duct	A	
h)	In trench	A	
1.15	De-rating factors for various conditions of laying are not worse than the ones specified in applicable IS Yes/No		
1.16	Conductor		
g)	Material reference standard for conductor		

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-001	02	TECHNICAL DATASHEET FOR R&M WORKS OF BOILER & AUXILIARIES VOLUME-III, PART-B	[26]	25.09.2014

Technical Specification For R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	[Logo of Utility]
--	--------------------------

S. No.	DESCRIPTION	UNIT	DATA
h)	Grad and Shape of conductor		
i)	Nominal cross section area	mm ²	
j)	Number of wires		
k)	Diameter of wire	mm	
l)	Diameter/size of conductor	mm	
1.17	Screening/Shielding / heat barrier tape (as applicable)		
d)	Material		
e)	Type/applicable std.		
f)	Thickness		
1.18	Insulation		
a)	Material composition and confirming standard and type		
b)	Thickness of insulation		
	iii. Between cores	mm	
	iv. Between cores and inner sheath	mm	
c)	Tolerance on thickness of insulation	%	
d)	Diameter of core over insulation	mm	
e)	Specific insulation resistance at 90 degrees centigrade	ohm-cm	
1.19	Screening/Shielding / barrier tape(as applicable)		
d)	Material		
e)	Type/applicable std.		
f)	Thickness		
1.20	Inner sheath		
h)	Material, confirming standard / type		
i)	Extruded	Yes/No	
j)	Calculated diameter over laid up cores		
k)	Thickness (min)	mm	
l)	Diameter of cable over inner sheath	mm	
m)	Whether inner sheath shall be of FRLS material and meet special Tests as per specification for FRLS cables	Yes/No	
n)	Filler Material details		
1.21	Armouring		
f)	Material		
g)	Type of armouring

Technical Specification For R&M of Unit No. [...] Capacity [...] of [Name of the Power Plant]	<i>[Logo of Utility]</i>
--	--------------------------

S. No.	DESCRIPTION	UNIT	DATA
h)	No. and size of strip/wire		
i)	Whether galvanized	Yes/No	
j)	Diameter of cable over armouring	mm	
1.22	Outer sheath		
i)	Material confirming standard/ type		
j)	Extruded	Yes/No	
k)	Minimum Thickness of sheath	mm	
l)	Tolerance on thickness of sheath	mm	
m)	Min. tensile strength	N/sq mm	
n)	Min. elongation percentage at rupture		
o)	Colour of Outer sheath		
p)	Whether outer sheath shall be of FRLS material and shall meet the special tests as per specification	Yes/No	
1.23	Overall diameter of cable and and tolerance for Outer Diameter		
1.24	Scheme for identification of cores		
1.25	Short circuit withstand capacity		
a)	Short circuit current	KA	
b)	Duration of short circuit	sec	
1.26	Allowable/attainable maximum conductor temperature when carrying rated continuous currents		
1.27	Allowable/attainable maximum conductor temperature at the termination of short circuit current		
1.28	Cable constants		
a)	Max. DC resistance of conductor at twenty (20) °C	ohm/km	
b)	AC resistance per core at twenty (20) °C	ohm/km	
c)	Reactance per core at 50 HZ	ohm/km	
d)	Capacitance per core at 50Hz	microfarad/km	
e)	Insulation		
	Insulation resistance constant at 27°C and at max. rated temperature	ohm-km	
	Volume resistivity ohm cm at 27°C and at max. rated temperature		
	Min. tensile strength	N/sq.mm

8 ILLUMINATION SYSTEM

S. No.	DESCRIPTION	UNIT	DATA
1.0	GENERAL		
1.1	Normal Supply Voltage, Phase and Frequency	AC	
1.2	Variation in Supply		
	a) Voltage	%	
	b) Frequency	%	
	c) Combined voltage & frequency	%	
1.3	Design Ambient Air Temperature	°C	
1.4	System Short-Circuit Level		
	a) At 415V AC	kA(rms)	
	b) At 220V DC (For DC LP)	kA(DC)	
1.4	Luminaries Earthing Terminal Suitable for		
a	Conductor material		
b	Conductor size	SWG	
2.0	Lighting Distribution Board and Lighting panel		
2.1	Manufacturer Name		
2.2	Rated Voltage, phase and Frequency	AC	
2.3	One Minute Withstand Voltage	V	
2.4	Mounting Type		
	a) LDBs		
	b) Single Phase LP		
2.5	Type and no of circuits & feeder rating		
2.6	Colour shade		
2.7	Lighting Transformer		
	a) Type		
	b) Voltage Ratio	V	
	c) Taps	%	
	d) Vector Group		
	e) Impedance	%	
	f) Rating	KVA	
3.0	Fixture details:		
3.1	Name of Manufacturer and Country		
3.2	Luminaries		
	a) Fluorescent		
	b) HPMV		
	c) HPSV		
	d) Metal Halide		
	e) Compact Fluorescent Lamp		
	f) Flame proof		
3.3	Applicable Standards for		
	a) Luminaires

1 PROGRAMMABLE LOGIC CONTROLLER (PLC)

Table 1.1
Data Sheet for PLC

S.N	Feature	To be Filled by Bidder
1	Type of the system offered and Model No.	
2	Make -	
3	Year of launching of the system	
4	Is the system offered, the latest system available/ being marketed in the international market by the vendor	
5	Place of Manufacturing	
6	Is the offered system confirms to the Specification provided in the tender document with regard to Spare Capacity, Expandability, Redundancy,	
7	Is the System offered is with open system architecture to enable integration of third party hardware/ software applications	
8	Support direct connectivity to Ethernet based LAN	
9	Deterministic and secure architecture	
10	On-line removal/replacement of I/O modules/ drive control modules possible without switching off power supply to the corresponding rack & without affecting controller operation	
11	Total I/O handling capacity of Controller	
12	No. of Tags handling capacity of Controller	
13	Total Power requirement for the offered system	
14	Total Heat Load of all cabinets	
15	Scanning rate for	
a	Analog Signal	
b	T/C Signal	
c	RTD Signal	
d	Binary Signal	
16	Loop Execution Time for

---	-------------------

S.N	Feature	To be Filled by Bidder
a	Interlocks	
b	Close loops	
17	Auto switchover to backup redundancy Level	
a	Controller Level	
b	Power supply Level	
c	Communication Level	
18	Output Status on Controller Failure	
19	Battery back-up duration for control processor	
20	Non-volatile memory capacity to store programs, standard software to perform control, DAS & Diagnostic functions	
21	Maximum no. of Channels for	
a	Analog Input module	
b	T/C Input module	
c	RTD Input module	
d	Analog Output module	
e	Binary Input Module	
f	Binary Output module	
22	Optical Isolation for Binary Input/Output provided.	
23	Galvanic isolation for Analog Input/Output provided	
24	Can the analog and binary controls be implemented at different execution speeds, in the multi-function controllers.	
25	Simulation of Analog/Digital Input/Output possible.	
26	Data Transmission speed for	
a	Ethernet LAN	
b	Data Highway	
c	I/O Bus

1.5 Time Schedule

The time schedule for completion of facilities and performance guarantee test shall be as per SCC.

1.6 Bid Submission

- (a) The Tender Documents are issued to bidders already qualified in a pre-qualification process. The Tender documents are not transferable.
- (b) The Bid proposals are to be submitted in two parts in separate sealed covers as follows:
 - Part I** : Bid Guarantee and Technical & Commercial Proposal without prices
 - Part II** : Price Schedule and Schedule of Functional Guarantee parameters with values.
- (c) All other terms and conditions along with the Technical Specifications, General Conditions of Contract, Special Conditions of Contract, Time Schedule, Bid Guarantee details, Validity of Bid and Instructions to Bidders, etc. are contained in the Tender Documents.
- (d) Bidder shall submit the bid on or before the scheduled date and time as specified. Any offer received after the expiry of the time specified for receiving the completed bids are liable for rejection. The bid shall be submitted to:
[Designation, Address and Contact details.....]
.....]
- (e) Issuance of Tender Documents to a Bidder shall not be construed to mean that such Bidder would be automatically considered.
- (f) The Bid may be made in Indian Rupees as well as in Foreign Currencies (maximum three foreign currencies) and all payments for the entire scope will be made in Indian Rupees as well as in the respective quoted Foreign Currencies.
- (g) Bids submitted by E-mail, Fax, E-tender etc. will not be accepted.
- (h) The Tender Documents are meant for the exclusive purpose of bidding against the subject package and shall not be transferred, reproduced or otherwise used for purposes other than for which these are specifically issued.

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 2-	30.09.2015.

2 INSTRUCTIONS TO BIDDERS

2.1 Introduction

[Name of Utility], the Owner, intends to carry out the Renovation & Modernization of [Unit no.-XX ----- of the XXXX Power Plant].

Under the subject Tender, [Utility] invites bid for Renovation & Modernization of Turbo Generator & Auxiliaries package of the said Renovation & Modernization work to be carried out as per the accompanying Technical Specifications. The Bidder shall submit the offer for complete scope of work indicated in the Technical Specification.

2.2 Address and Contact Details of Owner

[Designation, Address and Contact details

-----]
-----]

2.3 General Project Information

General information about the plant and R&M project is indicated in section 3.0 on General Project Information.

2.4 Owner's Consultant

[-----], hereinafter referred to as "Consultant" is the Consulting Engineer for the project, appointed by the Owner, [-----], to provide project consultancy services.

2.5 Sources of Fund

[Utility] intends to finance the subject Package of the said renovation & modernization work, through Internal and other sources & External/ Domestic Commercial/ Borrowing from international development funding agencies. [Utility] has tied up the required fund for this package.

2.6 Cost of Bidding

The Bidder shall bear all costs associated with the preparation and submission of its bid, and the Owner will in no case be responsible or liable for these costs, regardless of the conduct or outcome of the bidding process.

2.7 Non-Transferability of Bid document

Transfer of Bid documents issued to one intending bidder to another is not permissible.

2.8 Scope of Work & Single Bidder Responsibility

The scope of the work shall be on the basis of single Bidder responsibility, covering the complete scope of work specified under these specifications and documents. It shall include the following:

- Disassembly of existing equipment/ systems as required.
- Detailed design of the systems/equipment covering all Mechanical, Electrical, Control & Instrumentation, Civil and Structural works.
- Complete manufacture, including shop inspection and testing.
- Providing engineering drawings, data, operational & maintenance manuals, etc., for the Owner's review/ approval.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 3-	30.09.2015.

- (e) Packing, forwarding and transportation including insurance from the manufacturer's works to plant site and transportation from storage yard to erection site.
- (f) Receipt, storage, preservation and conservation of system/equipment at site including construction of storage facility viz. covered, semi-covered, air-conditioned, open yard at the space allocated at site by Owner including storage-cum-erection and all other specified & statutorily required insurance.
- (g) Pre-assembly, if any, erection, testing, commissioning, completion of plant and equipment/ system, conducting trial operation, performance guarantee test and handing over of all the plant and equipment/ system covered under this specification.
- (h) Carrying out all related civil and structural works at site including construction of foundations, buildings, structures etc. Including supply of cement and steel and all other required materials.
- (i) Supply of mandatory spares and tools & tackles.
- (j) Training of Owner's personnel.

Detailed scope is provided in Volume-II of the Technical Specifications.

Bids not covering the entire scope mentioned hereinabove may be treated as incomplete and hence are liable for rejection.

2.9 Time Schedule

The completion Time Schedule for Completion of R&M work and Performance Guarantee Tests shall be as given in the SCC.

2.10 Tender Documents

The scope of contract, technical specification, bidding procedures and contract terms are prescribed in the Tender Documents. The Tender Documents comprise, inter alia, the following volumes:

Volume – I	:	Commercial
Volume – I Chapter-1	:	Invitation for Bid
Volume – I Chapter-2	:	Instructions To Bidders
Volume – I Chapter-3	:	General Project Information
Volume – I Chapter-4	:	General Condition of Contract (GCC)
Volume – I Chapter-5	:	Special Condition of Contract (SCC)
Volume – I Chapter-6	:	Forms & Schedules
Volume – II	:	Technical Specifications
Volume – II Section-I	:	Project Technical Specification
Volume – II	:	Detailed Technical Specification-Mechanical

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 4-	30.09.2015.

Section-II, Part-A		
Volume – II Section-II, Part-B	:	Detailed Technical Specification-Electrical
Volume – II Section-II, Part-C	:	Detailed Technical Specification-I&C
Volume – II Section-II, Part-D	:	Detailed Technical Specification-Civil
Volume – III	:	Technical Schedules
Volume – III, Part-A	:	Technical Schedule-Mechanical
Volume – III, Part-B	:	Technical Schedule-Electrical
Volume – III, Part-C	:	Technical Schedule-I&C

The Bidder is expected to examine all instructions, forms, terms and specifications in the Tender Documents including clarifications/corrigendum/amendments for completeness and obtain clarifications, if any, from the Owner.

The Bidder is expected to examine all instructions, forms, terms, conditions, specifications and other information in the bidding documents. Failure to furnish all information required as per the bidding documents or submission of a bid not substantially responsive to the bidding documents in every respect will be at the Bidder's risk and may result in rejection of its bid.

A prospective Bidder requiring any clarification to the Tender Documents may notify the Owner in writing by post or by e-mail followed by postal confirmation at the Owner's address indicated in ITB. The Owner will respond in writing by post or by e-mail followed by post confirmation to any request for clarification or modification of the bidding documents that it receives not later than twenty-one (21) days prior to the deadline for submission of bids prescribed by the Owner. Owner's response will be sent to all prospective Bidders that have been issued the Bidding Documents.

The Bidder is advised to visit the plant and obtain on its own responsibility all information that may be necessary for preparing the bid. The Owner will facilitate the bidder to collect such information about the plant in the manner that does not interface with plant operation and does not in any way adversely impact the interest of the Owner. The costs of visiting the site including engaging any third party consultant by Bidder, if required as per the assessment of Bidder, shall be borne by the bidder fully.

The Bidder, its personnel and agents will release and indemnify the Owner and its personnel and agents from and against all liability during such information collection and will be responsible for death or personal injury, loss of or damage to property and any other loss, damage, costs and expenses incurred as a result of the inspection.

At any time prior to the deadline for submission of bids, the Owner may, for any reason, whether at its own initiative, or in response to a clarification requested by a prospective Bidder, amend the bidding documents.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 5-	30.09.2015.

The amendment will be notified in writing by post or by e-mail followed by post confirmation to all prospective Bidders that have received the bidding documents and will be binding on them.

At any time prior to the deadline for submission of bids, the Owner, at its discretion may extend the deadline for submission of the bids.

2.11 Preparation of Bids

2.11.1 Language of Bid

The bid prepared by the Bidder and all correspondence and documents related to the bid shall be in English language, provided that any printed literature furnished by the Bidder may be written in another language, as long as such literature is accompanied by a translation of its pertinent passages in English language in which case, for purposes of interpretation of the bid, the translation shall govern.

2.11.2 Bidding Procedure

Single Stage Two Part Bidding Procedure will be followed for this package.

The bidders are required to submit, the bids for the Renovation and Modernization work in two parts. Both the parts are to be submitted together before the indicated Bid submission Time & Dates.

The Part-I Bid comprises the techno-commercial bid without prices. The main components of the Techno-Commercial Bid are Bid Guarantee, Scope of Work & Terminal Points, Technical descriptions/details, Technical Data Sheets, List of Tools & Tackles, Deviations to Technical and Commercial Specifications/Conditions, Overall Completion Time Period & L-1 Network Schedule, Resource Deployment Schedule, Detail of Sub-Contractors/Sub-Suppliers/Sub-Vendors, Spares list, Quality Assurance Programme, Details of the present commitments & details of contracts in hand, Indices and Coefficients for Price Variation etc. Part-II Bid will comprise Quoted Price and Quoted Performance Guarantee Parameters. Initially, only the Part-I Bid will be opened and Part-II Bid is kept in safe custody.

After evaluation of the Techno-Commercial (Part-I) Bids, each Bidder who has submitted a broadly responsive Part-I Bid, will be invited for Techno-Commercial Discussion, during which, all the required amendments, additions, deletions and other adjustments are noted and recorded in a memorandum. Part-II Bid (Price Bid) of only those Bidders will be opened, whose Part-I Bid is found to be responsive to Tender Specifications and Conditions. The date & time for opening of Price Bid will be intimated separately.

Techno-Commercial Bid should not contain any price data.

Price Bid should not contain any matter in respect of Technical and / or Commercial aspects other than the details specifically sought by the Owner.

2.11.3 Bid Submission

- (1). Bid proposals shall be accepted from only those eligible bidders who are found qualified during the pre-qualification process & are issued Tender Documents. Unsolicited bids shall not be taken into cognizance.
- (2). All Bid proposals shall be prepared and submitted in two parts, part-wise in separate sealed covers, with all pages serially numbered. All bids shall be prepared in the English language only, by typing or printing.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 6-	30.09.2015.

- (3). [One original and 9 (nine) identical] copies of the original with all enclosures shall be submitted by each Bidder for Part-I and Part-II, clearly indicating the original and the number of the copy (i.e., "Original", "Copy No. 1", "Copy No. 2" etc.).
- (4). All these covers shall be individually sealed and put in an outer cover which also shall be sealed and super scribed as in other covers.
- (5). The covers should be pasted properly before applying the wax seal. Failure to do so may result in rejection of such bids.
- (6). The Bidder's Bid and the documents attached thereto shall be considered as forming part of the Contract documents.
- (7). In the event of discrepancy between "Original" and any copy of the bids, the hard copy of Original shall prevail.
- (8). The Bid shall be submitted to [-----]. Bid submitted to any other office of Owner is liable for rejection. Bids submitted by Telefax or e-mail will be rejected
- (9). Owner will receive Bids in respect of all the equipment/systems and scope of work as set forth in the accompanying Technical Specifications. All bids shall be prepared and submitted in accordance with the Tender Documents.
- (10). Failure to furnish all information required in the Tender Documents or submission of a Bid not substantially responsive to the Tender Conditions and Technical Specifications in every respect or bids received in incomplete shape shall be liable for rejection. A bid shall be determined as substantially responsive in every respect, if it conforms to all the terms, conditions and specifications specified in Tender Documents without material deviations, objections, conditionality or reservations.
- (11). A material deviation, objection, conditionality or reservation is one:
 - (i). That affects in any substantial way the scope, quality or performance of the contract;
 - (ii). That limits in any substantial way, inconsistent with the Tender Documents, the Owner's rights or the successful Bidder's obligations under the contract.
- (12). Deviation(s) to vital clauses listed under the Tender Documents shall be considered to be material deviation(s).
- (13). Notwithstanding any information and data, which may be contained in these Tender Documents, the Bidder has to make independent inquiries and generally obtain his own information on all matters that may in any way affect prices, risks and obligations of the Contractor under the Contract.
- (14). Either the Indian agent or the foreign Principal directly could bid in a tender, but not both. The same applies to an Indian agent/dealer representing and Indian manufacturer. In case both submit the tenders, the tender of the manufacture will alone be considered.
- (15). An agent representing one manufacturer in a tender will not be allowed to quote on behalf of another manufacturer along with previous manufacturer in a subsequent / parallel tender for the same item.

2.11.4 Bid Guarantee

- (1). The Bid shall be accompanied by Bid Guarantee either in the form of Bank Guarantee valid for [---] days from the scheduled date of opening of the Bids (Part-I) or Demand Draft of equivalent amount drawn in favour of "[-----]" payable at "[-----]".

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 7-	30.09.2015.

- (2). The Bank Guarantee shall be from any scheduled commercial Bank in India authorized by Reserve Bank of India,, to issue such Bank Guarantee on a non-judicial stamp paper of value not less than Rs. [---]/-.The stamp paper shall be purchased in the name of the Bank. Foreign Bidders may submit the Bank Guarantee from any bank in India as above or from any foreign bank which is in the approved list of RBI.
- (3). Unless otherwise expressly stated,
 - a) The Bid Guarantee shall be executed only on behalf of the Bidder in whose name the Tender Documents have been issued.
 - b) The Bid and other documents shall be submitted only by the Bidder in whose name the Tender Documents have been issued.
 - c) The Bid Guarantee shall be executed only as per the format prescribed by Owner at ([-----]). In the event of any deviation in this regard, the decision of Owner as to whether the same could be accepted or not, will be final and binding on the Bidder.
 - d) In case of foreign Bidder, the Bid Guarantee amount shall be in US Dollar / Euro/ Indian Rupee.
- (4). The Bidder shall arrange for extension of validity of Bid and that of the Bid Guarantee upon request from the Owner.
- (5). No interest shall be paid on Bid Guarantee amount. The offer without Bid Guarantee or with short Bid Guarantee or Bid Guarantee in the form other than that specified herein above or from banks not specified hereinabove will be liable for rejection.
- (6). Any Bid not accompanied by the Bid Guarantee shall be rejected and the Bidder shall not be permitted to participate in the tender.
- (7). The Bid Guarantee shall be forfeited if the Bidder withdraws / modifies / changes / impairs / derogates the bid proposal on its own after the Bids are opened or submits forged/bogus certificates or fails to accept the Letter of Award issued by Owner or fails to submit Contract Performance Guarantee.
- (8). The Bid Guarantee of all unsuccessful Bidders shall be returned after price cover opening and price evaluation. The Bid Guarantee of the successful Bidder shall be returned after furnishing of the Contract Performance Bank Guarantee to the Owner and acceptance thereof.

2.11.5 Bid Opening

1. This is a single stage two part tender. On the specified date and time of opening, Part– I Bid containing Bid Guarantee and Technical and Commercial Proposal without Prices will be opened. At the time of opening of Part–I of the bids, the names of the bidders who submitted their bids shall be read out and other such details as Owner, at its discretion, may consider appropriate, shall be read out. The Part – II (Price Bid) will be lodged and opening date of the same will be intimated separately to those Bidders whose Part-I Bid will be determined to be substantially responsive to Tender Conditions and Technical specifications in all respects.
2. If the Bidder desires to be present at the time of opening of Part-I of bids, it shall depute its representatives (not more than two persons) in time with due authorization for participating in the Bid opening.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 8-	30.09.2015.

3. Owner takes no responsibility for delays, loss or non-receipt of Bid documents or any letters sent by post/courier either way and also reserve the right to reject any Bid in part or full without assigning any reasons thereof.

2.12 Composition of Techno Commercial Bid (Part-1 Bid)

This part shall, inter alia, include the following in the same order as listed below. One original and 9 (nine) identical copies shall be submitted.

- (i). Duly filled in "Form of Bid" (As per Annexure-B & Annexure-C of this Volume).
- (ii). Power of Attorney/Authorization with the seal of the company in favour of the person signing the Bid.
- (iii). Letter of consent: To be furnished by the Bidder and Consortium Partners/Individual Companies of the Group (as the case may be)- as per Annexure—D of this Volume
- (iv). Letter of Unequivocal Consent to be furnished by the Bidder and Assignee as per Annexure-E of this Volume
- (v). Bid Guarantee- as per Annexure A.
- (vi). Schedule of Prices as per Schedule – F1 (Table 1 to Table-7) with the word "Quoted" in lieu of Price data and all other details except price data.
- (vii). Mandatory spares as per Technical Specifications (with the word "Quoted" in lieu of Price data)
- (viii). Recommended spares (with the word "Quoted" in lieu of Price data)
- (ix). Tools & Tackles as per Technical Specifications (with the word "Quoted" in lieu of Price data)
- (x). Schedule of Performance Guarantees- as per Schedule – F1 (Table-8) with the word "Quoted" in lieu of Performance Guarantee parameters
- (xi). Signed copy of all the corrigendum's/amendments/clarifications, if any issued for the tender
- (xii). Overall Time Schedule as per Schedule – F2 and Bar chart/PERT Network schedule to achieve the time schedule
- (xiii). Deviations to the Commercial specification, if any, as per Schedule – F3.
- (xiv). Deviations to Technical Specifications, if any, as per Schedule – F4.
- (xv). Requirements of the Contractor at site, as per Schedule – F5.
- (xvi). Resource deployment schedule as per Schedule – F6
- (xvii). Details of the present commitments of the Bidder, details of contracts in hand
- (xviii). Details of Sub-Contractors/Sub-Suppliers/Sub-Vendors, if any
- (xix). Quality Assurance Programme
- (xx). Technical Details to be furnished with the Bid as called for in the Technical Specification Vol-II and Technical Bid Data Sheet Vol-III.
- (xxi). Schedule of weights and dimensions
- (xxii). Coefficients and indices for price variation formula

The Part-I Bid shall not contain any Price data.

2.13 Composition of Price Bid (Part-II Bid)

The Bidders are requested to quote the Prices and the Performance Guarantee parameters only in the specified format. Price given in Part-II should cover the entire

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 9-	30.09.2015.

scope of work as given in Part-I of the offer including list of mandatory spares and Tools & tackles with itemized price and should be as per Schedule of Price enclosed. **[One original and 9 (Nine) identical]** copies shall be submitted.

1. The Price Bid shall contain the following :

- (i). Duly filled in Form of bid as per Annexure-B & Annexure-C
 - (ii). Completely filled in Schedule of Prices Schedule – F1 (Table 1 to Table-7)
 - (iii). Completely filled in Schedule of Performance Guarantees Schedule – F1 (Table-8).
2. The Bidder shall quote his price against each item of the schedules as indicated in the enclosed formats. The Bidder shall quote the prices only once after considering all the pros and cons, risks and contingencies. Rebate percentage etc., if any, should be spelt out by the Bidder in the first Bid itself.
 3. The amount shall be quoted both in figures and words clearly and legibly. No overwriting is allowed. All scoring and cancellations should be countersigned by the Bidder. In case of illegibility, the interpretation of the Owner shall be final. All entries shall be in English language only.
 4. The Bid may be made in Indian Rupees as well as in Foreign Currencies (maximum three foreign currencies) and all payments for the entire scope will be made in Indian Rupees as well as in the quoted Foreign Currencies.
 5. Prices in Indian supply shall be quoted on Ex-works supply of plant & equipment basis including Packing & forwarding. Inland transportation, Insurance charges, etc. shall be indicated separately.
 6. Prices of imported supply of plant & equipment directly consigned to site shall be quoted on CIF Indian port on entry basis. The bidder shall also quote separately for FOB port of shipment price for ocean freight for Marine insurance, all port charges including customs clearance and inland transport charges from port of destination to Owner's site.
 7. Custom Duty, Excise Duty, Central sales tax (CST), service tax, Value Added Tax (VAT), VAT on Works Contract, other applicable taxes, duties and Cess shall be clearly indicated by the bidder in the price schedules and these taxes shall be considered for bid evaluation.

2.14 Bid Prices

Bidders shall quote for the entire scope of work on single responsibility basis & the total bid price covers all the Contractor's obligations mentioned in tender document specification or to be reasonably inferred from the tender documents/ specification in respect of the disassembly/ dismantling of existing equipment facility as specified, design, manufacture, including procurement and subcontracting (if any), delivery, construction, installation, commissioning, completion of the facilities and conductance of Performance Guarantee tests for the facilities including supply of mandatory spares, recommended spare & tools/ tackles (if any). This includes all requirements under the Contractor's responsibilities for testing, pre-commissioning and commissioning of the facilities, conducting Guarantee tests and, where so required by the tender documents, the acquisition of all permits, approvals and licenses, etc.; the operation, maintenance and training services and such other items and services as may be specified in the tender documents, all in accordance with the requirements of the Conditions of Contract and Technical Specifications.

Bidders are required to quote the price for the commercial, contractual and technical obligations outlined in the tender documents.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 10-	30.09.2015.

Prices quoted by the Bidder shall be subject to adjustment during performance of the Contract to reflect changes in the cost of labour, material, etc. A bid submitted with a fixed price quotation will not be rejected, but the price adjustment will be treated as zero. The price adjustment provision will not be taken into consideration in bid evaluation.

2.15 Signature of Bids

Each page of the Bid must be signed and stamped by the Bidder with his usual signature. The names of all persons signing should also be typed or printed below the signature. Satisfactory evidences of authority of a person signing on behalf of the Bidder shall be furnished with the Bid. Erasures or corrections in the Bid documents if any shall be signed by the person signing the Bid. Printed literature, it enclosed need not be signed. Bids not conforming to the above requirements are liable to be treated as non-responsive.

2.16 Clarifications/Corrigendum/ Amendment of Tender Specifications

1. At any time prior to the deadline for submission of Bids, the Owner may, for any reason, whether at his own initiative or in response to clarification(s) requested by a prospective Bidder, modify the Tender Specifications by amendment.
2. Clarifications/Corrigendum/Amendment shall be construed to be an integral part of the Tender Specifications, which will be notified. Amendments will be hosted in Owner's website. Bidders are requested to visit Owner's website and note amendments, if any, before submission of bid. Owner shall not be responsible if any bidder fails to notice any amendment.
3. Amendment shall be numbered serially. Signed copies of amendments & clarifications shall be enclosed in Part-I of bid by bidder.

2.17 Modification of Bids

The Bidder is not permitted to modify his Bid suo-moto after the Bid submission.

2.18 Information to be Furnished with the Bid

1. The Bid (Part-I) must clearly indicate the name of the manufacturer, the type or model of each principal item of equipment proposed to be supplied and erected. The Bid should also contain drawings and descriptive materials indicating general dimensions, material from which the parts are manufactured, principles of operation and the extent of pre-assembly involved, major erection equipment required to be deployed, method of erection and the proposed erection Organization structure.
2. The above information shall be provided by the Bidder in the form of separate sheets, drawings, catalogues, etc.
3. Any Bid not containing sufficient descriptive material to describe accurately the system / equipment proposed may be treated as incomplete and hence rejected. Such descriptive materials and drawings submitted by the Bidder will be retained by the Owner. Any major departure from these 'drawings and descriptive material submitted will not be permitted during the execution of the Contract' without specific written permission of the Owner.
4. Oral statements made by the Bidder at any time regarding quality, quantity or arrangement of the equipment or any other matter will not be considered.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 11-	30.09.2015.

5. Standard catalogue pages and other documents of the Bidder may be used in the Bid to provide additional information and data as deemed necessary by the Bidder.
6. In addition to the hard copy of Part-I Bid, the Bidder shall submit soft copy of all data sheets, Schedule, List of Mandatory spares, tools & tackles and Bar Chart/PERT as well as deviation tables in a compact disk (CD). However, hard copy alone will be considered as authentic for evaluation. Bidder shall submit all the filled in datasheet also in soft copy. Bidder shall also furnish soft copies and hard copies of Data Sheet with filled in details wherever details are required to be indicated by the Bidder.

2.19 Policy of Bids under Consideration

Bids shall be deemed to be under consideration immediately after they are opened. While the Bids are under consideration, Bidder's and/or their representatives or other interested parties are advised to refrain from contacting by any means, the Owner and/or his employees/ representatives on matters related to the Bids under consideration. The Owner, if necessary will obtain clarifications on the Bids by requesting for such information from any or all the Bidders, in writing as may be necessary.

2.20 Validity of Bid

1. The Bid shall be kept valid for acceptance for **[180 days]** from the schedule date of opening of the Part-I Bid.
2. The Bidder will not be permitted to change the substance of the Bid suo-moto, after Bid has been opened.
3. Unilateral revision or withdrawal of offer by the Bidder within the subsistence of the validity period of offer shall not be permitted. Violation of this condition shall result in rejection of the Bid without notice, besides forfeiture of Bid Guarantee. The Bidder shall also be debarred either permanently or for a fixed period, at the discretion of Owner from participating in any of the Owner's tenders.

2.21 Understanding & Clarification on Documents & Specifications

1. The Bidder is required to carefully examine the specifications and documents and fully informs himself as to all the conditions and matters which may in any way affect the 'Renovation and Modernization work to be carried out or the cost thereof. Bidders are required to visit the plant to get familiarized with local conditions. However, the Bidders' visit to site shall be at their cost and risk, without any liability on part of the Owner.
2. Bidders may seek clarifications to the prescribed clauses and / or different part of the Tender Specifications. Such a request for clarifications, if any, should reach the Owner at least **[7 (seven) days]** before the date stipulated for pre-bid meeting. The Owner then will issue interpretations and clarifications as it may think fit in during the pre-bid meeting. After pre-Bid meeting, Bidder may seek further clarification till **[21 days]** prior to schedule opening date of Part-I Bid. After receipt of such clarifications, the Bidder may submit its Bid but within the time and date as specified in the Invitation for Bid or as amended by the Owner. All such clarifications and the relevant exchange of correspondence between the parties shall be construed to form part of the tender specifications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 12-	30.09.2015.

3. Pre-Bid Conference will be organized and outcome of the pre-bid conference is binding on all the Bidders. Outcome of the Pre-Bid Conference will be intimated by the Owner to all the Bidders.
4. A copy of such clarifications duly signed and stamped shall be enclosed with the Bid (Part-I). In case any queries remain un-replied, it shall be construed that in respect of those queries, the respective stipulations of the Tender Specifications/Conditions shall continue to apply and/or no new stipulations are made with respect to those queries.
5. No extension of time for submission of Bid will be granted on account of Bidders' request for interpretation/clarifications.

2.22 Latest Hour for Receipt of Bids

Bids must reach the designated Office of Owner not later than [-----] Hrs, Indian Standard Time (IST) on the date fixed for receipt of the Bid as indicated in the Invitation for Bid. Bids delivered / received after the time and date fixed for the receipt of the bids shall be liable for rejection.

2.23 Single Bidder Responsibility

1. The scope of supply and services shall be under single Bidder responsibility.
2. The successful Bidder should not sub contract the entire work on back to back basis or otherwise.

2.24 No Claim for Compensation for Submission of Bid

1. The submission of any Bid connected with these documents and specifications shall constitute an agreement that the Bidder shall have no cause of action or claim against the Owner for rejection of his Bid.
2. Regardless of the conduct or outcome of the bidding process, Bidder shall not be entitled to claim any costs, charges and expenses incidental to or incurred by him through or in connection with his submission of Bid or its consideration by the Owner, even though the Owner may elect to modify/withdraw the Invitation for Bid or does not accept the Bid(s).

2.25 Deputation of Representatives for Discussion

After opening of the Bid, if the Owner desires to have techno-commercial discussion on the Bid, the Bidder shall be in a position to depute his competent representatives of various disciplines at short notice with full authority for finalising technical parameters as well as Commercial Terms and Conditions of the Tender.

2.26 Evaluation of Bid

1. For evaluation and comparison of price bid, the prices indicated at [-----] summary of Prices as per Schedule [-----] will be considered. The Bids received will be evaluated by the Owner to ascertain the lowest evaluated substantially responsive Bid vis-à-vis the Tender Specifications. The Bidder has to satisfy himself that full information is furnished as required in the specifications. Lack of particulars or incomplete information furnished will run the risk of rejection of the bid. The following major procedures would be followed for evaluation of bids.
2. All the Bidders would be brought on par with reference to Technical Specification, Commercial Condition, Instructions to Bidders and subsequent techno-commercial discussions/ clarifications.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 13-	30.09.2015.

3. After the evaluation of Part-I bids (techno-commercial bids) and before opening of Part-II bids (Price Bids), in case the bidders are asked to make changes to their techno commercial offer that may have price implications, Owner may give the bidders opportunity to submit addendum to price bid covering the price implication only against such changes before the opening of Part-II bids (Price Bids). All the bidders will be notified, at least 15 days before the Price Bid opening date, about such changes against which they can submit addendum to Price Bid.
4. Commercial loading would be done for non-compliance of commercial terms and conditions of the Tender Specifications other than the vital clauses, as the case may be.
5. To facilitate evaluation and comparison, the Owner will convert all bid prices expressed in foreign currencies into Indian Rupee at State Bank of India Bills Selling exchange rates prevailing on the date of opening of the price bid.
6. The Bidder is eligible for a price variation as per Tender Condition. However Price variation shall not be considered for Bid evaluation.
7. Technical loading will be done for omission of price data in respect of equipment/facilities, spares, tools & tackles, etc. The highest quoted corresponding price will be loaded against such omission. If no quoted price is available, the loading will be done as per the corresponding price as estimated by the Owner.
8. The Bidder has to meet the minimum functional performance levels indicated in Volume-II Technical Specification for all categories of Guarantees. If one or more of Functional Performance Parameters offered by the Bidder is inferior to the minimum functional performance level (i.e. higher or lower than maximum or minimum value specified in Technical Specification), then such bid will be considered non-responsive and rejected.
9. The quoted values for Performance Guaranteed Parameters given in Table below would be evaluated using evaluation factors specified. The evaluation factors shall be applicable to the differential values calculated from among the Bidders of corresponding item with appropriate highest or lowest value (i.e., the best quoted value) as the base. The evaluation will be based on the guarantee parameters inclusive of all tolerance furnished at the Guaranteed Condition. Bidders to note that the values indicated in the Schedule of Performance Guarantees shall be inclusive of all tolerances including measurement uncertainty.

Table-Bid Evaluation Factors

Sl. No.	Functional Performance Parameter	Evaluation Factor Rate
1.	Turbine Cycle Heat Rate	[-----]INR per kCal/kWhr
2.	Auxiliary Power	[-----] INR per kW
3.	[TG output]	[-----] INR per kW

{NOTE: The utilities may decide whether credit has to be given for higher TG output during Bid Evaluation and structure the Tender Document accordingly. If the bidders are asked quote the value of TG output, then credit will be given for higher quoted TG Output during Bid Evaluation. However, if Owner specifies the TG Output, it may decide not to give any credit to Bidders offering TG Output higher than specified value and structure the Tender Documents accordingly.}

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 14-	30.09.2015.

The evaluation factors rate shall be prorated for any fractions of the specified value.

- (1). Arithmetical errors will be rectified on the following basis:
 - If there is any discrepancy between the unit price and the total price that is obtained by multiplying the unit price and the quantity, the unit price shall prevail and the total price will be corrected.
 - If there is a discrepancy between the total Bid Price and the sum of total prices, the sum of the total prices shall prevail and the total Bid Price will be corrected.
 - If there is discrepancy between the rates in figures and in words, the rates expressed in words shall only prevail and shall be adopted.
- (2). All the Sl. Nos. and columns in the 'Schedules of Prices' shall be quoted. If no prices are envisaged for any of the entries, 'Nil' shall be mentioned. In this context "Nil" mentioned against any item shall construe that the Bidder shall not charge any amount separately for that item from the Owner. If the terms, such as 'not applicable' "----" or blank are mentioned against any Sl. Nos./columns, the highest amount quoted for the concerned entry among all Bidders will be loaded for purposes of evaluating the Price Bids.

2.27 Local Conditions

1. The Bidder shall inspect the site and shall satisfy himself of the site conditions and shall apprise himself of the procedure for engagement of agencies/labour and shall collect any other information, which may be required before submitting the Bid.
2. Wages not less than Minimum wages for Contract labour shall be paid as applicable in this region from time to time. Claims and objections due to ignorance of site conditions will not be considered after submission of Bid.
 - (i). The Bidder is required to carefully examine the Technical & General Specification, commercial Terms and Conditions, drawings and other details relating to work given in the Tender Specification and get fully acquainted as to all conditions and matters which may in any way affect the work or the cost thereof.
 - (ii). The Bidder shall be deemed to have exhaustively examined the Tender Specifications including the Form of Contract, to have obtained all information and clarifications on all matters whatsoever that might affect the carrying out of the work and to have satisfied himself as to the adequacy of his Bid. He is deemed to have known the scope, nature and magnitude of the work and the requirements of materials and labour involved etc. and as to all work he has to complete in accordance with the Contract for the adequacy of his Bid.
 - (iii). The Bidder shall be deemed to have visited and carefully examined the plant/ site and surroundings, to have satisfied himself about the nature and details of all existing structures, if any, and also as to the nature and conditions of the railways, roads, bridges and culverts, means of transport and communications, whether by land, water or air and as to possible interruptions thereto and the access to and from the site, to have made independent enquiries, examined and satisfied himself as to the sources for obtaining earth, gravel, sand, stones, bricks and all other construction

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 15-	30.09.2015.

materials, the site for disposal of surplus earth and debris, the available accommodation, underground existing services, sub-soil water conditions, storms, prevailing winds, climatic conditions and all other similar matters which may affect the work.

- (iv). The Bidder shall be deemed to have acquainted himself with the Indian Income tax Act, 1961, Indian Companies Act, 1956, Indian Customs Act, 1962, Indian Central Excise Act, Value Added Tax, Indian Sales Tax Act, Indian Electricity Act, Central Electricity Authority Regulations, Indian Boiler Regulations, Factories Act, Pollution Control Regulations and other related Acts & Laws prevalent in the State of [-----] and in India and as amended from time to time. The Owner shall not entertain any request for clarifications from the Bidders regarding such local conditions.
- (v). Any neglect or omission or failure on the part of the bidder in obtaining necessary and reliable information as stated above or on any other matter affecting the Bidder shall not relieve him from any risk or liabilities or the entire responsibility for completion of the work in accordance with the Tender Specifications.

2.28 Deviations

1. Normally, deviations are not permitted in commercial terms & conditions and technical specification. Nevertheless, if the Bidder takes any deviation, it shall be clearly indicated in the deviation schedule (Schedule – [-----] and Schedule- [-----] with a soft copy in MS-Word format in compact disc, with “Original” of Part-I of the Bid). Deviation listed elsewhere in the Bid shall be summarily rejected and ignored. Separate printed standard terms and conditions of the Bidder shall not be taken into cognizance and shall be totally rejected.
2. No alterations or disfigurement, other than filling in particulars wherever called for in the formats of the Tender Specifications shall be made in the Bid. Any changes/modifications made by the Bidder in Bid documents itself shall not be taken into consideration.
3. If at any later date, it is found that documents, information, averments and data submitted by the bidder in the Bid, based on which the Bidder has been considered eligible or successful or has been awarded the Contract is incorrect or false to the extent that had the correct or true information been made available to the Owner at time of tender evaluation, the Bid would have been declared ineligible or unsuccessful, the Bidder shall be forthwith disqualified or, as the case may be, the Contract awarded based on such incorrect or false information shall be cancelled and the Bid Guarantee / contract performance Guarantees deposited shall be appropriated by the Owner towards Owner’s cost, loss and damage to Owner.

2.29 Blacklisting/Debarring

In case, certificates submitted by the Bidders are found to be a forged/untrue, the Bidder will not only be disqualified for this tender but also would be black listed/debarred by the Owner. Owner would also be at liberty to inform the matter to other PSUs of the Government of India / Statutory Bodies.

2.30 Award of Contract

1. Award Criteria

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 16-	30.09.2015.

- The Owner will award the contract to the successful Bidder whose Techno-commercial bid has been determined to be substantially responsive and Price Bid to be the lowest evaluated bid, further provided that the Bidder is determined to be qualified to perform the contract satisfactorily.
- The Owner reserves the right to vary the quantity of any of the Items / Spares and / or delete any Item / Spares altogether at the time of Award of Contract.

2. Owner's Right to Accept Any Bid and to Reject Any or All Bids

The Owner reserves the right to accept or reject any bid, for any reasons including National defense and security consideration and to annul the bidding process and to reject all bids at any time prior to award of contract, without thereby incurring any liability to the affected Bidder or bidders or any obligation to inform the affected Bidder or bidders of the grounds for the Owner's action.

3. Notification of Award

Prior to the expiration of the period of bid validity, the Owner will notify the successful Bidder in writing by registered letter (Letter of Award or LOA) or by email to be confirmed in writing by registered letter, that its bid has been accepted. The notification of award will constitute the formation of the contract.

Upon the successful Bidder's furnishing of the performance securities the Owner will promptly notify each unsuccessful Bidder and will discharge its bid security.

4. Signing the Contract Agreement

At the same time as the Owner notifies the successful Bidder that its bid has been accepted, the Owner will send to the Bidder the Contract Agreement provided in the bidding documents, incorporating all agreements between the parties.

Within **[twenty-eight (28)]** days of receipt of the Contract Agreement, the successful Bidder / assignee of foreign bidder (if applicable) shall sign and date the Contract Agreement and return it to the Owner.

5. Corrupt or Fraudulent Practices

The Owner requires that Bidders, Contractors and Suppliers observe the highest standard of ethics during the procurement and execution of the contracts. In pursuance of this policy, the Owner:

- The Owner requires that Bidders, Contractors and Suppliers observe the highest standard of ethics during the procurement and execution of the contracts. In pursuance of this policy, the Owner :
 - "corrupt practice" means the offering, giving, receiving or soliciting of anything of value to influence the action of a public official in the procurement process or in contract execution; and
 - "fraudulent practice" means a misrepresentation of facts in order to influence a procurement process or the execution of a contract to the detriment of the Owner, and includes collusive practice among Bidders (prior to or after bid submission) designed to establish bid prices at artificial non-competitive levels and to deprive the Owner of the benefits of free and open competition;

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 17-	30.09.2015.

- will reject a proposal for award if it determines that the Bidder recommended for award has engaged in corrupt or fraudulent practices in competing for the contract in question;
- Will declare a firm ineligible, either indefinitely or for a stated period of time, to be awarded a contract if it at any time determines that the firm has engaged in corrupt or fraudulent practices in competing for or in executing a contract of the Owner.

6. Fraud Prevention Policy

The Bidder along with its associate/collaborator/sub-contractors/sub-vendors/consultants/service providers shall strictly adhere to the Fraud Prevention Policy of Owner displayed on its tender website and shall immediately apprise the Owner about any fraud or suspected fraud as soon as it comes to their notice. A certificate to this effect shall be furnished by the bidder along with his bid.

2.31 Agency Commission

No Agency commission shall be payable under the Contract.

2.32 Contract Performance Bank Guarantee (CPBG)

As a Contract security, the successful Bidder, to whom the work is awarded, shall be required to furnish a Contract Performance Bank Guarantee (CPBG) in the Format attached as Annexure- G, in favour of the Owner within 30 days from the date of issue of Letter of Award (LOA). The guarantee amount shall be equal to ten percent (10%) of the 'Contract Price' and it shall guarantee the faithful performance of the 'Contract' in accordance with the terms and conditions specified in these documents and specifications. The CPBG shall be valid till the end of 'Warranty Period' plus Ninety (90) days grace period. If the contract price is in more than one currency, CPBG shall be 10% of respective currency.

If the bidder is a joint venture of two firms who collectively meet the Qualifying Requirement, in addition to the Contract Performance Guarantee (CPBG) of 10% furnished by the bidder, each of the JV partner shall furnish Additional Contract Performance Guarantee equal to 1% of Contract Price. To clarify further, in such a case, the value of Contract Performance Bank Guarantee furnished by the Bidder and Additional Contract Performance Bank Guarantee furnished by the JV partners taken together shall be 12% of the Contract Price.

If the bidder is a Consortium of two firms, in addition to the Contract Performance Guarantee (CPBG) of 10% furnished by the Consortium Leader, the other consortium member will furnish Additional Contract Performance Bank Guarantee equal to 2% of Contract Price. To clarify further, in such a case, the value of Contract Performance Bank Guarantee furnished by the Bidder (Consortium Leader) and Additional Contract Performance Bank Guarantee furnished by the other consortium member taken together shall be 12% of the Contract Price.

In case of a successful foreign bidder, if the Owner accepts to enter into the Second Contract and / or Third Contract with the assignee, then, within Thirty (30) days after receipt of Letter of Award, the assignee shall furnish an additional Contract Performance Bank Guarantee for five percent (5%) of the value of the Contract entered into with the assignee (i.e. for five percent of aggregate value of component Contract(s) entered into with the assignee).

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 18-	30.09.2015.

2.33 Contract Quality Assurance

1. The Bidder shall include in his Bid a detailed Quality Assurance Programme containing the overall quality, management and procedures which he proposes to follow in the performance of the 'Works' during various phases.
2. After Letter of Award (LOA) the detailed Quality Assurance Programme to be followed for the execution of the 'Contract' will be mutually discussed and agreed to and such agreed Programme shall form a part of the 'Contract'.

2.34 Codes & Standards

Specifications give reference to Indian or internationally accepted Standards. However, equipment or materials meeting other recognized National or International Standards, which ensure an equal or superior quality than Standards specified, will also be accepted. For details of codes and standards refer Technical specification, Volume-II.

2.35 Vital Clauses

The following clauses in the Tender Specification & Draft Contract are vital. Bidder is advised not to take deviations to these clauses. If deviations are taken from the stipulations of these clauses, such Bids would be liable for rejection:

- Scope of Work
- Time Schedule
- Price Basis
- Contract Performance Guarantee
- Warranty
- Liquidated Damages
- Force Majeure
- Arbitration
- Taxes & Duties
- Bid Guarantee
- Patents, Indemnity
- Validity of Bids

4 GENERAL CONDITIONS OF CONTRACT (GCC)

4.1 Definitions

- i. **"Applicable Laws"** means the laws of any national, state, local or municipal legislature in India, or of any other Competent Authority, including all laws, acts, judgments, statutes, rules, regulations, ordinances, orders, decrees, injunctions, governmental authorizations, requirements of Applicable Permits and any agreements, decisions, acts, instructions, requirements, directions and notifications of any competent or other Competent Authority or court or tribunal or arbitrator having jurisdiction over the matter in question, including those related to taxes, assessments, expropriation and duties, or authoritative interpretation, as amended, modified, enacted, reinterpreted or revised from time to time hereafter.
- ii. **"Applicable Permits"** means all permits, licenses, authorizations, consents, decrees, waivers, privileges, acknowledgements, concessions, approvals, rulings, decisions and visas from, filings with or applications submitted to, any Competent Authority or court or tribunal of competent jurisdiction necessary from time to time for or in relation to the performance of the Works, including as detailed in this GCC.
- iii. **"Agreement"** means the Contract Agreement (entitled "Contract Agreement") executed by the parties to which these Conditions are annexed and also includes supplements & amendments to the Contract Agreement.
- iv. **"Contract"** means the Agreement entered into between Owner and Contractor as per the 'Contract Agreement' signed by the parties, including contract documents, contract schedules, all attachments and appendices thereto and all documents incorporated by reference therein.
- v. **"Contract Documents"** means the complete documents, which are the basis of finalization of the contract, including correspondence exchanged from issue of tender till date of signing the contract. All such documents shall be listed in the Contract Agreement.
- vi. **"Contractor's Equipment"** means all plant, facilities, equipment, machinery, tools, apparatus, appliances or things of every kind required in or for installation, completion and maintenance of Facilities that are to be provided by the Contractor, but does not include Plant and Equipment, or other things intended to form or forming part of the Facilities.
- vii. **"Contractor"** means the person(s), Firm or a Company whose bid to perform the Contract has been accepted by the Owner and shall be named as such in the Contract Agreement, and includes the legal successors or permitted assigns of the Contractor.
- viii. **"Contract Price"** means any sum or sums finally accepted by the Owner for the execution of this contract, subject to such additions and adjustments thereto or deductions there from, as may be made pursuant to the Contract.
- ix. **"Contractor's Representative"** means any person nominated by the Contractor & approved by the Owner hereof to perform the duties delegated by the Contractor.
- x. **"Consulting Engineer"** means Owner's Engineer appointed by the Owner. Also refers to any other firm(s) or person(s) as may be appointed by the Owner from time to time.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 21-	30.09.2015.

- xi. **“Commissioning”** means the construction of plant and equipment for operation of the Facility at rated capacity are complete and the plant and equipment achieves the designated full load/full capacity, at designated fuel/input.
- xii. **“Completion”** means that the Facilities (or a specific part thereof where specific parts are agreed) have been completed operationally and structurally and put in a tight and clean condition, and that all work in respect of pre-commissioning of the Facilities or such specific part thereof has been completed and commissioning has been attained as per Technical Specifications.
- xiii. **“Competent Authority”** means any agency, authority, department, inspectorate, ministry or statutory person (whether autonomous or not) of GOI, [Name of the State], Ministry of Environment and Forests (MoEF) any other State of the Republic of India or any local authority.
- xiv. **“Day”** means calendar day of the Gregorian calendar.
- xv. **“Defect Liability Period”** means the period of validity of the warranties given by the Contractor, commencing at completion of the Facilities or a part thereof, during which the Contractor is responsible for defects with respect to the Facilities.
- xvi. **“Effective Date”** means the date from which the Time for Completion of the facilities and other milestones for execution of the Renovation & Modernization work as per the scope of work under this tender by the Contractor shall be determined.
- xvii. **“Erection Services”** means those entire services ancillary to the supply of the plant and equipment for the Facilities, to be provided by the Contractor under the Contract. e.g. transportation and provision of marine or other similar insurance, inspection, expediting, site preparation works (including the provision and use of Contractor's Equipment and the supply of all construction materials required), installation, testing, Pre-commissioning, commissioning, operations, maintenance, the provision of operations and maintenance manuals, training of Owner's Personnel etc.
- xviii. **“Facilities”** means the plant and equipment to be supplied and installed, as well as all the Erection Services to be carried out by the Contractor under the Contract.
- xix. **“Force Majeure”** means mean any event beyond the reasonable control of the Owner or of the Contractor, as the case may be, and which is unavoidable notwithstanding the reasonable care of the party affected.
- xx. **“GCC”** means the General Conditions of Contract hereof.
- xxi. **“Good Industry Practice”** means the exercise of that degree of skill, diligence and prudence which would reasonably and ordinarily be expected from a skilled and experienced Contractor, equipment manufacturer or operator applying the standards generally adopted by global Contractors, global equipment manufacturers and operators in the construction or operation of power generation facilities or the manufacture of equipment therefore, except in so far as inconsistent with any applicable Indian law or directive.
- xxii. **“Guarantee Test(s)”** means the test(s) specified in the Technical Specifications to be carried out to ascertain whether the Facilities or a

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 22-	30.09.2015.

- specified part thereof is able to attain the Functional/Performance Guarantees specified in the Technical Specification.
- xxiii. **"Incoterms"** means International rules for interpreting trade terms published by the International Chamber of Commerce (latest edition), Paris (France). Unless inconsistent with any provisions of the contract, the meaning of any trade term and the rights and obligations of the parties there under shall be as prescribed by Incoterms.
 - xxiv. **"Inspector/Inspecting Engineer"** means the Owner or any person nominated by the Owner from time to time, to inspect the equipment of works under the contract and/or the duly authorized representative of the Owner.
 - xxv. **"Latent Defect"** means the defects inherent in the material or arising out of design deficiency which does not manifest itself during the Warranty Period/Defect Liability Period, as described in this GCC.
 - xxvi. **"Letter of Intent (LOI)/Letter of Award (LOA)"** means the official letter issued by the Owner notifying the Contractor that its Bid Proposal has been accepted.
 - xxvii. **"Month"** means calendar month of the Gregorian calendar.
 - xxviii. **"Manufacturer's Works" or "Contractor's Works"** means the place used by the Contractor, its manufacturer, supplier, collaborators or sub-contractors/vendors/sub-vendors for the performance of the works.
 - xxix. **"Operational Acceptance"** means the acceptance by the Owner of the Facilities (or any part of the Facilities where the Contract provides for acceptance of the Facilities in parts), which certifies the Contractor's fulfillment of the Contract in respect of performance guarantees of the Facilities.
 - xxx. **"Owner" or "Purchaser"** shall means the [Name of the Utility], and includes its legal successors or permitted assignees.
 - xxxi. **"Person"** means any natural person, firm, corporation, company, voluntary association, partnership, joint venture, trust, and incorporated organization, unincorporated organization, Competent Authority or other entity.
 - xxxii. **"Pre-commissioning"** means the testing, checking and other requirements specified in the Technical specifications that are to be carried out by the Contractor in preparation for commissioning.
 - xxxiii. **"Project"** means the Owner's [-----] in respect of which the Contract has been signed.
 - xxxiv. **"Project Consultant" or "Owner's Consultant"** means the engineering firm or person(s) appointed by the Owner to render engineering project consultancy services for the project.
 - xxxv. **"Project Manager"** means the person appointed by the Owner thereof and named as such, to perform the duties delegated by the Owner.
 - xxxvi. **"Plant and Equipment"** means permanent plant, equipment, systems, machinery, apparatus, articles and things of all kinds to be provided and incorporated in the Facilities by the Contractor under the Contract (including the spare parts to be supplied by the Contractor under the Contract Agreement), but does not include Contractor's Equipment.
 - xxxvii. **"SCC"** means the Special Conditions of Contract hereof.

- xxxviii. **“Site”** means the land and other places upon which the Facilities are to be installed, and such other lands or places as may be specified in the Contract as forming part of the Site.
- xxxix. **“Sub Contractor”, including “Vendors/Sub-Vendors”**, means any firm or person to whom execution of any part of the Facilities, including preparation of any design or supply of any plant and equipment is subcontracted directly or indirectly by the Contractor, and includes its legal successors or permitted assignees.
- xl. **“Technical Specification / “Tender Documents”** means the document, setting out a description and specification of the Works and statement of the technical and other standards to which the Works are to be performed including any modifications thereto made in accordance with the Conditions. This includes the technical & commercial specifications and other Tender Documents forming a part of the Contract and such other Schedules and drawings as may be mutually agreed upon.
- xli. **“Tenderer”/“Bidder”** means the Person(s), Firm/Company who has submitted its Bid Proposal in response to the bid invitation by the Owner, for the Project.
- xl.ii. **“Time for Completion”** means the time within which completion of the Facilities as a whole (or of a part of the Facilities where a separate time for completion of such part has been specified) is to be attained in accordance with the stipulations and provisions of the Contract.
- xl.iii. **“Warranty Period” or “Defect Liability Period”** means the period during which the Contractor shall remain liable for repair or replacement of any defective part of the works performed under the contract, free of cost.
- xl. iv. **“Work(s)”** means and includes the tasks of furnishing of equipment, labour & services, transport, handling, unloading and storage at site, civil construction and complete erection, testing, commissioning putting into satisfactory operation and completion of successful performance tests, reliability tests and any other guaranteed parameters as defined in the Contract, replacement, modification, repair of defective parts or equipment during warranty period and rectification of latent defects during latent defect period.
- xl. v. **“Writing” or “Written”** shall include any manuscript, type-written or printed statement, under or over signature and/or seal as the case may be.

When the words "Approved", "Subject to Approval", "Satisfactory", "Equal to", "Proper", "Requested", "As Directed", "Where Directed", "When Directed", "Determined by", "Accepted", "Permitted", or words and phrases of similar importance are used, the approval, judgment, direction, etc., is understood to be a function of the Owner. Words implying persons or the gender neutral pronoun 'it', shall include firms, companies, corporation, associations or body of individuals whether incorporated or not. Words implying masculine gender or singular number shall also include the feminine gender and plural number and vice-versa where the context so requires or permits.

Terms and expressions not herein defined shall have the same meaning as are assigned to them in the Indian Sale of Goods Act (1930), failing that in the Indian Contract Act (1872) and failing that in the General Clauses Act (1897) including amendments thereof, if any.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 24-	30.09.2015.

4.2 Contract Documents

- a) All documents forming part of the Contract (and all parts thereof) are intended to be correlative, complementary and mutually explanatory. The Contract shall be read as a whole.
- b) The Contract will be signed in three originals and the Contractor shall be provided with one signed original and the rest will be retained by the Owner.

4.3 Order of Precedence of Contract Documents

In case there is any ambiguity of conflict between different contract documents, the order of precedence shall be as follows:-

- i. The signed Contract Agreement & the annexure/ appendices thereto (highest precedence)
- ii. Notification of award.
- iii. Special Condition of Contract
- iv. General Condition of Contract
- v. Technical specification & Tender Drawing submitted by the contractor.
- vi. The bid & schedules/ attachment.

4.4 Interpretation

All Contract Documents, all correspondence and communications to be given, and all other documentation to be prepared and supplied under the Contract shall be written in English, and the Contract shall be construed and interpreted in accordance with English language.

The singular shall include the plural and the plural the singular, except where the context requires otherwise.

Unless inconsistent with any provision of the Contract, the meaning of any trade term and the rights and obligations of parties there under shall be as prescribed by Incoterms. Incoterms means latest edition of International Rules for Interpreting Trade Terms published by the International Chamber of Commerce Paris, France.

4.5 Construction of the Contract

The Contracts to be entered between the Owner and the Contractor shall be as under:

- 'First Contract' for CIF Supply of all Offshore Plant and Equipments and Materials including Mandatory Spares to be supplied from abroad.
- 'Second Contract' for Ex-Works Supply of all Plant and Equipments and Materials including Mandatory Spares of Indian origin.
- 'Third Contract' for providing all services i.e. Port Handling, Port Clearance and Port Charges for the imported goods, further Loading and Inland Transportation for Delivery at Site, Unloading, Storage, Handling at Site, Installation, Insurance, Testing and Commissioning including carrying out Guarantee Tests for all the Equipments supplied under the First Contract and the Second Contract and all other services specified in the Tender Documents.

All the above Contracts will contain a cross-fall breach clause specifying that breach of one Contract will constitute breach of the other Contracts which will confer a right on the Owner to terminate the other Contracts also at the risk and the cost of the Contractor.

The foreign bidder, however, has the option, to be exercised as a part of its bid proposal, to propose an Assignee in its bid to execute the Second Contract and/or the Third Contract. Such foreign bidder shall furnish a written unequivocal consent (with

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 25-	30.09.2015.

Part-I Bid) of the proposed Assignee to work as independent Contractor on the terms and conditions offered by the bidder For the scope of work envisaged by the foreign bidder, in its bid, to be executed by Assignee, the Assignee should have relevant/required capacity and experience of executing similar job. The bidder shall substantiate with relevant/required documents in the bid to establish capacity and experience of the Assignee.

If the foreign bidder has proposed an Assignee in its bid to execute the Second Contract and/or the Third Contract and has also furnished written unequivocal consent of the proposed Assignee to work as an independent Contractor on the terms and conditions offered by the bidder and if the Owner is satisfied with the capacity and experience of the Assignee proposed in the bid, the Owner will enter into the "Second Contract" and/or the "Third Contract" with the Assignee. However, if the Owner in its judgment does not find acceptable the Assignee proposed in the bid as its Contractor, then on the request of the Owner, the Bidder shall have option to propose an alternate Assignee on the same terms and conditions and cost as offered in its bid. In case the Assignee option is not exercised by the Bidder or if the Assignee fails to enter into Contract(s) with the Owner or if the Owner in its judgment does not find acceptance of the Assignee as its Contractor, then the foreign bidder shall be obliged to enter into and execute all the contracts envisaged to be entered upon this Tender with the Owner covering the entire scope of work envisaged in the Tender Documents on the same terms and conditions and cost as offered in its Bid.

If any foreign bidder has proposed an Assignee in his bid to execute the Second Contract and/or the Third Contract and has also furnished written unequivocal consent of the proposed Assignee to work as independent Contractor on the terms and conditions offered by the bidder and if the Owner is satisfied with capacity and experience of the Assignee, the Owner will enter into the 'Second Contract' and/or 'Third Contract' with the said Assignee. In case no Assignee has been proposed by the foreign bidder in his bid or if the Assignee fails to enter into the Second Contract and/or Third Contract with the Owner or if the Owner in its judgment does not find acceptance of the proposed Assignee as its Contractor, then the foreign bidder shall be obliged to enter into and execute all the three Contracts with the Owner.

If the Owner accepts to enter into Second Contract and/or Third Contract with the Assignee of foreign bidder, the said Assignee, in addition to the Contract Performance Securities to be provided by the foreign Contractor shall provide within [twenty eight (28)] days of Notification of Award, separate Contract Performance Bank Guarantee equivalent to five percent (5%) of the value of the Contract(s) entered into with the Assignee for the due performance of the Contract, with an initial validity up to [ninety (90) days] beyond the scheduled Defects Liability Period.

The award of the separate Contracts shall not in any way dilute the responsibility of the Contractor for the successful completion of the Facilities as per Contract Documents and a breach in one Contract shall automatically be construed as a breach of the other Contract(s) which will confer a right on the Owner to terminate the other Contract(s) also at the risk and the cost of the Contractor.

4.6 Independent Contractor

The Contractor shall be an independent contractor performing the Contract. The Contract does not create any agency, partnership, joint venture or other joint relationship between the parties hereto.

Subject to the provisions of the Contract, the Contractor shall be solely responsible for the manner in which the Contract is performed. All employees, representatives or Subcontractors engaged by the Contractor in connection with the performance of the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 26-	30.09.2015.

Contract shall be under the complete control of the Contractor and shall not be deemed to be employees of the Owner, and nothing contained in the Contract or in any subcontract awarded by the Contractor shall be construed to create any contractual relationship between any such employees, representatives or Subcontractors and the Owner.

4.7 Joint Venture or Consortium

If the Bidder/Contractor is a joint venture or consortium of two or more firms, all such firms shall be jointly and severally bound to the Owner for the fulfillment of the provisions of the Contract and the Bidder shall submit a letter of consent to this effect (with Part-I Bid) signed by all joint venture partners / consortium members. The joint venture/consortium partners shall designate one of such firms to act as a leader with authority to bind the joint venture or consortium. The composition or the constitution of the joint venture or consortium shall not be altered without the prior consent of the Owner.

4.8 Non-Waiver

No relaxation, forbearance, delay or indulgence by either party in enforcing any of the terms and conditions of the Contract or the granting of time by either party to the other shall prejudice, affect or restrict the rights of that party under the Contract, nor shall any waiver by either party of any breach of Contract operate as waiver of any subsequent or continuing breach of Contract. Any waiver of a party's rights, powers or remedies under the Contract must be in writing, must be dated and signed by an authorized representative of the party granting such waiver, and must specify the right and the extent to which it is being waived.

4.9 Severability

If any provision or condition of the Contract is prohibited or rendered invalid or unenforceable, such prohibition, invalidity or unenforceability shall not affect the validity or enforceability of any other provisions and conditions of the Contract.

4.10 Origin

"Origin" means the place where the materials, equipments and other supplies for the Facilities are mined, grown, produced or manufactured, and from which the services are provided.

4.11 Notices

All notices to be given under the Contract shall be in writing, and shall be sent by personal delivery, or post, or special courier, or telefax, or E-mail to the address of the relevant party indicated in the Contract.

Either party may change its postal address, telefax number, or E-mail ID or addressee for receipt of such notices by ten (10) days' notice to the other party in writing

Notices shall be deemed to include any approvals, consents, instructions, orders and certificates to be given under the Contract.

4.12 Governing Laws

The Contract shall be governed by and interpreted in accordance with laws in force in India. The Courts of [.....] shall have exclusive jurisdiction in all matters arising under the Contract.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 27-	30.09.2015.

4.13 Settlement of Disputes

a) Mutual Consultation

If any differences/ dispute arises between the Owner and the Contractor in connection with or arising out of the Contract, before or after the termination, abandonment or breach of the Contract—the Owner & Contractor shall seek to resolve any such dispute or difference by mutual consultation. If the parties fail to resolve such a dispute or difference by mutual consultation, then the dispute shall be referred in writing by either party to the Arbitrator, with a copy to the other party.

b) Arbitration

Either Owner or the Contractor may, of its intention to commence arbitration, as to the matter in dispute, and no arbitration may be commenced unless such notice is given.

Any dispute, in respect of which a notice of intention to commence arbitration has been given, as above shall be finally settled by arbitration. Arbitration may be commenced prior to or after completion of the Facilities

Any dispute submitted by a party to arbitration shall be heard by an arbitration panel composed of three arbitrators, in accordance with the provisions set forth below.

The Owner and the Contractor shall each appoint one arbitrator, and these two arbitrators shall jointly appoint a third arbitrator, who shall chair the arbitration panel. If the two arbitrators do not succeed in appointing a third arbitrator within [twenty eight (28)] days after the latter of the two arbitrators has been appointed, the third arbitrator shall, at the request of either party, be appointed by the Appointing Authority for arbitrator is given below.

Appointing Authority for Arbitrator:

- President, Institution of Engineers in case of an Indian Contractor.
- President, International Chambers of Commerce, Paris in case of a Foreign Contractor.

If one party fails to appoint its arbitrator within [forty-two (42)] days after the other party has named its arbitrator, the party which has named an arbitrator may request the Appointing Authority to appoint the second arbitrator.

If for any reason an arbitrator is unable to perform its function, the mandate of the Arbitrator shall terminate in accordance with the provisions of applicable laws and a substitute shall be appointed in the same manner as the original arbitrator.

Arbitration proceedings as follows:-

- In case of a foreign contractor the arbitration proceeding shall be conducted in accordance with the United Nations Commission on International Trade Law (UNCITRAL) Arbitration Rules of 1976.
- In case of an Indian Contractor Adjudication/Arbitration proceedings shall be conducted in accordance with Indian Arbitration and Conciliation Act 1996.
- In case of a foreign associate of the contractor, the arbitration proceedings shall be conducted in accordance with the United Nation Commission on International Trade Law (UNCITRAL) Arbitration Rules of 1976.

The Place for Arbitration shall be: [New Delhi], India.

The language of arbitration shall be English.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 28-	30.09.2015.

The decision of a majority of the arbitrators (or of the third arbitrator chairing the arbitration, if there is no such majority) shall be final and binding and shall be enforceable in any court of competent jurisdiction as decree of the court. The parties thereby waive any objections to or claims of immunity from such enforcement.

Notwithstanding any reference to the arbitration,

- the parties shall continue to perform their respective obligations under the Contract unless they otherwise agree
- The Owner shall pay the Contractor consideration due to the Contractor.

4.14 Scope of Facilities

- a) Unless otherwise expressly limited in the Technical Specifications, Facilities the Contractor's obligations cover the provision of all Plant and Equipments including spares and the performance of all Services required for design, manufacture (including procurement, quality assurance, construction, installation, associated civil works, Structural and others construction works, precommissioning and delivery) of the Plant and Equipment and the installation, commissioning, completion of facilities and performance testing of the Facilities in accordance with the plans, procedures, specifications, drawings, codes and any other documents as specified in the Technical Specifications. Such specifications include, but are not limited to, the provision of supervision and engineering services; the supply of labour, materials, equipment, spare parts and accessories; Contractor's Equipments; construction utilities and supplies; temporary materials, structures and facilities; transportation loading & unloading.
- b) The Contractor shall, unless specifically excluded in the Contract, perform all such work and/or supply all such items and materials not specifically mentioned in the Contract but that can be reasonably inferred from the Contract as being required for attaining Completion of the Facilities.

4.15 Time for Commencement and Completion

- a) The Contractor shall commence work on the scope of work under this Tender from the date of Letter of Award. Contractor shall thereafter proceed with the Facilities in accordance with the time schedule specified in SCC & detailed network schedule agreed & appended to the contract.
- b) The Contractor shall attain Completion of the Facilities (or of a part where a separate time for Completion of such part is specified in the Contract) within the time stated in the SCC subject to time extensions, the contractor is entitled under the contract conditions or time extension expressly grouted by the Owner.

4.16 Spare Parts

In addition to the supply of Mandatory Spare Parts included in the Contract, the Contractor agrees to supply other spare parts (recommended spares) required for the operation and maintenance of the Facilities for 3 years. However, the identity, specifications and quantities of such spare parts and the terms and conditions relating to the supply thereof are to be agreed between the Owner and the Contractor, and the price of such spare parts shall be that given in Price Schedule for recommended spares. The price of such spare parts shall include the purchase price thereof and other costs and expenses (including the Contractor's fees) relating to the supply of spare parts. The prices of recommended spares covered in price schedule shall be

Document Number	Rev No.	Description	Page No.	Date of Issue

valid for a period of six months after the date of Notification of Award of Main Equipment and Mandatory Spares.

- The Contractor shall supply the recommended spares at the same terms and conditions as are otherwise applicable to this Contract.
- All the spares for the equipment under the Contract will strictly conform to the Specification and other relevant documents and will be identical to the corresponding main equipment/components supplied under the Contract and shall be fully interchangeable.
- All the Mandatory Spares covered under the Contract shall be manufactured along with the main equipments as a continuous operation and the delivery of the spares will be affected along with the main equipments in a phased manner and the delivery would be completed by the respective dates for the various categories of equipment as per the agreed schedule. If order for the Recommended Spares has been placed with the Contractor prior to commencement of manufacture of the main equipment this shall be applicable for manufacturer of recommended spares as well.
- The Contractor will provide the Owner with the manufacturing drawings, catalogues, assembly drawings and any other document required by the for the recommended spares. Such details will be furnished to the Owner as soon as they are prepared but in any case not later than six months prior to commencement of manufacture of the corresponding main equipment.
- In addition to the spares recommended by the Contractor, if the Owner further identifies certain particular items of spares, the Contractor will submit the prices and delivery quotation for such spares within [30] days of receipt of such request with a validity period of 6 months for consideration by the Owner and placement of order for additional spares, if the Owner so desires.
- The quality plan and the inspection requirement finalised for the main equipment will also be applicable to the corresponding spares.
- The Contractor will provide the Owner with all the addresses and particulars of his sub-suppliers while placing the order on vendors for items/components/equipment covered under the Contract and will further ensure with his vendors that the Owner, if so desires, will have the right to place order for spares directly on them on mutually agreed terms based on offers of such vendors.
- The Contractor shall guarantee the long term availability of spares to the Owner for the full life of the equipment covered under the Contract. The same provision will also be applicable to spares supplied by Sub-contractors.
- For the first 6 years from the schedule date of completion of facilities the prices will be derived from the corresponding Ex-Works Price at which the order for such spares have been placed by Owner as a part of Mandatory Spares or Recommended Spares, or from the rates of Mandatory Spares or Recommended Spares as quoted by/negotiated with the Contractor. Ex-Works order price of future spares shall be computed in accordance with the price adjustment provisions covered under the main Contract excepting that the base indices will be counted from the scheduled date of Commissioning of the last equipment under the main project. The Contractor will indicate in advance the delivery period of the items of spares, which the Owner may procure in accordance with this clause. In case of emergent requirements of

Document Number	Rev No.	Description	Page No.	Date of Issue

spares, the Contractor would make every effort to expedite the manufacture and delivery of such spares on the basis of mutually agreed time schedule.

- In case the Contractor fails to supply the mandatory or recommended spares in the terms stipulated above, the Owner shall be entitled to purchase the same from the alternate sources at the risk and the cost of the Contractor and recover from the Contractor, the excess amount paid by the Owner over the rates worked on the above basis. In the event of such risk purchase by the Owner, the purchases will be as per the Works and Procurement Policy of the Owner prevalent at the time of such purchases and the Owner at his option may include a representative from the Contractor in finalising the purchases.
- It is expressly understood that the final settlement between the parties in terms of relevant clauses of the Contract Documents shall not relieve the Contractor of any of his obligations under the provision of long term availability of spares and such provisions shall continue to be enforced till the expiry of 6 years period reckoned from the scheduled date of Commissioning of the Plant and Equipment unless otherwise discharged expressly in writing by the Owner.
- The Contractor shall warrant that all spares supplied will be new and in accordance with the Contract Documents and will be free from defects in design, material and workmanship. The defects liability period for spares shall be 12 months from the date it is put to use. In case of failure of any spare part due to fault in design material or workmanship the same part will be replaced by the contractor without any extra cost of the Owner.

In case of any failure in the original component/equipments due to faulty designs, materials and workmanship, the corresponding spare parts, if any, supplied will be replaced without any extra cost to the Owner unless a joint examination and analysis by the Owner and the Contractor of such spare parts prove that the defect found in the original part that failed, can safely be assumed not to be present in spare parts. Any replaced spare parts will have the Defects Liability period of 12 months from the date it is put in use. The discarded spare parts will become the property of the Contractor as soon as they have been replaced by the Contractor. In any case the defect liability of spares will expire at the end of 48 months from the date of their receipt at site

The Defects Liability of spares that are not used within 18 months from the respective date of the delivery at Site will, be subject to condition that all such spares are stored in accordance with Contractor's standard recommended practice, if any, and the same has been furnished to the Owner.

4.17 Contractor's Responsibilities

- a) The Contractor shall design, manufacture (including associated purchases and/or subcontracting), disassemble/dismantle wherever required, install, commission and complete the Facilities and carryout the Guarantee tests with due care and diligence in accordance with the Contract.
- b) Before entering into this contract the Contractor is responsible to have examined the data relating to the Facilities provided by the Owner, and on the basis of information that the Contractor could have obtained from a visual inspection of the Site and of other data readily available to it relating to the Facilities as at one month days prior to bid submission. Any failure to acquaint itself with all such data and information shall not relieve contractor of its responsibility for properly estimating the difficulty or cost of successfully performing its scope of work under this contract.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 31-	30.09.2015.

- c) The Contractor shall acquire all permits, approvals and/or licenses from all local, state or national government authorities or public service undertakings in the country where the Site is located that are necessary for the performance of the Contract, including, without limitation, visas for the Contractor's and Subcontractor's personnel and entry permits for all imported Contractor's Equipment.
- d) The Contractor shall comply with all laws in force in India and the place where the facility is located out. The laws will include all national, provincial, municipal or other laws that affect the performance of the Contract and bind upon the Contractor. The Contractor shall indemnify and hold harmless the Owner from and against any and all liabilities, damages, claims, fines, penalties and expenses of whatever nature arising or resulting from the violation of such laws by the Contractor.

4.18 Owner's Responsibilities

- a) The Owner shall be responsible for acquiring and providing legal and physical possession of the Site and access thereto, and for providing possession of and access to all other areas reasonably required for the proper execution of the Contract, including all requisite rights of way.
- b) The Owner shall acquire and pay for all permits, approvals and/or licenses from all local, state or national government authorities or public service undertakings, which such authorities or undertakings require the Owner to obtain them in the Owner's name, are necessary for the execution of the Contract.
- c) If requested by the Contractor, the Owner shall use its best endeavours to assist the Contractor in obtaining in a timely and expeditious manner all permits, approvals and/or licenses necessary for the execution of the Contract from all local, state or national government authorities or public service undertakings that such authorities or undertakings require the Contractor or Subcontractors or the personnel of the Contractor or Subcontractors, as the case may be, to obtain.
- d) The Owner shall be responsible for the continued operation of the Facilities after Completion.

4.19 Taxes & Duties

- a) Custom Duty, Excise Duty, Central sales tax (CST), service tax, Value Added Tax (VAT), VAT on Works Contract, other applicable taxes, duties and Cess shall be clearly indicated by the bidder in the price schedules and these taxes shall be considered for bid evaluation. The reimbursement of these taxes shall be on actual subject to the quoted value of these taxes as ceiling corresponding to the base price. Additional liability of taxes and duties arising out of price variation shall be reimbursed against documentary evidence over and above the ceiling (quoted value). Statutory variation in Indian taxes and duties will be dealt with as per the relevant stipulations of the specification.
- b) Except as otherwise specifically provided in the Contract, the Contractor shall bear and pay all Taxes, Duties, Levies and Charges including Entry Tax, Service Tax, if applicable in connection with the Facilities in India and outside India. All taxes, duties & levies on works contract, if any, shall be to the Contractor's account and no separate claim in this regard will be entertained by the Owner.
- c) All taxes, duties and levies including entry tax/octroi (if any) in respect of all components, equipments and material to be dispatched directly from the sub-vendor's works to site shall be to the Contractor's account and no separate claim in this regard will be entertained by the Owner.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 32-	30.09.2015.

- d) In case there is introduction of GST or any other tax in lieu of existing Excise Duty/Service Tax and VAT/ Sales Tax, the contract price will be adjusted for the impact of any differential tax liability subject to documentary evidence. This will be restricted to direct transaction between the owner and contractor, and bought out items directly dispatched from sub-vendor's works to project site.
- e) Further all taxes, duties and levies including sales tax on works contract, Entry Tax, if any, in respect of civil construction works, erection & commissioning if any and custom duty/sales tax as applicable on the materials used for such construction works shall be to the contractor's account and no separate claim in this regard will be entertained by the Owner. Incidence of Service Tax & cess on any component of the Bid Price shall be to the Contractor's account and bidders shall include Service Tax as applicable at the date seven (7) days prior to the date of bid submission in the bid price. The Contract Price will be adjusted for impact of any change in the rate of service tax or cess on service tax subsequent to this date for direct transactions between the Owner and the Contractor.
- f) If any tax exemptions, reductions, allowances or privileges may be available to the Contractor, the Owner shall use its best endeavours to enable the Contractor to benefit from any such tax savings to the maximum allowable extent.

4.20 Intellectual Property

The copyright in all drawings, documents and other materials containing data and information furnished to the Owner by the Contractor herein shall remain vested in the Contractor or, if they are furnished to the Owner directly or through the Contractor by any third party, including suppliers of materials, the copyright in such materials shall remain vested in such third party. The Owner shall however be free to reproduce all drawings, documents and other material furnished to the Owner for the purpose of the contract including, if required, for operation and maintenance.

4.21 Confidential Information

- a) The Owner and the Contractor shall keep confidential and shall not, without the written consent of the other party hereto, divulge to any third party any documents, data or other information furnished directly or indirectly by the other party hereto in connection with the Contract, whether such information has been furnished prior to, during or following termination of the Contract. Notwithstanding the above, the Contractor may furnish to its Subcontractor(s) such documents, data and other information it receives from the Owner to the extent required for the Subcontractor(s) to perform its work under the Contract, in which event the Contractor shall obtain from such Subcontractor(s) an undertaking of confidentiality similar to that imposed on the Contractor.
- b) The Owner shall not use such documents, data and other information received from the Contractor for any purpose other than the operation and maintenance of the Facilities. Similarly, the Contractor shall not use such documents, data and other information received from the Owner for any purpose other than the design, procurement of Plant and Equipments, construction or such other work and services as are required for the performance of the Contract.
- c) The obligation of a party, shall not apply to that information which
 - now or hereafter enters the public domain through no fault of that party
 - can be proven to have been possessed by that party at the time of disclosure and which was not previously obtained, directly or indirectly, from the other party hereto

- Otherwise lawfully becomes available to that party from a third party that has no obligation of confidentiality.

4.22 Representatives

a) Project Manager

If the Project Manager is not named in the Contract, then within fourteen (14) days of the Effective Date, the Owner shall appoint and notify the Contractor in writing of the name of the Project Manager. The Owner may from time to time appoint some other person as the Project Manager in place of the person previously so appointed, and shall give a notice of the name of such other person to the Contractor without delay. The Owner shall take reasonable care to see that no such appointment is made at such a time or in such a manner as to impede the progress of work on the Facilities. The Project Manager shall represent and act for the Owner at all times during the currency of the Contract. All notices, instructions, orders, certificates, approvals and all other communications under the Contract shall be given by the Project Manager, except as herein otherwise provided.

All notices, instructions, information and other communications given by the Contractor to the Owner under the Contract shall be given to the Project Manager, except as herein otherwise provided.

b) Contractor's Representative & Construction Manager

- If the Contractor's Representative is not named in the Contract, then within [fourteen (14) days] of the Effective Date, the Contractor shall appoint the Contractor's Representative and shall request the Owner in writing to approve the person so appointed. If the Owner makes no objection to the appointment within [fourteen (14)] days, the Contractor's Representative shall be deemed to have been approved. If the Owner objects to the appointment within [fourteen (14)] days giving the reason there for, then the Contractor shall appoint a replacement within [fourteen (14) days] of such objection.
- The Contractor's Representative shall represent and act for the Contractor at all times during the currency of the Contract and shall give to the Project Manager all the Contractor's notices, instructions, information and all other communications under the Contract. All notices, instructions, information and all other communications given by the Owner or the Project Manager to the Contractor under the Contract shall be given to the Contractor's Representative or, in its absence, its deputy, except as herein otherwise provided. The Contractor shall not revoke the appointment of the Contractor's Representative without the Owner's prior written consent, which shall not be unreasonably withheld. If the Owner consents thereto, the Contractor shall appoint some other person as the Contractor's Representative.
- The Contractor's Representative may, subject to the approval of the Owner (which shall not be unreasonably withheld), at any time delegate to any person any of the powers, functions and authorities vested in him or her. Any such delegation may be revoked at any time. Any such delegation or revocation shall be subject to a prior notice signed by the Contractor's Representative, and shall specify the powers, functions and authorities thereby delegated or revoked. No such delegation or revocation shall take effect unless and until a copy thereof has been delivered to the Owner and the Project Manager.
- From the commencement of installation of the Facilities at the Site until Operational Acceptance, the Contractor's Representative shall appoint a

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 34-	30.09.2015.

suitable person as the construction manager (hereinafter referred to as “the Construction Manager”). The Construction Manager shall supervise all work done at the Site by the Contractor and shall be present at the Site throughout normal working hours except when on leave, sick or absent for reasons connected with the proper performance of the Contract. Whenever the Construction Manager is absent from the Site, a suitable person shall be appointed to act as his or her deputy.

- The Owner may by notice to the Contractor object to any representative or person employed by the Contractor in the execution of the Contract who, in the reasonable opinion of the Owner, may behave inappropriately, may be incompetent or negligent, or may commit a serious breach of the Site regulations.
- If any representative or person employed by the Contractor is removed.

4.23 Work Program

a) Contractor’s Organization

The Contractor shall supply to the Owner and the Project Manager a chart showing the proposed organization to be established by the Contractor for carrying out work on the Facilities. The chart shall include the identities of the key personnel together with the curricula vitae of such key personnel to be employed within *[twenty one (21)]* days of the Effective Date. The Contractor shall promptly inform the Owner and the Project Manager in writing of any revision or alteration of such an organization chart.

b) Program of Performance

Within *[twenty-eight (28)]* days after the date of Notification of Award of Contract, the Contractor shall prepare and submit to the Project Manager a detailed Program of Performance of the Contract, made in the form specified in the SCC and showing the sequence in which it proposes to design, supply, transport, assemble, install and precommissioning the Facilities, as well as the date by which the Contractor reasonably requires that the Owner shall have fulfilled its obligations under the Contract so as to enable the Contractor to execute the Contract in accordance with the program and to achieve Completion and Acceptance of the Facilities in accordance with the Contract. The program so submitted by the Contractor shall accord with the Time Schedule included in Contract Schedule-3 (Time Schedule) to the Form of Contract Agreement and any other dates and periods specified in the Contract. The Contractor shall update and revise the program as and when appropriate or when required by the Project Manager, but without modification in the Times for Completion.

c) Progress Report

The Progress Report shall be in a form acceptable to the Project Manager and shall indicate: (a) percentage completion achieved compared with the planned percentage completion for each activity; and (b) where any activity is behind the program, giving comments and likely consequences and stating the corrective action being taken.

d) Progress of Performance

If at any time the Contractor’s actual progress falls behind the program, or it becomes apparent that it will so fall behind, the Contractor shall, at the request of the Owner or the Project Manager, prepare and submit to the Project Manager a revised program, taking into account the prevailing circumstances, and shall notify the Project Manager of the steps being taken to expedite progress so as to attain Completion of the Facilities within the Time for Completion.

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 35-	30.09.2015.

e) Work Procedures

The Contract shall be executed in accordance with the Contract Documents and the procedures given in the section on Forms and Procedures of the Contract Documents.

If agreed between the Owner and the Contractor, the Contractor may execute the Contract in accordance with its own standard project execution plans and procedures to the extent that they do not conflict with the provisions contained in the Contract.

4.24 Subcontractors and Subvendors

- a) The Contract Agreement specifies major items of supply or services and a list of approved Subcontractors against each item, including vendors. Insofar as no Subcontractors are listed against any such item, the Contractor shall prepare a list of Subcontractors for such item for inclusion in such list. The Contractor may from time to time propose any addition to or deletion from any such list. The Contractor shall submit any such list or any modification thereto to the Owner for its approval in sufficient time so as not to impede the progress of work on the Facilities. Such approval by the Owner for any of the Subcontractors shall not relieve the Contractor from any of its obligations, duties or responsibilities under the Contract.
- b) The Contractor shall select and employ its Subcontractors/Subvendors for such major items from those listed.

4.25 Design and Engineering

a) Specifications and Drawings

The Contractor shall execute the basic and detailed design and the engineering work in compliance with the provisions of the Contract, or where not so specified, in accordance with good engineering practice. The Contractor shall be responsible for any discrepancies, errors or omissions in the specifications, drawings and other technical documents that it has prepared, whether such specifications, drawings and other documents have been approved by the Project Manager or not, provided that such discrepancies, errors or omissions are not because of inaccurate information furnished in writing to the Contractor by or on behalf of the Owner.

b) Codes and Standards

Wherever references are made in the Contract to codes and standards in accordance with which the Contract shall be executed, the edition or the revised version of such codes and standards current at the date *[twenty eight (28)]* days prior to date of bid submission shall apply unless otherwise specified. During Contract execution, any changes in such codes and standards shall be applied after approval by the Owner.

c) Approval/Review of Technical Documents by Project Manager

The Contractor shall prepare (or cause its Subcontractors to prepare) and furnish to the Project Manager the documents for its approval Any part of the Facilities covered by or related to the documents to be approved by the Project Manager shall be executed only after the Project Manager's approval thereof.

Project Manager shall either return one copy thereof to the Contractor with its approval endorsed thereon or shall notify the Contractor in writing of its disapproval thereof and the reasons there for and the modifications that the Project Manager proposes. The Project Manager shall not disapprove any document, except on the grounds that the document does not comply with some specified provision of the

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 36-	30.09.2015.

Contract or that it is contrary to good engineering practice. The procedure for submission of the documents by the Contractor and their approval by the Project Manager shall be discussed and finalised with the Contractor.

If any dispute or difference occurs between the Owner and the Contractor in connection with or arising out of the disapproval by the Project Manager of any document and/or any modification(s) thereto that cannot be settled between the parties within a reasonable period, then such dispute or difference may be referred to an Adjudicator. If such dispute or difference is referred to an Adjudicator, the Project Manager shall give instructions as to whether and if so, how, performance of the Contract is to proceed. The Contractor shall proceed with the Contract in accordance with the Project Manager's instructions, provided that if the Adjudicator upholds the Contractor's view on the dispute, then the Contractor shall be reimbursed by the Owner for any additional costs incurred by reason of such instructions and shall be relieved of such responsibility or liability in connection with the dispute and the execution of the instructions as the Adjudicator shall decide, and the Time for Completion shall be extended accordingly.

The Project Manager's approval, with or without modification of the document furnished by the Contractor, shall not relieve the Contractor of any responsibility or liability imposed upon it by any provisions of the Contract except to the extent that any subsequent failure results from modifications required by the Project Manager.

4.26 Procurement

a) Plant and Equipment

The Contractor shall manufacture or procure and transport all the Plant and Equipments in an expeditious and orderly manner to the Site.

b) Transportation

The Contractor shall at its own risk and expense transport all the Plant and Equipments and the Contractor's Equipments to the Site by the mode of transport that the Contractor judges most suitable under all the circumstances. Unless otherwise provided in the Contract, the Contractor shall be entitled to select any safe mode of transport operated by any person to carry the Plant and Equipments and the Contractor's Equipment. Upon dispatch of each shipment of the Plant and Equipments and the Contractor's Equipments, the Contractor shall notify the Owner by telex, cable, telefax, facsimile or Electronic Data Interchange (EDI) of the description of the Plant and Equipments and of the Contractor's Equipments, the point and means of dispatch, and the estimated time and point of arrival in the country where the Site is located, if applicable, and at the Site. The Contractor shall furnish the Owner with relevant shipping documents to be agreed upon between the parties.

The Contractor shall be responsible for obtaining, if necessary, approvals from the authorities for transportation of the Plant and Equipments and the Contractor's Equipments to the Site. The Owner shall use its best endeavours in a timely and expeditious manner to assist the Contractor in obtaining such approvals, if requested by the Contractor. The Contractor shall indemnify and hold harmless the Owner from and against any claim for damage to roads, bridges or any other traffic facilities that may be caused by the transport of the Plant and Equipments and the Contractor's Equipments to the Site.

c) The Contractor shall, at its own expense, handle all imported Plant and Equipments and spares and Contractor's Equipments at the point(s) of import and shall handle any formalities for customs clearance.

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 37-	30.09.2015.

4.27 Installation

a) Setting Out/Supervision/Labour

Bench Mark: The Contractor shall be responsible for the true and proper setting-out of the Facilities in relation to bench marks, reference marks and lines provided to it in writing by or on behalf of the Owner.

If, at any time during the progress of installation of the Facilities, any error shall appear in the position, level or alignment of the Facilities, the Contractor shall forthwith notify the Project Manager of such error and, at its own expense, immediately rectify such error to the reasonable satisfaction of the Project Manager. If such error is based on incorrect data provided in writing by or on behalf of the Owner, the expense of rectifying the same shall be borne by the Owner.

Contractor's Supervision: The Contractor shall give or provide all necessary superintendence during the installation of the Facilities, and the Construction Manager or its deputy shall be constantly on the Site to provide full time superintendence of the installation. The Contractor shall provide and employ only technical personnel who are skilled and experienced in their respective callings and supervisory staff who are competent to adequately supervise the work at hand.

The Contractor shall provide and employ on the Site in the installation of the Facilities such skilled, semi-skilled and unskilled labour as is necessary for the proper and timely execution of the Contract. The Contractor is encouraged to use local labour that has the necessary skills. Unless otherwise provided in the Contract, the Contractor shall be responsible for the recruitment, transportation, accommodation and catering of all labour, local or expatriate, required for the execution of the Contract and for all payments in connection therewith.

The Contractor shall at its own expense provide the means of repatriation to all of its and its Subcontractor's personnel employed on the Contract at the Site to their various home countries. It shall also provide suitable temporary maintenance of all such persons from the cessation of their employment on the Contract to the date programmed for their departure. In the event that the Contractor defaults in providing such means of transportation and temporary maintenance, the Owner may provide the same to such personnel and recover the cost of doing so from the Contractor.

The Contractor shall, in all dealings with its labour and the labour of its Subcontractors currently employed on or connected with the Contract, pay due regard to all recognized festivals, official holidays, religious or other customs and all local laws and regulations pertaining to the employment of labour.

b) Contractor's Equipments

All Contractors' Equipments brought by the Contractor onto the Site shall be deemed to be intended to be used exclusively for the execution of the Contract. The Contractor shall not remove the same from the Site without the Project Manager's consent that such Contractor's Equipments are no longer required for the execution of the Contract. Unless otherwise specified in the Contract, upon completion of the Facilities, the Contractor shall remove from the Site all Equipments brought by the Contractor onto the Site and any surplus materials remaining thereon.

The Owner will, if requested, use its best endeavours to assist the Contractor in obtaining any local, state or national government permission required by the Contractor for the export of the Contractor's Equipments imported by the Contractor for use in the execution of the Contract that is no longer required for the execution of the Contract.

c) Site Regulations and Safety

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 38-	30.09.2015.

The Owner and the Contractor shall establish Site regulations setting out the rules to be observed in the execution of the Contract at the Site and shall comply therewith. The Contractor shall prepare and submit to the Owner, with a copy to the Project Manager, proposed Site regulations for the Owner's approval, which approval shall not be unreasonably withheld.

Such Site regulations shall include, but shall not be limited to, rules in respect of security, safety of the Facilities, gate control, sanitation, medical care, and fire prevention.

d) Opportunities for Other Contractors

The Contractor shall, upon written request from the Owner or the Project Manager, give all reasonable opportunities for carrying out the work to any other contractors employed by the Owner on or near the Site. If the Contractor, upon written request from the Owner or the Project Manager, makes available to other contractors any roads or ways the maintenance for which the Contractor is responsible, permits the use by such other contractors of the Contractor's Equipments, or provides any other service of whatsoever nature for such other contractors, the Owner shall fully compensate the Contractor for any loss or damage caused or occasioned by such other contractors in respect of any such use or service, and shall pay to the Contractor reasonable remuneration for the use of such equipments or the provision of such services.

The Contractor shall also so arrange to perform its work as to minimize, to the extent possible, interference with the work of other contractors. The Project Manager shall determine the resolution of any difference or conflict that may arise between the Contractor and other contractors and the workers of the Owner in regard to their work.

The Contractor shall notify the Project Manager promptly of any defects in the other Contractors' work that come to its notice, and that could affect the Contractor's work. The Project Manager shall determine the corrective measures, if any, required to rectify the situation after inspection of the Facilities. Decisions made by the Project Manager shall be binding on the Contractor.

e) Emergency Work

If, by reason of an emergency arising in connection with and during the execution of the Contract, any protective or remedial work is necessary as a matter of urgency to prevent damage to the Facilities, the Contractor shall immediately carry out such work.

If the Contractor is unable or unwilling to do such work immediately, the Owner may do or cause such work to be done as the Owner may determine is necessary in order to prevent damage to the Facilities. In such event the Owner shall, as soon as practicable after the occurrence of any such emergency, notify the Contractor in writing of such emergency, the work done and the reasons there for. If the work done or caused to be done by the Owner is work that the Contractor was liable to do at its own expense under the Contract, the reasonable costs incurred by the Owner in connection therewith shall be paid by the Contractor to the Owner. Otherwise, the cost of such remedial work shall be borne by the Owner.

f) Site Clearance

Site Clearance in Course of Performance: In the course of carrying out the Contract, the Contractor shall keep the Site reasonably free from all unnecessary obstruction, store or remove any surplus materials, clear away any wreckage, rubbish or temporary works from the Site, and remove any Contractor's Equipments no longer

Document Number	Rev No.	Description	Page No.	Date of Issue

required for execution of the Contract. Clearance of Site after Completion: After Completion of all parts of the Facilities, the Contractor shall clear away and remove all wreckage, rubbish and debris of any kind from the Site, and shall leave the Site and Facilities clean and safe.

g) Watching and Lighting

The Contractor shall provide and maintain at its own expense all lighting, fencing, and watching when and where necessary for the proper execution and the protection of the Facilities, or for the safety of the owners and occupiers of adjacent property and for the safety of the public as per specification.

4.28 Testing & Inspections

- a) The Contractor shall at its own expense carry out at the place of manufacture and/or on the Site all such tests and/or inspections of the Plant and Equipments and any part of the Facilities as are specified in the Contract.
- b) The Owner and the Project Manager or their designated representatives shall be entitled to attend the aforesaid test and/ or inspection, provided that the Owner shall bear all costs and expenses incurred in connection with such attendance including, but not limited to, all travelling and board and lodging expenses.
- c) Whenever the Contractor is ready to carry out any such test and/or inspection, the Contractor shall give a reasonable advance notice of such test and/or inspection and of the place and time thereof to the Project Manager. The Contractor shall obtain from any relevant third party or manufacturer any necessary permission or consent to enable the Owner and the Project Manager (or their designated representatives) to attend the test and/or inspection.
- d) The Contractor shall provide the Project Manager with a certified report of the results of any such test and/or inspection. If the Owner or Project Manager (or their designated representatives) fails to attend the test and/or inspection, or if it is agreed between the parties that such persons shall not do so, then the Contractor may proceed with the test and/or inspection in the absence of such persons, and may provide the Project Manager with a certified report of the results thereof.
- e) The Project Manager may require the Contractor to carry out any test and/or inspection not required by the Contract, provided that the Contractor's reasonable costs and expenses incurred in the carrying out of such test and/or inspection shall be added to the Contract Price. Further, if such test and/or inspection impede the progress of work on the Facilities and/or the Contractor's performance of its other obligations under the Contract, due allowance will be made in respect of the Time for Completion and the other obligations so affected.
- f) If any Plant and Equipment or any part of the Facilities fails to pass any test and/or inspection, the Contractor shall either rectify or replace such Plant and Equipment or part of the Facilities and shall repeat the test and/or inspection upon giving a notice.
- g) If any dispute or difference of opinion shall arise between the parties in connection with or arising out of the test and/or inspection of the Plant and Equipments or part of the Facilities that cannot be settled between the parties within a reasonable period of time, it may be referred to the Adjudicator.
- h) The Contractor shall afford the Owner and the Project Manager, at the Owner's expense, access at any reasonable time to any place where the Plant and Equipments are being manufactured or the Facilities are being installed, in order to inspect the progress and the manner of manufacture or installation, provided that the Project Manager shall give the Contractor a reasonable prior notice.

LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 40-	30.09.2015.

- i) The Contractor agrees that neither the execution of a test and/ or inspection of Plant and Equipments or any part of the Facilities, nor the witnessing of any test by the Owner, nor the issuance of any test certificate shall relieve the Contractor of any obligation under this Contract.
- j) No part of the Facilities or foundations shall be covered up on the Site without the Contractor carrying out any test and/or inspection required under the Contract. The Contractor shall give a reasonable notice to the Project Manager whenever any such part of the Facilities or foundations is ready or about to be ready for test and/or inspection; such test and/or inspection and notice thereof shall be subject to the requirements of the Contract.
- k) The Contractor shall uncover any part of the Facilities or foundations, or shall make openings in or through the same as the Project Manager may from time to time require at the Site, and shall reinstate and make good such part or parts.

4.29 Completion of the Facilities

- a) As soon as the Facilities or any part thereof has, in the opinion of the Contractor, been completed operationally and structurally and put in a tight and clean condition as specified in the Technical Specifications, excluding minor items not materially affecting the operation or safety of the Facilities, the Contractor shall so notify the Owner in writing.
- b) The Owner shall supply the operating and maintenance personnel as specified in the Contract for Precomissioning of the Facilities or any part thereof.
- c) As soon as all works in respect of Precomissioning are completed and, in the opinion of the Contractor, the Facilities or any part thereof is ready for Commissioning, the Contractor shall commence Commissioning as per procedures stipulated in Technical Specifications, and as soon as Commissioning is satisfactorily completed, the Contractor shall so notify the Project Manager in writing.
- d) If the Project Manager notifies the Contractor of any defects and/ or deficiencies, the Contractor shall then correct such defects and/or deficiencies.
If the Project Manager is satisfied that the Facilities or that part thereof have reached Completion, the Project Manager shall, within [seven (7)] days after receipt of the Contractor's notice, issue a Completion Certificate stating that the Facilities or that part thereof have reached Completion as at the date of the Contractor's notice.
If the Project Manager is not so satisfied, then it shall notify the Contractor in writing of any defects and/or deficiencies within [seven (7)] days after receipt of the Contractor's notice, and the above procedure shall be repeated.
- e) If the Project Manager fails to issue the Completion Certificate and fails to inform the Contractor of any defects and/or deficiencies within [seven (7)] days after receipt of the Contractor's notice, or if the Owner makes use of the Facilities or part thereof, then the Facilities or that part thereof shall be deemed to have reached Completion as of the date of the Contractor's notice, or as of the Owner's use of the Facilities, as the case may be.
- f) As soon as possible after Completion, the Contractor shall complete all outstanding minor items so that the Facilities are fully in accordance with the requirements of the Contract, failing which the Owner will undertake such completion and deduct the costs thereof from any monies owing to the Contractor.
- g) Upon Completion, the Owner shall be responsible for the care and custody of the Facilities or the relevant part thereof, together with the risk of loss or damage thereto, and shall thereafter take over the Facilities or the relevant part thereof.

4.30 Commissioning & Operation Acceptance

a) Commissioning

Commissioning of the Facilities or any part thereof Acceptance shall be completed by the Contractor as per procedures detailed in the Technical Specifications. The Contractor shall, unless otherwise specified in Contract/ Tender Specifications, supply the utilities, lubricants, chemicals, catalysts, facilities, services and other matters required for Commissioning.

b) Guarantee Test

The Guarantee Tests (and repeats thereof) shall be conducted by the Contractor after Commissioning of the Facilities or the relevant part thereof to ascertain whether the Facilities or the relevant part can attain the Functional Guarantees specified in the Contract Documents. The Contractor's and Project Manager's advisory personnel shall attend the Guarantee Test. The Owner shall promptly provide the Contractor with such information as the Contractor may reasonably require in relation to the conduct and results of the Guarantee Tests (and any repeats thereof). If for reasons not attributable to the Contractor, the Guarantee Tests of the Facilities or the relevant part thereof cannot be successfully completed within the period from the date of Completion, specified in the SCC or any other period agreed upon by the Owner and the Contractor, the Contractor shall be deemed to have fulfilled its obligations with respect to the Functional Guarantees.

c) Operational Acceptance

Operational Acceptance shall occur in respect of the Facilities or any part thereof when

- the Guarantee Tests have been successfully completed and the Functional Guarantees are met; or
- The Guarantee Tests have not been successfully completed or has not been carried out for reasons not attributable to the Contractor within the period from the date of Completion specified in the SCC or any other agreed upon period as specified in GCC.
- The Contractor may give a notice to the Project Manager requesting the issue of an Operational Acceptance Certificate in respect of the Facilities or the part thereof specified in such notice as at the date of such notice.
- The Project Manager shall, after consultation with the Owner, and within forty five (45) days after receipt of the Contractor's notice, issue an Operational Acceptance Certificate. If within [forty five (45)] days after receipt of the Contractor's notice, the Project Manager fails to issue the Operational Acceptance Certificate or fails to inform the Contractor in writing of the justifiable reasons why the Project Manager has not issued the Operational Acceptance Certificate, the Facilities or the relevant part thereof shall be deemed to have been accepted as at the date of the Contractor's said notice.

d) Partial Acceptance

If the Contract specifies that Completion, Commissioning and Guarantee Tests shall be carried out in respect of parts of the Facilities, the provisions relating to Completion and Commissioning including the Guarantee Tests shall apply to each such part of the Facilities individually, and the Operational Acceptance Certificate shall be issued accordingly for each such part of the Facilities. If a part of the Facilities comprises facilities such as buildings, for which no

Commissioning or Guarantee Tests are required, then the Project Manager shall issue the Operational Acceptance Certificate for such facility when it attains Completion, provided that the Contractor shall thereafter complete any outstanding minor items that are listed in the Operational Acceptance Certificate.

4.31 Completion Time and Liquidated Damage

a) Completion Time Period

The Contractor guarantees that it shall attain Completion of the Facilities (or a part for which a separate time for completion is specified in the SCC) within the Time for Completion specified in the SCC.

b) If the Contractor fails to attain Completion of the Facilities or any part thereof within the Time for Completion, the Contractor shall pay to the Owner liquidated damages in the amount computed at the rates specified in the SCC. The aggregate amount of such liquidated damages shall in no event exceed the amount specified as "Maximum" in the SCC.

However, the payment of liquidated damages shall not in any way relieve the Contractor from any of its obligations to complete the Facilities or from any other obligations and liabilities of the Contractor under the Contract.

c) No bonus will be given for earlier completion of the facilities or part thereof.

4.32 Defects Liability

a) The Contractor warrants that the Facilities or any part thereof shall be free from defects in the design, engineering, materials and workmanship of the Plant and Equipments supplied and of the work executed.

b) The Defects Liability Period shall be [eighteen (18)] months from the date of Completion of the Facilities (or any part thereof) or [twelve (12)] months from the date of Operational Acceptance of the Facilities (or any part thereof).

If during the Defects Liability Period any defect should be found in the design, engineering, materials and workmanship of the Plant and Equipments supplied or of the work executed by the Contractor, the Contractor shall promptly, in consultation and agreement with the Owner regarding appropriate remedying of the defects, and at its cost, repair, replace or otherwise make good (as the Contractor shall, at its discretion, determine) such defect as well as any damage to the Facilities caused by such defect. The Contractor shall not be responsible for the repair, replacement or making good of any defect or of any damage to the Facilities arising out of or resulting from any of the following causes:

- improper operation or maintenance of the Facilities by the Owner
- operation of the Facilities outside specifications provided in the Contract
- Normal wear and tear.

c) The Owner shall give the Contractor a notice stating the nature of any such defect together with all available evidence thereof, promptly following the discovery thereof. The Owner shall afford all reasonable opportunity for the Contractor to inspect any such defect.

d) The Owner shall afford the Contractor all necessary access to the Facilities and the Site to enable the Contractor to perform its obligations.

e) If the repair, replacement or making good is of such a character that it may affect the efficiency of the Facilities or any part thereof, the Owner may give to the Contractor a notice requiring that tests of the defective part of the Facilities shall be

Document Number	Rev No.	Description	Page No.	Date of Issue
LII-GETS12021-G-00129-002	02	Tender Document for Selection of R&M Contractors– Turbo Generator & Auxiliaries Volume-I	- 43-	30.09.2015.

made by the Contractor immediately upon completion of such remedial work, whereupon the Contractor shall carry out such tests.

- f) If the Contractor fails to commence the work necessary to remedy such defect or any damage to the Facilities caused by such defect within a reasonable time (which shall in no event be considered to be less than fifteen (15) days), the Owner may, following notice to the Contractor, proceed to do such work, and the reasonable costs incurred by the Owner in connection therewith shall be paid to the Owner by the Contractor or may be deducted by the Owner from any monies due to the Contractor or claimed under the Performance Security.
- g) If the Facilities or any part thereof cannot be used by reason of such defect and/or making good of such defect, the Defects Liability Period of the Facilities or such part, as the case may be, shall be extended by a period equal to the period during which the Facilities or such part cannot be used by the Owner because of any of the aforesaid reasons. Upon correction of the defects in the Facilities or any part thereof by repair/replacement, such repair/replacement shall have the Defects Liability Period extended by a period of **[twelve (12) month]** from the time such replacement/repair of the Facilities or any part thereof.

4.33 Functional Guarantees

The Contractor guarantees that during the Guarantee Tests, the Facilities and all parts thereof shall attain the Functional Guarantees as per the Contract. If, for reasons attributable to the Contractor, Functional Guarantees are not met either in whole or in part, the Contractor shall, within a mutually agreed time, at its cost and expense make such changes, modifications and/or additions to the Plant or any part thereof as may be necessary to meet such Guarantees. The Contractor shall notify the Owner upon completion of the necessary changes, modifications and/or additions, and shall seek the Owner's consent to repeat the Guarantee Test. If the specified Functional Guarantees are not established even during the repeat of the Guarantee Tests, the Owner may at its option, either reject the plant and equipment and recover from the Contractor payments already made or Accept the equipment/system/plant after levying Liquidated Damages as specified.

4.34 Patents Indemnity

The Contractor shall indemnify and hold harmless the Owner and its employees and officers from and against any and all suits, actions or administrative proceedings, claims, demands, losses, damages, costs, and expenses of whatsoever nature, including attorney's fees and expenses, which the Owner may suffer as a result of any infringement or alleged infringement of any patent, utility model, registered design, trademark, copyright or other intellectual property right registered or otherwise existing at the date of the Contract by reason of: (a) the installation of the Facilities by the Contractor or the use of the such Facilities.

4.35 Limitation of liability

Except in cases of criminal negligence or wilful misconduct by the Contractor, the aggregate liability of the Contractor to the Owner, whether under the Contract, in tort or otherwise, shall not exceed the total Contract Price, provided that this limitation shall not apply to any obligation of the Contractor to indemnify the Owner with respect to patent infringement.

Except in cases of criminal negligence or wilful misconduct by the Contractor, the Contractor shall not be liable to the Owner, whether in contract, tort, or otherwise, for any indirect or consequential loss or damage, loss of use, loss of production, or

Document Number	Rev No.	Description	Page No.	Date of Issue

loss of profits or interest costs, provided that this exclusion shall not apply to any obligation of the Contractor to pay liquidated damages to the Owner.

4.36 Transfer of Ownership

Ownership of the Plant and Equipments (including spare parts) to be imported into India shall be transferred to the Owner upon loading on to the mode of transport to be used to convey the Plant and Equipments from the country of origin to that country.

Ownership of the Plant and Equipments (including spare parts) procured from within India shall be transferred to the Owner when the Plant and Equipments including spares are loaded on to the mode of transport to be used to convey the Plant and Equipments including spares from the works to the site and upon endorsement of the despatch documents in favour of the Owner. Ownership of the Contractor's Equipments used by the Contractor and its Subcontractors in connection with the Contract shall remain with the Contractor or its Subcontractors. Ownership of any Plant and Equipments in excess of the requirements for the Facilities shall revert to the Contractor upon Completion of the Facilities or at such earlier time when the Owner and the Contractor agree that the Plant and Equipments in question are no longer required for the Facilities, provided quantity of any Plant and Equipments specifically stipulated in the Contract shall be the property of the Owner whether or not incorporated in the Facilities. Notwithstanding the transfer of ownership of the Plant and Equipments, the responsibility for care and custody thereof together with the risk of loss or damage shall remain with the Contractor until Completion of the Facilities.
